

## Data Sheet

**ADP1190**

### FEATURES

- Low input voltage range: 1.4 V to 3.6 V
- Power switch: low  $R_{DS\text{ON}}$  of 60 mΩ at 3.6 V, with active discharge
- 4 normally open SPST signal switches:  $R_{DS\text{ON}}$  of 2 Ω at 1.8 V with active pull-down on one side
- 500 mA continuous operating current
- Built-in level shift for control logic that can be operated by 1.2 V logic
- Ultralow shutdown current: <0.7 μA
- Ultrasmall 1.2 mm × 1.6 mm × 0.5 mm, 12-ball, 0.4 mm pitch WLCSP

### APPLICATIONS

- Mobile phones
- SIM card disconnect switches
- Digital cameras and audio devices
- Portable and battery-powered equipment

### FUNCTIONAL BLOCK DIAGRAM

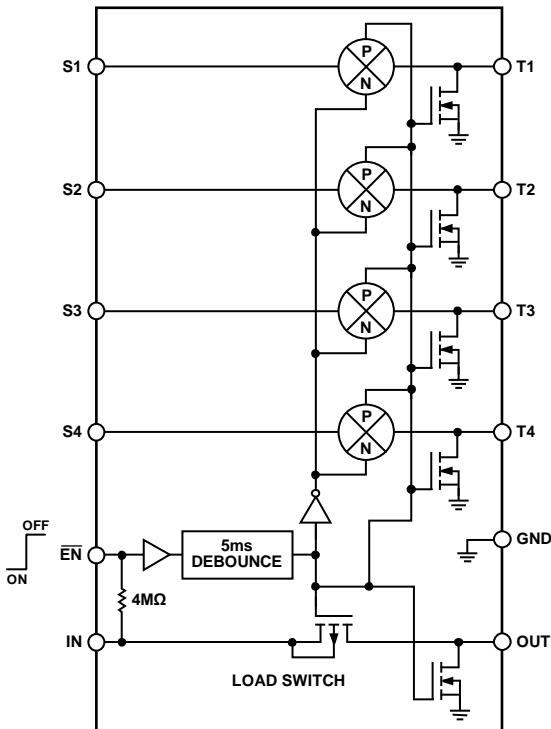

Figure 1.

11256-001

### GENERAL DESCRIPTION

The [ADP1190](#) is an integrated high-side load switch with four signal switches, designed for operation from 1.4 V to 3.6 V. This load switch provides power domain isolation for extended power battery life. The load switch is a low on-resistance P-channel MOSFET that supports up to 500 mA of continuous load current and minimizes power loss. Integrated with the load switch are four normally open 2 Ω SPST signal switches.

Aside from its excellent operating performance, the [ADP1190](#) occupies minimal printed circuit board (PCB) space with an area less than 1.92 mm<sup>2</sup> and a height of 0.50 mm. The [ADP1190](#) is available in an ultrasmall 1.2 mm × 1.6 mm, 12-ball, 0.4 mm pitch WLCSP.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
IN to GND	-0.3 V to +4.0 V
OUT to GND	-0.3 V to $V_{IN}$
Sx to GND	-0.3 V to +4.0 V
Tx to GND	-0.3 V to +4.0 V
EN to GND	-0.3 V to +4.0 V
Continuous Load Switch Current $T_A = 25^\circ\text{C}$	$\pm 1 \text{ A}$
$T_A = 85^\circ\text{C}$	$\pm 500 \text{ mA}$
Continuous Diode Current	-50 mA
Storage Temperature Range	-65°C to +150°C
Junction Temperature	+150°C
Operating Junction Temperature Range	-40°C to +125°C
Operating Ambient Temperature Range	-40°C to +85°C
Soldering Conditions	JEDEC J-STD-020

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL DATA

Absolute maximum ratings apply individually only, not in combination. The ADP1190 can be damaged when the junction temperature limits are exceeded. Monitoring ambient temperature does not guarantee that  $T_J$  is within the specified temperature limits. In applications with high power dissipation and poor thermal resistance, the maximum ambient temperature may need to be derated.

In applications with moderate power dissipation and low PCB thermal resistance, the maximum ambient temperature can exceed the maximum limit as long as the junction temperature is within specification limits. The junction temperature ( $T_J$ ) of the device is dependent on the ambient temperature ( $T_A$ ), the power dissipation of the device ( $P_D$ ), and the junction-to-ambient thermal resistance of the package ( $\theta_{JA}$ ).

Maximum junction temperature ( $T_J$ ) is calculated from the ambient temperature ( $T_A$ ) and power dissipation ( $P_D$ ) using the formula

$$T_J = T_A + (P_D \times \theta_{JA})$$

The junction-to-ambient thermal resistance ( $\theta_{JA}$ ) of the package is based on modeling and calculation using a 4-layer board. The junction-to-ambient thermal resistance is highly dependent on the application and board layout. In applications where high maximum power dissipation exists, close attention to thermal board design is required. The value of  $\theta_{JA}$  may vary, depending on PCB material, layout, and environmental conditions. The specified value of  $\theta_{JA}$  is based on a 4-layer, 4 in.  $\times$  3 in. circuit board. See JESD51-7 and JESD51-9 for detailed information on the board construction. For additional information, see the [AN-617 Application Note, Wafer Level Chip Scale Package](#), available at [www.analog.com](http://www.analog.com).

$\Psi_{JB}$  is the junction-to-board thermal characterization parameter with units of °C/W.  $\Psi_{JB}$  of the package is based on modeling and calculation using a 4-layer board. JESD51-12, *Guidelines for Reporting and Using Electronic Package Thermal Information*, states that thermal characterization parameters are not the same as thermal resistances.  $\Psi_{JB}$  measures the component power flowing through multiple thermal paths rather than through a single path as in thermal resistance,  $\theta_{JB}$ . Therefore,  $\Psi_{JB}$  thermal paths include convection from the top of the package as well as radiation from the package, factors that make  $\Psi_{JB}$  more useful in real-world applications. Maximum junction temperature ( $T_J$ ) is calculated from the board temperature ( $T_B$ ) and power dissipation ( $P_D$ ) using the formula

$$T_J = T_B + (P_D \times \Psi_{JB})$$

See JESD51-8 and JESD51-12 for more detailed information about  $\Psi_{JB}$ .

## THERMAL RESISTANCE

$\theta_{JA}$  and  $\Psi_{JB}$  are specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

Package Type	$\theta_{JA}$	$\Psi_{JB}$	Unit
12-Ball WLCSP	130	29.2	°C/W

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

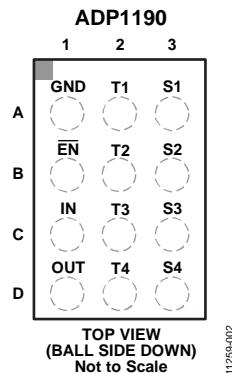

Figure 3. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
A1	GND	Ground.
B1	EN	Enable Input, Active Low.
C1	IN	Input Voltage.
D1	OUT	Load Switch Output Voltage.
A2	T1	Channel 1 Analog Switch. Connect to the SIM card socket (has active discharge).
B2	T2	Channel 2 Analog Switch. Connect to the SIM card socket (has active discharge).
C2	T3	Channel 3 Analog Switch. Connect to the SIM card socket (has active discharge).
D2	T4	Channel 4 Analog Switch. Connect to the SIM card socket (has active discharge).
A3	S1	Channel 1 Analog Switch. Connect to the microcontroller.
B3	S2	Channel 2 Analog Switch. Connect to the microcontroller.
C3	S3	Channel 3 Analog Switch. Connect to the microcontroller.
D3	S4	Channel 4 Analog Switch. Connect to the microcontroller.

## TYPICAL PERFORMANCE CHARACTERISTICS

$V_{IN} = 1.8 \text{ V}$ ,  $V_{EN} = V_{IN}$ ,  $C_{IN} = C_{OUT} = 1 \mu\text{F}$ ,  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

## THEORY OF OPERATION

The ADP1190 is a high-side load switch integrated with four signal switches. The load switch and signal switches are turned on by a low signal on the EN pin. A  $4\text{ M}\Omega$  pull-up resistor on this pin allows it to be driven by an open-collector or mechanical switch. When the part is disabled, the T1 to T4 pins are actively pulled down with a nominal resistance of  $215\ \Omega$ . There is a 5 ms debounce counter on EN for use with a mechanical EN switch. That is, EN must be held low for 5 ms before the part is enabled. If EN transitions high before this timeout, the counter is reset and starts a new 5 ms count.

The signal path is controlled by a PMOS/NMOS transmission gate with an on resistance of  $2\ \Omega$ . Break-before-make logic control ensures that the active pull-down is off before the signal path is enabled.

In addition to these features, the ADP1190 occupies minimal printed circuit board (PCB) space with an area less than  $1.92\text{ mm}^2$  and a height of 0.50 mm. The ADP1190 is available in an ultrasmall  $1.2\text{ mm} \times 1.6\text{ mm}$ , 12-ball, 0.4 mm pitch WLCSP.

**NOTES**

**Данный компонент на территории Российской Федерации****Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибуторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ Р В 0015-002 и ЭС РД 009
