

PSoC[®] 4: PSoC 4000S Datasheet

Programmable System-on-Chip (PSoC[®])

Functional Description

PSoC[®] 4 is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with an ARM[®] Cortex[®]-M0+ CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing. The PSoC 4000S product family is a member of the PSoC 4 platform architecture. It is a combination of a microcontroller with standard communication and timing peripherals, a capacitive touch-sensing system (CapSense) with best-in-class performance, programmable general-purpose continuous-time and switched-capacitor analog blocks, and programmable connectivity. PSoC 4000S products will be upward compatible with members of the PSoC 4 platform for new applications and design needs.

Features

32-bit MCU Subsystem

- 48-MHz ARM Cortex-M0+ CPU
- Up to 32 KB of flash with Read Accelerator
- Up to 4 KB of SRAM

Programmable Analog

- Single-slope 10-bit ADC function provided by Capacitance sensing block
- Two current DACs (IDACs) for general-purpose or capacitive sensing applications on any pin
- Two low-power comparators that operate in Deep Sleep low-power mode

Programmable Digital

Programmable logic blocks allowing Boolean operations to be performed on port inputs and outputs

Low-Power 1.71-V to 5.5-V Operation

Deep Sleep mode with operational analog and 2.5 µA digital system current

Capacitive Sensing

- Cypress CapSense Sigma-Delta (CSD) provides best-in-class signal-to-noise ratio (SNR) (>5:1) and water tolerance
- Cypress-supplied software component makes capacitive sensing design easy
- Automatic hardware tuning (SmartSense[™])

Serial Communication

 Two independent run-time reconfigurable Serial Communication Blocks (SCBs) with re-configurable I2C, SPI, or UART functionality

LCD Drive Capability

■ LCD segment drive capability on GPIOs

Timing and Pulse-Width Modulation

- Five 16-bit timer/counter/pulse-width modulator (TCPWM) blocks
- Center-aligned, Edge, and Pseudo-random modes
- Comparator-based triggering of Kill signals for motor drive and other high-reliability digital logic applications

Up to 36 Programmable GPIO Pins

- 48-pin TQFP, 40-pin QFN, 32-pin QFN, 24-pin QFN, 32-pin TQFP, and 25-ball WLCSP packages
- Any GPIO pin can be CapSense, analog, or digital
- Drive modes, strengths, and slew rates are programmable

PSoC Creator Design Environment

- Integrated Development Environment (IDE) provides schematic design entry and build (with analog and digital automatic routing)
- Applications Programming Interface (API) component for all fixed-function and programmable peripherals

Industry-Standard Tool Compatibility

After schematic entry, development can be done with ARM-based industry-standard development tools

Logic Block Diagram

PSoC 4000S devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware.

The ARM Serial-Wire Debug (SWD) interface supports all programming and debug features of the device.

Complete debug-on-chip functionality enables full-device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debug.

The PSoC Creator IDE provides fully integrated programming and debug support for the PSoC 4000S devices. The SWD interface is fully compatible with industry-standard third-party tools. The PSoC 4000S family provides a level of security not possible with multi-chip application solutions or with microcontrollers. It has the following advantages:

- Allows disabling of debug features
- Robust flash protection
- Allows customer-proprietary functionality to be implemented in on-chip programmable blocks

The debug circuits are enabled by default and can be disabled in firmware. If they are not enabled, the only way to re-enable them is to erase the entire device, clear flash protection, and reprogram the device with new firmware that enables debugging. Thus firmware control of debugging cannot be over-ridden without erasing the firmware thus providing security.

Additionally, all device interfaces can be permanently disabled (device security) for applications concerned about phishing attacks due to a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. All programming, debug, and test interfaces are disabled when maximum device security is enabled. Therefore, PSoC 4000S, with device security enabled, may not be returned for failure analysis. This is a trade-off the PSoC 4000S allows the customer to make.

Functional Overview

CPU and Memory Subsystem

CPU

The Cortex-M0+ CPU in the PSoC 4000S is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. Most instructions are 16 bits in length and the CPU executes a subset of the Thumb-2 instruction set. It includes a nested vectored interrupt controller (NVIC) block with eight interrupt inputs and also includes a Wakeup Interrupt Controller (WIC). The WIC can wake the processor from Deep Sleep mode, allowing power to be switched off to the main processor when the chip is in Deep Sleep mode.

The CPU also includes a debug interface, the serial wire debug (SWD) interface, which is a two-wire form of JTAG. The debug configuration used for PSoC 4000S has four breakpoint (address) comparators and two watchpoint (data) comparators.

Flash

The PSoC 4000S device has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The low-power flash block is designed to deliver two wait-state (WS) access time at 48 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average.

SRAM

Four KB of SRAM are provided with zero wait-state access at 48 MHz.

SROM

A supervisory ROM that contains boot and configuration routines is provided.

System Resources

Power System

The power system is described in detail in the section Power on page 10. It provides assurance that voltage levels are as required for each respective mode and either delays mode entry (for example, on power-on reset (POR)) until voltage levels are as required for proper functionality, or generates resets (for example, on brown-out detection). The PSoC 4000S operates with a single external supply over the range of either 1.8 V \pm 5% (externally regulated) or 1.8 to 5.5 V (internally regulated) and has three different power modes, transitions between which are managed by the power system. The PSoC 4000S provides Active, Sleep, and Deep Sleep low-power modes.

All subsystems are operational in Active mode. The CPU subsystem (CPU, flash, and SRAM) is clock-gated off in Sleep mode, while all peripherals and interrupts are active with instantaneous wake-up on a wake-up event. In Deep Sleep mode, the high-speed clock and associated circuitry is switched off; wake-up from this mode takes 35 µs. The opamps can remain operational in Deep Sleep mode.

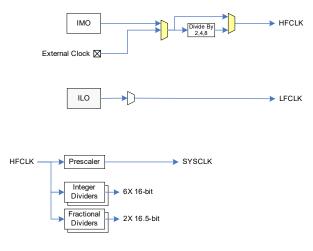

Clock System

The PSoC 4000S clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that there are no metastable conditions.

The clock system for the PSoC 4000S consists of the internal main oscillator (IMO), internal low-frequency oscillator (ILO), a 32 kHz Watch Crystal Oscillator (WCO) and provision for an external clock. Clock dividers are provided to generate clocks for peripherals on a fine-grained basis. Fractional dividers are also provided to enable clocking of higher data rates for UARTs.

The HFCLK signal can be divided down to generate synchronous clocks for the analog and digital peripherals. There are eight clock dividers for the PSoC 4000S, two of those are fractional dividers. The 16-bit capability allows flexible generation of fine-grained frequency values, and is fully supported in PSoC Creator.

Figure 2. PSoC 4000S MCU Clocking Architecture

IMO Clock Source

The IMO is the primary source of internal clocking in the PSoC 4000S. It is trimmed during testing to achieve the specified accuracy. The IMO default frequency is 24 MHz and it can be adjusted from 24 to 48 MHz in steps of 4 MHz. The IMO tolerance with Cypress-provided calibration settings is $\pm 2\%$.

ILO Clock Source

The ILO is a very low power, nominally 40-kHz oscillator, which is primarily used to generate clocks for the watchdog timer (WDT) and peripheral operation in Deep Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy. Cypress provides a software component, which does the calibration.

Watch Crystal Oscillator (WCO)

The PSoC 4000S clock subsystem also implements a low-frequency (32-kHz watch crystal) oscillator that can be used for precision timing applications.

Watchdog Timer

A watchdog timer is implemented in the clock block running from the ILO; this allows watchdog operation during Deep Sleep and generates a watchdog reset if not serviced before the set timeout occurs. The watchdog reset is recorded in a Reset Cause register, which is firmware readable.

Reset

The PSoC 4000S can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through reset and allows software to determine the cause of the reset. An XRES pin is reserved for external reset by asserting it active low. The XRES pin has an internal pull-up resistor that is always enabled.

Voltage Reference

The PSoC 4000S reference system generates all internally required references. A 1.2-V voltage reference is provided for the comparator. The IDACs are based on a $\pm 5\%$ reference.

Analog Blocks

Low-power Comparators (LPC)

The PSoC 4000S has a pair of low-power comparators, which can also operate in Deep Sleep modes. This allows the analog system blocks to be disabled while retaining the ability to monitor external voltage levels during low-power modes. The comparator outputs are normally synchronized to avoid metastability unless operating in an asynchronous power mode where the system wake-up circuit is activated by a comparator switch event. The LPC outputs can be routed to pins.

Current DACs

The PSoC 4000S has two IDACs, which can drive any of the pins on the chip. These IDACs have programmable current ranges.

Analog Multiplexed Buses

The PSoC 4000S has two concentric independent buses that go around the periphery of the chip. These buses (called amux buses) are connected to firmware-programmable analog switches that allow the chip's internal resources (IDACs, comparator) to connect to any pin on the I/O Ports.

Programmable Digital Blocks

The programmable I/O (Smart I/O) block is a fabric of switches and LUTs that allows Boolean functions to be performed in signals being routed to the pins of a GPIO port. The Smart I/O can perform logical operations on input pins to the chip and on signals going out as outputs.

Fixed Function Digital

Timer/Counter/PWM (TCPWM) Block

The TCPWM block consists of a 16-bit counter with user-programmable period length. There is a capture register to record the count value at the time of an event (which may be an I/O event), a period register that is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals that are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow use as dead-band programmable complementary PWM outputs. It also has a Kill input to force outputs to a predetermined state; for example, this is used in motor drive systems when an over-current state is indicated and the PWM driving the FETs needs to be shut off immediately with no time for software intervention. There are five TCPWM blocks in the PSoC 4000S.

Serial Communication Block (SCB)

The PSoC 4000S has two serial communication blocks, which can be programmed to have SPI, I2C, or UART functionality.

I²C Mode: The hardware I²C block implements a full multi-master and slave interface (it is capable of multi-master arbitration). This block is capable of operating at speeds of up to 400 kbps (Fast Mode) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. It also supports EZI2C that creates a mailbox address range in the memory of the PSoC 4000S and effectively reduces I²C communication to reading from and writing to an array in memory. In addition, the block supports an 8-deep FIFO for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduces the need for clock stretching caused by the CPU not having read data on time.

The I²C peripheral is compatible with the I²C Standard-mode and Fast-mode devices as defined in the NXP I²C-bus specification and user manual (UM10204). The I²C bus I/O is implemented with GPIO in open-drain modes.

The PSoC 4000S is not completely compliant with the I²C spec in the following respect:

GPIO cells are not overvoltage tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I²C system.

UART Mode: This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

SPI Mode: The SPI mode supports full Motorola SPI, TI SSP (adds a start pulse used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO.

GPIO

The PSoC 4000S has up to 36 GPIOs. The GPIO block implements the following:

- Eight drive modes:
 - □ Analog input mode (input and output buffers disabled)
 - □ Input only
 - □ Weak pull-up with strong pull-down
 - □ Strong pull-up with weak pull-down
 - Open drain with strong pull-down
 - Open drain with strong pull-up
 - □ Strong pull-up with strong pull-down
 - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTL).
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Selectable slew rates for dV/dt related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width (less for Ports 2 and 3). During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin.

Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves.

Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (5 for PSoC 4000S).

Special Function Peripherals

CapSense

CapSense is supported in the PSoC 4000S through a CapSense Sigma-Delta (CSD) block that can be connected to any pins through an analog multiplex bus via analog switches. CapSense function can thus be provided on any available pin or group of pins in a system under software control. A PSoC Creator component is provided for the CapSense block to make it easy for the user. Shield voltage can be driven on another analog multiplex bus to provide water-tolerance capability. Water tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input. Proximity sensing can also be implemented.

The CapSense block has two IDACs, which can be used for general purposes if CapSense is not being used (both IDACs are available in that case) or if CapSense is used without water tolerance (one IDAC is available).

The CapSense block also provides a 10-bit Slope ADC function, which can be used in conjunction with the CapSense function.

The CapSense block is an advanced, low-noise, programmable block with programmable voltage references and current source ranges for improved sensitivity and flexibility. It can also use an external reference voltage. It has a full-wave CSD mode that alternates sensing to VDDA and Ground to null out power-supply related noise.

LCD Segment Drive

The PSoC 4000S has an LCD controller, which can drive up to 8 commons and up to 28 segments. It uses full digital methods to drive the LCD segments requiring no generation of internal LCD voltages. The two methods used are referred to as Digital Correlation and PWM. Digital Correlation pertains to modulating the frequency and drive levels of the common and segment signals to generate the highest RMS voltage across a segment to light it up or to keep the RMS signal to zero. This method is good for STN displays but may result in reduced contrast with TN (cheaper) displays. PWM pertains to driving the panel with PWM signals to effectively use the capacitance of the panel to provide the integration of the modulated pulse-width to generate the desired LCD voltage. This method results in higher power consumption but can result in better results when driving TN displays. LCD operation is supported during Deep Sleep refreshing a small display buffer (4 bits; 1 32-bit register per port).

Pinouts

The following table provides the pin list for PSoC 4000S for the 48-pin TQFP, 40-pin QFN, 32-pin QFN, 24-pin QFN, 32-pin TQFP, and 25-ball CSP packages. All port pins support GPIO. Pin 11 is a No-Connect in the 48-TQFP.

Table 1. PSoC 4000S Pin List (continued)

Descriptions of the Pin functions are as follows:

VDDD: Power supply for the digital section.

VDDA: Power supply for the analog section.

VSSD, VSSA: Ground pins for the digital and analog sections respectively.

VCCD: Regulated digital supply (1.8 V ±5%)

VDD: Power supply to all sections of the chip

VSS: Ground for all sections of the chip

Alternate Pin Functions

Each port pin can be assigned to one of multiple functions; it can, for instance, be an analog I/O, a digital peripheral function, an LCD pin, or a CapSense pin. The pin assignments are shown in the following table.

| Port/ Pin | Analog | Smart I/O | Alternate Function 1 | Alternate Function 2 | Alternate Function 3 | Deep Sleep 1 | Deep Sleep 2 |

Power

The following power system diagram shows the set of power supply pins as implemented for the PSoC 4000S. The system has one regulator in Active mode for the digital circuitry. There is no analog regulator; the analog circuits run directly from the V_{DD} input.

Figure 3. Power Supply Connections

There are two distinct modes of operation. In Mode 1, the supply voltage range is 1.8 V to 5.5 V (unregulated externally; internal regulator operational). In Mode 2, the supply range is $1.8 \text{ V} \pm 5\%$ (externally regulated; 1.71 to 1.89, internal regulator bypassed).

Mode 1: 1.8 V to 5.5 V External Supply

In this mode, the PSoC 4000S is powered by an external power supply that can be anywhere in the range of 1.8 to 5.5 V. This range is also designed for battery-powered operation. For example, the chip can be powered from a battery system that starts at 3.5 V and works down to 1.8 V. In this mode, the internal regulator of the PSoC 4000S supplies the internal logic and its output is connected to the V_{CCD} pin. The VCCD pin must be bypassed to ground via an external capacitor (0.1 μ F; X5R ceramic or better) and must not be connected to anything else.

Mode 2: 1.8 V ±5% External Supply

In this mode, the PSoC 4000S is powered by an external power supply that must be within the range of 1.71 to 1.89 V; note that this range needs to include the power supply ripple too. In this mode, the VDD and VCCD pins are shorted together and bypassed. The internal regulator can be disabled in the firmware.

Bypass capacitors must be used from VDDD to ground. The typical practice for systems in this frequency range is to use a capacitor in the 1- μ F range, in parallel with a smaller capacitor (0.1 μ F, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

An example of a bypass scheme is shown in the following diagram.

Figure 4. External Supply Range from 1.8 V to 5.5 V with Internal Regulator Active

Power supply bypass connections example

Development Support

The PSoC 4000S has a rich set of documentation, development tools, and online resources to assist you during your development process. Visit www.cypress.com/go/psoc4 to find out more.

Documentation

A suite of documentation supports the PSoC 4000S to ensure that you can find answers to your questions quickly. This section contains a list of some of the key documents.

Software User Guide: A step-by-step guide for using PSoC Creator. The software user guide shows you how the PSoC Creator build process works in detail, how to use source control with PSoC Creator, and much more.

Component Datasheets: The flexibility of PSoC allows the creation of new peripherals (components) long after the device has gone into production. Component data sheets provide all of the information needed to select and use a particular component, including a functional description, API documentation, example code, and AC/DC specifications.

Application Notes: PSoC application notes discuss a particular application of PSoC in depth; examples include brushless DC motor control and on-chip filtering. Application notes often include example projects in addition to the application note document.

Technical Reference Manual: The Technical Reference Manual (TRM) contains all the technical detail you need to use a PSoC device, including a complete description of all PSoC registers. The TRM is available in the Documentation section at www.cypress.com/psoc4.

Online

In addition to print documentation, the Cypress PSoC forums connect you with fellow PSoC users and experts in PSoC from around the world, 24 hours a day, 7 days a week.

Tools

With industry standard cores, programming, and debugging interfaces, the PSoC 4000S is part of a development tool ecosystem. Visit us at www.cypress.com/go/psoccreator for the latest information on the revolutionary, easy to use PSoC Creator IDE, supported third party compilers, programmers, debuggers, and development kits.

Electrical Specifications

Absolute Maximum Ratings

Table 2. Absolute Maximum Ratings^[1]

| Spec ID# | Parameter | Description | Min | Тур | Мах | Units | Details/ Conditions |
|----------|-----------------------------|--|------|-----|----------------------|-------|-----------------------------|
| SID1 | V _{DDD_ABS} | Digital supply relative to V _{SS} | -0.5 | - | 6 | | _ |
| SID2 | V _{CCD_ABS} | Direct digital core voltage input relative to V_{SS} | -0.5 | - | 1.95 | V | - |
| SID3 | V _{GPIO_ABS} | GPIO voltage | -0.5 | _ | V _{DD} +0.5 | | - |
| SID4 | I _{GPIO_ABS} | Maximum current per GPIO | -25 | - | 25 | | - |
| SID5 | I _{GPIO_injection} | GPIO injection current, Max for V _{IH} > V _{DDD} , and Min for V _{IL} < V _{SS} | -0.5 | _ | 0.5 | mA | Current injected per pin |
| BID44 | ESD_HBM | Electrostatic discharge human body model | 2200 | _ | - | V | - |
| BID45 | ESD_CDM | Electrostatic discharge charged device model | 500 | - | - | v | - |
| BID46 | LU | Pin current for latch-up | -140 | _ | 140 | mA | - |

Note

 Usage above the absolute maximum conditions listed in Table 2 may cause permanent damage to the device. Exposure to Absolute Maximum conditions for extended periods of time may affect device reliability. The Maximum Storage Temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below Absolute Maximum conditions but above normal operating conditions, the device may not operate to specification.

Device Level Specifications

All specifications are valid for –40 °C \leq T_A \leq 85 °C and T_J \leq 100 °C, except where noted. Specifications are valid for 1.71 V to 5.5 V, except where noted.

Table 3. DC Specifications

Typical values measured at V_{DD} = 3.3 V and 25 °C.

| Spec ID# | Parameter | Description | Min | Тур | Мах | Units | Details/ Conditions |

| SID315E | IDAC2CRT32 | Output current of IDAC2(7 bits) in high range, 2X mode | 540 | - | 660 | μA | LSB = 4.8-µA typ. |
| SID315F | IDAC3CRT13 | Output current of IDAC in 8-bit mode in low range | 8 | - | 10.5 | μA | LSB = 37.5-nA typ. |
| SID315G | IDAC3CRT23 | Output current of IDAC in 8-bit mode in medium range | 69 | - | 82 | μA | LSB = 300-nA typ. |
| SID315H | IDAC3CRT33 | Output current of IDAC in 8-bit mode in high range | 540 | - | 660 | μA | LSB = 2.4-µA typ. |
| SID320 | IDACOFFSET | All zeroes input | _ | - | 1 | LSB | Polarity set by Source or Sink. Offset is 2 LSBs for 37.5 nA/LSB mode |
| SID321 | IDACGAIN | Full-scale error less offset | - | - | ±10 | % | |
| SID322 | IDACMISMATCH1 | Mismatch between IDAC1 and IDAC2 in Low mode | - | - | 9.2 | LSB | LSB = 37.5-nA typ. |
| SID322A | IDACMISMATCH2 | Mismatch between IDAC1 and IDAC2 in Medium mode | - | - | 5.6 | LSB | LSB = 300-nA typ. |
| SID322B | IDACMISMATCH3 | Mismatch between IDAC1 and IDAC2 in High mode | - | - | 6.8 | LSB | LSB = 2.4-µA typ. |
| SID323 | IDACSET8 | Settling time to 0.5 LSB for 8-bit IDAC | - | - | 10 | μs | Full-scale transition. No external load. |
| SID324 | IDACSET7 | Settling time to 0.5 LSB for 7-bit IDAC | - | - | 10 | μs | Full-scale transition. No external load. |
| SID325 | CMOD | External modulator capacitor. | - | 2.2 | _ | nF | 5-V rating, X7R or NP0 cap. |

Table 12. 10-bit CapSense ADC Specifications

| Spec ID# | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|----------|-----------|--|------------------|-----|------------------|-------|---|
| SIDA94 | A_RES | Resolution | _ | - | 10 | bits | Auto-zeroing is required every millisecond |
| SIDA95 | A_CHNLS_S | Number of channels - single ended | - | - | 16 | | Defined by AMUX Bus. |
| SIDA97 | A-MONO | Monotonicity | - | - | _ | Yes | |
| SIDA98 | A_GAINERR | Gain error | _ | - | ±2 | % | In V_{REF} (2.4 V) mode with V_{DDA} bypass capacitance of 10 μ F |
| SIDA99 | A_OFFSET | Input offset voltage | _ | - | 3 | mV | In V_{REF} (2.4 V) mode with V_{DDA} bypass capacitance of 10 μF |
| SIDA100 | A_ISAR | Current consumption | - | - | 0.25 | mA | |
| SIDA101 | A_VINS | Input voltage range - single ended | V _{SSA} | - | V _{DDA} | V | |
| SIDA103 | A_INRES | Input resistance | _ | 2.2 | _ | KΩ | |
| SIDA104 | A_INCAP | Input capacitance | _ | 20 | _ | pF | |
| SIDA106 | A_PSRR | Power supply rejection ratio | _ | 60 | _ | dB | In V_{REF} (2.4 V) mode with V_{DDA} bypass capacitance of 10 μ F |
| SIDA107 | A_TACQ | Sample acquisition time | - | 1 | - | μs | |
| SIDA108 | A_CONV8 | Conversion time for 8-bit resolution at conversion rate = Fhclk/(2 ^(N+2)). Clock frequency = 48 MHz. | _ | _ | 21.3 | μs | Does not include acqui- sition time. Equivalent to 44.8 ksps including acquisition time. |
| SIDA108A | A_CONV10 | Conversion time for 10-bit resolution at conversion rate = Fhclk/(2 ^(N+2)). Clock frequency = 48 MHz. | _ | _ | 85.3 | μs | Does not include acqui- sition time. Equivalent to 11.6 ksps including acquisition time. |
| SIDA109 | A_SND | Signal-to-noise and Distortion ratio (SINAD) | _ | 61 | _ | dB | With 10-Hz input sine wave, external 2.4-V reference, V _{REF} (2.4 V) mode |
| SIDA110 | A_BW | Input bandwidth without aliasing | - | - | 22.4 | kHz | 8-bit resolution |
| SIDA111 | A_INL | Integral Non Linearity. 1 ksps | - | - | 2 | LSB | V _{REF} = 2.4 V or greater |
| SIDA112 | A_DNL | Differential Non Linearity. 1 ksps | _ | - | 1 | LSB | |

Digital Peripherals

Timer Counter Pulse-Width Modulator (TCPWM)

Table 13. TCPWM Specifications

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|--------------|-----------------------|-------------------------------------|------|-----|-----|-------|---|
| SID.TCPWM.1 | ITCPWM1 | Block current consumption at 3 MHz | _ | — | 45 | | All modes (TCPWM) |
| SID.TCPWM.2 | ITCPWM2 | Block current consumption at 12 MHz | - | - | 155 | μA | All modes (TCPWM) |
| SID.TCPWM.2A | ITCPWM3 | Block current consumption at 48 MHz | - | - | 650 | | All modes (TCPWM) |
| SID.TCPWM.3 | TCPWM _{FREQ} | Operating frequency | - | - | Fc | MHz | Fc max = CLK_SYS Maximum = 48 MHz |
| SID.TCPWM.4 | TPWM _{ENEXT} | Input trigger pulse width | 2/Fc | - | - | | For all trigger events ^[6] |
| SID.TCPWM.5 | TPWM _{EXT} | Output trigger pulse widths | 2/Fc | _ | _ | | Minimum possible width of Overflow, Underflow, and CC (Counter equals Compare value) outputs |
| SID.TCPWM.5A | TC _{RES} | Resolution of counter | 1/Fc | _ | _ | ns | Minimum time between successive counts |
| SID.TCPWM.5B | PWM _{RES} | PWM resolution | 1/Fc | - | _ | | Minimum pulse width of PWM Output |
| SID.TCPWM.5C | Q _{RES} | Quadrature inputs resolution | 1/Fc | _ | _ | | Minimum pulse width between Quadrature phase inputs |

l²C

Table 14. Fixed I²C DC Specifications^[7]

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |

Memory

Table 22. Flash DC Specifications

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|---------|-----------------|---------------------------|------|-----|-----|-------|---------------------------|
| SID173 | V _{PE} | Erase and program voltage | 1.71 | - | 5.5 | V | - |

Table 23. Flash AC Specifications

| Spec ID | Parameter | Description | Min | Тур | Мах | Units | Details/Conditions |
|-------------------------|---------------------------------------|--|-------|-----|-----|---------|-----------------------------|
| SID174 | T _{ROWWRITE} ^[9] | Row (block) write time (erase and program) | _ | _ | 20 | | Row (block) = 128 bytes |
| SID175 | T _{ROWERASE} ^[9] | Row erase time | - | _ | 16 | ms | - |
| SID176 | | Row program time after erase | - | _ | 4 | | - |
| SID178 | T _{BULKERASE} ^[9] | Bulk erase time (32 KB) | - | _ | 35 | | - |
| SID180 ^[10] | T _{DEVPROG} ^[9] | Total device program time | - | - | 7 | Seconds | - |
| SID181 ^[10] | F _{END} | Flash endurance | 100 K | - | - | Cycles | - |
| SID182 ^[10] | F _{RET} | Flash retention. $T_A \le 55 \degree$ C, 100 K P/E cycles | 20 | - | - | Years | - |
| SID182A ^[10] | - | Flash retention. $T_A \le 85 \text{ °C}$, 10 K P/E cycles | 10 | _ | _ | Tears | _ |
| SID256 | TWS48 | Number of Wait states at 48 MHz | 2 | _ | _ | | CPU execution from Flash |
| SID257 | TWS24 | Number of Wait states at 24 MHz | 1 | _ | _ | | CPU execution from Flash |

System Resources

Power-on Reset (POR)

Table 24. Power On Reset (PRES)

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|------------------------|-----------------------|------------------------|------|-----|-----|-------|--------------------|
| SID.CLK#6 | SR_POWER_UP | Power supply slew rate | 1 | - | 67 | V/ms | At power-up |
| SID185 ^[10] | V _{RISEIPOR} | Rising trip voltage | 0.80 | - | 1.5 | V | - |
| SID186 ^[10] | V _{FALLIPOR} | Falling trip voltage | 0.70 | - | 1.4 | | - |

Table 25. Brown-out Detect (BOD) for V_{CCD}

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|------------------------|------------------------|--|------|-----|------|-------|--------------------|
| SID190 ^[10] | V _{FALLPPOR} | BOD trip voltage in active and sleep modes | 1.48 | _ | 1.62 | V | _ |
| SID192 ^[10] | V _{FALLDPSLP} | BOD trip voltage in Deep Sleep | 1.11 | | 1.5 | | _ |

Notes
 9. It can take as much as 20 milliseconds to write to Flash. During this time the device should not be Reset, or Flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

SWD Interface

Table 26. SWD Interface Specifications

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|-------------------------|--------------|---|--------|-----|-------|-------|-------------------------------------|
| SID213 | F_SWDCLK1 | $3.3 \text{ V} \leq \text{V}_{DD} \leq 5.5 \text{ V}$ | - | - | 14 | | SWDCLK ≤ 1/3 CPU clock frequency |
| SID214 | F_SWDCLK2 | $1.71 \text{ V} \le \text{V}_{DD} \le 3.3 \text{ V}$ | _ | _ | 7 | | SWDCLK ≤ 1/3 CPU clock frequency |
| | T_SWDI_SETUP | T = 1/f SWDCLK | 0.25*T | - | - | | - |
| | T_SWDI_HOLD | T = 1/f SWDCLK | 0.25*T | - | - | ns | - |
| SID217 ^[11] | T_SWDO_VALID | T = 1/f SWDCLK | - | - | 0.5*T | 115 | - |
| SID217A ^[11] | T_SWDO_HOLD | T = 1/f SWDCLK | 1 | - | - | | _ |

Internal Main Oscillator

Table 27. IMO DC Specifications

(Guaranteed by Design)

| Spec ID | Parameter | Description | Min | Тур | Max | Units | Details/Conditions |
|---------|-------------------|---------------------------------|-----|-----|-----|-------|---------------------------|
| SID218 | I _{IMO1} | IMO operating current at 48 MHz | - | - | 250 | μA | - |
| SID219 | I _{IMO2} | IMO operating current at 24 MHz | _ | _ | 180 | μA | _ |

Table 28. IMO AC Specifications

| Spec ID | Parameter | Description | Min | Тур | Мах | Units | Details/Conditions |
|---------|-------------------------|---|-----|-----|-----|-------|--------------------|
| SID223 | F _{IMOTOL1} | Frequency variation at 24, 32, and 48 MHz (trimmed) | - | _ | ±2 | % | |
| SID226 | T _{STARTIMO} | IMO startup time | _ | - | 7 | μs | _ |
| SID228 | T _{JITRMSIMO2} | RMS jitter at 24 MHz | _ | 145 | - | ps | _ |

Internal Low-Speed Oscillator

Table 29. ILO DC Specifications

(Guaranteed by Design)

The nomenclature used in the preceding table is based on the following part numbering convention:

| Field | Description | Values | Meaning |
|-------|-------------------|---------|--|
| CY8C | Cypress Prefix | | |
| 4 | Architecture | 4 | PSoC 4 |
| А | Family | 0 | 4000 Family |
| В | B CPU Speed | | 24 MHz |
| В | CFU Speed | 4 | 48 MHz |
| | | 4 | 16 KB |
| 0 | C Flash Capacity | 5 | 32 KB |
| C | | 6 | 64 KB |
| | | | 128 KB |
| | | AX | TQFP (0.8-mm pitch) |
| | | AZ | TQFP (0.5-mm pitch) |
| DE | Package Code | LQ | QFN |
| | | PV | SSOP |
| | | FN | CSP |

Table 36. Nomenclature

The following is an example of a part number:

Packaging

The PSoC 4000S will be offered in 48-pin TQFP, 40-pin QFN, 32-pin QFN, 24-pin QFN, 32-pin TQFP, and 25-ball WLCSP packages. Package dimensions and Cypress drawing numbers are in the following table.

| Spec ID# | Package | Description | Package Dwg |
|----------|---------------|---|-------------|
| BID20 | 48-pin TQFP | $7 \times 7 \times 1.4$ mm height with 0.5-mm pitch | 51-85135 |
| BID27 | 40-pin QFN | 6 × 6 × 0.6 mm height with 0.5-mm pitch | 001-80659 |
| BID34A | 32-pin QFN | $5 \times 5 \times 0.6$ mm height with 0.5-mm pitch | 001-42168 |
| BID34 | 24-pin QFN | $4 \times 4 \times 0.6$ mm height with 0.5-mm pitch | 001-13937 |
| BID34G | 32-pin TQFP | $7 \times 7 \times 1.4$ mm height with 0.8-mm pitch | 51-85088 |
| BID34F | 25-ball WLCSP | 2.02 × 1.93 × 0.48 mm height with 0.35-mm pitch | 002-09957 |

Table 37. Package List

Table 38. Package Thermal Characteristics

| Parameter | Description | Package | Min | Тур | Max | Units |
|-----------|--------------------------------|---------------|-----|------|-----|-------|
| ΤΑ | Operating ambient temperature | | -40 | 25 | 85 | °C |
| TJ | Operating junction temperature | | -40 | - | 100 | °C |
| Tja | Package θ _{JA} | 48-pin TQFP | - | 73.5 | - | °C/W |
| TJC | Package θ _{JC} | 48-pin TQFP | - | 33.5 | - | °C/W |
| Tja | Package θ _{JA} | 40-pin QFN | - | 17.8 | - | °C/W |
| TJC | Package θ _{JC} | 40-pin QFN | - | 2.8 | - | °C/W |
| Tja | Package θ _{JA} | 32-pin QFN | - | 20.8 | - | °C/W |
| TJC | Package θ _{JC} | 32-pin QFN | - | 5.9 | - | °C/W |
| Tja | Package θ_{JA} | 24-pin QFN | - | 21.7 | - | °C/W |
| TJC | Package θ_{JC} | 24-pin QFN | - | 5.6 | - | °C/W |
| TJA | Package θ _{JA} | 32-pin TQFP | - | 29.4 | - | °C/W |
| TJC | Package θ_{JC} | 32-pin TQFP | _ | 3.5 | - | °C/W |
| Tja | Package θ _{JA} | 25-ball WLCSP | _ | 54.6 | - | °C/W |
| TJC | Package θ_{JC} | 25-ball WLCSP | - | 0.5 | - | °C/W |

Table 39. Solder Reflow Peak Temperature

| Package | Maximum Peak Temperature | Maximum Time at Peak Temperature |
|---------|-----------------------------|----------------------------------|
| All | 260 °C | 30 seconds |

Table 40. Package Moisture Sensitivity Level (MSL), IPC/JEDEC J-STD-020

| Package | MSL |
|------------------|-------|
| All except WLCSP | MSL 3 |
| 25-ball WLCSP | MSL 1 |

Figure 8. 24-pin QFN Package Outline

001-13937 *F

The center pad on the QFN package should be connected to ground (VSS) for best mechanical, thermal, and electrical performance. If not connected to ground, it should be electrically floating and not connected to any other signal.

Acronyms

Table 41. Acronyms Used in this Document

| Acronym | Description |
|---------|---|
| abus | analog local bus |
| ADC | analog-to-digital converter |
| AG | analog global |
| AHB | AMBA (advanced microcontroller bus architecture) high-performance bus, an ARM data transfer bus |
| ALU | arithmetic logic unit |
| AMUXBUS | analog multiplexer bus |
| API | application programming interface |
| APSR | application program status register |
| ARM® | advanced RISC machine, a CPU architecture |
| ATM | automatic thump mode |
| BW | bandwidth |
| CAN | Controller Area Network, a communications protocol |
| CMRR | common-mode rejection ratio |
| CPU | central processing unit |
| CRC | cyclic redundancy check, an error-checking protocol |
| DAC | digital-to-analog converter, see also IDAC, VDAC |
| DFB | digital filter block |
| DIO | digital input/output, GPIO with only digital capabilities, no analog. See GPIO. |
| DMIPS | Dhrystone million instructions per second |
| DMA | direct memory access, see also TD |
| DNL | differential nonlinearity, see also INL |
| DNU | do not use |
| DR | port write data registers |
| DSI | digital system interconnect |
| DWT | data watchpoint and trace |
| ECC | error correcting code |
| ECO | external crystal oscillator |
| EEPROM | electrically erasable programmable read-only memory |
| EMI | electromagnetic interference |
| EMIF | external memory interface |
| EOC | end of conversion |
| EOF | end of frame |
| EPSR | execution program status register |
| ESD | electrostatic discharge |

Document History Page

| Revision | ECN | Orig. of Change | Submission Date | Description of Change | |
|----------|---------|--------------------|--------------------|---|--|
| ** | 4883809 | WKA | 08/28/2015 | New data sheet. | |
| *A | 4992376 | WKA | 10/30/2015 | Updated Pinouts. Added V _{DDD} ≥ 2.2V at –40 °C under Conditions for specs SID247A, SID90, SID92. Updated Table 12. Updated Ordering Information. | |
| *B | 5037826 | SLAN | 12/08/2015 | Changed datasheet status to Preliminary | |
| *C | 5104369 | WKA | 01/27/2016 | Added Errata. Added 25 WLCSP package details. Updated theta J _A and J _C values for all packages. | |
| *D | 5139206 | WKA | 02/16/2016 | Updated copyright information at the end of the document. | |
| *E | 5173961 | WKA | 03/15/2016 | Updated Pinouts. Updated values for SID79, BID194. SID175, and SID176. Updated CSD and IDAC Specifications. Updated 10-bit CapSense ADC Specifications. | |
| *F | 5268662 | WKA | 05/12/2016 | Updated Alternate Pin Functions. Updated the following specs: SID310, SID312, SID313, SID314, SID314C, SID314D, SID314E, SID315, SID315C, SID315D, SID315E, SID322A, SID322B, SIDA109. Removed Errata section. Updated the Cypress logo and copyright information based on the template. | |
| *G | 5330930 | WKA | 07/27/2016 | Changed status from Preliminary to Final. Updated LCD Segment Drive. Updated SID60 conditions. Updated IDD specs. Corrected package dimensions for WLCSP package and added WLCSP MSL condition. | |
| *H | 5415365 | WKA | 09/14/2016 | Added 40-pin QFN pin and package details. Updated IDD spec values in DC Specifications. | |
| * | 5561833 | WKA | 01/09/2017 | Changed PRGIO references to Smart I/O. | |
| *J | 5704046 | GNKK | 04/26/2017 | Updated the Cypress logo and copyright information. | |
| *К | 5969745 | JIAO | 11/17/2017 | Updated Document Title to read as "PSoC® 4: PSoC 4000S Datasheet Programmable System-on-Chip (PSoC®)". | |
| | | | | Added 32-pin TQFP Package related information in all instance across the document. Updated Ordering Information: Updated part numbers. Updated Packaging: Updated Package Diagrams: spec 001-42168 – Changed revision from *E to *F. Added spec 51-85088 *E. | |

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at Cypress Locations.

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.З, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
