# SAMA5D2 Series

## Ultra-Low-Power Arm® Cortex®-A5 Core-Based MPU, 500 MHz, Graphics Interface, Ethernet 10/100, CAN, USB, PCI 5.0 Pre-Certified

## Introduction

The SAMA5D2 series is a high-performance, ultra-low-power Arm Cortex-A5 CPU-based embedded microprocessor (MPU) running up to 500 MHz, with support for multiple memories such as DDR2, DDR3L, LPDDR2, LPDDR3, and QSPI and e.MMC Flash. The devices integrate powerful peripherals for connectivity and user interface applications, and offer advanced security functions (Arm TrustZone®, tamper detection, secure data storage, etc.), as well as high-performance crypto accelerators AES, SHA and TRNG.

Selected members of the SAMA5D2 series are qualified for extended industrial temperature range operation (-40°C to 105°C external temperature).

The SAMA5D2 series is delivered with a free Linux® distribution and bare metal C examples.

## Features

- Arm Cortex-A5 Core
  - Armv7-A architecture
  - Arm TrustZone
  - NEON™ Media Processing Engine
  - Up to 500 MHz
  - ETM/ETB 8 Kbytes
- Memory Architecture
  - Memory Management Unit (MMU)
  - 32-Kbyte L1 data cache, 32-Kbyte L1 instruction cache
  - 128-Kbyte L2 cache configurable to be used as an internal SRAM
  - One 128-Kbyte scrambled internal SRAM
  - One 160-Kbyte internal ROM
    - 64-Kbyte scrambled and maskable ROM embedding bootloader/Secure bootloader
    - 96-Kbyte unscrambled, unmaskable ROM for NAND Flash BCH ECC table
  - High-bandwidth scramblable 16-bit or 32-bit Double Data Rate (DDR) multiport dynamic RAM controller supporting up to 512 Mbytes 8-bank DDR2/DDR3 (DLL off only) / DDR3L (DLL off only) / LPDDR1/LPDDR2/LPDDR3, including “on-the-fly” encryption/decryption path
  - 8-bit SLC/MLC NAND controller, with up to 32-bit Error Correcting Code (PMECC)
- System Running up to 166 MHz in Typical Conditions

© 2018 Microchip Technology Inc.

  - Reset Controller (RSTC), Shutdown Controller (SHDWC), Periodic Interval Timer (PIT), independent Watchdog Timer (WDT) and secure Real-Time Clock (RTC) with clock calibration
  - One 600 to 1200 MHz PLL for the system and one 480 MHz PLL optimized for high-speed USB
  - Digital fractional PLL for audio (11.2896 MHz and 12.288 MHz)
  - Internal low-power 12 MHz RC and 32 kHz typical RC
  - Selectable 32.768 Hz low-power oscillator and 8 to 24 MHz oscillator
  - 51 DMA channels including two 16-channel 64-bit Central DMA Controllers
  - 64-bit Advanced Interrupt Controller (AIC)
  - 64-bit Secure Advanced Interrupt Controller (SAIC)
  - Three programmable external clock signals
- Low-Power Modes
  - Ultra-low-power mode with fast wake-up capability
  - Low-power Backup mode with 5-Kbyte SRAM and SleepWalking™ features
    - Wake up from up to nine wake-up pins, UART reception, analog comparison
    - Fast wake-up capability
    - Extended Backup mode with DDR in Self-Refresh mode
- Peripherals
  - LCD TFT controller (LCDC) up to 1024x768 or 1280x768 (still image). Four overlays, rotation, post-processing and alpha blending, 24-bit parallel RGB interface
  - ITU-R BT. 601/656/1120 Image Sensor Controller (ISC) supporting up to 5 Mpixel sensors with a parallel 12-bit interface for Raw Bayer, YCbCr, Monochrome and JPEG-compressed sensor interface
  - Two Synchronous Serial Controllers (SSC), two Inter-IC Sound Controllers (I2SC), and one Stereo Class D amplifier (CLASSD)
  - One Peripheral Touch Controller (PTC) with up to 8 X-lines and 8 Y-lines (64-channel capacitive touch)
  - One Pulse Density Modulation Interface Controller (PDMIC)
  - One USB device high-speed port (UDPHS) and one USB host high-speed port or two USB host high-speed ports (UHPHS)
  - One USB host high-speed port with a High-Speed Inter-Chip (HSIC) interface
  - One 10/100 Ethernet MAC (GMAC)
    - Energy efficiency support (IEEE® 802.3az standard)
    - Ethernet AVB support with IEEE802.1AS timestamping
    - IEEE802.1Qav credit-based traffic-shaping hardware support
    - IEEE1588 Precision Time Protocol (PTP)
  - Two high-speed memory card hosts:
    - SDMMC0: SD 3.0, eMMC 4.51, 8 bits
    - SDMMC1: SD 2.0, eMMC 4.41, 4 bits only
  - Two master/slave Serial Peripheral Interfaces (SPI)
  - Two Quad Serial Peripheral Interfaces (QSPI)
  - Five FLEXCOMs (USART, SPI and TWI)
  - Five UARTs
  - Two master CAN-FD (MCAN) controllers with SRAM-based mailboxes, and time- and event-triggered transmission

**WARNING** MCAN implements the non-ISO CAN FD frame format and therefore does not pass the CAN FD Conformance Test according to ISO 16845-1:2016.

  - One Rx only UART in backup area (RXLP)
  - One Analog Comparator Controller (ACC) in backup area
  - Two 2-wire interfaces (TWIHS) up to 400 Kbits/s supporting the $I^2C$ protocol and SMBUS
  - One full-featured 4-channel 16-bit Pulse Width Modulation (PWM) controller
  - Two 3-channel 32-bit Timer/Counters (TC), supporting basic PWM modes
  - One 12-channel, 12-bit, Analog-to-Digital Converter (ADC) with resistive touchscreen capability
- Safety
  - Zero-power Power-on Reset (POR) cells
  - Main crystal clock failure detector
  - Write-protected registers
  - Integrity Check Monitor (ICM) based on SHA256
  - Memory Management Unit (MMU)
  - Independent watchdog
- Security
  - 5 Kbytes of internal scrambled SRAM:
    - 1 Kbyte nonerasable on tamper detection
    - 4 Kbytes erasable on tamper detection
  - 256 bits of scrambled and erasable registers
  - Up to eight tamper pins for static or dynamic intrusion detections(1)
  - Environmental monitors on specific versions: temperature, voltage, frequency and active die shield(2)
  - Secure Bootloader(3)
  - On-the-fly AES encryption/decryption on DDR and QSPI memories (AESB)
  - RTC including timestamping on security intrusions
  - Programmable fuse box with 544 fuse bits (including JTAG protection and BMS)

  **Note:**
  1. For information specific to dynamic tamper protection (PIOBU), refer to the document *SAMA5D2External Tamper Protections* (document no. 44095).
  2. For environmental monitors, refer to the document *SAMA5D23 and SAMA5D28 Environmental Monitors* (document no. 44036), available under Non-Disclosure Agreement (NDA). Contact a Microchip Sales Representative for details.
  3. For secure boot strategies, refer to the document *SAMA5D2 Series Secure Boot Strategy* (document no. 44040), available under Non-Disclosure Agreement (NDA). Contact a Microchip Sales Representative for details.
- Hardware Cryptography
  - SHA (SHA1, SHA224, SHA256, SHA384, SHA512): compliant with FIPS PUB 180-2
  - AES: 256-, 192-, 128-bit key algorithms, compliant with FIPS PUB 197
  - TDES: two-key or three-key algorithms, compliant with FIPS PUB 46-3
  - True Random Number Generator (TRNG) compliant with NIST Special Publication 800-22 Test Suite and FIPS PUBs 140-2 and 140-3
- Up to 128 I/Os

© 2018 Microchip Technology Inc.

  - Fully programmable through set/clear registers
  - Multiplexing of up to eight peripheral functions per I/O line
  - Each I/O line can be assigned to a peripheral or used as a general-purpose I/O
  - The PIO controller features a synchronous output providing up to 32 bits of data output in one write operation
- Packages
  - 289-ball LFBGA, 14 x 14 mm body, 0.8 mm pitch
  - 256-ball TFBGA, 8 x 8 mm body, 0.4 mm pitch
  - 196-ball TFBGA, 11 x 11 mm body, 0.75 mm pitch

# 1. Description

The SAMA5D2 Series is a high-performance, power-efficient embedded MPU based on the Arm Cortex-A5 processor. It integrates the Arm NEON SIMD engine for accelerated multimedia and signal processing, a configurable 128-Kbyte L2 cache and a floating point unit (FPU) for high-precision computing. The device features an advanced user interface and connectivity peripherals. Advanced security is provided by powerful cryptographic accelerators, by the Arm TrustZone technology securing access to memories and sensitive peripherals, and by several hardware features that safeguard memory content, authenticate software, detect physical attacks and prevent information leakage during code execution.

The SAMA5D2 features an internal multilayer bus architecture associated with 2 x 16 DMA channels and dedicated DMAs for the communication and interface peripherals required to ensure uninterrupted data transfers with minimal processor overhead. The device supports DDR2, DDR3, DDR3L, LPDDR1, LPDDR2, LPDDR3, QSPI and e.MMC Flash, and SLC/MLC parallel NAND Flash memory up to 32-bit ECC.

The comprehensive peripheral set includes an LCD TFT controller with overlays for hardware-accelerated image composition, an image sensor controller, audio support through $I^2S$, SSC, a stereo Class D amplifier and a digital microphone. Connectivity peripherals include a 10/100 EMAC, USBs, CANs, FLEXCOMs, UARTs, SPIs and two QSPIs, SDIO/SD/e.MMCs, and TWIs/$I^2C$.

Protection of code and data is provided by automatic scrambling of memories and an Integrity Check Monitor (ICM) to detect any modification of the memory contents. The SAMA5D2 also supports execution of encrypted code (QSPI or one portion of the DDR) with an “on-the-fly” encryption-decryption process.

With its secure design architecture, cryptographic acceleration engines, and secure bootloader, the SAMA5D2 is the ideal solution for point-of-sale (POS), IoT and industrial applications requiring device authentication, anti-cloning, data protection and secure communication.

SAMA5D2 devices feature three software-selectable low-power modes: Idle, Ultra-Low-Power and Backup.

In Idle mode, the processor is stopped while all other functions can be kept running.

In Ultra-Low-Power mode 0, the processor is stopped while all other functions are clocked at 512 Hz and interrupts or peripherals can be configured to wake up the system based on events, including partial asynchronous wake-up (SleepWalking).

In Ultra-Low-Power mode 1, all clocks and functions are stopped but some peripherals can be configured to wake up the system based on events, including partial asynchronous wake-up (SleepWalking).

In Backup mode, RTC and wake-up logic are active. The Backup mode can be extended to feature DDR in Self-refresh mode.

SAMA5D2 devices also include an Event System that allows peripherals to receive, react to and send events in Active and Idle modes without processor intervention.

# 2. Configuration Summary

**Table 2-1. SAMA5D2 Configuration Summary**

| Feature | SAMA5D21 | SAMA5D22 | SAMA5D23 | SAMA5D24 | SAMA5D26 | SAMA5D27 | SAMA5D28 |
|---|---|---|---|---|---|---|---|
| Package | TFBGA196 | | | TFBGA256 | LFBGA289 | | |
| PIOs | 72 | | | 105 | 128 | | |
| DDR Bus | 16-bit | | | 16/32-bit | | | |
| SMC | Up to 16-bit | | | | | | |
| SRAM | 128 Kbytes | | | | | | |
| QSPI | 2 | | | | | | |
| LCD | 24-bit RGB | | | | | | |
| Camera Interface (ISC) | 1 | | | | | | |
| EMAC | 1 | | | | | | |
| PTC | – | 4 X-lines x 8 Y-lines | | 8 X-lines x 8 Y-lines | – | 8 X-lines x 8 Y-lines | |
| CAN | – | 1 | | – | | 2 | |
| USB | 2 (2 Hosts or 1 Host/1 Device) | | | 3 (2 Hosts/ 1 HSIC, or 1 Host/ 1 Device/ 1 HSIC) | 2 (2 Hosts or 1 Host/ 1 Device) | 3 (2 Hosts/1 HSIC or 1 Host/1 Device/1 HSIC) | |
| UART/SPI/$I^2C$ | 9 / 6 / 6 | | | 10 / 7 / 7 | | | |
| SDIO/SD/MMC | 1 | | | 2 | | | |
| $I^2S$/SSC/ Class D/PDM | 2 / 2 / 1 / 1 | | | | | | |
| ADC Inputs | 5 | | | 12 | | | |
| Timers | 5 | | | 6 | | | |
| PWM | 4 (PWM) + 5 (TC) | | | 4 (PWM) + 6 (TC) | | | |
| Tamper Pins | 6 | | | 2 | 8 | | |
| AESB | – | Yes | | | – | Yes | |
| Environmental Monitors, Die Shield | – | | Yes | – | | | Yes |

For information on device pin compatibility, see the section "Pinouts".

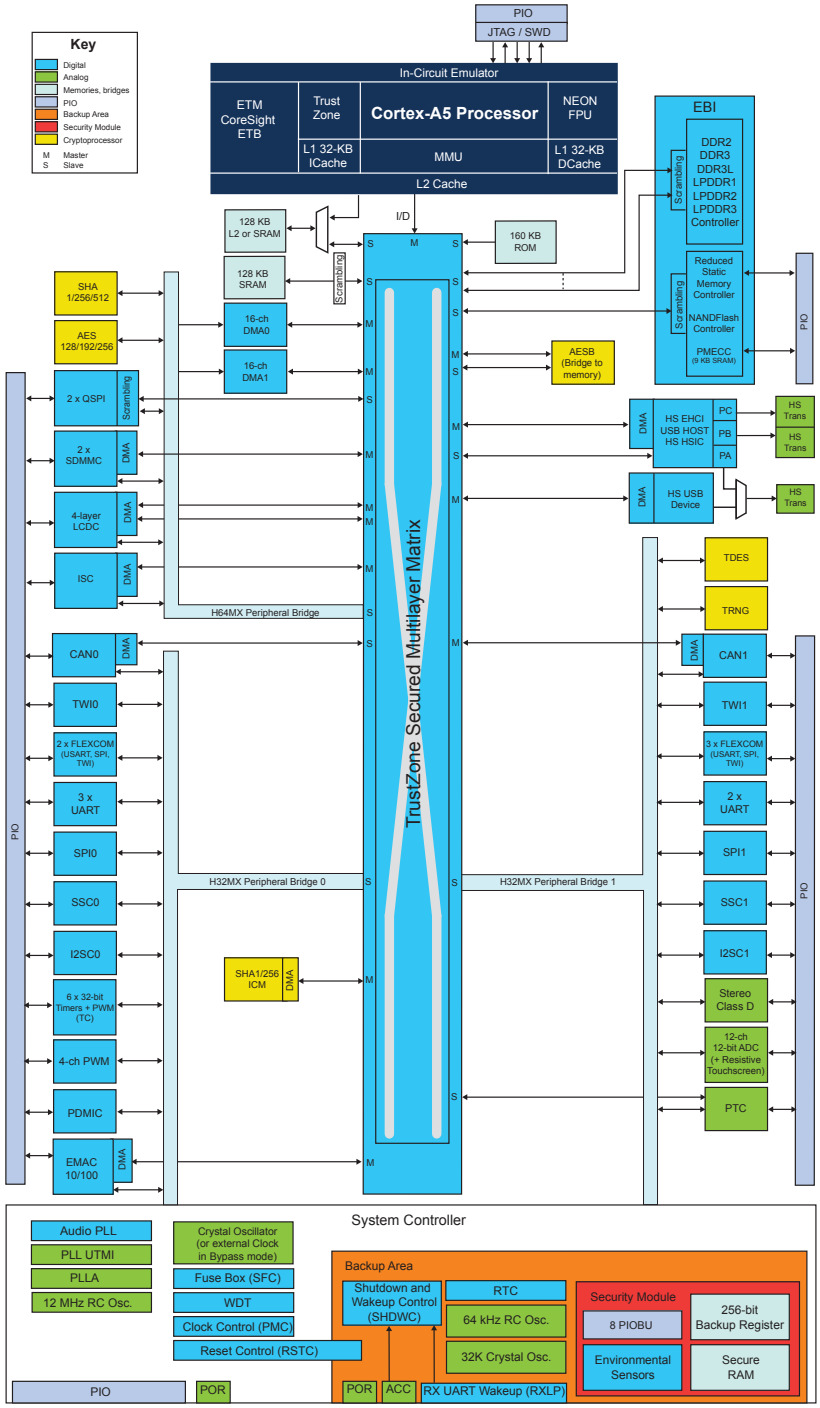
**Figure 3-1. SAMA5D2 Series Block Diagram**



Refer to the section DMA Controller (XDMAC) for peripheral connections to DMA.

# 4. Signal Description

**Table 4-1. Signal Description List**

| Signal Name | Function | Type | Comments | Active Level |
|---|---|---|---|---|
| **Clocks, Oscillators and PLLs** | | | | |
| XIN | Main Oscillator Input | Input | – | – |
| XOUT | Main Oscillator Output | Output | – | – |
| XIN32 | Slow Clock Oscillator Input | Input | – | – |
| XOUT32 | Slow Clock Oscillator Output | Output | – | – |
| CLK_AUDIO | Audio Clock | Output | – | – |
| VBG | Bias Voltage Reference for USB | Analog | – | – |
| PCK 0–2 | Programmable Clock Output | Output | Reset State:<br>- PIO Input<br>- Internal Pull-up enabled<br>- Schmitt Trigger enabled | – |
| **Shutdown, Wake-up Logic** | | | | |
| SHDN | Shutdown Control | Output | – | – |
| PIOBU 0–7 | Tamper or Wake-up Inputs | Input | – | – |
| WKUP | Wake-up Input | Input | – | – |
| **ICE and JTAG** | | | | |
| TCK/SWCLK | Test Clock/Serial Wire Clock | Input | – | – |
| TDI | Test Data In | Input | – | – |
| TDO | Test Data Out | Output | – | – |
| TMS/SWDIO | Test Mode Select/Serial Wire Input/ Output | I/O | – | – |
| JTAGSEL | JTAG Selection | Input | – | – |
| **Reset/Test** | | | | |
| NRST | Microprocessor Reset | Input | – | Low |
| TST | Test Mode Select | Input | – | – |
| NTRST | Test Reset Signal | Input | – | – |
| **Advanced Interrupt Controller - AIC** | | | | |
| IRQ | External Interrupt Input | Input | – | – |
| **Secured Advanced Interrupt Controller - SAIC** | | | | |

.....continued

| Signal Name | Function | Type | Comments | Active Level |
|---|---|---|---|---|
| FIQ | Fast Interrupt Input | Input | – | – |
| **PIO Controller** | | | | |
| PA0–PA31 | Parallel IO Controller | I/O | – | – |
| PB0–PB31 | Parallel IO Controller | I/O | – | – |
| PC0–PC31 | Parallel IO Controller | I/O | – | – |
| PD0–PD31 | Parallel IO Controller | I/O | – | – |
| **External Bus Interface - EBI** | | | | |
| D[15:0] | Data Bus | I/O | – | – |
| A[25:0] | Address Bus | Output | – | – |
| NWAIT | External Wait Signal | Input | – | Low |
| **Static Memory Controller - HSMC** | | | | |
| NCS0–NCS3 | Chip Select Lines | Output | – | Low |
| NWR0–NWR1 | Write Signal | Output | – | Low |
| NRD | Read Signal | Output | – | Low |
| NWE | Write Enable | Output | – | Low |
| NBS0–NBS1 | Byte Mask Signal | Output | – | Low |
| NANDOE | NAND Flash Output Enable | Output | – | Low |
| NANDWE | NAND Flash Write Enable | Output | – | Low |
| **DDR2/DDR3/LPDDR1/LPDDR2/LPDDR3 Controller** | | | | |
| DDR_CK, DDR_CLKN | DDR Differential Clock | Output | – | – |
| DDR_CKE | DDR Clock Enable | Output | When Backup Self-refresh mode is used, should be tied to GND using 100 KΩ pull-down | High |
| DDR_CS | DDR Controller Chip Select | Output | – | Low |
| DDR_BA[2:0] | Bank Select | Output | – | Low |
| DDR_WE | DDR Write Enable | Output | – | Low |
| DDR_RAS, DDR_CAS | Row and Column Signal | Output | – | Low |
| DDR_A[13:0] | DDR Address Bus | Output | – | – |
| DDR_D[31:0] | DDR Data Bus | I/O/-PD | – | – |

.....continued

| Signal Name | Function | Type | Comments | Active Level |
|---|---|---|---|---|
| DDR_DQS[3:0], DDR_DQSN[3:0] | Differential Data Strobe | I/O- PD | – | – |
| DDR_DQM[3:0] | Write Data Mask | Output | – | – |
| DDR_CAL | DDR/LPDDR Calibration | Input | – | – |
| DDR_VREF | DDR/LPDDR Reference | Input | – | – |
| DDR_RESETN | DDR3 Active Low Asynchronous Reset | Output | When Backup Self-refresh mode is used, should be tied to VDDIODDR using 100 KΩ pull-up | – |
| **Secure Data Memory Card - SDMMCx [1:0]** | | | | |
| SDMMCx_CD | SDcard / e.MMC Card Detect | Input | – | – |
| SDMMCx_CMD | SDcard / e.MMC Command line | I/O | – | – |
| SDMMCx_WP | SDcard Connector Write Protect Signal | Input | – | – |
| SDMMCx_RSTN | e.MMC Reset Signal | Output | – | – |
| SDMMCx_1V8SEL | SDcard Signal Voltage Selection | Output | – | – |
| SDMMCx_CK | SDcard / e.MMC Clock Signal | Output | – | – |
| SDMMCx_DAT[7:0] | SDcard / e.MMC Data Lines | I/O | – | – |
| **Flexible Serial Communication Controller - FLEXCOMx [4:0]** | | | | |
| FLEXCOMx_IO0 | FLEXCOMx Transmit Data | I/O | – | – |
| FLEXCOMx_IO1 | FLEXCOMx Receive Data | I/O | – | – |
| FLEXCOMx_IO2 | FLEXCOMx Serial Clock | I/O | – | – |
| FLEXCOMx_IO3 | FLEXCOMx Clear To Send / Peripheral Chip Select | I/O | – | – |
| FLEXCOMx_IO4 | FLEXCOMx Request To Send / Peripheral Chip Select | Output | – | – |
| **Universal Asynchronous Receiver Transmitter - UARTx [4..0]** | | | | |
| UTXDx | UARTx Transmit Data | Output | – | – |
| URXDx | UARTx Receive Data | Input | – | – |
| **Inter-IC Sound Controller - I2SCx [1..0]** | | | | |
| I2SCx_MCK | Master Clock | Output | – | – |
| I2SCx_CK | Serial Clock | I/O | – | – |
| I2SCx_WS | $I^2S$ Word Select | I/O | – | – |
| I2SCx_DI0 | Serial Data Input | Input | – | – |

.....continued

| Signal Name | Function | Type | Comments | Active Level |
|---|---|---|---|---|
| I2SCx_DO0 | Serial Data Output | Output | – | – |
| **Synchronous Serial Controller - SSCx [1..0]** | | | | |
| TDx | SSC Transmit Data | Output | – | – |
| RDx | SSC Receive Data | Input | – | – |
| TKx | SSC Transmit Clock | I/O | – | – |
| RKx | SSC Receive Clock | I/O | – | – |
| TFx | SSC Transmit Frame Sync | I/O | – | – |
| RFx | SSC Receive Frame Sync | I/O | – | – |
| **Timer/Counter - TCx [1..0]** | | | | |
| TCLK[5..0] | TC Channel y External Clock Input | Input | – | – |
| TIOA[5..0] | TC Channel y I/O Line A | I/O | – | – |
| TIOB[5..0] | TC Channel y I/O Line B | I/O | – | – |
| **Quad IO SPI - QSPIx [1..0]** | | | | |
| QSPIx_SCK | QSPI Serial Clock | Output | – | – |
| QSPIx_CS | QSPI Chip Select | Output | – | – |
| QSPIx_IO[0..3] | QSPI I/O<br>QIO0 is QMOSI Master Out - Slave In<br>QIO1 is QMISO Master In - Slave Out | I/O | – | – |
| **Serial Peripheral Interface - SPIx [1..0]** | | | | |
| SPIx_MISO | Master In Slave Out | I/O | – | – |
| SPIx_MOSI | Master Out Slave In | I/O | – | – |
| SPIx_SPCK | SPI Serial Clock | I/O | – | – |
| SPIx_NPCS0 | SPI Peripheral Chip Select 0 | I/O | – | Low |
| SPIx_NPCS[3..1] | SPI Peripheral Chip Select | Output | – | Low |
| **Two-wire Interface - TWIx [1..0]** | | | | |
| TWDx | Two-wire Serial Data | I/O | – | – |
| TWCKx | Two-wire Serial Clock | I/O | – | – |
| **Pulse Width Modulation Controller - PWM** | | | | |
| PWMH0–3 | PWM Waveform Output High | Output | – | – |
| PWML0–3 | PWM Waveform Output Low | Output | – | – |
| PWMFI0–1 | PWM Fault Inputs | Input | – | – |

.....continued

| Signal Name | Function | Type | Comments | Active Level |
|---|---|---|---|---|
| PWMEXTRG1–2 | PWM External Trigger | Input | – | – |
| **USB Host High-Speed Port - UHPHS** | | | | |
| HHSDPA | USB Host Port A High-Speed Data + | Analog | – | – |
| HHSDMA | USB Host Port A High-Speed Data - | Analog | – | – |
| HHSDPB | USB Host Port B High-Speed Data + | Analog | – | – |
| HHSDMB | USB Host Port B High-Speed Data - | Analog | – | – |
| **USB Device High-Speed Port - UDPHS** | | | | |
| DHSDP | USB Device High-Speed Data + | Analog | – | – |
| DHSDM | USB Device High-Speed Data - | Analog | – | – |
| **USB High-Speed Inter-Chip Port - HSIC** | | | | |
| HHSTROBE | USB High-Speed Inter-Chip Strobe | I/O | – | – |
| HHDATA | USB High-Speed Inter-Chip Data | I/O | – | – |
| **Ethernet 10/100 - GMAC** | | | | |
| GREFCK | Reference Clock | Input | – | – |
| GTXCK | Transmit Clock | Input | – | – |
| GRXCK | Receive Clock | Input | – | – |
| GTXEN | Transmit Enable | Output | – | – |
| GTX0–GTX3 | Transmit Data | Output | – | – |
| GTXER | Transmit Coding Error | Output | – | – |
| GRXDV | Receive Data Valid | Input | – | – |
| GRX0–GRX3 | Receive Data | Input | – | – |
| GRXER | Receive Error | Input | – | – |
| GCRS | Carrier Sense | Input | – | – |
| GCOL | Collision Detected | Input | – | – |
| GMDC | Management Data Clock | Output | – | – |
| GMDIO | Management Data Input/Output | I/O | – | – |
| GTSUCOMP | TSU timer comparison valid | Output | – | – |
| **LCD Controller - LCDC** | | | | |
| LCDDAT[23:0] | LCD Data Bus | Output | – | – |
| LCDVSYNC | LCD Vertical Synchronization | Output | – | – |

.....continued

| Signal Name | Function | Type | Comments | Active Level |
|---|---|---|---|---|
| LCDHSYNC | LCD Horizontal Synchronization | Output | – | – |
| LCDPCK | LCD Pixel Clock | Output | – | – |
| LCDDEN | LCD Data Enable | Output | – | – |
| LCDPWM | LCDPWM for Contrast Control | Output | – | – |
| LCDDISP | LCD Display ON/OFF | Output | – | – |
| **Touchscreen Analog-to-Digital Converter - ADC** | | | | |
| AD0–11 | 12 Analog Inputs | Analog | – | – |
| ADTRG | ADC Trigger | Input | – | – |
| ADVREF | ADC Reference | Analog | – | – |
| **Secure Box Module - SBM** | | | | |
| PIOBU0–7 | Tamper I/Os | I/O | – | – |

| **Pulse Density Modulation Interface Controller - PDMIC** | | | | |
| PDMIC_DAT | PDM Data | Input | – | – |
| PDMIC_CLK | PDM Clock | Output | – | – |

# 5. Safety and Security Features

## 5.1 Design for Safety and IEC60730 Class B Certification

### 5.1.1 Background Information

The IEC 60730 standard encompasses all aspects of appliance design. Annex H of the standard covers the aspects most relevant to microcontrollers. It details the tests and diagnostics which are intended to ensure safe operation of embedded control hardware and software. IEC 60730 defines three classifications for electronic control functions:

- Class A - Control functions which are not intended to be relied upon for safety of the equipment
- Class B - Control functions intended to prevent unsafe operation of the controlled equipment
- Class C - Control functions intended to prevent special hazards such as explosions

Specific design techniques have been used in the SAMA5D2 to ease compliance with the IEC 60730 Class B Certification and to resolve general-purpose safety concerns. This allows reduced software development and code size as well as savings on external hardware circuitry, since built-in self-tests are already embedded in the MPU. The table “Safety and IEC 60730 Features List” below gives the list of peripherals which incorporate these techniques, and details whether these features are applicable for the IEC 60730 Class B Certification or for general-purpose safety considerations.

## 5.2 Design for Security

The SAMA5D2 embeds peripherals with security features to prevent counterfeiting, to secure external communication, and to authenticate the system.

The table “Security Features” provides the list of peripherals and an overview of their security function. For more information, see the sections on each peripheral.

## 5.3 Safety and IEC 60730 Features

**Table 5-1. Safety and IEC 60730 Features List**

| Peripheral | Component | Fault/Error/Feature | Requirements for Class B IEC 60730(1) | General Safety |
|---|---|---|---|---|
| PMC | Clock | CPU clock monitoring<br>- Overclocking detection | – | X |
| | | 32.768 kHz crystal oscillator frequency monitoring<br>- Abnormal frequency deviation | X | X |
| | | Main crystal oscillator<br>- Crystal failure detection | X | X |

.....continued

| Peripheral | Component | Fault/Error/Feature | Requirements for Class B IEC 60730(1) | General Safety |
|---|---|---|---|---|
| PIOC | I/O Periphery | Programmable configuration lock (active until next $V_{DDCORE}$ reset) to protect against further software modifications (intentional or unintentional) | – | X |
| | | Digital I/O<br>- Plausibility check | X | – |
| ADCC | | Analog I/O and ADC converter<br>- Plausibility check | X | – |
| ICM (SHA) | Memory and Internal Data Path | All internal and external memories such as QSPI, DDR, and all memories on SMC | X | – |
| NAND Flash Controller ECC | | Non-volatile memory<br>- Mutiple error detection (2 to 32) | – | X |
| System Controller | Supply Monitor | Power supplies<br>- VDDCORE, VDDIO, VDDANA, VDDBU abnormal levels | – | X |
| WDT, RSTC | Watchdog | Watchdog can be fed by an internal always ON clock<br>- Program counter stuck at faults. | X | X |
| | | Watchdog configuration can be locked (write-protected)<br>- Errant writes (Programming errors, errors introduced by system or hardware failures) | – | X |
| | | Watchdog overflow generates a system reset | X | X |
| Cortex MMU | Memory Management Unit | Cortex-A5 Memory Management Unit | – | X |
| MATRIX, AIC, RTC, SYSC, RXLP, ACC, PMC, PIO, MPDDRC, SMC, CLASSD, SSC, TWI, UART, SPI, FLEXCOM, QSPI, TC, PDMIC, ADC | Peripherals | Configuration, Interrupt Enable/Disable, Control registers can be independently write-protected<br>- Errant writes (Programming errors, errors introduced by system or hardware failures) | – | X |

.....continued

| Peripheral | Component | Fault/Error/Feature | Requirements for Class B IEC 60730(1) | General Safety |
|---|---|---|---|---|
| PWM, PIO | PWM | Fault inputs can be configured to put the PWM outputs in Safe mode<br>- Programming errors, errors introduced by system or hardware failures | – | X |
| | | PIO controller can lock the PWM I/O<br>- Programming errors, errors introduced by system or hardware failures | – | X |
| | | Fault inputs can be external (IO) or internal (ADC, TIMER, ACC, etc.)<br>- Programming errors, errors introduced by system or hardware failures | – | X |

**Note:**
Class B IEC 60730 Requirements. Annex H - Table H.1 (H.11.12.7 of edition 3).

## 5.4 Security Features

**Table 5-2. Security Features**

| Peripheral | Function | Description | Comments |
|---|---|---|---|
| TrustZone | Security Enclave | Partition secure/non-secure world | Arm technology |
| Cortex MMU | Memory Management Unit | Cortex-A5 Memory Management Unit | – |
| PIO | I/O Control/ Peripheral Access | When a peripheral is not selected (PIO-controlled), I/O lines have no access to the peripheral. | – |
| | Freeze | Capability to freeze either the functional part or the physical part of the configuration. | Once the freeze command is issued, no modifications to the current configuration are possible. Only a hardware reset allows a change to the configuration. |

.....continued

| Peripheral | Function | Description | Comments |
|---|---|---|---|
| Classical Advanced Software Crypto LIbrary (CASCL) | Cryptography | Software ECC (Asymmetric key algorithm, elliptic curves) | Software library(1) |
| | | Software RSA (Asymmetric key algorithm) | |
| TDES, TRNG | | Hardware-accelerated Triple DES | FIPS-compliant(3) |
| | | True Random Number Generator | |
| AES, SHA | | Hardware-accelerated AES up to 256 bits | |
| | | SHA up to 512 and HMAC-SHA | |
| | Secure Boot | Code encrypted/decrypted, Trusted Code Authentication | Hardware SHA (HMAC) + Software RSA or AES Hardware (CMAC) |
| AESB | AES on-the-fly | On-the-fly encryption/decryption for DDR and QSPI memories | AES128 |
| Memories | Scrambling | On-the-fly scrambling/unscrambling for memories | All internal and external memories such as QSPI, DDR, and all memories on SMC |
| ICM | Memory Integrity Check Monitoring | Uses a hardware Secure Hash Algorithm (up to SHA256) | More robust than CRC. All internal and external memories such as QSPI, DDR, and all memories on SMC can be monitored |
| SECUMOD | JTAG | JTAG entry monitor | These tamper pins (JTAG, test, PIOBUs, monitors, etc.) can be configured to immediately erase Backup memories (BUSRAM4KB and BUREG256b), or generate an interrupt or a wakeup signal. |
| | Test | Test entry monitor | |
| | Active Shield(2) | Die Active Shield | |
| | Voltage Monitoring(2) | VDDBU monitoring | |
| | | VDDCORE monitoring | |
| | Temperature Monitoring(2) | Temperature monitoring | |
| | Frequency Monitoring(2) | 32.768 kHz crystal oscillator monitoring | |
| | | CPU clock monitoring | |
| | IO Tamper Pin | 8 tamper detection pins. Active and Dynamic modes supported. | |
| | Secure Backup SRAM | 5 Kbytes scrambled and non-imprinting avoiding data persistance | 4 Kbytes erasable on tamper detection |
| | Secure Backup Registers | 256-bit register bank, scrambled | Erasable on tamper detection |

.....continued

| Peripheral | Function | Description | Comments |
|---|---|---|---|
| RTC | RTC | Timestamping of tamper events. Protection against bad configuration (invalid entry for date and time are impossible) | All events are logged in the RTC. Timestamping gives the source of the reset/erase memory/ interruption |
| | | RTC robustness against glitch attack on 32 kHz crystal oscillator | – |
| Secure Fuse | JTAG Access Control | Disable JTAG access by fuse bit | – |
| | Secure Debug Disable | JTAG debug allowed in Normal mode only, not in Secure mode | TrustZone |

**Note:**

1. A PCI-certified Advanced Software Crypto Library (ASCL) is available under NDA.
2. Available on SAMA5D23 and SAMA5D28 only. For environmental monitors, refer to *SAMA5D23 and SAMA5D28 Environmental Monitors* (document no. 44036), available under Non-Disclosure Agreement (NDA). Contact a Microchip sales representative for details.
3. Refer to the sections on each peripheral for details on FIPS compliancy.

# 6. Package and Pinout

## 6.1 Packages

The SAMA5D2 is available in the packages listed below.

**Table 6-1. SAMA5D2 Packages**

| Package Name | Pin Count | Ball Pitch |
|---|---|---|
| LFBGA289 | 289 | 0.8 mm |
| TFBGA256 | 256 | 0.4 mm |
| TFBGA196 | 196 | 0.75 mm |

The package mechanical characteristics are described in the section Mechanical Characteristics.

## 6.2 Pinouts

Pinouts are provided in the tables below:

- Pin Description (all packages)
- Pin Description (SAMA5D23 pins different from those in table ”Pin Description (all packages)” )
- Pin Description (SAMA5D28B/C pins different from those in the table ”Pin Description (all packages)” )

I/Os for each peripheral are grouped into IO sets, listed in the column ‘IO Set’ in the pinout tables below. For all peripherals, it is mandatory to use I/Os that belong to the same IO set. The timings are not guaranteed when IOs from different IO sets are mixed.

**Table 6-2. Pin Description (all packages)**

**Note:**

1. Signal = ‘PIO’ if GPIO; Dir = Direction; PU = Pull-up; PD = Pull-down; HiZ = High impedance; ST = Schmitt Trigger
2. The GPIO reset state is not guaranteed during the power-up phase. During this phase, the GPIOs are in Input Pull-Up mode and they take their reset value only after VDDCORE POR reset has been released. If a GPIO must be at level zero at power-up, it is recommended to connect an external pull-down to ensure this state.
3. For NRST usage, refer to the section Reset and Test.
4. JTAG boundary scan is available only on JTAG IO Set 1.

The SAMA5D23 is not pin-to-pin compatible with SAMA5D21/SAMA5D22. The table below provides the differences in pinout.

**Note:**

1. Signal = ‘PIO’ if GPIO; Dir = Direction; PU = Pull-up; PD = Pull-down; HiZ = High impedance; ST = Schmitt Trigger.
2. The GPIO reset state is not guaranteed during the power-up phase. During this phase, the GPIOs are in Input Pull-Up mode and they take their reset value only after VDDCORE POR reset has been released. If a GPIO must be at level zero at power-up, it is recommended to connect an external pull-down to ensure this state.

# 7. Power Considerations

## 7.1 Power Supplies

**Table 7-1. SAMA5D2 Power Supplies**

| Name | Voltage Range, Nominal | Associated Ground | Powers |
|---|---|---|---|
| VDDCORE | 1.10V – 1.32V, 1.20V | GNDCORE | Core, including the processor, the embedded memories and the peripherals |
| VDDPLLA | 1.10V – 1.32V, 1.20V | GNDPLLA | PLLA Cell |
| VDDUTMIC | 1.10V – 1.32V, 1.20V | GNDUTMII | USB device and host UTMI+ core |
| VDDHSIC | 1.10V – 1.30V, 1.20V | GNDUTMII | USB High-Speed Inter-Chip |
| VDDIODDR | 1.70V – 1.90V, 1.80V<br>1.14V – 1.30V, 1.20V<br>1.29V – 1.45V, 1.35V<br>1.43V – 1.57V, 1.50V | GNDIODDR | LPDDR1 / DDR2 Interface I/O lines<br>LPDDR2 / LPDDR3 Interface I/O lines<br>DDR3L Interface I/O lines<br>DDR3 Interface I/O lines |

| VDDFUSE | 2.25V – 2.75V, 2.50V | GNDFUSE | Fuse box for programming. It can be tied to ground with a 100 Ω resistor for fuse reading only. It must be powered for fuse programming and to switch to Secure mode. |
| VDDBU | 1.65V – 3.60V | GNDBU | Slow Clock Oscillator, the internal 64-kHz RC Oscillator and a part of the System Controller |

## 7.2 Power-up Considerations

At power-up, from a supply sequencing perspective, the SAMA5D2 power supply inputs are categorized into two groups:

- Group 1 (core group) contains VDDCORE, VDDUTMIC, VDDHSIC and VDDPLLA.
- Group 2 (periphery group) contains all other power supply inputs except VDDFUSE.
  The figure below shows the recommended power-up sequence. Note that:

- VDDBU, when supplied from a battery, is an always-on supply input and is therefore not part of the power supply sequencing. When no backup battery is present in the application, VDDBU is part of Group 2.
- VDDFUSE is the only power supply that may be left unpowered during operation. This is possible if and only if the application does not access the Customer Fuse Matrix in Write mode. It is good practice to turn on VDDFUSE only when the Customer Fuse Matrix is accessed in Write mode, and to turn off VDDFUSE otherwise.
- VDDIODDR may be nominally supplied at 1.2V when the SAMA5D2 device is equipped with an LPDDR2 or LPDDR3 memory. In this case, VDDIODDR can be considered as part of Group 1.

**Figure 7-1. Recommended Power-up Sequence**

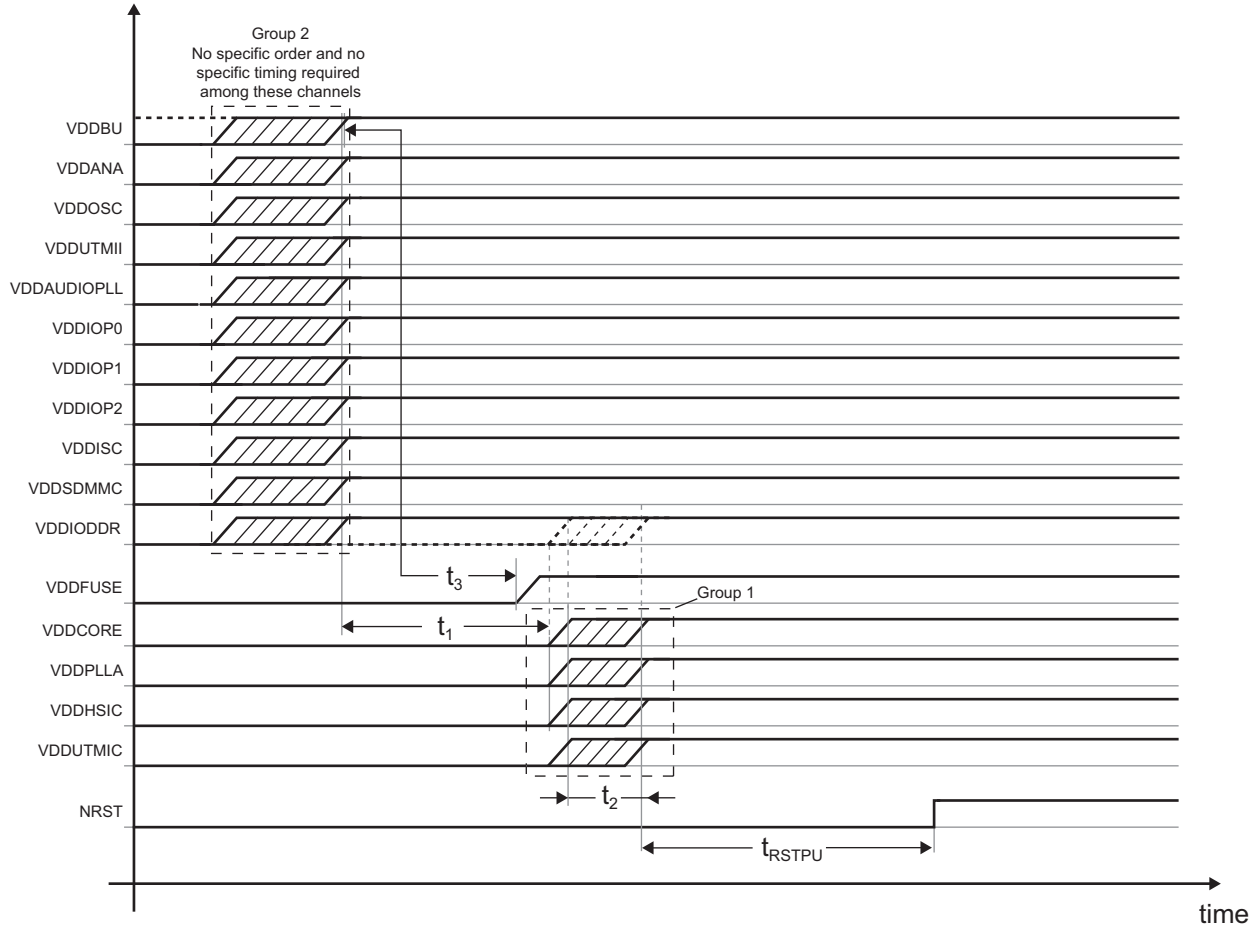

**Table 7-2. Power-up Timing Specification**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_1$ | Group 2 to Group 1 delay | Delay from the last Group 2 established(1) supply to the first Group1 supply turn-on | 0 | – | ms |
| $t_2$ | Group 1 delay(2) | Delay from the first group 1 established supply to the last Group 1 established supply | – | 1 | |
| $t_3$ | VDDFUSE to VDDBU delay | Delay from VDDBU established to VDDFUSE turn-on | 1 | – | |
| $t_{RSTPU}$ | Reset delay at power-up | From the last established supply to NRST high | 1 | – | |

**Note:**

1. An “established” supply refers to a power supply established at 90% of its final value.
2. Also applies to VDDIODDR when considered as part of Group 1.

## 7.3 Power-down Considerations

The figure below shows the SAMA5D2 power-down sequence that starts by asserting the NRST line to 0. Once NRST is asserted, the supply inputs can be immediately shut down without any specific timing or order. VDDBU may not be shut down if the application uses a backup battery on this supply input. In applications where VDDFUSE is powered, it is mandatory to shut down VDDFUSE prior to removing any other supply. VDDFUSE can be removed before or after asserting the NRST signal.

**Figure 7-2. Recommended Power-down Sequence**

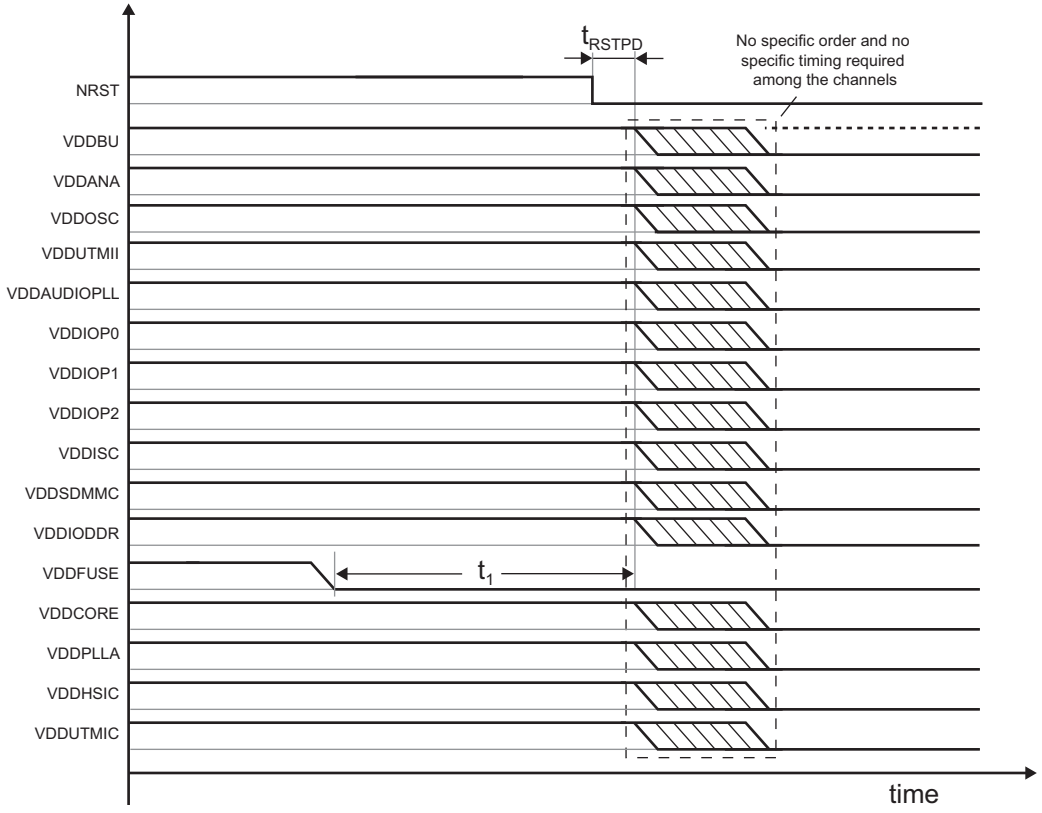

**Table 7-3. Power-down Timing Specification**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_{RSTPD}$ | Reset delay at power-down | From NRST low to the first supply turn-off | 0 | – | ms |
| $t_1$ | VDDFUSE delay at shut-down | From VDDFUSE < 1V to the first supply turn-off | 0 | – | |

## 7.4 Power Supply Sequencing at Backup Mode Entry and Exit

### 7.4.1 VDDBU Power Architecture

The backup power switch aims at optimizing the power consumption on VDDBU source by switching the supply of the backup digital part (BUREG memories + 64-kHz RC oscillator) to VDDANA.

When enabled, the backup power source can be automatically switched to VDDANA, which reduces power consumption on VDDBU. Then, VDDBU powers the pads, VDDBU POR, 32-kHz crystal and, on secure products SAMA5D23 and SAMA5D28, the temperature sensor and the backup supply monitor.

The power source (VDDANA or VDDBU) can be selected manually or can be set to work automatically by programming an SFRBU register (refer to SFRBU_PSWBUCTRL in the section Special Function Registers Backup (SFRBU)).

### 7.4.2 Backup Mode Entry

The figure below shows the recommended power down sequence to place the SAMA5D2 either in Backup mode or in Backup mode with its DDR in self-refresh. The SHDN signal, output of Shutdown Controller (SHDWC), signals the shutdown request to the power supply. This output is supplied by VDDBU that is present in Backup mode. Placing the external DDR memory in self-refresh while in Backup mode, requires to maintain also VDDIODDR. One possible way to signal this additional need to the power supply is to position one of the general purpose I/Os supplied by VDDBU (PIOBUx) in a predefined state.

**Figure 7-3. Recommended Backup Mode Entry**

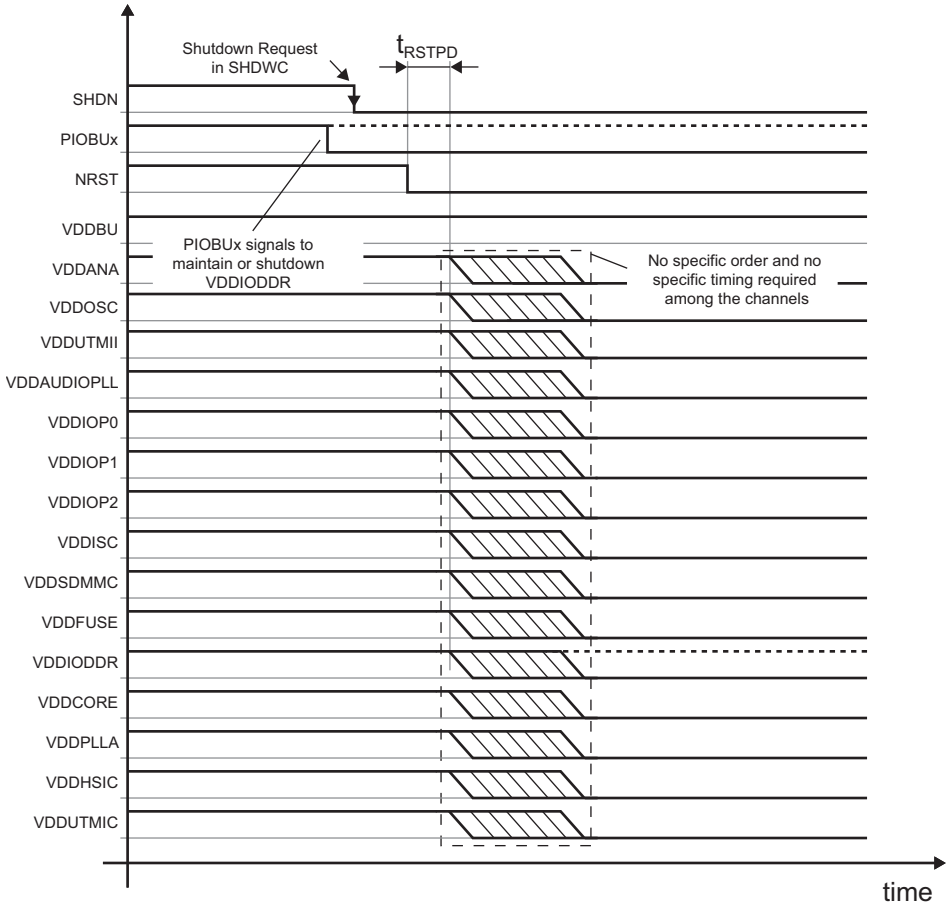

**Table 7-4. Powerdown Timing Specification**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_{RSTPD}$ | Reset delay at powerdown | From NRST low to the first supply turn-off | 0 | – | ms |

### 7.4.3 Backup Mode Exit (Wake-up)

The figure below shows the recommended power-up sequence to wake up SAMA5D2 from Backup mode. Upon a wake-up event, the Shutdown Controller toggles its SHDN output back to VDDBU to request the power supply to restart. Except for VDDIODDR which may already be present if the external DDR memory was placed in Self-refresh mode, this power-up sequence is the same one as presented in the figure “Recommended Power-up Sequence”. In particular, the definitions of Group 1 and Group 2 are the same.

**Figure 7-4. Recommended Power Supply Sequencing at Wake-up**

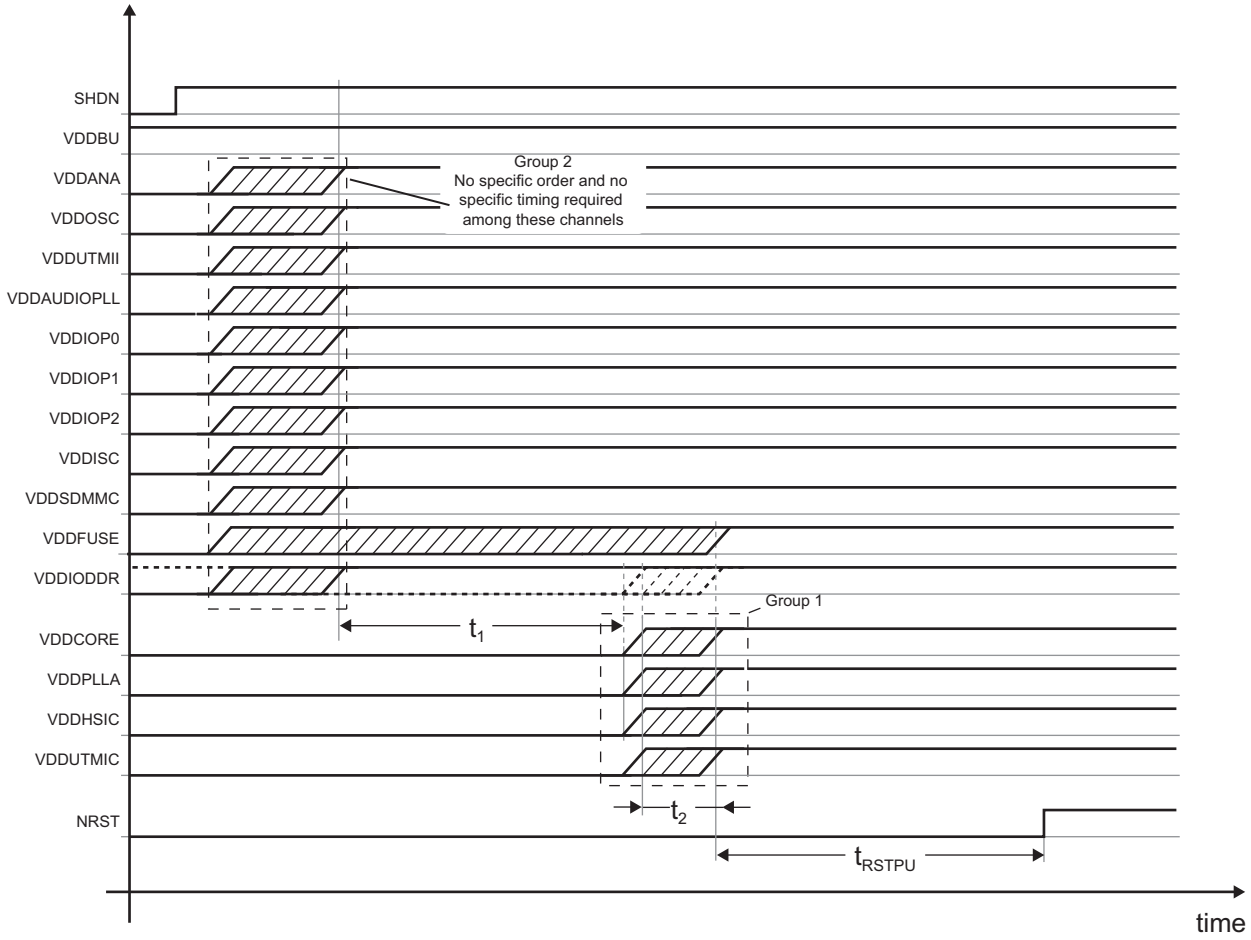

**Table 7-5. Power-up Timing Specification**

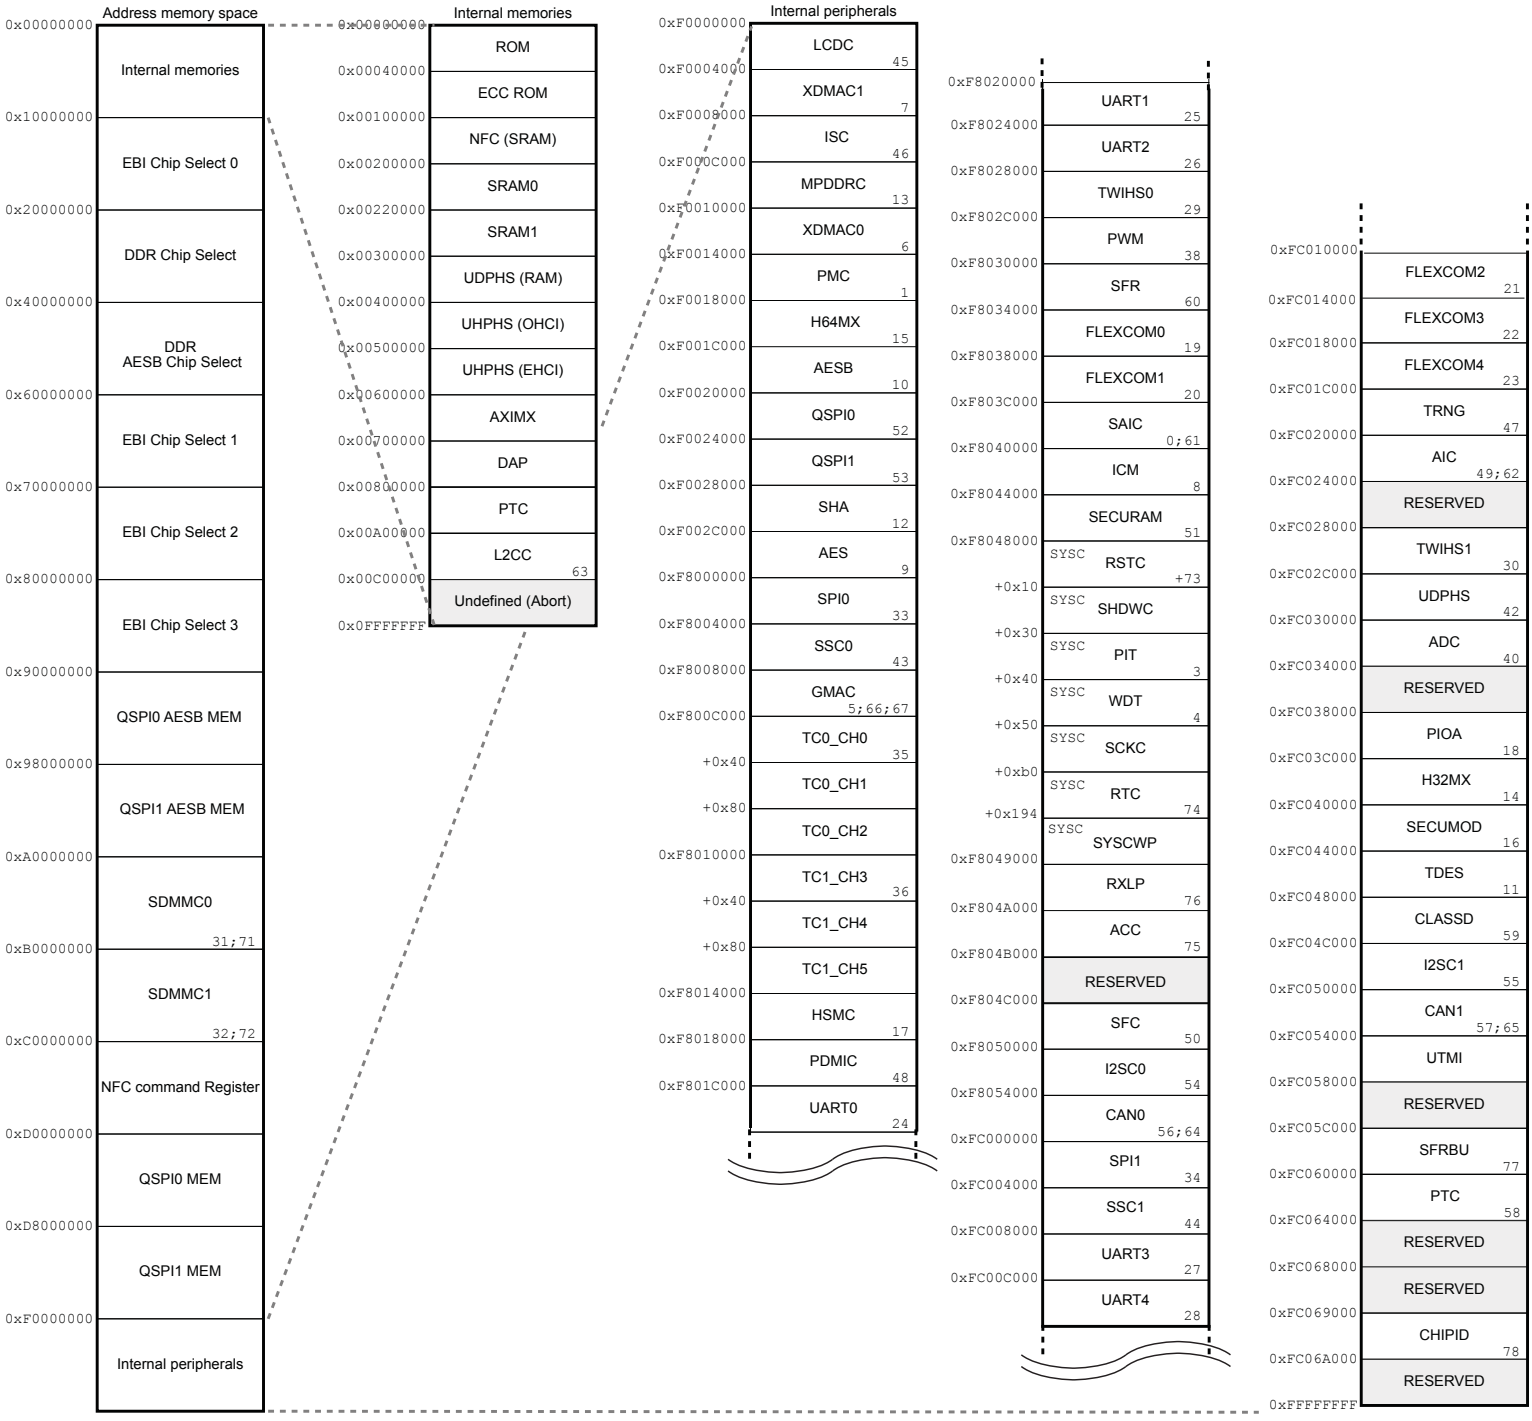
| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_1$ | Group 2 to Group 1 delay | Delay from the last Group 2 established[(1)] supply to the first Group1 supply turn-on | 1 | – | ms |
| $t_2$ | Group 1 delay[(2)] | Delay from the first group 1 established supply to the last Group 1 established supply | – | 1 | |
| $t_{RSTPU}$ | Reset delay at power-up | From the last established supply to NRST high. | 1 | – | |

**Note:**

1. An “established” supply refers to a power supply established at 90% of its final value.
2. Also applies to VDDIODDR when considered as part of Group 1.

# 8. Memories

### Figure 8-1. Memory Mapping



## 8.1 Embedded Memories

### 8.1.1 Internal SRAM

The SAMA5D2 embeds a total of 128 Kbytes of high-speed SRAM. After reset, and until the Remap command is performed, the SRAM is accessible at address 0x0020 0000. When the AXI Bus Matrix is remapped, the SRAM is also available at address 0x0.

The device features a second 128-Kbyte SRAM that can be allocated either to the L2 cache controller or used as an internal SRAM. After reset, this block is connected to the system SRAM, making the two 128-Kbyte RAMs contiguous. The SRAM_SEL bit, located in the SFR_L2CC_HRAMC register, is used to reassign this memory as a L2 cache memory.

### 8.1.2 Internal ROM

The product embeds one 160-Kbyte secured internal ROM mapped at address 0 after reset. The ROM contains a standard and secure bootloader as well as the BCH (Bose, Chaudhuri and Hocquenghem) code tables for NAND Flash ECC correction. The memory area containing the secure boot is automatically hidden after the execution of the secure boot while the one containing the code tables for ECC remains visible.

### 8.1.3 Boot Strategies

For standard boot strategies, refer to the section Standard Boot Strategies.

For secure boot strategies, refer to the document “SAMA5D2x Secure Boot Strategy”, document no. 44040 (Non-Disclosure Agreement required).

## 8.2 External Memory

The SAMA5D2 offers connections to a wide range of external memories or to parallel peripherals.

### 8.2.1 External Bus Interface

The External Bus Interface (EBI) is a 16-bit-wide interface working at MCK/2.

The EBI supports:

- Static memories
- 8-bit NAND Flash with 32-bit BCH ECC
- 16-bit NAND Flash

EBI I/Os accept three drive levels (Low, Medium, High) to avoid overshoots and provide the best performances according to the bus load and external memories voltage.

The drive levels are configured with the DRVSTR field in the PIO Configuration Register (PIO_CFGRx) if the corresponding line is nonsecure or the Secure PIO Configuration Register (S_PIO_CFGRx) if the I/O line is secure.

At reset, the selected drive is low. The user must make sure to program the correct drive according to the device load. The I/O embeds serial resistors for impedance matching.

### 8.2.2 Supported Memories on DDR Interface

- 16-bit or 32-bit external interface
- 512 Mbytes of address space on DDR CS and DDR/AES CS in 32-bit mode

- 256 Mbytes of address space on DDR CS and DDR/AES CS in 16-bit mode
- Supports 16-bit or 32-bit 8-bank DDR2, DDR3, LPDDR1, LPDDR2 and LPDDR3 memories
- Automatic drive level control
- Multiport
- Scramblable data path
- Port 0 of this interface has an embedded automatic AES encryption and decryption mechanism (refer to the section Advanced Encryption Standard Bridge (AESB)). Writing to or reading from the address 0x40000000 may trigger the encryption and decryption mechanism depending on the AESB on External Memories configuration.
- TrustZone: The multiport feature of this interface implies TrustZone configuration constraints. Refer to the section TrustZone Technology for more details.

### 8.2.3 Supported Memories on Static Memories and NAND Flash Interfaces

The Static Memory Controller is dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and parallel peripherals
- NAND Flash (MLC and SLC) 8-bit datapath

The Static Memory Controller is able to drive up to four chip select. NCS3 is dedicated to the NAND Flash control.

The HSMC embeds a NAND Flash Controller (NFC). The NFC can handle automatic transfers, sending the commands and address cycles to the NAND Flash and transferring the contents of the page (for read and write) to the NFC SRAM. It minimizes the processor overhead.

In order to improve overall system performance, the DATA phase of the transfer can be DMA-assisted. The static memory embeds the NAND Flash Error Correcting Code controller with the following features:

- Algorithm based on BCH codes
- Supports also SLC 1-bit (BCH 2-bit), SLC 4-bit (BCH 4-bit)
- Programmable Error Correcting Capability
  - 2-bit, 4-bit, 8-bit and 16-bit errors for 512 bytes/sector (4-Kbyte page)
  - 24-bit error for 1024 bytes/sector (8-Kbyte page)
- Programmable sector size: 512 bytes or 1024 bytes
- Programmable number of sectors per page: 1, 2, 4 or 8 blocks of data per page
- Programmable spare area size
- Supports spare area ECC protection
- Supports 8-Kbyte page size using 1024 bytes/sector and 4-Kbyte page size using 512 bytes/sector
- Error detection is interrupt-driven
- Provides hardware acceleration for error location
- Finds roots of error-locator polynomial
- Programmable number of roots

### 8.2.4 DDR and SDMMC I/Os Calibration

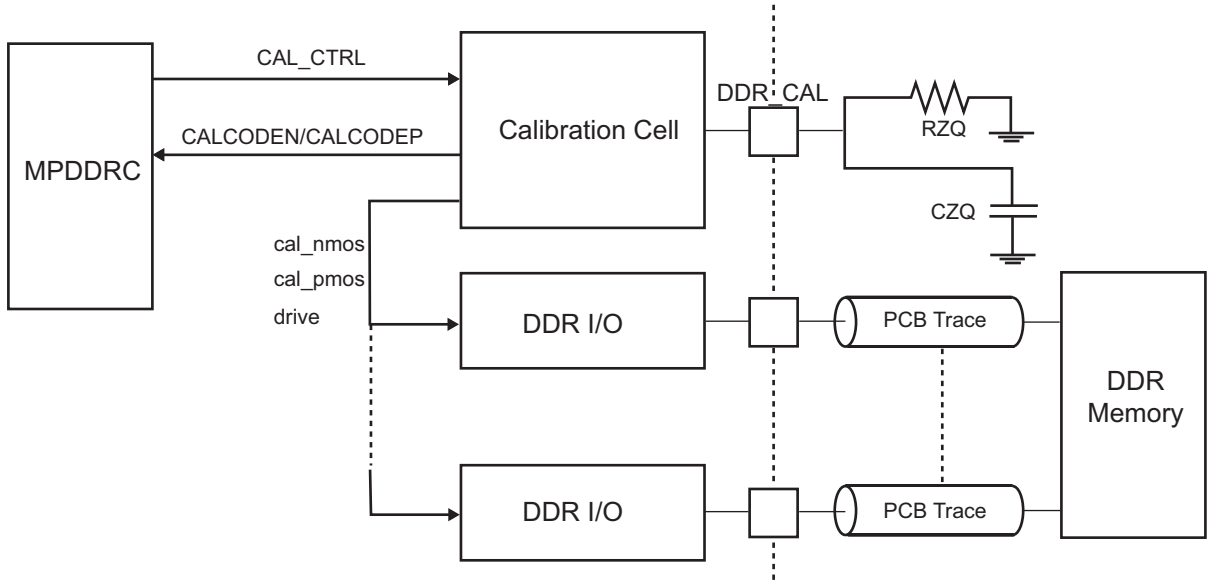
#### 8.2.4.1 DDR I/O Calibration

The DDR2/DDR3/LPDDR1/LPDDR2/LPDDR3/DDR3L I/Os embed an automatic impedance matching control to avoid overshoots and reach the best performance levels depending on the bus load and external memories. A serial termination connection scheme, where the driver has an output impedance matched to the characteristic impedance of the line, is used to improve signal quality and reduce EMI.

One specific analog input, DDR_CAL, is used to calibrate all DDR / IOs.

The MPDDRC supports the ZQ calibration procedure used to calibrate the SAMA5D2 DDR I/O drive strength and the commands to setup the external DDR device drive strength (refer to the section Multiport DDR-SDRAM Controller (MPDDRC)). The calibration cell supports all the memory types listed above.

**Figure 8-2. DDR Calibration Cell**



The calibration cell provides an input pin, DDR_CAL, loaded with one of the following resistor RZQ values:

- 24 KΩ for LPDDR2/LPDDR3
- 23 KΩ for DDR3L
- 22 KΩ for DDR3
- 21 KΩ for DDR2/LPDDR1

The typical value for CZQ is 22 pF.

#### 8.2.4.1.1 LPDDR2 Power Fail Management

The DDR controller (MPDDRC) is used to manage the LPDDR memory when an uncontrolled power off occurs.

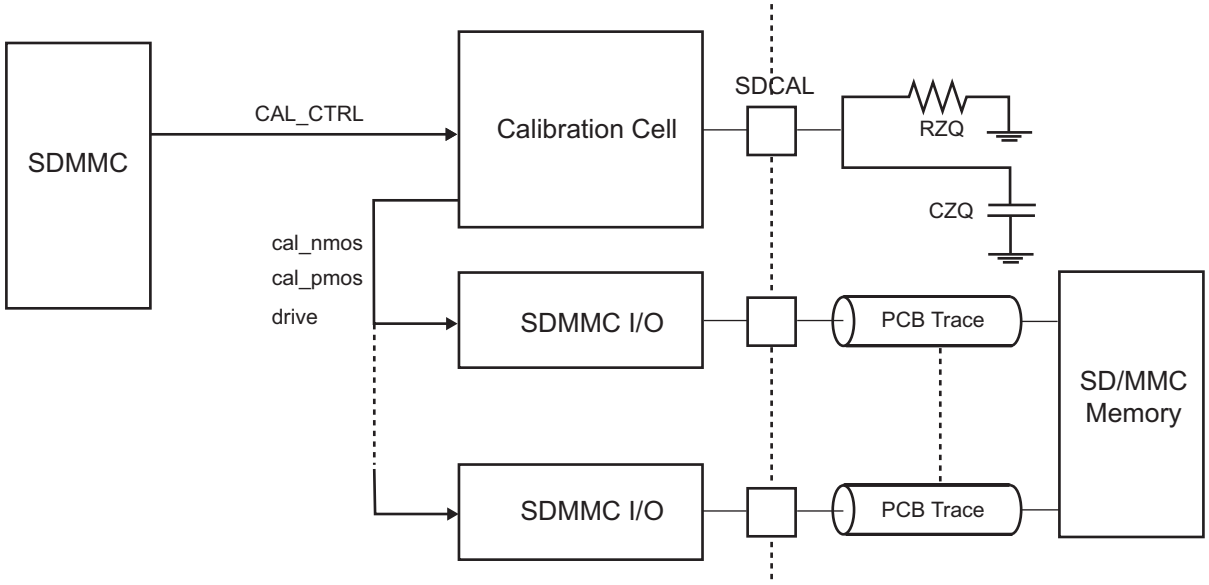
The DDR power rail must be monitored externally and generate an interrupt when a power fail condition is triggered. The interrupt handler must apply the sequence defined in the MPDDRC Low-power register (MPDDRC_LPR) by setting bit LPDDR2_PWOFF (LPDDR2 Power Off bit).

### 8.2.4.2 SDMMC I/O Calibration

The SAMA5D2 also embeds an SDMMC I/O calibration cell. The purpose of this block is to provide to e.MMC/SD I/Os an output impedance reference to limit the impact of process, voltage and temperature on the drivers output impedance. The impedance control is required at high frequency in order to improve signal quality.

The control and procedure to setup the SDMMC calibration cell is described in the section Secure Digital MultiMedia Card Controller (SDMMC).

**Figure 8-3. SDMMC I/O Calibration Cell**



The calibration cell provides an input pin SDCAL loaded with a 20 KΩ resistor for 1.8V memories and a 16.9 KΩ resistor for 3.3V memories.

According to the e.MMC specification, the output impedance calibration is mandatory for HS200 mode (1.8V) when it is not for other modes (3.3V).

In addition, according to the SD specification, the output impedance calibration is mandatory for 1.8V signaling when it is not for 3.3V signaling.

Thus, the calibration cell design is oriented to get the highest accuracy under 1.8V.

In case of interfacing which would need to operate under both 1.8V and 3.3V, external devices RZQ and CZQ must get values related to the 1.8V mode. The typical value for CZQ is 22 pF.

# 9. Event System

The events generated by peripherals are designed to be directly routed to peripherals managing/using these events without processor intervention. Peripherals receiving events contain logic by which to select the one required.

## 9.1 Real-time Event List

- Timers, PWM, and IO peripherals generate event triggers which are directly routed to event managers such as ADC, for example, to start measurement/conversion without processor intervention.
- ADC is connected to nine trigger inputs defined as two groups:
  - One group of eight elements for Timer Counter (TC0 to TC4), ADTRIG and PMW0 event0, PWM0 event1
  - One group of one element for low-rate trigger, RTC
- UART, USART, SPI, TWI, PWM, CLASSD, AES, SHA, ADC, PIO, TIMER (Capture mode) generate event triggers directly connected to DMA controllers (XDMAC) for data transfer without processor intervention.
- PWM safety events (faults) are in combinational form and directly routed from event generators (ADC, ACC, PMC, TIMER) to the PWM module.
- PWM receives external triggers to provide PFC, DC/DC functions.
- PWM output comparators generate events directly connected to TIMER.
- PMC safety event (clock failure detection) can be programmed to switch the MCK on a reliable main RC internal clock without processor intervention.

## 9.2 Real-time Event Mapping

**Table 9-1. Real-time Event Mapping List**

| Function | Application | Description | Event Source | Event Destination |
|---|---|---|---|---|
| Safety | General-purpose | Automatic switch to reliable main RC oscillator in case of main crystal clock failure(1) | Power Management Controller (PMC) | PMC |
| | General-purpose, motor control, power factor correction (PFC) | Puts the PWM outputs in Safe mode (main crystal clock failure detection)(1)(2) | | PWM |
| | Motor control, PFC | Puts the PWM outputs in Safe mode (overspeed, overcurrent detection, etc.)(2)(3) | ADC | |
| | Motor control | Puts the PWM outputs in Safe mode (overspeed detection through TIMER quadrature decoder)(2)(4) | Timer Counter Block (TC 0, 1, 2) | |
| | | | Timer Counter Block (TC 3, 4, 5) | |
| | General-purpose | Puts the PWM outputs in Safe mode (general-purpose fault inputs)(2) | 2 IOs (PWM_Flx) | |

.....continued

| Function | Application | Description | Event Source | Event Destination |
|---|---|---|---|---|
| Measurement trigger | General-purpose | Programmable delay in PWM(7) | PWM Event Line 0 | ADC |
| | | | PWM Event Line 1 | |
| | General-purpose | Trigger source selection in ADC(5) | IO (ADC_ADTRG) | |
| | | | TC Output 0 | |
| | | | TC Output 1 | |
| | | | TC Output 2 | |
| | | | TC Output 3 | |
| | | | TC Output 4 | RTCOUT0 |
| | General-purpose | Low-speed measurement(6) | RTC | RTCOUT1 |
| GTSUCOMP synchronous clock generation trigger | Audio | Trigger source selection in TC | GMAC GTSUCOMP Line | TC5 |
| Delay measurement | Motor control | Delay measurement between PWM outputs and TC inputs externally connected to power transistor bridge driver.(8)(9) | PWM Compare Line 0 | TC Input (A/B) 0 |
| | | | PWM Compare Line 1 | TC Input (A/B) 1 |
| | | | PWM Compare Line 2 | TC Input (A/B) 2 |

**Note:**

1. Refer to Main Crystal Oscillator Failure Detection in section Power Management Controller (PMC).
2. Refer to Fault Inputs and Fault Protection in section Pulse Width Modulation Controller (PWM).
3. Refer to Fault Outputin section Analog-to-Digital Converter (ADC).
4. Refer to 53.6.18 Fault Mode in section Timer Counter (TC).
5. Refer to ADC Trigger Register in section Analog-to-Digital Converter (ADC).
6. Refer to Waveform Generation in section Real-time Clock (RTC).
7. Refer to PWM Comparison Units and PWM Event Lines in section Pulse Width Modulation Controller (PWM).
8. Refer to 53.6.14 Synchronization with PWM in section Timer Counter (TC).
9. Refer to 55.6.2.2 Comparator in section Pulse Width Modulation Controller (PWM).

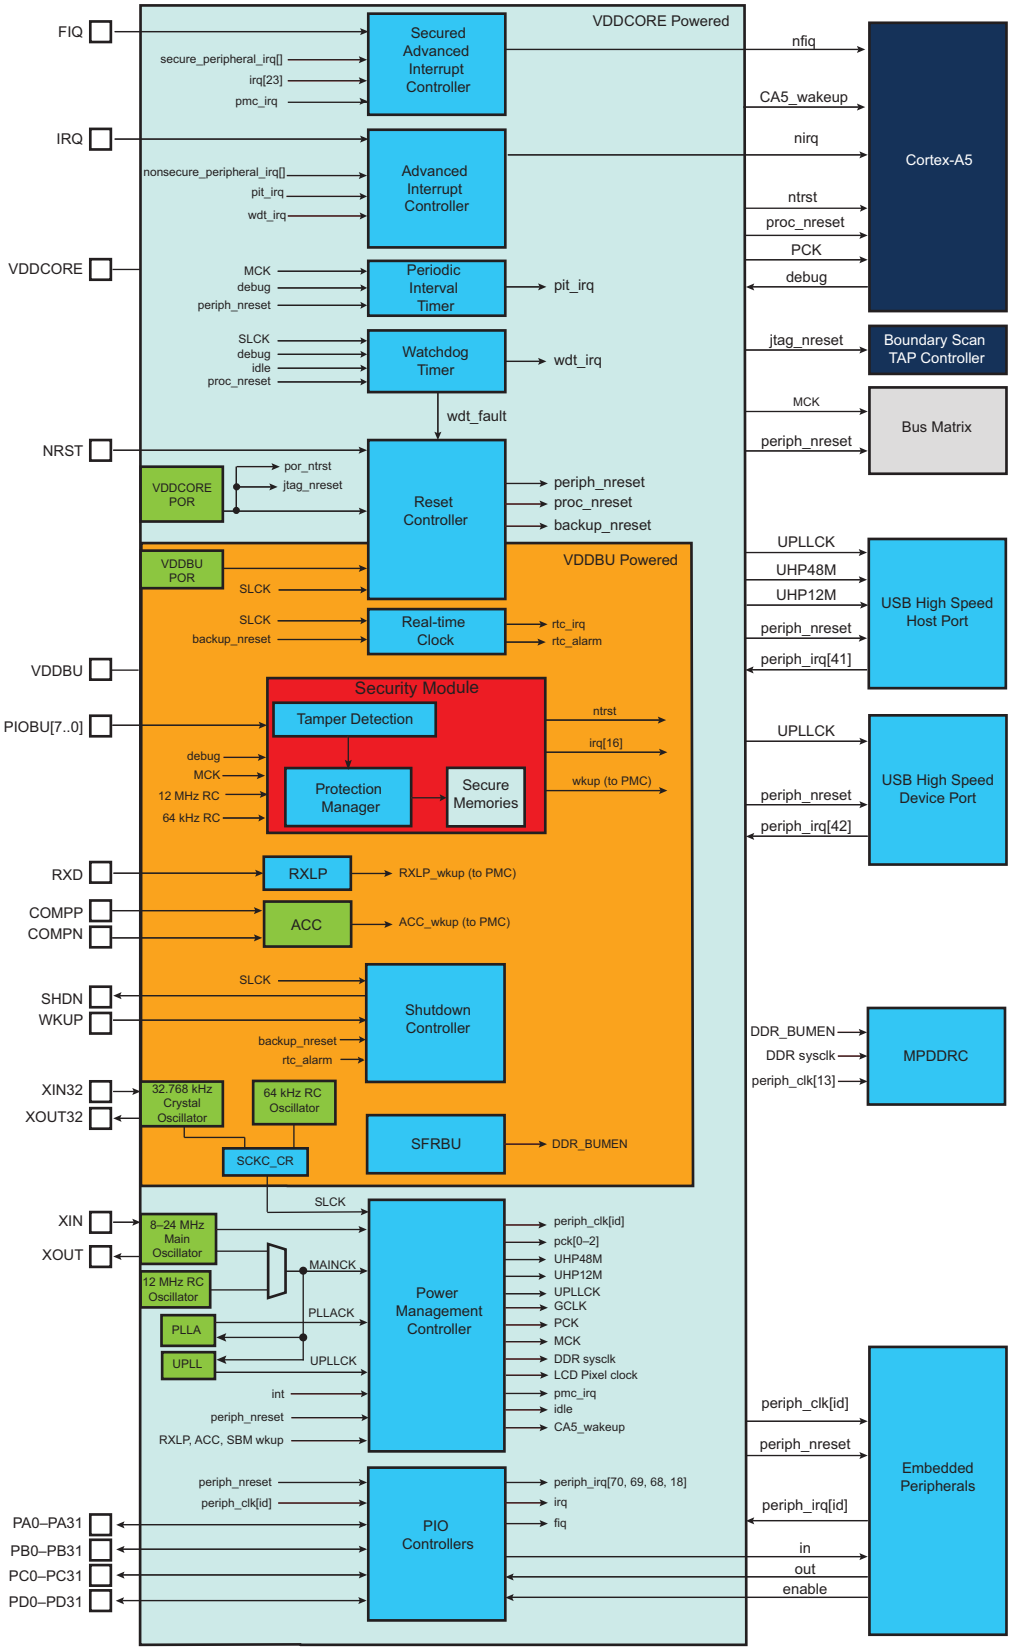
# 10. System Controller

The system controller is a set of peripherals handling key elements of the system, such as power, resets, clocks, time, interrupts, watchdog, etc.

The system controller's peripherals are all mapped between addresses 0xF8049000 and 0xF8048000.

The figure below shows the system controller block diagram.

**Figure 10-1. System Controller Block Diagram**



## 10.1 Power-On Reset

The SAMA5D2 embeds several Power-On Resets (PORs) to ensure the power supply is established when the reset is released. These PORs are dedicated to monitoring VDDBU, VDDIOP and VDDCORE respectively.

# 11. Peripherals

## 11.1 Peripheral Mapping

As shown in the figure Memory Mapping, the peripherals are mapped in the upper 256 Mbytes of the address space, between addresses 0xF000 0000 and 0xFFFC 0000.

## 11.2 Peripheral Identifiers

For details, refer to Table 18-9.

## 11.3 Peripheral Signal Multiplexing on I/O Lines

The SAMA5D2 features several PIO Controllers that multiplex the I/O lines of the peripheral set.

The table Pin Description (all packages) defines how the I/O lines are multiplexed on the different PIO Controllers. Several I/O sets are available for each peripheral. However, selecting I/Os from different I/O sets for one peripheral is prohibited.

The column “Reset State” shows whether the PIO line resets in I/O mode or in Peripheral mode. If I/O is shown, the PIO line resets in input with the pull-up enabled, so that the device is maintained in a static state as soon as the reset is released. As a result, the bit corresponding to the PIO line in register PIO_CFGR (PIO Configuration Register) resets low.

If a signal name is shown in the “Reset State” column, the PIO line is assigned to this function and the corresponding bit in PIO_CFGR resets high. That is the case for pins controlling memories, in particular address lines, which require the pin to be driven as soon as the reset is released.

The PIO state can be retained when the system enters in Backup mode.

## 11.4 Peripheral Clock Types

The table below lists the clock types available on embedded peripherals in SAMA5D2. Clock type suffixes HS and LS refer to Matrix (H64MX) and Matrix (H32MX), respectively.

For details on embedded peripherals, refer to the section Matrix (H64MX/H32MX).

**Table 11-1. Peripheral Clock Types**

| Clock Type | Description |
|---|---|
| HCLOCK_HS<br>HCLOCK_LS | AHB Clock.<br>Managed with the PMC_PCER, PMC_PCDR, PMC_PCSR and PMC_PCR registers of Peripheral Clock.(1) |
| PCLOCK_HS<br>PCLOCK_LS | APB Clock.<br>Managed with the PMC_PCER, PMC_PCDR, PMC_PCSR and PMC_PCR registers of Peripheral Clock. (1) |
| SYS_CLK_LS | This clock cannot be disabled. (2) |
| SYS_CLOCK | This clock cannot be disabled. (2) |

| .....continued | |
|---|---|
| **Clock Type** | **Description** |
| PROC_CLK | The clock related to Processor Clock (PCK) and managed with the PMC_SCDR and PMC_SCSR registers of PMC System Clock |
| SLOW_CLOCK | The clock related to the backup area and the RTC and managed with the SCKC_CR. This clock can be generated either by an external 32.768 kHz crystal oscillator or by the on-chip 64 kHz RC oscillator. |

**Note:**

1. Refer to the figure General Clock Block Diagram in the section Power Management Controller (PMC).
2. Refer to the MCK clock in the figure General Clock Block Diagram in the section Power Management Controller (PMC).

# 12. Chip Identifier (CHIPID)

## 12.1 Description

Chip Identifier (CHIPID) registers are used to recognize the device and its revision. These registers provide the sizes and types of the on-chip memories, as well as the set of embedded peripherals.

Two CHIPID registers are embedded: Chip ID Register (CHIPID_CIDR) and Chip ID Extension Register (CHIPID_EXID). Both registers contain a hard-wired value that is read-only.

The CHIPID_CIDR register contains the following fields:

- VERSION: Identifies the revision of the silicon
- EPROC: Indicates the embedded ARM processor
- NVPTYP and NVPSIZ: Identify the type of embedded non-volatile memory and the size
- SRAMSIZ: Indicates the size of the embedded SRAM
- ARCH: Identifies the set of embedded peripherals
- EXT: Shows the use of the extension identifier register

The CHIPID_EXID register is device-dependent and reads 0 if CHIPID_CIDR.EXT = 0.

## 12.2 Embedded Characteristics

- Chip ID Registers
  - Identification of the Device Revision, Sizes of the Embedded Memories, Set of Peripherals, Embedded Processor

**Table 12-1. SAMA5D2 Chip ID Registers**

| Chip Name | CHIPID_CIDR | CHIPID_EXID |

# 13. Cortex-A5 Processor (ARM)

## 13.1 Reference Documents

The following table gives the references of the documents and their denominations in this document.

**Table 13-1. Reference Documents**

| Document Title | Document No. |
|---|---|
| Cortex-A5 Technical Reference Manual | ARM DDI 0433 |
| Cortex-A5 Floating-Point Unit Technical Reference Manual | ARM DDI 0449 |
| Cortex-A5 NEON Media Processing Engine Technical Reference Manual | ARM DDI 0450 |
| ARM Architecture Reference Manual, ARMv7-A and ARMv7-R edition | ARM DDI 0406 |

## 13.2 Description

The ARM Cortex-A5 processor is a high-performance, low-power, ARM macrocell with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex-A5 processor implements the ARMv7 architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb-2 instructions, and 8-bit Java™ byte codes in Jazelle® state.

The Cortex-A5 NEON Media Processing Engine (MPE) extends the Cortex-A5 functionality to provide support for the ARM v7 Advanced SIMD v2 and Vector Floating-Point v4 (VFPv4) instruction sets. The Cortex-A5 NEON MPE provides flexible and powerful acceleration for signal processing algorithms including multimedia such as image processing, video decode/encode, 2D/3D graphics, and audio. See the Cortex-A5 NEON Media Processing Engine Technical Reference Manual.

The Cortex-A5 processor includes TrustZone® technology to enhance security by partitioning the SoC's hardware and software resources in a Secure world for the security subsystem and a Normal world for the rest, enabling a strong security perimeter to be built between the two. See Security Extensions overview in the Cortex-A5 Technical Reference Manual. See the ARM Architecture Reference Manual for details on how TrustZone works in the architecture.

**Note:** All ARM publications referenced in this datasheet can be found at www.arm.com.

### 13.2.1 Power Management

The Cortex-A5 design supports the following main levels of power management:

- Run Mode
- Standby Mode

#### 13.2.1.1 Run Mode

Run mode is the normal mode of operation where all of the processor functionality is available. Everything, including core logic and embedded RAM arrays, is clocked and powered up.

#### 13.2.1.2 Standby Mode

Standby mode disables most of the clocks of the processor, while keeping it powered up. This reduces the power drawn to the static leakage current, plus a small clock power overhead required to enable the processor to wake up from Standby mode. The transition from Standby mode to Run mode is caused by one of the following:

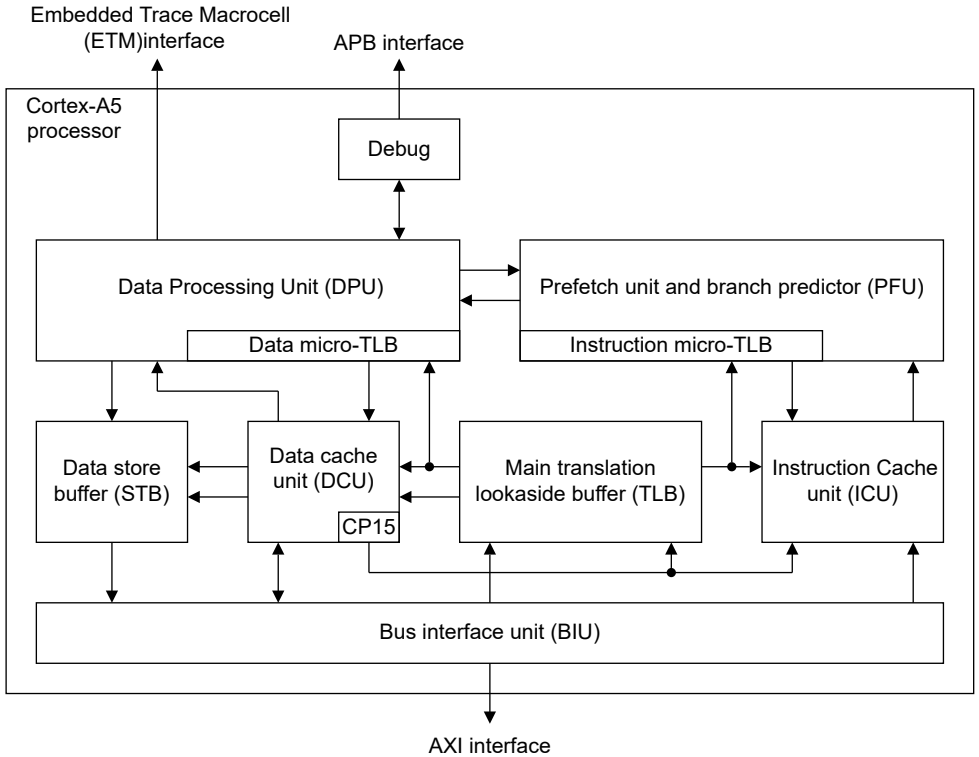
- the arrival of an interrupt, either masked or unmasked
- the arrival of an event, if standby mode was initiated by a Wait for Event (WFE) instruction
- a debug request, when either debug is enabled or disabled
- a reset.

## 13.3 Embedded Characteristics

- In-order Pipeline with Dynamic Branch Prediction
- ARM, Thumb-2, and Thumb-2EE Instruction Set Support
- TrustZone Security Extensions
- Harvard Level 1 Memory System with a Memory Management Unit (MMU)
- 32 Kbytes Data Cache
- 32 Kbytes Instruction Cache
- 64-bit AXI Master Interface
- ARM v7 Debug Architecture
- Trace Support through an Embedded Trace Macrocell (ETM) Interface
- Media Processing Engine (MPE) with NEON Technology
- Jazelle Hardware Acceleration

## 13.4 Block Diagram

**Figure 13-1. Cortex-A5 Processor Top-level Diagram**



## 13.5 Programmer Model

### 13.5.1 Processor Operating Modes

The following operation modes are present in all states:

- User mode (USR) is the usual ARM program execution state. It is used for executing most application programs.
- Fast Interrupt (FIQ) mode is used for handling fast interrupts. It is suitable for high-speed data transfer or channel process.
- Interrupt (IRQ) mode is used for general-purpose interrupt handling.
- Supervisor mode (SVC) is a protected mode for the operating system.
- Abort mode (ABT) is entered after a data or instruction prefetch abort.
- System mode (SYS) is a privileged user mode for the operating system.
- Undefined mode (UND) is entered when an undefined instruction exception occurs.
- Monitor mode (MON) is secure mode that enables change between Secure and Non-secure states, and can also be used to handle any of FIQs, IRQs and external aborts. Entered on execution of a Secure Monitor Call (SMC) instruction.

Mode changes may be made under software control, or may be brought about by external interrupts or exception processing. Most application programs execute in User Mode. The non-user modes, known as privileged modes, are entered in order to service interrupts or exceptions or to access protected resources.

### 13.5.2 Processor Operating States

The processor has the following instruction set states controlled by the T bit and J bit in the CPSR.

- ARM state:
  The processor executes 32-bit, word-aligned ARM instructions.
- Thumb-2 state:
  The processor executes 16-bit and 32-bit, halfword-aligned Thumb-2 instructions.
- Thumb-2EE state:
  The processor executes a variant of the Thumb-2 instruction set designed as a target for dynamically generated code. This is code compiled on the device either shortly before or during execution from a portable bytecode or other intermediate or native representation.
- Jazelle state:
  The processor executes variable length, byte-aligned Java bytecodes.

The J bit and the T bit determine the instruction set used by the processor. The table below shows the encoding of these bits.

**Table 13-2. CPSR J and T Bit Encoding**

| J | T | Instruction Set State |
|---|---|---|
| 0 | 0 | ARM |
| 0 | 1 | Thumb-2 |
| 1 | 0 | Jazelle |
| 1 | 1 | Thumb-2EE |

Alternating between ARM and Thumb-2 states does not affect the processor mode or the register contents. See the ARM Architecture Reference Manual, ARMv7-A and ARMv7-R edition for information on entering and exiting Thumb-2EE state.

#### 13.5.2.1 Switching State

It is possible to change the instruction set state of the processor between:

- ARM state and Thumb-2 state using the BX and BLX instructions.
- Thumb-2 state and Thumb-2EE state using the ENTERX and LEAVEX instructions.
- ARM and Jazelle state using the BXJ instruction.
- Thumb-2 and Jazelle state using the BXJ instruction.

See the ARM Architecture Reference Manual for more information about changing instruction set state.

### 13.5.3 Cortex-A5 Registers

This view provides 16 ARM core registers, R0 to R15, that include the Stack Pointer (SP), Link Register (LR), and Program Counter (PC). The current execution mode determines the selected set of registers, as shown in the table below. This shows that the arrangement of the registers provides duplicate copies of some registers, with the current register selected by the execution mode. This arrangement is described as banking of the registers, and the duplicated copies of registers are referred to as banked registers.

**Table 13-3. Cortex-A5 Modes and Registers Layout**

| User and System | Monitor | Supervisor | Abort | Undefined | Interrupt | Fast Interrupt |
|---|---|---|---|---|---|---|
| R0 | R0 | R0 | R0 | R0 | R0 | R0 |
| R1 | R1 | R1 | R1 | R1 | R1 | R1 |
| R2 | R2 | R2 | R2 | R2 | R2 | R2 |
| R3 | R3 | R3 | R3 | R3 | R3 | R3 |
| R4 | R4 | R4 | R4 | R4 | R4 | R4 |
| R5 | R5 | R5 | R5 | R5 | R5 | R5 |
| R6 | R6 | R6 | R6 | R6 | R6 | R6 |
| R7 | R7 | R7 | R7 | R7 | R7 | R7 |

| R12 | R12 | R12 | R12 | R12 | R12 | R12_FIQ(1) |
| R13(1) | R13_MON(1) | R13_SVC(1) | R13_ABT(1) | R13_UND(1) | R13_IRQ(1) | R13_FIQ(1) |
| R14(1) | R14_MON(1) | R14_SVC(1) | R14_ABT(1) | R14_UND(1) | R14_IRQ(1) | R14_FIQ(1) |
| PC | PC | PC | PC | PC | PC | PC |

.....continued

| User and System | Monitor | Supervisor | Abort | Undefined | Interrupt | Fast Interrupt |
|---|---|---|---|---|---|---|
| CPSR | CPSR | CPSR | CPSR | CPSR | CPSR | CPSR |
| | SPSR_MON(1) | SPSR_SVC(1) | SPSR_ABT(1) | SPSR_UND(1) | SPSR_IRQ(1) | SPSR_FIQ(1) |

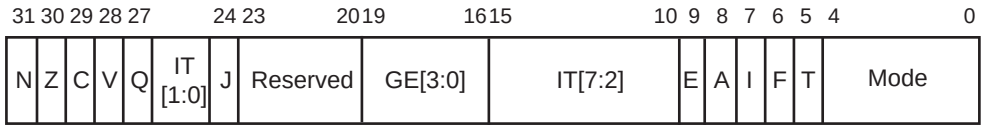
**Note:**

1. Mode-specific banked registers.

The core contains one CPSR, and six SPSRs for exception handlers to use. The program status registers:

- hold information about the most recently performed ALU operation
- control the enabling and disabling of interrupts
- set the processor operating mode

**Figure 13-2. Status Register Format**



- N: Negative, Z: Zero, C: Carry, and V: Overflow are the four ALU flags
- Q: cumulative saturation flag
- IT: If-Then execution state bits for the Thumb-2 IT (If-Then) instruction
- J: Jazelle bit, see the description of the T bit
- GE: Greater than or Equal flags, for SIMD instructions
- E: Endianness execution state bit. Controls the load and store endianness for data accesses. This bit is ignored by instruction fetches.
  - E = 0: Little endian operation
  - E = 1: Big endian operation
- A: Asynchronous abort disable bit. Used to mask asynchronous aborts.
- I: Interrupt disable bit. Used to mask IRQ interrupts.
- F: Fast interrupt disable bit. Used to mask FIQ interrupts.
- T: Thumb-2 execution state bit. This bit and the J execution state bit, bit [24], determine the instruction set state of the processor, ARM, Thumb-2, Jazelle, or Thumb-2EE.
- Mode: five bits to encode the current processor mode. The effect of setting M[4:0] to a reserved value is UNPREDICTABLE.

**Table 13-4. Processor Mode vs. Mode Field**

| Mode | M[4:0] |
|---|---|
| USR | 10000 |
| FIQ | 10001 |
| IRQ | 10010 |
| SVC | 10011 |
| MON | 10110 |

| .....continued | |
|---|---|
| **Mode** | **M[4:0]** |
| ABT | 10111 |
| UND | 11011 |
| SYS | 11111 |
| Reserved | Other |

#### 13.5.3.1 CP15 Coprocessor

Coprocessor 15, or System Control Coprocessor CP15, is used to configure and control all the items in the list below:

- Cortex-A5
- Caches (ICache, DCache and write buffer)
- MMU
- Security
- Other system options

To control these features, CP15 provides 16 additional registers. See the table below.

**Table 13-5. CP15 Registers**

| Register | Name | Read/Write |
|---|---|---|
| 0 | ID Code(1) | Read/Unpredictable |
| 0 | Cache type(1) | Read/Unpredictable |
| 1 | Control(1) | Read/Write |
| 1 | Security(1) | Read/Write |
| 2 | Translation Table Base | Read/Write |
| 3 | Domain Access Control | Read/Write |
| 4 | Reserved | None |
| 5 | Data fault Status(1) | Read/Write |
| 5 | Instruction fault status | Read/Write |
| 6 | Fault Address | Read/Write |
| 7 | Cache and MMU Operations(1) | Read/Write |
| 8 | TLB operations | Unpredictable/Write |
| 9 | Cache lockdown(1) | Read/Write |
| 10 | TLB lockdown | Read/Write |
| 11 | Reserved | None |
| 12 | Interrupts management | Read/Write |
| 12 | Monitor vectors | Read-only |

| .....continued | | |
|---|---|---|
| **Register** | **Name** | **Read/Write** |
| 13 | FCSE PID[1] | Read/Write |
| 13 | Context ID[1] | Read/Write |
| 14 | Reserved | None |
| 15 | Test configuration | Read/Write |

**Note:**

1. This register provides access to more than one register. The register accessed depends on the value of the CRm field or opcode_2 field.

### 13.5.4 CP15 Register Access

CP15 registers can only be accessed in privileged mode by:

- MCR (Move to Coprocessor from ARM Register) instruction is used to write an ARM register to CP15.
- MRC (Move to ARM Register from Coprocessor) instruction is used to read the value of CP15 to an ARM register.

Other instructions such as CDP, LDC, STC can cause an undefined instruction exception.

The assembler code for these instructions is:

```
MCR/MRC{cond} p15, opcode_1, Rd, CRn, CRm, opcode_2
```

The MCR/MRC instructions bit pattern is shown below:

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | cond | | | | 1 | 1 | 1 | 0 |
| **Bit** | **23** | **22** | **21** | **20** | **19** | **18** | **17** | **16** |
| | opcode_1 | | | L | CRn | | | |
| **Bit** | **15** | **14** | **13** | **12** | **11** | **10** | **9** | **8** |
| | Rd | | | | 1 | 1 | 1 | 1 |
| **Bit** | **7** | **6** | **5** | **4** | **3** | **2** | **1** | **0** |
| | opcode_2 | | | 1 | CRm | | | |

**• CRm[3:0]: Specified Coprocessor Action**

Determines specific coprocessor action. Its value is dependent on the CP15 register used. For details, see CP15 specific register behavior.

**• opcode_2[7:5]**

Determines specific coprocessor operation code. By default, set to 0.

**• Rd[15:12]: ARM Register**

Defines the ARM register whose value is transferred to the coprocessor. If R15 is chosen, the result is unpredictable.

**• CRn[19:16]: Coprocessor Register**

Determines the destination coprocessor register.

**• L: Instruction Bit**

0: MCR instruction

1: MRC instruction

**• opcode_1[23:20]: Coprocessor Code**

Defines the coprocessor specific code. Value is c15 for CP15.

**• cond [31:28]: Condition**

### 13.5.5 Addresses in the Cortex-A5 Processor

The Cortex-A5 processor operates using virtual addresses (VAs). The Memory Management Unit (MMU) translates these VAs into the physical addresses (PAs) used to access the memory system. Translation tables hold the mappings between VAs and PAs.

See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for more information.

When the Cortex-A5 processor is executing in Non-secure state, the processor performs translation table look-ups using the Non-secure versions of the Translation Table Base Registers. In this situation, any VA can only translate into a Non-secure PA. When it is in Secure state, the Cortex-A5 processor performs translation table look-ups using the Secure versions of the Translation Table Base Registers. In this situation, the security state of any VA is determined by the NS bit of the translation table descriptors for that address.

Following is an example of the address manipulation that occurs when the Cortex-A5 processor requests an instruction:

1. The Cortex-A5 processor issues the VA of the instruction as Secure or Non-secure VA accesses according to the state the processor is in.
2. The instruction cache is indexed by the bits of the VA. The MMU performs the translation table look-up in parallel with the cache access. If the processor is in the Secure state it uses the Secure translation tables, otherwise it uses the Non-secure translation tables.
3. If the protection check carried out by the MMU on the VA does not abort and the PA tag is in the instruction cache, the instruction data is returned to the processor.
4. If there is a cache miss, the MMU passes the PA to the AXI bus interface to perform an external access. The external access is always Non-secure when the core is in the Non-secure state. In the Secure state, the external access is Secure or Non-secure according to the NS attribute value in the selected translation table entry. In Secure state, both L1 and L2 translation table walk accesses are marked as Secure, even if the first level descriptor is marked as NS.

### 13.5.6 Security Extensions Overview

The purpose of the Security Extensions is to enable the construction of a secure software environment. See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for details of the Security Extensions.

#### 13.5.6.1 System Boot Sequence

> ⚠ **CAUTION** The Security Extensions enable the construction of an isolated software environment for more secure execution, depending on a suitable system design around the processor. The technology does not protect the processor from hardware attacks, and care must be taken to be sure that the hardware containing the reset handling code is appropriately secure.

The processor always boots in the privileged Supervisor mode in the Secure state, with the NS bit set to 0. This means that code that does not attempt to use the Security Extensions always runs in the Secure state. If the software uses both Secure and Non-secure states, the less trusted software, such as a complex operating system and application code running under that operating system, executes in Non-secure state, and the most trusted software executes in the Secure state.

The following sequence is expected to be typical use of the Security Extensions:

1. Exit from reset in Secure state.
2. Configure the security state of memory and peripherals. Some memory and peripherals are accessible only to the software running in Secure state.
3. Initialize the secure operating system. The required operations depend on the operating system, and include initialization of caches, MMU, exception vectors, and stacks.
4. Initialize Secure Monitor software to handle exceptions that switch execution between the Secure and Non-secure operating systems.
5. Optionally lock aspects of the secure state environment against further configuration.
6. Pass control through the Secure Monitor software to the non-secure OS with an SMC instruction.
7. Enable the Non-secure operating system to initialize. The required operations depend on the operating system, and typically include initialization of caches, MMU, exception vectors, and stacks.

The overall security of the secure software depends on the system design, and on the secure software itself.

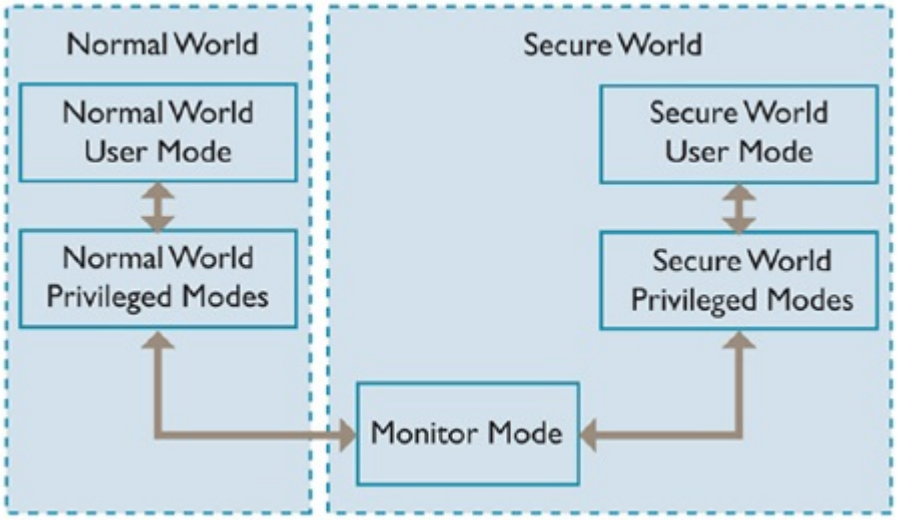
### 13.5.7 TrustZone

#### 13.5.7.1 Hardware

TrustZone enables a single physical processor core to execute code safely and efficiently from both the Normal world and the Secure world. This removes the need for a dedicated security processor core, saving silicon area and power, and allowing high performance security software to run alongside the Normal world operating environment.

The two virtual processors context switch via a new processor mode called monitor mode when changing the currently running virtual processor.

**Figure 13-3. TrustZone Hardware Implementation**

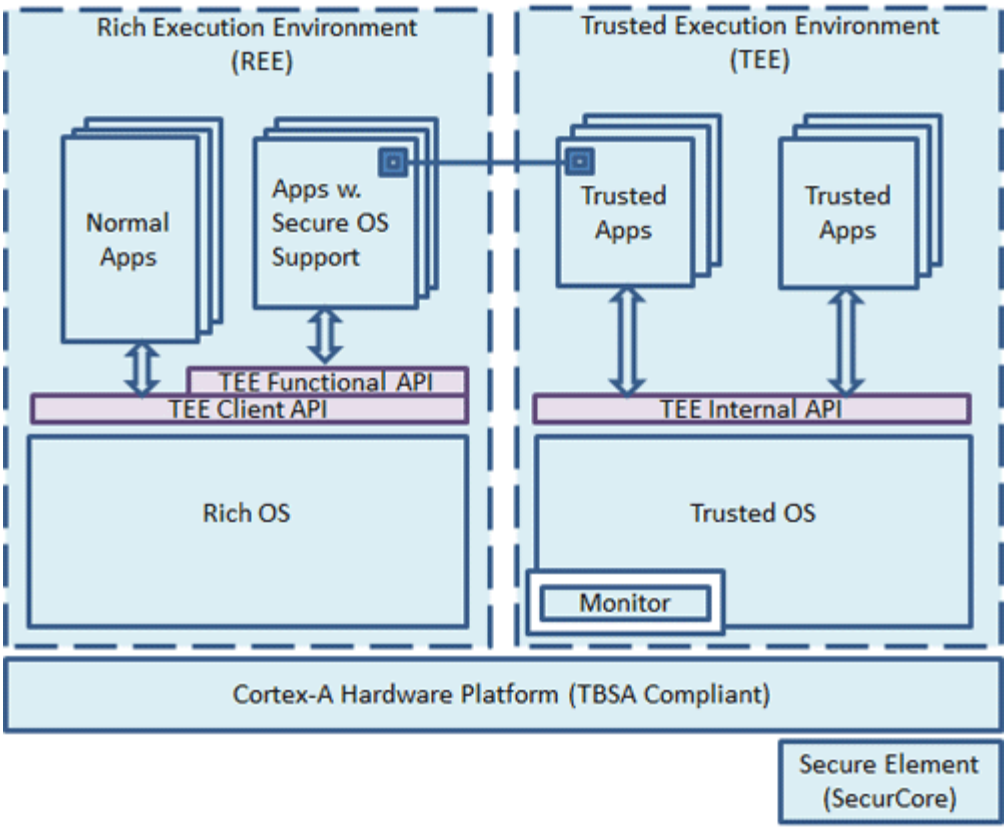


#### 13.5.7.2 Software

The mechanisms by which the physical processor can enter monitor mode from the Normal world are tightly controlled, and are all viewed as exceptions to the monitor mode software. Software executing a dedicated instruction can trigger entry to monitor, the Secure Monitor Call (SMC) instruction, or by a subset of the hardware exception mechanisms. Configuration of the IRQ, FIQ, external Data Abort, and external Prefetch Abort exceptions can cause the processor to switch into monitor mode.

The software that executes within monitor mode is implementation defined, but it generally saves the state of the current world and restores the state of the world at the location to which it switches. It then performs a return-from-exception to restart processing in the restored world.

**Figure 13-4. TrustZone Software Implementation in a Trusted Execution Environment (TEE)**



#### 13.5.7.3 Debug

TrustZone hardware architecture is a security-aware debug infrastructure that can enable control over access to secure world debug, without impairing debug visibility of the Normal world. This is controlled with bits in the Secure Fuse Controller.

**Note:** Secure debug modes are described in the document SAMA5D2 External Tamper Protections, ref. 44095. Contact a Microchip sales representative for further details.

## 13.6 Memory Management Unit (MMU)

### 13.6.1 About the MMU

The MMU works with the L1 and L2 memory system to translate virtual addresses to physical addresses. It also controls accesses to and from external memory.

The ARM v7 Virtual Memory System Architecture (VMSA) features include the following:

- Page table entries that support:
  - 16 Mbyte supersections. The processor supports supersections that consist of 16 Mbyte blocks of memory.
  - 1 Mbyte sections
  - 64 Kbyte large pages
  - 4 Kbyte small pages
- 16 access domains

- Global and application-specific identifiers to remove the requirement for context switch TLB flushes.
- Extended permissions checking capability.

TLB maintenance and configuration operations are controlled through a dedicated coprocessor, CP15, integrated with the core. This coprocessor provides a standard mechanism for configuring the L1 memory system.

See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for a full architectural description of the ARMv7 VMSA.

### 13.6.2 Memory Management System

The Cortex-A5 processor supports the ARM v7 VMSA including the TrustZone security extension. The translation of a Virtual Address (VA) used by the instruction set architecture to a Physical Address (PA) used in the memory system and the management of the associated attributes and permissions is carried out using a two-level MMU.

The first level MMU uses a Harvard design with separate micro TLB structures in the PFU for instruction fetches (IuTLB) and in the DPU for data read and write requests (DuTLB).

A miss in the micro TLB results in a request to the main unified TLB shared between the data and instruction sides of the memory system. The TLB consists of a 128-entry two-way set-associative RAM based structure. The TLB page-walk mechanism supports page descriptors held in the L1 data cache. The caching of page descriptors is configured globally for each translation table base register, TTBRx, in the system coprocessor, CP15.

The TLB contains a hitmap cache of the page types which have already been stored in the TLB.

#### 13.6.2.1 Memory Types

Although various different memory types can be specified in the page tables, the Cortex-A5 processor does not implement all possible combinations:

- Write-through caches are not supported. Any memory marked as write-through is treated as Non-cacheable.
- The outer shareable attribute is not supported. Anything marked as outer shareable is treated in the same way as inner shareable.
- Write-back no write-allocate is not supported. It is treated as write-back write-allocate.

The table below shows the treatment of each different memory type in the Cortex-A5 processor in addition to the architectural requirements.

**Table 13-6. Treatment of Memory Attributes**

| Memory Type Attribute | Shareability | Other Attributes | Notes |
|---|---|---|---|
| Strongly Ordered | – | – | – |
| Device | Non-shareable | – | – |
| | Shareable | – | – |

.....continued

| Memory Type Attribute | Shareability | Other Attributes | Notes |
|---|---|---|---|
| Normal | Non-shareable | Non-cacheable | Does not access L1 caches |
| | | Write-through cacheable | Treated as non-cacheable |
| | | Write-back cacheable, write allocate | Can dynamically switch to no write allocate, if more than three full cache lines are written in succession |
| | | Write-back cacheable, no write allocate | Treated as non-shareable write-back cacheable, write allocate |
| | Inner shareable | Non-cacheable | – |
| | | Write-through cacheable | Treated as inner shareable non-cacheable |
| | | Write-back cacheable, write allocate | Treated as inner shareable non-cacheable unless the SMP bit in the Auxiliary Control Register is set (ACTLR[6] = b1). If this bit is set the area is treated as write-back cacheable write allocate. |
| | | Write-back cacheable, no write allocate | |
| | Outer shareable | Non-cacheable | Treated as inner shareable non-cacheable |
| | | Write-through cacheable | |
| | | Write-back cacheable, write allocate | Treated as inner shareable non-cacheable unless the SMP bit in the Auxiliary Control Register is set (ACTLR[6] = b1). If this bit is set the area is treated as write-back cacheable write allocate. |
| | | Write-back cacheable, no write allocate | |

### 13.6.3 Translation Lookaside Buffer (TLB) Organization

The Translation Lookaside Buffer (TLB) has two parts:

- Micro TLB
- Main TLB

#### 13.6.3.1 Micro TLB

The first level of caching for the page table information is a micro TLB of 10 entries that is implemented on each of the instruction and data sides. These blocks provide a lookup of the virtual addresses in a single cycle.

The micro TLB returns the physical address to the cache for the address comparison, and also checks the access permissions to signal either a Prefetch Abort or a Data Abort.

All main TLB related maintenance operations affect both the instruction and data micro TLBs, causing them to be flushed. In the same way, any change of the following registers causes the micro TLBs to be flushed:

- Context ID Register (CONTEXTIDR)
- Domain Access Control Register (DACR)
- Primary Region Remap Register (PRRR)
- Normal Memory Remap Register (NMRR)
- Translation Table Base Registers (TTBR0 and TTBR1)

#### 13.6.3.2 Main TLB

Misses from the instruction and data micro TLBs are handled by a unified main TLB. Accesses to the main TLB take a variable number of cycles, according to competing requests from each of the micro TLBs and other implementation-dependent factors.

The main TLB is 128-entry two-way set-associative.

**TLB match process**

Each TLB entry contains a virtual address, a page size, a physical address, and a set of memory properties. Each is marked as being associated with a particular application space (ASID), or as global for all application spaces. The CONTEXTIDR determines the currently selected application space.

A TLB entry matches when these conditions are true:

- Its virtual address matches that of the requested address.
- Its Non-secure TLB ID (NSTID) matches the Secure or Non-secure state of the MMU request.
- Its ASID matches the current ASID in the CONTEXTIDR or is global.

The operating system must ensure that, at most, one TLB entry matches at any time. The TLB can store entries based on the following block sizes:

| | |
|---|---|
| **Supersections** | Describe 16 Mbyte blocks of memory |
| **Sections** | Describe 1 Mbyte blocks of memory |
| **Large pages** | Describe 64 Kbyte blocks of memory |
| **Small pages** | Describe 4 Kbyte blocks of memory |

Supersections, sections and large pages are supported to permit mapping of a large region of memory while using only a single entry in the TLB. If no mapping for an address is found within the TLB, then the translation table is automatically read by hardware and a mapping is placed in the TLB.

### 13.6.4 Memory Access Sequence

When the processor generates a memory access, the MMU:

1. Performs a lookup for the requested virtual address and current ASID and security state in the relevant instruction or data micro TLB.
2. If there is a miss in the micro TLB, performs a lookup for the requested virtual address and current ASID and security state in the main TLB.
3. If there is a miss in main TLB, performs a hardware translation table walk.

The MMU can be configured to perform hardware translation table walks in cacheable regions by setting the IRGN bits in Translation Table Base Register 0 and Translation Table Base Register 1. If the encoding of the IRGN bits is write-back, an L1 data cache lookup is performed and data is read from the data

cache. If the encoding of the IRGN bits is write-through or non-cacheable, an access to external memory is performed. For more information, see *Cortex-A5 Technical Reference Manual*.

The MMU might not find a global mapping, or a mapping for the currently selected ASID, with a matching Non-secure TLB ID (NSTID) for the virtual address in the TLB. In this case, the hardware does a translation table walk if the translation table walk is enabled by the PD0 or PD1 bit in the Translation Table Base Control Register. If translation table walks are disabled, the processor returns a Section Translation fault. For more information, see *Cortex-A5 Technical Reference Manual*.

If the TLB finds a matching entry, it uses the information in the entry as follows:

1. The access permission bits and the domain determine if the access is enabled. If the matching entry does not pass the permission checks, the MMU signals a memory abort. See the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R* edition for a description of access permission bits, abort types and priorities, and for a description of the Instruction Fault Status Register (IFSR) and Data Fault Status Register (DFSR).
2. The memory region attributes specified in both the TLB entry and the CP15 c10 remap registers determine if the access is
   – Secure or Non-secure
   – Shared or not
   – Normal memory, Device, or Strongly-ordered

   For more information, see *Cortex-A5 Technical Reference Manual*, Memory region remap.
3. The TLB translates the virtual address to a physical address for the memory access.

### 13.6.5 Interaction with Memory System

The MMU can be enabled or disabled as described in the *ARM Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

### 13.6.6 External Aborts

External memory errors are defined as those that occur in the memory system rather than those that are detected by the MMU. External memory errors are expected to be extremely rare. External aborts are caused by errors flagged by the AXI interfaces when the request goes external to the Cortex-A5 processor. External aborts can be configured to trap to Monitor mode by setting the EA bit in the Secure Configuration Register. For more information, see *Cortex-A5 Technical Reference Manual*.

#### 13.6.6.1 External Aborts on Data Write

Externally generated errors during a data write can be asynchronous. This means that the r14_abt on entry into the abort handler on such an abort might not hold the address of the instruction that caused the exception.

The DFAR is Unpredictable when an asynchronous abort occurs.

Externally generated errors during data read are always synchronous. The address captured in the DFAR matches the address which generated the external abort.

#### 13.6.6.2 Synchronous and Asynchronous Aborts

The section System Control in the *Cortex-A5 Technical Reference Manual* describes synchronous and asynchronous aborts, their priorities, and the IFSR and DFSR. To determine a fault type, read the DFSR for a data abort or the IFSR for an instruction abort.

The processor supports an Auxiliary Fault Status Register for software compatibility reasons only. The processor does not modify this register because of any generated abort.

### 13.6.7 MMU Software Accessible Registers

The system control coprocessor registers, CP15, in conjunction with page table descriptors stored in memory, control the MMU.

Access all the registers with instructions of the form:

```
MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

```
MCR p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

CRn is the system control coprocessor register. Unless specified otherwise, CRm and opcode_2 should be zero.

# 14. L2 Cache Controller (L2CC)

## 14.1 Description

The L2 Cache Controller (L2CC) is based on the L2CC-PL310 ARM multi-way cache macrocell, version r3p2. The addition of an on-chip secondary cache, also referred to as a Level 2 or L2 cache, is a method of improving the system performance when significant memory traffic is generated by the processor.

## 14.2 Embedded Characteristics

- 8-Way Set Associative Cache Architecture
- Data Banking Not Supported
- No Parity Bit Embedded
- Lockdown by Master Not Supported
- Lockdown by Line Not Supported
- TrustZone Architecture for Enhanced OS Security

## 14.3 Product Dependencies

### 14.3.1 Power Management

The L2 Cache Controller is continuously clocked by the Processor Clock. The Power Management Controller has no effect on the behavior of the L2 Cache Controller.

## 14.4 Functional Description

The addition of an on-chip secondary cache, also referred to as a Level 2 or L2 cache, is a recognized method of improving the performance of ARM-based systems when significant memory traffic is generated by the processor. By definition a secondary cache assumes the presence of a Level 1 or primary cache, closely coupled or internal to the processor. Memory access is fastest to L1 cache, followed closely by L2 cache. Memory access is typically significantly slower with L3 main memory.

The cache controller is a unified, physically addressed, physically tagged cache with up to 8 ways. The user can lock the replacement algorithm on a way basis, enabling the associativity to be reduced from 8-way down to 1-way (directly mapped).

The cache controller does not have snooping hardware to maintain coherency between caches, so the user has to maintain coherency by software.

### 14.4.1 Double Linefill Issuing

The L2CC cache line length is 32-byte. Therefore, by default, on each L2 cache miss, the L2CC issues 32-byte linefills, 4 x 64-bit read bursts, to the L3 memory system. The L2CC can issue 64-byte linefills, 8 x 64-bit read bursts, on an L2 cache miss. When the L2CC is waiting for the data from L3, it performs a lookup on the second cache line targeted by the 64-byte linefill. If it misses, data corresponding to the second cache line are allocated to the L2 cache. If it hits, data corresponding to the second cache line are discarded.

The user can control this feature using the DLEN, DLFWRDIS and DLEN bits of the L2CC Prefetch Control Register. The IDLEN and DLFWRDIS bits are only used if the user sets the DLEN bit HIGH. The

table below shows the behavior of the L2CC master ports, depending on the configuration chosen by the user.

**Table 14-1. L2CC Master Port Behavior**

| Bit 30 DLEN | Bit 27 DLFWRDIS | Bit 23 IDLEN | Original Read Address from L1 | Read Address to L3 | AXI Burst Type | AXI Burst Length | Targeted Cache Lines |
|---|---|---|---|---|---|---|---|
| 0 | 0 or 1 | 0 or 1 | 0x00 | 0x00 | WRAP | 0x3, 4x64-bit | 0x00 |
| 0 | 0 or 1 | 0 or 1 | 0x20 | 0x20 | WRAP | 0x3, 4x64-bit | 0x20 |
| 1 | 0 or 1 | 0 | 0x00 | 0x00 | WRAP | 0x7, 8x64-bit | 0x00 and 0x20 |
| 1 | 1 | 0 | 0x08 or 0x10 or 0x18 | 0x08 | WRAP | 0x3, 4x64-bit | 0x00 |
| 1 | 0 | 0 | 0x08 or 0x10 or 0x18 | 0x00 | WRAP | 0x7, 8x64-bit | 0x00 and 0x20 |
| 1 | 0 or 1 | 0 | 0x20 | 0x20 | WRAP | 0x7, 8x64-bit | 0x00 and 0x20 |
| 1 | 1 | 0 | 0x28 or 0x30 or 0x38 | 0x28 | WRAP | 0x3, 4x64-bit | 0x20 |
| 1 | 0 | 0 | 0x28 or 0x30 or 0x38 | 0x20 | WRAP | 0x7, 8x64-bit | 0x00 and 0x20 |
| 1 | 0 or 1 | 1 | 0x00 | 0x00 | INCR or WRAP | 0x7, 8x64-bit | 0x00 and 0x20 |
| 1 | 1 | 1 | 0x08 or 0x10 or 0x18 | 0x08 | WRAP | 0x3, 4x64-bit | 0x00 |
| 1 | 0 | 1 | 0x08 or 0x10 or 0x18 | 0x00 | INCR or WRAP | 0x7, 8x64-bit | 0x00 and 0x20 |
| 1 | 0 or 1 | 1 | 0x20 | 0x20 | INCR | 0x7, 8x64-bit | 0x20 and 0x40 |
| 1 | 1 | 1 | 0x28 or 0x30 or 0x38 | 0x28 | WRAP | 0x3, 4x64-bit | 0x20 |
| 1 | 0 | 1 | 0x28 or 0x30 or 0x38 | 0x20 | INCR | 0x7, 8x64-bit | 0x20 and 0x40 |

**Note:**

1. Double linefills are not issued for prefetch reads if exclusive cache configuration is enabled.
2. Double linefills are not launched when crossing a 4-Kbyte boundary.
3. Double linefills only occur if a WRAP4 or an INCR4 64-bit transaction is received on the slave ports. This transaction is most commonly seen as a result of a cache linefill in a master, but can be produced by a master when accessing memory marked as inner non-cacheable.

## 14.5 Register Summary

|---|---|---|---|---|---|---|---|---|
| | | IL2ASS | | | | | | |
| Access | | R | | | | | | |
| Reset | | 0 | | | | | | |

**Bits 22:20 – DL2WSIZE[2:0]** Data L2 Cache Way Size
The value is read from the field WAYSIZE in Auxiliary Control Register, should be 0x1.

**Bit 18 – DL2ASS** Data L2 Cache Associativity
The value is read from the field ASS in Auxiliary Control Register, should be 0.

**Bits 10:8 – IL2WSIZE[2:0]** Instruction L2 Cache Way Size
The value is read from the field WAYSIZE in Auxiliary Control Register, should be 0x1.

**Bit 6 – IL2ASS** Instruction L2 Cache Associativity
The value is read from the field ASS in Auxiliary Control Register, should be 0.

### 14.5.3 L2CC Control Register

**Name:** L2CC_CR
**Offset:** 0x100
**Reset:** 0x00000000
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | L2CEN |
| Access | | | | | | | | |
| Reset | | | | | | | | 0 |

**Bit 0 – L2CEN** L2 Cache Enable

| Value | Description |
|---|---|
| 0 | L2 Cache is disabled. This is the default value. |
| 1 | L2 Cache is enabled. |

### 14.5.4 L2CC Auxiliary Control Register

**Name:** L2CC_ACR
**Offset:** 0x104
**Reset:** 0x02020000
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

The L2 Cache Controller (L2CC) must be disabled in the L2CC Control Register prior to any write access to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | IPEN | DPEN | NSIAC | NSLEN | CRPOL | FWA[1:1] |
| Access | | | | | | | | |
| Reset | | | 0 | 0 | 0 | 0 | 1 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | FWA[0:0] | SAOEN | PEN | EMBEN | WAYSIZE[2:0] | | | ASS |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

|---|---|---|---|---|---|---|---|---|
| | | | SAIE | EXCC | SBDLE | HPSO | | |
| Access | | | | | | | | |
| Reset | | | 0 | 0 | 0 | 0 | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 29 – IPEN** Instruction Prefetch Enable

| Value | Description |
|---|---|
| 0 | Instruction prefetching is disabled. This is the default value. |
| 1 | Instruction prefetching is enabled. |

**Bit 28 – DPEN** Data Prefetch Enable

| Value | Description |
|---|---|
| 0 | Data prefetching is disabled. This is the default value. |
| 1 | Data prefetching is enabled. |

**Bit 27 – NSIAC** Non-Secure Interrupt Access Control

| Value | Description |
|---|---|
| 0 | Interrupt Clear Register and Interrupt Mask Register can only be modified or read with secure accesses. This is the default value. |
| 1 | Interrupt Clear Register and Interrupt Mask Register can be modified or read with secure or non-secure accesses. |

**Bit 26 – NSLEN** Non-Secure Lockdown Enable

| Value | Description |
|---|---|
| 0 | Lockdown registers cannot be modified using non-secure accesses. This is the default value. |
| 1 | Non-secure accesses can write to the lockdown registers. |

**Bit 25 – CRPOL** Cache Replacement Policy

| Value | Description |
|---|---|
| 0 | Pseudo-random replacement using the LFSR algorithm. |
| 1 | Round-robin replacement. This is always the default value. |

**Bits 24:23 – FWA[1:0]** Force Write Allocate

| Value | Description |
|---|---|
| 0 | The L2 Cache controller uses AWCACHE attributes for WA. This is the default value. |
| 1 | User forces no allocate, WA bit must be set to 0. |
| 2 | User overrides AWCACHE attributes, WA bit must be set to 1. All cacheable write misses become write allocated. |
| 3 | The write allocation is internally mapped to 00. |

**Bit 22 – SAOEN** Shared Attribute Override Enable

| Value | Description |
|---|---|
| 0 | Treats shared accesses. This is the default value. |
| 1 | Shared attribute is internally ignored. |

**Bit 21 – PEN** Parity Enable

| Value | Description |
|---|---|
| 0 | Disabled. This is the default value. |
| 1 | Enabled. |

**Bit 20 – EMBEN** Event Monitor Bus Enable

| Value | Description |
|---|---|
| 0 | Disabled. This is the default value. |
| 1 | Enabled. |

**Bits 19:17 – WAYSIZE[2:0]** Way Size

| Value | Name | Description |
|---|---|---|
| 0x0 | RESERVED | Reserved |
| 0x1 | 16KB_WAY | 16-Kbyte way set associative |
| 0x2 | RESERVED | Reserved |
| 0x3 | RESERVED | Reserved |
| 0x4 | RESERVED | Reserved |
| 0x5 | RESERVED | Reserved |
| 0x6 | RESERVED | Reserved |
| 0x7 | RESERVED | Reserved |

**Bit 16 – ASS** Associativity

| Value | Description |
|---|---|
| 0 | 8-way.This is the default value. |
| 1 | Reserved. |

**Bit 13 – SAIE** Shared Attribute Invalidate Enable

| Value | Description |
|---|---|
| 0 | Shared invalidate behavior is disabled. This is the default value. |
| 1 | Shared invalidate behavior is enabled if the Shared Attribute Override Enable bit is not set.<br>Shared invalidate behavior is enabled if both:<br>• Shareable Attribute Invalidate Enable bit is set in the Auxiliary Control Register, bit[13]<br>• Shared Attribute Override Enable bit is not set in the Auxiliary Control Register, bit[22] |

**Bit 12 – EXCC** Exclusive Cache Configuration

| Value | Description |
|---|---|
| 0 | Disabled. This is the default value. |
| 1 | Enabled. |

**Bit 11 – SBDLE** Store Buffer Device Limitation Enable

| Value | Description |
|---|---|
| 0 | Store buffer device limitation is disabled. Device writes can take all slots in the store buffer. This is the default value. |
| 1 | Store buffer device limitation is enabled. |

**Bit 10 – HPSO** High Priority for SO and Dev Reads Enable

| Value | Description |
|---|---|
| 0 | Strongly Ordered and Device reads have lower priority than cacheable accesses when arbitrated in the L2CC master ports. This is the default value. |
| 1 | Strongly Ordered and Device reads get the highest priority when arbitrated in the L2CC master ports. |

### 14.5.5 L2CC Tag RAM Latency Control Register

**Name:** L2CC_TRCR
**Offset:** 0x108
**Reset:** 0x00000111
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

The L2 Cache Controller (L2CC) must be disabled in the L2CC Control Register prior to any write access to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | TWRLAT[2:0] | | |

|---|---|---|---|---|---|---|---|---|
| Access | | TRDLAT[2:0] | | | | TSETLAT[2:0] | | |
| Reset | | 0 | 0 | 1 | | 0 | 0 | 1 |

**Bits 10:8 – TWRLAT[2:0]** Write Access Latency
Latency to Tag RAM is the programmed value + 1.

Default value is 0.

**Bits 6:4 – TRDLAT[2:0]** Read Access Latency

**Bits 2:0 – TSETLAT[2:0]** Setup Latency

### 14.5.6 L2CC Data RAM Latency Control Register

**Name:** L2CC_DRCR
**Offset:** 0x10C
**Reset:** 0x00000111
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

The L2 Cache Controller (L2CC) must be disabled in the L2CC Control Register prior to any write access to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – EVC1RST** Event Counter 1 Reset

| Value | Description |
|---|---|
| 0 | No effect, always read as zero. |
| 1 | Resets Counter 1. |

**Bit 1 – EVC0RST** Event Counter 0 Reset

| Value | Description |
|---|---|
| 0 | No effect, always read as zero. |
| 1 | Resets Counter 0. |

**Bit 0 – EVCEN** Event Counter Enable

| Value | Description |
|---|---|
| 0 | Disables Event Counter. This is the default value. |
| 1 | Enables Event Counter. |

### 14.5.8 L2CC Event Counter 1 Configuration Register

**Name:** L2CC_ECFGR1
**Offset:** 0x204
**Reset:** 0x02020000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| 0xe | SRC_SRCONF | Source is SRCONF |
| 0xf | SRC_EPFRCVD | Source is EPFRCVD |

**Bits 1:0 – EIGEN[1:0]** Event Counter Interrupt Generation

| Value | Name | Description |
|---|---|---|
| 0x0 | INT_DIS | Disables (default) |
| 0x1 | INT_EN_INCR | Enables with Increment condition |
| 0x2 | INT_EN_OVER | Enables with Overflow condition |
| 0x3 | INT_GEN_DIS | Disables Interrupt generation |

### 14.5.10 L2CC Event Counter 1 Value Register

**Name:** L2CC_EVR1
**Offset:** 0x20C
**Reset:** 0x00000000
**Property:** Read/Write

Counter 1 must be disabled in the L2CC Event Counter 1 Configuration Register prior to any write access to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – VALUE[31:0]** Event Counter Value
Value returns the number of instance of the selected event.

If a counter reaches its maximum value, it remains saturated at that value until it is reset.

### 14.5.11 L2CC Event Counter 0 Value Register

**Name:** L2CC_EVR0
**Offset:** 0x210
**Reset:** 0x00000000
**Property:** Read/Write

Counter 0 must be disabled in the L2CC Event Counter 0 Configuration Register prior to any write access to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VALUE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – VALUE[31:0]** Event Counter Value
Value returns the number of instance of the selected event.

If a counter reaches its maximum value, it remains saturated at that value until it is reset.

### 14.5.12 L2CC Interrupt Mask Register

**Name:** L2CC_IMR
**Offset:** 0x214
**Reset:** 0x00000000
**Property:** Programmable in Auxiliary Control register.

The following configuration values are valid for all listed bit names of this register:

0: Masked. This is the default value.

1: Enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 8 – DECERR** DECERR from L3 Memory

**Bit 7 – SLVERR** SLVERR from L3 Memory

**Bit 6 – ERRRD** Error on L2 Data RAM, Read

**Bit 5 – ERRRT** Error on L2 Tag RAM, Read

**Bit 4 – ERRWD** Error on L2 Data RAM, Write

**Bit 3 – ERRWT** Error on L2 Tag RAM, Write

**Bit 2 – PARRD** Parity Error on L2 Data RAM, Read

**Bit 1 – PARRT** Parity Error on L2 Tag RAM, Read

**Bit 0 – ECNTR** Event Counter 1/0 Overflow Increment

### 14.5.13 L2CC Masked Interrupt Status Register

**Name:** L2CC_MISR
**Offset:** 0x218
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No interrupt has been generated or the interrupt is masked.

1: The input lines have triggered an interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

**Bit 2 – PARRD** Parity Error on L2 Data RAM, Read

**Bit 1 – PARRT** Parity Error on L2 Tag RAM, Read

**Bit 0 – ECNTR** Event Counter 1/0 Overflow Increment

### 14.5.15 L2CC Interrupt Clear Register

**Name:** L2CC_ICR
**Offset:** 0x220
**Reset:** 0x00000000
**Property:** Programmable in Auxiliary Control register.

The following configuration values are valid for all listed bit names of this register:

0: No effect. Read returns zero.

1: Clears the corresponding bit in the Raw Interrupt Status Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | SPNIDEN | DWB | DCL |
| Access | | | | | | | | |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – SPNIDEN** SPNIDEN Value
Reads value of the SPNIDEN input.

**Bit 1 – DWB** Disable Write-back, Force Write-through

| Value | Description |
|---|---|
| 0 | Enables write-back behavior. This is the default value. |
| 1 | Forces write-through behavior. |

**Bit 0 – DCL** Disable Cache Linefill

| Value | Description |
|---|---|
| 0 | Enables cache linefills. This is the default value. |
| 1 | Disables cache linefills. |

### 14.5.28 L2CC Prefetch Control Register

**Name:** L2CC_PCR
**Offset:** 0xF60
**Reset:** 0x00000000
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | DLEN | INSPEN | DATPEN | DLFWRDIS | | | PDEN |
| Access | | | | | | | | |
| Reset | | 0 | 0 | 0 | 0 | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IDLEN | | NSIDEN | | | | | |
| Access | | | | | | | | |
| Reset | 0 | | 0 | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | OFFSET[4:0] | | | | |
| Access | | | | | | | | |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

**Bit 30 – DLEN** Double Linefill Enable
See 14.4.1 Double Linefill Issuing for details on double linefill functionality.

| Value | Description |
|---|---|
| 0 | The L2CC always issues 4x64-bit read bursts to L3 on reads that miss in the L2 cache. This is the default value. |
| 1 | The L2CC issues 8x64-bit read bursts to L3 on reads that miss in the L2 cache. |

**Bit 29 – INSPEN** Instruction Prefetch Enable

| Value | Description |
|---|---|
| 0 | Instruction prefetching is disabled. This is the default value. |
| 1 | Instruction prefetching is enabled. |

**Bit 28 – DATPEN** Data Prefetch Enable

| Value | Description |
|---|---|
| 0 | Data prefetching is disabled. This is the default value. |
| 1 | Data prefetching is enabled. |

**Bit 27 – DLFWRDIS** Double Linefill on WRAP Read Disable

| Value | Description |
|---|---|
| 0 | Double linefill on WRAP read is enabled. This is the default value. |
| 1 | Double linefill on WRAP read is disabled.<br>Note: This bit can only be used if the DLEN bit is set HIGH. See 14.4.1 Double Linefill Issuing for details on double linefill functionality. |

**Bit 24 – PDEN** Prefetch Drop Enable

| Value | Description |
|---|---|
| 0 | The L2CC does not discard prefetch reads issued to L3. This is the default value. |
| 1 | The L2CC discards prefetch reads issued to L3 when there is a resource conflict with explicit reads. |

**Bit 23 – IDLEN** INCR Double Linefill Enable
This bit can only be used if the DLEN bit is set HIGH. See 14.4.1 Double Linefill Issuing for details on double linefill functionality.

| Value | Description |
|---|---|
| 0 | The L2CC does not issue INCR 8x64-bit read bursts to L3 on reads that miss in the L2 cache. This is the default value. |
| 1 | The L2CC can issue INCR 8x64-bit read bursts to L3 on reads that miss in the L2 cache. |

**Bit 21 – NSIDEN** Not Same ID on Exclusive Sequence Enable

| Value | Description |
|---|---|
| 0 | Read and write portions of a non-cacheable exclusive sequence have the same AXI ID when issued to L3. This is the default value. |
| 1 | Read and write portions of a non-cacheable exclusive sequence do not have the same AXI ID when issued to L3. |

**Bits 4:0 – OFFSET[4:0]** Prefetch Offset
Only use the Prefetch offset values of 0 to 7, 15, 23, and 31 for these bits. The L2CC does not support the other values.

### 14.5.29 L2CC Power Control Register

**Name:** L2CC_POWCR
**Offset:** 0xF80
**Reset:** 0x00000000
**Property:** Read/Write in Secure mode, Read-only in Non-secure mode

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | DCKGATEN | STBYEN |
| Access | | | | | | | | |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – DCKGATEN** Dynamic Clock Gating Enable

| Value | Description |
|---|---|
| 0 | Disabled. This is the default value. |
| 1 | Enabled. |

**Bit 0 – STBYEN** Standby Mode Enable

| Value | Description |
|---|---|
| 0 | Disabled. This is the default value. |
| 1 | Enabled. |

# 15. Debug and Test Features

## 15.1 Description

The device features a number of complementary debug and test capabilities.

A common JTAG/ICE (In-Circuit Emulator) port is used for standard debugging functions, such as downloading code and single-stepping through programs.

A 2-pin debug port Serial Wire Debug (SWD) replaces the 5-pin JTAG port and provides an easy and risk-free alternative to JTAG as the two signals, SWDIO and SWCLK, are overlaid on the TMS and TCK pins, allowing for bi-modal devices that provide the other JTAG signals. These extra JTAG pins can be switched to other uses when in SWD mode.

A set of dedicated debug and test input/output pins gives direct access to these capabilities from a PC-based test environment.

## 15.2 Embedded Characteristics

- Cortex-A5 In-circuit Emulator
  - Two real-time watchpoint units
  - Two independent registers: Debug Control Register and Debug Status Register
  - Test access port accessible through JTAG protocol
  - Debug communications channel
  - Serial wire debug
  - Trace
- Chip ID Register
- IEEE1149.1 JTAG Boundary-scan on All Digital Pins
- ETM, ETB: 8-Kbyte Embedded Trace Buffer

## 15.3 Debug and Test Block Diagrams

**Figure 15-1. Debug and Test General Block Diagram**

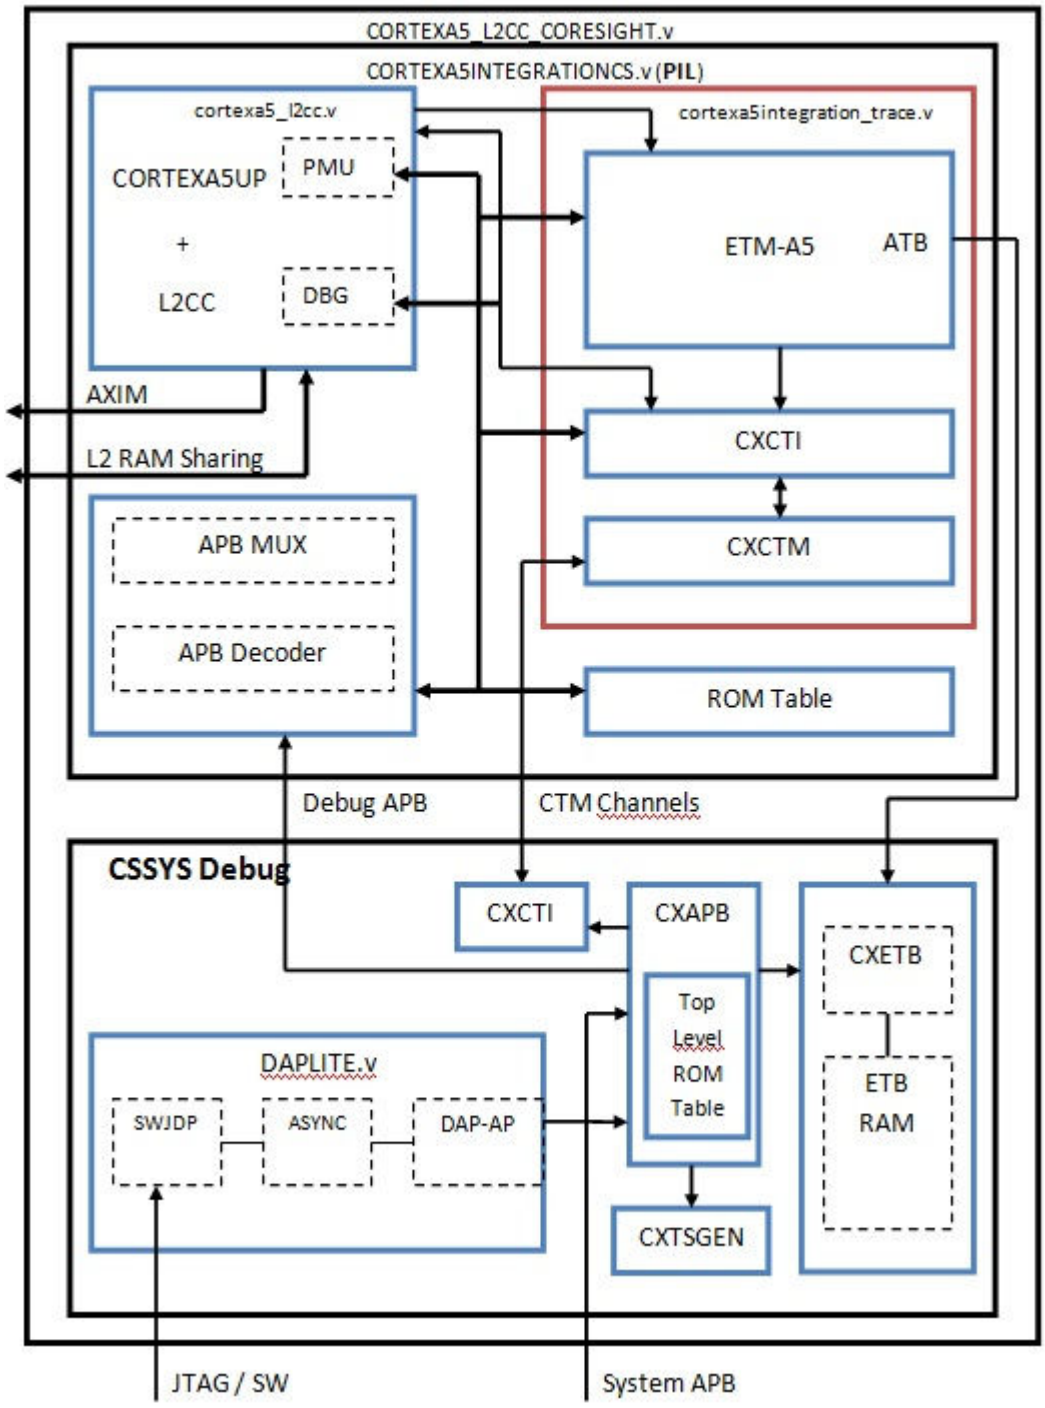

**Figure 15-2. Debug and Test Interface Block Diagram**

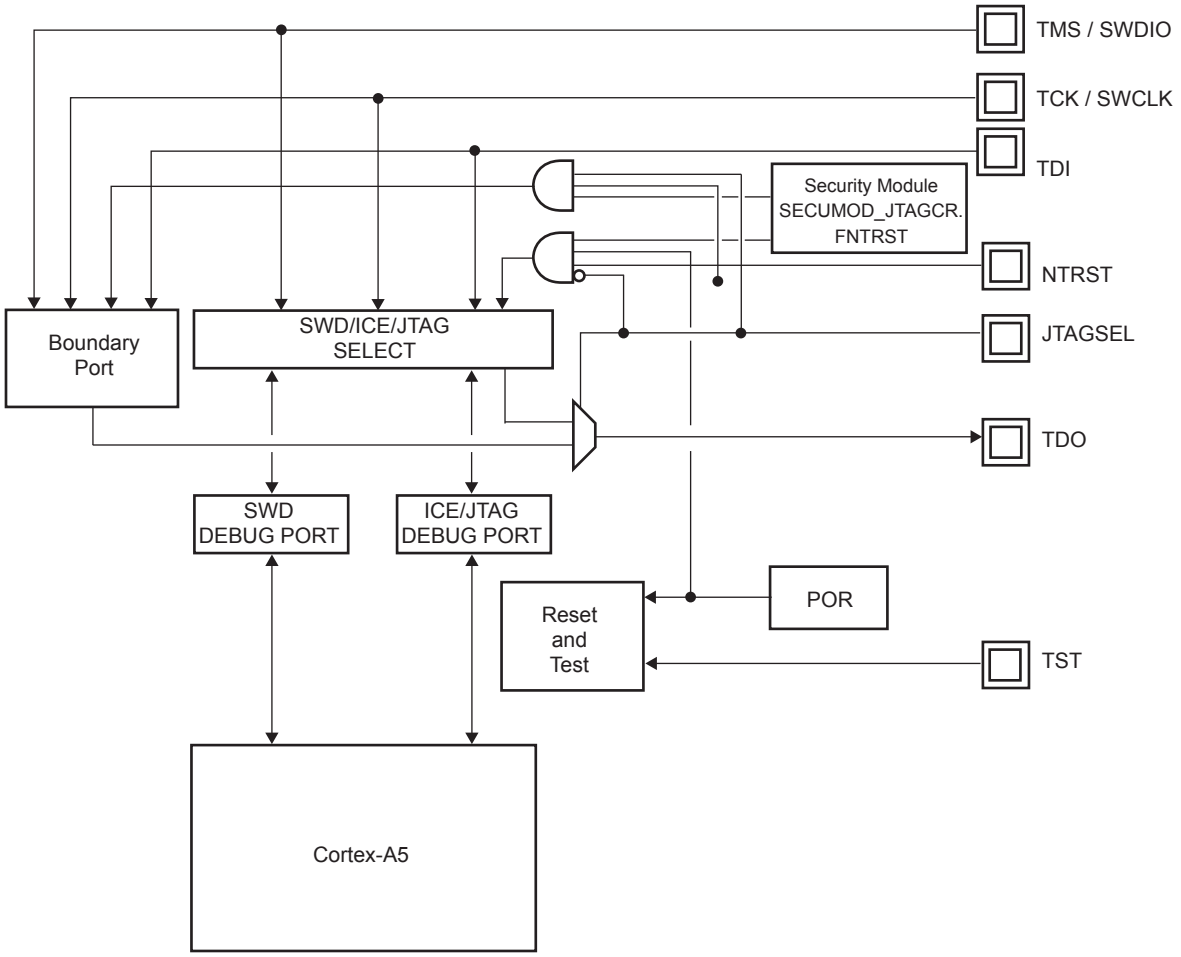
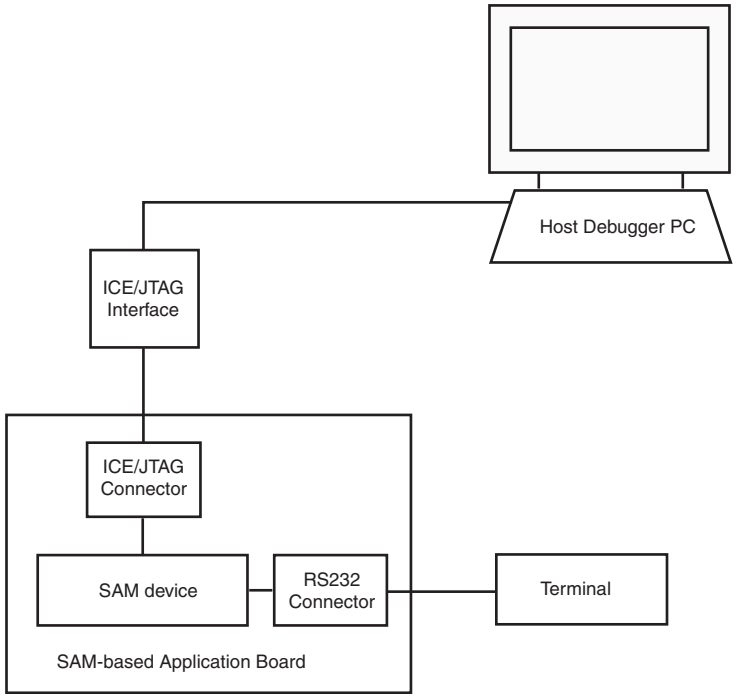


## 15.4 Application Examples

### 15.4.1 Debug Environment

The figure below shows a complete debug environment example. The ICE/JTAG interface is used for standard debugging functions, such as downloading code and single-stepping through the program. A software debugger running on a personal computer provides the user interface for configuring a Trace Port interface utilizing the ICE/JTAG interface.

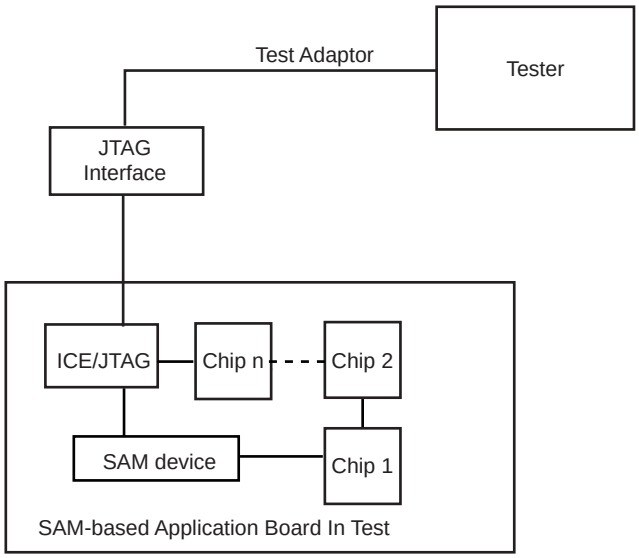
**Figure 15-3. Application Debug and Trace Environment Example**



### 15.4.2 Test Environment

The figure below shows a test environment example. Test vectors are sent and interpreted by the tester. In this example, the “board in test” is designed using a number of JTAG-compliant devices. These devices can be connected to form a single scan chain.

**Figure 15-4. Application Test Environment Example**



## 15.5 Debug and Test Pin Description

**Table 15-1. Debug and Test Pin List**

| Pin Name | Function | Type | Active Level |
|---|---|---|---|
| **Reset/Test** | | | |
| NRST | Microprocessor Reset | Input | Low |
| TST | Test Mode Select | Input | – |
| NTRST | Test Reset Signal | Input | – |
| **ICE and JTAG** | | | |
| TCK/SWCLK | Test Clock/Serial Wire Clock | Input | – |
| TDI | Test Data In | Input | – |
| TDO | Test Data Out | Output | – |
| TMS/SWDIO | Test Mode Select/Serial Wire Input/Output | I/O | – |
| JTAGSEL | JTAG Selection | Input | – |

## 15.6 Functional Description

### 15.6.1 Test Pin

One dedicated pin, TST, is used to define the device operating mode. The user must make sure that this pin is tied at low level to ensure normal operating conditions. Other values associated with this pin are reserved for manufacturing test.

### 15.6.2 EmbeddedICE

The Cortex-A5 EmbeddedICE-RT is supported via the ICE/JTAG port. It is connected to a host computer via an ICE interface. The internal state of the Cortex-A5 is examined through an ICE/JTAG port which allows instructions to be serially inserted into the pipeline of the core without using the external data bus. Therefore, when in debug state, a store-multiple (STM) can be inserted into the instruction pipeline. This exports the contents of the Cortex-A5 registers. This data can be serially shifted out without affecting the rest of the system.

There are two scan chains inside the Cortex-A5 processor which support testing, debugging, and programming of the EmbeddedICE-RT. The scan chains are controlled by the ICE/JTAG port.

EmbeddedICE mode is selected when JTAGSEL is low. It is not possible to switch directly between ICE and JTAG operations. A chip reset must be performed after JTAGSEL is changed.

For further details on the EmbeddedICE-RT, see the Arm document *ARM IHI 0031A_ARM_debug_interface_v5.pdf*

### 15.6.3 JTAG Signal Description

TMS is the Test Mode Select input which controls the transitions of the test interface state machine.

TDI is the Test Data Input line which supplies the data to the JTAG registers (Boundary Scan Register, Instruction Register, or other data registers).

TDO is the Test Data Output line which is used to serially output the data from the JTAG registers to the equipment controlling the test. It carries the sampled values from the boundary scan chain (or other JTAG registers) and propagates them to the next chip in the serial test circuit.

NTRST (optional in IEEE Standard 1149.1) is a Test-ReSeT input which is mandatory in ARM cores and used to reset the debug logic. On Cortex-A5-based cores, NTRST is a Power On Reset output. It is asserted on power on. If necessary, the user can also reset the debug logic with the NTRST pin assertion during 2.5 MCK periods.

TCK is the Test ClocK input which enables the test interface. TCK is pulsed by the equipment controlling the test and not by the tested device. It can be pulsed at any frequency.

### 15.6.4 IEEE 1149.1 JTAG Boundary Scan

IEEE 1149.1 JTAG Boundary Scan allows pin-level access independent of the device packaging technology.

IEEE 1149.1 JTAG Boundary Scan is enabled when JTAGSEL is high. The SAMPLE, EXTEST and BYPASS functions are implemented. In ICE debug mode, the Arm processor responds with a non-JTAG chip ID that identifies the processor to the ICE system. This is not IEEE 1149.1 JTAG-compliant.

It is not possible to switch directly between JTAG and ICE operations. A chip reset must be performed after JTAGSEL is changed.

A Boundary-scan Descriptor Language (BSDL) file is provided for test setup.

## 15.7 Boundary JTAG ID Register

**Name:** Boundary JTAG ID Register
**Property:** Read-only

JTAG ID Code value is 0x05B3F03F.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VERSION[3:0] | | | | PART NUMBER[15:12] | | | |

**Bits 31:28 – VERSION[3:0]** Product Version Number
Set to 0x0.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number
Product part number is 0x5B3F.

**Bits 11:1 – MANUFACTURER IDENTITY[10:0]**
Set to 0x01F.

**Bit 0 – 1**
Required by IEEE Std. 1149.1. Set to 1.

## 15.8 Cortex-A5 DP Identification Code Register IDCODE

The Identification Code Register is always present on all DP implementations. It provides identification information about the Arm Debug Interface.

### 15.8.1 JTAG Debug Port (JTAG-DP)

**Name:** JTAG Debug Port (JTAG-DP)
**Property:** Read-only

Debug Port JTAG IDCODE value is 0x5BA00477.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VERSION[3:0] | | | | PART NUMBER[15:12] | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

**Bits 31:28 – VERSION[3:0]** Product Version Number
Set to 0x5.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number
Product part number is 0xBA00.

**Bits 11:1 – DESIGNER[10:0]**
Set to 0x23B.

**Bit 0 – 1**
Required by IEEE Std. 1149.1. Set to 1.

### 15.8.2 Serial Wire Debug Port (SW-DP)

**Name:** Serial Wire Debug Port (SW-DP)
**Property:** Read-only

Debug Port Serial Wire IDCODE is 0x5ba02477.

At address 0x0 on read operations when the APnDP bit = 0. Access to the Identification Code Register is not affected by the value of the CTRLSEL bit in the Select Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 31:28 – VERSION[3:0]** Product Version Number
Set to 0x0.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number
Product part number is 0xBA01.

**Bits 11:1 – DESIGNER[10:0]**
Set to 0x23B.

**Bit 0 – 1**
Required by IEEE Std. 1149.1. Set to 1.

# 16. Standard Boot Strategies

## 16.1 Description

The system always boots from the ROM memory at address 0x0.

The ROM code is a boot program contained in the embedded ROM. It is also called “First level boot loader”.

This microcontroller can be configured to run a Standard Boot mode or a Secure Boot mode. More information on how the Secure Boot mode can be enabled, and how the chip operates in this mode, is provided in the document *SAMA5D2x Secure Boot Strategy*, document no. 44040. To obtain this application note and additional information about the secure boot and related tools, contact a Microchip sales representative.

By default, the chip starts in Standard Boot mode.

## 16.2 Chip Access Using JTAG Connection

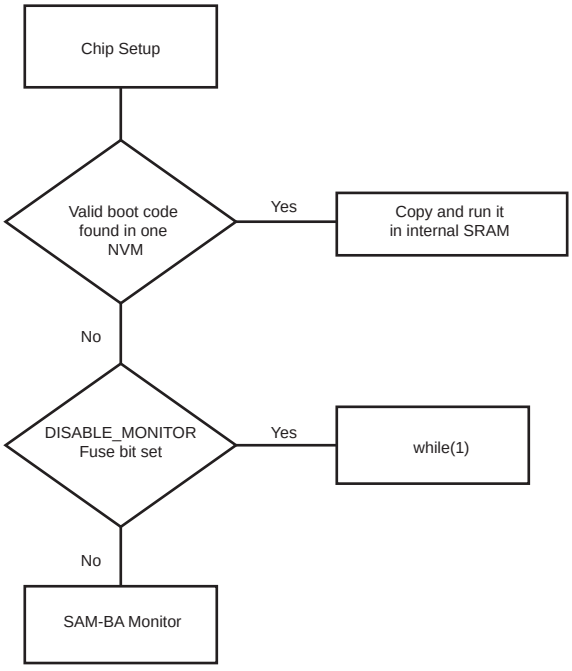
The JTAG connection is disabled at reset, and during the ROM Code execution.

It is re-enabled when the ROM code jumps in the boot file copied from an external Flash memory into the internal SRAM, or when the ROM code launches the SAM-BA monitor, when no boot file has been found in any external Flash memory.

## 16.3 Flow Diagram

The ROM code global flow is shown in the figure below.

**Figure 16-1. ROM Code Flow Diagram**



## 16.4 Chip Setup

When the chip is powered on, the processor clock (PCK) and the master clock (MCK) source is the 12 MHz fast RC oscillator.

The ROM code performs a low-level initialization that follows the steps described below:

1. Stack Setup for Arm supervisor mode.
2. PLLA Initialization
3. Master Clock Selection: when the PLLA is stabilized, the Master Clock source is switched from internal 12 MHz RC to PLLA. The PMC Status Register is polled to wait for MCK Ready. PCK and MCK are now the Main Clock.
4. C Variable Initialization: non zero-initialized data is initialized in the RAM (copy from ROM to RAM). Zero-initialized data is set to 0 in the RAM.

For clock frequencies, see the table Clock Frequencies during External Memory Boot Sequence.

**Note:** No external crystal or clock is needed during the external boot memories sequence. An external clock source is checked before the launch of the SAM-BA monitor to get a more accurate clock signal for USB.

## 16.5 Boot Configuration

The boot sequence is controlled using a Boot Configuration Word in the Fuse area or in the backup registers BUREG.

### 16.5.1 Boot Configuration Word

The Boot Configuration Word allows several customizations of the Boot Sequence:

- To configure the IO Set where the external memories used to boot are connected (see Hardware and Software Constraints for a description of the IO sets)
- To disable the boot on selected memories
- To configure the UART port used as a terminal console
- To configure the JTAG pins used for debug

See the section Boot Configuration Word for a detailed description of all the bitfields in this word.

By default, the value of this word is 0x0.

For MRL A and B parts, the ROM code does not try to detect a valid bootable software in any external memory, and runs directly the SAM-BA monitor. See the figure NVM Bootloader Program Description for MRL A and MRL B Parts.

For MRL C parts, the ROM code only tries to boot on SDMMC1 and SDMMC0 memory interfaces and then run the SAM-BA monitor. See the figure NVM Bootloader Program Description for MRL C Parts.

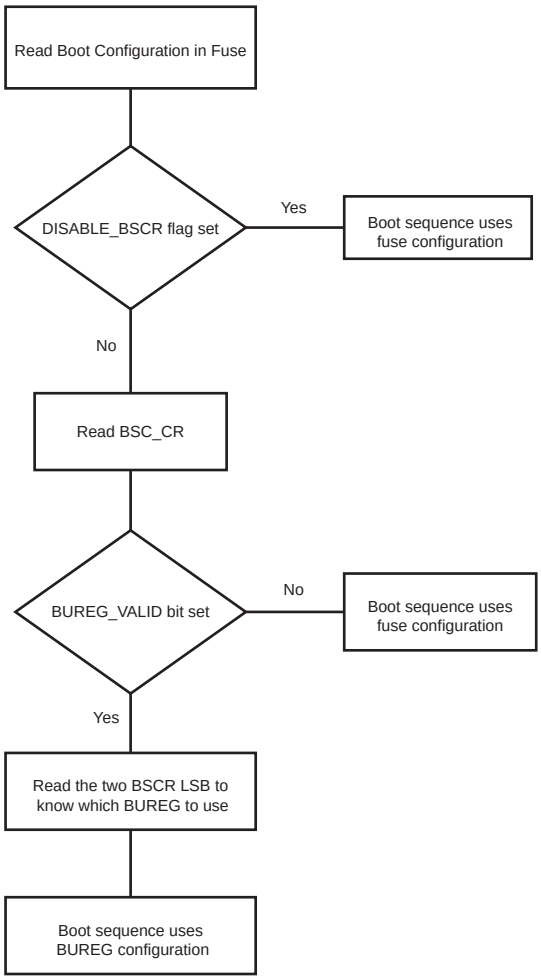
During prototyping phases, the value of this fuse word can be overridden by the content of a backup register. The conditions to enable this feature are as follows:

- The fuse bit DISABLE_BSCR must not be set (default value).
- The Boot Sequence Controller Configuration register (BSC_CR) must have the BUREG_VALID bit set and indicate in BUREG_INDEX which register has to be used.

Using BUREG allows the user to test several boot configuration options, including Secure Boot Mode, without burning fuses.

**Note:** VDDBU must be connected in order to benefit from this feature. However, in production, it is highly recommended to disable this feature and to write the boot configuration in fuses.

**Figure 16-2. Boot Configuration Loading**



### 16.5.2 Boot Sequence Controller Configuration Register

**Name:** BSC_CR
**Offset:** 0xF8048054
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | BUREG_VALID | BUREG_INDEX[1:0] | |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | | | |

**Bits 31:16 – WPKEY[15:0]** Write Protect Key (Write-only)

| Value | Name | Description |
|---|---|---|
| 0x6683 | PASSWD | Writing any other value in this field aborts the write operation of the BOOT field. Always reads as 0. |

**Bit 2 – BUREG_VALID** Validate the data in BUREG_INDEX field

| Value | Description |
|---|---|
| 0 | No BUREG contains valid Boot Configuration data. |
| 1 | The BUREG indicated in BUREG_INDEX contains Boot Configuration data for use in configuring the boot sequence. |

**Bits 1:0 – BUREG_INDEX[1:0]** Select the BUREG where the Boot Configuration data must be read

| Value | Name | Description |
|---|---|---|
| 0 | BUREG_0 | Use BUREG 0 value |
| 1 | BUREG_1 | Use BUREG 1 value |
| 2 | BUREG_2 | Use BUREG 2 value |
| 3 | BUREG_3 | Use BUREG 3 value |

### 16.5.3 Backup Registers (BUREG)

The four BUREGs used to override the Boot Configuration Word in Fuse are at addresses:

- 0xF8045400
- 0xF8045404
- 0xF8045408
- 0xF804540C

### 16.5.4 Boot Configuration Word

**Name:** Boot Configuration Word
**Reset:** 0x00000000

The Boot Configuration Word comprises the 32 boot configuration bits (see the table Customer Fuse Matrix).

**WARNING** To avoid any malfunctioning, the user must not write the “DO NOT USE (DNU)” fuse bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | SECURE_ MODE | DNU | DNU | DNU | DNU | DISABLE_MONITOR |
| Access | | | | | | | | |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DNU | DISABLE_BSCR | QSPI_XIP_MODE | DNU | DNU | EXT_MEM_BOOT_ENABLE | JTAG_IO_SET[1:0] | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | UART_CONSOLE[3:0] | | | | SDMMC_1 | SDMMC_0 | NFC[1:0] | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPI_1[1:0] | | SPI_0[1:0] | | QSPI_1[1:0] | | QSPI_0[1:0] | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 29 – SECURE_ MODE** Enable Secure Boot Mode

| Value | Description |
|---|---|
| 0 | Standard boot sequence |
| 1 | Secure boot sequence |

**Bits 25, 26, 27, 28 – DNU** DO NOT USE

**Bit 24 – DISABLE_MONITOR** Disable SAM-BA Monitor

| Value | Description |
|---|---|
| 0 | If no boot file found, launch SAM-BA Monitor. |
| 1 | SAM-BA Monitor never launched. |

**Bit 23 – DNU** DO NOT USE

**Bit 22 – DISABLE_BSCR** Disable Read of BSC_CR

| Value | Description |
|---|---|
| 0 | If the BUREG index in the BSC_CR is valid, its data replace Fuse configuration bits. |
| 1 | Does not read BSC_CR content, so the Boot settings are those from the Fuse. |

**Bit 21 – QSPI_XIP_MODE** Enable XIP Mode on QSPI Flash

| Value | Description |
|---|---|
| 0 | QSPI is accessed in QSPI mode and data copied into internal SRAM. |
| 1 | QSPI is accessed in XIP mode, and the bootstrap directly executed from it. |

**Bits 19, 20 – DNU** DO NOT USE

**Bit 18 – EXT_MEM_BOOT_ENABLE** Enable Boot on External Memories

| Value | Description |
|---|---|
| 0 | No external memory boot performed. |
| 1 | External memory boot enabled. |

**Bits 17:16 – JTAG_IO_SET[1:0]** Pin Selection for JTAG Access
Refer to "JTAG_TCK on IOSET 4 pin has a wrong configuration after boot" in the document *SAMA5D2 Family Silicon Errata and Data Sheet Clarification*, available on www.microchip.com.

| Value | Name | Description |
|---|---|---|
| 0 | JTAG_IOSET_1 | Use JTAG IO Set 1 |
| 1 | JTAG_IOSET_2 | Use JTAG IO Set 2 |
| 2 | JTAG_IOSET_3 | Use JTAG IO Set 3 |
| 3 | JTAG_IOSET_4 | Use JTAG IO Set 4 |

**Bits 15:12 – UART_CONSOLE[3:0]** Selects the pins and UART interface used as a console terminal

| Value | Name | Description |

| 3 | DISABLED | QSPI_0 boot is disabled |

### 16.5.5 NVM Boot Sequence

The ROM code performs the initialization and valid code detection for the external memories as described below only if those memories are not disabled in the Boot Configuration word.

**Figure 16-3. NVM Bootloader Program Description for MRL A and MRL B Parts**

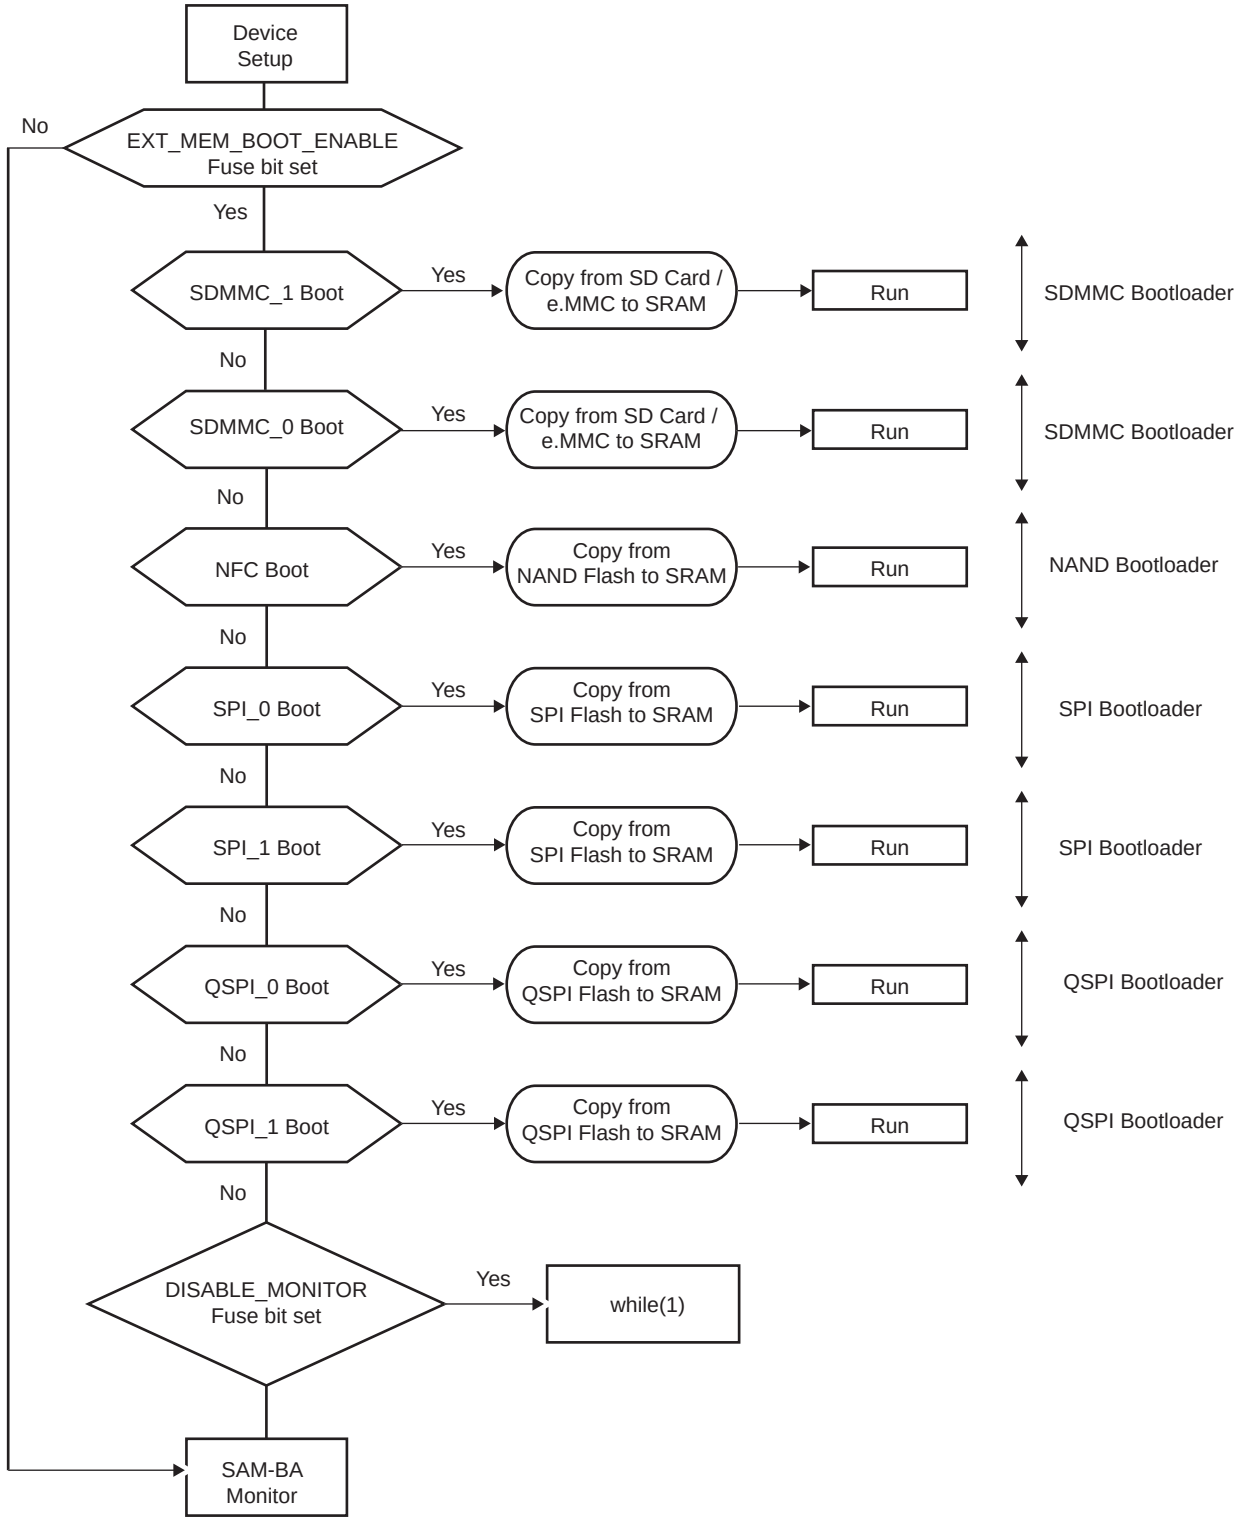

**Figure 16-4. NVM Bootloader Program Description for MRL C Parts**

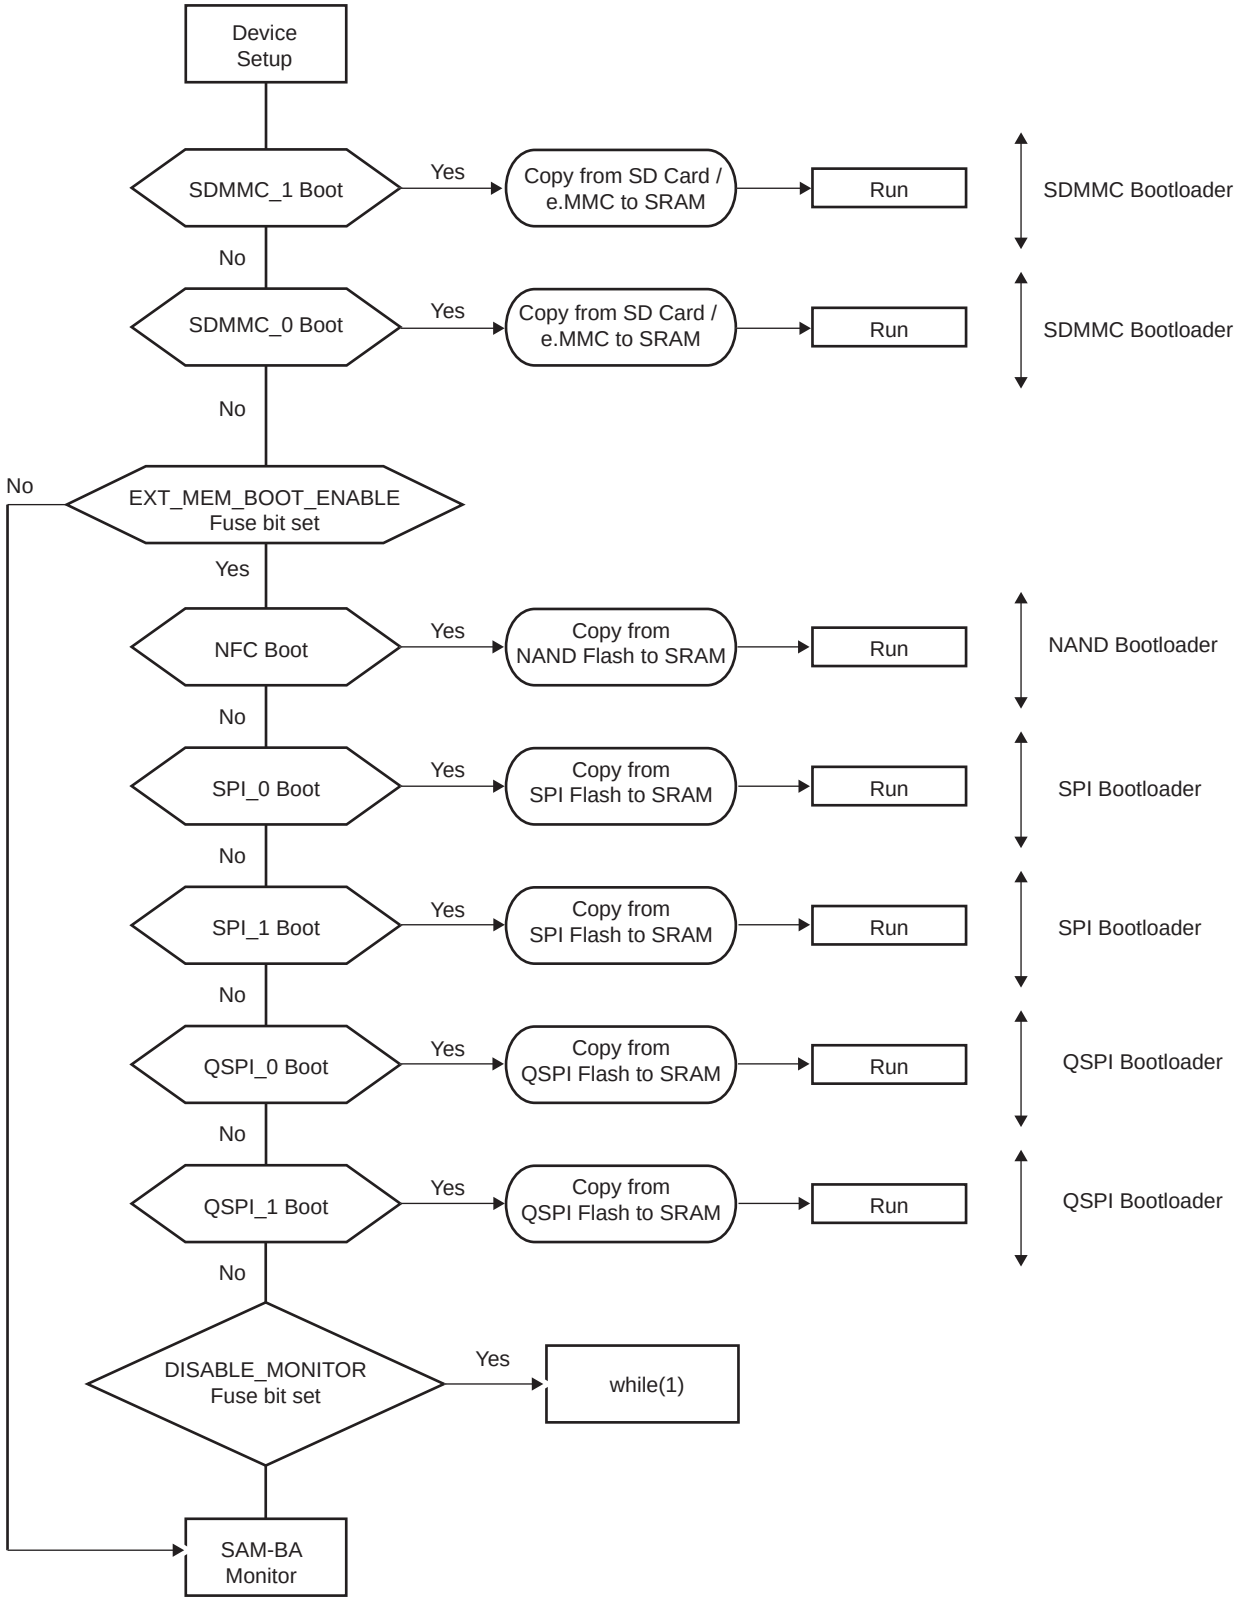

**Figure 16-5. NVM Boot Diagram**

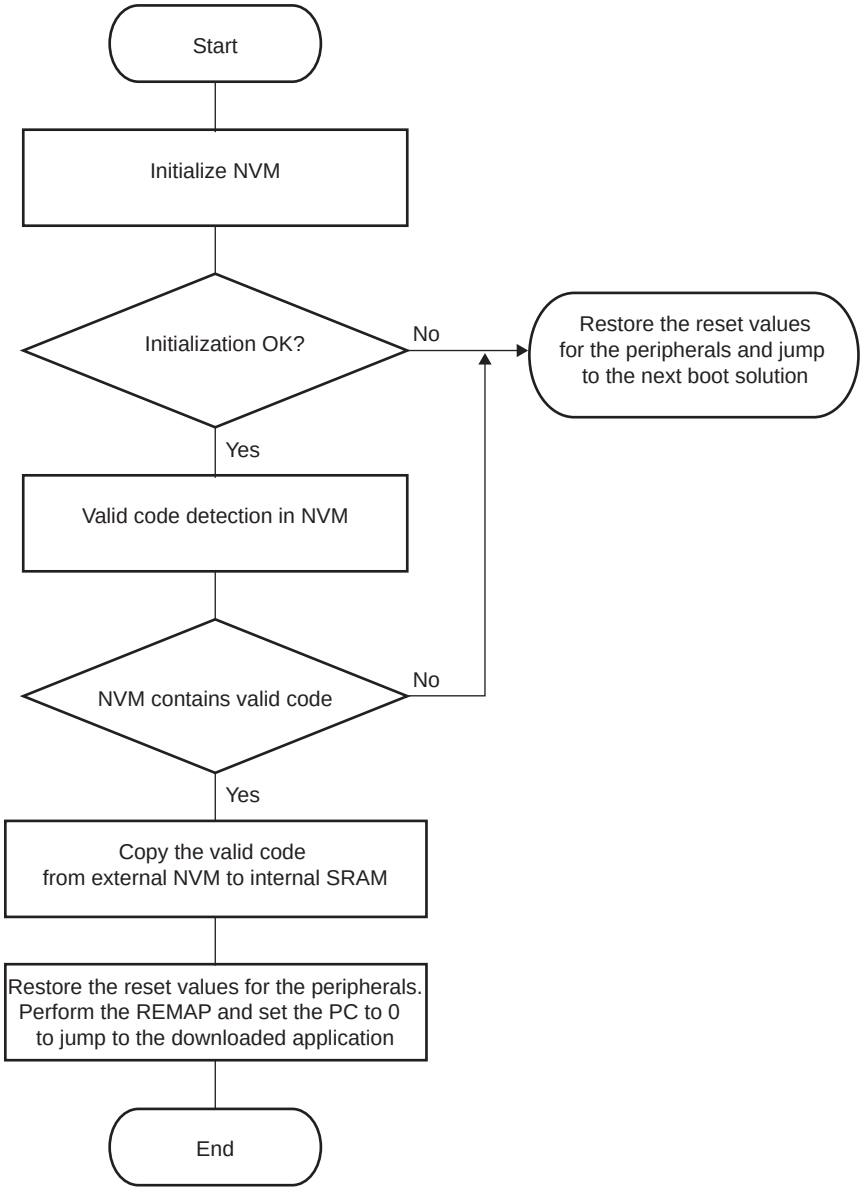


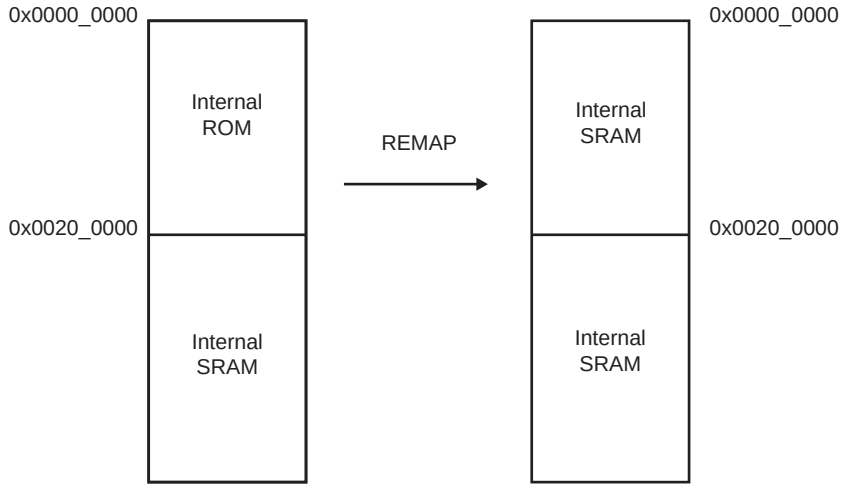
The NVM bootloader program first initializes the PIOs related to the NVM device. Then it configures the right peripheral depending on the NVM and tries to access this memory. If the initialization fails, it restores the reset values for the PIO and the peripheral, and then tries to fulfill the same operations on the next NVM of the sequence.

If the initialization is successful, the NVM bootloader program reads the beginning of the NVM and determines if the NVM contains a valid code.

If the NVM does not contain a valid code, the NVM bootloader program restores the reset value for the peripherals and then tries to fulfill the same operations on the next NVM of the sequence.

If a valid code is found, this code is loaded from the NVM into the internal SRAM and executed by branching at address 0x0000_0000 after remap. This code may be the application code or a second-level bootloader. All the calls to functions are PC-relative and do not use absolute addresses.

**Figure 16-6. Remap Action after Download Completion**



### 16.5.6 Valid Code Detection

There are two kinds of valid code detection, which are described in the following sections.

#### 16.5.6.1 Arm Exception Vectors Check

The NVM bootloader program reads and analyzes the first 28 bytes corresponding to the first seven Arm exception vectors. Except for the sixth vector, these bytes must implement the Arm instructions for either branch or load PC with PC-relative addressing.

**Figure 16-7. LDR Opcode**

| 31 28 | 27 24 | 23 20 | 19 16 | 15 12 | 11 0 |
|---|---|---|---|---|---|
| 1 1 1 0 | 0 1 I P | U 1 W 0 | Rn | Rd | Offset |

**Figure 16-8. B Opcode**

| 31 28 | 27 24 | 23 0 |
|---|---|---|
| 1 1 1 0 | 1 0 1 0 | Offset (24 bits) |

Unconditional instruction: 0xE for bits 31 to 28. Load PC with the PC-relative addressing instruction:

- Rn = Rd = PC = 0xF
- I==0 (12-bit immediate value)
- P==1 (pre-indexed)
- U offset added (U==1) or subtracted (U==0)
- W==1

The sixth vector, at the offset 0x14, contains the size of the image to download. The user must replace this vector with the user's own vector. This procedure is described below.

**Figure 16-9. Arm Vector 6 Structure**

| 31 0 |
|---|
| Size of the code to download in bytes |

The value has to be smaller than 64 Kbytes.

An example of valid vectors:

```
00          ea000006                B 0x20
04          eafffffe                B 0x04
```

```
08          ea00002f                B _main
0c          eafffffe                B 0x0c
10          eafffffe                B 0x10
14          00001234                B 0x14 ← Code size = 4660 bytes
18          eafffffe                B 0x18
```

#### 16.5.6.2 boot.bin File Check

This method is the one used on FAT-formatted SD Card and e.MMC. The boot program must be a file named `boot.bin` written in the root directory of the file system. Its size must not exceed the maximum size allowed of 64 Kbytes (0x10000).

### 16.5.7 Detailed Memory Boot Procedures

#### 16.5.7.1 NAND Flash Boot: NAND Flash Detection

After the NAND Flash interface configuration, a reset command is sent to the memory.

Hardware ECC detection and correction are provided by the PMECC peripheral. See the section PMECC Controller Functional Description for more details.

The Boot Program is able to retrieve NAND Flash parameters and ECC requirements using two methods as follows:

- The detection of a specific header written at the beginning of the first page of the NAND Flash

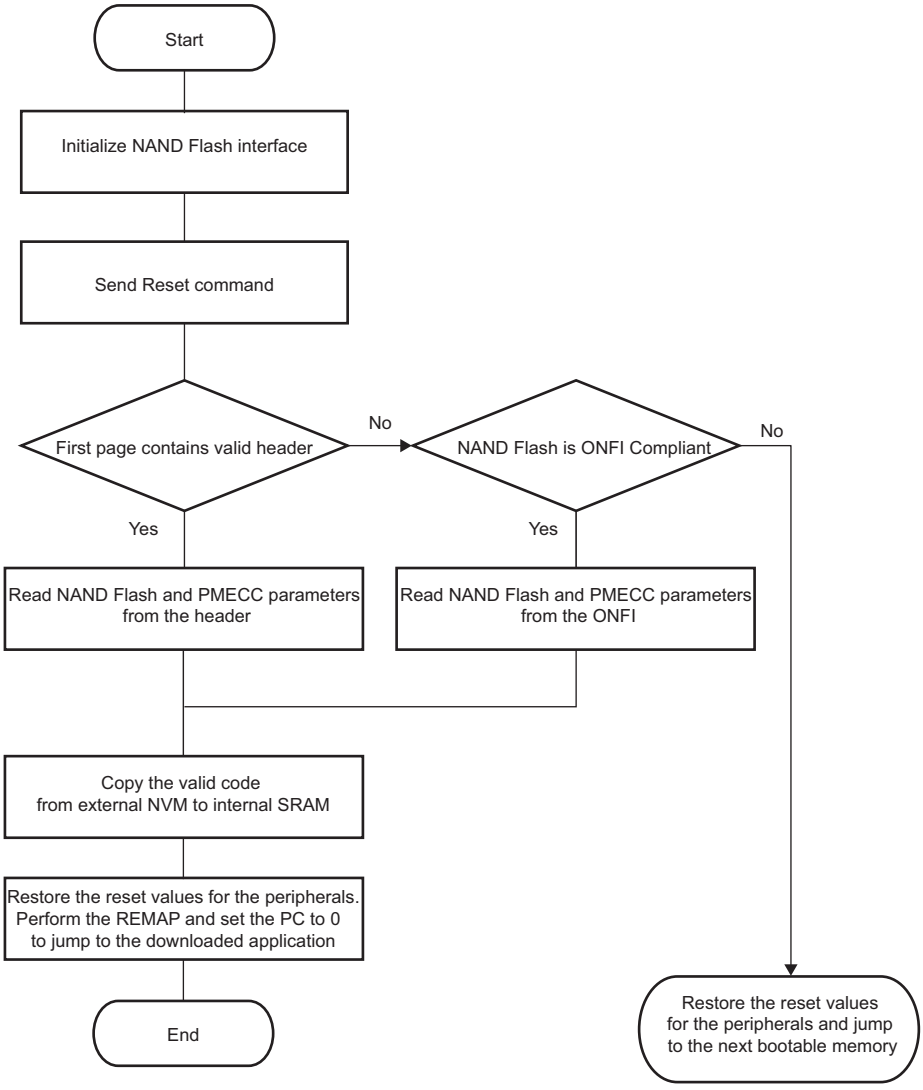
or

- Through the ONFI parameters for the ONFI-compliant memories

However, it is highly recommended to use the NAND Flash Header method (first bullet above) since it indicates exactly how the PMECC has been configured to write the bootable program in the NAND Flash, and not to rely only on the NAND Flash capabilities.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

**Figure 16-10. Boot NAND Flash Download**



#### 16.5.7.1.1 NAND Flash Specific Header Detection (Recommended Solution)

This is the first method used to determine NAND Flash parameters. After Initialization and Reset command, the Boot Program reads the first page without an ECC check, to determine whether the NAND parameter header is present. The header is made of 52 times the same 32-bit word (for redundancy reasons) which must contain NAND and PMECC parameters used to correctly perform the read of the rest of the data in the NAND. This 32-bit word is described below.

If the header is valid, the Boot Program continues with the detection of a valid code.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

***[NAND Flash PMECC Register]***

**Name:** NAND Flash PMECC Register

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | key[3:0] | | | | | eccOffset[8:6] | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | eccOffset[5:0] | | | | | | sectorSize[1:0] | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | eccBitReq[2:0] | | | spareSize[8:4] | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | spareSize[3:0] | | | | nbSectorPerPage[2:0] | | | usePMECC |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bits 31:28 – key[3:0]** Value 0xC Must be Written here to Validate the Content of the Whole Word.

**Bits 26:18 – eccOffset[8:0]** Offset of the First ECC Byte in the Spare Zone
A value below 2 is not allowed and is considered as 2.

**Bits 17:16 – sectorSize[1:0]** Size of the ECC Sector

| Value | Description |
|---|---|
| 0 | For 512 bytes |
| 1 | For 1024 bytes per sector |
| Other values | For future use |

**Bits 15:13 – eccBitReq[2:0]** Number of ECC Bits Required

| Value | Description |
|---|---|
| 0 | 2-bit ECC |
| 1 | 4-bit ECC |
| 2 | 8-bit ECC |
| 3 | 12-bit ECC |
| 4 | 24-bit ECC |
| 5 | 32-bit ECC |

**Bits 12:4 – spareSize[8:0]** Size of the Spare Zone in Bytes

**Bits 3:1 – nbSectorPerPage[2:0]** Number of Sectors per Page

**Bit 0 – usePMECC** Use PMECC

| Value | Description |
|---|---|
| 0 | Do not use PMECC to detect and correct the data. |
| 1 | Use PMECC to detect and correct the data. |

***ONFI 2.2 Parameters (Not Recommended)***

In case no valid header is found, the Boot Program checks if the NAND Flash is ONFI-compliant, sending a Read Id command (0x90) with 0x20 as parameter for the address. If the NAND Flash is ONFI-compliant, the Boot Program retrieves the following parameters with the help of the Get Parameter Page command:

- Number of bytes per page (byte 80)
- Number of bytes in spare zone (byte 84)
- Number of ECC bit corrections required (byte 112)
- ECC sector size: by default, set to 512 bytes; or to 1024 bytes if the ECC bit capability above is 0xFF

By default, the ONFI NAND Flash detection turns ON the usePmecc parameter, and the ECC correction algorithm is automatically activated.

Once the Boot Program retrieves the parameter, using one of the two methods described above, it reads the first page again, with or without ECC, depending on the usePmecc parameter. Then it looks for a valid code programmed just after the header offset 0xD0. If the code is valid, the program is copied at the beginning of the internal SRAM.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

#### 16.5.7.2 NAND Flash Boot: PMECC Error Detection and Correction

NAND Flash boot procedure uses PMECC to detect and correct errors during NAND Flash read operations in two cases:

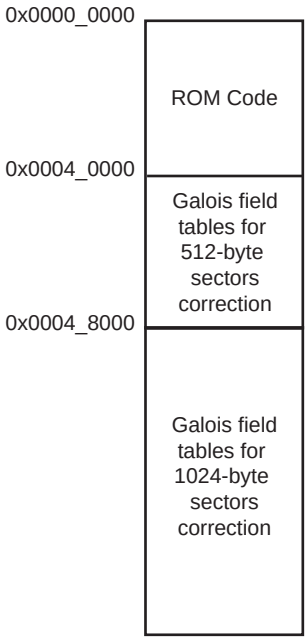
- When the usePmecc flag is set in a specific NAND header.
- If the flag is not set, no ECC correction is performed during the NAND Flash page read. When the NAND Flash has been detected using ONFI parameters.

The ROM memory embeds the Galois field tables. The user does not need to embed them in his own software.

The Galois field tables are mapped in the ROM just after the ROM code, as illustrated in the figure below.

For a full description and an example of how to use the PMECC detection and correction feature, see the software package dedicated to this device on our website.

**Figure 16-11. Galois Field Table Mapping**



#### 16.5.7.3 SDCard/e.MMC Boot

The SDCard/e.MMC boot requires the Card Detect pin to be connected. If the level on the Card Detect pin is low, SDCard/e.MMC access is initiated (IOs toggling). If not, no communication with SDCard/e.MMC is performed (no IOs toggling).

The SDMMC0 and SDMMC1 pin card detect must be left unconnected if the interfaces are used with a non-removable and non-bootable device (wifi module, etc.).

This prevents the ROM code from trying to boot out of these interfaces and avoids a bad behavior of the boot.

In the case of non-removable devices (soldered on board), the card detect can be managed by software (refer to "Force Card Detect" bit) or by hardware by enabling the pull-down resistor on SDMMCx_CD PIO after the ROM Code execution..

**Supported SDCard Devices**

SDCard Boot supports all SDCard memories compliant with the SD Memory Card Specification V3.0. This includes SDMMC cards.

**e.MMC with Boot Partition**

The ROM code first checks if the e.MMC Boot Partition is enabled. If enabled, the ROM code reads the first 64 Kbytes of the boot partition, and copy them into the internal SRAM.

**FAT Filesystem boot**

If no boot partition is enabled on an e.MMC, the boot process continues with a Standard SDCard/e.MMC detection, and the ROM code looks for a `boot.bin` file in the root directory of a FAT12/16/32 file system.

#### 16.5.7.4 SPI Flash Boot

Two types of SPI Flash are supported

- SPI DataFlash

- SPI Serial Flash

The SPI Flash bootloader tries to boot on SPI0, first looking for SPI Serial Flash, and then for SPI DataFlash.

It uses only one valid code detection: analysis of Arm exception vectors.

The SPI Flash read is done by means of a Continuous Read command from the address 0x0. This command is 0xE8 for DataFlash and 0x0B for Serial Flash devices.

#### 16.5.7.4.1 Supported DataFlash Devices

The SPI Flash Boot program supports the DataFlash devices listed in the table below.

| Device | Density | Page Size (bytes) | Number of Pages |
|---|---|---|---|
| AT45DB011 | 1 Mbit | 264 | 512 |
| AT45DB021 | 2 Mbits | 264 | 1024 |
| AT45DB041 | 4 Mbits | 264 | 2048 |
| AT45DB081 | 8 Mbits | 264 | 4096 |
| AT45DB161 | 16 Mbits | 528 | 4096 |
| AT45DB321 | 32 Mbits | 528 | 8192 |
| AT45DB642 | 64 Mbits | 1056 | 8192 |
| AT45DB641 | 64 Mbits | 264 | 37768 |

#### 16.5.7.4.2 Supported Serial Flash Devices

The SPI Flash Boot program supports all SPI Serial Flash devices responding correctly to both Get Status and Continuous Read commands.

### 16.5.7.5 QSPI NOR Flash Boot for MRL A and MRL B

**Important:** This section applies to the devices listed in the table below.

**Table 16-1. SAMA5D2 MRL A and MRL B Parts**

| Device Name |
|---|
| ATSAMA5D22A |
| ATSAMA5D24A |
| ATSAMA5D27A |
| ATSAMA5D28A |
| ATSAMA5D21B |
| ATSAMA5D22B |
| ATSAMA5D23B |
| ATSAMA5D24B |

| .....continued |
|---|
| **Device Name** |
| ATSAMA5D26B |
| ATSAMA5D27B |
| ATSAMA5D28B |

#### 16.5.7.5.1 Definitions (MRL A, MRL B)

SPI x-y-z protocol:

- Command opcode is sent on x I/O data line(s) with x in {1, 2, 4}
- Address is sent on y I/O data line(s) with y in {1, 2, 4}
- Data are sent or received on z I/O data lin(s) with z in {1, 2, 4}

Relevant combinations are shown in the table below:

| Protocol | Description |
|---|---|
| SPI 1-1-1 | Legacy SPI protocol using MOSI/IO0 and MISO/IO1 lines |
| SPI 1-1-2 | SPI Dual Output using IO0 and IO1 lines |
| SPI 1-2-2 | SPI Dual I/O using IO0 and IO1 lines |
| SPI 2-2-2 | SPI Dual Command using IO0 and IO1 lines |
| SPI 1-1-4 | SPI Quad Output using IO0, IO1, IO2 and IO3 lines |
| SPI 1-4-4 | SPI Quad I/O using IO0, IO1, IO2 and IO3 lines |
| SPI 4-4-4 | Quad Command using IO0, IO1, IO2 and IO3 lines |

#### 16.5.7.5.2 Supported QSPI Memory Manufacturers (MRL A, MRL B)

The ROM code only supports the three following manufacturers (manufacturer ID):

- Cypress (01h)
- Micron (20h)
- Macronix (C2h)

Other manufacturer IDs are ignored and the ROM code jumps to the next non-volatile memory in the Boot Sequence.

#### 16.5.7.5.3 SPI Clock Frequency, Phase and Polarity (MRL A, MRL B)

The peripheral clock of each QSPI controller is gated from the Master Clock (MCK). The ROM code configures MCK and the QSPI Serial Clock (QSCK). See the table "Clock Frequencies during External Memory Boot Sequence".

The QSPI controller is configured to use Clock Mode 0: Both CPHA and CPOL are cleared in QSPI_SCR.

- CPOL = 0: The inactive state value of QSCK is logic level zero.
- CPHA = 0: Data is captured on the leading edge of QSCK and changed on the following edge of QSCK.

#### 16.5.7.5.4 QSPI Memory Detection (MRL A, MRL B)

The ROM code probes the QSPI memory using JEDEC Read ID commands. However the opcode and the SPI protocol to be used to read the JEDEC ID of the QSPI memory depend on its Manufacturer and its current internal state.

**Cypress**

Cypress memories do not support the SPI 4-4-4 protocol. The command opcode is always sent on the single MOSI/IO1 data line. Hence when writing the 9Fh opcode on MOSI during the first 8 cycles, Cypress memories should always reply on MISO with their JEDEC ID during the following cycles.

**Micron**

Micron memories provide three modes of operation:

- Extended SPI: standard SPI protocol upgraded with dual (SPI 1-1-2, SPI 1-2-2) and quad (SPI 1-1-4, SPI 1-4-4) operations
- Dual I/O SPI: all commands use the SPI 2-2-2 protocol
- Quad I/O SPI: all commands use the SPI 4-4-4 protocol

The ROM code supports the Extended and Quad I/O SPI modes but not Dual I/O SPI.

In Extended SPI mode, Micron memories replies to the regular Read JEDEC ID opcode using the protocol SPI 1-1-1: the 9Fh opcode is sent on MOSI using eight clock cycles then the JEDEC ID is read from MISO only.

In Quad I/O SPI mode, Micron memories no longer reply to the regular Read JEDEC ID (9Fh) but answer the new Read JEDEC ID Multiple I/O command instead: The AFh op code is sent on the 4 I/O lines using 2 clock cycles, then only the 3 first bytes (1 byte for the Manufacturer ID followed by 2 bytes for the Device ID) of the JEDEC ID are returned by the memory on the 4 I/O lines.

The AFh opcode is not supported in Extended SPI mode.

**Macronix**

Macronix memories provide two modes of operation:

- SPI: standard SPI protocol upgraded with dual (SPI 1-1-2, SPI 1-2-2) and quad (SPI 1-1-4, SPI 1-4-4) operations
- QPI: all commands use the SPI 4-4-4 protocol

The ROM code supports only the Macronix SPI mode.

In SPI mode, Macronix memories reply to the regular Read JEDEC ID opcode using the protocol SPI 1-1-1: The 9Fh opcode is sent on MOSI using 8 clock cycles then the JEDEC ID is read from MISO only.

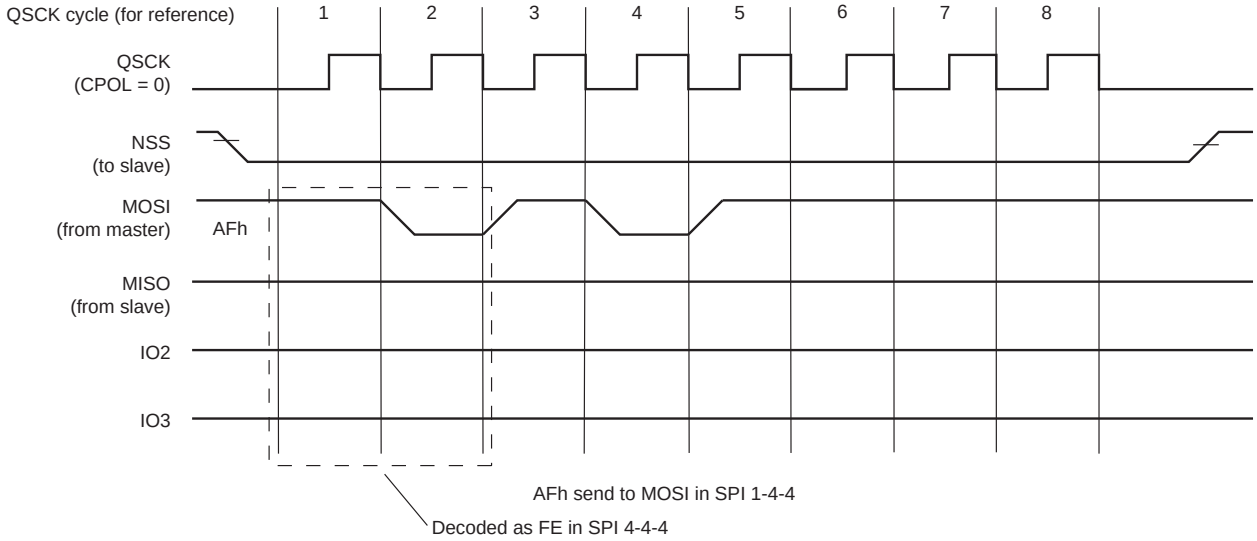
Hence the ROM code uses the following sequence to read the JEDEC ID:

| Step | SPI Protocol | Opcode | Support by Manufacturer Modes |
|---|---|---|---|
| 1 | 1-1-1 | 9Fh | Cypress, Micron Extended SPI, Macronix SPI |
| 2 | 1-4-4 | AFh | **See Note below** |
| 3 | 4-4-4 | AFh | Micron Quad I/O SPI |

**Note:** Step 2 is a wrong combination but should not change the internal state of any QSPI memory. Indeed, **assuming pull-up resistors are used on the four I/O lines**, sending the AFh op code with SPI

1-x-y protocols (the opcode is sent only to MOSI during eight clock cycles) to a memory in Quad I/O SPI or QPI mode should be harmless (FEh opcode decoded by the memory when in Quad I/O SPI or QPI mode: unknown opcode). See the figure below.

**Figure 16-12. QSPI Transfer Format (CPHA = 0, 8 bits per opcode)**



#### 16.5.7.5.5 Allowing Quad I/O Commands (MRL A, MRL B)

On most QSPI memories, some pins are shared between legacy functions such as Write Protect (#WP), Hold (#HOLD) or Reset (#RST) and I/O data lines 2 and 3.

Hence before sending any Quad I/O commands, the ROM code updates the relevant register to reassign those pins to functions IO2 and IO3:

**Cypress**

The ROM code sets the Quad Enable bit (bit1) in the Configuration Register (CR) / Status Register 2 (SR2). The bit is volatile or non-volatile depending on memory versions. This operation is performed using the Write Status command (01h), setting SR1 to 00h and SR2 to 02h.

**Micron**

The ROM code updates the Enhanced Volatile Configuration Register (EVCR) to clear the Quad I/O protocol bit (bit7) hence enabling the Quad I/O protocol. From this point, all commands must use the SPI 4-4-4 protocol.

**Macronix**

The ROM code updates the Status Register (SR1) to set its Quad Enable non-volatile bit (bit6) using the Write Status command (01h).

#### 16.5.7.5.6 Configuration of Fast Read Quad I/O (EBh) Operations (MRL A, MRL B)

The ROM code performs all read operations using the Fast Read Quad I/O (EBh) opcode followed by a 3-byte address.

Since we cannot afford to add an exhaustive table of Read JEDEC IDs and to provide support of future products of memory manufacturers, the ROM code only relies on the very first byte of the JEDEC ID, i.e., the Manufacturer ID, to configure read operations. The ROM code matches the Manufacturer ID as shown in the following table.

**Table 16-2. Fast Read Quad I/O (EBh) Configuration by Manufacturer ID**

| Manufacturer ID | Manufacturer | SPI Protocol | # of Mode Cycles | # of Dummy Cycles | Mode Cycle Value | |
|---|---|---|---|---|---|---|
| | | | | | (no XIP) | (XIP) |
| 01h | Cypress | SPI 1-4-4 | 2 (1) | 4 (1) | 00h | A0h |
| 20h | Micron | SPI 4-4-4 | 1 (2) | 9 (2) | 1h | 0h |
| C2h | Macronix | SPI 1-4-4 | 2 (3) | 4 (3) | 00h | F0h |

**Note:**

1. The ROM code **expects** the Latency Control non-volatile bits of the Cypress Status Register 3 (SR3) / Control Register 1 (CR1) to be zero (LC = 0). The ROM code **does not update** this value.
2. The ROM code sets the number of mode/dummy cycles for Micron memories updating bits [7:4] of their Volatile Configuration Register (VCR) with the 81h opcode. During this update of the VCR:
   - ROM code v1.1 always clears bit3 to enable XIP.
   - ROM code v1.2 clears bit3 to enable XIP if and only if XIP bit is set in the Boot Config word, otherwise it sets bit3 to disable XIP.
3. The ROM code configures the number of mode/dummy cycles for Macronix memories by clearing the volatile DC0 and DC1 bits (bits [7:6]) in the Configuration Register (CR) / Status Register 2 (SR2). It also clears the 4-byte volatile bit (bit5), resulting in the memory going back to its 3-byte address mode. This register updated (read, modify, write) using a Write Status command (01h).

#### 16.5.7.5.7 Miscellaneous Information (MRL A, MRL B)

**Pull-up Resistors**

The ROM code removes the internal pull-up resistors when it configures PIO controller to mux the QSPI controller I/O lines. Therefore the probing step may fail if the Quad I/O mode of the memory has not been enabled yet and if this memory does not embed an internal pull-up resistor on #HOLD or #RESET pin.

This is why we recommend to add external pull-up resistors if needed on the four I/O data lines MOSI/IO0, MISO/IO1, #WP/IO2 and #HOLD/IO3.

Another solution is to update the Quad Enable non-volatile bit in the relevant register to reassign #WP and #HOLD/#RESET pins to functions IO2 and IO3.

**4-byte Address Mode (> 16 MB memories)**

Except for Macronix, the ROM code never sends any command to the memory to leave its 4-byte address mode or to select its first memory bank.

The ROM code expects to read from the very beginning of the QSPI memory using the Fast Read Quad I/O (EBh) command with a 3-byte address. Therefore we recommend that the customer application does not change the internal state of the QSPI memory but uses 4-byte opcodes when needed instead. Hence the ROM code can still read from the QSPI memory after a reset of the SoCs.

#### 16.5.7.6 QSPI NOR Flash Boot for MRL C

**Important:** This section applies to the devices listed in the table below:

| Device Name |
|---|
| ATSAMA5D21C |
| ATSAMA5D22C |
| ATSAMA5D23C |
| ATSAMA5D24C |
| ATSAMA5D26C |
| ATSAMA5D27C |
| ATSAMA5D28C |

##### 16.5.7.6.1 Supported QSPI Memories by Manufacturer (MRL C)

**Table 16-3. QSPI NOR Memories Tested with and Supported by MRL C ROM Code (non exhaustive)**

| Manufacturer | Memories |
|---|---|
| Microchip (SST) | SST26VF016B |
| | SST26VF032B |
| | SST26VF032BA |
| | SST26VF064B |
| Micron | N25Q128A |

#### 16.5.7.6.2 Hardware Considerations (MRL C)

The ROM code configures the hardware so that:

- the QSPI controller uses SPI Mode 0 (CPOL = 0 and CPHA = 0),
- the QSPIx_SCK clock frequency is ≤ 50 MHz,
- QSPIx_SCK and QSPIx_CS do not use any internal pull-up/pull-down resistor,
- each QSPIx_IO{0,1,2,3} uses the PIO controller's internal pull-up resistor.

#### 16.5.7.6.3 Software Considerations (MRL C)

Before reading any data, the ROM code sends a software reset to the QSPI NOR memory. Then the ROM code looks for the Serial Flash Discoverable Parameters (SFDP) of the QSPI NOR memory, if available, to learn the parameters (instruction op code, timing settings) required to read the user-programmed boot file.

If SFDP tables are not available, the ROM code uses hard-coded values as fallback settings to read the boot file.

The ROM code supports any QSPI NOR memory which can provide its Serial Flash Discoverable Parameters (SFDP) as defined in the JEDEC JESD216B standard.

The supported revisions of this JEDEC standard are:

- JESD216 (version 1.0)

- JESD216 rev. A (version 1.5)
- JESD216 rev. B (version 1.6)

Refer to the datasheet of the QSPI NOR memory to check compliance with any of the above JEDEC JESD216 standard revisions/versions.

***QSPI NOR memories with SFDP (JEDEC JESD216x compliant)***

The ROM code reads the memory SFDP tables to learn the factory settings (instruction op code, number of dummy cycles, etc.). The ROM code also reads bits[22:20] in DWORD15 from the Basic Flash Parameter Table (refer to JEDEC JESD216B specification) to select and then execute the relevant procedure, if any, to set the Quad Enable (QE) bit in some internal register of the QSPI NOR memory.

For most memory manufacturers, this QE bit is nonvolatile and must be set before performing any Quad SPI command. This is the only persistent setting that the ROM code may change in the internal registers of the QSPI NOR memory. All other settings are kept unchanged.

**Note:** Values 001b and 100b for bits[22:20] in DWORD15 are not correctly supported by ROM code rev. C. Consequently, booting from memories using one the above values in their SFDP tables is likely to fail. Almost all Winbond QSPI NOR memories suffer from this issue.

Refer to the datasheet of the QSPI NOR memory to find which value was chosen by the memory manufacturer and written into the SFDP tables.

Finally, the ROM code reads the boot file from the data area of the QSPI NOR memory, and then continues its boot procedure.

***QSPI NOR memories without SFDP***

This section only applies when the ROM code fails to read the SFDP tables from the QSPI NOR memory.

The ROM code reads the JEDEC ID of the QSPI NOR memory, and then selects the read settings based on the manufacturer ID (first byte of the JEDEC ID) from the following hard-coded values:

| | Cypress (01h) | Micron (20h) | Macronix (C2h) | Winbond (EFh) | Others |
|---|---|---|---|---|---|
| Fast Read protocol | SPI 1-4-4 | SPI 1-4-4 | SPI 1-4-4 | SPI 1-4-4 | SPI 1-1-1 |
| Fast Read op code | EBh | EBh | EBh | EBh | 0Bh |
| Address width | 24 bits | 24 bits | 24 bits | 24 bits | 24 bits |
| Number of mode clock cycles | 2 | 1 | 2 | 2 | 0 |
| Number of wait states | 4 | 9 | 4 | 4 | 8 |
| Value of mode cycles to enter the 0-4-4 mode (XIP) | A0h | 0h<br>The ROM code first sets XIP bit[3] in the Volatile Configuration Register (VCR) | 0Fh | A5h | N/A |
| Value of mode cycles to exit the 0-4-4 mode (normal read) | 00h | 1h | 00h | FFh | N/A |
| XIP supported | Yes | Yes | Yes | Yes | No |

Those hard-coded parameters give a last chance to the ROM code to boot from a QSPI NOR memory in either normal mode or XIP (continuous read) mode.

### 16.5.8 Hardware and Software Constraints

The table below provides clock frequencies configured by the ROM code during boot.

**Table 16-4. Clock Frequencies during External Memory Boot Sequence**

| Clock | MRL A | MRL B | MRL C |
|---|---|---|---|
| PLLA | 792 MHz | 792 MHz | 756 MHz |
| PCK | 396 MHz | 396 MHz | 378 MHz |
| MCK | 132 MHz | 132 MHz | 126 MHz |
| SDMMC (init/operational) | 400 kHz / 25 MHz | 400 kHz / 25 MHz | 400 kHz / 25 MHz |
| SPI | 6 MHz | 12 MHz | 12 MHz |
| QSPI | 25 MHz | 50 MHz | 50 MHz |

The NVM drivers use several PIOs in Peripheral mode to communicate with external memory devices. Care must be taken when these PIOs are used by the application. The connected devices could be unintentionally driven at boot time, and thus electrical conflicts between the output pins used by the NVM drivers and the connected devices could occur.

To ensure the correct functionality, it is recommended to plug in critical devices to other pins not used by the NVM.

The table below contains a list of pins that are driven during the boot program execution. These pins are driven during the boot sequence for a period of less than 1 second if no correct boot program is found. For MRL C parts only, the drive strength of some I/O pins is set to 'medium' while the pins are used in peripheral mode by the ROM code. For MRL A and B, drive strength is always low.

Before performing the jump to the application in the internal SRAM, all the PIOs and peripherals used in the boot program are set to their reset state.

**Table 16-5. PIO Driven during Boot Program Execution**

| NVM Bootloader | Peripheral | IO Set | Pin | PIO Line | Drive Strength (MRL C only) |
|---|---|---|---|---|---|
| SD Card / e.MMC | SDMMC_0 | 1 | SDMMC0_CK | PIOA0 | low |

## 16.6 SAM-BA Monitor

This part of the ROM code is executed when no valid code is found in any NVM during the NVM boot sequence, and if the DISABLE_MONITOR Fuse bit is not set.

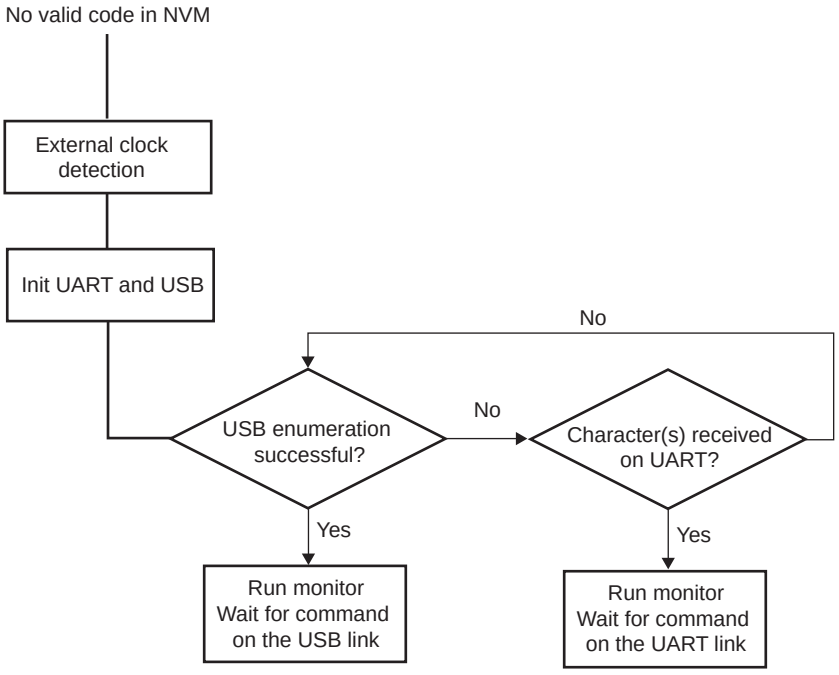
The Main Oscillator is enabled and set in Bypass mode. If the MOSCSELS bit rises, an external clock is connected. If not, the Bypass mode is cleared to attempt external quartz detection. This detection is successful when the MOSCXTS and MOSCSELS bits rise, else the internal 12 MHz fast RC oscillator is used as the Main Clock.

If an external clock or crystal frequency is found, then the PLLA is configured to allow communication on the USB link for the SAM-BA Monitor, else the Main Clock is switched back to the internal 12 MHz fast RC oscillator and USB is not activated. The SAM-BA Monitor steps are:

- Initialize UART and USB.
- Check if USB Device enumeration occurred.
- Check if characters are received on the UART.

Once the communication interface is identified, the application runs in an infinite loop waiting for different commands as listed in the table "Commands Available through the SAM-BA Monitor".

**Figure 16-13. SAM-BA Monitor**



### 16.6.1 Command List

**Table 16-6. Commands Available through the SAM-BA Monitor**

| Command | Action | Argument(s) | Example |
|---|---|---|---|
| N | Set Normal Mode | No argument | N# |
| T | Set Terminal Mode | No argument | T# |
| O | Write a byte | Address, Value# | O200001,CA# |
| o | Read a byte | Address,# | o200001,# |
| H | Write a half word | Address, Value# | H200002,CAFE# |
| h | Read a half word | Address,# | h200002,# |
| W | Write a word | Address, Value# | W200000,CAFEDECA# |
| w | Read a word | Address,# | w200000,# |
| S | Send a file | Address,# | S200000,# |
| R | Receive a file | Address, NbOfBytes# | R200000,1234# |
| G | Go | Address# | G200200# |
| V | Display version | No argument | V# |

- Mode commands:
  - Normal mode configures SAM-BA Monitor to send / receive data in binary format,

  - Terminal mode configures SAM-BA Monitor to send / receive data in ASCII format.
- Write commands: Writes a byte (O), a halfword (H) or a word (W) to the target
  - Address: Address in hexadecimal
  - Value: Byte, halfword or word to write in hexadecimal
  - Output: '>'
- Read commands: Reads a byte (o), a halfword (h) or a word (w) from the target
  - Address: Address in hexadecimal
  - Output: The byte, halfword or word read in hexadecimal followed by '>'
- Send a file (S): Sends a file to a specified address
  - Address: Address in hexadecimal
  - Output: '>'
    **Note:** There is a timeout on this command which is reached when the prompt '>' appears before the end of the command execution.
- Receive a file (R): Receives data into a file from a specified address
  - Address: Address in hexadecimal
  - NbOfBytes: Number of bytes in hexadecimal to receive
  - Output: '>'
- Go (G): Jumps to a specified address and executes the code
  - Address: Address to jump to in hexadecimal
  - Output: '>' once returned from the program execution. If the executed program does not handle the link register at its entry and does not return, the prompt is not displayed.
- Get Version (V): Returns the Boot Program version
  - Output: version, date and time of ROM code followed by '>'

### 16.6.2 UART Port

Communication is performed through the UART port initialized to 115,200 bauds, 8 bits of data, no parity, 1 stop bit.

### 16.6.3 Xmodem Protocol

The Send and Receive File commands use the Xmodem protocol to communicate. Any terminal using this protocol can be used to send the application file to the target. The size of the binary file to send depends on the SRAM size embedded in the product. In all cases, the size of the binary file must be lower than the SRAM size because the Xmodem protocol requires some SRAM memory in order to work.

The Xmodem protocol supported is the 128-byte length block. This protocol uses a two-character CRC16 to guarantee detection of maximum bit errors.

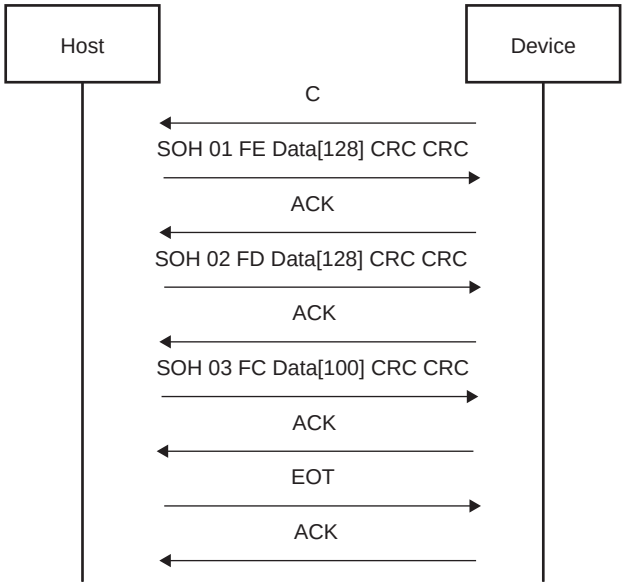
The Xmodem protocol with CRC is supported by successful transmission reports provided both by a sender and by a receiver. Each transfer block is as follows:

<SOH><blk #><255-blk #><--128 data bytes--><checksum> in which:

- <SOH> = 01 hex
- <blk #> = binary number, starts at 01, increments by 1, and wraps 0FFH to 00H (not to 01)
- <255-blk #> = 1's complement of the blk#.
- <checksum> = 2 bytes CRC16

The figure below shows a transmission using this protocol.

**Figure 16-14. Xmodem Transfer Example**



### 16.6.4 USB Device Port

#### 16.6.4.1 Supported External Crystal / External Clocks

The SAM-BA Monitor only supports an external crystal or external clock frequency at 12 MHz to allow USB communication.

#### 16.6.4.2 Supported External Crystal / External Clocks

The device uses the USB Communication Device Class (CDC) drivers to take advantage of the installed PC Serial Communication software to talk over the USB. The CDC is implemented in all releases of Windows®, starting from Windows 98SE®. The CDC document, available at www.usb.org, describes how to implement devices such as ISDN modems and virtual COM ports.

Vendor ID is 0x03EB. The product ID is 0x6124. These references are used by the host operating system to mount the correct driver. On Windows systems, INF files contain the correspondence between vendor ID and product ID.

#### 16.6.4.3 Supported External Crystal / External Clocks

The USB protocol is a master/slave protocol. The host starts the enumeration, sending requests to the device through the control endpoint. The device handles standard requests as defined in the USB Specification.

**Table 16-7. Handled Standard Requests**

| Request | Definition |
|---|---|
| GET_DESCRIPTOR | Returns the current device configuration value |
| SET_ADDRESS | Sets the device address for all future device access |
| SET_CONFIGURATION | Sets the device configuration |
| GET_CONFIGURATION | Returns the current device configuration value |
| GET_STATUS | Returns status for the specified recipient |
| SET_FEATURE | Used to set or enable a specific feature |

| .....continued | |
|---|---|
| **Request** | **Definition** |
| CLEAR_FEATURE | Used to clear or disable a specific feature |

The device also handles some class requests defined in the CDC class.

**Table 16-8. Handled Class Requests**

| Request | Definition |
|---|---|
| SET_LINE_CODING | Configures DTE rate, stop bits, parity and number of character bits |
| GET_LINE_CODING | Requests current DTE rate, stop bits, parity and number of character bits |
| SET_CONTROL_LINE_STATE | RS-232 signal used to indicate to the DCE device that the DTE device is now present |

Unhandled requests are stalled.

#### 16.6.4.4 Communication Endpoints

Endpoint 0 is used for the enumeration process.

Endpoint 1 (64-byte Bulk OUT) and endpoint 2 (64-byte Bulk IN) are used as communication endpoints.

SAM-BA Boot commands are sent by the host through Endpoint 1. If required, the message is split into several data payloads by the host driver.

If the command requires a response, the host sends IN transactions to pick up the response.

## 16.7 Fuse Box Controller

Read/write access to the fuse bits requires that the internal 12 MHz RC oscillator is enabled.

### 16.7.1 Fuse Bit Mapping

One 32-bit word is reserved for boot configuration.

512 fuse bits are available for customer needs.

Writing a ‘1’ to SFR_SECURE.FUSE disables access to the Secure Fuse Controller (SFC).

To avoid any malfunctioning, the user must not write the “DO NOT USE (DNU)” fuse bits in the Boot Configuration area.

**Table 16-9. Customer Fuse Matrix**

| SFC_DR | Bits | Use | | |
|---|---|---|---|---|
| 16 | [543:512] | JTAG_DIS[543] | SEC_DEBUG_DIS[542] | Boot Configuration bits[541:512](1) |

.....continued

| SFC_DR | Bits | Use |
|---|---|---|
| 15 | [511:480] | USER_DATA[511:0] |
| 14 | [479:448] | |
| 13 | [447:416] | |
| 12 | [415:384] | |
| 11 | [383:352] | |
| 10 | [351:320] | |
| 9 | [319:288] | |
| 8 | [287:256] | |
| 7 | [255:224] | |
| 6 | [223:192] | |
| 5 | [191:160] | |
| 4 | [159:128] | |
| 3 | [127:96] | |
| 2 | [95:64] | |
| 1 | [63:32] | |
| 0 | [31:0] | |

**Note:** See section Boot Configuration Word for details on the contents of these bits.

**Table 16-10. Special Function Bits**

| JTAG Disable (Fuse bit 543) | Secure Debug Disable (Fuse bit 542) | Description |
|---|---|---|
| 0 | 0 | Full JTAG debug allowed in Secure and Normal modes |
| 0 | 1 | JTAG debug allowed in Normal mode only (not in Secure mode) |
| 1 | X | JTAG debug disabled |

# 17. AXI Matrix (AXIMX)

## 17.1 Description

The AXI Matrix comprises the embedded Advanced Extensible Interface (AXI) bus protocol which supports separate address/control and data phases, unaligned data transfers using byte strobes, burst-based transactions with only start address issued, separate read and write data channels to enable low-cost DMA, ability to issue multiple outstanding addresses, out-of-order transaction completion, and easy addition of register stages to provide timing closure.

## 17.2 Embedded Characteristics

- High-Performance AXI Network Interconnect
- One Master
  - Cortex-A5 Core
- Two Slaves
  - ROM
  - AXI/AHB bridge to AHB Matrix
- Single-Cycle Arbitration
- Full Pipelining to Prevent Master Stalls
- One Remap State

## 17.3 Operation

### 17.3.1 Remap

Remap states are managed in the AXI Matrix Remap register (AXIMX_REMAP): AXIMX_REMAP.REMAP0 (register bit 0) is used to remap RAM @ addr 0x00000000.

The number of remap states can be defined using eight bits of the AXIMX_REMAP register, and a bit in AXIMX_REMAP controls each remap state.

Each remap state can be used to control the address decoding for one or more slave interfaces. If a slave interface is affected by two remap states that are both asserted, the remap state with the lowest remap bit number takes precedence.

Each slave interface can be configured independently so that a remap state can perform different functions for different masters.

A remap state can:

- Alias a memory region into two different address ranges
- Move an address region
- Remove an address region

Because of the nature of the distributed register subsystem, the masters receive the updated remap bit states in sequence, and not simultaneously.

A slave interface does not update to the latest remap bit setting until:

- The address completion handshake accepts any transaction that is pending
- Any current lock sequence completes

At powerup, ROM is seen at address 0. After powerup, the internal SRAM can be moved down to address 0 by means of the remap bits.

## 17.4 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | AXIMX_REMAP | 7:0 | | | | | | | | REMAP0 |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |

### 17.4.1 AXI Matrix Remap Register

**Name:** AXIMX_REMAP
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | REMAP0 |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – REMAP0** Remap State 0
SRAM is seen at address 0x00000000 (through AHB slave interface) instead of ROM.

# 18. Matrix (H64MX/H32MX)

## 18.1 Description

The system embeds three system bus matrixes: one based on the AXI protocol (AXIMX) and two based on the AHB protocol (H64MX and H32MX). This section describes the implementation of the 64-bit Matrix (H64MX) and the 32-bit Matrix (H32MX).

For details on the AXIMX matrix, refer to the section “AXI Matrix (AXIMX)”.

Each matrix implements a multilayer system bus, which enables parallel access paths between multiple masters and slaves in a system, thus increasing the overall bandwidth. The normal latency to connect a master to a slave is one cycle, except for the default master of the accessed slave which is connected directly (zero cycle latency).

**Note:** When a master and a slave are on different bus matrixes (AXIMX, H64MX, or H32MX), both matrixes (H64MX and H32MX) and the bridge between the bus matrixes must be configured accordingly.

## 18.2 Embedded Characteristics

- 32-bit or 64-bit Data Bus
- 64-bit Matrix (H64MX) Providing 12 Masters and 15 Slaves
- 32-bit Matrix (H32MX) Providing 8 Masters and 6 Slaves
- One Address Decoder for Each Master
- Support for Long Bursts of Length 32, 64, 128 and Up to the Limit of 256-bit Burst Beats of Words
- Enhanced Programmable Mixed Arbitration for Each Slave:
  - Round-robin
  - Fixed priority
  - Latency quality of service
- Programmable Default Master for Each Slave:
  - No default master
  - Last accessed default master
  - Fixed default master
- Deterministic Maximum Access Latency for Masters
- Zero or One Cycle Arbitration Latency for the First Access of a Burst
- Bus Lock Forwarding to Slaves
- One Special Function Register for Each Slave (not dedicated)
- Register Write Protection
- ARM TrustZone Technology

## 18.3 64-bit Matrix (H64MX)

### 18.3.1 Matrix Masters

The H64MX manages 12 masters, which means that each master can perform an access, concurrently with others, to an available slave.

This matrix operates at MCK.

Each master has its own decoder, which is defined specifically for each master. In order to simplify the addressing, all the masters have the same decodings.

**Table 18-1. List of H64MX Masters**

| Master No. | Name | Security Type |
|---|---|---|
| 0 | Bridge from AXI Matrix (Core) | Not applicable |
| 1, 2 | DMA Controller 0 | Peripheral Securable |
| 3, 4 | DMA Controller 1 | Peripheral Securable |
| 5, 6 | LCDC DMA | Peripheral Securable |
| 7 | SDMMC0 | Peripheral Securable |
| 8 | SDMMC1 | Peripheral Securable |
| 9 | ISC DMA | Peripheral Securable |
| 10 | AESB | Not applicable(1) |
| 11 | Bridge from H32MX to H64MX | Not applicable |

**Note:**

1. Master signals secure/not secure are propagated through the AES bridge.

### 18.3.2 Matrix Slaves

The H64MX manages 15 slaves. Each slave has its own arbiter providing a dedicated arbitration per slave.

**Table 18-2. List of H64MX Slaves**

| Slave No. | Description | TrustZone Access Management |
|---|---|---|
| 0 | Bridge from H64MX to H32MX | Not applicable |
| 1 | H64MX Peripheral Bridge | HSEL0: not applicable |
| | SDMMC0 | HSEL1: Internal Securable to Peripheral: 1 region(1) |
| | SDMMC1 | HSEL2: Internal Securable to Peripheral: 1 region(1) |
| 2 | DDR2 Port 0 - AESB | Scalable Securable: 4 regions(2) |
| 3 | DDR2 Port 1 | Scalable Securable: 4 regions(2) |
| 4 | DDR2 Port 2 | Scalable Securable: 4 regions(2) |
| 5 | DDR2 Port 3 | Scalable Securable: 4 regions(2) |
| 6 | DDR2 Port 4 | Scalable Securable: 4 regions(2) |
| 7 | DDR2 Port 5 | Scalable Securable: 4 regions(2) |
| 8 | DDR2 Port 6 | Scalable Securable: 4 regions(2) |
| 9 | DDR2 Port 7 | Scalable Securable: 4 regions(2) |

| .....continued | | |
|---|---|---|
| **Slave No.** | **Description** | **TrustZone Access Management** |
| 10 | Internal SRAM 128K | Internal Securable: 1 region |
| 11 | Internal SRAM 128K (Cache L2) | Internal Securable: 1 region |
| 12 | QSPI0 | Internal Securable: 1 region |
| 13 | QSPI1 | Internal Securable: 1 region |
| 14 | AESB | Not applicable |

**Note:**

1. For each SDMMCx, see "Security Types of SDMMC System Bus Slaves" for Internal Securable to Peripheral type configuration. A consistent configuration must be done for:
   - the slave port,
   - MATRIX_SPSELSR for the general interrupt and the master port,
   - MATRIX_SPSELSR for the TIMER interrupt.
2. For consistency, each DDR2 port must have the same TrustZone access management configuration.

### 18.3.3 Master to Slave Access

The following table shows how masters and slaves interconnect. Writing in a register or field not dedicated to a master or a slave has no effect.

**Table 18-3. Master to Slave Access on H64MX**

| | | MASTER | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
| **SLAVE** | | **Bridge from AXIMX (Core)** | **XDMAC0** | | **XDMAC1** | | **LCDC DMA** | | **SDMMC0 DMA** | **SDMMC1 DMA** | **ISC DMA** | **AESB** | **Bridge from H32MX** |
| 0 | Bridge from H64MX to H32MX | X | X | X | X | X | – | – | – | – | – | – | – |
| 1 | H64MX Peripheral Bridge | X | X | X | X | X | – | – | – | – | – | – | X |
| | SDMMC0–SDMMC1 | X | X | X | X | X | – | – | – | – | – | – | X |
| 2 | DDR2 Port 0 | – | – | – | – | – | – | – | – | – | – | X(1) | – |
| 3 | DDR2 Port 1 | X | – | – | – | – | – | – | – | – | – | – | – |
| 4 | DDR2 Port 2 | – | – | – | – | – | X | – | – | – | – | – | – |
| 5 | DDR2 Port 3 | – | – | – | – | – | – | X | – | – | – | – | – |
| 6 | DDR2 Port 4 | – | – | – | – | – | – | – | X | X | X | – | – |

.....continued

| | | MASTER | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
| SLAVE | | Bridge from AXIMX (Core) | XDMAC0 | | XDMAC1 | | LCDC DMA | | SDMMC0 DMA | SDMMC1 DMA | ISC DMA | AESB | Bridge from H32MX |
| 7 | DDR2 Port 5 | – | X | – | X | – | – | – | – | – | – | – | – |
| 8 | DDR2 Port 6 | – | – | X | – | X | – | – | – | – | – | – | – |
| 9 | DDR2 Port 7 | – | – | – | – | – | – | – | – | – | – | – | X |
| 10 | Internal SRAM | X | X | X | X | X | X | X | X | X | X | – | X |
| 11 | L2C SRAM | X | X | X | X | X | X | X | X | X | X | – | X |
| 12 | QSPI0 | X | X | X | X | X | – | – | – | – | – | X(1) | X |
| 13 | QSPI1 | X | X | X | X | X | – | – | – | – | – | X(1) | X |
| 14 | AESB | X | X | X | X | X | – | – | – | – | – | – | X |

**Note:**

1. To avoid deadlock when accessing the AESB slave, the QSPI0, QSPI1 and DDR2 Port 0 Slave Configuration registers (MATRIX_SCFGx) must be configured either with DEFMSTR_TYPE = NONE ('0') or with DEFMSTR_TYPE = FIXED ('2') and FIXED_DEFMSTR = 10.

## 18.4 32-bit Matrix (H32MX)

### 18.4.1 Matrix Masters

The H32MX manages eight masters, which means that each master can perform an access, concurrently with others, to an available slave.

This matrix can operate at MCK if MCK is lower than 83 MHz, or at MCK/2 if MCK is higher than 83 MHz. Refer to the section “Power Management Controller (PMC)” for more details.

Each master has its own decoder, which is defined specifically for each master. In order to simplify the addressing, all the masters have the same decodings.

**Table 18-4. List of H32MX Masters**

| Master No. | Name | Security Type |
|---|---|---|
| 0 | Bridge from H64MX to H32MX | Not applicable |
| 1 | Integrity Check Monitor (ICM) | Peripheral Securable |
| 2 | UHPHS EHCI DMA | Peripheral Securable |
| 3 | UHPHS OHCI DMA | Peripheral Securable |
| 4 | UDPHS DMA | Peripheral Securable |
| 5 | GMAC DMA | Peripheral Securable |

| .....continued | | |
|---|---|---|
| **Master No.** | **Name** | **Security Type** |
| 6 | CAN0 DMA | Peripheral Securable |
| 7 | CAN1 DMA | Peripheral Securable |

### 18.4.2 Matrix Slaves

The H32MX manages six slaves. Each slave has its own arbiter providing a dedicated arbitration per slave.

**Table 18-5. List of H32MX Slaves**

| Slave No. | Description | TZ Access Management |
|---|---|---|
| 0 | Bridge from H32MX to H64MX | Not applicable |
| 1 | H32MX Peripheral Bridge 0 | Not applicable |
| 2 | H32MX Peripheral Bridge 1 | Not applicable |
| 3 | External Bus Interface | External Securable: 7 regions:<br>HSEL0: 0x10000000 128 MB CS0<br>HSEL1: 0x18000000 128 MB CS0<br>HSEL2: 0x60000000 128 MB CS1<br>HSEL3: 0x68000000 128 MB CS1<br>HSEL4: 0x70000000 128 MB CS2<br>HSEL5: 0x78000000 128 MB CS2<br>HSEL6: 0x80000000 128 MB CS3 |
| | NFC Command Register | Internal Securable to Peripheral: 1 region<br>HSEL7: 0xC0000000 256 MB NFCCMD |
| 4 | NFC SRAM | Internal Securable: 1 region |
| 5 | USB Device High Speed (UDPHS) Dual Port RAM (DPR) | HSEL0: Internal Securable: 1 region |
| | USB Host (UHPHS) OHCI registers | HSEL1: Internal Securable to Peripheral: 1 region(Note) |
| | USB Host (UHPHS) EHCI registers | HSEL2: Internal Securable to Peripheral: 1 region(Note) |
| 6 | Peripheral Touch Controller (PTC) | Internal Securable: 1 region |

**Note:** UHPHS: Consistent configuration must be done on:

- Slave UHPHS OHCI Internal Securable Peripheral,
- Slave UHPHS EHCI Internal Securable Peripheral,
- MATRIX_SPSELSR for Interrupt and Master

### 18.4.3 Master to Slave Access

The following table shows how masters and slaves interconnect. Writing in a register or field not dedicated to a master or a slave has no effect.

**Table 18-6. Master to Slave Access on H32MX**

| | | MASTER | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | 0 (Through Bridge from H64MX) | | | | | 1 | 2 | 3 | 4 | 5 | 6 |

| | UHP EHCI Reg | X | – | – | – | X | – | – | – | – | – | – |
| 6 | Peripheral Touch Controller (PTC) | X | – | – | – | – | – | – | – | – | – | – |

## 18.5 Memory Mapping

The MATRIX provides one decoder for every master interface. The decoder offers each master several memory mappings. Each memory area can be assigned to several slaves. Booting at the same address while using different slaves (i.e., external RAM, internal ROM or internal Flash, etc.) becomes possible.

## 18.6 Special Bus Granting Mechanism

The MATRIX provides some speculative bus granting techniques in order to anticipate access requests from masters. This mechanism reduces latency at first access of a burst, or for a single transfer, as long as the slave is free from any other master access. It does not provide any benefit if the slave is

continuously accessed by more than one master, since arbitration is pipelined and has no negative effect on the slave bandwidth or access latency.

This bus granting mechanism sets a different default master for every slave.

At the end of the current access, if no other request is pending, the slave remains connected to its associated default master. A slave can be associated with three kinds of default masters:

- No default master
- Last access master
- Fixed default master

To change from one type of default master to another, the user interface provides Slave Configuration registers (MATRIX_SCFGx), one for every slave, which set a default master for each slave. MATRIX_SCFGx contains two fields to manage master selection: DEFMSTR_TYPE and FIXED_DEFMSTR. The 2-bit DEFMSTR_TYPE field selects the default master type (no default, last access master, fixed default master), whereas the 4-bit FIXED_DEFMSTR field selects a fixed default master provided that DEFMSTR_TYPE is set to fixed default master. See “Bus Matrix Slave Configuration Registers”.

## 18.7 No Default Master

After the end of the current access, if no other request is pending, the slave is disconnected from all masters.

This configuration incurs one latency clock cycle for the first access of a burst after bus Idle. Arbitration without default master can be used for masters that perform significant bursts or several transfers with no Idle in between, or if the slave bus bandwidth is widely used by one or more masters.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput regardless of the number of requesting masters.

## 18.8 Last Access Master

After the end of the current access, if no other request is pending, the slave remains connected to the last master that performed an access request.

This allows the MATRIX to remove the one latency cycle for the last master that accessed the slave. Other nonprivileged masters still get one latency clock cycle if they need to access the same slave. This technique is used for masters that mainly perform single accesses or short bursts with some Idle cycles in between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput whatever is the number of requesting masters.

## 18.9 Fixed Default Master

After the end of the current access, if no other request is pending, the slave connects to its fixed default master. Unlike the last access master, the fixed default master does not change unless the user modifies it by software (FIXED_DEFMSTR field of the related MATRIX_SCFG).

This allows the MATRIX arbiters to remove the one latency clock cycle for the fixed default master of the slave. All requests attempted by the fixed default master do not cause any arbitration latency, whereas

other nonprivileged masters will get one latency cycle. This technique is used for a master that mainly performs single accesses or short bursts with Idle cycles in between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput, regardless of the number of requesting masters.

## 18.10 Arbitration

The MATRIX provides an arbitration mechanism that reduces latency when conflicts occur, i.e., when two or more masters try to access the same slave at the same time. One arbiter per slave is provided, thus arbitrating each slave specifically.

The user can choose between two arbitration types or mix them for each slave:

- Round-robin Arbitration (default)
- Fixed Priority Arbitration

The resulting algorithm may be complemented by selecting a default master configuration for each slave.

When rearbitration must be done, specific conditions apply. See “Arbitration Scheduling” .

### 18.10.1 Arbitration Scheduling

Each arbiter has the ability to arbitrate between two or more master requests. In order to avoid burst breaking and also to provide the maximum throughput for slave interfaces, arbitration takes place during the following cycles:

- Idle Cycles: when a slave is not connected to any master or is connected to a master which is not currently accessing it.
- Single Cycles: when a slave is currently performing a single access.
- End of Burst Cycles: when the current cycle is the last cycle of a burst transfer. For defined burst length, predicted end of burst matches the size of the transfer but is managed differently for undefined burst length. See “Undefined Length Burst Arbitration” .
- Slot Cycle Limit: when the slot cycle counter has reached the limit value indicating that the current master access is too long and must be broken. See “Slot Cycle Limit Arbitration” .

#### 18.10.1.1 Undefined Length Burst Arbitration

To prevent long burst lengths that can lock the access to the slave for an excessive period of time, the user can trigger the rearbitration before the end of the incremental bursts. The rearbitration period can be selected from the following Undefined Length Burst Type (ULBT) possibilities:

- Unlimited: no predetermined end of burst is generated. This value enables 1 Kbyte burst lengths.
- 1-beat bursts: predetermined end of burst is generated at each single transfer during the INCR transfer.
- 4-beat bursts: predetermined end of burst is generated at the end of each 4-beat boundary during INCR transfer.
- 8-beat bursts: predetermined end of burst is generated at the end of each 8-beat boundary during INCR transfer.
- 16-beat bursts: predetermined end of burst is generated at the end of each 16-beat boundary during INCR transfer.
- 32-beat bursts: predetermined end of burst is generated at the end of each 32-beat boundary during INCR transfer.

© 2018 Microchip Technology Inc.

- 64-beat bursts: predetermined end of burst is generated at the end of each 64-beat boundary during INCR transfer.
- 128-beat bursts: predetermined end of burst is generated at the end of each 128-beat boundary during INCR transfer.

Undefined-length bursts lower than 8 beats should not be used since this may decrease the overall bus bandwidth due to arbitration and slave latencies at each first access of a burst.

However, if the length of undefined-length bursts is known for a master, it is recommended to configure MATRIX_MCFG.ULBT accordingly.

#### 18.10.1.2 Slot Cycle Limit Arbitration

The MATRIX contains specific logic to break long accesses, such as very long bursts on a very slow slave (e.g., an external low speed memory). At each arbitration time, a counter is loaded with the value previously written in the SLOT_CYCLE field of the related Slave Configuration Register (MATRIX_SCFG) and decreased at each clock cycle. When the counter elapses, the arbiter has the ability to rearbitrate at the end of the current system bus access cycle.

Unless a master has a very tight access latency constraint, which could lead to data overflow or underflow due to a badly undersized internal FIFO with respect to its throughput, the Slot Cycle Limit should be disabled (SLOT_CYCLE = 0) or set to its default maximum value in order not to inefficiently break long bursts performed by some masters.

In most cases, this feature is not needed and should be disabled for power saving.

**⚠WARNING** This feature cannot prevent any slave from locking its access indefinitely.

### 18.10.2 Arbitration Priority Scheme

The MATRIX arbitration scheme is organized in priority pools, each corresponding to an access criticality class as shown in the “Latency Quality of Service” column in the following table.

**Table 18-7. Arbitration Priority Pools**

| Priority Pool | Latency Quality of Service |
|---|---|
| 3 | Latency Critical |
| 2 | Latency Sensitive |
| 1 | Bandwidth Sensitive |
| 0 | Background Transfers |

Round-robin priority is used in the highest and lowest priority pools 3 and 0, whereas fixed level priority is used between priority pools and in the intermediate priority pools 2 and 1. See “Round-robin Arbitration” .

For each slave, each master is assigned to one of the slave priority pools through the priority registers for slaves (MxPR fields of MATRIX_PRAS and MATRIX_PRBS). When evaluating master requests, this priority pool level always takes precedence.

After reset, most of the masters belong to the lowest priority pool (MxPR = 0, Background Transfer) and are therefore granted bus access in a true round-robin order.

The highest priority pool must be specifically reserved for masters requiring very low access latency. If more than one master belongs to this pool, they will be granted bus access in a biased round-robin manner which allows tight and deterministic maximum access latency from system bus requests. In the worst case, any currently occurring high-priority master request will be granted after the current bus master access has ended and other high priority pool master requests, if any, have been granted once each.

The lowest priority pool shares the remaining bus bandwidth between masters.

Intermediate priority pools allow fine priority tuning. Typically, a latency-sensitive master or a bandwidth-sensitive master will use such a priority level. The higher the priority level (MxPR value), the higher the master priority.

To optimize processor performance, it is recommended configure CPU priority with the default reset value 2 (Latency Sensitive).

All combinations of MxPR values are allowed for all masters and slaves. For example, some masters might be assigned the highest priority pool (round-robin), and remaining masters the lowest priority pool (round-robin), with no master for intermediate fixed priority levels.

#### 18.10.2.1 Fixed Priority Arbitration

Fixed priority arbitration algorithm is the first and only arbitration algorithm applied between masters from distinct priority pools. It is also used in priority pools other than the highest and lowest priority pools (intermediate priority pools).

Fixed priority arbitration allows the MATRIX arbiters to dispatch the requests from different masters to the same slave by using the fixed priority defined by the user in the MxPR field for each master in the registers MATRIX_PRAS and MATRIX_PRBS. If two or more master requests are active at the same time, the master with the highest priority MxPR number is serviced first.

In intermediate priority pools, if two or more master requests with the same priority are active at the same time, the master with the highest number is serviced first.

#### 18.10.2.2 Round-robin Arbitration

This algorithm is only used in the highest and lowest priority pools. It allows the MATRIX arbiters to properly dispatch requests from different masters to the same slave. If two or more master requests are active at the same time in the priority pool, they are serviced in a round-robin increasing master number order.

## 18.11 Register Write Protection

To prevent any single software error from corrupting MATRIX behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the Write Protection Mode Register (MATRIX_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the Write Protection Status Register (MATRIX_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is reset by writing the Write Protect Mode Register (MATRIX_WPMR) with the appropriate access key WPKEY.

The following registers can be write-protected:

- Bus Matrix Master Configuration Registers

- Bus Matrix Slave Configuration Registers
- Bus Matrix Priority Registers A For Slaves
- Bus Matrix Priority Registers B For Slaves
- Master Error Interrupt Enable Register
- Master Error Interrupt Disable Register
- Security Slave Registers
- Security Areas Split Slave Registers
- Security Region Top Slave Registers
- Security Peripheral Select x Registers

## 18.12 TrustZone Technology

TrustZone secure software is supported through the filtering of each slave access with master security bit extension signals.

TrustZone technology adds the ability to manage the access rights for secure and non-secure accesses. The access rights are defined through the hardware and software configuration of the device. The operating mode is as follows:

- Masters transmit requests with the secure or non-secure Security option.
- The MATRIX, according to its configuration and the request, grants or denies the access.

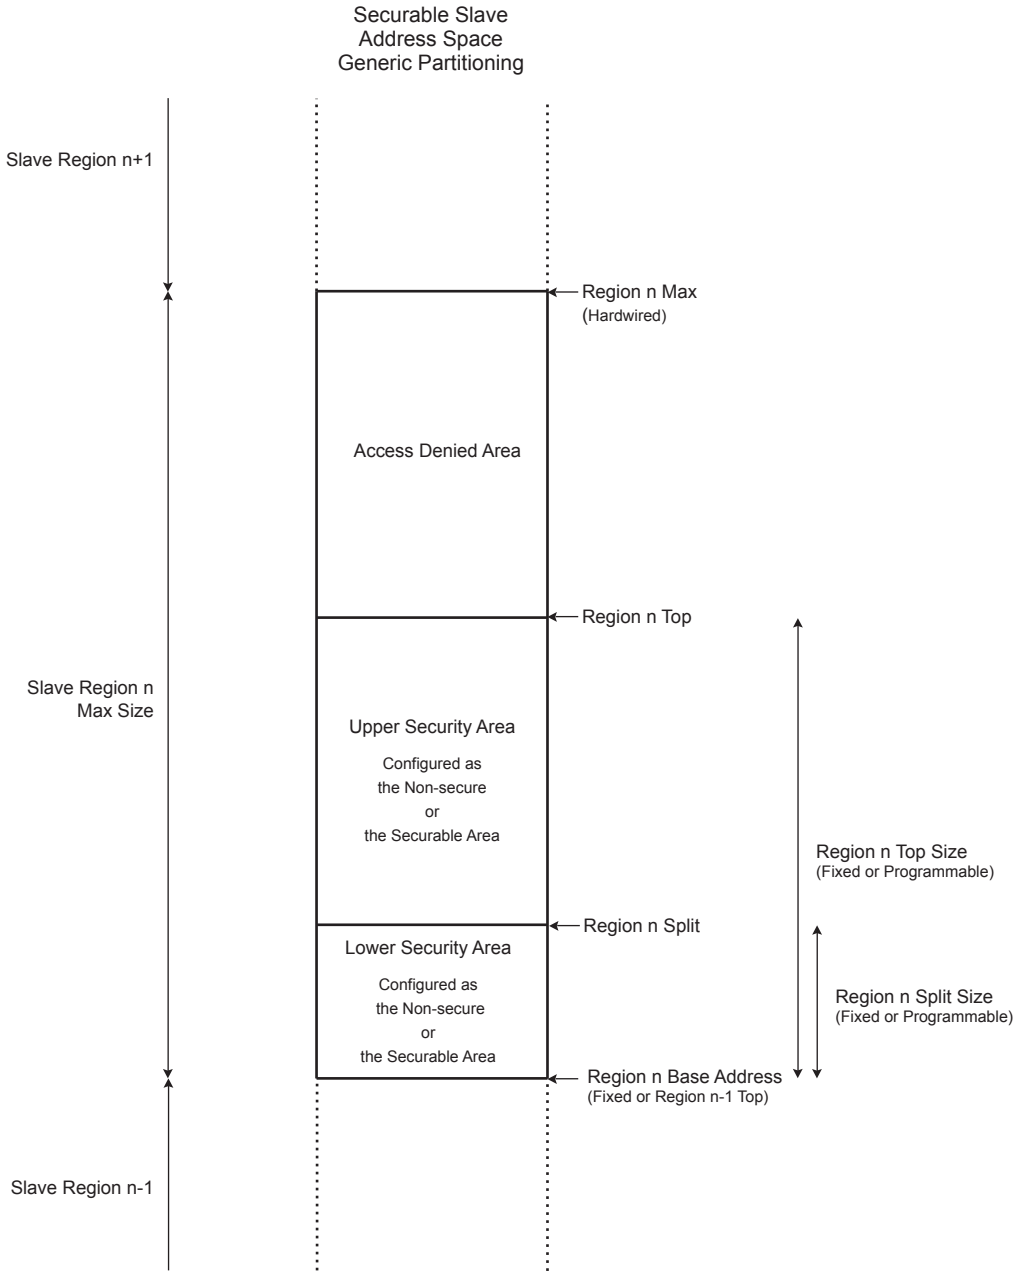
The slave address space is divided into one or more slave regions. The slave regions are generally contiguous parts of the slave address space. The slave region is potentially split into an access denied area (upper part) and a security region which can be split (lower part), unless the slave security region occupies the whole slave region. The security region itself can be split into one secure area and one non-secure area. The secure area may be independently secure for read access and for write access.

For one slave region, the following characteristics are configured by hardware or software:

- Base Address of the slave region
- Max size of the slave region: the maximum size for the region’s physical content
- Top size of the slave security region: the actually programmed or fixed size for the region’s physical content
- Split size of the slave security region: the size of the lower security area of the region.

The following figure shows how the terms defined here are implemented in a slave address space.

**Figure 18-1. Generic Partitioning of the AHB Slave Address Space**



A set of security registers allows to specify, for each slave, the slave security region or slave security area, the security mode required to access this slave, slave security region or slave security area.

Additional Bus Matrix security registers allow to specify, for each peripheral bus slave, the security mode required to access this slave (see "Security Peripheral Select x Registers").

See "Security Slave Registers".

These registers can only be accessed in Secure mode.

The MATRIX propagates the security bit down to the slaves to let them perform additional security checks, and the MATRIX itself allows or denies the access to the slaves by means of its TrustZone embedded controller.

Access violations may be reported either by a slave through the bus error response (example from the AHB/APB Bridge), or by the Bus Matrix embedded TrustZone controller. In both cases, a bus error response is sent to the offending master and the error is flagged in the Master Error Status Register. An interrupt can be sent to the Secure world, if it has been enabled for that master by writing into the Master Error Interrupt Enable Register. Thus, the offending master is identified. The offending address is registered in the Master Error Address Registers, so that the slave and the targeted security region are also known.

Depending on the hardware parameters and software configuration, the address space of each slave security region may or may not be split into two parts, one belonging to the Secure world and the other one to the Normal world.

Five different security types of slaves are supported. The number of security regions is set by design for each slave, independently, from 1 to 8, totalling from 1 up to 16 security areas for security configurable slaves.

### 18.12.1 Security Types of Slaves

#### 18.12.1.1 Principles

The MATRIX supports five different security types of slaves: two fixed types and three configurable types. The security type of a slave is set at hardware design among the following:

- Never Secure
- Always Secure
- Internal Securable
- External Securable
- Scalable Securable

The security type is set at hardware design on a per-master and a per-slave basis. **Never Secure** and **Always Secure** security types are not software configurable.

The different security types have the following characteristics:

- **Never Secure** slaves have no security mode access restriction. Their address space is precisely set by design. Any out-of-address range access is denied and reported.
- **Always Secure** slaves can only be accessed by a secure master request. Their address space is precisely set by design. Any non-secure or out-of-address range access is denied and reported.
- **Internal Securable** is intended for internal RAM. The Internal Securable slave has one slave region which has a hardware fixed base address and Security Region Top. This slave region may be split through software configuration into one Non-secure area plus one Secure area. Inside the slave security region, the split boundary is programmable in powers of 2 from 4 Kbytes up to the full slave security region address space. The security area located below the split boundary may be configured as the Non-secure or the Secure one. The Securable area may be independently configured as Read Secured and/or Write Secured. Any access with security or address range violation is denied and reported.
- **External Securable** is intended for external memories on the EBI, such as DDR, SDRAM, external ROM or NAND Flash. The External Securable slave has identical features as the Internal Securable slave, plus the ability to configure each of its slave security region address space sizes according to the external memory parts used. This avoids mirroring Secure areas into Non-secure areas, and further restricts the overall accessible address range. Any access with security or configured address range violation is denied and reported.

- **Scalable Securable** is intended for external memories with a dedicated slave, such as DDR. The Scalable Securable slave is divided into a fixed number of scalable, equally sized, and contiguous security regions. Each of them can be split in the same way as for Internal or External Securable slaves. The security region size must be configured by software, so that the equally-sized regions fill the actual available memory. This avoids mirroring Secure areas into Non-secure areas, and further restricts the overall accessible address range. Any access with security or configured address range violation is denied and reported.

As the security type is set at hardware design on a per-master and per-slave basis, it is possible to set some slave access security as configurable from one or some particular masters, and to set the access as Always Secure from all the other masters.

As the security type is set by design at the slave region level, different security region types can be mixed inside a single slave.

Likewise, the mapping base address and the accessible address range of each slave or slave region may have been hardware-restricted on a per-master basis from no access to full slave address space.

#### 18.12.1.2 Examples

The following table shows an example of Security Type settings.

**Table 18-8. Security Type Setting Example**

| Slave | Master0 | Master1 | Master2 |
|---|---|---|---|
| Slave0<br>Internal Memory | Never Secure | Internal Securable<br>1 region | Internal Securable<br>1 region |
| Slave1<br>EBI | External Securable<br>2 regions | Always Secure | External Securable<br>2 regions |

This example is constructed with the following characteristics:

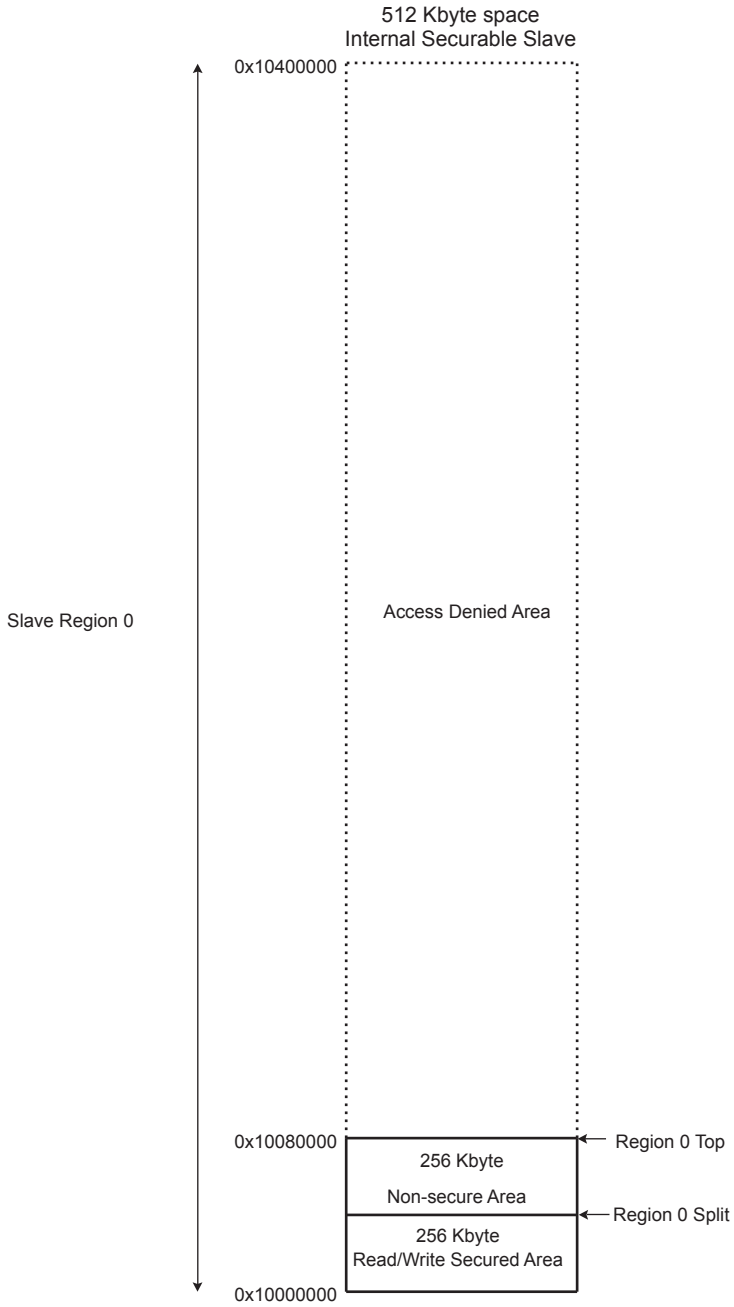
- Slave0 is an Internal Memory containing one region:
  - The Access from Master0 to Slave0 is Never Secure
  - The access from Master1 and Master2 to Slave0 is Internal Securable with one region and with the same software configuration (Choice of SASPLIT0 and the security configuration bits LANSECH, RDNSECH, WRNSECH).
- Slave1 is an EBI containing two regions:
  - The Access from Master1 to Slave1 is Always Secure
  - The access from Master0 and Master2 to Slave1 is External Securable with two regions and with the same software configuration (Choice of SRTOP0, SRTOP1, SASPLIT0, SASPLIT1 and the security configuration bits LANSECH, RDNSECH, WRNSECH).

The figure below shows an Internal Securable slave example. This example is constructed with the following hypothesis:

- The slave is an Internal Memory containing one region. The Slave region max size is 4 Mbytes.
- The slave region 0 base address equals 0x10000000. Its top size is 512 Kbytes (hardware configuration).
- The slave software configuration is:
  - SASPLIT0 is set to 256 Kbytes
  - LANSECH0 is set to 0, the low area of region 0 is the securable one

– RDNSECH0 is set to 0, region 0 Securable area is secured for reads
– WRNSECH0 is set to 0, region 0 Securable area is secured for writes

**Figure 18-2. Partitioning Example of an Internal Securable Slave Featuring 1 Security Region of 512 Kbytes Split into 1 or 2 Security Areas of 4 Kbytes to 512 Kbytes**



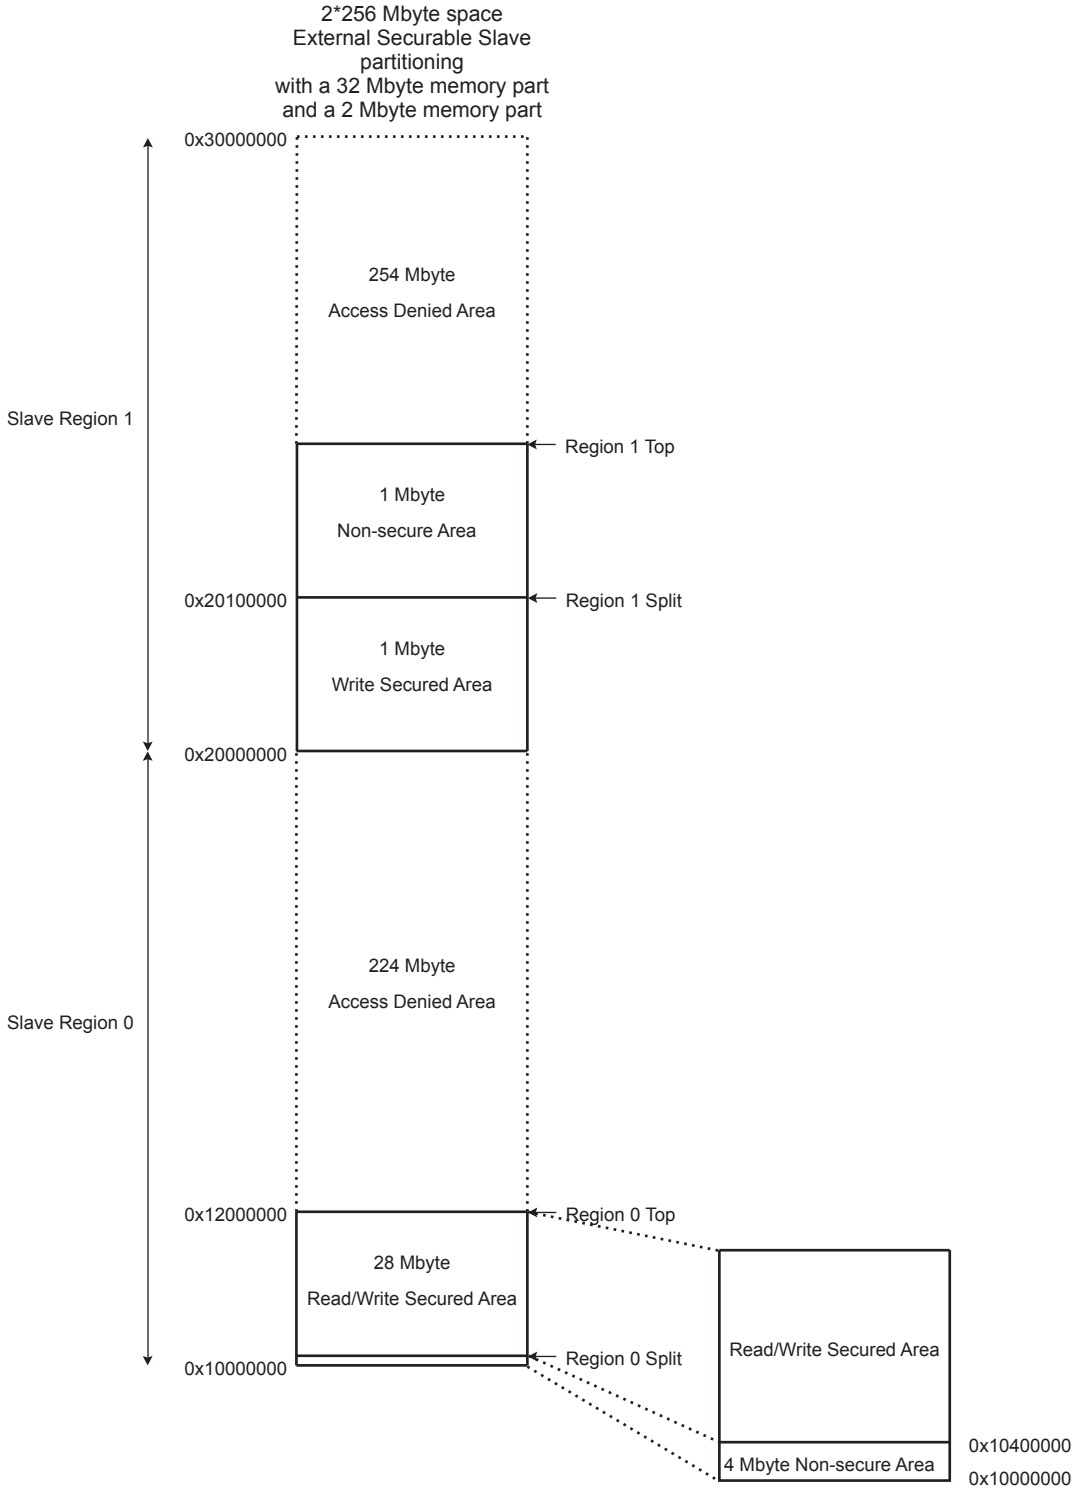
**Note:** The slave security areas split inside the security region are configured by writing into the Security Areas Split Slave Registers.

The figure below shows an External Securable slave example. This example is constructed with the following hypothesis:

- The slave is an interface with the external bus (EBI) containing two regions. The slave size is 2 × 256 Mbytes. Each slave region max size is 256 Mbytes.

- The slave region 0 base address equals 0x10000000. It is connected to a 32 Mbyte memory, for example an external DDR. The slave region 0 top size must be set to 32 Mbytes.
- The slave region 1 base address equals 0x20000000. It is connected to a 2 Mbyte memory, for example an external NAND Flash. The slave region 1 top size must be set to 2 Mbytes.
- The slave software configuration is:
  - SRTOP0 is set to 32 Mbytes
  - SRTOP1 is set to 2 Mbytes
  - SASPLIT0 is set to 4 Mbytes
  - SASPLIT1 is set to 1 Mbyte
  - LANSECH0 is set to 1, the low area of region 0 is the non-securable one
  - RDNSECH0 is set to 0, region 0 Securable area is secured for reads
  - WRNSECH0 is set to 0, region 0 Securable area is secured for writes
  - LANSECH1 is set to 0, the low area of region 1 is the Securable one
  - RDNSECH1 is set to 1, region 1 Securable area is non-secured for reads
  - WRNSECH1 is set to 0, region 1 Securable area is secured for writes

**Figure 18-3. Partitioning Example of an External Securable Slave Featuring 2 Security Regions of 4 Kbytes to 128 Mbytes each and up to 4 Security Areas of 4 Kbytes to 128 Mbytes**



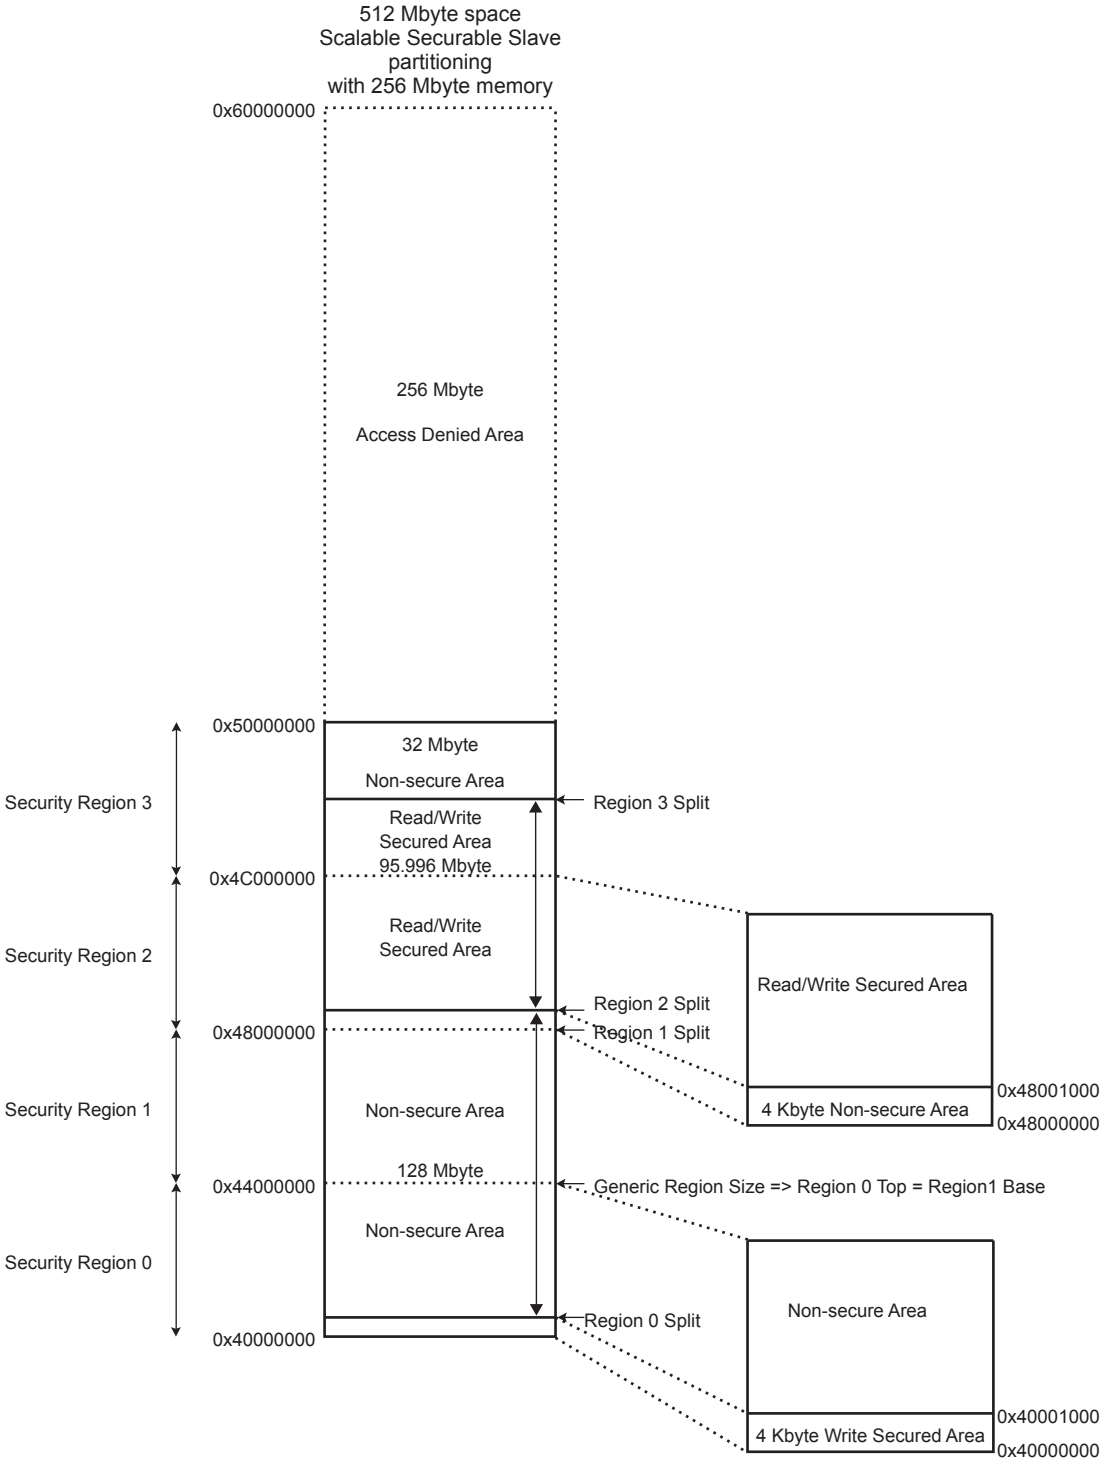
**Note:** The slave region sizes are configured by writing into the Security Region Top Slave Registers.

The slave security area split inside each region is configured by writing into the Security Areas Split Slave Registers.

The figure below shows a Scalable Securable slave example. This example is constructed with the following hypothesis:

- The slave is an external memory with dedicated slave containing four regions, for example an external DDR.
- The slave size is 512 Mbytes.
- The slave base address equals 0x40000000. It is connected to a 256-Mbyte external memory.
- As the connected memory size is 256 Mbytes and there are four regions, the size of each region is 64 Mbytes. This gives the value of the slave region max size and top size. The slave region 0 top size must be configured to 64 Mbytes.
- The slave software configuration is:
  - SRTOP0 is set to 64 Mbytes
  - SASPLIT0 is set to 4 Kbytes
  - SASPLIT1 is set to 64 Mbytes, so its low area occupies the whole region 1
  - SASPLIT2 is set to 4 Kbytes
  - SASPLIT3 is set to 32 Mbytes
  - LANSECH0 is set to 0, the low area of region 0 is the Securable one
  - RDNSECH0 is set to 1, region 0 Securable area is non-secured for reads
  - WRNSECH0 is set to 0, region 0 Securable area is secured for writes
  - LANSECH1 is set to 1, the low area of region 1 is the non-securable one
  - RDNSECH1 is ‘don’t care’ since the low area occupies the whole region 1
  - WRNSECH1 is ‘don’t care’ since the low area occupies the whole region 1
  - LANSECH2 is set to 1, the low area of region 2 is the non-securable one
  - RDNSECH2 is set to 0, region 2 Securable area is secured for reads
  - WRNSECH2 is set to 0, region 2 Securable area is secured for writes
  - LANSECH3 is set to 0, the low area of region 3 is the Securable one
  - RDNSECH3 is set to 0, region 3 Securable area is secured for reads
  - WRNSECH3 is set to 0, region 3 Securable area is secured for writes

**Figure 18-4. Partitioning Example of a Scalable Securable Slave Featuring 4 Equally-sized Security Regions of 1 Mbytes to 128 Mbytes each and up to 8 Security Areas of 4 Kbytes to 128 Mbytes**



**Note:** The slaves' generic security regions sizes are configured by writing into field SRTOP0 of the Security Region Top Slave Registers and the custom slave security areas splits inside each region is configured by writing into the Security Areas Split Slave Registers.

### 18.12.2 Security Types of SDMMC System Bus Slaves

The SDMMC user interface is connected as a system bus slave, and must be configured as Internal Securable to Peripheral (ISP).

Each region in the “Internal Securable to Peripheral” slave type must be programmed with the following characteristics:

- The region must be programmed to be entirely secure or entirely non-secure. This is done with:
  - The split offset must be equal to the maximum size of 128 Mbytes so that the whole peripheral user interface is in the low area below the split. Code sample: MATRIX_SASSRx.SASPLITy = 0xF
  - The bits WRNSECH and RDNSECH must be set respectively to 0=”write secured” and 0=”read secured”. Code sample: MATRIX_SSRx.WRNSECHy = 0; MATRIX_SSRx.RDNSECHy = 0;
  - To set the peripheral to “secure”: the bit LANSECHy must be set to 0 (low area according to RDNSECH0 and WRNSECH0, hence secure).
  - To set the peripheral to “non-secure”: the bit LANSECHy must be set to 1 (low area is non-secure).
    **Note:** The MATRIX_SRTSRx register is not applicable for the “Internal Securable to Peripheral” type.
- The Security Peripheral Select registers (MATRIX_SPSELRx) must be set to the same security attributes for the corresponding Peripheral identifiers: MATRIX_SPSELRx.NSECPy.

### 18.12.3 Security Types of System Bus Masters

Masters send requests to the MATRIX with a security attribute that depends on the master security type, which is identical to the security type of the slave user interface.

For DMA, the TrustZone security attribute can be selected for each channel. Refer to the XDMAC user interface description.

### 18.12.4 Security of Peripheral Bus Slaves

The security type of an APB slave is set at hardware design among the following:

- Always Secure (AS)
- Never Secure (NS)
- Programmable Secure (PS)

To configure the security mode required for accessing a peripheral bus slave connected to the system-to-peripheral bus bridge (HBRIDGE), the MATRIX features three 32-bit Security Peripheral Select x Registers. Some of these bits may have been set to a secure or a non-secure value by design, whereas others are programmed by software (see “Security Peripheral Select x Registers”).

Peripheral security state, “secure” or “non-secure” is an AND operation between H32MX MATRIX_SPSELRx and H64MX MATRIX_SPSELRx for the bit corresponding to the peripheral.

As a general rule:

- The peripheral security state is applied to the corresponding peripheral interrupt line. Exceptions may occur on some peripherals (PIO Controller, etc.). In such case, refer to the peripheral description.
- The peripheral security state is applied to the peripheral master part, if any. Exceptions may occur on some peripherals. In such case, refer to the peripheral description. See “Security Types of AHB Master Peripherals”.

MATRIX_SPSELRx bits in the H32MX or H64MX user interface are respectively read/write or read-only to ‘1’ depending on whether the peripheral is connected or not, on the matrix.

All bit values in the following table except those marked ‘UD’ (User Defined) are read-only and cannot be changed. Values marked ‘UD’ can be changed. Refer to the following examples.

- Example for GMAC, Peripheral ID 5, which is connected to the H32MX Matrix
  - H64MX MATRIX_SPSELR1[5] = 1 (read-only); no influence on the security configuration
  - H32MX MATRIX_SPSELR1[5] can be written by user to program the security.
- Example for LCDC, Peripheral ID 45, which is connected to the H64MX Matrix
  - H64MX MATRIX_SPSELR2[13] can be written by user to program the security.
  - H32MX MATRIX_SPSELR2[13] = 1 (read-only); no influence on the security configuration
- Example for AIC, Peripheral ID 49, which is connected to the H32MX Matrix
  - H64MX MATRIX_SPSELR2[17] = 1 (read-only); sets the peripheral as Non-secure by hardware, also called “Never Secure”
  - H32MX MATRIX_SPSELR2[17] = 1 (read-only); no influence on the security configuration
- Example for SAIC, Peripheral ID 0, which is connected to the H32MX Matrix
  - H64MX MATRIX_SPSELR1[0] = 1 (read-only); no influence on the security configuration
  - H32MX MATRIX_SPSELR1[0] = 0 (read-only); sets the peripheral as Secure by hardware, also called “Always Secure”

**Table 18-9. Peripheral Identifiers**

| Instance ID | Instance Name | Internal Interrupt | PMC Clock Control | Instance Description | Clock Type | Security(1) | In Matrix | MATRIX_SPSELRx Bit | Bit Value in H32MX | Bit Value in H64MX |

**Note:**

1. AS = Always Secure; PS = Programmable Secure; NS = Never Secure.
2. For security purposes, there is no matching clock but a peripheral ID only.
3. The PIT, RSTC and WDT are controlled by the RTC. They are in Secure mode if the RTC is in Secure mode; they are in Non-secure mode if the RTC is in Non-secure mode.

The system-to-peripheral bus bridge compares the incoming master request security bit with the required security mode for the selected peripheral, and accepts or denies access. In the last case, its bus error response is internally flagged in the Master Error Status Register; the offending address is registered in the Master Error Address Registers so that the slave and the targeted protected region are also known.

## 18.13 Register Summary

The user interface below is constructed with the maximum numbers of masters, slaves and regions by slave that are possible on the two product matrixes. The exact number of these elements must be used to deduce the exact register description of the Matrix user interface.

The exact numbers of these elements can be found in the following sections:

- "64-bit Matrix (H64MX)"
- "32-bit Matrix (H32MX)"

### 18.13.1 Bus Matrix Master Configuration Registers

**Name:** MATRIX_MCFGx
**Offset:** 0x00 + x*0x04 [x=0..11]
**Reset:** 0x00000004
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | ULBT[2:0] | | |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 1 | 0 | 0 |

**Bits 2:0 – ULBT[2:0]** Undefined Length Burst Type

| Value | Name | Description |
|---|---|---|
| 0 | UNLIMITED | Unlimited Length Burst—No predicted end of burst is generated, therefore INCR bursts coming from this master can only be broken if the Slave Slot Cycle Limit is reached. If the Slot Cycle Limit is not reached, the burst is normally completed by the master, at the latest, on the next system bus 1 Kbyte address boundary, allowing up to 256-beat word bursts or 128-beat double-word bursts.<br>This value should not be used in the very particular case of a master capable of performing back-to-back undefined length bursts on a single slave, since this could indefinitely freeze the slave arbitration and thus prevent another master from accessing this slave. |
| 1 | SINGLE | Single Access—The undefined length burst is treated as a succession of single accesses, allowing rearbitration at each beat of the INCR burst or bursts sequence. |
| 2 | 4_BEAT | 4-beat Burst—The undefined length burst or bursts sequence is split into 4-beat bursts or less, allowing rearbitration every 4 beats. |
| 3 | 8_BEAT | 8-beat Burst—The undefined length burst or bursts sequence is split into 8-beat bursts or less, allowing rearbitration every 8 beats. |

| Value | Name | Description |
|---|---|---|
| 4 | 16_BEAT | 16-beat Burst—The undefined length burst or bursts sequence is split into 16-beat bursts or less, allowing rearbitration every 16 beats. |
| 5 | 32_BEAT | 32-beat Burst—The undefined length burst or bursts sequence is split into 32-beat bursts or less, allowing rearbitration every 32 beats. |
| 6 | 64_BEAT | 64-beat Burst—The undefined length burst or bursts sequence is split into 64-beat bursts or less, allowing rearbitration every 64 beats. |
| 7 | 128_BEAT | 128-beat Burst—The undefined length burst or bursts sequence is split into 128-beat bursts or less, allowing rearbitration every 128 beats.<br>Unless duly needed, the ULBT should be left at its default 0 value for power saving. |

### 18.13.2 Bus Matrix Slave Configuration Registers

**Name:** MATRIX_SCFGx
**Offset:** 0x40 + x*0x04 [x=0..14]
**Reset:** 0x00000004
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | FIXED_DEFMSTR[3:0] | | | | DEFMSTR_TYPE[1:0] | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SLOT_CYCLE[8:8] |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SLOT_CYCLE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

**Bits 21:18 – FIXED_DEFMSTR[3:0]** Fixed Default Master
This is the number of the Default Master for this slave. Only used if DEFMSTR_TYPE value = 2. Specifying the number of a master which is not connected to the selected slave is equivalent to clearing DEFMSTR_TYPE.

**Bits 17:16 – DEFMSTR_TYPE[1:0]** Default Master Type

| Value | Name | Description |
|---|---|---|
| 0 | NONE | No Default Master—At the end of the current slave access, if no other master request is pending, the slave is disconnected from all masters.<br>This results in a one clock cycle latency for the first access of a burst transfer or for a single access. |
| 1 | LAST | Last Default Master—At the end of the current slave access, if no other master request is pending, the slave stays connected to the last master having accessed it.<br>This results in not having one clock cycle latency when the last master tries to access the slave again. |

| Value | Name | Description |
|---|---|---|
| 2 | FIXED | Fixed Default Master—At the end of the current slave access, if no other master request is pending, the slave connects to the fixed master the number that has been written in the FIXED_DEFMSTR field.<br>This results in not having one clock cycle latency when the fixed master tries to access the slave again. |

**Bits 8:0 – SLOT_CYCLE[8:0]** Maximum Bus Grant Duration for Masters
When SLOT_CYCLE system bus clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access.

This limit must not be too small. Unreasonably small values break every burst and the MATRIX arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See “Slot Cycle Limit Arbitration” for details.

### 18.13.3 Bus Matrix Priority Registers A For Slaves

**Name:** MATRIX_PRASx
**Offset:** 0x80 + x*0x08 [x=0..14]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | M7PR[1:0] | | | | M6PR[1:0] | |

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MPR** Master x Priority
Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool.

Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools.

Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See “Arbitration Priority Scheme” for details.

### 18.13.4 Bus Matrix Priority Registers B For Slaves

**Name:** MATRIX_PRBSx
**Offset:** 0x84 + x*0x08 [x=0..14]
**Reset:** 0
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – SASPLITx** Security Areas Split for HSELx Security Region
This field defines the boundary address offset where the HSELx slave security region splits into two Security Areas with access controlled according to the corresponding MATRIX_SSR. It also defines the Security Low Area size inside the HSELx region.

If this Low Area size is set at or above the HSELx Region Size, then the Security High Area is no longer available and the MATRIX_SSR settings for the Low Area apply to the entire HSELx Security Region.

When applicable to a slave region, the initial value of MATRIX_SASSRx.SASPLITy is 0xF. When not applicable to a slave region, the initial value of MATRIX_SASSRx.SASPLITy is 0x0.

| SASPLITx | Split Offset | Security Low Area Size |
|---|---|---|
| 0000 | 0x00001000 | 4 Kbytes |
| 0001 | 0x00002000 | 8 Kbytes |
| 0010 | 0x00004000 | 16 Kbytes |
| 0011 | 0x00008000 | 32 Kbytes |
| 0100 | 0x00010000 | 64 Kbytes |
| 0101 | 0x00020000 | 128 Kbytes |

.....continued

| SASPLITx | Split Offset | Security Low Area Size |
|---|---|---|

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – SRTOPx** HSELx Security Region Top
This field defines the size of the HSELx security region address space. Invalid sizes for the slave region must never be programmed. Valid sizes and number of security regions are product-, slave- and slave-configuration dependent.

**Note:** The slaves featuring multiple scalable contiguous security regions have a single SRTOP0 field for all the security regions.

If this HSELx security region size is set at or below the HSELx low area size, then there is no Security High Area and the MATRIX_SSR settings for the Low Area apply to the whole HSELx security region.

| SRTOPx | Top Offset | Security Region Size |
|---|---|---|
| 0000 | 0x00001000 | 4 Kbytes |
| 0001 | 0x00002000 | 8 Kbytes |

### 18.13.15 Security Peripheral Select x Registers

**Name:** MATRIX_SPSELRx
**Offset:** 0x02C0 + x*0x04 [x=0..2]
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

The actual number of peripherals implemented is device-specific; refer to the “Peripheral Identifiers” section for details.

Each MATRIX_SPSELR can configure the access security type for up to 32 peripherals:

- MATRIX_SPSELR1 configures the access security type for peripheral identifiers 0–31 (bits NSECP0–NSECP31).
- MATRIX_SPSELR2 configures the access security type for peripheral identifiers 32–63 (bits NSECP0–NSECP31).
- MATRIX_SPSELR3 configures the access security type for peripheral identifiers 64–95 (bits NSECP0–NSECP31).

Reset values are as follows:

- MATRIX_SPSELR1: 0x000D2504 for H32MX, 0xFFF2DAFB for H64MX
- MATRIX_SPSELR2: 0x011C0000 for H32MX, 0xFFE7FFFF for H64MX
- MATRIX_SPSELR3: 0xFFFFFFFA for H32MX, 0xFFFFFFE7 for H64MX

| Value | Description |
|---|---|
| 0 | The selected peripheral address space is configured as “Secured” access (value of ‘0’ has no effect if the peripheral security type is “Peripheral Always Non-secured”). |

| Value | Description |
|---|---|
| 1 | The selected peripheral address space is configured as “Non-secured” access (value of ‘1’ has no effect if the peripheral security type is “Peripheral Always Secured”). |

# 19. Special Function Registers (SFR)

## 19.1 Description

Special Function Registers (SFR) manage specific aspects of the integrated memory, bridge implementations, processor and other functionality not controlled elsewhere.

## 19.2 Embedded Characteristics

- 32-bit Special Function Registers Control Specific Behavior of the Product

## 19.3 Register Summary

### 19.3.1 DDR Configuration Register

**Name:** SFR_DDRCFG
**Offset:** 0x04
**Reset:** 0x00000001
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | FDQSIEN | FDQIEN |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 17 – FDQSIEN** Force DDR_DQS Input Buffer Always On
FDQSIEN = 1 is used to force the selection of the analog comparator inside the IO. If this bit is cleared, the DDR controller automatically manages the selection of the analog comparator. Forcing the bit to 0 reduces power consumption.

| Value | Description |
|---|---|
| 0 | DDR_DQS input buffer controlled by DDR controller. |
| 1 | DDR_DQS input buffer always on. |

**Bit 16 – FDQIEN** Force DDR_DQ Input Buffer Always On
FDQIEN = 1 is used to force the selection of the analog comparator inside the IO. If this bit is cleared, the DDR controller automatically manages the selection of the analog comparator. Forcing the bit to 0 reduces power consumption.

| Value | Description |
|---|---|
| 0 | DDR_DQ input buffer controlled by DDR controller. |
| 1 | DDR_DQ input buffer always on. |

### 19.3.2 OHCI Interrupt Configuration Register

**Name:** SFR_OHCIICR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 27 – HSIC_SEL** Reserved

| Value | Description |
|---|---|
| 0 | Must write 0. |

**Bit 23 – UDPPUDIS** USB DEVICE PULLUP DISABLE

| Value | Description |
|---|---|
| 0 | USB device pullup connection is enabled. |
| 1 | USB device pullup connection is disabled. |

**Bit 10 – SUSPEND_C** USB PORT C

| Value | Description |
|---|---|
| 0 | Suspends controlled by EHCI-OHCI. |
| 1 | Forces the suspend for PORTC. |

**Bit 9 – SUSPEND_B** USB PORT B

| Value | Description |
|---|---|
| 0 | Suspend controlled by EHCI-OHCI. |
| 1 | Forces the suspend for PORTB. |

**Bit 8 – SUSPEND_A** USB PORT A

| Value | Description |
|---|---|
| 0 | Suspends controlled by EHCI-OHCI. |
| 1 | Forces the suspend for PORTA. |

**Bit 5 – APPSTART** Reserved

| Value | Description |
|---|---|
| 0 | Must write 0. |

**Bit 4 – ARIE** OHCI Asynchronous Resume Interrupt Enable

| Value | Description |
|---|---|
| 0 | Interrupt disabled. |
| 1 | Interrupt enabled. |

**Bits 0, 1, 2 – RESx** USB PORTx RESET

| Value | Description |
|---|---|
| 0 | Resets USB Port. |
| 1 | Usable USB Port. |

### 19.3.3 OHCI Interrupt Status Register

**Name:** SFR_OHCIISR
**Offset:** 0x14
**Reset:** –
**Property:** Read/Write

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | ROM |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 8 – FUSE** Disable Access to Fuse Controller
This bit is writable once only. When the Fuse Controller is secured, only a reset signal can clear this bit.

| Value | Description |
|---|---|
| 0 | Fuse Controller is enabled. |
| 1 | Fuse Controller is disabled. |

**Bit 0 – ROM** Disable Access to ROM Code
This bit is writable once only. When the ROM is secured, only a reset signal can clear this bit.

| Value | Description |
|---|---|
| 0 | ROM is enabled. |
| 1 | ROM is disabled. |

### 19.3.5 UTMI Clock Trimming Register

**Name:** SFR_UTMICKTRIM
**Offset:** 0x30
**Reset:** 0x00010000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bits 22:20 – ZP[2:0]** FS Transceiver PMOS Impedance Trimming
Calibration bits to adjust the FS transceiver PMOS output impedance.

**Bits 18:16 – ZN[2:0]** FS Transceiver NMOS Impedance Trimming
Calibration bits to adjust the FS transceiver NMOS output impedance.

**Bits 9:8 – XCVR[1:0]** FS Transceiver Crossover Voltage Trimming
Calibration bits to adjust the FS transceiver crossover voltage.

**Bits 6:4 – FALL[2:0]** FS Transceiver Output Falling Slope Trimming
Calibration bits to adjust the FS transceiver output falling slope.

**Bits 2:0 – RISE[2:0]** FS Transceiver Output Rising Slope Trimming
Calibration bits to adjust the FS transceiver output rising slope.

### 19.3.8 UMTI DP/DM Pin Swapping Register

**Name:** SFR_UTMISWAP
**Offset:** 0x3C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | PORT2 | PORT1 | PORT0 |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 0, 1, 2 – PORTx** PORT x DP/DM Pin Swapping
0 (NORMAL): DP/DM normal pinout.

1 (SWAPPED): DP/DM swapped pinout.

### 19.3.9 CAN Memories Address-based Register

**Name:** SFR_CAN
**Offset:** 0x48
**Reset:** 0x00200020
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | EXT_MEM_CAN1_ADDR[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | EXT_MEM_CAN1_ADDR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | EXT_MEM_CAN0_ADDR[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – EXT_MEM_CAN1_ADDR[15:0]** MSB CAN1 DMA Base Address
Gives the 16-bit MSB of the CAN1 DMA base address. The 16-bit LSB must be programmed in the CAN1 user interface.

**Bits 15:0 – EXT_MEM_CAN0_ADDR[15:0]** MSB CAN0 DMA Base Address
Gives the 16-bit MSB of the CAN0 DMA base address. The 16-bit LSB must be programmed in the CAN0 user interface.

### 19.3.10 Serial Number 0 Register

**Name:** SFR_SN0
**Offset:** 0x4C
**Reset:** –
**Property:** Read-only

This register is used to read the first 32 bits of the 64-bit Serial Number (unique ID).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SN0[31:24] | | | | | | | |

| | SN1[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – SN1[31:0]** Serial Number 1

### 19.3.12 AIC Interrupt Redirection Register

**Name:** SFR_AICREDIR
**Offset:** 0x54
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | AICREDIRKEY[30:23] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | AICREDIRKEY[22:15] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | AICREDIRKEY[14:7] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | AICREDIRKEY[6:0] | | | | | | | NSAIC |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:1 – AICREDIRKEY[30:0]** Unlock Key
Value is a XOR between 0xb6d81c4d and SN1[31:0] but only field [31:1] of the result must be written in this field. In case of set in Secure mode by fuse configuration, this register is read_only 0 (it is not possible to redirect secure interrupts on non-secure AIC for products set in secure mode for security reasons).

After three tries, entering a wrong key results in locking the NSAIC bit. A reset is needed.

**Bit 0 – NSAIC** Interrupt Redirection to Non-Secure AIC

| Value | Description |
|---|---|
| 0 | Interrupts are managed by the AIC corresponding to the Secure State of the peripheral (secure AIC or non-secure AIC). |
| 1 | All interrupts are managed by the non-secure AIC. |

### 19.3.13 HRAMC L2CC Register

**Name:** SFR_L2CC_HRAMC
**Offset:** 0x58
**Reset:** 0x00000000
**Property:** Read/Write

This register is used to configure the L2 cache to be used as an internal SRAM.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SRAM_SEL |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – SRAM_SEL** SRAM Selector

| Value | Description |
|---|---|
| 0 | Selects SRAM. |
| 1 | Selects L2CC. |

### 19.3.14 I2S Register

**Name:** SFR_I2SCLKSEL
**Offset:** 0x90
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | CLKSEL1 | CLKSEL0 |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – CLKSEL1** Clock Selection 1

| Value | Description |
|---|---|
| 0 | Selects PCLK (peripheral clock). |
| 1 | Selects GCLK. |

**Bit 0 – CLKSEL0** Clock Selection 0

| Value | Description |
|---|---|
| 0 | Selects PCLK (peripheral clock). |
| 1 | Selects GCLK. |

### 19.3.15 QSPI Clock Pad Supply Select Register

**Name:** QSPICLK_REG
**Offset:** 0x94
**Reset:** 0x1
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SUP_SEL |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 1 |

**Bit 0 – SUP_SEL** Supply Selection

| Value | Description |
|---|---|
| 0 | 1.8V supply selected. |
| 1 | 3.3V supply selected. |

# 20. Special Function Registers Backup (SFRBU)

## 20.1 Description

Special Function Registers Backup (SFRBU) manages specific aspects of the integrated memory, bridge implementations, processor and other functionality not controlled elsewhere.

## 20.2 Embedded Characteristics

- 32-bit Special Function Registers Backup Controls Specific Behavior of the Product

## 20.3 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SFRBU_PSWBUCTRL | 7:0 | | | | | STATE | SMCTRL | SSWCTRL | SCTRL |
| | | 15:8 | KEY_PSW_MODE[7:0] | | | | | | | |
| | | 23:16 | KEY_PSW_MODE[15:8] | | | | | | | |
| | | 31:24 | KEY_PSW_MODE[23:16] | | | | | | | |
| 0x04 | SFRBU_TSRANGECFG | 7:0 | | | | | | | | TSHRSEL |

| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x14 | SFRBU_RXLPPUCR | 7:0 | | | | | | | | RXDPUCTRL |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |

### 20.3.1 SFRBU Power Switch BU Control Register

**Name:** SFRBU_PSWBUCTRL
**Offset:** 0x00
**Reset:** 0x09
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEY_PSW_MODE[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | KEY_PSW_MODE[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | KEY_PSW_MODE[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | STATE | SMCTRL | SSWCTRL | SCTRL |
| Access | | | | | R | R/W | R/W | R/W |
| Reset | | | | | 1 | 0 | 0 | 1 |

**Bits 31:8 – KEY_PSW_MODE[23:0]** Specific value mandatory to allow writing of other register bits (Write-only)
This field is a security key to prevent power switch changes due to software error or malicious code.

| Value | Description |
|---|---|
| 0x4BD20C | SFRBU_PSWBUCTRL register write possible. |
| Other values | SFRBU_PSWBUCTRL register write impossible. |

**Bit 3 – STATE** Power Switch BU state (Read-only)
Reflects the power switch BU supply source selection in real time. After a switching request, the user must wait for the analog cell switching time to have an updated status (see the section "Electrical Characteristics").

| Value | Description |
|---|---|
| 0 | LDO BU Supply source is VDDBU. |
| 1 | LDO BU Supply source is VDDANA. |

**Bit 2 – SMCTRL** Allow Power Switch BU Control by Security Module Autobackup (Hardware)
Enables automatic selection of the VDDBU source when the security module enters Backup mode.

This automatic supply source switching is independent from the SCTRL and SSWCTRL bits.

| Value | Description |
|---|---|
| 0 | Reset value. No automatic supply source switching from security module. |
| 1 | Automatic supply source switching from security module activated. |

**Bit 1 – SSWCTRL** Power Switch BU Source Selection
Has an action only if SCTRL bit value is “1”.

| Value | Description |
|---|---|
| 0 | Reset value. LDO Supply source is VDDBU. |
| 1 | LDO Supply source is VDDANA. |

**Bit 0 – SCTRL** Power Switch BU Software Control
Used to control the Power Switch BU state by software in addition to the SSWCTRL bit.

| Value | Description |
|---|---|
| 0 | Power Switch BU is controlled by hardware (SSWCTRL bit has no action). |
| 1 | Reset value. Power Switch BU is controlled by software (SSWCTRL bit has an action). |

### 20.3.2 SFRBU Temperature Sensor Range Configuration Register

**Name:** SFRBU_TSRANGECFG
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | TSHRSEL |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – TSHRSEL** Temperature Sensor Range Selection

| Value | Description |
|---|---|
| 0 | Reset value. Temperature sensor high triggering level is +105°C (internal transistor junction temperature). |
| 1 | Temperature sensor high triggering level is +115°C (internal transistor junction temperature). |

### 20.3.3 SFRBU DDR BU Mode Control Register

**Name:** SFRBU_DDRBUMCR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | BUMEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – BUMEN** DDR BU Mode Enable
Isolates the DDR pads from the CPU domain (VDDCORE).

Must be set after enabling the Self-refresh mode on the DDR memory and before powering down on VDDCORE.

To enable Self-refresh mode, refer to the MPDDRC Low-power register (MPDDRC_LPR) in the section "Multi-port DDR-SDRAM Controller" and to "Backup Mode with DDR in Self-refresh" in the section "Electrical Characteristics".

| Value | Description |
|---|---|
| 0 | Reset value. DDR Backup mode disabled. The DDR pads are not isolated from CPU domain. |
| 1 | DDR Backup mode enabled. The DDR pads are isolated from CPU domain (IOs are in memory state). |

### 20.3.4 SFRBU RXLP Pull-Up Control Register

**Name:** SFRBU_RXLPPUCR
**Offset:** 0x14
**Reset:** 0x01
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RXDPUCTRL |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 1 |

**Bit 0 – RXDPUCTRL** RXLP RXD Pull-Up Control
If the RXLP is not used, it is recommended to clear this bit (enable the pull-up) to avoid power consumption on the VDDBU rail.

| Value | Description |
|---|---|
| 0 | Reset value. Pull-up enabled on RXD IO. |
| 1 | Pull-up disabled on RXD IO. |

# 21. Advanced Interrupt Controller (AIC)

## 21.1 Description

The Advanced Interrupt Controller (AIC) is an 8-level priority, individually maskable, vectored interrupt controller providing handling of up to one hundred and twenty-eight interrupt sources. It is designed to substantially reduce the software and real-time overhead in handling internal and external interrupts.

The AIC drives the nFIQ (fast interrupt request) and the nIRQ (standard interrupt request) inputs of an ARM processor. Inputs of the AIC are either internal peripheral interrupts or external interrupts coming from the product's pins.

The 8-level Priority Controller allows the user to define the priority for each interrupt source, thus permitting higher priority interrupts to be serviced even if a lower priority interrupt is being processed.

Internal interrupt sources can be programmed to be level-sensitive or edge-triggered. External interrupt sources can be programmed to be rising-edge or falling-edge triggered or high-level or low-level sensitive.

## 21.2 Embedded Characteristics

- Controls the Interrupt Lines (nIRQ and nFIQ) of an ARM Processor
- 128 Individually Maskable and Vectored Interrupt Sources
  - Source 0 is reserved for the fast interrupt input (FIQ)
  - Source 74 is reserved for system peripheral interrupts
  - Sources 2 to 73 and Sources 75 to 127 control up to 125 embedded peripheral interrupts or external interrupts
  - Programmable edge-triggered or level-sensitive internal sources
  - Programmable rising/falling edge-triggered or high/low level-sensitive external sources
- 8-level Priority Controller
  - Drives the normal interrupt of the processor
  - Handles priority of the interrupt sources 1 to 127
  - Higher priority interrupts can be served during service of lower priority interrupt
- Vectoring
  - Optimizes interrupt service routine branch and execution
  - One 32-bit vector register for all interrupt sources
  - Interrupt vector register reads the corresponding current interrupt vector
- Protect Mode
  - Easy debugging by preventing automatic operations when protect models are enabled
- General Interrupt Mask
  - Provides processor synchronization on events without triggering an interrupt
- Register Write Protection
- AIC0 is Non-Secure AIC, AIC1 is Secure AIC
- AIC0 manages nIRQ line, AIC1 manages nFIQ line

## 21.3 Block Diagram

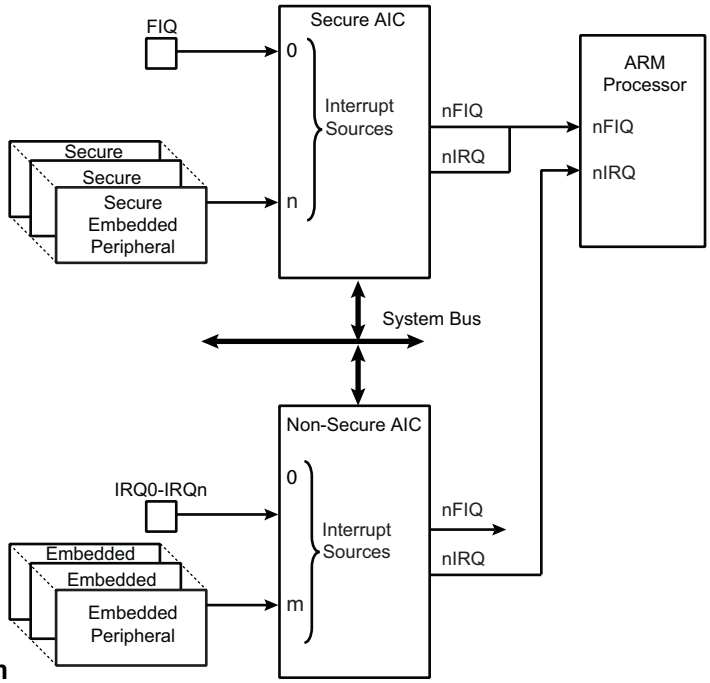

**Figure 21-1. Block Diagram**

## 21.6 I/O Line Description

**Table 21-1. I/O Line Description**

| Pin Name | Pin Description | Type |
|---|---|---|
| FIQ | Fast Interrupt | Input |
| IRQ0–IRQn | Interrupt 0–Interrupt n | Input |

## 21.7 Product Dependencies

### 21.7.1 I/O Lines

The interrupt signals FIQ and IRQ0 to IRQn are normally multiplexed through the PIO controllers. Depending on the features of the PIO controller used in the product, the pins must be programmed in accordance with their assigned interrupt functions. This is not applicable when the PIO controller used in the product is transparent on the input path.

### 21.7.2 Power Management

The AIC is continuously clocked. The Power Management Controller has no effect on the AIC behavior.

The assertion of the AIC outputs, either nIRQ or nFIQ, wakes up the ARM processor while it is in Idle mode. The General Interrupt Mask feature enables the AIC to wake up the processor without asserting the interrupt line of the processor, thus providing synchronization of the processor on an event.

### 21.7.3 Interrupt Sources

FIQ always drives Interrupt Source 0.

The System Controller interrupt drives Interrupt Source 74.

The System Controller interrupt is the result of the OR-wiring of the System Controller interrupt lines. When a System Controller interrupt occurs, the service routine must first distinguish the cause of the interrupt. This is performed by reading successively the status registers of the System Controller peripherals.

Interrupt sources 2 to 73 and 75 to 127 can either be connected to the interrupt outputs of an embedded user peripheral, or to external interrupt lines. The external interrupt lines can be connected either directly or through the PIO Controller.

PIO controllers are considered as user peripherals in the scope of interrupt handling. Accordingly, the PIO controller interrupt lines are connected to interrupt sources 2 to 73 and 75 to 127.

The peripheral identification defined at the product level corresponds to the interrupt source number (as well as the bit number controlling the clock of the peripheral). Consequently, to simplify the description of the functional operations and the user interface, the interrupt sources are named FIQ, SYS, and PID2 to PID73 and PID75 to PID127.

AIC0 manages all Non-Secure Interrupts including IRQn; AIC1 manages all Secure Interrupts including FIQ.

Each AIC has its own User Interface. The user should pay attention to use the relevant user interface for each source.

## 21.8 Functional Description

### 21.8.1 Interrupt Source Control

#### 21.8.1.1 Interrupt Source Mode

The AIC independently programs each interrupt source. The SRCTYPE field of the Source Mode register (AIC_SMR) selects the interrupt condition of the interrupt source selected by the INTSEL field of the Source Select register (AIC_SSR).

**Note:** Configuration registers such as AIC_SMR and AIC_SSR return the values corresponding to the interrupt source selected by INTSEL.

The internal interrupt sources wired on the interrupt outputs of the embedded peripherals can be programmed either in Level-Sensitive mode or in Edge-Triggered mode. The active level of the internal interrupts is not important for the user.

The external interrupt sources can be programmed either in High Level-Sensitive or Low Level-Sensitive modes, or in Rising Edge-Triggered or Negative Edge-Triggered modes.

#### 21.8.1.2 Interrupt Source Enabling

Each interrupt source, including the FIQ in source 0, can be enabled or disabled by using the command registers Interrupt Enable Command register (AIC_IECR) and Interrupt Disable Command register (AIC_IDCR). The interrupt mask of the selected interrupt source can be read in the Interrupt Mask register (AIC_IMR). A disabled interrupt does not affect servicing of other interrupts.

#### 21.8.1.3 Interrupt Clearing and Setting

All interrupt sources programmed to be edge-triggered (including the FIQ in source 0) can be individually set or cleared by writing respectively the Interrupt Set Command register (AIC_ISCR) and Interrupt Clear

Command register (AIC_ICCR). Clearing or setting interrupt sources programmed in Level-Sensitive mode has no effect.

The clear operation is perfunctory, as the software must perform an action to reset the “memorization” circuitry activated when the source is programmed in Edge-Triggered mode. However, the set operation is available for auto-test or software debug purposes. It can also be used to execute an AIC-implementation of a software interrupt.

The AIC features an automatic clear of the current interrupt when AIC_IVR (Interrupt Vector register) is read. Only the interrupt source being detected by the AIC as the current interrupt is affected by this operation. (See the section “Priority Controller”.) The automatic clear reduces the operations required by the interrupt service routine entry code to read AIC_IVR.

The automatic clear of interrupt source 0 is performed when the FIQ Vector register (AIC_FVR) is read.

#### 21.8.1.4 Interrupt Status

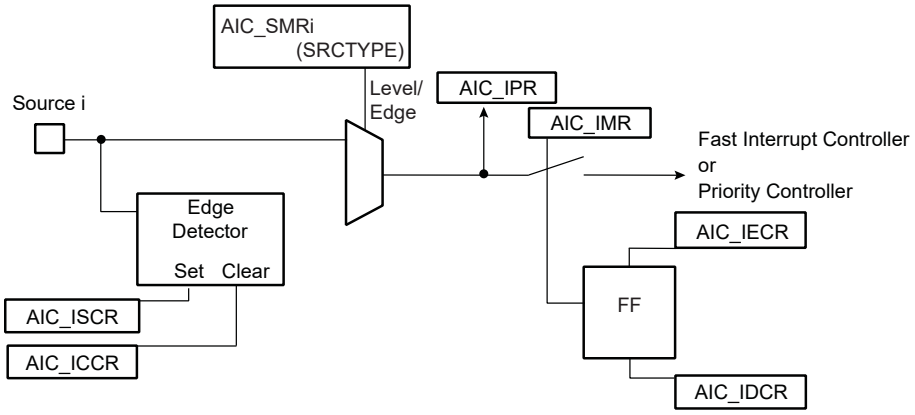
Interrupt Pending registers (AIC_IPR) represent the state of the interrupt lines, whether they are masked or not. AIC_IMR can be used to define the mask of the interrupt lines.

The Interrupt Status register (AIC_ISR) reads the number of the current interrupt (see the section ”Priority Controller”) and the Core Interrupt Status register (AIC_CISR) gives an image of the nIRQ and nFIQ signals driven on the processor.

Each status referred to above can be used to optimize the interrupt handling of the systems.

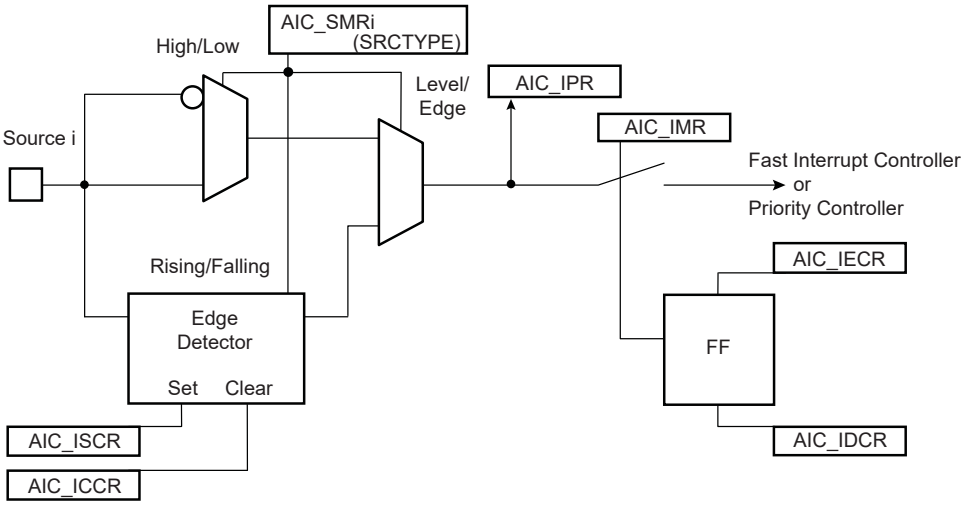
#### 21.8.1.5 Internal Interrupt Source Input Stage

**Figure 21-4. Internal Interrupt Source Input Stage**



#### 21.8.1.6 External Interrupt Source Input Stage

**Figure 21-5. External Interrupt Source Input Stage**



### 21.8.2 Interrupt Latencies

Global interrupt latencies depend on several parameters, including:

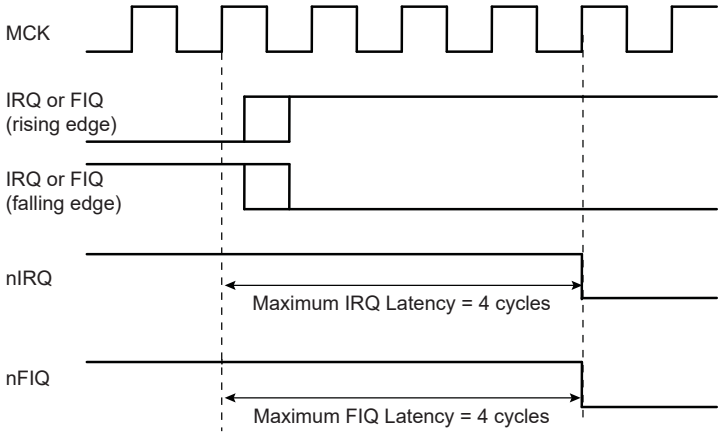
- The time the software masks the interrupts
- Occurrence, either at the processor level or at the AIC level
- The execution time of the instruction in progress when the interrupt occurs
- The treatment of higher priority interrupts and the resynchronization of the hardware signals

This section addresses hardware resynchronizations only. It gives details about the latency times between the events on an external interrupt leading to a valid interrupt (edge or level) or the assertion of an internal interrupt source and the assertion of the nIRQ or nFIQ line on the processor. The resynchronization time depends on the programming of the interrupt source and on its type (internal or external). For the standard interrupt, resynchronization times are given assuming there is no higher priority in progress.

The PIO Controller multiplexing has no effect on the interrupt latencies of the external interrupt sources.

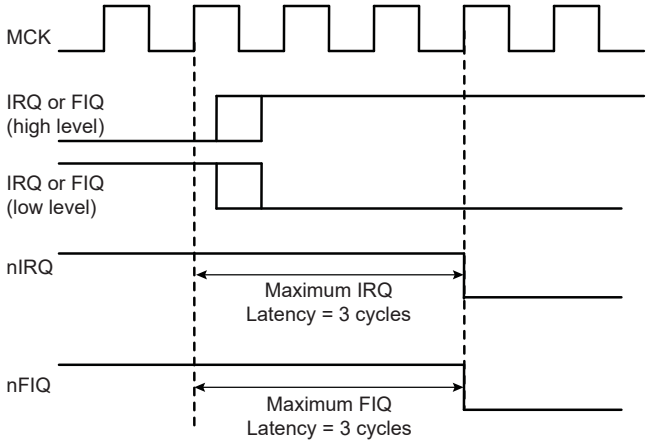
#### 21.8.2.1 External Interrupt Edge Triggered Source

**Figure 21-6. External Interrupt Edge Triggered Source**



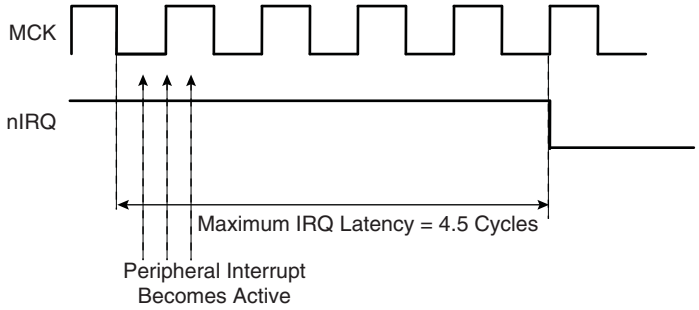
#### 21.8.2.2 External Interrupt Level Sensitive Source

**Figure 21-7. External Interrupt Level Sensitive Source**



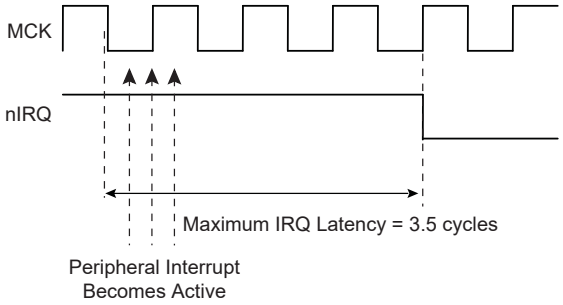
#### 21.8.2.3 Internal Interrupt Edge Triggered Source

**Figure 21-8. Internal Interrupt Edge Triggered Source**



#### 21.8.2.4 Internal Interrupt Level Sensitive Source

**Figure 21-9. Internal Interrupt Level Sensitive Source**



### 21.8.3 Normal Interrupt

#### 21.8.3.1 Priority Controller

An 8-level priority controller drives the nIRQ line of the processor, depending on the interrupt conditions occurring on the interrupt sources 1 to 127.

Each interrupt source has a programmable priority level of 7 to 0, which is user-definable by writing AIC_SMR.PRIOR. Level 7 is the highest priority and level 0 the lowest.

As soon as an interrupt condition occurs, as defined by AIC_SMR.SRCTYPE, the nIRQ line is asserted. As a new interrupt condition might have happened on other interrupt sources since the nIRQ has been asserted, the priority controller determines the current interrupt at the time AIC_IVR is read. The read of

AIC_IVR is the entry point of the interrupt handling which allows the AIC to consider that the interrupt has been taken into account by the software.

The current priority level is defined as the priority level of the current interrupt.

If several interrupt sources of equal priority are pending and enabled when AIC_IVR is read, the interrupt with the lowest interrupt source number is serviced first.

The nIRQ line can be asserted only if an interrupt condition occurs on an interrupt source with a higher priority. If an interrupt condition happens (or is pending) during the interrupt treatment in progress, it is delayed until the software indicates to the AIC the end of the current service by writing AIC_EOICR (End of Interrupt Command register). The write of AIC_EOICR is the exit point of the interrupt handling.

#### 21.8.3.2 Interrupt Nesting

The priority controller utilizes interrupt nesting in order for the high priority interrupt to be handled during the service of lower priority interrupts. This requires the interrupt service routines of the lower interrupts to re-enable the interrupt at the processor level.

When an interrupt of a higher priority happens during an already occurring interrupt service routine, the nIRQ line is re-asserted. If the interrupt is enabled at the core level, the current execution is interrupted and the new interrupt service routine should read AIC_IVR. At this time, the current interrupt number and its priority level are pushed into an embedded hardware stack, so that they are saved and restored when the higher priority interrupt servicing is finished and AIC_EOICR is written.

The AIC is equipped with an 8-level wide hardware stack in order to support up to eight interrupt nestings to match the eight priority levels.

#### 21.8.3.3 Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the ARM processor, and especially the Processor Interrupt modes and the associated status bits.

It is assumed that:

1. The AIC has been programmed, AIC_SVR registers are loaded with corresponding interrupt service routine addresses and interrupts are enabled.
2. The instruction at the ARM interrupt exception vector address is required to work with the vectoring. Load the PC with the absolute address of the interrupt handler.

When nIRQ is asserted, if the bit “I” of CPSR is 0, the sequence is as follows:

1. The CPSR is stored in SPSR_irq, the current value of the Program Counter is loaded in the Interrupt link register (R14_irq) and the Program Counter (R15) is loaded with 0x18. In the following cycle during fetch at address 0x1C, the ARM core adjusts R14_irq, decrementing it by four.
2. The ARM core enters Interrupt mode, if it has not already done so.
3. When the instruction loaded at address 0x18 is executed, the program counter is loaded with the value read in AIC_IVR. Reading AIC_IVR has the following effects:
   - Sets the current interrupt to be the pending and enabled interrupt with the highest priority. The current level is the priority level of the current interrupt.
   - De-asserts the nIRQ line on the processor. Even if vectoring is not used, AIC_IVR must be read in order to de-assert nIRQ.
   - Automatically clears the interrupt, if it has been programmed to be edge-triggered.
   - Pushes the current level and the current interrupt number on to the stack.
   - Returns the value written in AIC_SVR corresponding to the current interrupt.

4. The previous step has the effect of branching to the corresponding interrupt service routine. This should start by saving the link register (R14_irq) and SPSR_IRQ. The link register must be decremented by four when it is saved if it is to be restored directly into the program counter at the end of the interrupt. For example, the instruction `SUB PC, LR, #4` may be used.
5. Further interrupts can then be unmasked by clearing the “I” bit in CPSR, allowing re-assertion of the nIRQ to be taken into account by the core. This can happen if an interrupt with a higher priority than the current interrupt occurs.
6. The interrupt handler can then proceed as required, saving the registers that will be used and restoring them at the end. During this phase, an interrupt of higher priority than the current level will restart the sequence from step 1.
   **Note:** If the interrupt is programmed to be level-sensitive, the source of the interrupt must be cleared during this phase.
7. The “I” bit in CPSR must be set in order to mask interrupts before exiting to ensure that the interrupt is completed in an orderly manner.
8. AIC_EOICR must be written in order to indicate to the AIC that the current interrupt is finished. This causes the current level to be popped from the stack, restoring the previous current level if one exists on the stack. If another interrupt is pending, with lower or equal priority than the old current level but with higher priority than the new current level, the nIRQ line is re-asserted, but the interrupt sequence does not immediately start because the “I” bit is set in the core. SPSR_irq is restored. Finally, the saved value of the link register is restored directly into the PC. This has the effect of returning from the interrupt to whatever was being executed before, and of loading the CPSR with the stored SPSR, masking or unmasking the interrupts depending on the state saved in SPSR_irq.
   **Note:** The “I” bit in SPSR is significant. If it is set, it indicates that the ARM core was on the verge of masking an interrupt when the mask instruction was interrupted. Hence, when SPSR is restored, the mask instruction is completed (interrupt is masked).

### 21.8.4 Fast Interrupt

#### 21.8.4.1 Fast Interrupt Source

Interrupt source 0 is the only source which can raise a fast interrupt request to the processor. Interrupt source 0 is generally connected to a FIQ pin of the product, either directly or through a PIO Controller.

#### 21.8.4.2 Fast Interrupt Control

The fast interrupt logic of the AIC has no priority controller. The mode of interrupt source 0 is programmed with AIC_SMR and INTSEL = 0; the PRIOR field of this register is not used even if it reads what has been written. AIC_SMR.SRCTYPE enables programming the fast interrupt source to be rising-edge triggered or falling-edge triggered or high-level sensitive or low-level sensitive.

Writing 0x1 in AIC_IECR and AIC_IDCR respectively enables and disables the fast interrupt when INTSEL = 0. Bit 0 of AIC_IMR indicates whether the fast interrupt is enabled or disabled.

#### 21.8.4.3 Fast Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the ARM processor, and especially the Processor Interrupt modes and associated status bits.

Assuming that:

1. The AIC has been programmed, AIC_SVR is loaded with the fast interrupt service routine address, and interrupt source 0 is enabled.

2. The Instruction at address 0x1C (FIQ exception vector address) is required to vector the fast interrupt. Load the PC with the absolute address of the interrupt handler.
3. The user does not need nested fast interrupts.

When nFIQ is asserted, if bit “F” of CPSR is 0, the sequence is:

1. The CPSR is stored in SPSR_fiq, the current value of the program counter is loaded in the FIQ link register (R14_FIQ) and the program counter (R15) is loaded with 0x1C. In the following cycle, during fetch at address 0x20, the ARM core adjusts R14_fiq, decrementing it by four.
2. The ARM core enters FIQ mode.
3. The routine must read AIC1_CISR to know if the interrupt is the FIQ or a Secure Internal interrupt.

```
   ldr r1, =REG_SAIC_CISR
   ldr r1, [r1]
   cmp r1, #AIC_CISR_NFIQ
   beq get_fiqvec_addr
```

   If FIQ is active, it is processed in priority, even if another interrupt is active.

```
get_irqvec_addr
   ldr r14, =REG_SAIC_IVR
   b read_vec
get_fiqvec_addr
   ldr r14, =REG_SAIC_FVR
read_vec
   ldr r0, [r14]
```

   Now r0 contains the correct vector address, IVR for a Secure Internal interrupt or FVR for FIQ.

   The system can branch to the routine pointed to by r0.

```
FIQ_Handler_Branch
   mov r14, pc
   bx r0
```

4. The previous step enables branching to the corresponding interrupt service routine. It is not necessary to save the link register R14_fiq and SPSR_fiq if nested fast interrupts are not needed.
5. The Interrupt Handler can then proceed as required. It is not necessary to save registers R8 to R13 because the FIQ mode has its own dedicated registers and registers R8 to R13 are banked. The other registers, R0 to R7, must be saved before being used, and restored at the end (before the next step).
   **Note:** If the fast interrupt is programmed to be level-sensitive, the source of the interrupt must be cleared during this phase in order to de-assert interrupt source 0.
6. Finally, Link register R14_fiq is restored into the PC after decrementing it by four (with instruction `SUB PC, LR, #4` for example). This has the effect of returning from the interrupt to whatever was being executed before, loading the CPSR with the SPSR and masking or unmasking the fast interrupt depending on the state saved in the SPSR.
   **Note:** The “F” bit in SPSR is significant. If it is set, it indicates that the ARM core was just about to mask FIQ interrupts when the mask instruction was interrupted. Hence, when the SPSR is restored, the interrupted instruction is completed (FIQ is masked).

Another way to handle the fast interrupt is to map the interrupt service routine at the address of the ARM vector 0x1C. This method does not use vectoring, so that reading AIC_FVR must be performed at the very beginning of the handler operation. However, this method saves the execution of a branch instruction.

### 21.8.5 Protect Mode

The Protect mode is used to read the Interrupt Vector register without performing the associated automatic operations. This is necessary when working with a debug system. When a debugger, working either with a Debug Monitor or the ARM processor's ICE, stops the applications and updates the opened windows, it might read the AIC User Interface and thus the IVR. This has adverse consequences:

- If an enabled interrupt with a higher priority than the current one is pending, it is stacked.
- If there is no enabled pending interrupt, the spurious vector is returned.

In either case, an End of Interrupt command is necessary to acknowledge and restore the context of the AIC. This operation is generally not performed by the debug system, as the debug system would become strongly intrusive and cause the application to enter an undesired state.

This is avoided by using the Protect mode. Writing PROT in the Debug Control register (AIC_DCR) at 0x1 enables the Protect mode.

When the Protect mode is enabled, the AIC performs interrupt stacking only when a write access is performed on AIC_IVR. Therefore, the Interrupt Service Routines must write (arbitrary data) to AIC_IVR just after reading it. The new context of the AIC, including the value of AIC_ISR, is updated with the current interrupt only when AIC_IVR is written.

An AIC_IVR read on its own (e.g., by a debugger) modifies neither the AIC context nor AIC_ISR. Extra AIC_IVR reads perform the same operations. However, it is recommended to not stop the processor between the read and the write of AIC_IVR of the interrupt service routine to make sure the debugger does not modify the AIC context.

To summarize, in normal operating mode, the read of AIC_IVR performs the following operations within the AIC:

1. Calculates active interrupt (higher than current or spurious).
2. Determines and returns the vector of the active interrupt.
3. Memorizes the interrupt.
4. Pushes the current priority level onto the internal stack.
5. Acknowledges the interrupt.

However, while the Protect mode is activated, only operations 1 to 3 are performed when AIC_IVR is read. Operations 4 and 5 are only performed by the AIC when AIC_IVR is written.

Software that has been written and debugged using the Protect mode runs correctly in normal mode without modification. However, in normal mode, the AIC_IVR write has no effect and can be removed to optimize the code.

### 21.8.6 Spurious Interrupt

The AIC features a protection against spurious interrupts. A spurious interrupt is defined as being the assertion of an interrupt source long enough for the AIC to assert the nIRQ, but no longer present when AIC_IVR is read. This is most prone to occur when:

- An external interrupt source is programmed in Level-Sensitive mode and an active level occurs for only a short time.
- An internal interrupt source is programmed in level-sensitive and the output signal of the corresponding embedded peripheral is activated for a short time (as is the case for the watchdog).
- An interrupt occurs just a few cycles before the software begins to mask it, thus resulting in a pulse on the interrupt source.

The AIC detects a spurious interrupt at the time AIC_IVR is read while no enabled interrupt source is pending. When this happens, the AIC returns the value stored by the programmer in the Spurious Vector register (AIC_SPU). The programmer must store the address of a spurious interrupt handler in AIC_SPU as part of the application, to enable an as fast as possible return to the normal execution flow. This handler writes in AIC_EOICR and performs a return from interrupt.

### 21.8.7 General Interrupt Mask

The AIC features a General Interrupt Mask bit (AIC_DCR.GMSK) to prevent interrupts from reaching the processor. Both the nIRQ and the nFIQ lines are driven to their inactive state if AIC_DCR.GMSK is set. However, this mask does not prevent waking up the processor if it has entered Idle mode. This function facilitates synchronizing the processor on a next event and, as soon as the event occurs, performs subsequent operations without having to handle an interrupt. It is strongly recommended to use this mask with caution.

### 21.8.8 Register Write Protection

To prevent any single software error from corrupting AIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the AIC Write Protection Mode Register (AIC_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the AIC Write Protection Status Register (AIC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading AIC_WPSR.

The following registers can be write-protected:

- AIC Source Mode Register
- AIC Source Vector Register
- AIC Spurious Interrupt Vector Register
- AIC Debug Control Register

## 21.9 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|

| | | 31:24 | | | | | | | | |

### 21.9.1 AIC Source Select Register

**Name:** AIC_SSR
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | INTSEL[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 6:0 – INTSEL[6:0]** Interrupt Line Selection
0–127 = Selects the interrupt line to handle.

See the section ”Interrupt Source Mode”.

### 21.9.2 AIC Source Mode Register

**Name:** AIC_SMR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | SRCTYPE[1:0] | | | | PRIOR[2:0] | | |
| Access | | R/W | R/W | | | R/W | R/W | R/W |
| Reset | | 0 | 0 | | | 0 | 0 | 0 |

**Bits 6:5 – SRCTYPE[1:0]** Interrupt Source Type
The active level or edge is not programmable for the internal interrupt source selected by INTSEL.

| Value | Name | Description |
|---|---|---|
| 0 | INT_LEVEL_SENSITIVE | High-level sensitive for internal source.<br>Low-level sensitive for external source. |
| 1 | EXT_NEGATIVE_EDGE | Negative-edge triggered for external source. |
| 2 | EXT_HIGH_LEVEL | High-level sensitive for internal source.<br>High-level sensitive for external source. |
| 3 | EXT_POSITIVE_EDGE | Positive-edge triggered for external source. |

**Bits 2:0 – PRIOR[2:0]** Priority Level
Programs the priority level of the source selected by INTSEL except FIQ source (source 0).

The priority level can be between 0 (lowest) and 7 (highest).

The priority level is not used for the FIQ.

### 21.9.3 AIC Source Vector Register

**Name:** AIC_SVR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VECTOR[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VECTOR[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | VECTOR[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VECTOR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – VECTOR[31:0]** Source Vector
The user may store in this register the address of the corresponding handler for the interrupt source selected by INTSEL.

### 21.9.4 AIC Interrupt Vector Register

**Name:** AIC_IVR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IRQV[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IRQV[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IRQV[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IRQV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – IRQV[31:0]** Interrupt Vector Register
The Interrupt Vector Register contains the vector programmed by the user in the Source Vector Register corresponding to the current interrupt.

The Source Vector Register is indexed using the current interrupt number when the Interrupt Vector Register is read.

When there is no current interrupt, the Interrupt Vector Register reads the value stored in AIC_SPU.

### 21.9.5 AIC FIQ Vector Register

**Name:** AIC_FVR
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FIQV[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | FIQV[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | FIQV[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FIQV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – FIQV[31:0]** FIQ Vector Register
The FIQ Vector Register contains the vector programmed by the user in the Source Vector Register when INTSEL = 0. When there is no fast interrupt, the FIQ Vector Register reads the value stored in AIC_SPU.

### 21.9.6 AIC Interrupt Status Register

**Name:** AIC_ISR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | IRQID[6:0] | | | | | | |
| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 6:0 – IRQID[6:0]** Current Interrupt Identifier
The Interrupt Status Register returns the current interrupt source number.

### 21.9.7 AIC Interrupt Pending Register 0

**Name:** AIC_IPR0
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PID31 | PID30 | PID29 | PID28 | PID27 | PID26 | PID25 | PID24 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PID23 | PID22 | PID21 | PID20 | PID19 | PID18 | PID17 | PID16 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | PID15 | PID14 | PID13 | PID12 | PID11 | PID10 | PID9 | PID8 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PID7 | PID6 | PID5 | PID4 | PID3 | PID2 | PID1 | FIQ |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32 – PIDx** Interrupt Pending
PID2...PID31 refer to the identifiers as defined in the Peripheral Identifiers section.

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

**Bit 0 – FIQ** Interrupt Pending

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

### 21.9.8 AIC Interrupt Pending Register 1

**Name:** AIC_IPR1
**Offset:** 0x24
**Reset:** 0x00000000
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.
PID32...PID63 refer to the identifiers as defined in the Peripheral Identifiers section.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PID63 | PID62 | PID61 | PID60 | PID59 | PID58 | PID57 | PID56 |

|---|---|---|---|---|---|---|---|---|
| | PID39 | PID38 | PID37 | PID36 | PID35 | PID34 | PID33 | PID32 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Interrupt Pending

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

### 21.9.9 AIC Interrupt Pending Register 2

**Name:** AIC_IPR2
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PID95 | PID94 | PID93 | PID92 | PID91 | PID90 | PID89 | PID88 |

**Bits 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Interrupt Pending

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

**Bit 10 – SYS** Interrupt Pending

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 – PIDx** Interrupt Pending

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

### 21.9.10 AIC Interrupt Pending Register 3

**Name:** AIC_IPR3
**Offset:** 0x2C
**Reset:** 0x00000000
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.
PID96...PID127 bit fields refer to the identifiers as defined in the Peripheral Identifiers section.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PID127 | PID126 | PID125 | PID124 | PID123 | PID122 | PID121 | PID120 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PID103 | PID102 | PID101 | PID100 | PID99 | PID98 | PID97 | PID96 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Interrupt Pending

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not pending. |
| 1 | The corresponding interrupt is pending. |

### 21.9.11 AIC Interrupt Mask Register

**Name:** AIC_IMR
**Offset:** 0x30
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | INTM |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 0 – INTM** Interrupt Mask

| Value | Description |
|---|---|
| 0 | The interrupt source selected by AIC_SSR.INTSEL is disabled. |
| 1 | The interrupt source selected by AIC_SSR.INTSEL is enabled. |

### 21.9.12 AIC Core Interrupt Status Register

**Name:** AIC_CISR
**Offset:** 0x34
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | NIRQ | NFIQ |
| Access | | | | | | | R | R |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – NIRQ** NIRQ Status

| Value | Description |
|---|---|
| 0 | nIRQ line is deactivated. |
| 1 | nIRQ line is active. |

**Bit 0 – NFIQ** NFIQ Status

| Value | Description |
|---|---|
| 0 | nFIQ line is deactivated. |
| 1 | nFIQ line is active. |

### 21.9.13 AIC End of Interrupt Command Register

**Name:** AIC_EOICR
**Offset:** 0x38
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | ENDIT |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – ENDIT** Interrupt Processing Complete Command
The End of Interrupt Command Register is used by the interrupt routine to indicate that the interrupt treatment is complete. Any value can be written because it is only necessary to make a write to this register location to signal the end of interrupt treatment.

### 21.9.14 AIC Spurious Interrupt Vector Register

**Name:** AIC_SPU
**Offset:** 0x3C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SIVR[31:24] | | | | | | | |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of AIC_WPSR. |
| 1 | A write protection violation has occurred since the last read of AIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 22. Watchdog Timer (WDT)

## 22.1 Description

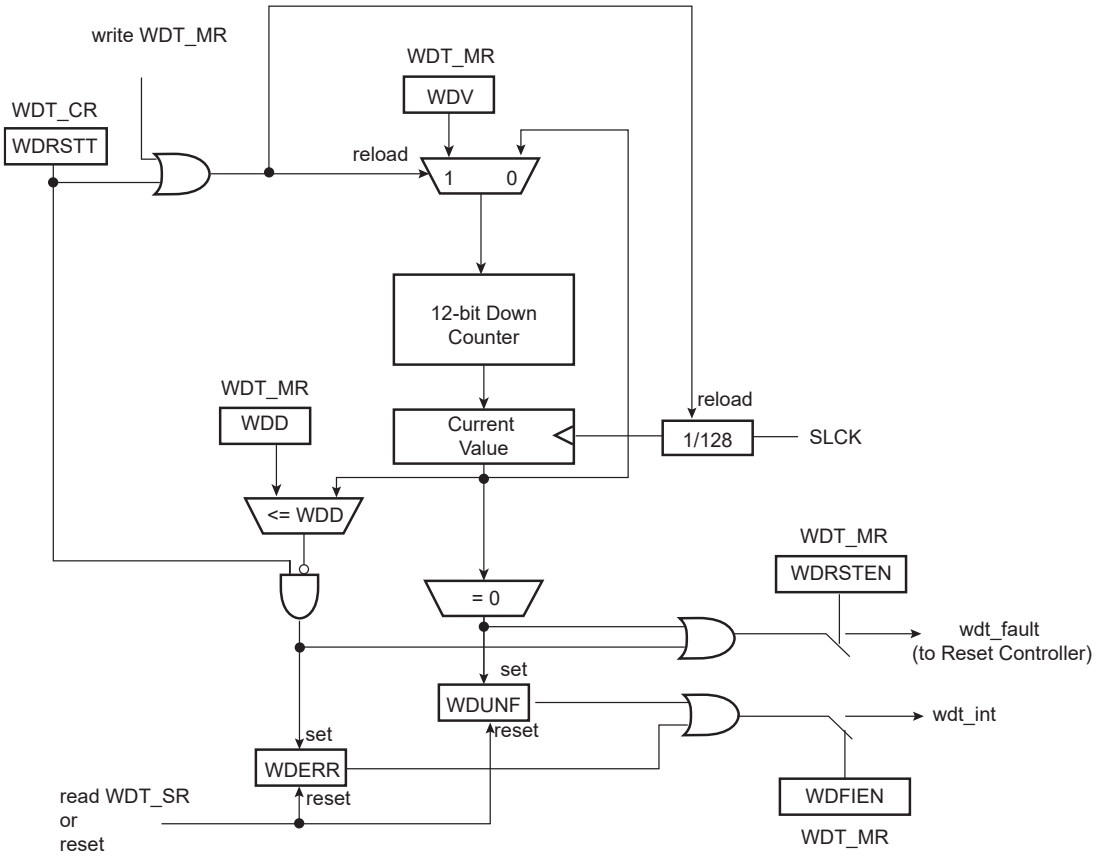
The Watchdog Timer (WDT) is used to prevent system lock-up if the software becomes trapped in a deadlock. It features a 12-bit down counter that allows a watchdog period of up to 16 seconds (slow clock around 32 kHz). It can generate a general reset or a processor reset only. In addition, it can be stopped while the processor is in Debug mode or Sleep mode (Idle mode).

## 22.2 Embedded Characteristics

- 12-bit Key-protected Programmable Counter
- Watchdog Clock is Independent from Processor Clock
- Provides Reset or Interrupt Signals to the System
- Counter May Be Stopped while the Processor is in Debug State or in Idle Mode

## 22.3 Block Diagram

**Figure 22-1. Watchdog Timer Block Diagram**



## 22.4 Functional Description

The Watchdog Timer is used to prevent system lock-up if the software becomes trapped in a deadlock. It is supplied with VDDCORE. It restarts with initial values on processor reset.

The watchdog is built around a 12-bit down counter, which is loaded with the value defined in the field WDV of the Mode Register (WDT_MR). The Watchdog Timer uses the slow clock divided by 128 to establish the maximum watchdog period to be 16 seconds (with a typical slow clock of 32.768 kHz).

After a processor reset, the value of WDV is 0xFFF, corresponding to the maximum value of the counter with the external reset generation enabled (field WDRSTEN at 1 after a backup reset). This means that a default watchdog is running at reset, i.e., at power-up. The user can either disable the WDT by setting bit WDT_MR.WDDIS or reprogram the WDT to meet the maximum watchdog period the application requires.

When setting the WDDIS bit, and while it is set, the fields WDV and WDD must not be modified.

If the watchdog is restarted by writing into the Control Register (WDT_CR), WDT_MR must not be programmed during a period of time of three slow clock periods following the WDT_CR write access. In any case, programming a new value in WDT_MR automatically initiates a restart instruction.

WDT_MR can be written until a LOCKMR command is issued in WDT_CR. Only a processor reset resets it. Writing WDT_MR reloads the timer with the newly programmed mode parameters.

In normal operation, the user reloads the watchdog at regular intervals before the timer underflow occurs, by setting bit WDT_CR.WDRSTT. The watchdog counter is then immediately reloaded from WDT_MR and restarted, and the slow clock 128 divider is reset and restarted. WDT_CR is write-protected. As a result, writing WDT_CR without the correct hard-coded key has no effect. If an underflow does occur, the “wdt_fault” signal to the Reset Controller is asserted if bit WDT_MR.WDRSTEN is set. Moreover, the bit WDUNF is set in the Status Register (WDT_SR).

The reload of the watchdog must occur while the watchdog counter is within a window between 0 and WDD. WDD is defined in WDT_MR.

Any attempt to restart the watchdog while the watchdog counter is between WDV and WDD results in a watchdog error, even if the watchdog is disabled. The bit WDT_SR.WDERR is updated and the “wdt_fault” signal to the Reset Controller is asserted.

Note that this feature can be disabled by programming a WDD value greater than or equal to the WDV value. In such a configuration, restarting the Watchdog Timer is permitted in the whole range [0; WDV] and does not generate an error. This is the default configuration on reset (the WDD and WDV values are equal).

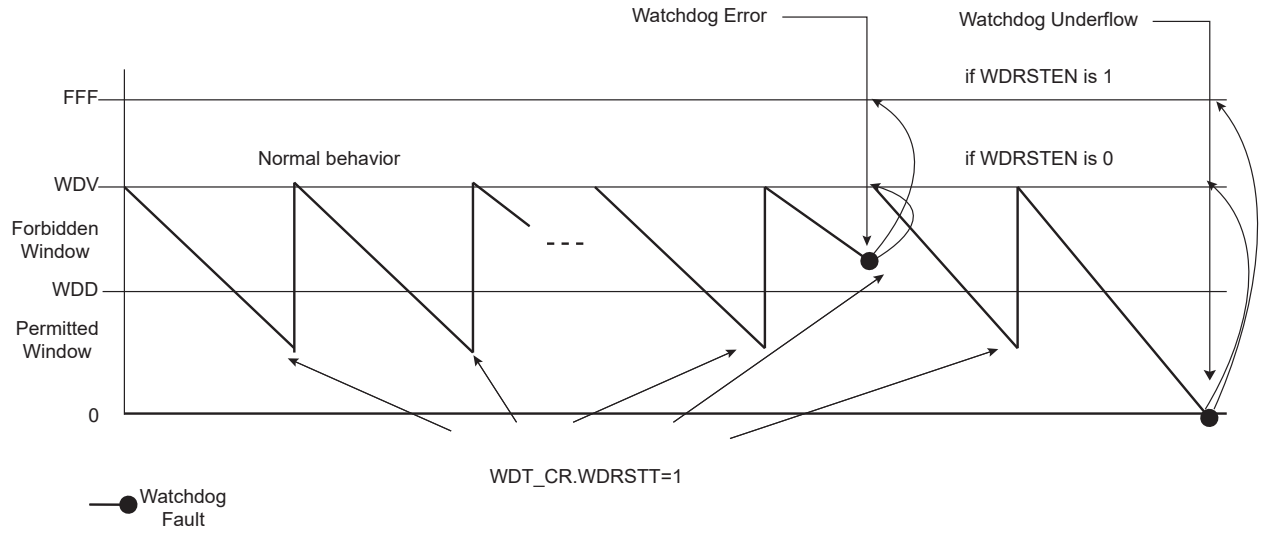
The status bits WDUNF (Watchdog Underflow) and WDERR (Watchdog Error) trigger an interrupt, provided the bit WDT_MR.WDFIEN is set. The signal “wdt_fault” to the Reset Controller causes a watchdog reset if the WDRSTEN bit is set as already explained in the Reset Controller documentation. In this case, the processor and the Watchdog Timer are reset, and the WDERR and WDUNF flags are reset.

If a reset is generated or if WDT_SR is read, the status bits are reset, the interrupt is cleared, and the “wdt_fault” signal to the reset controller is deasserted.

Writing WDT_MR reloads and restarts the down counter.

While the processor is in debug state or in Sleep mode, the counter may be stopped depending on the value programmed for the bits WDIDLEHLT and WDDBGHLT in WDT_MR.

**Figure 22-2. Watchdog Behavior**



## 22.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | WDT_CR | 7:0 | | | | LOCKMR | | | | WDRSTT |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |

### 22.5.1 Watchdog Timer Control Register

**Name:** WDT_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

The WDT_CR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | LOCKMR | | | | WDRSTT |
| Access | | | | W | | | | W |
| Reset | | | | – | | | | – |

**Bits 31:24 – KEY[7:0]** Password

| Value | Name | Description |
|---|---|---|
| 0xA5 | PASSWD | Writing any other value in this field aborts the write operation. |

**Bit 4 – LOCKMR** Lock Mode Register Write Access

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Locks the Mode Register (WDT_MR) if KEY is written to 0xA5, write access to WDT_MR has no effect. |

**Bit 0 – WDRSTT** Watchdog Restart

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Restarts the watchdog if KEY is written to 0xA5. |

### 22.5.2 Watchdog Timer Mode Register

**Name:** WDT_MR
**Offset:** 0x04
**Reset:** 0x3FFF2FFF
**Property:** Read/Write

Write access to this register has no effect if the LOCKMR command is issued in WDT_CR (unlocked on hardware reset).

The WDT_MR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | WDIDLEHLT | WDDBGHLT | WDD[11:8] | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|
| | WDV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Bit 29 – WDIDLEHLT** Watchdog Idle Halt

| Value | Description |
|---|---|
| 0 | The watchdog runs when the system is in idle state. |
| 1 | The watchdog stops when the system is in idle state. |

**Bit 28 – WDDBGHLT** Watchdog Debug Halt

| Value | Description |
|---|---|
| 0 | The watchdog runs when the processor is in debug state. |
| 1 | The watchdog stops when the processor is in debug state. |

**Bits 27:16 – WDD[11:0]** Watchdog Delta Value
Defines the permitted range for reloading the Watchdog Timer.

If the Watchdog Timer value is less than or equal to WDD, setting bit WDT_CR.WDRSTT restarts the timer.

If the Watchdog Timer value is greater than WDD, setting bit WDT_CR.WDRSTT causes a watchdog error.

**Bit 15 – WDDIS** Watchdog Disable
When setting the WDDIS bit, and while it is set, the fields WDV and WDD must not be modified.

| Value | Description |
|---|---|
| 0 | Enables the Watchdog Timer. |
| 1 | Disables the Watchdog Timer. |

**Bit 13 – WDRSTEN** Watchdog Reset Enable

| Value | Description |
|---|---|
| 0 | A watchdog fault (underflow or error) has no effect on the resets. |
| 1 | A watchdog fault (underflow or error) triggers a watchdog reset. |

**Bit 12 – WDFIEN** Watchdog Fault Interrupt Enable

| Value | Description |
|---|---|
| 0 | A watchdog fault (underflow or error) has no effect on interrupt. |
| 1 | A watchdog fault (underflow or error) asserts interrupt. |

**Bits 11:0 – WDV[11:0]** Watchdog Counter Value
Defines the value loaded in the 12-bit watchdog counter.

### 22.5.3 Watchdog Timer Status Register

**Name:** WDT_SR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | WDERR | WDUNF |
| Access | | | | | | | R | R |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – WDERR** Watchdog Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No watchdog error occurred since the last read of WDT_SR. |
| 1 | At least one watchdog error occurred since the last read of WDT_SR. |

**Bit 0 – WDUNF** Watchdog Underflow (cleared on read)

| Value | Description |
|---|---|
| 0 | No watchdog underflow occurred since the last read of WDT_SR. |
| 1 | At least one watchdog underflow occurred since the last read of WDT_SR. |

# 23. Reset Controller (RSTC)

## 23.1 Description

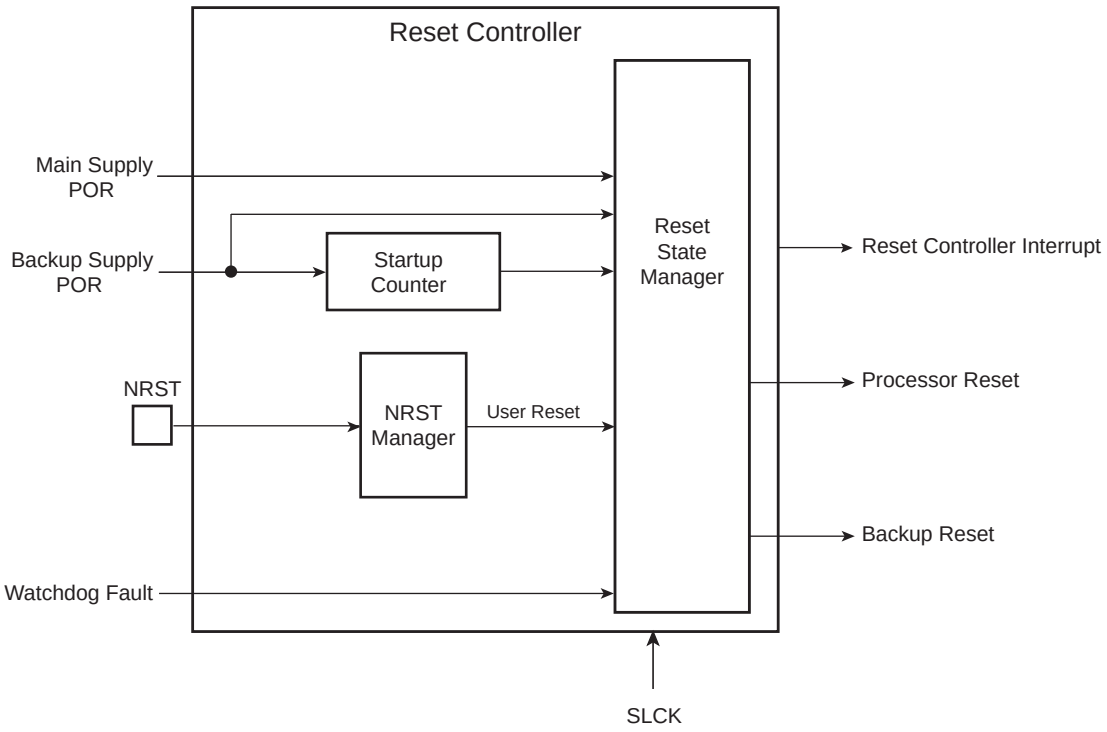
The Reset Controller (RSTC), based on power-on reset cells, handles all the resets of the system without any external components. It reports which reset occurred last.

## 23.2 Embedded Characteristics

- Manages All Resets of the System, Including
  - Processor reset
  - Backed-up peripheral reset
- Based on Two Embedded Power-on Reset Cells
- Reset Source Status
  - Status of the last reset
  - Either general reset, wake-up reset, software reset, user reset, watchdog reset

## 23.3 Block Diagram

**Figure 23-1. Reset Controller Block Diagram**



## 23.4 Functional Description

### 23.4.1 Reset Controller Overview

The Reset Controller (RSTC) is made up of an NRST manager, a startup counter and a reset state manager. It runs at Slow Clock and generates the following reset signals:

- Processor reset–Resets the processor and the entire set of embedded peripherals.
- Backup reset–Resets all the peripherals powered by VDDBU.

These reset signals are asserted by the RSTC, either on external events or on software action. The reset state manager controls the generation of reset signals.

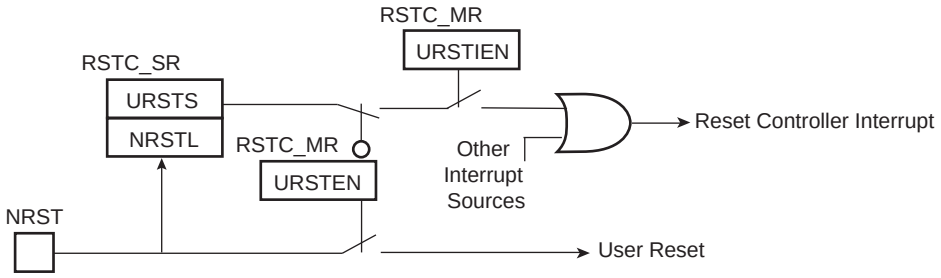
The startup counter waits for the complete crystal oscillator startup. The wait delay is given by the crystal oscillator startup time maximum value that can be found in the section “Crystal Oscillator Characteristics” in “Electrical Characteristics”.

The Mode register (RSTC_MR), used to configure the reset controller, is powered with VDDBU, so that its configuration is saved as long as VDDBU is on.

### 23.4.2 NRST Manager

The NRST manager samples the NRST input pin and drives this pin low when required by the reset state manager. The figure below shows the block diagram of the NRST manager.

**Figure 23-2. NRST Manager**



#### 23.4.2.1 NRST Signal or Interrupt

The NRST manager samples the NRST pin at Slow Clock speed. When the line is detected low, a user reset is reported to the reset state manager.

However, the NRST manager can be programmed to not trigger a reset when an assertion of NRST occurs. Writing a zero to RSTC_MR.URSTEN disables the user reset trigger.

The level of the pin NRST can be read at any time in the bit NRSTL (NRST level) in the Status register (RSTC_SR). As soon as the pin NRST is asserted, RSTC_SR.URSTS is set. This bit clears only when RSTC_SR is read.

The RSTC can also be programmed to generate an interrupt instead of generating a reset. To do so, RSTC_MR.URSTIEN must be set.

### 23.4.3 Reset States

The reset state manager handles the different reset sources and generates the internal reset signals. It reports the reset status in RSTC_SR.RSTTYP. The update of RSTTYP is performed when the processor reset is released.

#### 23.4.3.1 General Reset

A general reset occurs when VDDBU and VDDCORE are powered on. The backup supply POR cell output rises and is filtered with a startup counter, which operates at Slow Clock. The purpose of this counter is to make sure the Slow Clock oscillator is stable before starting up the device. The length of startup time is hardcoded to comply with the Slow Clock Oscillator startup time.

After this time, the processor clock is released at Slow Clock and all the other signals remain valid for two cycles for proper processor and logic reset. Then, all the reset signals are released and RSTC_SR.RSTTYP reports a general reset.

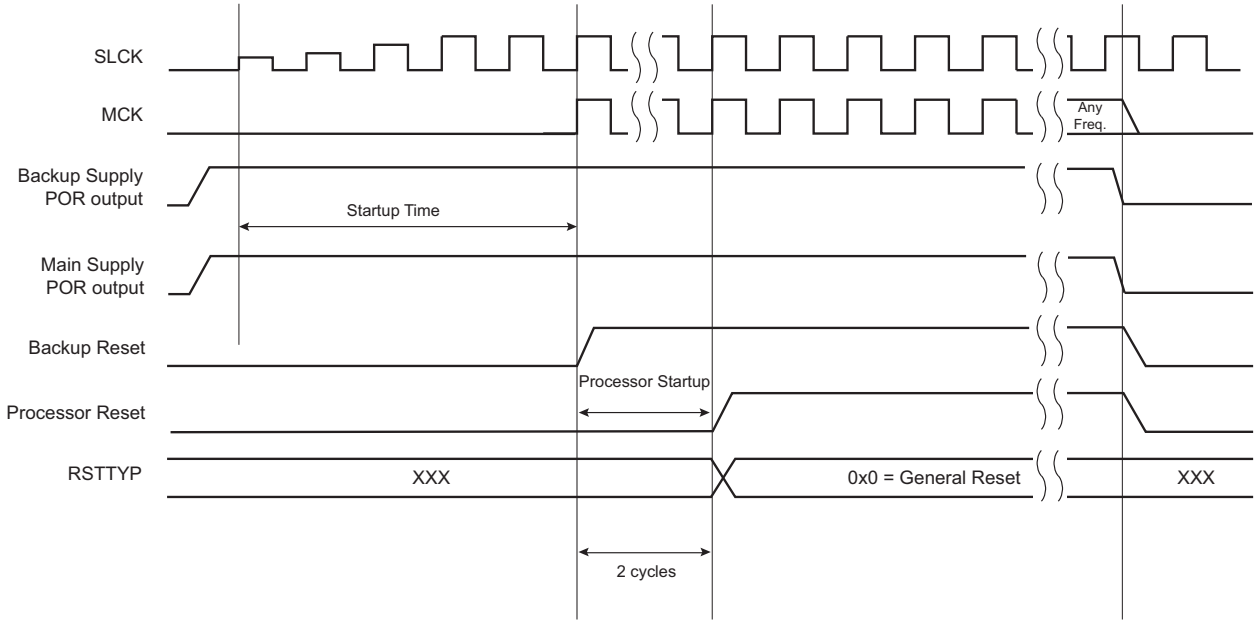
When VDDBU is detected low by the backup supply POR cell, all resets signals are immediately asserted, even if the main supply POR cell does not report a main supply shutdown.

VDDBU only activates the backup reset signal.

Backup reset must be released so that any other reset can be generated by VDDCORE (main supply POR output).

The figure below shows how the general reset affects the reset signals.

**Figure 23-3. General Reset State**



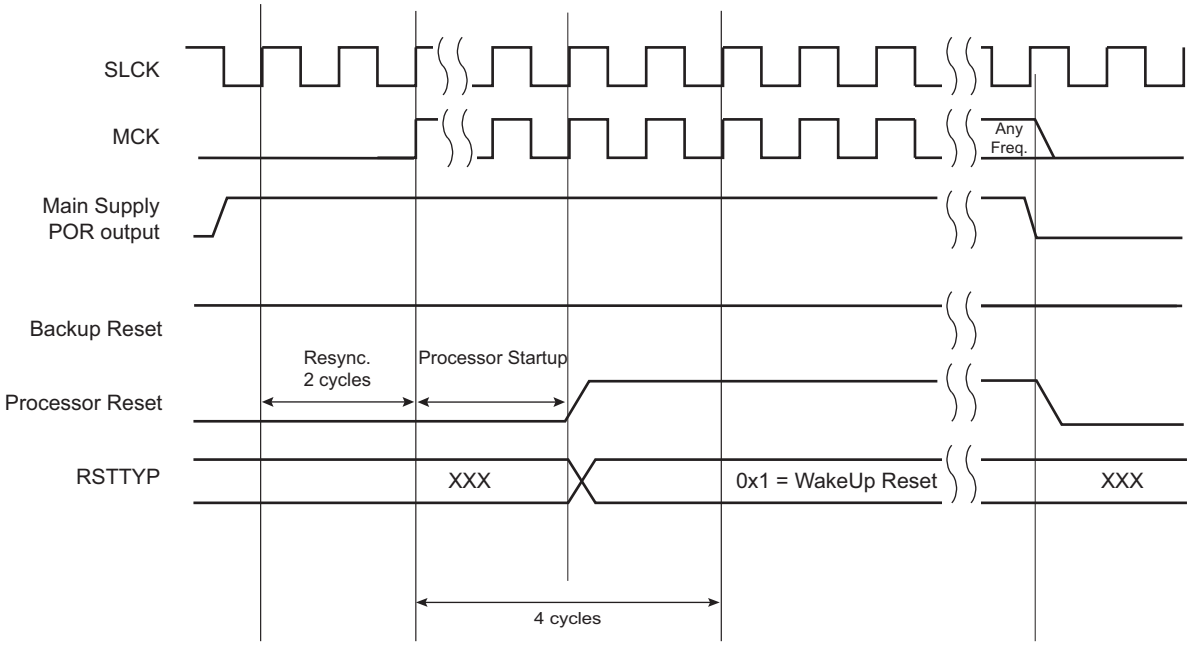
#### 23.4.3.2 Wake-up Reset

The wake-up reset occurs when the main supply is down. When the main supply POR output is active, all the reset signals are asserted except backup reset. When the main supply powers up, the POR output is resynchronized on Slow Clock. The processor clock is then re-enabled during two Slow Clock cycles, depending on the requirements of the ARM processor.

At the end of this delay, the processor and other reset signals rise. RSTC_SR.RSTTYP is updated to report a wake-up reset.

When the main supply is detected falling, the reset signals are immediately asserted. This transition is synchronous with the output of the main supply POR.

**Figure 23-4. Wake-up Reset**



### 23.4.3.3 User Reset

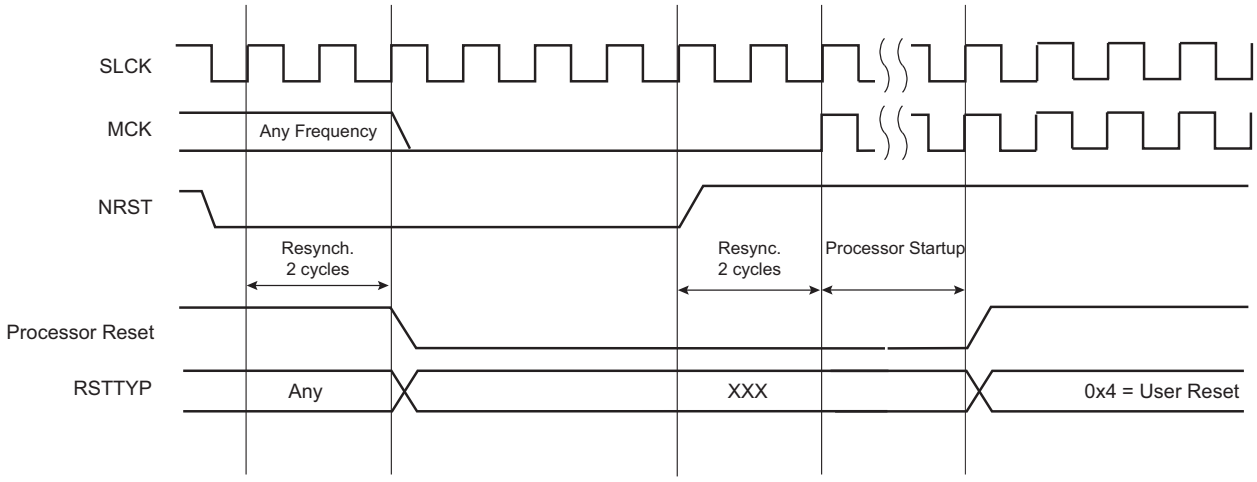
The user reset is entered when a low level is detected on the NRST pin and RSTC_MR.URSTEN is at 1. The NRST input signal is resynchronized with SLCK to ensure proper behavior of the system.

The processor reset and the peripheral reset are asserted.

The user reset is left when NRST rises, after a two-cycle resynchronization time and a two-cycle processor startup. The processor clock is re-enabled as soon as NRST is confirmed high.

When the processor reset signal is released, RSTC_SR.RSTTYP is loaded with the value 0x4, indicating a user reset.

**Figure 23-5. User Reset State**



### 23.4.3.4 Software Reset

The RSTC offers several commands used to assert the different reset signals. These commands are performed by writing the Control register (RSTC_CR) with the following bits at 1:

- PROCRST–Writing PROCRST at 1 resets the processor, the watchdog timer and all the embedded peripherals, including the memory system, and, in particular, the remap command.

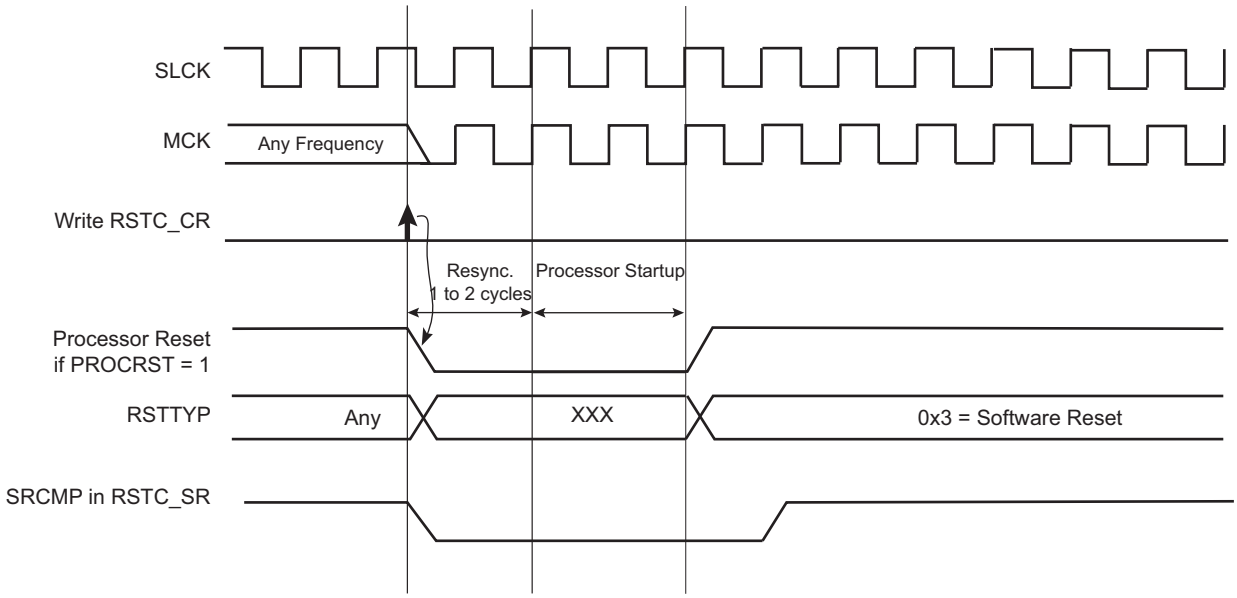
The software reset is entered if at least one of these bits is set by the software. All these commands can be performed independently or simultaneously. The software reset lasts two Slow Clock cycles.

The internal reset signals are asserted as soon as the register write is performed. This is detected on the Master Clock (MCK). They are released when the software reset is left, i.e., synchronously to SLCK.

If and only if RSTC_CR.PROCRST is set, the RSTC reports the software status in RSTC_SR.RSTTYP. Other software resets are not reported in RSTTYP.

As soon as a software operation is detected, RSTC_SR.SRCMP is set. It is cleared as soon as the software reset is left. No other software reset can be performed while RSTC_SR.SRCMP is set, and writing any value in RSTC_CR has no effect.

**Figure 23-6. Software Reset**



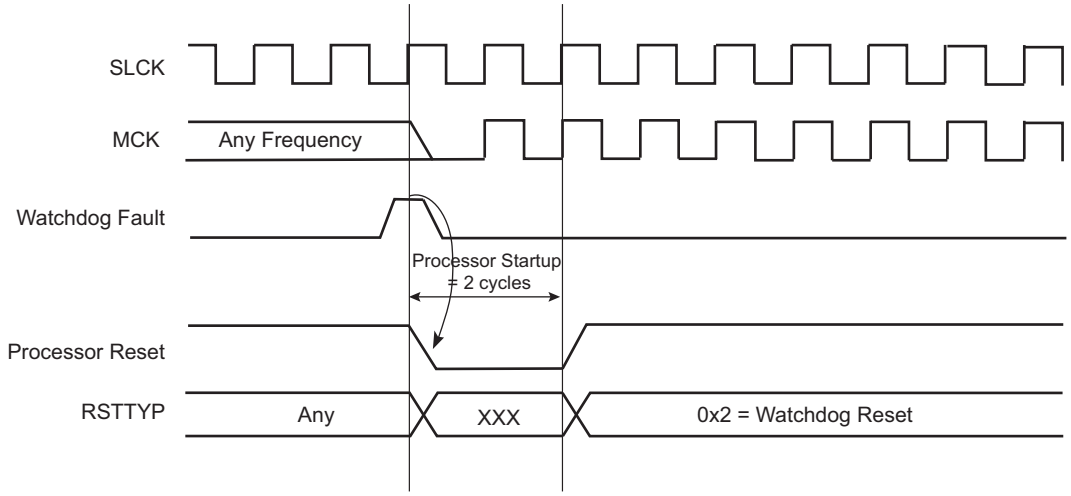
#### 23.4.3.5 Watchdog Reset

The watchdog reset is entered when a watchdog fault occurs. This state lasts two Slow Clock cycles.

The watchdog timer is reset by the processor reset signal. As the watchdog fault always causes a processor reset if WDT_MR.WDRSTEN is set, the watchdog timer is always reset after a watchdog reset and the watchdog is enabled by default and with a period set to a maximum.

When WDT_MR.WDRSTEN is reset, the watchdog fault has no impact on the reset controller.

**Figure 23-7. Watchdog Reset**



### 23.4.4 Reset State Priorities

The reset state manager manages the following priorities between the different reset sources, given in descending order:

- Backup reset
- Wake-up reset
- Watchdog reset
- Software reset
- User reset

Particular cases are listed below:

- When in user reset:
  - A watchdog event is impossible because the watchdog timer is being reset by the processor reset signal.
  - A software reset is impossible, since the processor reset is being activated.
- When in software reset:
  - A watchdog event has priority over the current state.
  - The NRST has no effect.
- When in watchdog reset:
  - The processor reset is active and so a software reset cannot be programmed.
  - A user reset cannot be entered.

## 23.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | RSTC_CR | 7:0 | | | | | | | | PROCRST |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | KEY[7:0] | | | | | | | |
| 0x04 | RSTC_SR | 7:0 | | | | | | | | URSTS |
| | | 15:8 | | | | | | RSTTYP[2:0] | | |
| | | 23:16 | | | | | | | SRCMP | NRSTL |
| | | 31:24 | | | | | | | | |
| 0x08 | RSTC_MR | 7:0 | | | | URSTIEN | | | | URSTEN |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | KEY[7:0] | | | | | | | |

### 23.5.1 Reset Controller Control Register

**Name:** RSTC_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | PROCRST |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bits 31:24 – KEY[7:0]** Write Access Password

| Value | Name | Description |
|---|---|---|
| 0xA5 | PASSWD | Writing any other value in this field aborts the write operation.<br>Always reads as 0. |

**Bit 0 – PROCRST** Processor Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If KEY value = 0xA5, resets the processor and the peripherals<br>. |

### 23.5.2 Reset Controller Status Register

**Name:** RSTC_SR
**Offset:** 0x04
**Reset:** See Note
**Property:** Read-only

**Note:** Register reset values are:
0x00000100 only when VDDCORE is rising

0x00000000 when both power supplies VDDCORE and VDDBU are rising (backup reset)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | R | R |
| Reset | | | | | | | SRCMP | NRSTL |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | R | R | R |
| Reset | | | | | | RSTTYP[2:0] | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | R |
| Reset | | | | | | | | URSTS |

**Bit 17 – SRCMP** Software Reset Command in Progress

| Value | Description |
|---|---|
| 0 | No software command is being performed by the RSTC. The RSTC is ready for a software command. |
| 1 | A software reset command is being performed by the RSTC. The RSTC is busy. |

**Bit 16 – NRSTL** NRST Pin Level
Records the level of the NRST pin sampled on each Master Clock (MCK) rising edge.

**Bits 10:8 – RSTTYP[2:0]** Reset Type
Reports the cause of the last processor reset. Reading RSTC_SR does not reset this field.

| Value | Name | Description |
|---|---|---|
| 0 | GENERAL_RST | Both VDDCORE and VDDBU rising |
| 1 | WKUP_RST | VDDCORE rising |
| 2 | WDT_RST | Watchdog fault occurred |
| 3 | SOFT_RST | Processor reset required by the software |

| Value | Name | Description |
|---|---|---|
| 4 | USER_RST | NRST pin detected low |

**Bit 0 – URSTS** User Reset Status

| Value | Description |
|---|---|
| 0 | No high-to-low edge on NRST happened since the last read of RSTC_SR. |
| 1 | At least one high-to-low transition of NRST has been detected since the last read of RSTC_SR. Reading the RSTC_SR resets URSTS and clears the interrupt. |

### 23.5.3 Reset Controller Mode Register

**Name:** RSTC_MR
**Offset:** 0x08
**Reset:** See Note
**Property:** Read/Write

**Note:**
Backup reset value is 0x00000000

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | URSTIEN | | | | URSTEN |
| Access | | | | R/W | | | | R/W |
| Reset | | | | | | | | |

**Bits 31:24 – KEY[7:0]** Write Access Password

| Value | Name | Description |
|---|---|---|
| 0xA5 | PASSWD | Writing any other value in this field aborts the write operation.<br>Always reads as 0. |

**Bit 4 – URSTIEN** User Reset Interrupt Enable

| Value | Description |
|---|---|
| 0 | RSTC_SR.URSTS at 1 has no effect on the RSTC interrupt. |
| 1 | RSTC_SR.URSTS at 1 asserts the RSTC interrupt if URSTEN = 0. |

**Bit 0 – URSTEN** User Reset Enable

| Value | Description |
|---|---|
| 0 | The detection of a low level on the pin NRST does not trigger a user reset. |
| 1 | The detection of a low level on the pin NRST triggers a user reset. |

# 24. Shutdown Controller (SHDWC)

## 24.1 Description

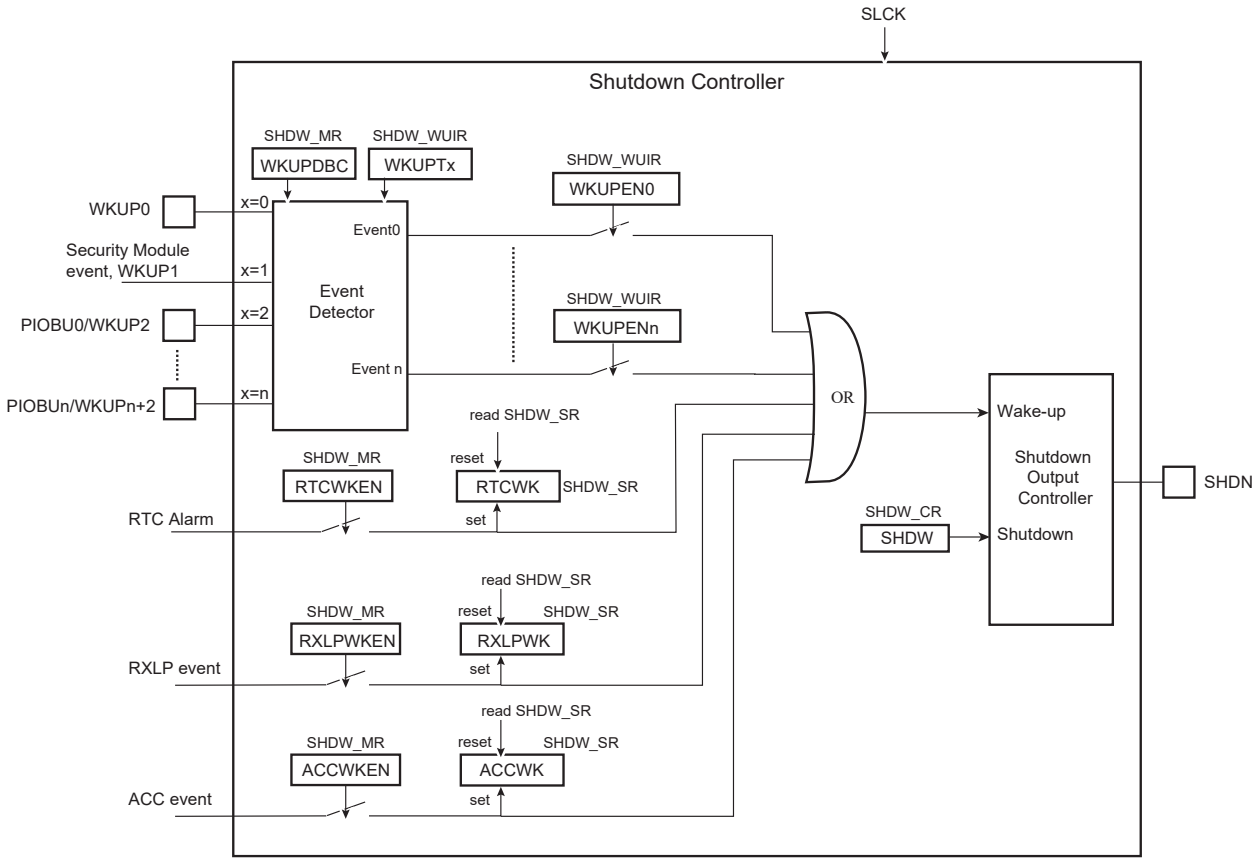
The Shutdown Controller (SHDWC) controls the VDDIO and VDDCORE power supplies and the wakeup detection on debounced input lines.

## 24.2 Embedded Characteristics

- Shutdown Logic
  - Software Assertion of the Shutdown Output Pin (SHDN)
  - Programmable De-assertion from the PIOBU, WKUP Input Pins
- Wakeup Logic
  - Programmable Assertion from the PIOBU, WKUP Input Pins, and Internal Wakeup Event from RTC, RXLP, ACC, Security Module

## 24.3 Block Diagram

**Figure 24-1. Shutdown Controller Block Diagram**



## 24.4 I/O Lines Description

**Table 24-1. I/O Lines Description**

| Name | Description | Type |
|---|---|---|
| WKUP0 | Wakeup inputs | Input |
| PIOBU 0-7 | Wakeup inputs, WKUP(2-9) | Input |
| SHDN | Shutdown output | Output |

## 24.5 Product Dependencies

### 24.5.1 Power Management

The Shutdown Controller is continuously clocked by the Slow Clock (SLCK). The Power Management Controller has no effect on the behavior of the Shutdown Controller.

## 24.6 Functional Description

The Shutdown Controller manages the main power supply. To do so, it is supplied with VDDBU and manages wakeup input pins and one output pin, SHDN.

A typical application connects the pin SHDN to the shutdown input of the DC/DC Converter providing the main power supplies of the system, and especially VDDCORE and/or VDDIO. The wakeup inputs (WKUPn) connect to any push-buttons or signal that wake up the system.

The software is able to control the pin SHDN by writing the Shutdown Control Register (SHDW_CR) with the bit SHDW at 1. The shutdown is taken into account only two slow clock cycles after the write of SHDW_CR. This register is password-protected and so the value written should contain the correct key for the command to be taken into account. As a result, the system should be powered down.

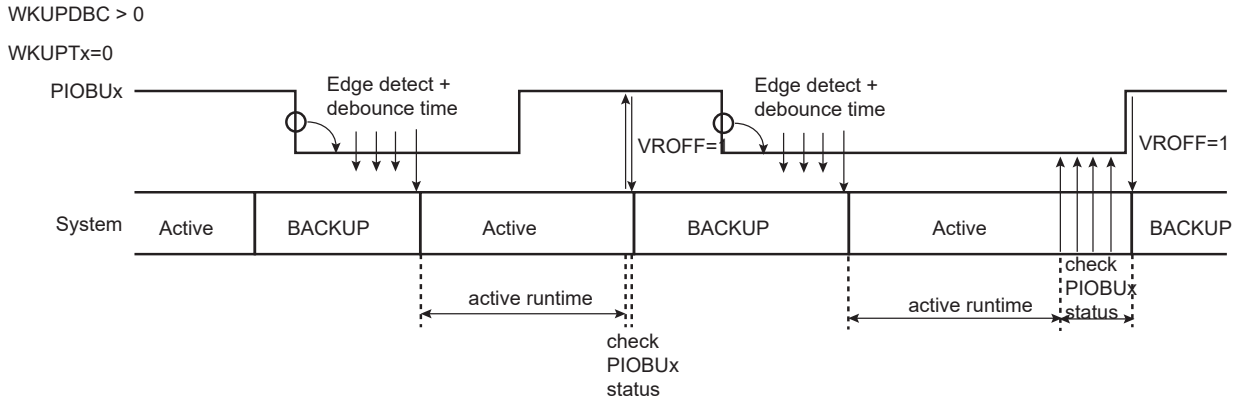
### 24.6.1 Wakeup Inputs

Any level change on a PIOBUx, WKUP pin, or Security Module event, can trigger a wakeup. Wakeup is configured in the Shutdown Mode Register (SHDW_MR) and Shutdown Wakeup Inputs Register (SHDW_WUIR). The transition detector can be programmed to detect either a positive or negative transition on any PIOBUx, WKUP pin. The detection can also be disabled. Programming is performed by enabling the Wakeup Input (WKUPENx bit) and defining the Wakeup Input Type (WKUPTx bit) in the SHDW_WUIR.

Moreover, a debouncing circuit can be programmed for PIOBUx, WKUP. The debouncing circuit filters pulses on PIOBUx, WKUP shorter than the programmed value in the WKUPDBC field in SHDW_MR. If the programmed level change is detected on a pin, a counter starts. When the counter reaches the value programmed in the corresponding field WKUPDBC, the SHDN pin is released. If a new input change is detected before the counter reaches the corresponding value, the counter is stopped and cleared. One counter is shared among all PIOBUx, WKUP inputs and all programmed level detection is merged into this counter. The WKUPISx bit of the Status Register (SHDW_SR) reports the detection of the programmed events on PIOBUx, WKUP with a reset after the read of SHDW_SR.

© 2018 Microchip Technology Inc.

**Figure 24-2. Entering and Exiting Backup Mode with a PIOBUx, WKUP Pin**



The Shutdown Controller can be programmed so as to activate the wakeup using the RTC alarm, RXLP event, ACC comparison event, security module event (detection of the rising edge event is synchronized with SLCK). This is done by writing the SHDW_MR using the RTCWKEN bit, RXLPWKEN bit and ACCWKEN bit. When enabled, the detection of RTC alarm, RXLP event, ACC comparison event, security module event is reported in the RTCWK bit, RXLPWK and ACCWK bits of SHDW_SR. They are cleared after reading SHDW_SR. When using the RTC alarm to wake up the system, the user must ensure that RTC alarm, RXLPWK and ACCWK status flags are cleared before shutting down the system. Otherwise, no rising edge of the status flags may be detected and the wakeup will fail.

## 24.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SHDW_CR | 7:0 | | | | | | | | SHDW |

**Bits 26:24 – WKUPDBC[2:0]** Wakeup Inputs Debouncer Period

| Value | Name | Description |
|---|---|---|
| 0 | IMMEDIATE | Immediate, no debouncing, detected active at least on one Slow Clock edge |
| 1 | 3_SLCK | PIOBUx shall be in its active state for at least 3 SLCK periods |
| 2 | 32_SLCK | PIOBUx shall be in its active state for at least 32 SLCK periods |
| 3 | 512_SLCK | PIOBUx shall be in its active state for at least 512 SLCK periods |
| 4 | 4096_SLCK | PIOBUx shall be in its active state for at least 4,096 SLCK periods |
| 5 | 32768_SLCK | PIOBUx shall be in its active state for at least 32,768 SLCK periods |

**Bit 19 – RXLPWKEN** Debug Unit Wakeup Enable

| Value | Description |
|---|---|
| 0 | The Backup RX UART Comparison event has no effect on the Shutdown Controller. |
| 1 | The Backup RX UART Comparison event forces the de-assertion of the SHDN pin. |

**Bit 18 – ACCWKEN** Analog Comparator Controller Wakeup Enable

| Value | Description |
|---|---|
| 0 | The Analog comparator alarm signal has no effect on the Shutdown Controller. |

| Value | Description |
|---|---|
| 1 | The Analog comparator alarm signal forces the de-assertion of the SHDN pin. |

**Bit 17 – RTCWKEN** Real-time Clock Wakeup Enable

| Value | Description |
|---|---|
| 0 | The RTC Alarm signal has no effect on the Shutdown Controller. |
| 1 | The RTC Alarm signal forces the de-assertion of the SHDN pin. |

### 24.7.3 Shutdown Controller Status Register

**Name:** SHDW_SR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | WKUPIS9 | WKUPIS8 |
| Access | | | | | | | R | R |
| Reset | | | | | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RXLPWK | ACCWK | RTCWK | | | | | WKUPS |
| Access | R | R | R | | | | | R |
| Reset | 0 | 0 | 0 | | | | | 0 |

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25 – WKUPIS** Wakeup 0 to 9 Input Status
0 (DISABLE): The corresponding wakeup input is disabled, or was inactive at the time the debouncer triggered a wakeup event.

1 (ENABLE): The corresponding wakeup input was active at the time the debouncer triggered a wakeup event.

**Bit 7 – RXLPWK** Debug Unit Wakeup

| Value | Description |
|---|---|
| 0 | No wakeup alarm from the Backup RX UART Comparison unit (RXLP) occurred since the last read of SHDW_SR. |
| 1 | At least one wakeup alarm from the Backup RX UART Comparison unit (RXLP) occurred since the last read of SHDW_SR. |

**Bit 6 – ACCWK** Analog Comparator Controller Wakeup

| Value | Description |
|---|---|
| 0 | No wakeup alarm from the ACC occurred since the last read of SHDW_SR. |
| 1 | At least one wakeup alarm from the ACC occurred since the last read of SHDW_SR. |

**Bit 5 – RTCWK** Real-time Clock Wakeup

| Value | Description |
|---|---|
| 0 | No wakeup alarm from the RTC occurred since the last read of SHDW_SR. |
| 1 | At least one wakeup alarm from the RTC occurred since the last read of SHDW_SR. |

**Bit 0 – WKUPS** PIOBU, WKUP Wakeup Status
WKUPIS1 reports the status of the Security Module event.
0 (NO): No wakeup due to the assertion of the PIOBU, WKUP pins has occurred since the last read of SHDW_SR.

1 (PRESENT): At least one wakeup due to the assertion of the PIOBU, WKUP pins has occurred since the last read of SHDW_SR.

| Value | Description |
|---|---|
| 0 | No wakeup alarm from the RTT occurred since the last read of SHDW_SR. |
| 1 | At least one wakeup alarm from the RTT occurred since the last read of SHDW_SR. |

### 24.7.4 Shutdown Controller Wakeup Inputs Register

**Name:** SHDW_WUIR
**Offset:** 0x0C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25 – WKUPT** Wakeup 0 to 9 Input Type
0 (LOW): A falling edge followed by a low level, for a period defined by WKUPDBC, on the corresponding wakeup input forces the wakeup of the core power supply.

1 (HIGH): A rising edge followed by a high level, for a period defined by WKUPDBC, on the corresponding wakeup input forces the wakeup of the core power supply.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 – WKUPEN** Wakeup 0 to 9 Input Enable
0 (DISABLE): The corresponding wakeup input has no wakeup effect.

1 (ENABLE): The corresponding wakeup input forces the wakeup of the core power supply.

# 25. Periodic Interval Timer (PIT)

## 25.1 Description

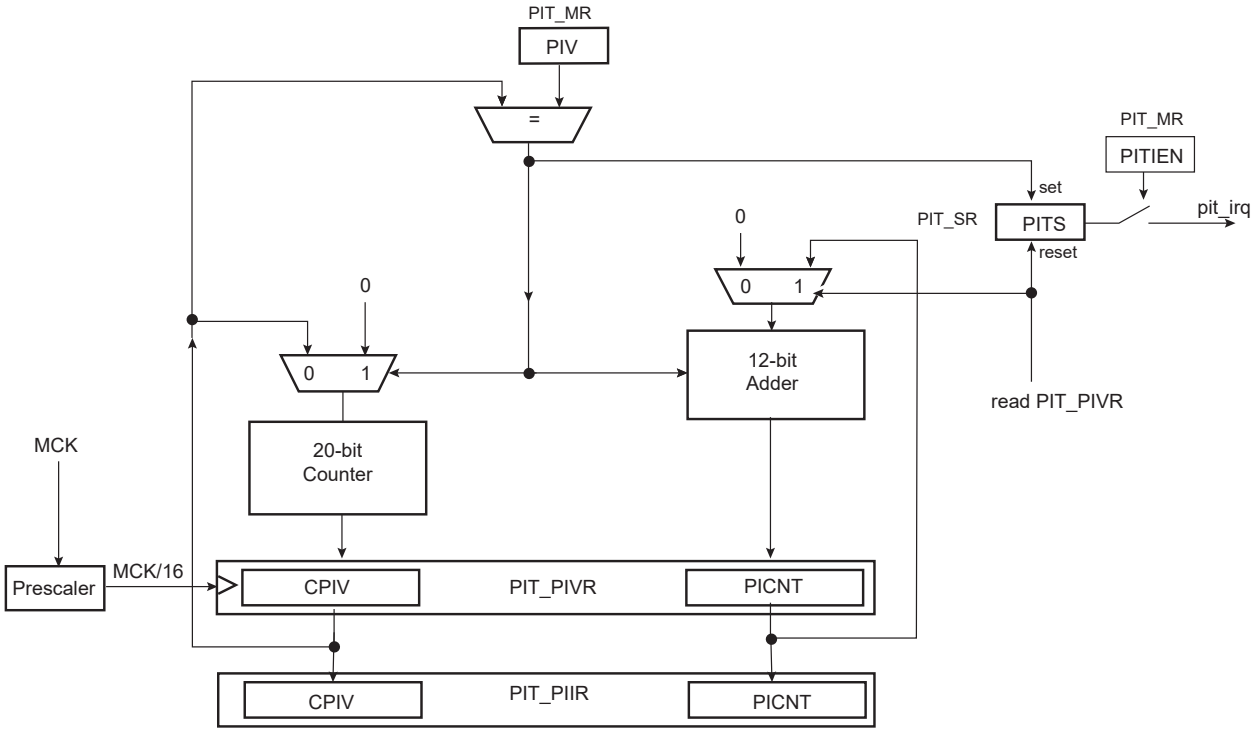
The Periodic Interval Timer (PIT) provides the operating system's scheduler interrupt. It is designed to offer maximum accuracy and efficient management, even for systems with long response time.

## 25.2 Embedded Characteristics

- 20-bit Programmable Counter plus 12-bit Interval Counter
- Reset-on-read Feature
- Both Counters Work on Master Clock/16

## 25.3 Block Diagram

**Figure 25-1. Periodic Interval Timer**



## 25.4 Functional Description

The Periodic Interval Timer provides periodic interrupts for use by operating systems.

The PIT provides a programmable overflow counter and a reset-on-read feature. It is built around two counters: a 20-bit CPIV counter and a 12-bit PICNT counter. Both counters work at Master Clock /16.

The first 20-bit CPIV counter increments from 0 up to a programmable overflow value set in the field PIV of the Mode Register (PIT_MR). When the counter CPIV reaches this value, it resets to 0 and increments

the Periodic Interval Counter, PICNT. The status bit PITS in the Status Register (PIT_SR) rises and triggers an interrupt, provided the interrupt is enabled (PITIEN in PIT_MR).

Writing a new PIV value in PIT_MR does not reset/restart the counters.

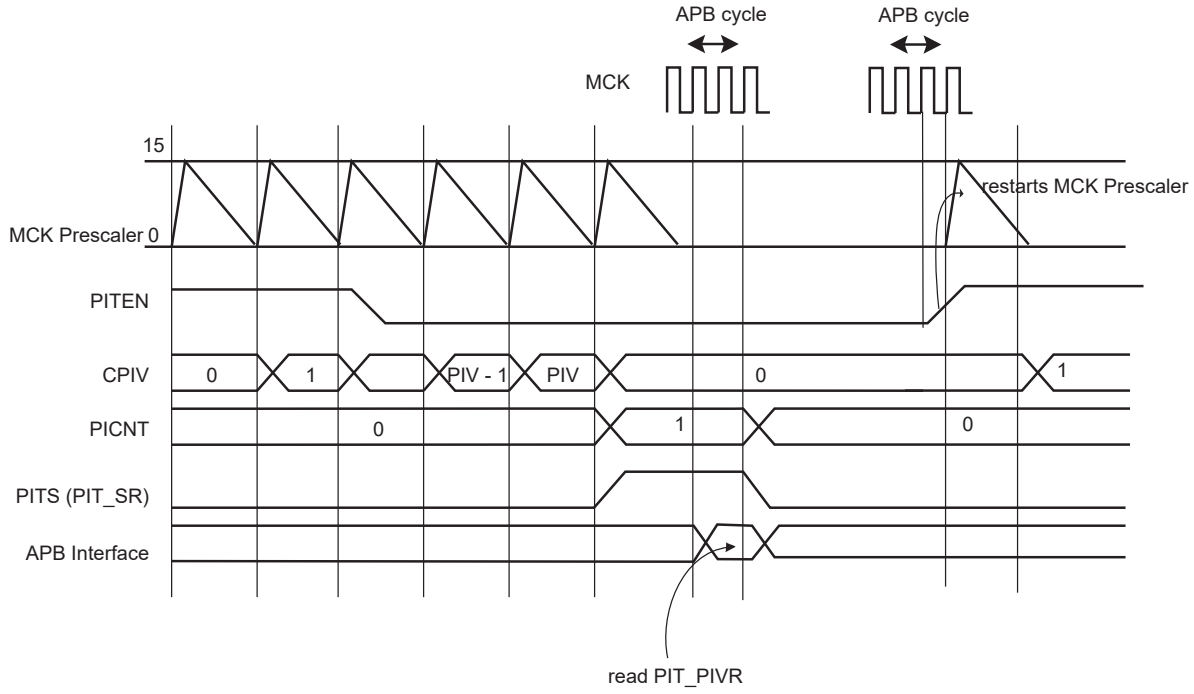
When CPIV and PICNT values are obtained by reading the Periodic Interval Value Register (PIT_PIVR), the overflow counter (PICNT) is reset and the PITS bit is cleared, thus acknowledging the interrupt. The value of PICNT gives the number of periodic intervals elapsed since the last read of PIT_PIVR.

When CPIV and PICNT values are obtained by reading the Periodic Interval Image Register (PIT_PIIR), there is no effect on the counters CPIV and PICNT, nor on the bit PITS. For example, a profiler can read PIT_PIIR without clearing any pending interrupt, whereas a timer interrupt clears the interrupt by reading PIT_PIVR.

The PIT may be enabled/disabled using the PITEN bit in the PIT_MR register (disabled on reset). The PITEN bit only becomes effective when the CPIV value is 0. The figure below illustrates the PIT counting. After the PIT Enable bit is reset (PITEN = 0), the CPIV goes on counting until the PIV value is reached, and is then reset. PIT restarts counting, only if the PITEN is set again.

The PIT is stopped when the core enters debug state.

**Figure 25-2. Enabling/Disabling PIT with PITEN**



## 25.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | PIT_MR | 7:0 | PIV[7:0] | | | | | | | |
| | | 15:8 | PIV[15:8] | | | | | | | |
| | | 23:16 | | | | | PIV[19:16] | | | |
| | | 31:24 | | | | | | | PITIEN | PITEN |
| 0x04 | PIT_SR | 7:0 | | | | | | | | PITS |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x08 | PIT_PIVR | 7:0 | CPIV[7:0] | | | | | | | |
| | | 15:8 | CPIV[15:8] | | | | | | | |
| | | 23:16 | PICNT[3:0] | | | | CPIV[19:16] | | | |
| | | 31:24 | PICNT[11:4] | | | | | | | |
| 0x0C | PIT_PIIR | 7:0 | CPIV[7:0] | | | | | | | |
| | | 15:8 | CPIV[15:8] | | | | | | | |
| | | 23:16 | PICNT[3:0] | | | | CPIV[19:16] | | | |
| | | 31:24 | PICNT[11:4] | | | | | | | |

### 25.5.1 Periodic Interval Timer Mode Register

**Name:** PIT_MR
**Offset:** 0x00
**Reset:** 0x000FFFFF
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | PITIEN | PITEN |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PIV[19:16] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 1 | 1 | 1 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | PIV[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PIV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Bit 25 – PITIEN** Period Interval Timer Interrupt Enable

| Value | Description |
|---|---|
| 0 | The bit PITS in PIT_SR has no effect on the interrupt. |
| 1 | The bit PITS in PIT_SR asserts an interrupt. |

**Bit 24 – PITEN** Period Interval Timer Enabled

| Value | Description |
|---|---|
| 0 | The Periodic Interval Timer is disabled when the PIV value is reached. |
| 1 | The Periodic Interval Timer is enabled. |

**Bits 19:0 – PIV[19:0]** Periodic Interval Value
Defines the value compared with the primary 20-bit counter of the Periodic Interval Timer (CPIV). The period is equal to (PIV + 1).

### 25.5.2 Periodic Interval Timer Status Register

**Name:** PIT_SR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | PITS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 0 – PITS** Periodic Interval Timer Status

| Value | Description |
|---|---|
| 0 | The Periodic Interval timer has not reached PIV since the last read of PIT_PIVR. |
| 1 | The Periodic Interval timer has reached PIV since the last read of PIT_PIVR. |

### 25.5.3 Periodic Interval Timer Value Register

**Name:** PIT_PIVR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read-only

Reading this register clears PITS in PIT_SR.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PICNT[11:4] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PICNT[3:0] | | | | CPIV[19:16] | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CPIV[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CPIV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:20 – PICNT[11:0]** Periodic Interval Counter
Returns the number of occurrences of periodic intervals since the last read of PIT_PIVR.

**Bits 19:0 – CPIV[19:0]** Current Periodic Interval Value
Returns the current value of the periodic interval timer.

### 25.5.4 Periodic Interval Timer Image Register

**Name:** PIT_PIIR
**Offset:** 0x0C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PICNT[11:4] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PICNT[3:0] | | | | CPIV[19:16] | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CPIV[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CPIV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:20 – PICNT[11:0]** Periodic Interval Counter
Returns the number of occurrences of periodic intervals since the last read of PIT_PIVR.

**Bits 19:0 – CPIV[19:0]** Current Periodic Interval Value
Returns the current value of the periodic interval timer.

# 26. Real-time Clock (RTC)

## 26.1 Description

The Real-time Clock (RTC) peripheral is designed for very low power consumption. For optimal functionality, the RTC requires an accurate external 32.768 kHz clock, which can be provided by a crystal oscillator.

It combines a complete time-of-day clock with alarm and a Gregorian or Persian calendar, complemented by a programmable periodic interrupt. The alarm and calendar registers are accessed by a 32-bit data bus.

The RTC can also be configured for the UTC time format.

The time and calendar values are coded in binary-coded decimal (BCD) format. The time format can be 24-hour mode or 12-hour mode with an AM/PM indicator.

Updating time and calendar fields and configuring the alarm fields are performed by a parallel capture on the 32-bit data bus. An entry control is performed to avoid loading registers with incompatible BCD format data or with an incompatible date according to the current month/year/century.

A clock divider calibration circuitry can be used to compensate for crystal oscillator frequency variations.

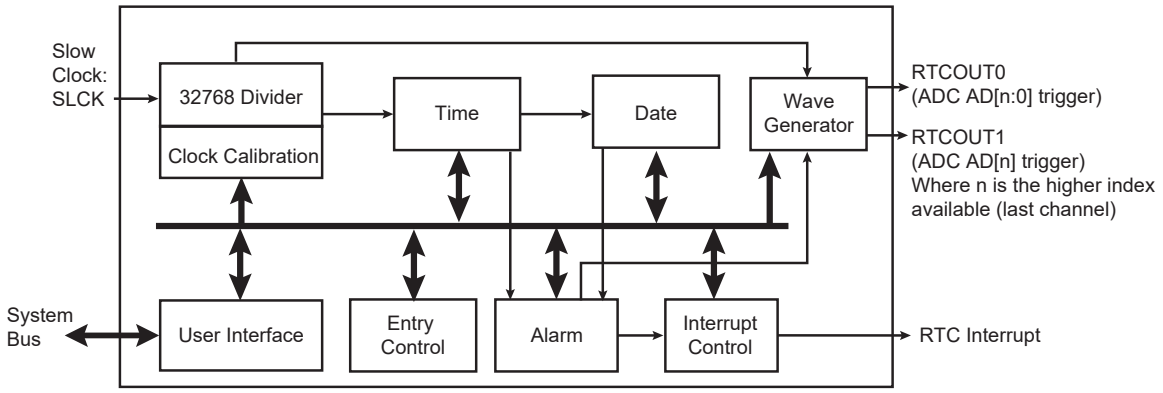
Timestamping capability reports the first and last occurrences of tamper events.

## 26.2 Embedded Characteristics

- Full Asynchronous Design for Ultra Low Power Consumption
- Gregorian, UTC and Persian Modes Supported
- Programmable Periodic Interrupt
- Safety/security Features:
  - Valid Time and Date Programming Check
  - On-The-Fly Time and Date Validity Check
- Counters Calibration Circuitry to Compensate for Crystal Oscillator Variations
- Waveform Generation for Trigger Event
- Tamper Timestamping Registers
- Register Write Protection

## 26.3 Block Diagram

**Figure 26-1. Real-time Clock Block Diagram**



## 26.4 Product Dependencies

### 26.4.1 Power Management

The Real-time Clock is continuously clocked at 32.768 kHz. The Power Management Controller has no effect on RTC behavior.

### 26.4.2 Interrupt

Within the System Controller, the RTC interrupt is OR-wired with all the other module interrupts.

Only one System Controller interrupt line is connected on one of the internal sources of the interrupt controller.

RTC interrupt requires the interrupt controller to be programmed first.

When a System Controller interrupt occurs, the service routine must first determine the cause of the interrupt. This is done by reading each status register of the System Controller peripherals successively.

## 26.5 Functional Description

The RTC provides a full binary-coded decimal (BCD) clock that includes century (19/20), year (with leap years), month, date, day, hours, minutes and seconds reported in RTC Time Register (RTC_TIMR) and RTC Calendar Register (RTC_CALR).

The RTC can operate in UTC mode, giving the number of seconds elapsed since a reference time defined by the user (the UTC standard—ISO 8601—reference time is the 30th of June 1972). In this mode, the timefield is 32 bits wide and coded in hexadecimal format.

The valid year range is up to 2099 in Gregorian mode (or 1300 to 1499 in Persian mode).

The RTC can operate in 24-hour mode or in 12-hour mode with an AM/PM indicator.

Corrections for leap years are included (all years divisible by 4 being leap years except 1900). This is correct up to the year 2099.

The RTC can generate events to trigger ADC measurements.

### 26.5.1 Reference Clock

The reference clock is the Slow Clock (SLCK) which can be driven internally or by an external 32.768 kHz crystal.

During low-power modes of the processor, the oscillator runs and power consumption is critical. The crystal selection must consider the current consumption for power saving and the frequency drift due to temperature effect on the circuit for time accuracy.

### 26.5.2 Timing

In Gregorian and Persian modes, the RTC is updated in real time at one-second intervals in Normal mode for the counters of seconds, at one-minute intervals for the counter of minutes and so on.

In UTC mode, the RTC is updated in real time at one-second intervals (32-bit UTC counter default configuration).

Due to the asynchronous operation of the RTC with respect to the rest of the chip, to be certain that the value read in the RTC registers (century, year, month, date, day, hours, minutes, seconds) are valid and stable, it is necessary to read these registers twice. If the data is the same both times, then it is valid. Therefore, a minimum of two and a maximum of three accesses are required.

### 26.5.3 Alarm

In Gregorian and Persian modes, the RTC has five programmable fields: month, date, hours, minutes and seconds.

Each of these fields can be enabled or disabled to match the alarm condition:

- If all the fields are enabled, an alarm flag is generated (the corresponding flag is asserted and an interrupt generated if enabled) at a given month, date, hour/minute/second.
- If only the “seconds” field is enabled, then an alarm is generated every minute.

Depending on the combination of fields enabled, a large number of possibilities are available to the user ranging from minutes to 365/366 days.

Hour, minute and second matching alarms (SECEN, MINEN, HOUREN) can be enabled independently of SEC, MIN, HOUR fields.

**Note:** To change one of the SEC, MIN, HOUR, DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC_TIMALR or RTC_CALALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN, DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR, DATE, MONTH). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREn, DATEEN, MTHEN fields.

In UTC mode, RTC_TIMALR must be configured to set the UTC alarm value and bit 0 in RTC_CALALR must be used to enable or disable the UTC alarm. If the UTC alarm is enabled, the alarm is generated once the UTC time matches the programmed UTC_TIME alarm field.

To change the UTC_TIME alarm field, proceed as follows:

1. Disable the UTC alarm by clearing the UTCEN bit in RTC_CALALR if it is not already cleared.
2. Change the UTC_TIME alarm value in RTC_TIMALR.
3. Re-enable the UTC alarm by setting the UTCEN bit in RTC_CALALR.

### 26.5.4 Error Checking when Programming

Verification on user interface data is performed when accessing the century, year, month, date, day, hours, minutes, seconds and alarms. A check is performed on illegal BCD entries such as illegal date of the month with regard to the year and century configured.

If one of the time fields is not correct, the data is not loaded into the register/counter and a flag is set in the validity register. The user can not reset this flag. It is reset as soon as an acceptable value is programmed. This avoids any further side effects in the hardware. The same procedure is followed for the alarm.

The following checks are performed:

1. Century (check if it is in range 19–20 or 13–14 in Persian mode)
2. Year (BCD entry check)
3. Date (check range 01–31)
4. Month (check if it is in BCD range 01–12, check validity regarding “date”)
5. Day (check range 1–7)
6. Hour (BCD checks: in 24-hour mode, check range 00–23 and check that AM/PM flag is not set if RTC is set in 24-hour mode; in 12-hour mode check range 01–12)
7. Minute (check BCD and range 00–59)
8. Second (check BCD and range 00–59)

**Note:** If the 12-hour mode is selected by means of the RTC Mode Register (RTC_MR), a 12-hour value can be programmed and the returned value on RTC_TIMR will be the corresponding 24-hour value. The entry control checks the value of the AM/PM indicator (bit 22 of RTC_TIMR) to determine the range to be checked.

**Note:** In UTC mode, no check is performed on the entries. The RTC does not report any failure.

### 26.5.5 RTC Internal Free Running Counter Error Checking

To improve the reliability and security of the RTC, a permanent check is performed on the internal free running counters to report non-BCD or invalid date/time values.

An error is reported by TDERR bit in the status register (RTC_SR) if an incorrect value has been detected. The flag can be cleared by setting the TDERRCLR bit in the Status Clear Command Register (RTC_SCCR).

The TDERR error flag will be set again if the source of the error has not been cleared before clearing the TDERR flag. The clearing of the source of such error can be done by reprogramming a correct value on RTC_CALR and/or RTC_TIMR.

The RTC internal free running counters may automatically clear the source of TDERR due to their roll-over (i.e., every 10 seconds for SECONDS[3:0] field in RTC_TIMR). In this case the TDERR is held high until a clear command is asserted by TDERRCLR bit in RTC_SCCR.

### 26.5.6 Updating Time/Calendar

#### 26.5.6.1 Gregorian and Persian Modes

The update of the time/calendar must be synchronized on a second periodic event by either polling the RTC_SR.SEC status bit or by enabling the SECEN interrupt in the RTC_IER register.

Once the second event occurs, the user must stop the RTC by setting the corresponding field in the Control Register (RTC_CR). Bit UPDTIM must be set to update time fields (hour, minute, second) and bit UPDCAL must be set to update calendar fields (century, year, month, date, day).

The ACKUPD bit must then be read to 1 by either polling the RTC_SR or by enabling the ACKUPD interrupt in the RTC_IER. Once ACKUPD is read to 1, it is mandatory to clear this flag by writing the corresponding bit in the RTC_SCCR, after which the user can write to the Time Register, the Calendar Register, or both.

Once the update is finished, the user must write UPDTIM and/or UPDCAL to 0 in the RTC_CR.

The timing sequence of the time/calendar update is described in the figure below.

When entering the programming mode of the calendar fields, the time fields remain enabled and both the time and the calendar fields are stopped. This is due to the location of the calendar logical circuity (downstream for low-power considerations). It is highly recommended to prepare all the fields to be updated before entering programming mode. In successive update operations, the user must wait for at least one second after resetting the UPDTIM/UPDCAL bit in the RTC_CR before setting these bits again. This is done by waiting for the SEC flag in the RTC_SR before setting the UPDTIM/UPDCAL bit. After resetting UPDTIM/UPDCAL, the SEC flag must also be cleared.

**Figure 26-2. Time/Calendar Update Timing Diagram**

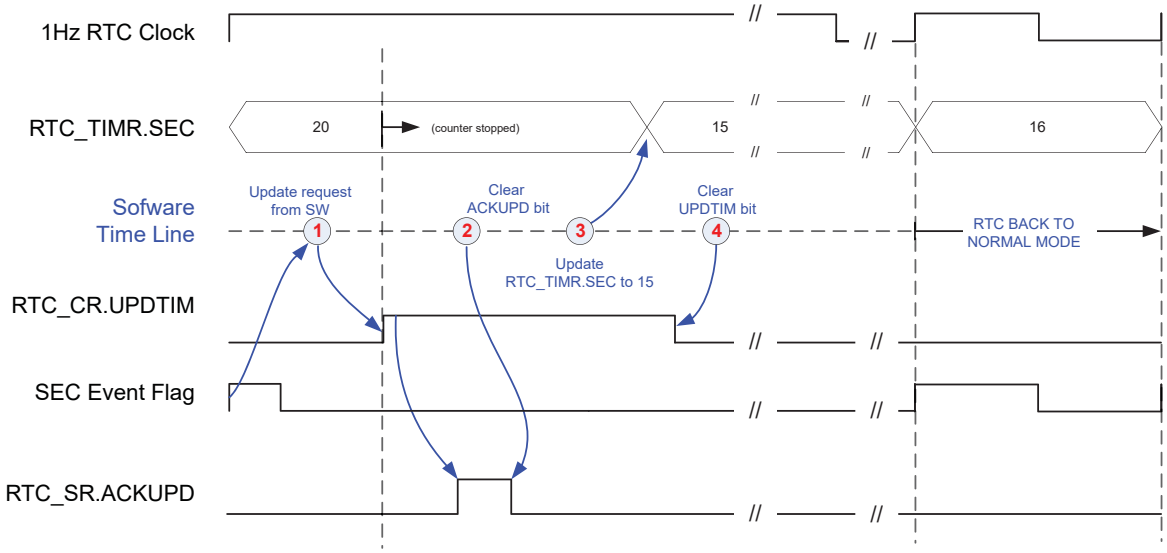


**Figure 26-3. Gregorian and Persian Modes Update Sequence**

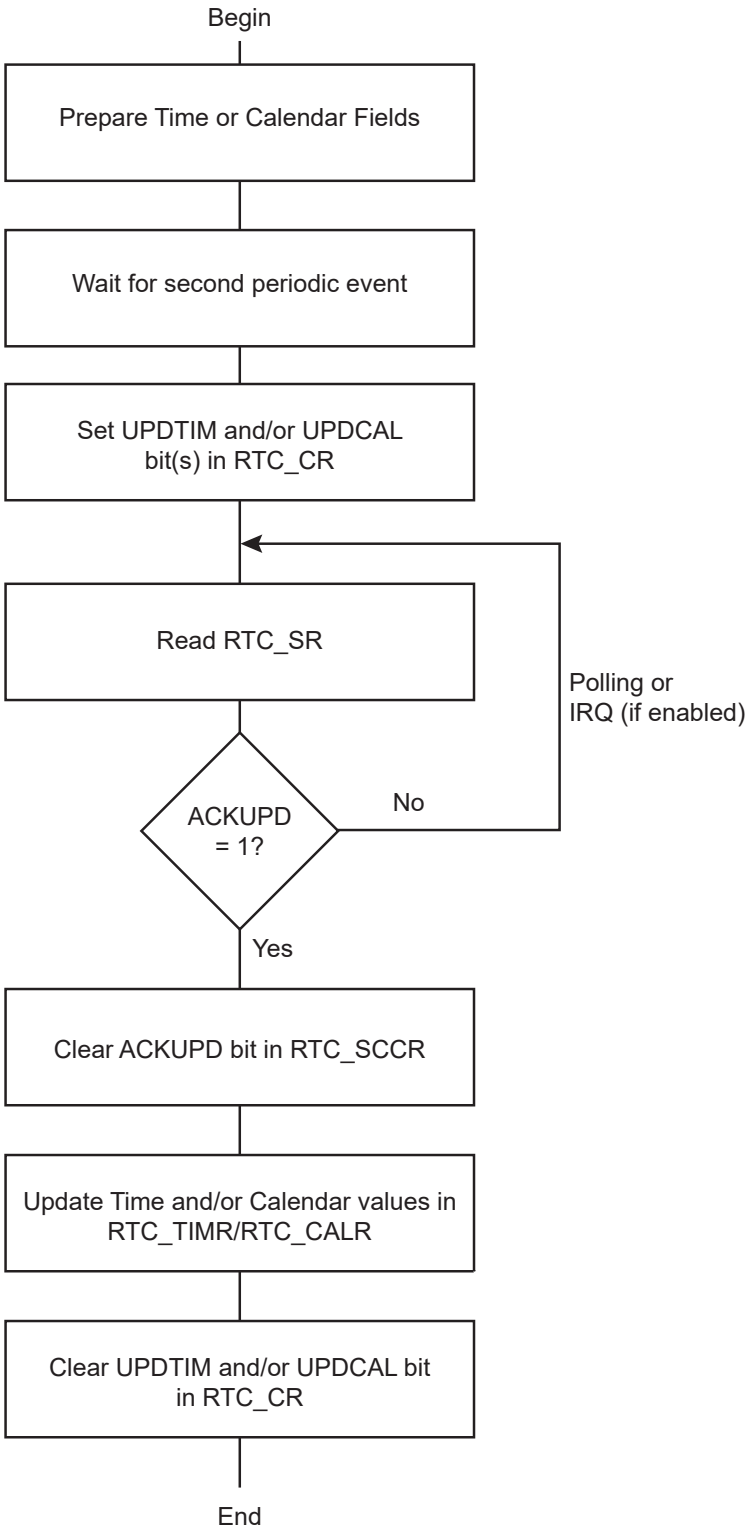

#### 26.5.6.2 UTC Mode

The update of the UTC time field must be synchronized on a second periodic event by either polling the RTC_SR.SEC status bit or by enabling the SECEN interrupt in the RTC_IER.

Once the second event occurs, the user must stop the RTC by setting the UPDTIM field in the Control Register (RTC_CR).

The ACKUPD bit must then be read to 1 by either polling the RTC_SR or by enabling the ACKUPD interrupt in the RTC_IER. Once ACKUPD is read to 1, it is mandatory to clear this flag by writing the corresponding bit in the RTC_SCCR, after which the user can write to the Time Register.

Once the update is finished, the user must write UPDTIM to 0 in the RTC_CR.

The timing sequence of the UTC time update is described in the figure below.

In successive update operations, the user must wait for at least one second after resetting the UPDTIM bit in the RTC_CR before setting this bit again. This is done by waiting for the SEC flag in the RTC_SR before setting UPDTIM bit. After resetting UPDTIM, the SEC flag must also be cleared.

**Figure 26-4. UTC Time Update Timing Diagram**

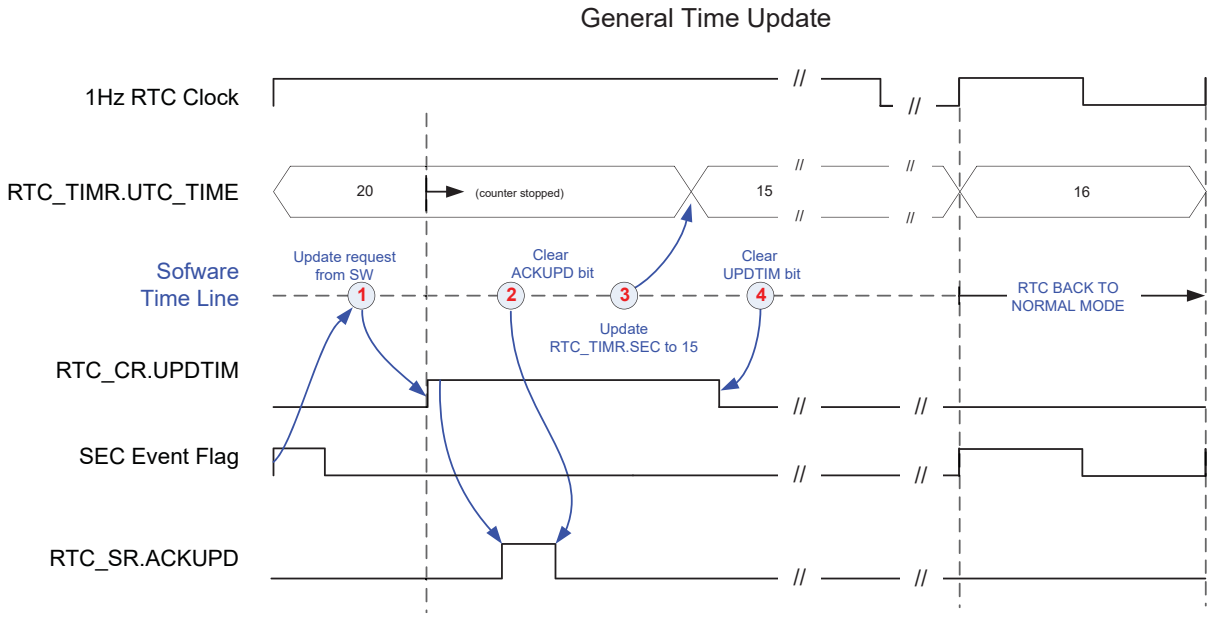

**Figure 26-5. UTC Mode Update Sequence**

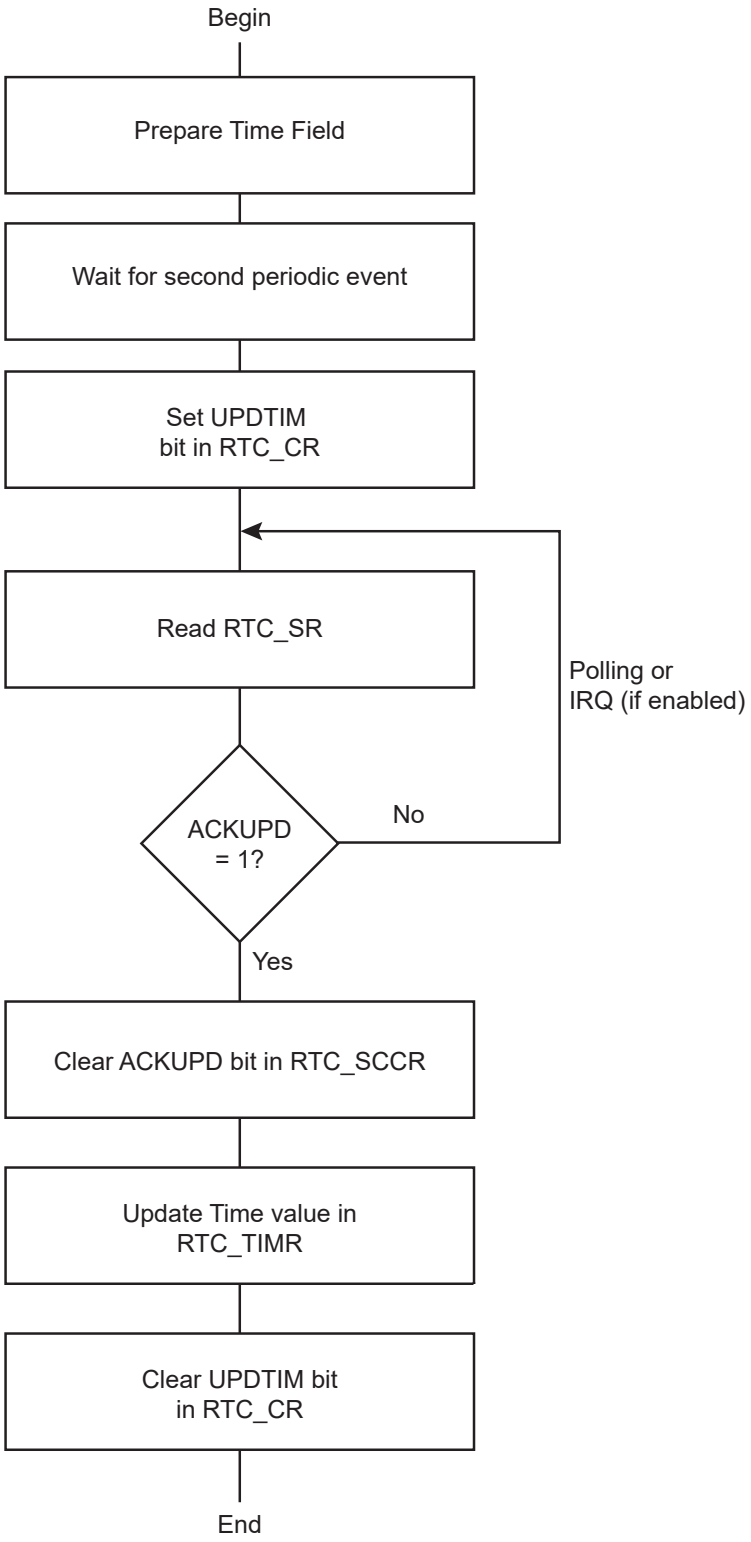

### 26.5.7 RTC Accurate Clock Calibration

The crystal oscillator that drives the RTC may not be as accurate as expected mainly due to temperature variation. The RTC is equipped with circuitry able to correct slow clock crystal drift.

To compensate for possible temperature variations over time, this accurate clock calibration circuitry can be programmed on-the-fly and also programmed during application manufacturing, in order to correct the crystal frequency accuracy at room temperature (20–25°C). The typical clock drift range at room temperature is ±20 ppm.

In the device operating temperature range, the 32.768 kHz crystal oscillator clock inaccuracy can be up to -200 ppm.

The RTC clock calibration circuitry allows positive or negative correction in a range of 1.5 ppm to 1950 ppm.

The calibration circuitry is fully digital. Thus, the configured correction is independent of temperature, voltage, process, etc., and no additional measurement is required to check that the correction is effective.

If the correction value configured in the calibration circuitry results from an accurate crystal frequency measure, the remaining accuracy is bounded by the values listed below:

- Below 1 ppm, for an initial crystal drift between 1.5 ppm up to 20 ppm, and from 30 ppm to 90 ppm
- Below 2 ppm, for an initial crystal drift between 20 ppm up to 30 ppm, and from 90 ppm to 130 ppm
- Below 5 ppm, for an initial crystal drift between 130 ppm up to 200 ppm

The calibration circuitry does not modify the 32.768 kHz crystal oscillator clock frequency but it acts by slightly modifying the 1 Hz clock period from time to time. The correction event occurs every 1 + [(20 - (19 x HIGHPPM)) x CORRECTION] seconds. When the period is modified, depending on the sign of the correction, the 1 Hz clock period increases or reduces by around 4 ms. Depending on the CORRECTION, NEGPPM and HIGHPPM values configured in RTC_MR, the period interval between two correction events differs.

**Figure 26-6. Calibration Circuitry**

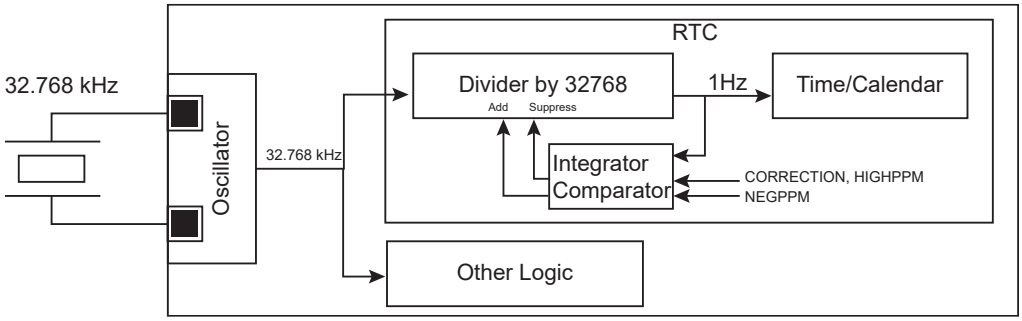

**Figure 26-7. Calibration Circuitry Waveforms**

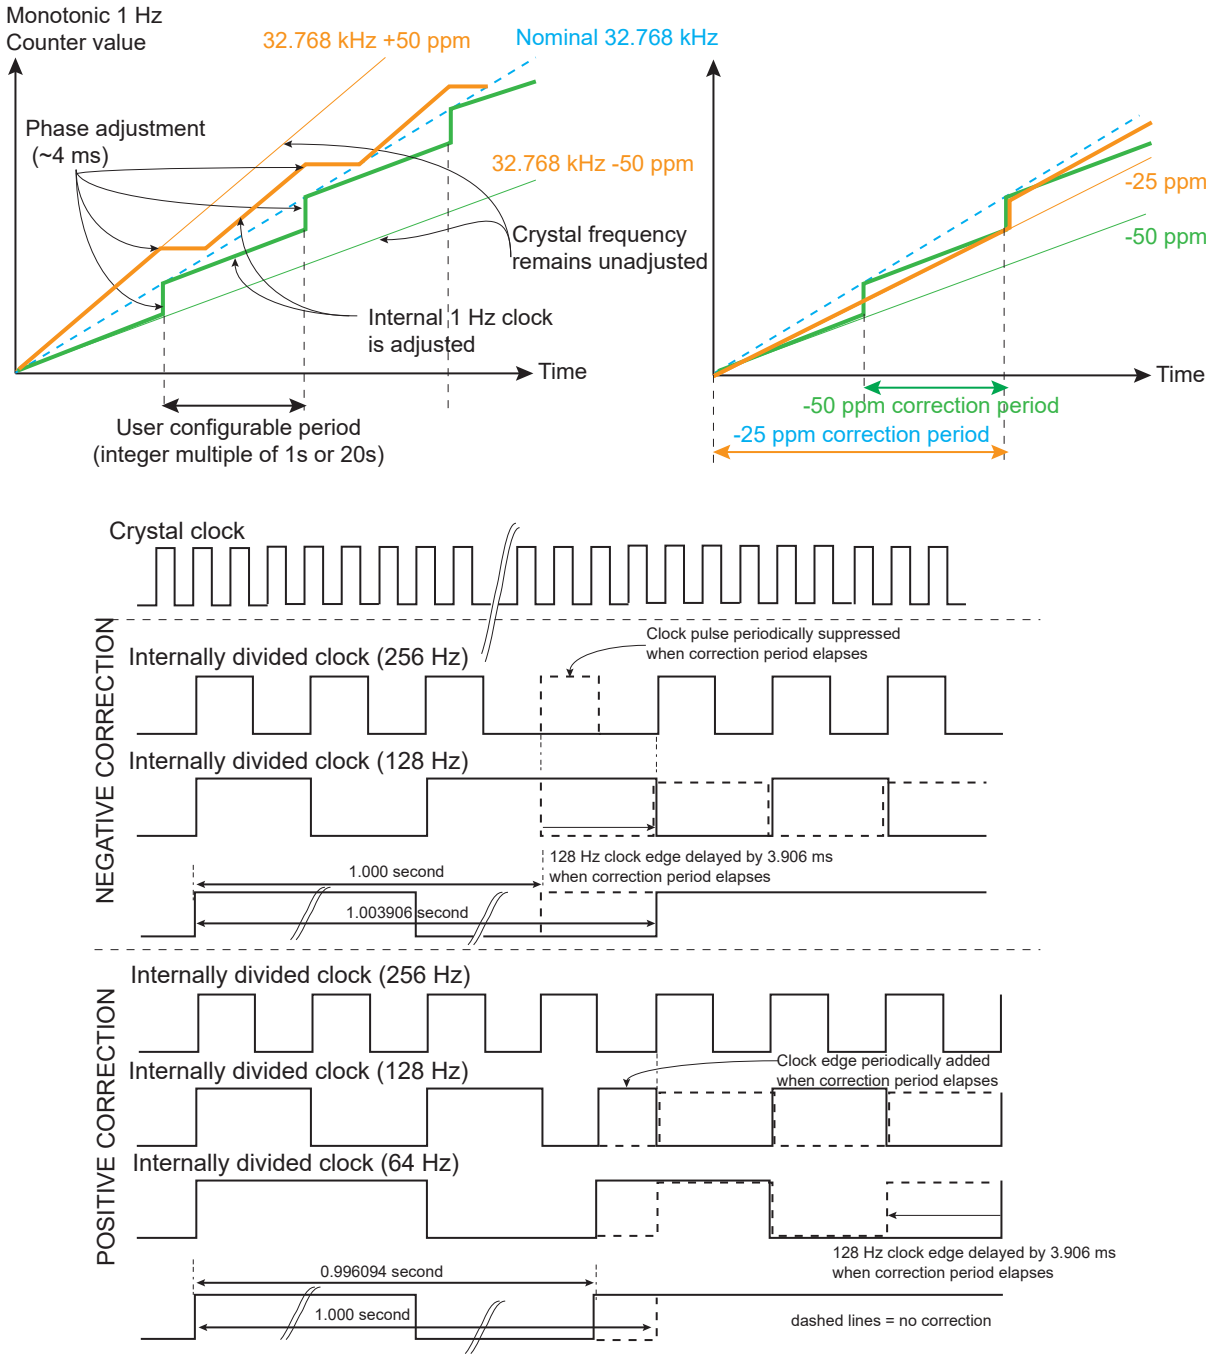


The inaccuracy of a crystal oscillator at typical room temperature (±20 ppm at 20–25 °C) can be compensated if a reference clock/signal is used to measure such inaccuracy. This kind of calibration operation can be set up during the final product manufacturing by means of measurement equipment embedding such a reference clock. The correction of value must be programmed into the (RTC_MR), and this value is kept as long as the circuitry is powered (backup area). Removing the backup power supply cancels this calibration. This room temperature calibration can be further processed by means of the networking capability of the target application.

Note that this adjustment does not take into account the temperature variation.

The frequency drift (up to -200 ppm) due to temperature variation can be compensated using a reference time if the application can access such a reference. If a reference time cannot be used, a temperature sensor can be placed close to the crystal oscillator in order to get the operating temperature of the crystal oscillator. Once obtained, the temperature may be converted using a lookup table (describing the accuracy/temperature curve of the crystal oscillator used) and RTC_MR configured accordingly. The calibration can be performed on-the-fly. This adjustment method is not based on a measurement of the crystal frequency/drift and therefore can be improved by means of the networking capability of the target application.

If no crystal frequency adjustment has been done during manufacturing, it is still possible to do it. In the case where a reference time of the day can be obtained through LAN/WAN network, it is possible to calculate the drift of the application crystal oscillator by comparing the values read on RTC Time Register (RTC_TIMR) and programming the HIGHPPM and CORRECTION fields on RTC_MR according to the difference measured between the reference time and those of RTC_TIMR.

### 26.5.8 Waveform Generation

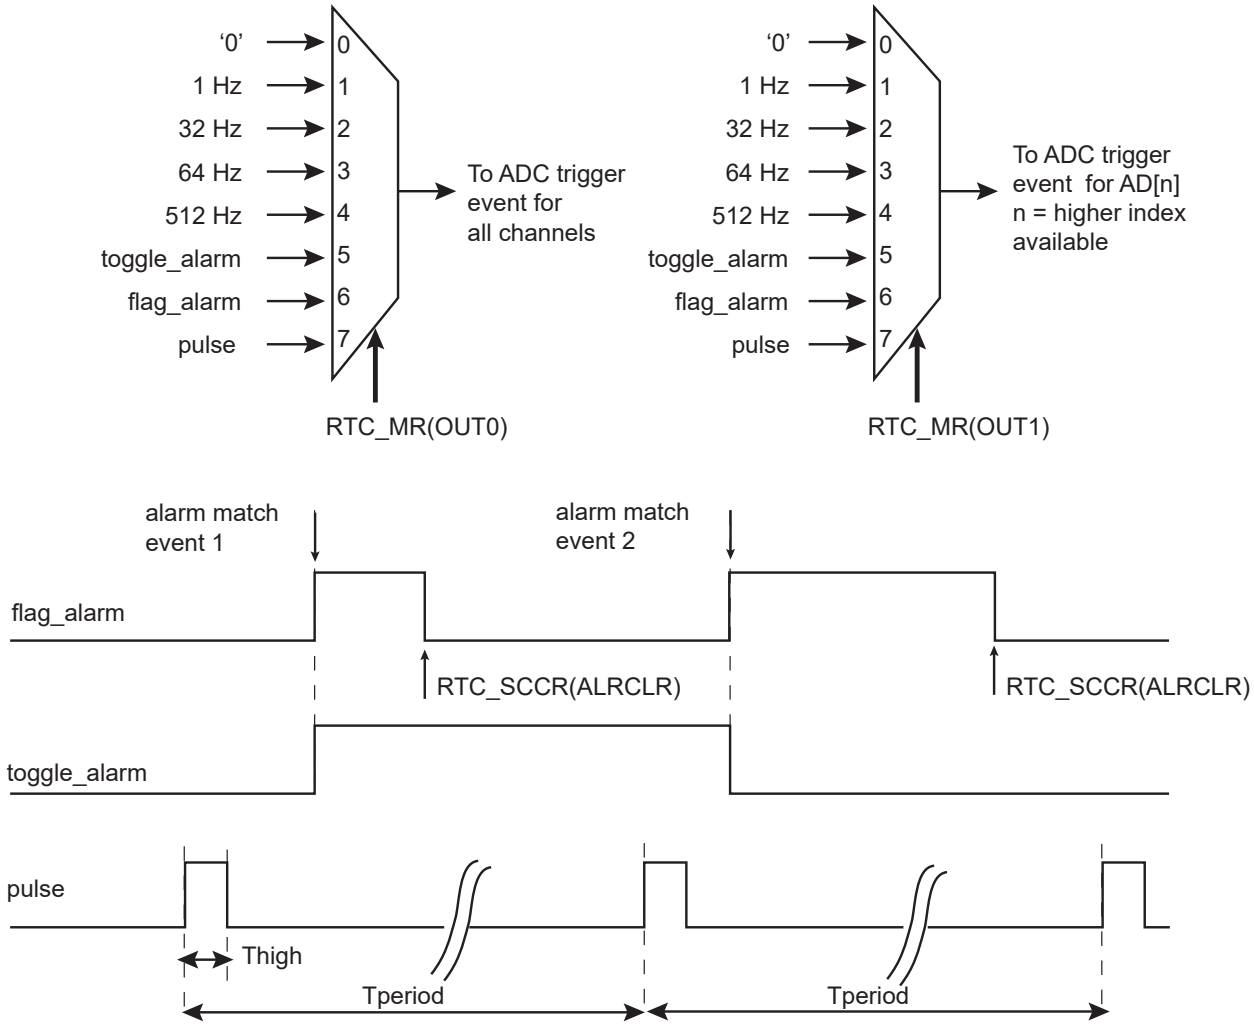
Waveforms can be generated in order to take advantage of the RTC inherent prescalers while the RTC is the only powered circuitry (Low-power mode of operation, Backup mode) or in any active mode. Entering Backup or Low-power operating modes does not affect the waveform generation outputs.

The RTC waveforms are internally routed to ADC trigger events. These events can be configured to provide several types of waveforms. The figure below illustrates the different signals available to generate the waveforms. Two different triggers can be generated at a time. The first is configured in RTC_MR.OUT0 while the second is configurable in RTC_MR.OUT1. OUT0 manages the trigger for channel AD[n:0] (where n is the higher index available (last channel)), while OUT1 manages the channel AD[n] only for specific modes. See the section "Analog to Digital Converter (ADC)" for selection of the measurement triggers and associated modes of operation.

The first selection choice sticks the associated output at 0. (This is the reset value and it can be used at any time to disable the waveform generation).

Selection choices 1 to 4 respectively select 1 Hz, 32 Hz, 64 Hz and 512 Hz.

**Figure 26-8. Waveform Generation for ADC Trigger Event**



### 26.5.9 Tamper Timestamping

As soon as a tamper is detected, the tamper counter is incremented and the RTC stores the time of the day, the date and the source of the tamper event in registers located in the backup area. Up to two tamper events can be stored.

In UTC mode, only the UTC time is stored. The date information is not relevant.

The tamper counter saturates at 15. Once this limit is reached, the exact number of tamper occurrences since the last read of stamping registers cannot be known.

The first set of timestamping registers (RTC_TSTR0, RTC_TSDR0, RTC_TSSR0) cannot be overwritten, so once they have been written all data are stored until the registers are reset. Therefore these registers are storing the first tamper occurrence after a read.

The second set of timestamping registers (RTC_TSTR1, RTC_TSDR1, RTC_TSSR1) are overwritten each time a tamper event is detected. Thus the date and the time data of the first and the second stamping registers may be equal. This occurs when the tamper counter value carried on field TEVCNT in RTC_TSTR0 equals 1. Thus this second set of registers stores the last occurrence of tamper before a read.

Reading a set of timestamping registers requires three accesses, one for the time of the day, one for the date and one for the tamper source.

Reading the third part (RTC_TSSR0/1) of a timestamping register set clears the whole content of the registers (time, date and tamper source) and makes the timestamping registers available to store a new event.

## 26.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | RTC_CR | 7:0 | | | | | | | UPDCAL | UPDTIM |
| | | 15:8 | | | | | | | TIMEVSEL[1:0] | |
| | | 23:16 | | | | | | | CALEVSEL[1:0] | |
| | | 31:24 | | | | | | | | |
| 0x04 | RTC_MR | 7:0 | | | | NEGPPM | | UTC | PERSIAN | HRMOD |

### 26.6.1 RTC Control Register

**Name:** RTC_CR
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | CALEVSEL[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | TIMEVSEL[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | UPDCAL | UPDTIM |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bits 17:16 – CALEVSEL[1:0]** Calendar Event Selection
The event that generates the flag CALEV in RTC_SR depends on the value of CALEVSEL

In UTC mode, this field has no effect on the RTC_SR.

| Value | Name | Description |
|---|---|---|
| 0 | WEEK | Week change (every Monday at time 00:00:00) |
| 1 | MONTH | Month change (every 01 of each month at time 00:00:00) |
| 2 | YEAR | Year change (every January 1 at time 00:00:00) |
| 3 | YEAR | Reserved |

**Bits 9:8 – TIMEVSEL[1:0]** Time Event Selection
The event that generates the flag TIMEV in RTC_SR depends on the value of TIMEVSEL.

In UTC mode, this field has no effect on the RTC_SR.

| Value | Name | Description |
|---|---|---|
| 0 | MINUTE | Minute change |
| 1 | HOUR | Hour change |
| 2 | MIDNIGHT | Every day at midnight |
| 3 | NOON | Every day at noon |

**Bit 1 – UPDCAL** Update Request Calendar Register
Calendar counting consists of day, date, month, year and century counters. Calendar counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC_SR.

In UTC mode, this bit has no effect on the RTC behavior.

| Value | Description |
|---|---|
| 0 | No effect or, if UPDCAL has been previously written to 1, stops the update procedure. |
| 1 | Stops the RTC calendar counting. |

**Bit 0 – UPDTIM** Update Request Time Register
Time counting consists of second, minute and hour counters. Time counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC_SR.

| Value | Description |
|---|---|
| 0 | No effect or, if UPDTIM has been previously written to 1, stops the update procedure. |
| 1 | Stops the RTC time counting. |

### 26.6.2 RTC Mode Register

**Name:** RTC_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | TPERIOD[1:0] | | | THIGH[2:0] | | |
| Access | | | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | 0 | 0 | | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | OUT1[2:0] | | | | OUT0[2:0] | | |
| Access | | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | HIGHPPM | CORRECTION[6:0] | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | NEGPPM | | UTC | PERSIAN | HRMOD |
| Access | | | | R/W | | R/W | R/W | R/W |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bits 29:28 – TPERIOD[1:0]** Period of the Output Pulse

| Value | Name | Description |
|---|---|---|
| 0 | P_1S | 1 second |
| 1 | P_500MS | 500 ms |
| 2 | P_250MS | 250 ms |
| 3 | P_125MS | 125 ms |

**Bits 26:24 – THIGH[2:0]** High Duration of the Output Pulse

| Value | Name | Description |
|---|---|---|
| 0 | H_31MS | 31.2 ms |
| 1 | H_16MS | 15.6 ms |
| 2 | H_4MS | 3.91 ms |
| 3 | H_976US | 976 µs |
| 4 | H_488US | 488 µs |
| 5 | H_122US | 122 µs |
| 6 | H_30US | 30.5 µs |
| 7 | H_15US | 15.2 µs |

**Bits 22:20 – OUT1[2:0]** ADC Last Channel Trigger Event Source Selection

| Value | Name | Description |
|---|---|---|
| 0 | NO_WAVE | No waveform, stuck at ‘0’ |
| 1 | FREQ1HZ | 1 Hz square wave |
| 2 | FREQ32HZ | 32 Hz square wave |
| 3 | FREQ64HZ | 64 Hz square wave |
| 4 | FREQ512HZ | 512 Hz square wave |
| 5 | ALARM_TOGGLE | Output toggles when alarm flag rises |
| 6 | ALARM_FLAG | Output is a copy of the alarm flag |
| 7 | PROG_PULSE | Duty cycle programmable pulse |

**Bits 18:16 – OUT0[2:0]** All ADC Channel Trigger Event Source Selection

| Value | Name | Description |
|---|---|---|
| 0 | NO_WAVE | No waveform, stuck at ‘0’ |
| 1 | FREQ1HZ | 1 Hz square wave |
| 2 | FREQ32HZ | 32 Hz square wave |
| 3 | FREQ64HZ | 64 Hz square wave |
| 4 | FREQ512HZ | 512 Hz square wave |
| 5 | ALARM_TOGGLE | Output toggles when alarm flag rises |
| 6 | ALARM_FLAG | Output is a copy of the alarm flag |
| 7 | PROG_PULSE | Duty cycle programmable pulse |

**Bit 15 – HIGHPPM** HIGH PPM Correction
If the absolute value of the correction to be applied is lower than 30 ppm, it is recommended to clear HIGHPPM. HIGHPPM set to 1 is recommended for 30 ppm correction and above.

**Formula:**

If HIGHPPM = 0, then the clock frequency correction range is from 1.5 ppm up to 98 ppm. The RTC accuracy is less than 1 ppm for a range correction from 1.5 ppm up to 30 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\mathrm{CORRECTION} = \frac{3906}{20 \times \mathrm{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to being programmed into CORRECTION field.

If HIGHPPM = 1, then the clock frequency correction range is from 30.5 ppm up to 1950 ppm. The RTC accuracy is less than 1 ppm for a range correction from 30.5 ppm up to 90 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\mathrm{CORRECTION} = \frac{3906}{\mathrm{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to be programmed into CORRECTION field.

If NEGPPM is set to 1, the ppm correction is negative (used to correct crystals that are faster than the nominal 32.768 kHz).

| Value | Description |
|---|---|
| 0 | Lower range ppm correction with accurate correction. |
| 1 | Higher range ppm correction with accurate correction. |

**Bits 14:8 – CORRECTION[6:0]** Slow Clock Correction

| Value | Description |
|---|---|
| 0 | No correction |
| 1-127 | The slow clock will be corrected according to the formula given in HIGHPPM description. |

**Bit 4 – NEGPPM** Negative PPM Correction
See CORRECTION and HIGHPPM field descriptions.

NEGPPM must be cleared to correct a crystal slower than 32.768 kHz.

| Value | Description |
|---|---|
| 0 | Positive correction (the divider will be slightly higher than 32768). |
| 1 | Negative correction (the divider will be slightly lower than 32768). |

**Bit 2 – UTC** UTC Time Format
It is forbidden to write a one to the UTC and PERSIAN bits at the same time.

| Value | Description |
|---|---|
| 0 | Gregorian or Persian calendar. |
| 1 | UTC format. |

**Bit 1 – PERSIAN** PERSIAN Calendar

| Value | Description |
|---|---|
| 0 | Gregorian calendar. |
| 1 | Persian calendar. |

**Bit 0 – HRMOD** 12-/24-hour Mode

| Value | Description |
|---|---|
| 0 | 24-hour mode is selected. |
| 1 | 12-hour mode is selected. |

### 26.6.3 RTC Time Register

**Name:** RTC_TIMR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

In UTC mode, this register view is not relevant, see 26.6.7 RTC_TIMALR (UTC_MODE) .

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | MIN[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | SEC[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 22 – AMPM** Ante Meridiem Post Meridiem Indicator
This bit is the AM/PM indicator in 12-hour mode.

| Value | Description |
|---|---|
| 0 | AM. |
| 1 | PM. |

**Bits 21:16 – HOUR[5:0]** Current Hour
The range that can be set is 1–12 (BCD) in 12-hour mode or 0–23 (BCD) in 24-hour mode.

**Bits 14:8 – MIN[6:0]** Current Minute
The range that can be set is 0–59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 6:0 – SEC[6:0]** Current Second
The range that can be set is 0–59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### 26.6.4 RTC Time Register (UTC_MODE)

**Name:** RTC_TIMR (UTC_MODE)
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

This configuration is relevant only if UTC = 1 in RTC_MR.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – UTC_TIME[31:0]** Current UTC Time
Any value can be set.

### 26.6.5 RTC Calendar Register

**Name:** RTC_CALR
**Offset:** 0x0C
**Reset:** 0x01E11220
**Property:** Read/Write

In UTC mode, values read in this register are not relevant.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | DATE[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DAY[2:0] | | | MONTH[4:0] | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | YEAR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | CENT[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

**Bits 29:24 – DATE[5:0]** Current Day in Current Month
The range that can be set is 01–31 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 23:21 – DAY[2:0]** Current Day in Current Week
The range that can be set is 1–7 (BCD).

The coding of the number (which number represents which day) is user-defined as it has no effect on the date counter.

**Bits 20:16 – MONTH[4:0]** Current Month
The range that can be set is 01–12 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 15:8 – YEAR[7:0]** Current Year
The range that can be set is 00–99 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 6:0 – CENT[6:0]** Current Century
The range that can be set is 19–20 (Gregorian) or 13–14 (Persian) (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### 26.6.6 RTC Time Alarm Register

**Name:** RTC_TIMALR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

To change one of the SEC, MIN, HOUR fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC_TIMALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN fields.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | HOUREN | AMPM | HOUR[5:0] | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | MINEN | MIN[6:0] | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SECEN | SEC[6:0] | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 23 – HOUREN** Hour Alarm Enable

| Value | Description |
|---|---|
| 0 | The hour-matching alarm is disabled. |
| 1 | The hour-matching alarm is enabled. |

**Bit 22 – AMPM** AM/PM Indicator
This field is the alarm field corresponding to the BCD-coded hour counter.

**Bits 21:16 – HOUR[5:0]** Hour Alarm
This field is the alarm field corresponding to the BCD-coded hour counter.

**Bit 15 – MINEN** Minute Alarm Enable

| Value | Description |
|---|---|
| 0 | The minute-matching alarm is disabled. |
| 1 | The minute-matching alarm is enabled. |

**Bits 14:8 – MIN[6:0]** Minute Alarm
This field is the alarm field corresponding to the BCD-coded minute counter.

**Bit 7 – SECEN** Second Alarm Enable

| Value | Description |
|---|---|
| 0 | The second-matching alarm is disabled. |
| 1 | The second-matching alarm is enabled. |

**Bits 6:0 – SEC[6:0]** Second Alarm
This field is the alarm field corresponding to the BCD-coded second counter.

### 26.6.7 RTC Time Alarm Register (UTC_MODE)

**Name:** RTC_TIMALR (UTC_MODE)
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

This configuration is relevant only if UTC = 1 in RTC_MR.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – UTC_TIME[31:0]** UTC_TIME Alarm
This field is the alarm field corresponding to the UTC time counter. To change it, proceed as follows:

1. Disable the UTC alarm by clearing the UTCEN bit in RTC_CALALR if it is not already cleared.
2. Change the UTC_TIME alarm value.
3. Enable the UTC alarm by setting the UTCEN bit in RTC_CALALR.

### 26.6.8 RTC Calendar Alarm Register

**Name:** RTC_CALALR
**Offset:** 0x14
**Reset:** 0x01010000
**Property:** Read/Write

In UTC mode, this register view is not relevant, see 26.6.9 RTC_CALALR (UTC_MODE).

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

To change one of the DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC_CALALR. The first access clears the enable corresponding to the field to change (DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (DATE, MONTH). The third access is required to re-enable the field by writing 1 in DATEEN, MTHEN fields.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DATEEN | | DATE[5:0] | | | | | |
| Access | R/W | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | MTHEN | | | MONTH[4:0] | | | | |
| Access | R/W | | | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | | 0 | 0 | 0 | 0 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 31 – DATEEN** Date Alarm Enable

| Value | Description |
|---|---|
| 0 | The date-matching alarm is disabled. |
| 1 | The date-matching alarm is enabled. |

**Bits 29:24 – DATE[5:0]** Date Alarm
This field is the alarm field corresponding to the BCD-coded date counter.

**Bit 23 – MTHEN** Month Alarm Enable

| Value | Description |
|---|---|
| 0 | The month-matching alarm is disabled. |
| 1 | The month-matching alarm is enabled. |

**Bits 20:16 – MONTH[4:0]** Month Alarm
This field is the alarm field corresponding to the BCD-coded month counter.

### 26.6.9 RTC Calendar Alarm Register (UTC_MODE)

**Name:** RTC_CALALR (UTC_MODE)
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | UTCEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – UTCEN** UTC Alarm Enable

| Value | Description |
|---|---|
| 0 | The UTC-matching alarm is disabled. |
| 1 | The UTC-matching alarm is enabled. |

### 26.6.10 RTC Status Register

**Name:** RTC_SR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TDERR | CALEV | TIMEV | SEC | ALARM | ACKUPD |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – TDERR** Time and/or Date Free Running Error
If the RTC is configured in UTC mode, the value returned by this field is not relevant.

| Value | Name | Description |
|---|---|---|
| 0 | CORRECT | The internal free running counters are carrying valid values since the last read of the Status Register (RTC_SR). |
| 1 | ERR_TIMEDATE | The internal free running counters have been corrupted (invalid date or time, non-BCD values) since the last read and/or they are still invalid. |

**Bit 4 – CALEV** Calendar Event
The calendar event is selected in the CALEVSEL field in the Control Register (RTC_CR) and can be any one of the following events: week change, month change and year change. If the RTC is configured in UTC mode, the value returned by this field is not relevant.

| Value | Name | Description |
|---|---|---|
| 0 | NO_CALEVENT | No calendar event has occurred since the last clear. |
| 1 | CALEVENT | At least one calendar event has occurred since the last clear. |

**Bit 3 – TIMEV** Time Event
The time event is selected in the TIMEVSEL field in the Control Register (RTC_CR) and can be any one of the following events: minute change, hour change, noon, midnight (day change). If the RTC is configured in UTC mode, the value returned by this field is not relevant.

| Value | Name | Description |
|---|---|---|
| 0 | NO_TIMEVENT | No time event has occurred since the last clear. |
| 1 | TIMEVENT | At least one time event has occurred since the last clear. |

**Bit 2 – SEC** Second Event

| Value | Name | Description |
|---|---|---|
| 0 | NO_SECEVENT | No second event has occurred since the last clear. |
| 1 | SECEVENT | At least one second event has occurred since the last clear. |

**Bit 1 – ALARM** Alarm Flag

| Value | Name | Description |
|---|---|---|
| 0 | NO_ALARMEVENT | No alarm matching condition occurred. |
| 1 | ALARMEVENT | An alarm matching condition has occurred. |

**Bit 0 – ACKUPD** Acknowledge for Update

| Value | Name | Description |
|---|---|---|
| 0 | FREERUN | Time and calendar registers cannot be updated. |
| 1 | UPDATE | Time and calendar registers can be updated. |

### 26.6.11 RTC Status Clear Command Register

**Name:** RTC_SCCR
**Offset:** 0x1C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Clears the corresponding status flag in the Status register (RTC_SR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TDERRCLR | CALCLR | TIMCLR | SECCLR | ALRCLR | ACKCLR |
| Access | | | W | W | W | W | W | W |
| Reset | | | – | – | – | – | – | – |

**Bit 5 – TDERRCLR** Time and/or Date Free Running Error Clear
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALCLR** Calendar Clear
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMCLR** Time Clear
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECCLR** Second Clear

**Bit 1 – ALRCLR** Alarm Clear

**Bit 0 – ACKCLR** Acknowledge Clear

### 26.6.12 RTC Interrupt Enable Register

**Name:** RTC_IER
**Offset:** 0x20
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TDERREN | CALEN | TIMEN | SECEN | ALREN | ACKEN |
| Access | | | W | W | W | W | W | W |
| Reset | | | – | – | – | – | – | – |

**Bit 5 – TDERREN** Time and/or Date Error Interrupt Enable
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALEN** Calendar Event Interrupt Enable
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMEN** Time Event Interrupt Enable
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECEN** Second Event Interrupt Enable

**Bit 1 – ALREN** Alarm Interrupt Enable

**Bit 0 – ACKEN** Acknowledge Update Interrupt Enable

### 26.6.13 RTC Interrupt Disable Register

**Name:** RTC_IDR
**Offset:** 0x24
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TDERRDIS | CALDIS | TIMDIS | SECDIS | ALRDIS | ACKDIS |
| Access | | | W | W | W | W | W | W |
| Reset | | | – | – | – | – | – | – |

**Bit 5 – TDERRDIS** Time and/or Date Error Interrupt Disable
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALDIS** Calendar Event Interrupt Disable
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMDIS** Time Event Interrupt Disable
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECDIS** Second Event Interrupt Disable

**Bit 1 – ALRDIS** Alarm Interrupt Disable

**Bit 0 – ACKDIS** Acknowledge Update Interrupt Disable

### 26.6.14 RTC Interrupt Mask Register

**Name:** RTC_IMR
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TDERR | CAL | TIM | SEC | ALR | ACK |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – TDERR** Time and/or Date Error Mask
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CAL** Calendar Event Interrupt Mask
If the RTC is configured in UTC mode, this bit is not relevant.

**Bit 3 – TIM** Time Event Interrupt Mask
If the RTC is configured in UTC mode, this bit is not relevant.

**Bit 2 – SEC** Second Event Interrupt Mask

**Bit 1 – ALR** Alarm Interrupt Mask

**Bit 0 – ACK** Acknowledge Update Interrupt Mask

### 26.6.15 RTC Valid Entry Register

**Name:** RTC_VER
**Offset:** 0x2C
**Reset:** 0x00000000
**Property:** Read-only

If the RTC is configured in UTC mode, the values returned by this register are not relevant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | NVCALALR | NVTIMALR | NVCAL | NVTIM |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 3 – NVCALALR** Non-valid Calendar Alarm

| Value | Description |
|---|---|
| 0 | No invalid data has been detected in RTC_CALALR (Calendar Alarm Register). |
| 1 | RTC_CALALR has contained invalid data since it was last programmed. |

**Bit 2 – NVTIMALR** Non-valid Time Alarm

| Value | Description |
|---|---|
| 0 | No invalid data has been detected in RTC_TIMALR (Time Alarm Register). |
| 1 | RTC_TIMALR has contained invalid data since it was last programmed. |

**Bit 1 – NVCAL** Non-valid Calendar

| Value | Description |
|---|---|
| 0 | No invalid data has been detected in RTC_CALR (Calendar Register). |
| 1 | RTC_CALR has contained invalid data since it was last programmed. |

**Bit 0 – NVTIM** Non-valid Time

| Value | Description |
|---|---|
| 0 | No invalid data has been detected in RTC_TIMR (Time Register). |

| Value | Description |
|---|---|
| 1 | RTC_TIMR has contained invalid data since it was last programmed. |

### 26.6.16 RTC TimeStamp Time Register 0

**Name:** RTC_TSTR0
**Offset:** 0xB0
**Reset:** 0x00000000
**Property:** Read-only

These fields are valid for non-UTC mode only.

RTC_TSTR0 reports the timestamp of the first tamper event after reading RTC_TSSR0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BACKUP | | | | TEVCNT[3:0] | | | |
| Access | R | | | | R | R | R | R |
| Reset | 0 | | | | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | AMPM | HOUR[5:0] | | | | | |
| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | MIN[6:0] | | | | | | |
| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | SEC[6:0] | | | | | | |
| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC_TSSR0)

| Value | Description |
|---|---|
| 0 | The state of the system is different from Backup mode when the tamper event occurs. |
| 1 | The system is in Backup mode when the tamper event occurs. |

**Bits 27:24 – TEVCNT[3:0]** Tamper Events Counter (cleared by reading RTC_TSSR0)
Each time a tamper event occurs, this counter is incremented. This counter saturates at 15. Once this value is reached, it is no more possible to know the exact number of tamper events.

If this field is not null, this implies that at least one tamper event occurs since last register reset and that the values stored in timestamping registers are valid.

**Bit 22 – AMPM** AM/PM Indicator of the Tamper (cleared by reading RTC_TSSR0)

**Bits 21:16 – HOUR[5:0]** Hours of the Tamper (cleared by reading RTC_TSSR0)

**Bits 14:8 – MIN[6:0]** Minutes of the Tamper (cleared by reading RTC_TSSR0)

**Bits 6:0 – SEC[6:0]** Seconds of the Tamper (cleared by reading RTC_TSSR0)

### 26.6.17 RTC TimeStamp Time Register 0 (UTC_MODE)

**Name:** RTC_TSTR0 (UTC_MODE)
**Offset:** 0xB0
**Reset:** 0x00000000
**Property:** Read-only

RTC_TSTR0 reports the timestamp of the first tamper event after reading RTC_TSSR0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BACKUP | | | | TEVCNT[3:0] | | | |
| Access | R | | | | R | R | R | R |
| Reset | 0 | | | | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC_TSSR0)

| Value | Description |
|---|---|
| 0 | The state of the system is different from Backup mode when the tamper event occurs. |
| 1 | The system is in Backup mode when the tamper event occurs. |

**Bits 27:24 – TEVCNT[3:0]** Tamper Events Counter (cleared by reading RTC_TSSR0)
Each time a tamper event occurs, this counter is incremented. This counter saturates at 15. Once this value is reached, it is no more possible to know the exact number of tamper events.

If this field is not null, this implies that at least one tamper event occurs since last register reset and that the values stored in timestamping registers are valid.

### 26.6.18 RTC TimeStamp Time Register 1

**Name:** RTC_TSTR1
**Offset:** 0xBC
**Reset:** 0x00000000
**Property:** Read-only

These fields are valid for non-UTC mode only.

RTC_TSTR1 reports the timestamp of the last tamper event after reading RTC_TSSR1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC_TSSR1)

| Value | Description |
|---|---|
| 0 | The state of the system is different from Backup mode when the tamper event occurs. |
| 1 | The system is in Backup mode when the tamper event occurs. |

**Bit 22 – AMPM** AM/PM Indicator of the Tamper (cleared by reading RTC_TSSR1)

**Bits 21:16 – HOUR[5:0]** Hours of the Tamper (cleared by reading RTC_TSSR1)

**Bits 14:8 – MIN[6:0]** Minutes of the Tamper (cleared by reading RTC_TSSR1)

**Bits 6:0 – SEC[6:0]** Seconds of the Tamper (cleared by reading RTC_TSSR1)

### 26.6.19 RTC TimeStamp Time Register 1 (UTC_MODE)

**Name:** RTC_TSTR1 (UTC_MODE)
**Offset:** 0xBC
**Reset:** 0x00000000
**Property:** Read-only

RTC_TSTR1 reports the timestamp of the last tamper event after reading RTC_TSSR1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BACKUP | | | | | | | |
| Access | R | | | | | | | |

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC_TSSR1)

| Value | Description |
|---|---|
| 0 | The state of the system is different from Backup mode when the tamper event occurs. |
| 1 | The system is in Backup mode when the tamper event occurs. |

### 26.6.20 RTC TimeStamp Date Register

**Name:** RTC_TSDRx
**Offset:** 0xB4 + x*0x0C [x=0..1]
**Reset:** 0x00000000
**Property:** Read-only

These fields contain the date and the source of a tamper occurrence if RTC_TSTR0.TEVCNT is not null.

These fields are relevant for non-UTC mode only.

RTC_TSDR0 reports the timestamp of the first tamper event after reading RTC_TSSR0, and RTC_TSDR1 reports the timestamp of the last tamper event.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | DATE[5:0] | | | | | |

**Bits 29:24 – DATE[5:0]** Date of the Tamper (cleared by reading RTC_TSSRx)

**Bits 23:21 – DAY[2:0]** Day of the Tamper (cleared by reading RTC_TSSRx)

**Bits 20:16 – MONTH[4:0]** Month of the Tamper (cleared by reading RTC_TSSRx)

**Bits 15:8 – YEAR[7:0]** Year of the Tamper (cleared by reading RTC_TSSRx)

**Bits 6:0 – CENT[6:0]** Century of the Tamper (cleared by reading RTC_TSSRx)

### 26.6.21 RTC TimeStamp Date Register (UTC_MODE)

**Name:** RTC_TSDRx (UTC_MODE)
**Offset:** 0xB4
**Reset:** 0x00000000
**Property:** Read-only

RTC_TSDR0 reports the timestamp of the first tamper event after reading RTC_TSSR0, and RTC_TSDR1 reports the timestamp of the last tamper event.
This register is cleared by reading RTC_TSSRx.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | UTC_TIME[31:24] | | | | | | | |

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – UTC_TIME[31:0]** Time of the Tamper (UTC format)
This configuration is relevant only if UTC = 1 in RTC_MR.

### 26.6.22 RTC TimeStamp Source Register

**Name:** RTC_TSSRx
**Offset:** 0xB8 + x*0x0C [x=0..1]
**Reset:** 0x00000000
**Property:** Read-only

This register is cleared after read and the read access also performs a clear on RTC_TSTRx and RTC_TSDRx.
The following configuration values are valid for all listed bit names of this register:

0: No alarm generated since the last clear.

1: An alarm has been generated by the corresponding monitor since the last clear.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | | | | 0 | 0 | | |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx** PIOBU Intrusion Detector (cleared on read)

**Bit 3 – JTAG** JTAG Pins Monitor (cleared on read)

**Bit 2 – TST** Test Pin Monitor (cleared on read)

# 27. System Controller Write Protection (SYSCWP)

## 27.1 Functional Description

### 27.1.1 System Controller Peripherals Mapping

**Table 27-1. System Controller Peripherals Mapping**

| Offset | System Controller Peripheral | Name |
|---|---|---|
| 0x000-0x00C | Reset Controller | RSTC |
| 0x010-0x01C | Shutdown Controller | SHDWC |
| 0x030-0x03C | Period Interval Timer | PIT |
| 0x040-0x04C | Watchdog Timer | WDT |
| 0x050-0x05C | Slow Clock Controller | SCKC |
| 0x0B0-0x190 | Real Time Clock | RTC |
| 0x194 | Write Protection Mode Register | SYSC_WPMR |

### 27.1.2 Register Write Protection

To prevent any single software error from modifying the configuration of the Reset Controller (RSTC), Shutdown Controller (SHDWC), Periodic Interval Timer (PIT), Slow Clock Controller (SCKC), Real-time Clock (RTC) and Watchdog Timer (WDT), some registers of these peripherals can be write-protected by setting the WPEN bit in the System Controller Write Protection Mode register (SYSC_WPMR).

**Note:** The WDT embeds additional write protection mechanisms.

The following registers can be write-protected when SYSC_WPMR.WPEN=1:

- WDT Control Register
- WDT Mode Register
- RSTC Mode Register
- SHDWC Mode Register
- SHDWC Wakeup Inputs Register
- PIT Mode Register
- SCKC Configuration Register
- RTC Control Register
- RTC Mode Register
- RTC Time Alarm Register
- RTC Calendar Alarm Register

## 27.2 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SYSC_WPMR | 7:0 | | | | | | | | WPEN |
| | | 15:8 | WPKEY[7:0] | | | | | | | |
| | | 23:16 | WPKEY[15:8] | | | | | | | |
| | | 31:24 | WPKEY[23:16] | | | | | | | |

### 27.2.1 SYSC Write Protection Mode Register

**Name:** SYSC_WPMR
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x535943 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection of the configuration registers if WPKEY corresponds to 0x535943 (“SYC” in ASCII). |
| 1 | Enables the write protection of the configuration registers if WPKEY corresponds to 0x535943 (“SYC” in ASCII). |

# 28. Slow Clock Controller (SCKC)

## 28.1 Description

The System Controller embeds a Slow Clock Controller (SCKC). The SCKC selects the slow clock from one of two sources:

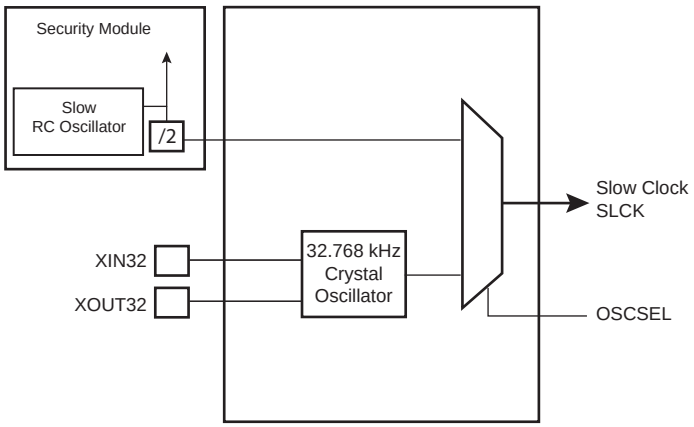
- External 32.768 kHz crystal oscillator
- Embedded 64 kHz (typical) RC oscillator

## 28.2 Embedded Characteristics

- 64 kHz (typical) RC Oscillator or 32.768 kHz Crystal Oscillator Selector
- VDDBU Powered

## 28.3 Block Diagram

**Figure 28-1. Block Diagram**



## 28.4 Functional Description

The OSCSEL bit is located in the Slow Clock Controller Configuration register (SCKC_CR), in the backup domain, and its value is kept while VDDBU is present.

The embedded 64 kHz (typical) Slow RC oscillator and the 32.768 kHz crystal oscillator are always enabled as soon as VDDBU is established. The Slow Clock Selector command (OSCSEL bit) selects the slow clock source.

After the VDDBU power-on reset, the default configuration is OSCSEL = 0, allowing the system to start on the embedded 64 kHz (typical) RC oscillator.

The programmer controls the slow clock switching by software, so precautions must be taken during the switching phase.

### 28.4.1 Switching from Embedded 64 kHz RC Oscillator to 32.768 kHz Crystal Oscillator

The sequence to switch from the embedded 64 kHz (typical) RC oscillator to the 32.768 kHz crystal oscillator is the following:

1. Switch the master clock to a source different from slow clock (PLL or Main Oscillator) through the Power Management Controller.
2. Switch from the embedded 64 kHz (typical) RC oscillator to the 32.768 kHz crystal oscillator by writing a 1 to the OSCSEL bit.
3. Wait 5 slow clock cycles for internal resynchronization.

### 28.4.2 Switching from 32.768 kHz Crystal Oscillator to Embedded 64 kHz RC Oscillator

The sequence to switch from the 32.768 kHz crystal oscillator to the embedded 64 kHz (typical) RC oscillator is the following:

1. Switch the master clock to a source different from slow clock (PLL or Main Oscillator).
2. Switch from the 32.768 kHz crystal oscillator to the embedded RC oscillator by writing a 0 to the OSCSEL bit.
3. Wait 5 slow clock cycles for internal resynchronization.

## 28.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SCKC_CR | 7:0 | | | | | OSCSEL | | | |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |

### 28.5.1 Slow Clock Controller Configuration Register

**Name:** SCKC_CR
**Offset:** 0x0
**Reset:** 0x00000001
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC_WPMR).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | OSCSEL | | | |
| Access | | | | | R/W | | | |
| Reset | | | | | 0 | | | |

**Bit 3 – OSCSEL** Slow Clock Selector

| Value | Description |
|---|---|
| 0 (RC) | Slow clock is the embedded 64 kHz (typical) RC oscillator. |
| 1 (XTAL) | Slow clock is the 32.768 kHz crystal oscillator. |

# 29. Peripheral Touch Controller (PTC)

## 29.1 Description

The QTouch Peripheral Touch Controller (PTC) subsystem offers built-in hardware for capacitive touch measurement on sensors that function as buttons, sliders and wheels. The PTC subsystem supports both mutual and self-capacitance measurement without the need for any external component. It offers sensitivity and noise tolerance, as well as self-calibration, and minimizes the sensitivity tuning effort by the user.

The PTC subsystem is intended for autonomously performing capacitive touch sensor measurements. The external capacitive touch sensor is typically formed on a PCB, and the sensor electrodes are connected to the analog charge integrator of the PTC using the device I/O pins. The PTC supports mutual capacitance sensors organized as capacitive touch matrices in different X-Y configurations. In Mutual Capacitance mode, the PTC requires one pin per X line (drive line) and one pin per Y line (sense line). In Self-capacitance mode, the PTC requires only one pin with a Y-line driver for each self-capacitance sensor.

## 29.2 Embedded Characteristics

- Implements Low-power, High-sensitivity, Environmentally-robust Capacitive Touch Buttons, Sliders, and Wheels
  - One Pin per Electrode – No External Components
  - Zero Drift over Temperature and supply/reference ranges
  - No Need for Temperature or supply/reference compensation
- “On demand” or “Timed” measurement
- Supports Mutual Capacitance and Self-capacitance Sensing
  - Up to 8 Buttons in Self-capacitance Mode
  - Up to 64 Buttons in Mutual Capacitance Mode
  - Supports Lumped Mode Configuration(1)
- Calibration
  - Load Compensating Charge Sensing
  - Parasitic capacitance compensation together with the electrode capacitance
- Adjustable Gain for Higher Sensitivity
  - Analog Gain 1 to 16
  - Digital Gain 1 to 32
- Noise Immunity
  - Hardware Noise Filtering by Accumulation 1 to 64
  - Adjacent Key Suppression (AKS), Removal of False Detection(2)
  - Frequency Hopping: Noise Signal Desynchronization for High Conducted Immunity(3)
- Provided PTC Subsystem Firmware(4)
- Acquisition Module (Node Definitions, pPP and PTC Management) is Product-dependent, which implements all Hardware-dependent Operations for Configuration and Measurement of Capacitive Touch or Proximity Sensors

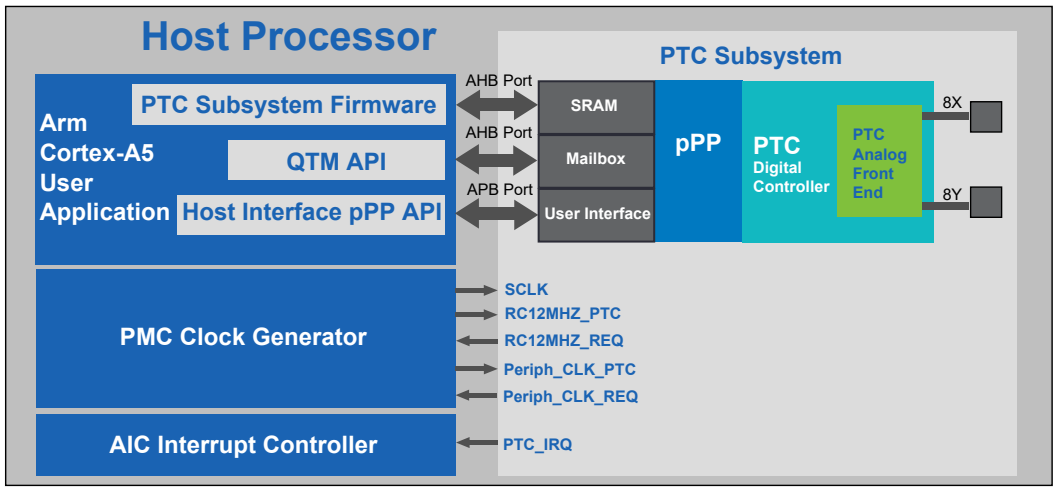
- Signal Conditioning Module (Frequency Hopping) applies Algorithmic and Feedback Control Methods to improve the Quality of Measurement Data captured by an Acquisition Module
- Post-processing Modules (Key, Scroller) interpret Measurement Data in the Context of a Capacitive Touch or Proximity Sensor
- Scroller Module defines Slider and Wheels Configuration and Data, based on Keys Module Setting

**Note:**

1. A lumped sensor is implemented as a combination of multiple sense lines (self-capacitance measurement) or multiple drive and sense lines (mutual capacitance measurement) to act as one single button sensor. This provides the application developer with greater flexibility in the touch sensor implementation.
2. The PTC incorporates the Adjacent Key Suppression (AKS) technology, which can be selected on a per-key basis. The AKS technology is used to suppress multiple key presses based on relative signal strength. This feature assists in solving the problem of surface moisture which can bridge a key touch to an adjacent key, causing multiple key presses.
3. This PTC subsystem supports frequency hopping, which tries to select a sampling frequency that does not clash with noise at specific frequencies elsewhere in products or product operating environments. Frequency Hopping tries to hop away from the noise.
4. It is necessary to use the firmware provided by Microchip in order to use the PTC subsystem.

## 29.3 Block Diagram

**Figure 29-1. PTC Block Diagram**



**Note:** QTM is the QTouch Manager firmware interface.

## 29.4 Signal Description

**Table 29-1. Signal Description**

| Name | Type | Description |
|---|---|---|
| PTC_X[n..0] | Output | 8 X-lines with n=7<br>Transmit lines in Mutual Capacitance mode. |

| .....continued | | |
|---|---|---|
| **Name** | **Type** | **Description** |
| PTC_Y[m..0] | Input | 8 Y-lines with m=7<br>Receive lines in Mutual/Self-capacitance mode. |
| SCLK | Input | Connection to the product system 32 kHz slow clock |
| RC12MHZ_PTC | Input | Direct connection to the 12 MHz RC oscillator |
| RC12MHZ_REQ | Output | Request to supply the RC12MHz PTC subsystem clock |
| Periph_CLK_PTC | Input | Peripheral clock enabled by the PTC ID (max 83 MHz) |
| Periph_CLK_REQ | Output | Request to supply the peripheral clock |
| PTC_IRQ | Output | One PTC IRQ rises for host flag (28, 29, 30 or 31). |

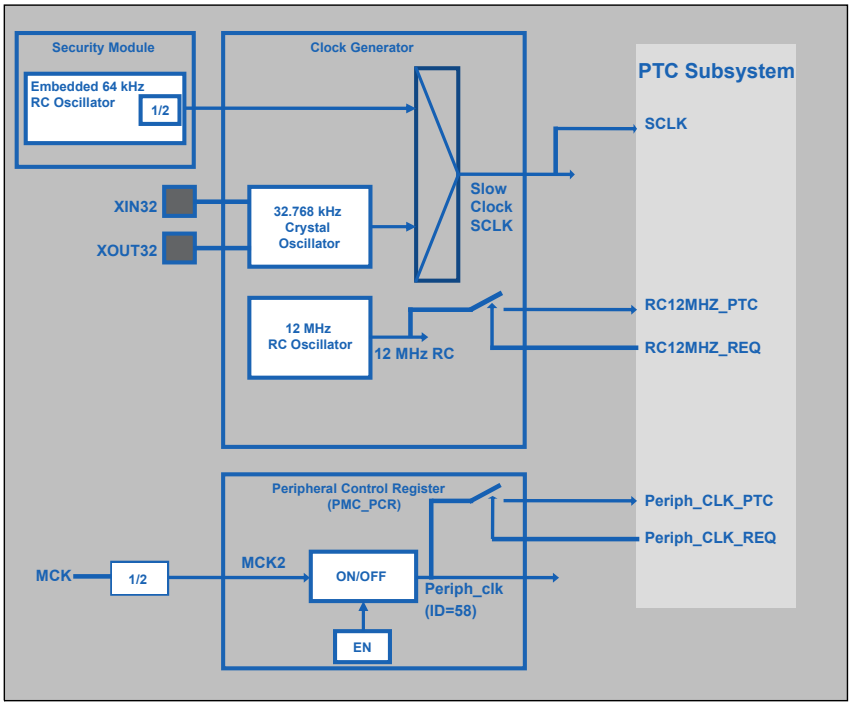
## 29.5 Product Dependencies

The PTC subsystem needs to have some other peripherals of the Arm system configured correctly, as described in the following sections. Those peripherals are the PIO Controller (PIO), the Advanced Interrupt Controller (AIC) and the Power Management Controller (PMC).

### 29.5.1 Power Management

The PTC Controller is not continuously clocked. The programmer must first enable the PTC Controller peripheral clock in the Power Management Controller (PMC) before using the PTC Controller. However, if the application does not require PTC operations, the PTC Controller clock can be stopped when not needed and restarted when necessary. Configuring the PTC Controller requires the PTC Controller clock to be enabled.

**Figure 29-2. PTC Subsystem Clock Sources**



The PTC subsystem operates both from a peripheral clock synchronous to the master clock of the system and from an asynchronous clock source directly connected to the embedded 12 MHz RC oscillator. The selected clocks must be enabled in the PMC before they can be used by the PTC. By default, the 12 MHz RC oscillator is enabled at startup of the product.

The various clock sources are as follows:

- PERIPH_CLK_PTC

This clock source is dedicated to the picoPower processor. It is located in the PMC as Periph_clk[PID]=PCLOCK_LS. This clock is synchronous with the AHB/APB matrix controlling the host interface and the mailbox. The clock frequency is between 12 MHz and 83 MHz. The same clock is used for the Arm interface connected as an APB slave via an AHB/APB bridge. It is also used to program the code/data SRAM and to access the mailbox SRAM.

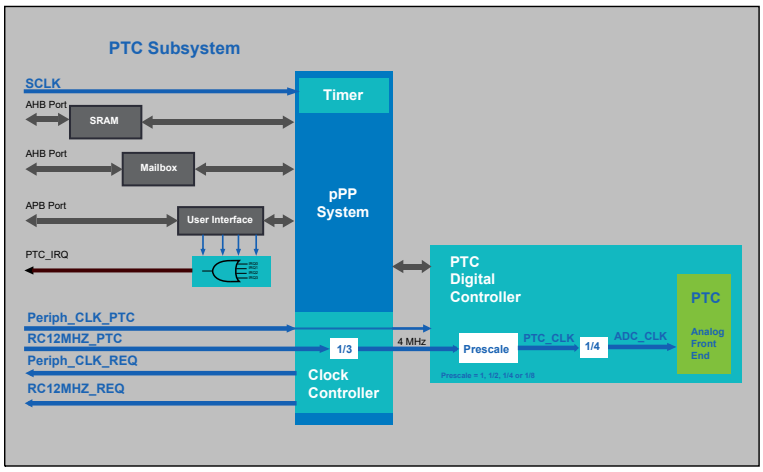
- RC12MHZ

A different clock is used for the PTC digital controller. This clock can be divided internally in the pPP before being used. There is also a small local prescaler in the PTC digital controller to allow lower clock rates. Thus, the PTC operates from an asynchronous clock source and the operation is independent from the main system clock and its derivative clocks, such as the peripheral bus clock (PERIPH_CLK_PTC).

- SCLK

For the timers, a 32 kHz clock is used and divided internally down to a 1 kHz clock for counting the timer interrupt.

**Figure 29-3. PTC Subsystem Clock Schematic**



The RC12HMZ clock is internally divided by 3 in the PTC subsystem, and so a 4 MHz clock is provided to the PTC digital controller. This controller can divide the clock further by 1, 2, 4 or 8 to slow down the PTC clock.

- ADC_CLK

The prescaled clock PTC_CLK is divided by 4 to supply an ADC_CLK to the PTC analog front end.

The ADC data rate is defined by the controller. The typical value is about 33 kHz to 66 kHz depending on the timing configuration.

### 29.5.2 I/O Lines

The pins used for interfacing the PTC may be multiplexed with GPIO lines. When the PTC subsystem is activated and the X-Y lines selected, the GPIO switches automatically to analog state. The ADC modules

possibly hanging on the same PTC analog lines should not use the same GPIO for ADC conversion. Adjacent GPIO lines to PTC lines must not be used to output high speed signals to avoid crosstalk with PTC sensing.

When a line is disabled, the corresponding I/O pin is not reserved for the PTC subsystem, and it can be used for some alternative I/O function.

There is an individual selection bit for each Y or X line. In normal cases, just one line should be active at the same time. For more advanced uses, like proximity sensing, several lines may be selected in parallel. The input and output functionality, such as charging and sensing pulses of the selected line, is controlled automatically by the PTC digital controller sequencer in various operating modes. The I/O lines used for analog PTC_X lines and PTC_Y lines must be connected to external capacitive touch sensor electrodes. External components are not required for normal operation.

### 29.5.3 Interrupt Sources

The PTC_IRQ interrupt line is connected on one of the internal sources of the host processor interrupt controller (AIC). Using the PTC_IRQ interrupt requires the interrupt controller to be programmed first.

Four interrupts (IRQ0,1,2,3) can be generated in the host interface register. The PTC_IRQ line is a logical “OR” between the four IRQ0, IRQ1, IRQ2 and IRQ3.

## 29.6 Functional Description

The PTC analog front end (AFE) and the digital controller are not managed directly by the Cortex-A5 processor. An intermediate processor (pPP) is introduced to manage all functionalities of the PTC. A pPP program, a “firmware”, is needed. This program is loaded by the Arm (host) in a shared SRAM area. The firmware embeds many software functionalities and algorithms to ensure an efficient touch detection.

### 29.6.1 picoPower Processor (pPP)

The picoPower Processor (pPP) is a small processor dedicated to handling the PTC and to processing its data in order to offload the main host Arm processor.

The pPP uses a unified memory architecture where instructions and data share the address space. The pPP embeds a 16 Kbytes SRAM block. When the processor is stopped, the 16 Kbytes SRAM block can be used by the Arm processor.

The pPP has single-cycle access to instructions and data that reside in the SRAM.

Loads and stores go to the local code/data SRAM, the shared mailbox SRAM or the local I/O space.

Accesses to the mailbox enter a wait state for every other access cycle.

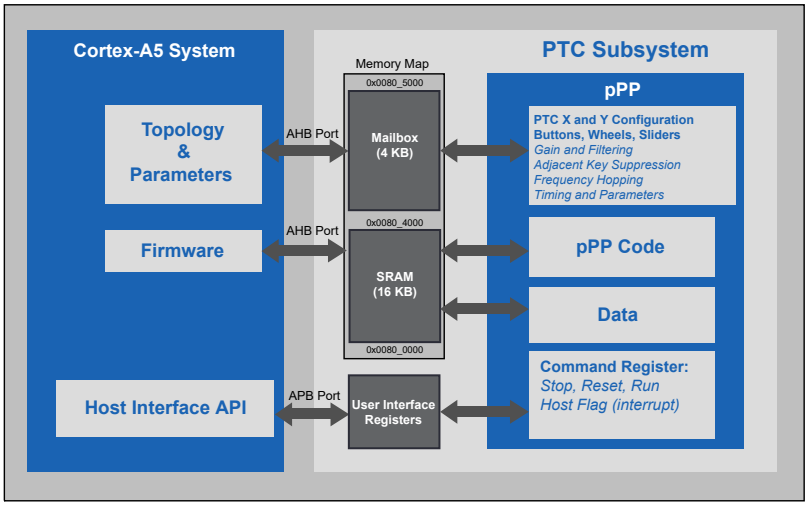
Accesses to code/data SRAM and local I/O space never enter wait states.

### 29.6.2 Shared Memories

The SRAM memory space contains context save, interrupt vectors and a unified instruction/data space that can be used for stacks and instructions.

On top of the SRAM space is the shared mailbox SRAM.

**Figure 29-4. Memory Map**



#### 29.6.2.1 Mailbox

The mailbox (4 Kbytes) is used to indicate to the pPP the X and Y topoloy as well as the number of sensors implemented.

The mailbox can also be used, for example, to pass the parameters required by an application to adjust the analog or digital gain, the filtering functions and some touch operation timing values.

The mailbox is the main way to control the PTC digital and analog components. The pPP firmware reads the mailbox and performs the tasks requested. After execution, some data are fed back to the mailbox to be read by the main processor, such as touch button confirmation or touch position on the slider or wheel.

#### 29.6.2.2 SRAM Data Area

The pPP uses the SRAM data area for its own needs and to work with the firmware local variables. This SRAM section is not used to communicate with the Arm.

#### 29.6.2.3 Firmware in SRAM Code Area

The firmware contains all PTC subsystem functionalities, allowing PTC measurement in the different conditions of parameters and configurations. The firmware is a binary file copied to the SRAM code area at the address defined by the memory map. The firmware makes the pPP work properly with some peripherals like the timer, a clock generator and obviously the PTC digital controller and the PTC analog front end. The firmware embeds all QTML (QTouch Modular Library) functionalities. Those modules are not modifiable by the application developer. The QTML functionalities configuration and data are controllable by the mailbox. The host has read and write accesses to the mailbox.

#### 29.6.2.4 Host Interface

The pPP can be controlled by the host processor through an APB interface and the user interface registers. This is referred to as the “host interface”. Some configurations are only accessible when the pPP is stopped. The host interface includes pPP flags, which are also called host flags on the firmware, for interprocessor communications. The user interface registers can run, stop and reset the pPP and read the IRQ host flags. Nevertheless, the mailbox remains the main means of communication.

##### 29.6.2.4.1 Processor Command Registers

The CMD field is part of the host interface and is used to start, stop and reset the pPP. Writing a valid command to this field changes the internal state of the pPP. After a number of cycles, this state change is reflected in the processor state register.

When a START command is issued, the host is no longer able to write to host interface registers which are marked as run-time write-locked. The pPP RAM block is also locked by this command. The host interface registers and RAM block can be unlocked by using the STOP or RESET commands. The lock is released when the processor state register reflects this state.

### 29.6.3 PTC Digital Controller

The PTC digital controller is a peripheral of the pPP. It is intended for acquiring capacitive touch sensor and capacitive proximity sensor signals under limited firmware control by the controlling processor. The PTC digital controller consists of an Analog Charge Integrator and a 10-bit ADC Controller, 16-bit Digital Accumulator for the ADC results and a State Machine taking care of sensor sampling and digital accumulation sequence.

#### 29.6.3.1 PTC Digital Controller Operations

- Sensing mode (mutual or self)
- Control of the ADC 10-bit SAR state machine single ADC conversion or free run mode (comparator and ADC data/accumulator register)
- Digital gain up to 32 and averaging up to 64 ADC codes
- Selection of the filtering resistance (0, 20, 50 or 100 kΩ)
- Adjustment of the compensation capacitor up to 30 pF
- Adjustment of the integration capacitor up to 30 pF
- Frequency hopping(1) implementation (modification of the sampling rate to avoid synchronous parasitic noise)
- Channel Change Delay Selection CDS(2) (settling time)
- Prescaling (1, 1/2, 1/4, 1/8), 4 MHz down to ADC_CLK

**Note:**

1. A programmable sampling delay can be used to choose (modify) the sampling frequency that is best suited in an application where other periodic noise sources may otherwise disturb the sampling. Frequency hopping can also be modified automatically from one sampling cycle to another, by setting the software driver parameters.
2. CDS bits define the delay when changing input channels. The delay allows the analog circuits to settle on a new (Y) channel or channel pair (X-Y). The delay is application-dependent, and therefore this option enables the user to select a suitable delay. The delay is expressed as a number of PTC clock cycles.

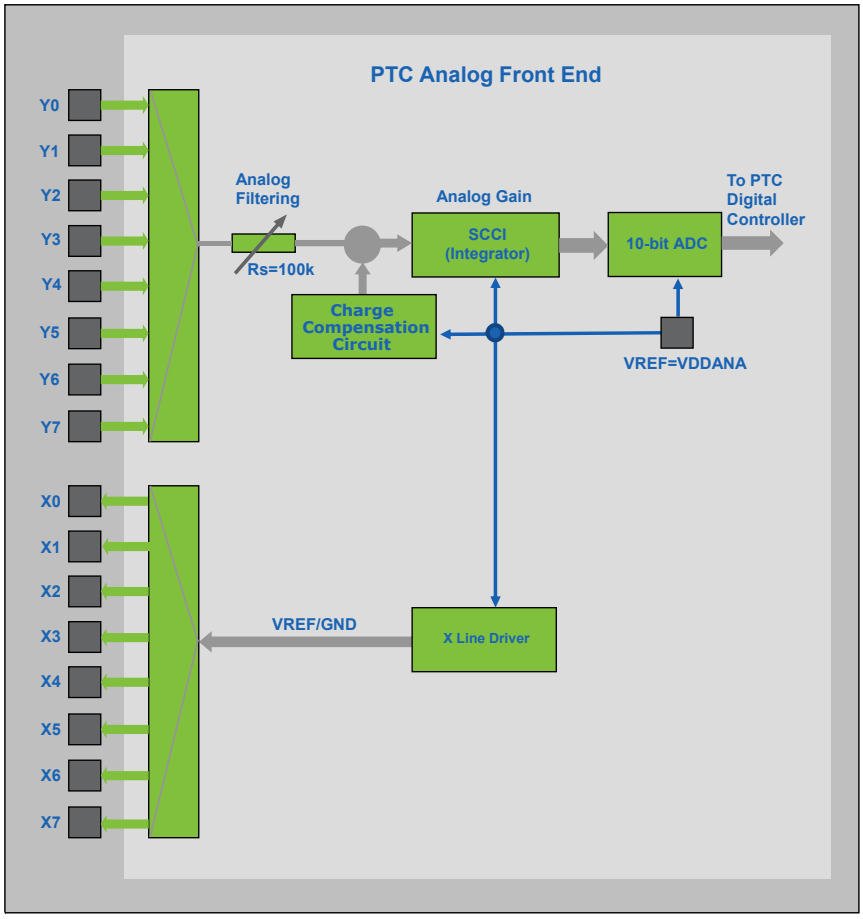
### 29.6.4 PTC Analog Front End (AFE)

The analog front end consists of X-line drivers, a sensor capacitance compensation circuit and a parasitic capacitance insensitive analog Switched Capacitor Charge Integrator (SCCI). The integrator is connected to sensor Y-lines via an analog multiplexer. When the PTC digital controller is enabled, the SCCI output is automatically connected to the ADC input.

The external capacitive touch sensor is typically formed on a PCB and the sensor electrodes are connected to the Analog Charge Integrator of the PTC AFE via MCU I/O port pins. The PTC AFE supports mutual capacitance sensors organized as capacitive touch matrices in different X-Y configurations (QTouch Surface). The PTC AFE requires one pin per X-line and one pin per Y-line. No external components are needed.

The PTC AFE also supports “self-capacitance touch sensors” (QTouch). In Self-capacitance mode, the PTC AFE requires just one Y-line pin per self-capacitance sensor.

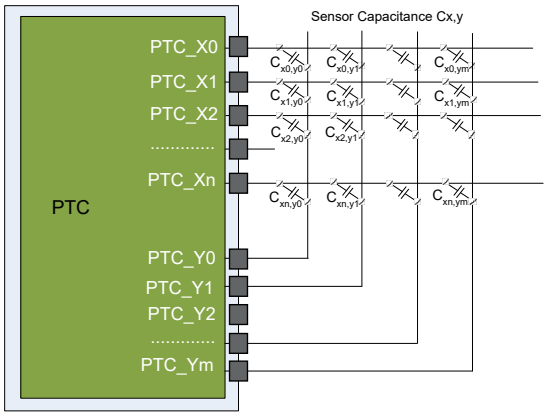
**Figure 29-5. PTC Analog Front End**



### 29.6.5 Operations in Mutual Capacitance

A mutual capacitance sensor is formed between two I/O lines, a PTC_X electrode for transmitting, and a PTC_Y electrode for receiving. The mutual capacitance between the PTC_X and PTC_Y electrodes is calibrated and measured by the PTC. It is not necessary to connect all X and Y lines; when unused, they can be left unconnected.

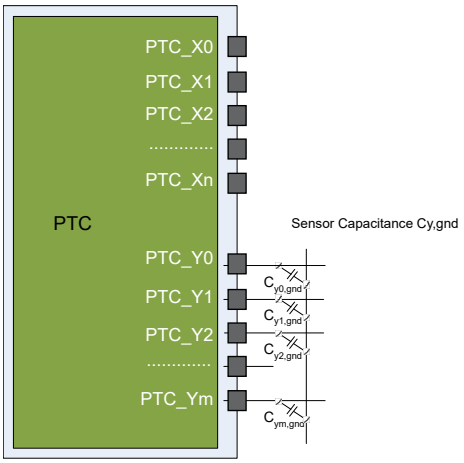
**Figure 29-6. Mutual Capacitance Sensor Arrangement**



### 29.6.6 Operations in Self-capacitance

The self-capacitance sensor is connected to a single pin on the PTC through the PTC_Ym electrodes to receive the signal. The sensor electrode capacitance is measured by the PTC.

**Figure 29-7. Self-capacitance Sensor Arrangement**



## 29.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x28 | PTC_CMD | 7:0 | | | | | CMD[3:0] | | | |
| 0x29<br>...<br>0x2F | Reserved | | | | | | | | | |
| 0x30 | PTC_ISR | 7:0 | IRQ3 | IRQ2 | IRQ1 | IRQ0 | | | | NOTIFY0 |
| 0x31<br>...<br>0x34 | Reserved | | | | | | | | | |
| 0x35 | PTC_IED | 7:0 | IER3 | IER2 | IER1 | IER0 | | | | |

### 29.7.1 PTC Command Register

**Name:** PTC_CMD
**Offset:** 0x28
**Reset:** –
**Property:** Write-only

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CMD[3:0] | | | |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

**Bits 3:0 – CMD[3:0]** Host Command
Issues commands to the pPP.

| Value | Name | Description |
|---|---|---|
| 0x0 | NO_ACTION | – |
| 0x1 | STOP | Waits for ongoing execution to complete, then stops. |
| 0x2 | RESET | Stops and resets. |
| 0x3 | Reserved | – |
| 0x4 | ABORT | Stops without waiting for ongoing execution to complete. |
| 0x5 | RUN | Starts execution (from stopped state). |
| 0x6–0xF | Reserved | – |

### 29.7.2 PTC Interrupt Status Register

**Name:** PTC_ISR
**Offset:** 0x30
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IRQ3 | IRQ2 | IRQ1 | IRQ0 | | | | NOTIFY0 |
| Access | R/W | R/W | R/W | R/W | | | | R/W |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

**Bits 4, 5, 6, 7 – IRQx** Interrupt to the Host
Used for communications between the host processor and the pPP. The firmware can set an IRQ event in fields IRQ0 to IRQ3. Any of the pPP IRQ0 to IRQ3 fields automatically rises the PTC_IRQ signal.

**Bit 0 – NOTIFY0** Notification to the Firmware
Used for communications between the host processor and the pPP. The firmware is notified when a command is used.

### 29.7.3 PTC Enable Register

**Name:** PTC_IED
**Offset:** 0x35
**Reset:** –
**Property:** Write-only

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IER3 | IER2 | IER1 | IER0 | | | | |
| Access | W | W | W | W | | | | |
| Reset | – | – | – | – | | | | |

**Bits 4, 5, 6, 7 – IERx** Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables interrupt for device-to-host interrupt. |

# 30. Low Power Asynchronous Receiver (RXLP)

## 30.1 Description

The Low Power Asynchronous Receiver (RXLP) is a low-power UART with a slow clock. It works only in Receive mode. It features a Receive Data (RXD) pin that can be used to wake up the system. The wake-up occurs only on data matching. Expected data can be a single value, two values, or a range of values.

The RXLP operates on a slow clock domain to reduce power consumption.

## 30.2 Embedded Characteristics

- Exit from Backup Mode on Comparison Match
- Programmable Baud Rate Generator
- Even, Odd, Mark or Space Parity Check
- Parity and Framing Error Detection
- Digital Filter on Receive Line
- Comparison Function on Received Character
- Register Write Protection

## 30.3 Block Diagram

**Figure 30-1. Block Diagram**

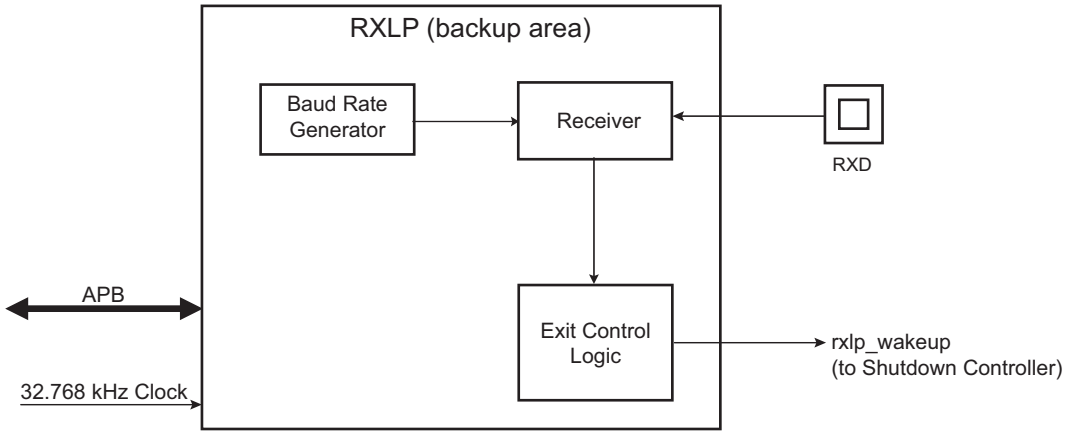


**Table 30-1. Pin Description**

| Pin Name | Description | Type |
|---|---|---|
| RXD | RXLP Receive Data | Input |

## 30.4 Product Dependencies

### 30.4.1 Power Management

The peripheral clock is not managed by the PMC. It is automatically activated when the RXLP is enabled and receive line is active. The peripheral clock is automatically de-activated after transmission of the wakeup signal.

## 30.5 Functional Description

The RXLP features an RS232 receive-only circuitry able to decode and compare data and parity while the system is in Backup mode. If a matching comparison occurs, the RXLP instructs the system to wake up (if enabled).

The RXLP operates in Asynchronous mode only and supports only 8-bit character handling (with or without parity).

The RXLP is made up of a receiver and a baud rate generator. Receiver timeout is not implemented and there is no interrupt line.

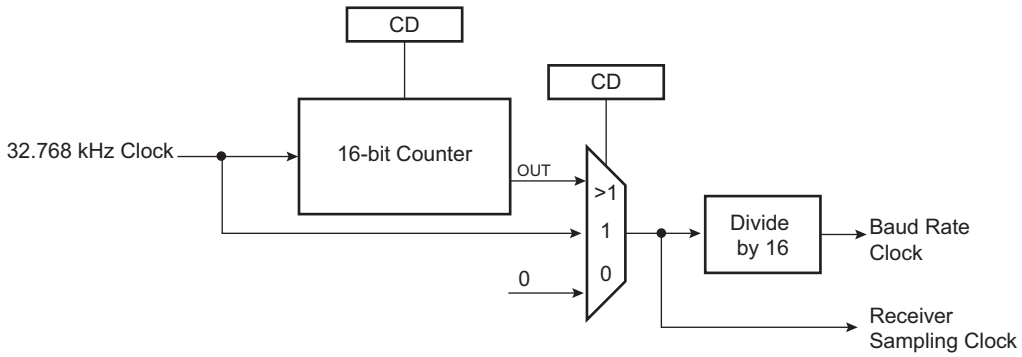
### 30.5.1 Baud Rate Generator

The baud rate generator provides the bit period clock named baud rate clock to the receiver.

The baud rate clock is the 32.768 kHz clock from the crystal oscillator, divided by 16 times the value (CD) written in the Baud Rate Generator register (RXLP_BRGR). If RXLP_BRGR is set to 0, the baud rate clock is disabled and the RXLP remains inactive. The maximum allowable baud rate is 32.768 kHz clock divided by 16. The minimum allowable baud rate is 32.768 kHz clock divided by (16 × 3).

$$\text{Baud Rate} = \frac{f_{32.768\ \text{kHz clock}}}{16 \times \text{CD}}$$

**Figure 30-2. Baud Rate Generator**



### 30.5.2 Receiver

#### 30.5.2.1 Receiver Reset, Enable and Disable

After device reset, the RXLP is disabled and must be enabled before being used. The receiver can be enabled by setting bit RXEN in the Control register (RXLP_CR). At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by setting bit RXLP_CR.RXDIS. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by setting bit RXLP_CR.RSTRX. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost. After initiating a reset it is mandatory to clear bit RXLP_CR.RSTRX.

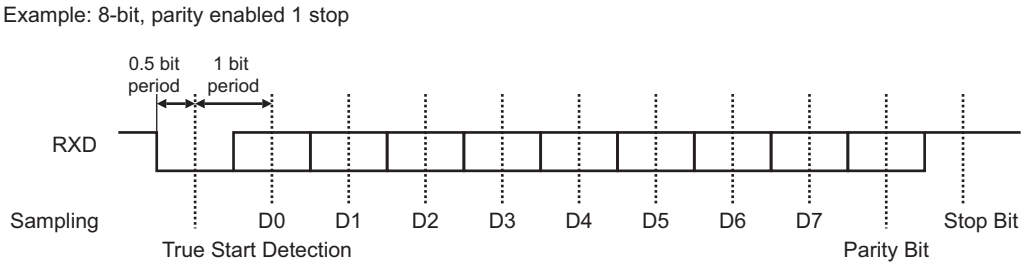
#### 30.5.2.2 Start Detection and Data Sampling

The RXLP only supports asynchronous operations, and this affects only its receiver. The RXLP detects the start of a received character by sampling the RXD signal until it detects a valid start bit. A low level (space) on RXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the RXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

**Figure 30-3. Character Reception**



#### 30.5.2.3 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode register (RXLP_MR). It then compares the result with the received parity bit. If different, the received character is ignored and the receiver continues to wait for a new valid start bit.

#### 30.5.2.4 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the received character is ignored and the receiver continues to wait for a new valid start bit.

#### 30.5.2.5 Receiver Digital Filter

The RXLP embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in RXLP_MR.FILTER. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

### 30.5.3 Comparison Function on Received Character

Each time a valid character is received (without parity error and without frame error) it is compared to the wake-up trigger values. If the received character matches to the condition of wake-up, it is stored in the Receiver Holding register (RXLP_RHR), a system wake-up is generated and the RXLP is automatically disabled. If the character received does not match, it is ignored and the receiver continues to wait for a new valid start bit.

RXLP_CMPR (see RXLP Comparison Register) can be programmed to provide three different comparison methods:

- VAL1 equals VAL2—the comparison is performed on a single value and the wake-up request is generated if the received character equals VAL1.
- VAL1 is strictly lower than VAL2—any value between VAL1 and VAL2 generates a wake-up request.
- VAL1 is strictly higher than VAL2—the wake-up request is generated if either received character equals VAL1 or VAL2.

### 30.5.4 Register Write Protection

To prevent any single software error from corrupting RXLP behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the RXLP Write Protection Mode Register (RXLP_WPMR).

The following registers can be write-protected:

- RXLP Mode Register
- RXLP Baud Rate Generator Register
- RXLP Comparison Register

## 30.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | RXLP_CR | 7:0 | | | RXDIS | RXEN | | RSTRX | | |

### 30.6.1 RXLP Control Register

**Name:** RXLP_CR
**Offset:** 0x0000
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RXDIS | RXEN | | RSTRX | | |
| Access | | | W | W | | W | | |
| Reset | | | – | – | | – | | |

**Bit 5 – RXDIS** Receiver Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped. |

**Bit 4 – RXEN** Receiver Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The receiver is enabled if RXDIS is 0. |

**Bit 2 – RSTRX** Reset Receiver

| Value | Description |
|---|---|
| 0 | Deactivates the reset of the receiver logic. |
| 1 | The receiver logic is reset and disabled. If a character is being received, the reception is aborted. The receiver logic remains in reset state until RSTRX is written to 0. |

### 30.6.2 RXLP Mode Register

**Name:** RXLP_MR
**Offset:** 0x0004
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | | | | FILTER | | | | |
| Access | | | | R/W | | | | |
| Reset | | | | 0 | | | | |

**Bits 11:9 – PAR[2:0]** Parity Type

| Value | Name | Description |
|---|---|---|
| 0 | EVEN | Even parity |
| 1 | ODD | Odd parity |
| 2 | SPACE | Parity forced to 0 |
| 3 | MARK | Parity forced to 1 |
| 4 | NO | No parity |

**Bit 4 – FILTER** Receiver Digital Filter

| Value | Name | Description |
|---|---|---|
| 0 | DISABLED | RXLP does not filter the receive line. |
| 1 | ENABLED | RXLP filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority). |

### 30.6.3 RXLP Receiver Holding Register

**Name:** RXLP_RHR
**Offset:** 0x0018
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | CD[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bits 1:0 – CD[1:0]** Clock Divisor

| Value | Description |
|---|---|
| 0 | Baud rate clock is disabled |
| 1 | $f_{32.768\ kHz\ clock}$ / (CD × 16) |
| 2 | $f_{32.768\ kHz\ clock}$ / (CD × 16) |
| 3 | $f_{32.768\ kHz\ clock}$ / (CD × 16) |

### 30.6.5 RXLP Comparison Register

**Name:** RXLP_CMPR
**Offset:** 0x0024
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VAL2[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VAL1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:16 – VAL2[7:0]** Second Comparison Value for Received Character
0 to 255.

The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to request a system wake-up.

**Bits 7:0 – VAL1[7:0]** First Comparison Value for Received Character
0 to 255.

The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to request a system wake-up.

### 30.6.6 RXLP Write Protection Mode Register

**Name:** RXLP_WPMR
**Offset:** 0x00E4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x525840 | PASSWD | Writing any other value in this field aborts the write operation. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See Register Write Protection for the list of registers that can be protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x52584C (RXL in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x52584C (RXL in ASCII). |

# 31. Clock Generator

## 31.1 Description

The Clock Generator User Interface is embedded within the Power Management Controller and is described in 32.22 Register Summary. However, the Clock Generator registers are named CKGR_.

## 31.2 Embedded Characteristics

The Clock Generator is made up of:

- A low-power 32.768 kHz crystal oscillator
- A low-power embedded 64 kHz (typical) RC oscillator generating the 32 kHz source clock
- A 8 to 24 MHz crystal oscillator or a 12 to 48 MHz XRCGB crystal resonator with Bypass mode
- A 12 MHz RC oscillator
- A 480 MHz UTMI PLL providing a clock for the USB High-speed Device Controller
- A 600 to 1200 MHz programmable PLL (input from 8 to 50 MHz), provides the clock to the processor and to the peripherals
- A 700 MHz fractional-N programmable audio PLL, with 22-bit frequency resolution and two independent programmable post dividers to drive the CLK_AUDIO output pin and the internal peripherals (AUDIOPLLCLK)

The Clock Generator provides the following clocks:

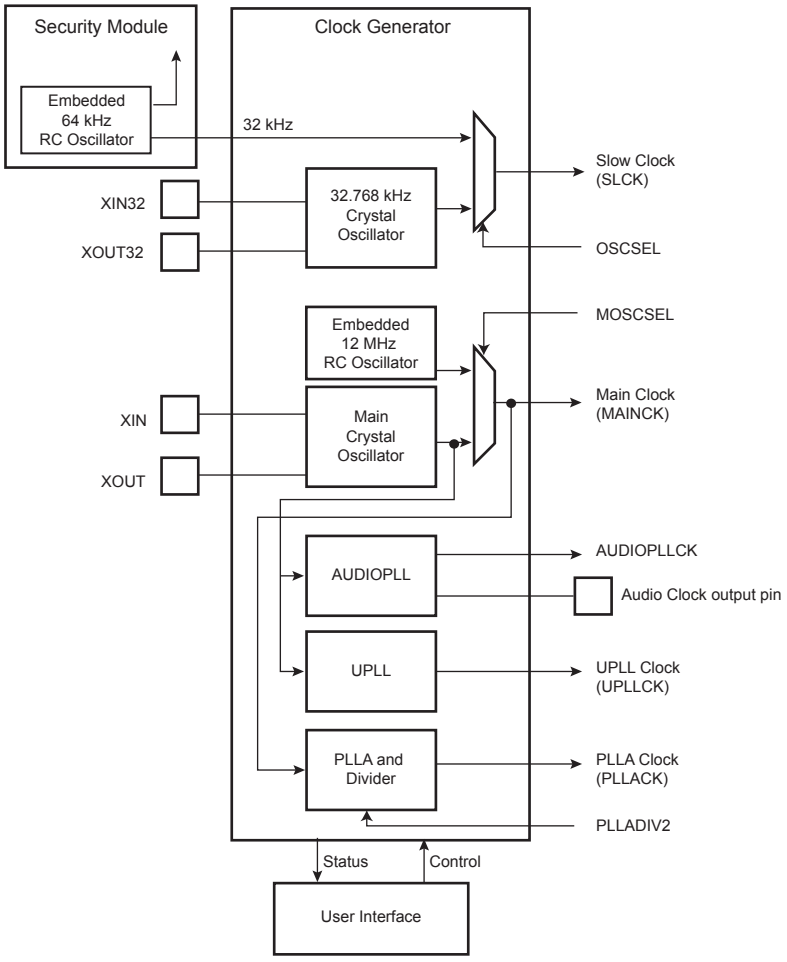
- SLCK—Slow clock. The only permanent clock within the system.
- MAINCK—Output of the Main clock oscillator selection: either 8 to 24 MHz crystal oscillator or 12 MHz RC oscillator
- PLLACK—Output of the divider and the 600 to 1200 MHz programmable PLL (PLLA)
- AUDIOPLLCLK—Output of the first Audio PLL post-divider, with a frequency range from 24 to 125 MHz
- AUDIOPINCLK—Output of the second Audio PLL post-divider, with a frequency range from 8 to 30 MHz
- UPLLCK—Output of the 480 MHz UTMI PLL (UPLL)

The Power Management Controller also provides the following operations on clocks:

- 8 to 24 MHz crystal oscillator clock failure detector
- 32.768 kHz crystal oscillator frequency monitor
- Frequency counter on Main clock and an on-the-fly adjustable 12 MHz RC oscillator frequency

## 31.3 Block Diagram

**Figure 31-1. Clock Generator Block Diagram**



## 31.4 Slow Clock

The Slow Clock Controller embeds a Slow clock generator that is supplied with the VDDBU power supply. As soon as VDDBU is supplied, both the 32.768 kHz crystal oscillator and the embedded 64 kHz (typical) RC oscillator are powered, but only the RC oscillator is enabled.

The Slow clock is generated either by the 32.768 kHz crystal oscillator or by the embedded 64 kHz (typical) RC oscillator divided by two.

The selection of the Slow clock source is made via the OSCSEL bit in the Slow Clock Controller Configuration register (SCKC_CR).

SCKC_CR.OSCSEL and PMC_SR.OSCSELS report which oscillator is selected as the Slow clock source. PMC_SR.OSCSELS informs when the switch sequence initiated by a new value written in SCKC_CR.OSCSEL is done.

### 31.4.1 Embedded 64 kHz (typical) RC Oscillator

By default, the embedded 64 kHz (typical) RC oscillator is enabled and selected as a source of SLCK. The user has to take into account the possible drifts of this oscillator. Refer to the section “DC Characteristics”.

### 31.4.2 32.768 kHz Crystal Oscillator

The Clock Generator integrates a low-power 32.768 kHz crystal oscillator. To use this oscillator, the XIN32 and XOUT32 pins must be connected to a 32.768 kHz crystal. Refer to the section “Electrical Characteristics” for appropriate loading capacitor selection on XIN32 and XOUT32.

Note that the user is not obliged to use the 32.768 kHz crystal oscillator and can use the 64 kHz (typical) RC oscillator instead.

The 32.768 kHz crystal oscillator provides a more accurate frequency than the 64 kHz (typical) RC oscillator.

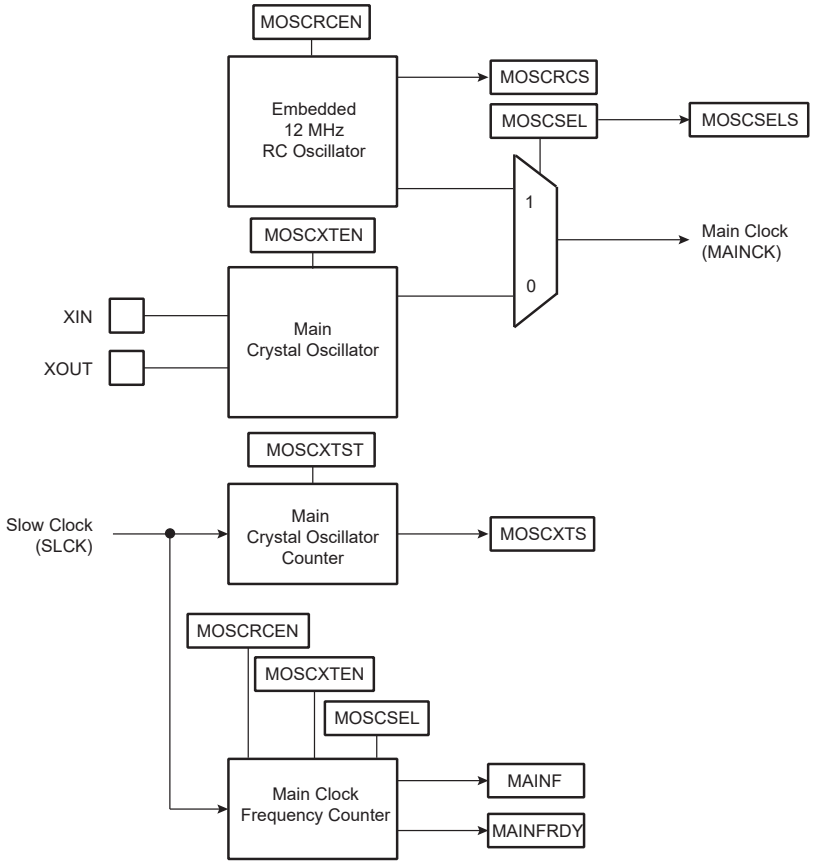
To select the 32.768 kHz crystal oscillator as the source of the Slow clock, the bit SCKC_CR.OSCSEL must be set. This results in a sequence which enables the 32.768 kHz crystal oscillator. The switch of the Slow clock source is glitch-free.

## 31.5 Main Clock

The Main clock has two sources:

- a 12 MHz RC oscillator with a fast start-up time and used at start-up
- a 8 to 24 MHz crystal oscillator with Bypass mode

**Figure 31-2. Main Clock Block Diagram**



### 31.5.1 12 MHz RC Oscillator

After reset, the 12 MHz RC oscillator is enabled and selected as the source of MAINCK and MCK. MCK is the default clock selected to start up the system.

Refer to the table “DC Characteristics”.

The software can disable or enable the 12 MHz RC oscillator with the MOSCRCEN bit in the Clock Generator Main Oscillator register (CKGR_MOR).

When disabling the Main clock by clearing CKGR_MOR.MOSCRCEN, PMC_SR.MOSCRCS is automatically cleared, indicating the Main clock is OFF.

Setting the MOSCRCS bit in the Power Management Controller Interrupt Enable register (PMC_IER) triggers an interrupt to the processor.

### 31.5.2 12 MHz RC Oscillator Clock Frequency Adjustment

It is possible for the user to adjust the 12 MHz RC oscillator frequency through the PMC Oscillator Calibration Register (PMC_OCR). By default, PMC_OCR.SEL is low, so the RC oscillator is driven with fuse calibration bits which are programmed during the chip production.

The user can adjust the trimming of the 12 MHz RC oscillator through PMC_OCR in order to obtain more accurate frequency (to compensate derating factors such as temperature and voltage).

In order to calibrate the main oscillator frequency, SEL must be set to 1 and a correct frequency value must be configured in the CAL field.

It is possible to restart, at anytime, a measurement of the frequency of the selected clock by means of the RCMEAS bit in the Clock Generator Main Clock Frequency register (CKGR_MCFR). Thus, when MAINFRDY flag reads 1, another read access on CKGR_MCFR provides an image of the frequency of the Main clock on MAINF field. The software can calculate the error with an expected frequency and correct PMC_OCR.CAL accordingly. This may be used to compensate frequency drift due to derating factors such as temperature and/or voltage.

### 31.5.3 8 to 24 MHz Crystal Oscillator

After reset, the 8 to 24 MHz crystal oscillator is disabled and is not selected as the source of MAINCK.

As the source of MAINCK, the 8 to 24 MHz crystal oscillator provides an accurate frequency. The software enables or disables this oscillator in order to reduce power consumption via CKGR_MOR.MOSCXTEN.

When disabling this oscillator by clearing the CKGR_MOR.MOSCXTEN bit, the PMC_SR.MOSCXTS bit is automatically cleared, indicating the 8 to 24 MHz crystal oscillator is off.

When enabling this oscillator, the user must initiate the start-up time counter. This start-up time depends on the characteristics of the external device connected to this oscillator. Refer to the section “Electrical Characteristics” for the start-up time.

When CKGR_MOR.MOSCXTEN and CKGR_MOR.MOSCXTST are written to enable this oscillator, the PMC_SR.MOSCXTS bit is cleared and the counter starts counting down on the Slow clock divided by 8 from the MOSCXTST value. When the counter reaches 0, the PMC_SR.MOSCXTS is set, indicating that the 8 to 24 MHz crystal oscillator is stabilized. Setting MOSCXTS in the PMC Interrupt Mask register (PMC_IMR) triggers an interrupt to the processor.

### 31.5.4 Main Clock Source Selection

The source of the Main clock can be selected from the following:

- embedded 12 MHz RC oscillator
- 8 to 24 MHz crystal oscillator
- an XRCGB crystal resonator

The advantage of the Main RC oscillator is its fast start-up time. By default, this oscillator is selected to start the system and it must be selected prior to entering Wait mode.

The advantage of the Main crystal oscillator is its high level of accuracy.

The selection is made by writing CKGR_MOR.MOSCSEL. The switch of the Main clock source is glitch-free, so there is no need to run out of SLCK or PLLACK in order to change the selection. PMC_SR.MOSCSELS indicates when the switch sequence is done.

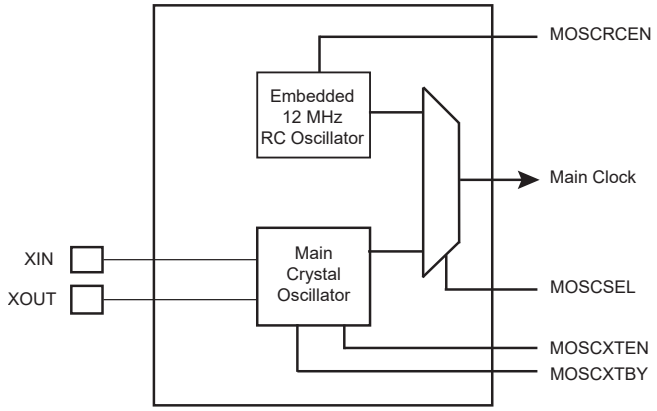
Setting PMC_IMR.MOSCSELS triggers an interrupt to the processor.

The 8 to 24 MHz crystal oscillator can be bypassed by setting CKGR_MOR.MOSCXTBY to accept an external Main clock on XIN (see 31.5.5 Bypassing the 8 to 24 MHz Crystal Oscillator).

MOSCRCEN, MOSCSEL, MOSCXTEN and MOSCXTBY bits are located in the PMC Clock Generator Main Oscillator Register (CKGR_MOR).

After a VDDBU power-on reset, the default configuration is MOSCRCEN = 1, MOSCXTEN = 0 and MOSCSEL = 0, allowing the 12 MHz RC oscillator to start as Main clock.

**Figure 31-3. Main Clock Source Selection**



### 31.5.5 Bypassing the 8 to 24 MHz Crystal Oscillator

Prior to bypassing the 8 to 24 MHz crystal oscillator, the external clock frequency provided on the XIN pin must be stable and within the values specified in the XIN clock characteristics. Refer to the section “Electrical Characteristics”.

The sequence to bypass the crystal oscillator is as follows:

1. Ensure that an external clock is connected on XIN.
2. Enable the bypass by setting CKGR_MOR.MOSCXTBY.
3. Disable the 8 to 24 MHz crystal oscillator by clearing CKGR_MOR.MOSCXTEN.

### 31.5.6 Main Frequency Counter

The main frequency counter measures the Main RC oscillator and the Main crystal oscillator against the SLCK and is managed by CKGR_MCFR.

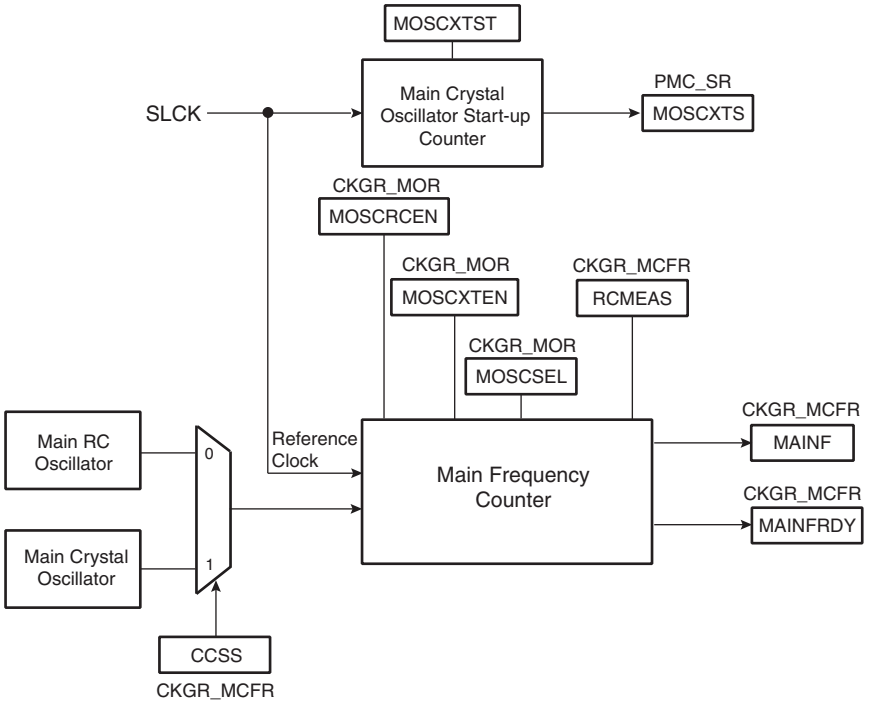
During the measurement period, the main frequency counter increments at the speed of the clock defined by the bit CKGR_MCFR.CCSS.

A measurement is started in the following cases:

- When CKGR_MCFR.RCMEAS is written to ‘1’.
- When the 12 MHz RC oscillator is selected as the source of the Main clock and when this oscillator becomes stable (i.e., when the MOSCRCS bit is set)
- When the 8 to 24 MHz crystal oscillator is selected as the source of the Main clock and when this oscillator becomes stable (i.e., when the MOSCXTS bit is set)
- When the Main clock source selection is modified

The measurement period ends at the 16th falling edge of the Slow clock, CKGR_MCFR.MAINFRDY is set and the counter stops counting. Its value can be read in the CKGR_MCFR.MAINF and gives the number of Main clock cycles during 16 periods of Slow clock, so that the frequency of the 12 MHz RC oscillator or the crystal oscillator can be determined.

**Figure 31-4. Main Frequency Counter Block Diagram**



### 31.5.7 Switching Main Clock Between the RC Oscillator and the Crystal Oscillator

When switching the source of the Main clock between the RC oscillator and the crystal oscillator, both oscillators must be enabled. After completion of the switch, the unused oscillator can be disabled.

If switching to the crystal oscillator, a check must be carried out to ensure that the oscillator is present and that its frequency is valid. Follow the sequence below:

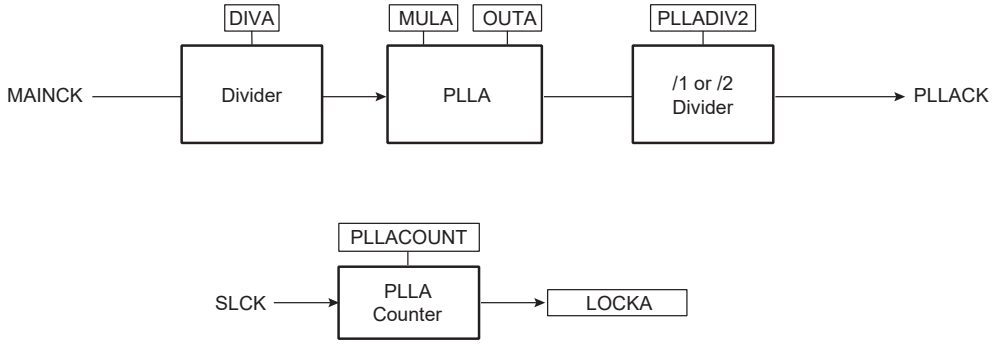
1. Enable the crystal oscillator by setting CKGR_MOR.MOSCXTEN. Configure the CKGR_MOR. MOSCXTST field with the crystal oscillator start-up time as defined in the section “Electrical Characteristics”.
2. Wait for PMC_SR.MOSCXTS flag to rise, indicating the end of a start-up period of the crystal oscillator.
3. Select the crystal oscillator as the source clock of the frequency meter by setting CKGR_MCFR.CCSS
4. Initiate a frequency measurement by setting CKGR_MCFR.RCMEAS.
5. Read CKGR_MCFR.MAINFRDY until its value equals 1.
6. Read CKGR_MCFR.MAINF and compute the value of the crystal frequency.
   – If the MAINF value is valid, the Main clock can be switched to the crystal oscillator.

## 31.6 Divider and PLLA Block

The PLLA embeds an input divider to increase the accuracy of the resulting clock signals. However, the user must respect the PLLA minimum input frequency when programming the divider.

The following figure shows the block diagram of the divider and PLLA block.

**Figure 31-5. Divider and PLLA Block Diagram**



### 31.6.1 Divider and Phase Lock Loop Programming

The PLLA allows multiplication of the divider's outputs. The PLLA clock signal has a frequency that depends on the respective source signal frequency and on the parameters DIVA and MULA. The factor applied to the source signal frequency is (MULA + 1)/DIVA. When MULA is written to 0, the PLLA is disabled and its power consumption is saved. Re-enabling the PLLA can be performed by writing a value higher than 0 in the MUL field.

Whenever the PLLA is re-enabled or one of its parameters is changed, PMC_SR.LOCKA is automatically cleared. The values written in the PLLACOUNT field in the Clock Generator PLLA register (CKGR_PLLAR) are loaded in the PLLA counter. The PLLA counter then decrements at the speed of the Slow clock until it reaches 0. At this time, PMC_SR.LOCKA is set and can trigger an interrupt to the processor. The user has to load the number of Slow clock cycles required to cover the PLLA transient time into CKGR_PLLACOUNT.

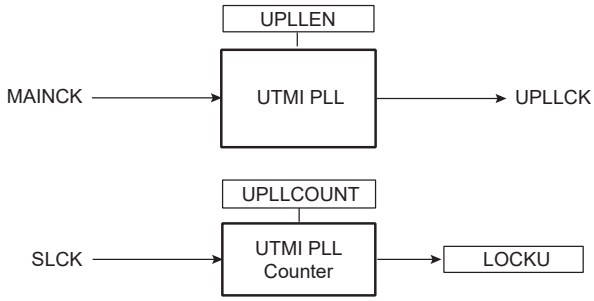
The PLLA clock must be divided by 2 by writing PMC_MCKR.PLLADIV2, if the ratio between Processor clock (PCK) and MCK is 3 (MDIV = 3).

## 31.7 UTMI PLL Clock

The source of the UTMI PLL (UPLL) is the Main clock (MAINCK). MAINCK must select the Main crystal oscillator to meet the frequency accuracy required by USB.

The crystal frequency selection among 12, 16 or 24 MHz must be configured to the correct value in the field SFR_UTMICKTRIM.FREQ, in order to apply the correct multiplier, x40, x30 or x20, respectively.

**Figure 31-6. UTMI PLL Block Diagram**



Whenever the UTMI PLL is enabled by writing UPLLEN in the UTMI Clock register (CKGR_UCKR), PMC_SR.LOCKU is automatically cleared. The values written in CKGR_UCKR.UPLLCOUNT are loaded in the UTMI PLL counter. The UTMI PLL counter then decrements at the speed of the Slow clock divided by 8 until it reaches 0. At this time, the PMC_SR.LOCKU is set in and can trigger an interrupt to the

processor. The user has to load the number of Slow clock cycles required to cover the UTMI PLL transient time into CKGR_UCKR.UPLLCOUNT.

## 31.8 Audio PLL

The Audio PLL is a high-resolution fractional-N digital PLL specifically designed for low jitter operation.

In audio applications, the CLK_AUDIO output pin typically serves as the Master clock frequency generator for external components such as Audio DAC, Audio ADCs, or Audio Codecs, thus saving one crystal on the board.

The reference clock of the Audio PLL is the fast crystal oscillator. The PLL core operating frequency is defined as:

$$f_{\mathrm{AUDIOCORECLK}} = f_{\mathrm{ref}}\left(\mathrm{ND} + 1 + \frac{\mathrm{FRACR}}{2^{22}}\right)$$

where $f_{ref}$ is the frequency of the main crystal oscillator. Refer to the section “PLL Characteristics” for the limits of $f_{AUDIOCORECLK}$.

The PLL core features two post-dividers enabling the generation of two output clock signals, AUDIOPLLCLK and AUDIOPINCLK. AUDIOPLLCLK is dedicated to the PMC and can be sent to the GCLK input of peripherals or to the Programmable clock outputs PCKx. AUDIOPINCLK is dedicated to driving the external audio pin CLK_AUDIO.

The AUDIOPLLCLK frequency is defined by the following formula:

$$f_{\mathrm{AUDIOPLLCLK}} = \frac{f_{\mathrm{AUDIOCORECLK}}}{(\mathrm{QDPMC} + 1)}$$

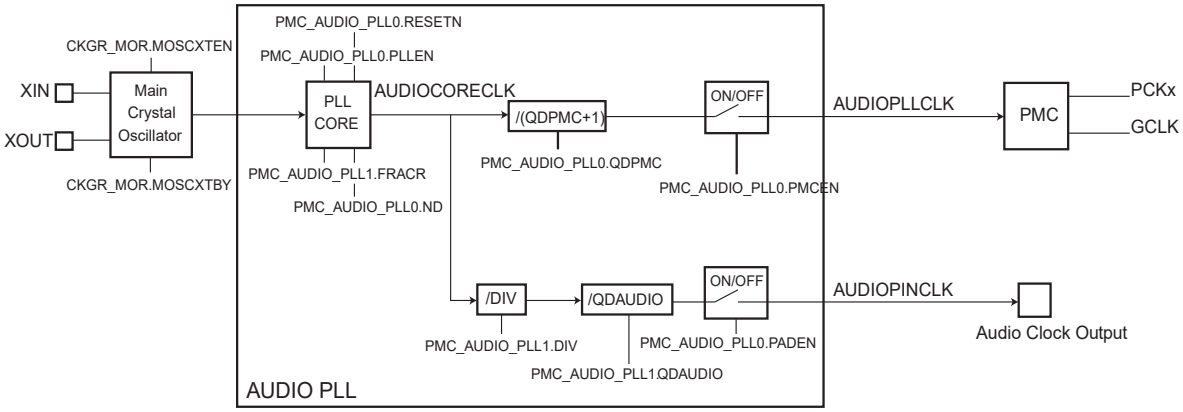
The AUDIOPINCLK frequency is defined by the following formula:

$$f_{\mathrm{AUDIOPINCLK}} = \frac{f_{\mathrm{AUDIOCORECLK}}}{(\mathrm{DIV} \times \mathrm{QDAUDIO})}$$

The typical programming sequence of the audio PLL is the following:

1. Disable the PLL by writing ‘0’ in bits PLLEN and RESETN in the Audio PLL Control register 0 (PMC_AUDIO_PLL0).
2. Release the reset of the PLL by writing ‘1’ in PMC_AUDIO_PLL0.RESETN.
3. Configure the PLL frequency by writing QDPMC and ND in PMC_AUDIO_PLL0, QDAUDIO, DIV and FRACR in PMC_AUDIO_PLL1. ND and FRACR must be configured so as to set AUDIOCORECLK frequency in its authorized range. Refer to the “Electrical Characteristics” section.
4. Enable the PLL by writing ‘1’ in PMC_AUDIO_PLL0.PLLEN, PMC_AUDIO_PLL0.PADEN and PMC_AUDIO_PLL0.PMCEN.
5. Wait for the start-up time of this PLL. Refer to the “Electrical Characteristics” section.
6. If needed, ND or FRACR can be adjusted at any time. The typical frequency settling time of this PLL is indicated in the “Electrical Characteristics” section.

**Figure 31-7. Audio PLL**



# 32. Power Management Controller (PMC)

## 32.1 Description

The Power Management Controller (PMC) optimizes power consumption by controlling all system and user peripheral clocks. The PMC enables/disables the clock inputs to many of the peripherals and the Core.

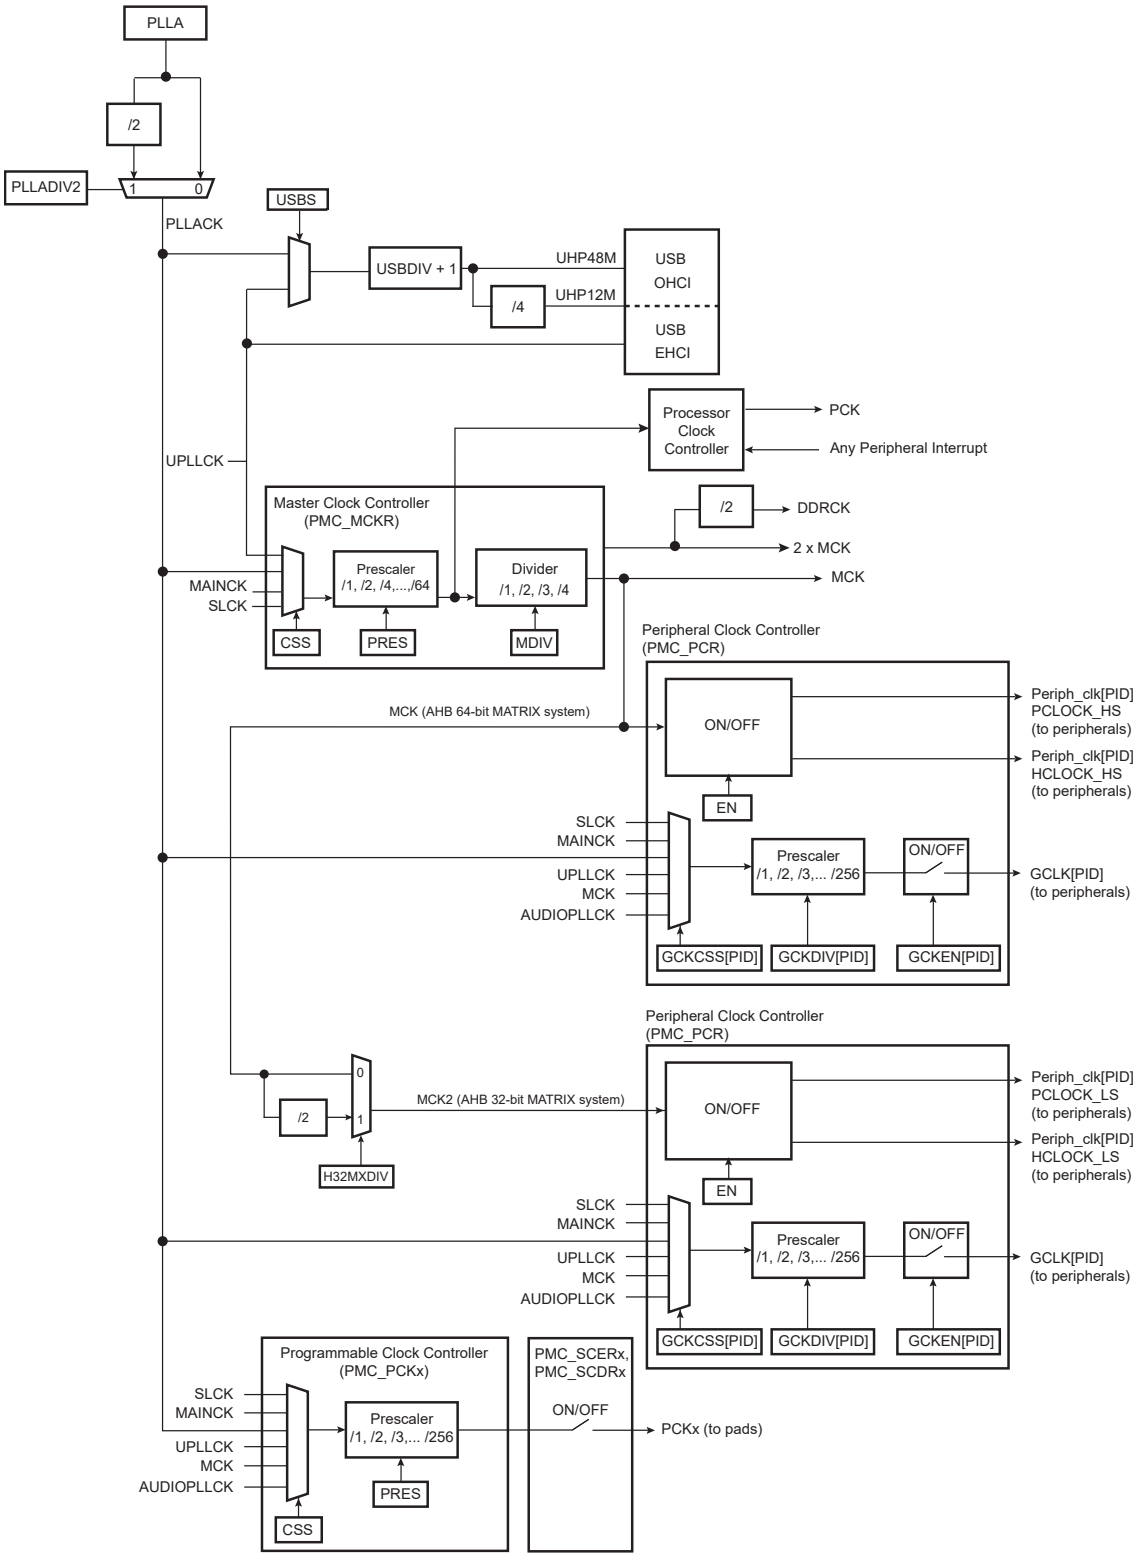
## 32.2 Embedded Characteristics

The Power Management Controller provides the following clocks:

- Master Clock (MCK)—programmable from a few hundred Hz to the maximum operating frequency of the device. It is available to the modules running permanently.
- Processor Clock (PCK)—must be switched off when processor is entering Idle mode
- HS USB Device Clock (UDPCK)
- H64MX Matrix Clock (MCK) and H32MX Matrix Clock (MCK or MCK/2)
- Peripheral Clocks—provided to the embedded peripherals and independently controllable
- Programmable Clock Outputs—can be selected from the clocks provided by the Clock Generator and driven on the PCKx pins
- Generic Clock (GCLK)—for peripherals that can accept a second clock source
- Asynchronous Partial Wake-up (SleepWalking)—for FLEXCOMx, SPIx, TWIx, UARTx and ADC

## 32.3 Block Diagram

**Figure 32-1. General Clock Block Diagram**



## 32.4 Master Clock Controller

The Master Clock Controller provides selection and division of the Master clock (MCK). MCK is the source clock of the peripheral clocks.

The Master clock is selected from one of the clocks provided by the Clock Generator. Selecting the Slow clock provides a Slow clock signal to the whole device. Selecting the Main clock saves power consumption of the PLLs.

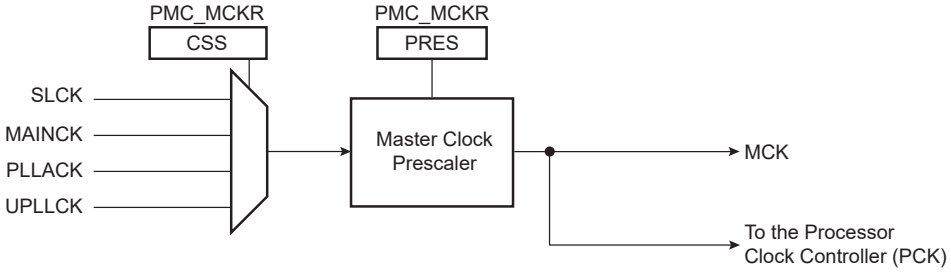
The Master Clock Controller is made up of a clock selector and a prescaler. It also contains a Master clock divider which allows the processor clock to be faster than the Master clock.

The Master clock selection is made by writing the CSS (Clock Source Selection) field in the Master Clock register (PMC_MCKR). The prescaler supports the division by a power of 2 of the selected clock between 1 and 64, and the division by 6. PMC_MCKR.PRES programs the prescaler.

**Note:** It is forbidden to modify MDIV and CSS at the same access. Each field must be modified separately with a wait for MCKRDY flag between the first field modification and the second field modification.

Each time PMC_MCKR is written to define a new Master clock, PMC_SR.MCKRDY is cleared. It reads 0 until the Master clock is established. Then, the MCKRDY bit is set and can trigger an interrupt to the processor. This feature is useful when switching from a high-speed clock to a lower one to inform the software when the change is actually done.

**Figure 32-2. Master Clock Controller**



## 32.5 Processor Clock Controller

The PMC features a Processor Clock (PCK) Controller that implements the processor Idle mode.

The Processor clock can be disabled by executing the WFI (WaitForInterrupt) processor instruction or the WFE (WaitForEvent) processor instruction while the LPM bit is at 0 in the PMC Fast Startup Mode register (PMC_FSMR).

The Processor clock can be disabled by writing the PMC System Clock Disable Register (PMC_SCDR). The status of this clock (at least for debug purposes) can be read in the PMC System Clock Status Register (PMC_SCSR).

The Processor clock is enabled after a reset and is automatically re-enabled by any enabled interrupt. The processor Idle mode is entered by disabling the Processor clock, which is automatically re-enabled by any enabled fast or normal interrupt, or by the reset of the product.

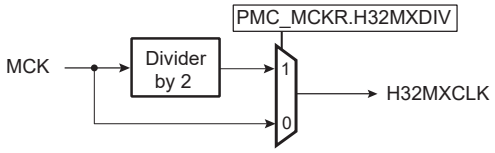
When processor Idle mode is entered, the current instruction is finished before the clock is stopped, but this does not prevent data transfers from other masters of the system bus.

## 32.6 Matrix Clock Controller

The AXI Matrix and H64MX 64-bit Matrix clocks are MCK.

The H32MX 32-bit matrix clock is to be configured as MCK if MCK does not exceed 83 MHz (refer to “Master Clock Characteristics” in the section “Electrical Characteristics”); otherwise, this clock is to be configured as MCK/2. Selection is done with the H32MXDIV bit in PMC Master Clock Register.

**Figure 32-3. H32MX 32-bit Matrix Clock Configuration**



## 32.7 Programmable Clock Controller

The PMC controls three signals to be outputs on external pins PCKx. Each signal can be independently programmed via the Programmable Clock registers (PMC_PCKx).

PCKx can be independently selected between the Slow clock (SLCK), the Master clock (MAINCK), the PLLACK, the UTMI PLL output, the Main clock and the AUDIO PLL (AUDIOPLLCLK) output by writing PMC_PCKx.CSS. Each output signal can also be divided by a factor between 1 and 256 by writing PMC_PCKx.PRES.

Each output signal can be enabled and disabled by writing a ‘1’ in the corresponding bits, PMC_SCER.PCKx and PMC_SCDR.PCKx, respectively. The status of each active programmable output clocks is given in PMC_SCSR.PCKx.

The status flag PMC_SR.PCKRDYx indicates that the Programmable clock programmed in PMC_PCKx is ready.

As the Programmable Clock Controller does not implement glitch prevention when switching clocks, the PCKx must be disabled before any configuration change (clock source and prescaler) and must be re-enabled after the change is performed.

## 32.8 Core and Bus Independent Clocks for Peripherals

The following table lists the peripherals that can operate while the core, bus and peripheral clock frequencies are modified, thus providing communications at a bit rate which is independent for the core/bus/peripheral clock. This mode of operation is possible by using the internally generated independent clock sources.

**Table 32-1. Clock Assignments**

| Peripheral | Specific Clock Requirements |
|---|---|
| GMAC | – |
| UDPHS | – |
| UHPHS | – |
| CLASSD | GCLK |

| .....continued | |
|---|---|
| **Peripheral** | **Specific Clock Requirements** |
| I2SC | GCLK |
| FLEXCOM (USART, SPI, TWI) | GCLK |
| ISC | PCK (pad clock) |
| MCAN | GCLK |
| TC | GCLK |
| ADC | GCLK |

## 32.9 Peripheral and Generic Clock Controller

The PMC controls the clocks of the embedded peripherals by means of the Peripheral Control register (PMC_PCR). With this register, the user can enable and disable the different clocks used by the peripherals:

- Peripheral clocks (periph_clk[..]), routed to every peripheral and derived from the Master clock (MCK), and
- Generic clocks (GCLK[PID]), routed to selected peripherals only (refer to the Peripheral Identifiers table in section Peripherals). These clocks are independent of the core and bus clocks (PCK, MCK and Periph_clk[PID]).

To configure a peripheral's clocks, PMC_PCR.CMD must be written to '1' and PMC_PCR.PID must be written with the index of the corresponding peripheral.

The GCLK[PID] clocks are generated by selection and division of the following sources: SLCK, MAINCK, UPLLCKDIV, PLLACK, AUDIOCKDIV and MCK. The source clock is selected by writing PMC_PCR.GCKCSS and the source clock divider is configured by writing PMC_PCR.GCKDIV. To apply a clock source selection and division factor, PID, CMD and GCKDIV, GCKCSS must be written in a single operation.

As the Generic Clock Controller (GCLK[PID]) does not implement glitch prevention when switching clocks, the GCLK[PID] must be disabled (PMC_PCR.GCKEN=0) before any configuration change (clock source and prescaler) and must be re-enabled after the change is performed.

The peripheral clock (periph_clk[..]) can be enabled or disabled by writing PMC_PCR.EN.

The user can also enable and disable these clocks by configuring the Peripheral Clock Enable (PMC_PCERx) and Peripheral Clock Disable (PMC_PCDRx) registers. The status of the peripheral clock activity can be read in the Peripheral Clock Status registers (PMC_PCSRx).

When a peripheral or a generic clock is disabled, it is immediately stopped. These clocks are disabled after a reset.

To stop a peripheral clock, the application software must wait until the peripheral has executed its last programmed operation before disabling the clock. This is to avoid data corruption or erroneous behavior of the system.

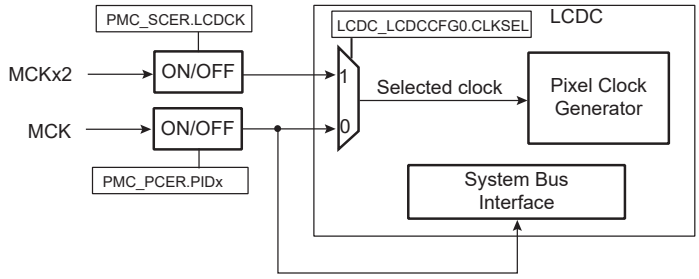
For a peripheral clock (periph_clk[..]), the bit number in PMC_PCERx, PMC_PCDRx, and PMC_PCSRx is the Peripheral Identifier defined at the product level. The bit number corresponds to the interrupt source number assigned to the peripheral.

To read the current clock configuration of a peripheral, PMC_PCR.CMD must be written to ‘0’ and PMC_PCR.PID must be written with the index of the corresponding peripheral regardless of the values of other fields. This write does not modify the configuration of the peripheral. The PMC_PCR can then be read to know the configuration status of the corresponding PID.

## 32.10 LCDC Clock Controller

In order to have more flexibility on the pixel clock, the LCDC can use MCK, or MCKx2 if LCDCK is set in the PMC System Clock Enable Register (PMC_SCER).

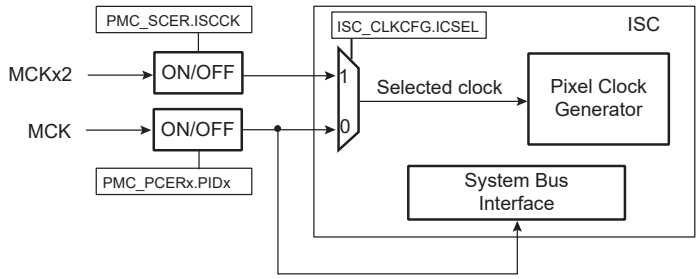
**Figure 32-4. LCDCLK Clock Configuration**



## 32.11 ISC Clock Controller

In order to have more flexibility on the pixel clock, the ISC can use MCK, or MCKx2 if ISCCK is set in the PMC System Clock Enable Register (PMC_SCER).

**Figure 32-5. ISCCLK Clock Configuration**



## 32.12 USB Device and Host Clocks

The USB Device and Host High Speed ports (UDPHS and UHPHS) clocks are enabled by the corresponding PIDx bits in the Peripheral Clock Enable register (PMC_PCERx). To save power on this peripheral when they are not used, the user can set these bits in the Peripheral Clock Disable register (PMC_PCDRx). Corresponding PIDx bits in the Peripheral Clock Status register (PMC_PCSRx) give the status of these clocks.

The PMC also provides the clocks UHP48M and UHP12M to the USB Host OHCI. The USB Host OHCI clocks are controlled by PMC_SCER.UHP. To save power on this peripheral when they are not used, the user can set PMC_SCDR.UHP. PMC_SCSR.UHP gives the status of this clock. The USB host OHCI requires both the 12/48 MHz signal and the Master clock. The USBDIV field in the USB Clock register (PMC_USB) is to be programmed to 9 (division by 10) for normal operations.

To further reduce power consumption the user can stop the UTMI PLL. In this case USB high-speed operations are not possible. Nevertheless, as the USB OHCI Input clock can be selected with PMC_USB.USBS (PLLA or UTMI PLL), OHCI full-speed operation remains possible.

The user must program the USB OHCI Input clock and the USBDIV divider in the PMC_USB register to generate a 48 MHz and a 12 MHz signal with an accuracy of ±0.25%.

The USB clock input is to be defined according to main oscillator via the FREQ field in the UTMI Clock Trimming register (SFR_UTMICKTRIM). Refer to the section “Special Function Registers (SFR)”. This input clock can be 12, 16, or 24 MHz.

## 32.13 DDR2/LPDDR/LPDDR2 Clock Controller

The PMC controls the clocks of the DDR memory.

The DDR clock can be enabled and disabled with the DDRCK bit in PMC_SCER and PMC_SDER, respectively. At reset, the DDR clock is disabled to reduce power consumption.

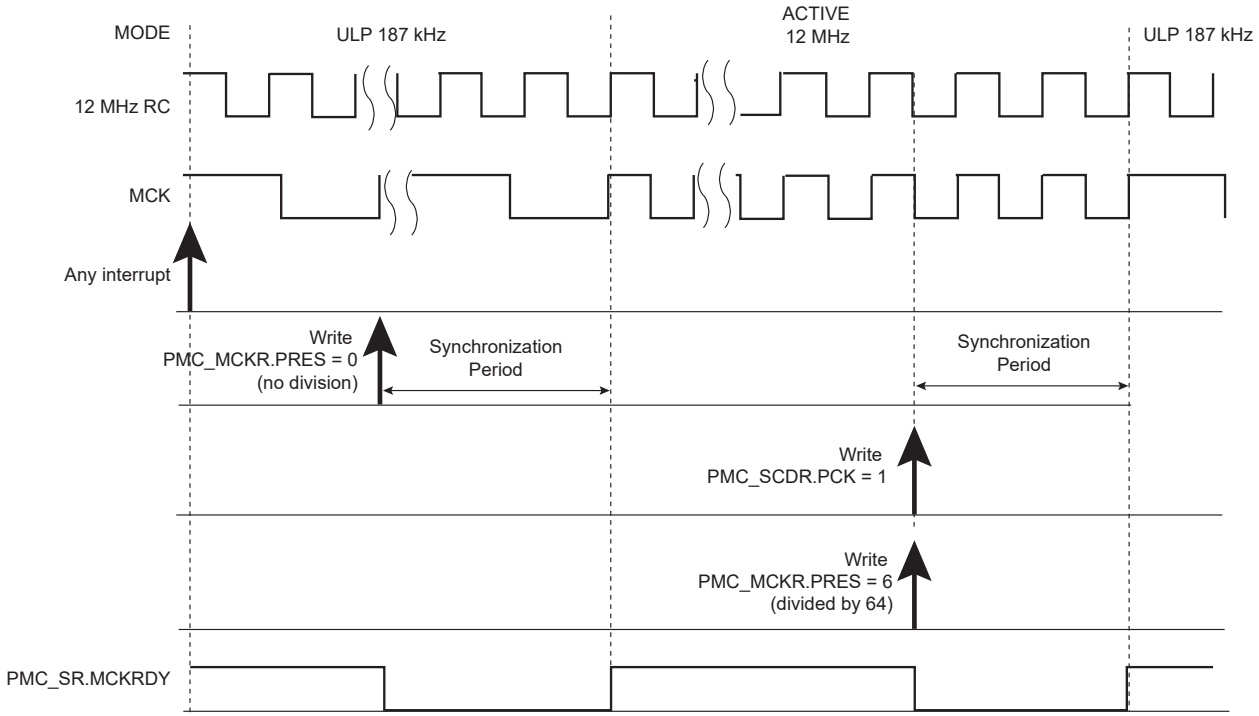
If PMC_MCKR.MDIV = 0 (PCK = MCK), the DDR clock is not available.

To reduce PLLA power consumption, the user can choose UPLLCK as an input clock for the system. In this case, the DDR Controller can drive LPDDR or LPDDR2 at up to 120 MHz.

## 32.14 Fast Start-up from Ultra-Low-Power (ULP) Mode 0

In Ultra-Low-power (ULP) mode 0, the Main clock (MAINCK) must be running, thus either the 12 MHz crystal oscillator or the Fast RC oscillator must be enabled. The lowest power consumption that can be achieved in ULP Mode 0, can be obtained when dividing the selected oscillator frequency by 64 by writing PMC_MCKR.PRES to 6. Any interrupt exits the system from ULP Mode. The software must write PMC_MCKR.PRES to 1 to provide MCK with the fastest clock. If the PLL is used, the start-up procedure must be done prior to writing PMC_MCKR.PRES to 1. The following figure illustrates an example of start-up phase from ULP Mode 0 without use of PLL.

**Figure 32-6. Fast Start-up from Ultra-Low-Power Mode 0**



**WARNING** The duration of the WKUPx pins active level must be greater than four MAINCK cycles.

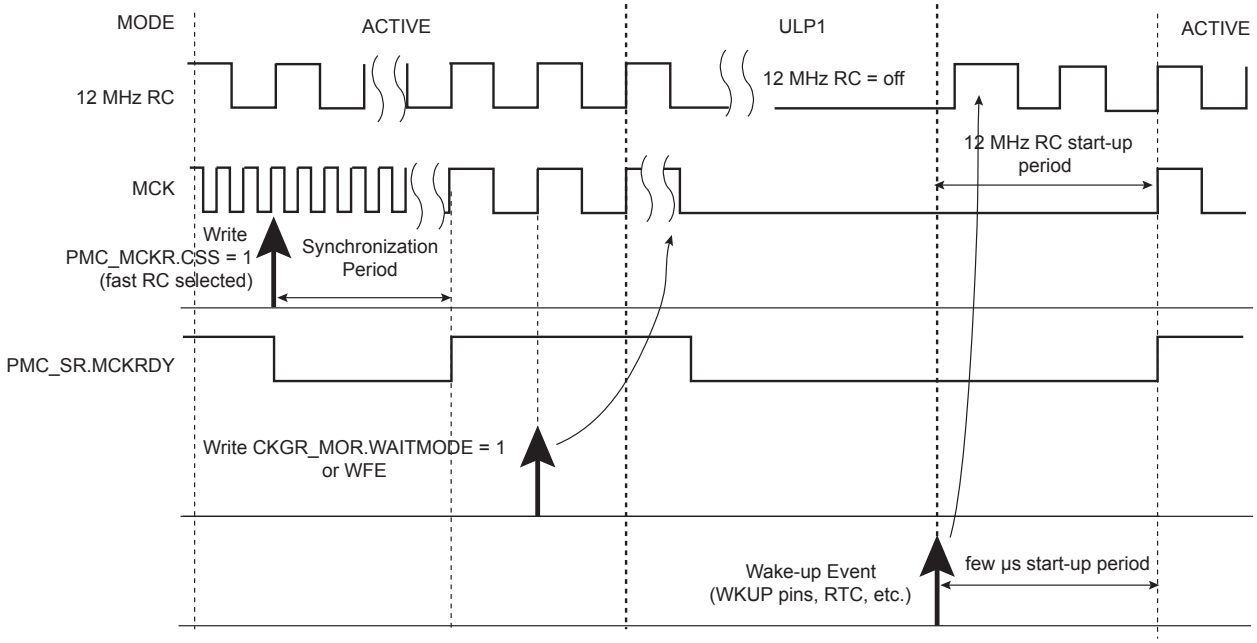
## 32.15 Fast Start-up from Ultra-Low-Power (ULP) Mode 1

The device allows the processor to restart in less than 10 µs while the device exits Ultra-Low-power (ULP) mode 1 only if the C-code function managing the ULP mode 1 entry and exit is linked to and executed from on-chip SRAM.

Prior to instructing the device to enter ULP mode 1, the RC oscillator must be selected as the Master clock source (PMC_MCKR.CSS must be written to 1, wait for PMC_SR.MCKRDY to be set) and the internal sources of wake-up must be cleared. In addition, it must be checked that none of the enabled external wake-up inputs (WKUP) hold an active polarity.

The system enters ULP mode 1 either by setting the CKGR_MOR.WAITMODE, or by executing the WaitForEvent (WFE) instruction of the processor while PMC_FSMR.LPM is at 1. Immediately after setting the WAITMODE bit or using the WFE instruction, wait for PMC_SR.MCKRDY to be set. See the following figure.

**Figure 32-7. Fast Start-up from ULP Mode 1**



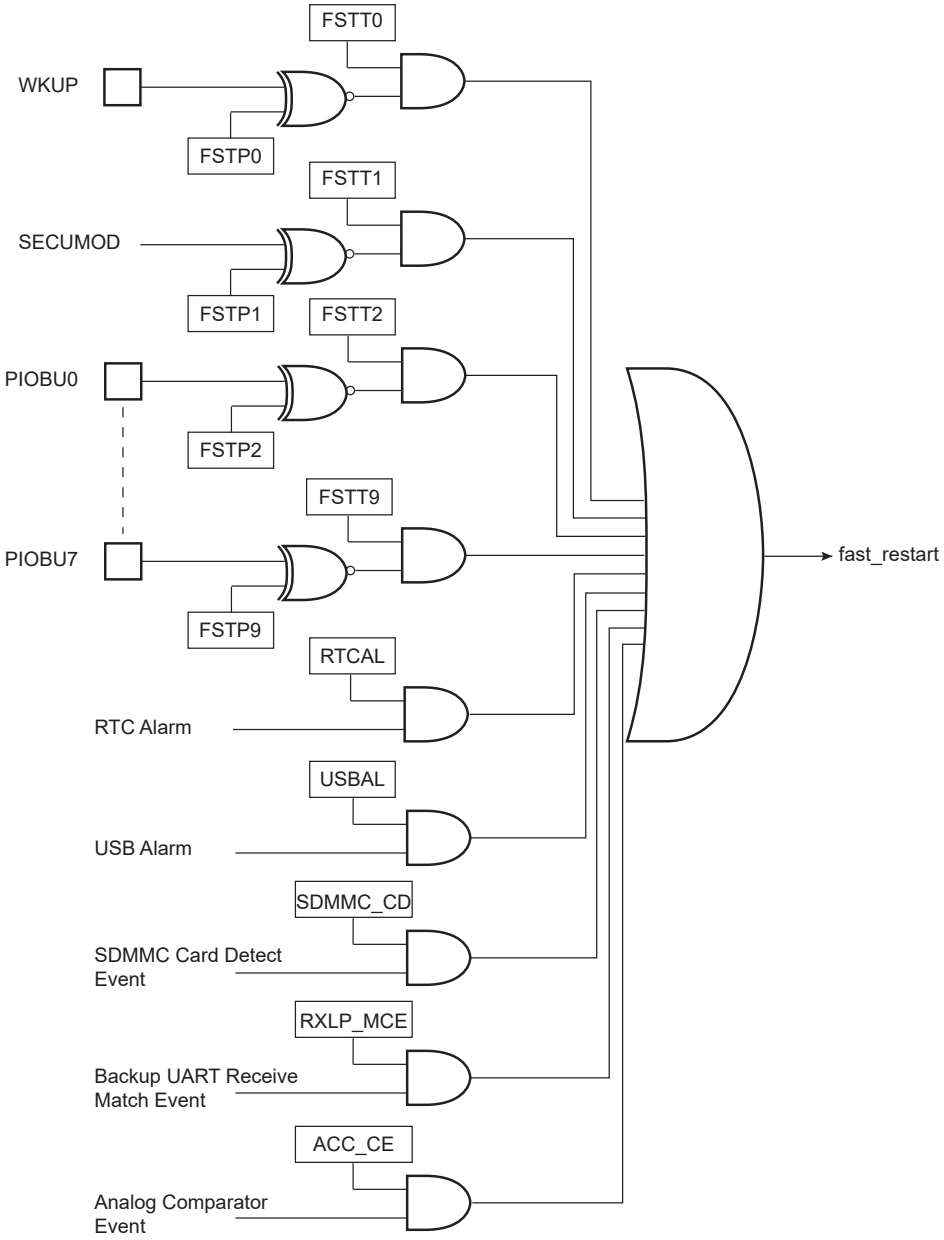
A fast start-up is enabled upon any of the following events:

- detection of a programmed level on one of the nine wake-up inputs (WKUP, PIOBUx)
- an active alarm from the RTC
- a resume from the USB Controller
- SDMMC card detect
- backup UART (RXLP) received character comparison match
- an analog comparison (ACC)
- any SleepWalking event coming from TWI, FLEXCOMx, SPI, ADC

The polarity of the nine wake-up inputs is programmable by writing the PMC Fast Startup Polarity register (PMC_FSPR). All the fast restart event sources except SleepWalking can be individually enabled/disabled by writing in PMC_FSMR. SleepWalking events can be individually enabled/disabled by writing in PMC_SLPWK_ERx/PMC_SLPWK_DRx (see Asynchronous Partial Wake-up (SleepWalking)).

The fast start-up circuitry, as shown in the following figure, is fully asynchronous and provides a fast start-up signal to the PMC. As soon as the fast start-up signal is asserted, the embedded 12 MHz RC oscillator restarts automatically.

**Figure 32-8. Fast Start-up Circuitry**



The PMC user interface does not provide the source of the fast start-up, but the user can recover this information by reading the PIO Controller and the status registers of the RTC, ACC, RXLP, and USB Controller.

## 32.16 Asynchronous Partial Wake-up (SleepWalking)

### 32.16.1 Description

The asynchronous partial wake-up (SleepWalking) wakes up a peripheral in a fully asynchronous way when activity is detected on the communication line. Moreover, under some user configurable conditions, the asynchronous partial wake-up can trigger an exit of the system from ULP mode 1 (full system wake-up).

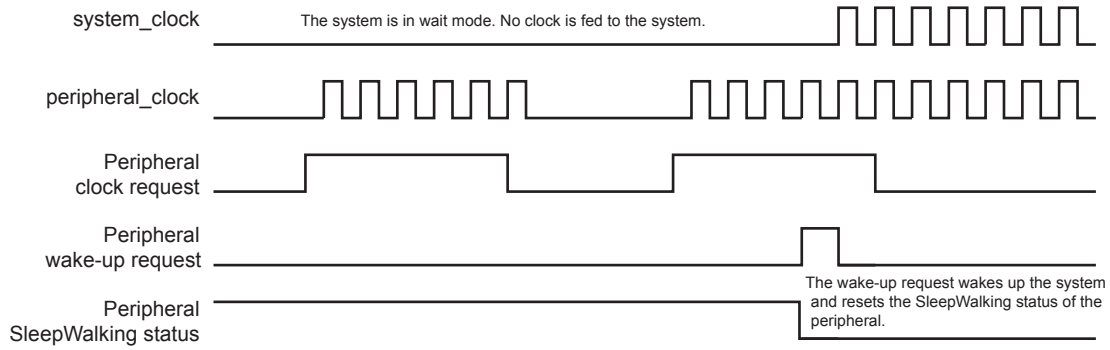
The asynchronous partial wake-up function automatically manages the peripheral clock. It improves the overall power consumption of the system by clocking peripherals only when needed.

Only the following peripherals can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The peripheral selected for asynchronous partial wake-up must be first configured so that its clock is enabled by setting the appropriate PIDx bit in PMC_PCERx.

When the system is in ULP mode 1, all clocks of the system (except SLCK) are stopped. When an asynchronous clock request from a peripheral occurs, the PMC partially wakes up the system to feed the clock only to this peripheral. The rest of the system is not fed with the clock, thus optimizing power consumption. Finally, depending on user-configurable conditions, the peripheral either wakes up the whole system if these conditions are met or stops the peripheral clock until the next clock request. If a wake-up request occurs, the Asynchronous Partial Wake-up mode is automatically disabled until the user instructs the PMC to enable asynchronous partial wake-up. This is done by setting PIDx in the PMC SleepWalking Enable register (PMC_SLPWK_ER).

**Figure 32-9. SleepWalking During Ultra-Low-Power Mode 1**

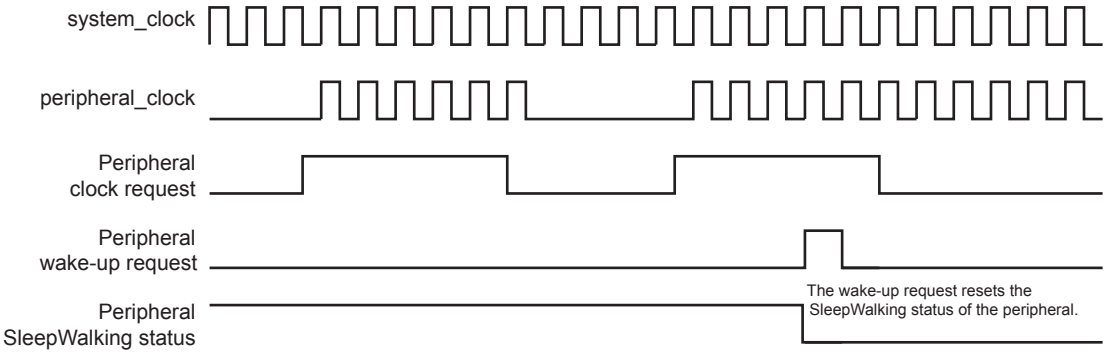


When the system is in Active mode, peripherals enabled for asynchronous partial wake-up have their respective clocks stopped until the peripherals request a clock. When a peripheral requests the clock, the PMC provides the clock without CPU intervention.

The triggering of the peripheral clock request depends on conditions which can be configured for each peripheral. If these conditions are met, the peripheral asserts a request to the PMC. The PMC disables the Asynchronous Partial Wake-up mode of the peripheral and provides the clock to the peripheral until the user instructs the PMC to re-enable partial wake-up on the peripheral. This is done by setting PIDx in PMC_SLPWK_ER.

If the conditions are not met, the peripheral clears the clock request and PMC stops the peripheral clock until the clock request is re-asserted by the peripheral.

**Figure 32-10. SleepWalking During Active Mode**



### 32.16.2 Configuration Procedure

Before configuring the asynchronous partial wake-up (SleepWalking) function of a peripheral, check that the peripheral clock is enabled (the PIDx bit in the PMC Peripheral Clock Status register (PMC_PCSR) must be set).

The procedure to enable the asynchronous partial wake-up (SleepWalking) function of a peripheral is the following:

1. Check that the corresponding PIDx bit in the PMC SleepWalking Activity Status register (PMC_SLPWK_ASR) is cleared. This ensures that the peripheral has no activity in progress.
2. Enable the asynchronous partial wake-up function of the peripheral by writing a one to the corresponding PIDx bit in PMC_SLPWK_ER.
3. Check that the corresponding PIDx bit in PMC_SLPWK_ASR is cleared. This ensures that no activity has started during the enable phase.
4. In PMC_SLPWK_ASR, if the corresponding PIDx bit is set, the asynchronous partial wake-up function must be immediately disabled by writing a one to the PIDx bit in the PMC SleepWalking Disable register (PMC_SLPWK_DR). Wait for the end of peripheral activity before reinitializing the procedure.
   If the corresponding PIDx bit is cleared, then the peripheral clock is disabled and the system can now be placed in ULP mode 1.

Before entering ULP mode 1, check that the AIP bit in the PMC SleepWalking Activity In Progress register (PMC_SLPWK_AIPR) is cleared. This ensures that none of the peripherals has any activity in progress.

**Note:** When asynchronous partial wake-up (SleepWalking) of a peripheral is enabled and the core is running (system not in ULP mode 1), the peripheral must not be accessed before a wake-up of the peripheral is performed.

## 32.17 Main Crystal Oscillator Failure Detection

The Main crystal oscillator failure detector monitors the 8 to 24 MHz crystal oscillator or ceramic resonator-based oscillator to identify a possible failure of this oscillator.

The clock failure detector can be enabled or disabled by configuring CKGR_MOR.CFDEN. The detector is also disabled in either of the following cases:

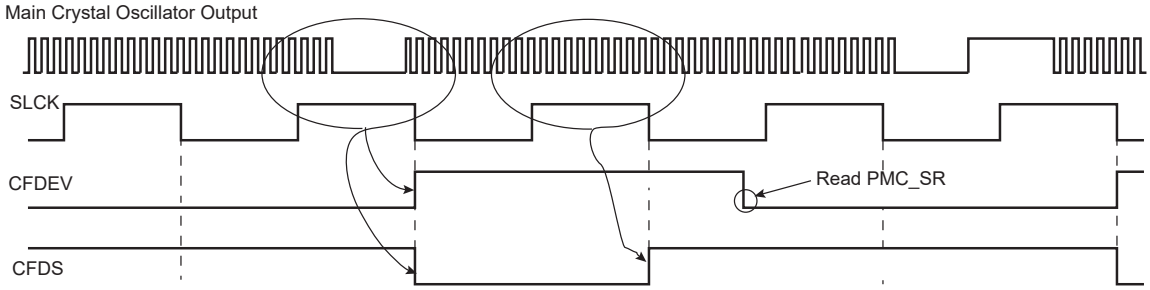
- after a VDDCORE reset
- when the oscillator is disabled (CKGR_MOR.MOSCXTEN = 0)

A failure is detected by means of a counter incrementing on the main oscillator clock edge and detection logic is triggered by the 32 kHz generated by the 64 kHz (typical) RC oscillator. This oscillator is automatically enabled when CKGR_MOR.CFDEN = 1.

The counter is cleared when the 32 kHz generated by the 64 kHz (typical) RC oscillator clock signal is low, and enabled when the signal is high. Thus, the failure detection time is one RC oscillator period. If, during the high level period of the 32 kHz generated by the 64 kHz (typical) RC oscillator clock signal, less than eight 8 to 24 MHz crystal oscillator clock periods have been counted, then a failure is reported.

If a failure of the Main clock is detected, bit PMC_SR.CFDEV indicates a failure event and generates an interrupt if the corresponding interrupt source is enabled. The interrupt remains active until a read occurs in PMC_SR. The user can know the status of the clock failure detection at any time by reading bit PMC_SR.CFDS.

**Figure 32-11. Clock Failure Detection (Example)**



Note: Ratio of clock periods is for illustration purposes only.

If the 8 to 24 MHz crystal oscillator or ceramic resonator-based oscillator is selected as the source clock of MAINCK (CKGR_MOR.MOSCSEL = 1), and if MCK source is PLLACK or UPLLCK (PMC_MCKR.CSS = 2 or 3), a clock failure detection automatically forces MAINCK to be the source clock for the Master clock (MCK). Then, regardless of the PMC configuration, a clock failure detection automatically forces the 12 MHz RC oscillator to be the source clock for MAINCK. If this oscillator is disabled when a clock failure detection occurs, it is automatically re-enabled by the clock failure detection mechanism.

It takes two 32 kHz (typical) clock cycles to detect and switch from the 8 to 24 MHz crystal oscillator to the 12 MHz RC oscillator if the source Master clock (MCK) is Main clock (MAINCK), or three 32 kHz (typical) cycles if the source of MCK is PLLACK or UPLLCK.

A clock failure detection activates a fault output that is connected to the Pulse Width Modulator (PWM) Controller. With this connection, the PWM controller is able to force its outputs and to protect the driven device, if a clock failure is detected.

The user can know the status of the clock failure detector at any time by reading bit PMC_SR.FOS.

This fault output remains active until the defect is detected and until it is cleared by the bit FOCLR in the PMC Fault Output Clear register (PMC_FOCR).

## 32.18 32.768 kHz Crystal Oscillator Frequency Monitor

The frequency of the 32.768 kHz crystal oscillator can be monitored by means of logic driven by the 12 MHz RC oscillator known as a reliable clock source. This function is enabled by configuring the XT32KFME bit of CKGR_MOR.

The error flag XT32KERR in PMC_SR is asserted when the 32.768 kHz crystal oscillator frequency is out of the ±10% nominal frequency value (i.e., 32.768 kHz). The error flag can be cleared only if the Slow clock frequency monitoring is disabled.

The monitored clock frequency is declared invalid if at least four consecutive clock period measurement results are over the nominal period ±10%.

Due to the possible frequency variation of the embedded 12 MHz RC oscillator acting as reference clock for the monitor logic, any Slow clock crystal frequency deviation over ±10% of the nominal frequency is systematically reported as an error by means of PMC_SR.XT32KERR. Between -1% and -10% and +1% and +10%, the error is not systematically reported.

Thus, only a crystal running at a 32.768 kHz frequency ensures that the error flag is not asserted. The permitted drift of the crystal is 10000 ppm (1%), which allows any standard crystal to be used.

The error flag can be defined as an interrupt source of the PMC by setting PMC_IER.XT32KERR.

## 32.19 Programming Sequence

1. If the 8 to 24 MHz crystal oscillator is not required, PLL can be directly configured (begin with Step 6. or Step 7.) else this oscillator must be started (begin with Step 2.).
2. Enable the 8 to 24 MHz crystal oscillator by setting CKGR_MOR.MOSCXTEN. The user can define a start-up time. This can be achieved by writing a value in CKGR_MOR.MOSCXTST. Once this register has been correctly configured, the user must wait for PMC_SR.MOSCXTS to be set. This can be done either by polling MOSCXTS or by waiting for the interrupt line to be raised if the associated interrupt source (MOSCXTS) has been enabled in PMC_IER.
3. Switch the MAINCK to the 8 to 24 MHz crystal oscillator by setting CKGR_MOR.MOSCSEL.
4. Wait for PMC_SR.MOSCSELS to be set to ensure the switchover is complete.
5. Check the Main clock frequency:
   The Main clock frequency can be measured via CKGR_MCFR.

   Read CKGR_MCFR until the MAINFRDY field is set, after which the user can read the field CKGR_MCFR.MAINF by performing an additional read. This provides the number of Main clock cycles that have been counted during a period of 16 Slow clock cycles.

   If MAINF = 0, switch the MAINCK to the 12 MHz RC oscillator by clearing CKGR_MOR.MOSCSEL.
   If MAINF ≠ 0, proceed to Step 6.
6. Set the PLLA and divider (if not required, proceed to Step 7.)
   All parameters needed to configure PLLA and the divider are located in CKGR_PLLAR.

   The MULA field is the PLLA multiplier factor. This parameter can be programmed between 0 and 127. If MULA is cleared, PLLA is turned off, otherwise the PLLA output frequency is PLLA input frequency multiplied by (MULA + 1).

   The PLLACOUNT field specifies the number of Slow clock cycles before LOCKA bit is set in PMC_SR after CKGR_PLLAR has been written.

   Once CKGR_PLLAR has been written, the user must wait for the LOCKA bit to be set in PMC_SR. This can be done either by polling LOCKA in PMC_SR or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKA) has been enabled in PMC_IER. All parameters in CKGR_PLLAR can be programmed in a single write operation. If at some stage parameter MULA or DIVA is modified, LOCKA bit goes low to indicate that PLLA is not yet ready. When PLLA is locked, LOCKA is set again.

   The user must wait for the LOCKA bit to be set before using the PLLA output clock.
7. Set High-speed PLL (UPLL) for UTMI

The UTMI PLL is enabled by setting CKGR_UCKR.UPLLEN. In some cases, it may be preferable to define a start-up time. This can be achieved by writing a value in CKGR_UCKR.PLLCOUNT.

Once this register has been correctly configured, the user must wait for PMC_SR.LOCKU to be set. This can be done either by polling LOCKU in PMC_SR or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKU) has been enabled in PMC_IER.

8. Select Master Clock and Processor Clock
The Master clock and the Processor clock are configurable via PMC_MCKR.

The CSS field is used to select the clock source of the Master clock and Processor clock dividers. By default, the selected clock source is the Main clock.

The PRES field is used to define the Processor clock and Master clock prescaler. The user can choose between different values from 1 to 256). Prescaler output is the selected clock source frequency divided by the PRES value.

The MDIV field is used to define the Master clock divider. It is possible to choose between different values (0, 1, 2, 3). The Master clock output is Processor clock frequency divided by 1, 2, 3 or 4, depending on the value programmed in MDIV.

The PMC PLLA clock input must be divided by 2 by writing the PLLADIV2 bit if MDIV is set to 3.

By default, MDIV and PLLLADIV2 are cleared, which indicates that Processor clock is equal to the Master clock.

Once PMC_MCKR has been written, the user must wait for the MCKRDY bit to be set in PMC_SR. This can be done either by polling MCKRDY in PMC_SR or by waiting for the interrupt line to be raised if the associated interrupt source (MCKRDY) has been enabled in PMC_IER.

PMC_MCKR must not be programmed in a single write operation. The programming sequence for PMC_MCKR is the following:

If a new value for CSS field corresponds to PLL clock,

a. Program PMC_MCKR.PRES.

b. Wait for PMC_SR.MCKRDY to be set.

c. Program PMC_MCKR.MDIV.

d. Wait for PMC_SR.MCKRDY to be set.

e. Program PMC_MCKR.CSS.

f. Wait for PMC_SR.MCKRDY to be set.

If a new value for CSS field corresponds to Main clock or Slow clock,

a. Program PMC_MCKR.CSS.

b. Wait for PMC_SR.MCKRDY to be set.

c. Program PMC_MCKR.PRES.

d. Wait for PMC_SR.MCKRDY to be set.

If CSS, MDIV or PRES are modified at some stage, the MCKRDY bit goes low to indicate that the Master clock and the Processor clock are not yet ready. The user must wait for the MCKRDY bit to be set again before using the Master and Processor clocks.

**Note:** If PLLA clock was selected as the Master clock and the user decides to modify it by writing in CKGR_PLLR, the MCKRDY flag goes low while PLL is unlocked. Once PLL is locked again, LOCKA goes high and MCKRDY is set.
While PLL is unlocked, the Master clock selection is automatically changed to Slow clock. For further information, see Clock Switching Waveforms.

Code Example:

write_register(PMC_MCKR,0x00000001)

wait (MCKRDY=1)

write_register(PMC_MCKR,0x00000011)

wait (MCKRDY=1)

The Master clock is Main clock divided by 2.

The Processor clock is the Master clock.

9. Select Programmable Clocks
Programmable clocks can be enabled and/or disabled via PMC_SCER and PMC_SCDR. 3 programmable clocks can be used. PMC_SCSR indicates which programmable clock is enabled. By default all programmable clocks are disabled.

   PMC_PCKx registers are used to configure programmable clocks.

   The PMC_PCKx.CSSfield selects the programmable clock divider source. Five clock options are available: Main clock, Slow clock, Master clock, PLLACK, UPLLCK. The Slow clock is the default clock source.

   The PRES field is used to control the programmable clock prescaler. It is possible to choose among different values (from 1 to 256). Programmable clock output is prescaler input divided by PRES parameter. By default, the PRES value is cleared which means that PCKx is equal to Slow clock.

   Once the PMC_PCKx register has been configured, The corresponding programmable clock must be enabled and the user is constrained to wait for the PCKRDYx bit to be set in PMC_SR. This can be done either by polling PCKRDYx in PMC_SR or by waiting for the interrupt line to be raised if the associated interrupt source (PCKRDYx) has been enabled in PMC_IER. All parameters in PMC_PCKx can be programmed in a single write operation.

   If the CSS and PRES parameters are to be modified, the corresponding programmable clock must be disabled first. The parameters can then be modified. Once this has been done, the user must re-enable the programmable clock and wait for the PCKRDYx bit to be set.

10. Enable Peripheral Clocks
Once all of the previous steps have been completed, the peripheral clocks can be enabled and/or disabled via PMC_PCERx and PMC_PCDRx.

## 32.20 Clock Switching Details

### 32.20.1 Master Clock Switching Timings

The following tables give the worst case timings required for the Master clock to switch from one selected clock to another one. This is in the event that the prescaler is deactivated. When the prescaler is activated, an additional time of 64 clock cycles of the new selected clock has to be added.

**Table 32-2. Clock Switching Timings (Worst Case)**

| To | From | | |
|---|---|---|---|
| | Main Clock | SLCK | PLL Clock |
| Main Clock | – | 4 × SLCK +<br>2.5 × Main Clock | 3 × PLL Clock +<br>4 × SLCK +<br>1 × Main Clock |
| SLCK | 0.5 × Main Clock +<br>4.5 × SLCK | – | 3 × PLL Clock +<br>5 × SLCK |
| PLL Clock | 0.5 × Main Clock +<br>4 × SLCK +<br>PLLCOUNT × SLCK +<br>2.5 × PLL Clock | 2.5 × PLL Clock +<br>5 × SLCK +<br>PLLCOUNT × SLCK | 2.5 × PLL Clock +<br>4 × SLCK +<br>PLLCOUNT × SLCK |

**Note:** PLL designates either the PLLA or the UPLL Clock. PLLCOUNT designates either PLLACOUNT or UPLLCOUNT.

**Table 32-3. Clock Switching Timings Between Two PLLs (Worst Case)**

| To | From | |
|---|---|---|
| | PLLA Clock | UPLL Clock |
| PLLA Clock | 2.5 × PLLA Clock +<br>4 × SLCK +<br>PLLACOUNT × SLCK | 3 × PLLA Clock +<br>4 × SLCK +<br>1.5 × PLLA Clock |
| UPLL Clock | 3 × UPLL Clock +<br>4 × SLCK +<br>1.5 × UPLL Clock | 2.5 × UPLL Clock +<br>4 × SLCK +<br>UPLLCOUNT × SLCK |

## 32.21 Register Write Protection

To prevent any single software error from corrupting PMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the PMC Write Protection Mode Register (PMC_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the PMC Write Protection Status Register (PMC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PMC_WPSR.

The following registers can be write-protected:

- PMC System Clock Enable Register
- PMC System Clock Disable Register
- PMC Peripheral Clock Enable Register 0
- PMC Peripheral Clock Disable Register 0
- PMC Clock Generator Main Oscillator Register
- PMC Clock Generator Main Clock Frequency Register
- PMC Clock Generator PLLA Register
- PMC Master Clock Register
- PMC USB Clock Register
- PMC Fast Startup Polarity Register
- PMC Fast Startup Mode Register
- PLL Charge Pump Current Register
- PMC Oscillator Calibration Register
- PMC SleepWalking Enable Register 0
- PMC SleepWalking Disable Register 1
- PMC SleepWalking Enable Register 1
- PMC SleepWalking Disable Register 1
- PMC SleepWalking Control Register

## 32.22 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |

### 32.22.1 PMC System Clock Enable Register

**Name:** PMC_SCER
**Offset:** 0x0000
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

**Bit 18 – ISCCK** ISC Clock Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the ISC clock. |

**Bits 8, 9, 10 – PCKx** Programmable Clock x Output Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the corresponding Programmable Clock output. |

**Bit 7 – UDP** USB Device Clock Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the USB Device clock. |

**Bit 6 – UHP** USB Host OHCI Clocks Enable

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Enables the UHP48M and UHP12M OHCI clocks. |

**Bit 3 – LCDCK** MCK2x Clock Enable
MCK2x is selected as LCD Pixel source clock if LCDC_LCDCFG0.CLKSEL = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the MCK2x clock. |

**Bit 2 – DDRCK** DDR Clock Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the DDR clock. |

### 32.22.2 PMC System Clock Disable Register

**Name:** PMC_SCDR
**Offset:** 0x0004
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Reset | – | – | | | – | – | | – |

**Bit 18 – ISCCK** ISC Clock Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the ISC clock. |

**Bits 8, 9, 10 – PCKx** Programmable Clock x Output Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the corresponding Programmable Clock output. |

**Bit 7 – UDP** USB Device Clock Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the USB Device clock. |

**Bit 6 – UHP** USB Host OHCI Clock Disable

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Disables the UHP48M and UHP12M OHCI clocks. |

**Bit 3 – LCDCK** MCK2x Clock Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the MCK2x clock. |

**Bit 2 – DDRCK** DDR Clock Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the DDR clock. |

**Bit 0 – PCK** Processor Clock Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the Processor clock. This is used to enter the processor in Idle mode. |

### 32.22.3 PMC System Clock Status Register

**Name:** PMC_SCSR
**Offset:** 0x0008
**Reset:** 0x00000005
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

**Bit 18 – ISCCK** ISC Clock Status

| Value | Description |
|---|---|
| 0 | The ISC clock is disabled. |
| 1 | The ISC clock is enabled. |

**Bits 8, 9, 10 – PCKx** Programmable Clock x Output Status

| Value | Description |
|---|---|
| 0 | The corresponding Programmable Clock output is disabled. |
| 1 | The corresponding Programmable Clock output is enabled. |

**Bit 7 – UDP** USB Device Port Clock Status

| Value | Description |
|---|---|
| 0 | The USB Device clock is disabled. |
| 1 | The USB Device clock is enabled. |

**Bit 6 – UHP** USB Host Port Clock Status

| Value | Description |
|---|---|
| 0 | The UHP48M and UHP12M OHCI clocks are disabled. |
| 1 | The UHP48M and UHP12M OHCI clocks are enabled. |

**Bit 3 – LCDCK** MCK2x Clock Status
MCK2x is selected as LCD Pixel source clock if LCDC_LCDCFG0.CLKSEL = 1.

| Value | Description |
|---|---|
| 0 | The MCK2x clock is disabled. |
| 1 | The MCK2x clock is enabled. |

**Bit 2 – DDRCK** DDR Clock Status

| Value | Description |
|---|---|
| 0 | The DDR clock is disabled. |
| 1 | The DDR clock is enabled. |

**Bit 0 – PCK** Processor Clock Status

| Value | Description |
|---|---|
| 0 | The Processor clock is disabled. |
| 1 | The Processor clock is enabled. |

### 32.22.4 PMC Peripheral Clock Enable Register 0

**Name:** PMC_PCER0
**Offset:** 0x0010
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PID31 | PID30 | PID29 | PID28 | PID27 | PID26 | PID25 | PID24 |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

PID2 to PID31 refer to identifiers as defined in section “Peripheral Identifiers”. Other peripherals can be enabled in PMC_PCER1.
Programming the control bits of the Peripheral ID that are not implemented has no effect on the behavior of the PMC.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the corresponding peripheral clock. |

### 32.22.5 PMC Peripheral Clock Disable Register 0

**Name:** PMC_PCDR0
**Offset:** 0x0014
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 31:28 – BIASCOUNT[3:0]** UTMI BIAS Start-up Time
Specifies the number of slow clock cycles for the UTMI BIAS start-up time.

**Bits 23:20 – UPLLCOUNT[3:0]** UTMI PLL Start-up Time
Specifies the number of slow clock cycles multiplied by 8 for the UTMI PLL start-up time.

**Bit 16 – UPLLEN** UTMI PLL Enable
When UPLLEN is set, the LOCKU flag is set once the UTMI PLL start-up time is achieved.

| Value | Description |
|---|---|
| 0 | The UTMI PLL is disabled. |
| 1 | The UTMI PLL is enabled. |

### 32.22.8 PMC Clock Generator Main Oscillator Register

**Name:** CKGR_MOR
**Offset:** 0x0020

**Bit 25 – CFDEN** Clock Failure Detector Enable

| Value | Description |
|---|---|
| 0 | The clock failure detector is disabled. |
| 1 | The clock failure detector is enabled. |

**Bit 24 – MOSCSEL** Main Clock Oscillator Selection

| Value | Description |
|---|---|
| 0 | The 12 MHz RC oscillator is selected. |
| 1 | The 8 to 24 MHz crystal oscillator is selected. |

**Bits 23:16 – KEY[7:0]** Password

| Value | Name | Description |
|---|---|---|
| 0x37 | PASSWD | Writing any other value in this field aborts the write operation. |

**Bits 15:8 – MOSCXTST[7:0]** 8 to 24 MHz Crystal Oscillator Start-up Time
Specifies the number of Slow clock cycles multiplied by 8 for the crystal oscillator start-up time.

**Bit 5 – ONE** Must Be Set to 1
When programming CKGR_MOR, bit 5 must always be set to 1; bits 6 and 4 must always be set to 0.

**Bit 3 – MOSCRCEN** 12 MHz RC Oscillator Enable
When MOSCRCEN is set, the MOSCRCS flag is set once the RC oscillator start-up time is achieved.

| Value | Description |
|---|---|
| 0 | The 12 MHz RC oscillator is disabled. |
| 1 | The 12 MHz RC oscillator is enabled. |

**Bit 2 – WAITMODE** Wait Mode Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Puts the device in Wait mode. |

**Bit 1 – MOSCXTBY** 8 to 24 MHz Crystal Oscillator Bypass
When MOSCXTBY is set, the MOSCXTS flag in PMC_SR is automatically set.

Clearing MOSCXTEN and MOSCXTBY bits allows resetting the MOSCXTS flag.

When Main Oscillator Bypass is disabled (MOSCXTBY = 0), the MOSCXTS flag must be read as 0 in PMC_SR prior to enabling the main crystal oscillator (MOSCXTEN = 1).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The 8 to 24 MHz crystal oscillator is bypassed. MOSCXTEN must be cleared. An external clock must be connected on XIN. |

**Bit 0 – MOSCXTEN** 8 to 24 MHz Crystal Oscillator Enable
A crystal must be connected between XIN and XOUT.

When MOSCXTEN is set, the MOSCXTS flag is set once the crystal oscillator startup time is achieved.

| Value | Description |
|---|---|
| 0 | The 8 to 24 MHz crystal oscillator is disabled. |
| 1 | The 8 to 24 MHz crystal oscillator is enabled. MOSCXTBY must be cleared. |

Bits 4 and 6 must always be configured to 1.

### 32.22.9 PMC Clock Generator Main Clock Frequency Register

**Name:** CKGR_MCFR
**Offset:** 0x0024
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CCSS |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | RCMEAS | | | | MAINFRDY |
| Access | | | | R/W | | | | R/W |
| Reset | | | | 0 | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | MAINF[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | MAINF[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 24 – CCSS** Counter Clock Source Selection

| Value | Description |
|---|---|
| 0 | The clock of the MAINF counter is the RC oscillator. |
| 1 | The clock of the MAINF counter is the crystal oscillator. |

**Bit 20 – RCMEAS** RC Oscillator Frequency Measure (write-only)
The measure is performed on the main frequency (i.e., not limited to RC oscillator only), but if the Main clock frequency source is the 8 to 24 MHz crystal oscillator, the restart of measuring is not needed because of the well known stability of crystal oscillators.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Restarts measuring of the frequency of the Main clock source. MAINF will carry the new frequency as soon as a low to high transition occurs on the MAINFRDY flag. |

**Bit 16 – MAINFRDY** Main Clock Frequency Measure Ready
To ensure that a correct value is read on the MAINF field, the MAINFRDY flag must be read at 1, then another read access must be performed on the register to get a stable value on the MAINF field.

| Value | Description |
|---|---|
| 0 | MAINF value is not valid or the measured oscillator is disabled or a measure has just been started by means of RCMEAS. |
| 1 | The measured oscillator has been enabled previously and MAINF value is available. |

**Bits 15:0 – MAINF[15:0]** Main Clock Frequency
Gives the number of cycles of the clock selected by the bit CCSS within 16 Slow clock periods. To calculate the frequency of the measured clock:

$f_{SELCK} = (MAINF \times f_{SLCK}) / 16$

where frequency is in MHz.

### 32.22.10 PMC Clock Generator PLLA Register

**Name:** CKGR_PLLAR
**Offset:** 0x0028
**Reset:** 0x00003F00
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Possible limitations on PLL input frequencies and multiplier factors should be checked before using the PMC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | ONE | | | | | MULA[6:6] |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DIVA |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 29 – ONE** Must Be Set to 1
Bit 29 must always be set to 1 when programming CKGR_PLLAR.

**Bits 24:18 – MULA[6:0]** PLLA Multiplier

| Value | Description |
|---|---|
| 0 | The PLLA is disabled. |
| 1-127 | The PLLA Clock frequency is the PLLA input frequency multiplied by MULA + 1. |

**Bits 17:14 – OUTA[3:0]** PLLA Clock Frequency Range
To be programmed to 0.

**Bits 13:8 – PLLACOUNT[5:0]** PLLA Counter
Specifies the number of Slow clock cycles before the LOCKA bit is set in PMC_SR after CKGR_PLLAR is written.

**Bit 0 – DIVA** Divider A

| Value | Name | Description |
|---|---|---|
| 0 | 0 | PLLA is disabled. |
| 1 | BYPASS | Divider is bypassed and the PLL input entry is Main clock (MAINCK). |

### 32.22.11 PMC Master Clock Register

**Name:** PMC_MCKR
**Offset:** 0x0030
**Reset:** 0x00000001
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | H32MXDIV |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | | R/W | R/W | R/W | | | R/W | R/W |
| Reset | | 0 | 0 | 0 | | | 0 | 1 |

**Bit 24 – H32MXDIV** AHB 32-bit Matrix Divisor

| Value | Name | Description |
|---|---|---|
| 0 | H32MXDIV1 | The AHB 32-bit Matrix frequency is equal to the AHB 64-bit Matrix frequency. It is possible only if the AHB 64-bit Matrix frequency does not exceed 83 MHz. |
| 1 | H32MXDIV2 | The AHB 32-bit Matrix frequency is equal to the AHB 64-bit Matrix frequency divided by 2. |

**Bit 12 – PLLADIV2** PLLA Divisor by 2
Bit PLLADIV2 must always be set to 1 when MDIV is set to 3.

**Bits 9:8 – MDIV[1:0]** Master Clock Division

| Value | Name | Description |
|---|---|---|
| 0 | EQ_PCK | Master Clock is Prescaler Output Clock divided by 1.<br>**Warning: DDRCK is not available.** |
| 1 | PCK_DIV2 | Master Clock is Prescaler Output Clock divided by 2. DDRCK is equal to MCK. |
| 2 | PCK_DIV4 | Master Clock is Prescaler Output Clock divided by 4. DDRCK is equal to MCK. |
| 3 | PCK_DIV3 | Master Clock is Prescaler Output Clock divided by 3. DDRCK is equal to MCK. |

**Bits 6:4 – PRES[2:0]** Master/Processor Clock Prescaler

| Value | Name | Description |
|---|---|---|
| 0 | CLOCK | Selected clock |
| 1 | CLOCK_DIV2 | Selected clock divided by 2 |
| 2 | CLOCK_DIV4 | Selected clock divided by 4 |
| 3 | CLOCK_DIV8 | Selected clock divided by 8 |
| 4 | CLOCK_DIV16 | Selected clock divided by 16 |
| 5 | CLOCK_DIV32 | Selected clock divided by 32 |
| 6 | CLOCK_DIV64 | Selected clock divided by 64 |
| 7 | – | Reserved |

**Bits 1:0 – CSS[1:0]** Master/Processor Clock Source Selection

| Value | Name | Description |
|---|---|---|
| 0 | SLOW_CLK | Slow clock is selected |
| 1 | MAIN_CLK | Main clock is selected |
| 2 | PLLA_CLK | PLLACK is selected |
| 3 | UPLL_CLK | UPLL Clock is selected |

### 32.22.12 PMC USB Clock Register

**Name:** PMC_USB
**Offset:** 0x0038
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 11:8 – USBDIV[3:0]** Divider for USB OHCI Clock
USB Clock is Input clock divided by USBDIV + 1.

**Bit 0 – USBS** USB OHCI Input Clock Selection

| Value | Description |
|---|---|
| 0 | USB Clock Input is PLLA. |
| 1 | USB Clock Input is UPLL. |

### 32.22.13 PMC Programmable Clock Register

**Name:** PMC_PCKx
**Offset:** 0x40 + x*0x04 [x=0..2]
**Reset:** 0x00000000
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 11:4 – PRES[7:0]** Programmable Clock Prescaler
Programmable Clock Frequency = Selected Clock Frequency / (PRES + 1)

| Value | Name | Description |
|---|---|---|
| 0 | CLOCK | Selected clock |
| 1 | CLOCK_DIV2 | Selected clock divided by 2 |
| 2 | CLOCK_DIV4 | Selected clock divided by 4 |
| 3 | CLOCK_DIV8 | Selected clock divided by 8 |
| 4 | CLOCK_DIV16 | Selected clock divided by 16 |
| 5 | CLOCK_DIV32 | Selected clock divided by 32 |
| 6 | CLOCK_DIV64 | Selected clock divided by 64 |
| 7 | – | Reserved |

**Bits 2:0 – CSS[2:0]** Master Clock Source Selection

| Value | Name | Description |
|---|---|---|
| 0 | SLOW_CLK | Slow clock is selected. |
| 1 | MAIN_CLK | Main clock is selected. |
| 2 | PLLA_CLK | PLLACK is selected. |
| 3 | UPLL_CLK | UPLL clock is selected. |

| Value | Name | Description |
|---|---|---|
| 4 | MCK_CLK | Master clock is selected. |
| 5 | AUDIO_CLK | Audio PLL clock is selected. |

### 32.22.14 PMC Interrupt Enable Register

**Name:** PMC_IER
**Offset:** 0x0060
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bit 24 – GCKRDY** Generic Clock Status

| Value | Description |
|---|---|
| 0 | One of the generic clocks is not ready yet. |
| 1 | All generic clocks are ready. |

**Bit 20 – FOS** Clock Failure Detector Fault Output Status

| Value | Description |
|---|---|
| 0 | The fault output of the clock failure detector is inactive. |
| 1 | The fault output of the clock failure detector is active. |

**Bit 19 – CFDS** Clock Failure Detector Status

| Value | Description |
|---|---|
| 0 | A clock failure of the 8 to 24 MHz crystal oscillator is not detected. |
| 1 | A clock failure of the 8 to 24 MHz crystal oscillator is detected. |

**Bit 18 – CFDEV** Clock Failure Detector Event

| Value | Description |
|---|---|
| 0 | No clock failure detection of the 8 to 24 MHz crystal oscillator has occurred since the last read of PMC_SR. |

| Value | Description |
|---|---|
| 1 | At least one clock failure detection of the 8 to 24 MHz crystal oscillator has occurred since the last read of PMC_SR. |

**Bit 17 – MOSCRCS** 12 MHz RC Oscillator Status

| Value | Description |
|---|---|
| 0 | 12 MHz RC oscillator is not stabilized. |
| 1 | 12 MHz RC oscillator is stabilized. |

**Bit 16 – MOSCSELS** Main Oscillator Selection Status

| Value | Description |
|---|---|
| 0 | Selection is in progress. |
| 1 | Selection is done. |

**Bits 10:8 – PCKRDYx[2:0]** Programmable Clock Ready Status

| Value | Description |
|---|---|
| 0 | Programmable Clock x is not ready. |
| 1 | Programmable Clock x is ready. |

**Bit 7 – OSCSELS** Slow Clock Oscillator Selection

| Value | Description |
|---|---|
| 0 | Embedded 64 kHz RC oscillator is selected. |
| 1 | 32.768 kHz crystal oscillator is selected. |

**Bit 6 – LOCKU** UPLL Clock Status

| Value | Description |
|---|---|
| 0 | UPLL Clock is not ready. |
| 1 | UPLL Clock is ready. |

**Bit 3 – MCKRDY** Master Clock Status

| Value | Description |
|---|---|
| 0 | Master Clock is not ready. |
| 1 | Master Clock is ready. |

**Bit 1 – LOCKA** PLLA Lock Status

| Value | Description |
|---|---|
| 0 | PLLA is not locked. |
| 1 | PLLA is locked. |

**Bit 0 – MOSCXTS** 8 to 24 MHz Crystal Oscillator Status

| Value | Description |
|---|---|
| 0 | 8 to 24 MHz crystal oscillator is not stabilized. |
| 1 | 8 to 24 MHz crystal oscillator is stabilized. |

### 32.22.17 PMC Interrupt Mask Register

**Name:** PMC_IMR
**Offset:** 0x006C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: Corresponding interrupt is not enabled.

1: Corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bit 10 – FSTP10** GMAC Wake-up On LAN Polarity for Fast Start-up
If PMC_FSMR.FSTT10 = 1, FSTP10 must be written to 1.

**Bits 2, 3, 4, 5, 6, 7, 8, 9 – FSTPx** PIOBU0–7 Pin Polarity for Fast Start-up
Defines the active polarity of the corresponding PIOBUx input. If the corresponding wake-up input is enabled and at the FSTP level, it enables a fast restart signal.

**Bit 1 – FSTP1** Security Module Polarity for Fast Start-up
If PMC_FSMR.FSTT1 = 1, FSTP1 must be written to 1.

**Bit 0 – FSTP0** WKUP Pin Polarity for Fast Start-up
Defines the active polarity of the wake-up input. If the wake-up input is enabled and at the FSTP level, it enables a fast restart signal.

### 32.22.19 PMC Fast Start-up Mode Register

**Name:** PMC_FSMR
**Offset:** 0x0070
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bit 25 – ACC_CE** Fast Start-up from Analog Comparator Controller Comparison Enable

| Value | Description |
|---|---|
| 0 | The ACC (Analog Comparator Controller) comparison has no effect on the PMC. |
| 1 | The ACC (Analog Comparator Controller) comparison can trigger a fast restart signal to the PMC. |

**Bit 24 – RXLP_MCE** Fast Start-up from Backup UART Receive Match Condition Enable

| Value | Description |
|---|---|
| 0 | The matching condition on the RXLP has no effect on the PMC. |
| 1 | The matching condition on the RXLP can trigger a fast restart signal to the PMC. |

**Bit 20 – LPM** Low-power Mode

| Value | Description |
|---|---|
| 0 | The WaitForInterrupt (WFI) or the WaitForEvent (WFE) instruction of the processor instructs the processor to enter Idle mode. |
| 1 | The WaitForEvent (WFE) instruction of the processor instructs the system to enter ULP mode 1. |

**Bit 19 – SDMMC_CD** Fast Start-up from SDMMC Card Detect Enable

| Value | Description |
|---|---|
| 0 | The SDMMC card detect has no effect on the PMC. |
| 1 | The SDMMC card detect can trigger a fast restart signal to the PMC. |

**Bit 18 – USBAL** Fast Start-up from USB Resume Enable

| Value | Description |
|---|---|
| 0 | The USB resume has no effect on the PMC. |
| 1 | The USB resume can trigger a fast restart signal to the PMC. |

**Bit 17 – RTCAL** Fast Start-up from RTC Alarm Enable

| Value | Description |
|---|---|
| 0 | The RTC alarm has no effect on the PMC. |
| 1 | The RTC alarm can trigger a fast restart signal to the PMC. |

**Bit 10 – FSTT10** Fast Start-up from GMAC Wake-up On LAN Enable

| Value | Description |
|---|---|
| 0 | The GMAC_WOL input has no effect on the PMC. |
| 1 | The GMAC_WOL input can trigger a fast restart signal to the PMC. |

**Bits 2, 3, 4, 5, 6, 7, 8, 9 – FSTTx** Fast Start-up from PIOBU0–7 Input Enable

| Value | Description |
|---|---|
| 0 | The corresponding PIOBUx input has no effect on the PMC. |
| 1 | The corresponding PIOBUx input can trigger a fast restart signal to the PMC. |

**Bit 1 – FSTT1** Fast Start-up from Security Module Enable

| Value | Description |
|---|---|
| 0 | The SECUMOD has no effect on the PMC. |
| 1 | The SECUMOD can trigger a fast restart signal to the PMC. |

**Bit 0 – FSTT0** Fast Start-up from WKUP Pin Enable

| Value | Description |
|---|---|
| 0 | The wake-up input (WKUP) has no effect on the PMC. |
| 1 | The wake-up input (WKUP) can trigger a fast restart signal to the PMC. |

### 32.22.20 PMC Fault Output Clear Register

**Name:** PMC_FOCR
**Offset:** 0x0078
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| | | | | | | | | FOCLR |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – FOCLR** Fault Output Clear
Clears the clock failure detector fault output.

### 32.22.21 PLL Charge Pump Current Register

**Name:** PMC_PLLICPR
**Offset:** 0x0080
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | IVCO_PLLU[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ICP_PLLU[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ICP_PLLA[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bits 25:24 – IVCO_PLLU[1:0]** Voltage Control Output Current PLL UTMI
Should be written to 0.

**Bits 17:16 – ICP_PLLU[1:0]** Charge Pump Current PLL UTMI
Should be written to 0.

**Bits 1:0 – ICP_PLLA[1:0]** Charge Pump Current
To optimize clock performance, this field must be programmed as specified in “PLL A Characteristics” in the Electrical Characteristics section.

### 32.22.22 PMC Write Protection Mode Register

**Name:** PMC_WPMR
**Offset:** 0x00E4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | WPKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x504D43 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See Register Write Protection for the list of registers that can be write-protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x504D43 (“PMC” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x504D43 (“PMC” in ASCII). |

### 32.22.23 PMC Write Protection Status Register

**Name:** PMC_WPSR
**Offset:** 0x00E8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of PMC_WPSR. |
| 1 | A write protection violation has occurred since the last read of PMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

### 32.22.24 PMC Peripheral Clock Enable Register 1

**Name:** PMC_PCER1
**Offset:** 0x0100
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PID63 | PID62 | PID61 | PID60 | PID59 | PID58 | PID57 | PID56 |

PID32 to PID63 refer to identifiers as defined in the section “Peripheral Identifiers”. Programming the control bits of the Peripheral ID that are not implemented has no effect on the behavior of the PMC.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the corresponding peripheral clock. |

### 32.22.25 PMC Peripheral Clock Disable Register 1

**Name:** PMC_PCDR1
**Offset:** 0x0104
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Disable
PID32 to PID63 refer to identifiers as defined in the section “Peripheral Identifiers”.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the corresponding peripheral clock. |

### 32.22.26 PMC Peripheral Clock Status Register 1

**Name:** PMC_PCSR1
**Offset:** 0x0108
**Reset:** 0x00000000
**Property:** Read-only

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx** Peripheral Clock x Status
PID32 to PID63 refer to identifiers as defined in the section “Peripheral Identifiers”.

| Value | Description |
|---|---|
| 0 | The corresponding peripheral clock is disabled. |
| 1 | The corresponding peripheral clock is enabled. |

### 32.22.27 PMC Peripheral Control Register

**Name:** PMC_PCR
**Offset:** 0x010C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 29 – GCKEN** Generic Clock Enable

| Value | Description |
|---|---|
| 0 | The selected generic clock is disabled. |
| 1 | The selected generic clock is enabled. |

**Bit 28 – EN** Enable

| Value | Description |
|---|---|
| 0 | The selected peripheral clock is disabled. |
| 1 | The selected peripheral clock is enabled. |

**Bits 27:20 – GCKDIV[7:0]** Generic Clock Division Ratio
Generic clock is: selected clock period divided by GCKDIV + 1. GCKDIV must not be changed while the peripheral selects GCLK (e.g., bit rate, etc.).

**Bit 12 – CMD** Command

| Value | Description |
|---|---|
| 0 | Read mode |
| 1 | Write mode |

**Bits 10:8 – GCKCSS[2:0]** Generic Clock Source Selection

| Value | Name | Description |
|---|---|---|
| 0 | SLOW_CLK | Slow clock is selected. |
| 1 | MAIN_CLK | Main clock is selected. |
| 2 | PLLA_CLK | PLLACK is selected. |
| 3 | UPLL_CLK | UPLL Clock is selected. |
| 4 | MCK_CLK | Master Clock is selected. |
| 5 | AUDIO_CLK | Audio PLL clock is selected. |

**Bits 6:0 – PID[6:0]** Peripheral ID
Peripheral ID selection from PID2 to the maximum PID number. This refers to identifiers as defined in the section “Peripheral Identifiers”.

### 32.22.28 PMC Oscillator Calibration Register

**Name:** PMC_OCR
**Offset:** 0x0110
**Reset:** 0x00404040
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Reset | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 7 – SEL** Selection of RC Oscillator Calibration Bits

| Value | Description |
|---|---|
| 0 | Factory determined value. |
| 1 | Value written by user in CAL field of this register. |

**Bits 6:0 – CAL[6:0]** 12 MHz RC Oscillator Calibration Bits
Calibration bits applied to the RC oscillator when SEL is set.

### 32.22.29 PMC SleepWalking Enable Register 0

**Name:** PMC_SLPWK_ER0
**Offset:** 0x0114
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

**Bits 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 – PIDx** Peripheral x SleepWalking Enable
Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The clock of the peripheral must be enabled before using its asynchronous partial wake-up (SleepWalking) function (its associated PIDx field in ISCCK: ISC Clock Status or PMC Peripheral Clock Status Register 1 is set to ‘1’).

The values for PIDx are defined in section “Peripheral Identifiers”.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The asynchronous partial wake-up (SleepWalking) function of the corresponding peripheral is enabled. |

### 32.22.30 PMC SleepWalking Disable Register 0

**Name:** PMC_SLPWK_DR0
**Offset:** 0x0118
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 – PIDx** Peripheral x Activity Status
Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.
All other PIDs are always read at 0.

The values for PIDx are defined in the section “Peripheral Identifiers”.

| Value | Description |
|---|---|
| 0 | The peripheral x is not presently active. The asynchronous partial wake-up (SleepWalking) function can be activated. |
| 1 | The peripheral x is presently active. The asynchronous partial wake-up (SleepWalking) function must not be activated. |

### 32.22.33 PMC SleepWalking Enable Register 1

**Name:** PMC_SLPWK_ER1
**Offset:** 0x0134
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

The clock of the peripheral must be enabled before using its asynchronous partial wake-up (SleepWalking) function (the associated PIDx field in PMC Peripheral Clock Status Register 1 or ISCCK: ISC Clock Status is set to ‘1’).

The values for PIDx are defined in the section “Peripheral Identifiers”.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: The asynchronous partial wake-up (SleepWalking) function of the corresponding peripheral is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 28 – SLPWKSR** SleepWalking Status Register
Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

| Value | Description |
|---|---|
| 0 | The asynchronous partial wake-up (SleepWalking) function of the peripheral is disabled. |
| 1 | The asynchronous partial wake-up (SleepWalking) function of the peripheral is enabled. |

**Bit 16 – ASR** Activity Status Register
Not all PIDs can be configured with asynchronous partial wake-up.

Only the following PIDs can be configured with asynchronous partial wake-up: FLEXCOMx, SPIx, TWIx, UARTx and ADC.

| Value | Description |
|---|---|
| 0 | The peripheral x is not currently active; the asynchronous partial wake-up (SleepWalking) function can be activated. |
| 1 | The peripheral x is currently active; the asynchronous partial wake-up (SleepWalking) function must not be activated. |

**Bit 12 – CMD** Command

| Value | Description |
|---|---|
| 0 | Read mode |
| 1 | Write mode |

**Bits 6:0 – PID[6:0]** Peripheral ID
Peripheral ID selection from PID2 to the maximum PID number. This refers to identifiers as defined in the section “Peripheral Identifiers”.

### 32.22.39 PMC Audio PLL Control Register 0

**Name:** PMC_AUDIO_PLL0
**Offset:** 0x014C
**Reset:** 0x000000D0
**Property:** Read/Write

**Bits 29:28 – DCO_GAIN[1:0]** Digitally Controlled Oscillator Gain Selection
For optimization, the value of this field must be configured to 0.

**Bits 27:24 – DCO_FILTER[3:0]** Digitally Controlled Oscillator Filter Selection
For optimization, the value of this field must be configured to 0.

**Bits 22:16 – QDPMC[6:0]** Output Divider Ratio for PMC Clock
$f_{pmc} = f_{ref} \times ((ND + 1) + FRACR \div 2^{22}) / (QDPMC + 1)$

**Bits 14:8 – ND[6:0]** Loop Divider Ratio

**Bits 7:4 – PLLFLT[3:0]** PLL Loop Filter Selection
Default value should be 13 (0xD).

**Bit 3 – RESETN** Audio PLL Reset

| Value | Description |
|---|---|
| 0 | The audio PLL is in reset state. |
| 1 | The audio PLL is in active state. |

**Bit 2 – PMCEN** PMC Clock Enable

| Value | Description |
|---|---|
| 0 | The output clock of the audio PLL is not sent to the PMC. |
| 1 | The output clock of the audio PLL is sent to the PMC. |

**Bit 1 – PADEN** Pad Clock Enable

| Value | Description |
|---|---|
| 0 | The external audio pin CLK_AUDIO is driven low. |
| 1 | The external audio pin CLK_AUDIO is driven by AUDIOPINCLK. |

**Bit 0 – PLLEN** PLL Enable

| Value | Description |
|---|---|
| 0 | The Audio PLL is disabled. |
| 1 | The Audio PLL is enabled |

### 32.22.40 PMC Audio PLL Control Register 1

# 33. Parallel Input/Output Controller (PIO)

## 33.1 Description

The Parallel Input/Output Controller (PIO) manages up to 128 fully programmable input/output lines. Each I/O line may be dedicated as a general purpose I/O or be assigned to a function of an embedded peripheral. This ensures effective optimization of the pins of the product.

Each I/O line of the PIO Controller features:

- An input change interrupt enabling level change detection on any I/O line
- Rising edge, falling edge, both edge, low-level or high-level detection on any I/O line
- A glitch filter providing rejection of glitches lower than one-half of PIO clock cycle
- A debouncing filter providing rejection of unwanted pulses from key or push button operations
- Multi-drive capability similar to an open drain I/O line
- Control of the pull-up and pull-down of the I/O line
- Input visibility and output control
- Secure or Non-Secure management of the I/O line

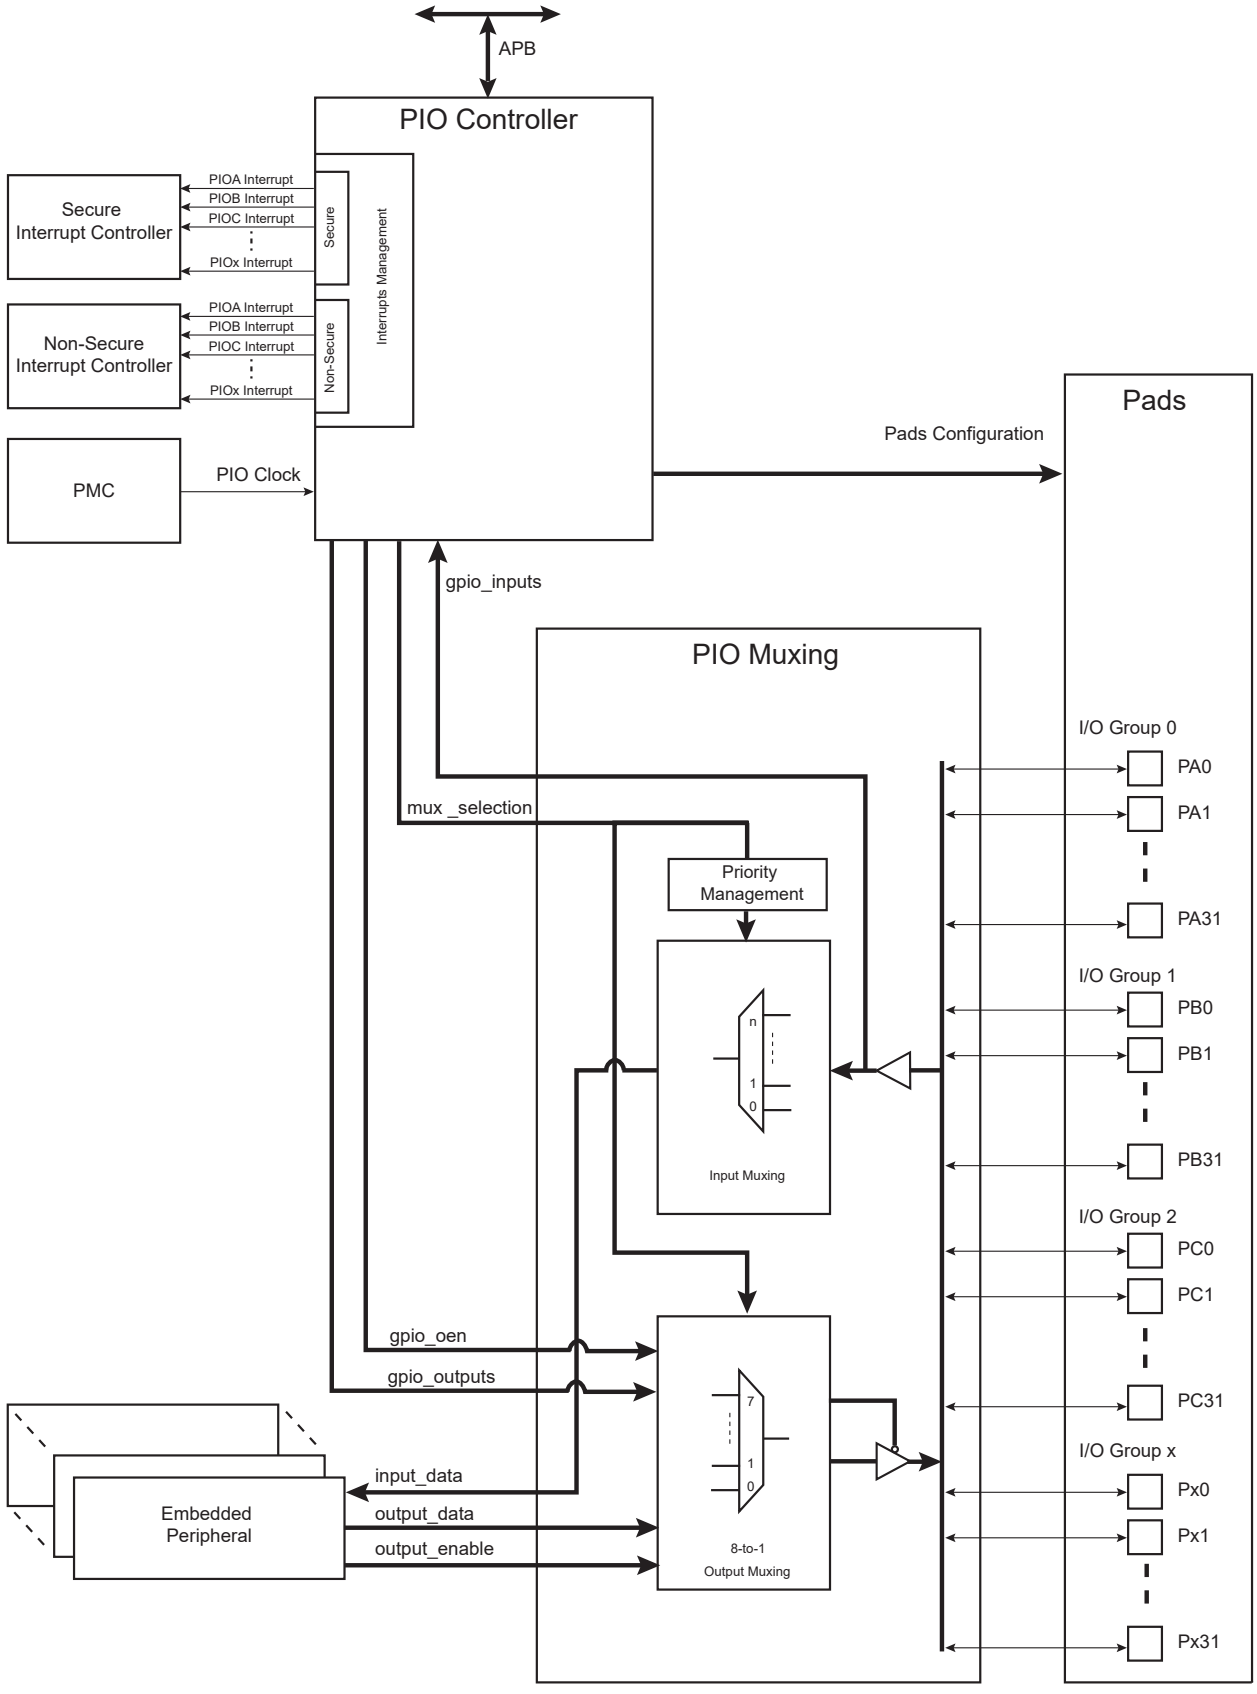
The PIO Controller also features a synchronous output providing up to 32 bits of data output in a single write operation.

## 33.2 Embedded Characteristics

- Up to 128 Programmable I/O Lines
- Multiplexing of up to 6 Peripheral Functions per I/O Line
- For each I/O Line (whether assigned to a peripheral or used as general purpose I/O):
  - Input Change Interrupt
  - Programmable Glitch Filter
  - Programmable Debouncing Filter
  - Multi-drive Option Enables Driving in Open Drain
  - Programmable Pull-Up/Pull-Down on Each I/O Line
  - Pin Data Status Register, Supplies Visibility of the Level on the Pin at Any Time
  - Programmable Event: Rising Edge, Falling Edge, Both edge, Low-Level or High-Level
  - Configuration Lock by the Connected Peripheral
  - Security management of each I/O line
  - Programmable Configuration Lock (Active Until Next $V_{DDCORE}$ Reset) to protect Against Further Software Modifications (intentional or unintentional)
- Register Write Protection against unintentional software modifications:
  - One configuration bit to enable or disable protection of I/O line settings
  - One configuration bit to enable or disable protection of interrupt settings
- Synchronous Output, possibility to set or clear simultaneously up to 32 I/O Lines in a Single Write
- Programmable Schmitt Trigger Inputs
- Programmable I/O Drive

## 33.3 Block Diagram

**Figure 33-1. Block Diagram**



**Note:**

1. x = 3 (the number of I/O groups is 4).
2. n depends on the number of I/O lines affected to the IP input.

## 33.4 Product Dependencies

### 33.4.1 Pin Multiplexing

Each pin is configurable, depending on the product, as either a general purpose I/O line only, or as an I/O line multiplexed with up to 6 peripheral I/Os. As the multiplexing is hardware defined and thus product-dependent, the hardware designer and programmer must carefully determine the configuration of the PIO Controllers required by their application. When an I/O line is general purpose only, i.e., not multiplexed with any peripheral I/O, programming of the PIO Controller regarding the assignment to a peripheral has no effect and only the PIO Controller can control how the pin is driven by the product.

### 33.4.2 External Interrupt Lines

The interrupt signals FIQ and IRQ0 to IRQn are multiplexed through the PIO Controllers.

### 33.4.3 Power Management

The Power Management Controller (PMC) controls the PIO Controller clock in order to save power. Writing any of the registers of the user interface does not require the PIO Controller clock to be enabled. This means that the configuration of the I/O lines does not require the PIO Controller clock to be enabled.

However, when the clock is disabled, not all of the features of the PIO Controller are available, including glitch filtering. Note that the input change interrupt, the interrupt modes on a programmable event and the read of the pin level require the clock to be validated.

After a hardware reset, the PIO clock is disabled by default.

The user must configure the PMC before any access to the input line information.

### 33.4.4 Interrupt Generation

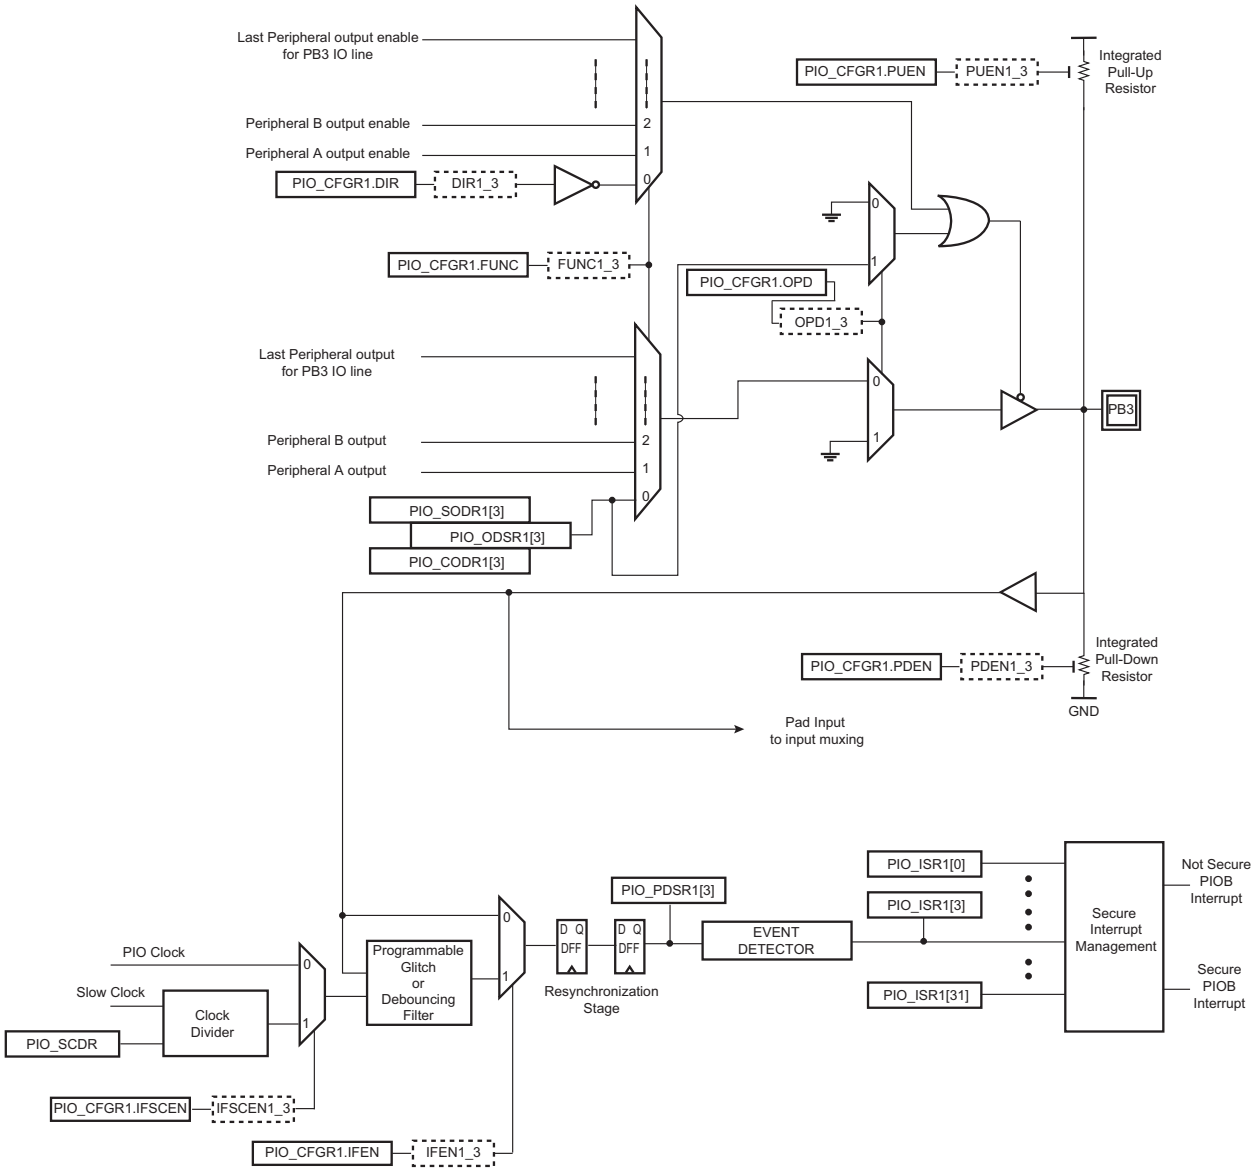
For interrupt handling, the PIO Controllers are considered as user peripherals. This means that the PIO Controller interrupt lines are connected among the interrupt sources. The PIO Controller supplies one interrupt signal per I/O group. Refer to the PIO Controller peripheral identifier in the product description to identify the interrupt sources dedicated to the PIO Controller. The PIO Controller can target either the Secure or Non-Secure Interrupt Controller according to security level of the I/O line which triggers the interruption. Using the PIO Controller requires the Interrupt Controller to be programmed first.

The PIO Controller interrupt can be generated only if the PIO Controller clock is enabled.

## 33.5 Functional Description

The PIO Controller features up to 512 fully-programmable I/O lines. Most of the control logic associated to each I/O is represented in the following figure, where the I/O line 3 of the PIOB (PB3) is described as an example. In this description each signal shown represents one of up to 512 possible indexes.

**Figure 33-2. I/O Line Control Logic**



### 33.5.1 I/O Line Configuration Method

The user interface of the PIO Controller provides several sets of registers. Each set of registers interfaces with one I/O group.

**Table 33-1. I/O Group List**

| I/O Group Number | PIO |
|---|---|
| 0 | PIOA |
| 1 | PIOB |
| ... | ... |
| 3 | PIOD |

#### 33.5.1.1 Security Management

The user must first define the security level of the I/O line. Each I/O line of each I/O group can be defined as either secure or non-secure lines. Each I/O line of the I/O group x can be set as non-secure I/O line by writing a 1 to the corresponding bit P0–P31 of the Secure PIO Set I/O Non-Secure register (S_PIO_SIONRx) of the I/O group x.

To define an I/O line of I/O group x as a secure I/O line, write a 1 to the corresponding bit P0–P31 of the Secure PIO Set I/O Secure register (S_PIO_SIOSRx) of the I/O group x.

Examples:

Setting the I/O line PC4 as non-secure line:

Write the value 16 (bit No. 4 at 1) at address 0x10B0 (S_PIO_SIONR2)

Setting the I/O line PB3 as secure line:

Write the value 8 (bit No. 3 at 1) at address 0x1074 (S_PIO_SIOSR1)

The security level of each I/O line is reported by the Secure PIO I/O Security Status register (S_PIO_IOSSRx) of the corresponding I/O group. Reading 0 at the corresponding bit P0–P31 means that the corresponding I/O line of the I/O group is defined as secure. Reading 1 means that this I/O line of the I/O group is non-secure.

The PIO Controller user interface is divided into two register mapping areas:

- The Non-Secure area, located from address 0x0 to 0x1000, can be accessed by any master (Secure or Non-Secure master). This area interfaces with all the I/O lines defined as non-secure. Trying to access to an I/O line defined as secure through this area will have no effect on I/O line and read values will be 0.
- The Secure area, located above address 0xSEC_GRP_MSB000, can only be accessed by a Secure master (if the PIO Controller is defined as secure at the HMATRIX level). This area interfaces with all the I/O lines defined as secure. Trying to access to an I/O line defined as non-secure through this area will have no effect on I/O line and read values will be 0.

#### 33.5.1.2 Programming I/O Line Configuration

The user must first define which I/O line in the group will be targeted by writing a 1 to the corresponding bit in the PIO Mask Register (PIO_MSKRx). Several I/O lines in an I/O group can be configured at the same time by setting the corresponding bits in PIO_MSKRx. Then, writing the PIO Configuration Register (PIO_CFGRx) apply the configuration to the I/O line(s) defined in PIO_MSKRx. All the I/O lines defined as secure in the S_PIO_SIOSRx must be configured by writing the S_PIO_CFGRx and S_PIO_MSKRx registers.

For more details concerning the I/O line configuration using PIO_MSKRx and PIO_CFGRx, see section I/O Lines Programming Example.

#### 33.5.1.3 Reading the I/O Line Configuration

As for programming operation, reading configuration requires the user to first define which I/O line in the group x will be targeted by writing a 1 to the corresponding bit in the PIO Mask Register (PIO_MSKRx). The value of the targeted I/O line is read in PIO_CFGRx.

If several bits are set in PIO_MSKRx, then the read configuration in PIO_CFGRx is the configuration of the I/O line with the lowest index.

Note that S_PIO_MSKRx and S_PIO_CFGRx must be used to read the configuration of a secure I/O line.

### 33.5.2 Pull-up and Pull-down Resistor Control

Each I/O line is designed with an embedded pull-up resistor and an embedded pull-down resistor.

The pull-up resistor on the I/O line(s) defined in PIO_MSKRx can be enabled by setting the PUEN bit in PIO_CFGRx. Clearing the PUEN bit in PIO_CFGRx disables the pull-up resistor of I/O lines defined in PIO_MSKRx.

The pull-down resistor on the I/O line(s) defined in PIO_MSKRx can be enabled by setting the PDEN bit in PIO_CFGRx. Clearing the PDEN bit in PIO_CFGRx disables the pull-down resistor of I/O lines defined in PIO_MSKRx.

If both PUEN and PDEN bit are set in PIO_CFGRx, only the pull-up resistor is enabled for I/O line(s) defined in PIO_MSKRx and the PDEN bit is discarded.

Control of the pull-up resistor is possible regardless of the configuration of the I/O line (Input, Output, Open-drain).

Note that S_PIO_MSKRx and S_PIO_CFGRx must be used to program the pull-up or pull-down configuration of a secure I/O line.

For more details concerning Pull-up and Pull-down configuration, see PIO Configuration Register or Secure PIO Configuration Register for secure I/O line configuration.

The reset value of PUEN and PDEN bits of each I/O line is defined at the product level and depends on the multiplexing of the device.

### 33.5.3 General Purpose or Peripheral Function Selection

The PIO Controller provides multiplexing of up to 6 peripheral functions on a single pin. The selection is performed by writing the FUNC field in PIO_CFGRx. The selected function is applied to the I/O line(s) defined in PIO_MSKRx.

When FUNC is 0, no peripheral is selected and the General Purpose PIO (GPIO) mode is selected (in this mode, the I/O line is controlled by the PIO Controller).

When FUNC is not 0, the peripheral selected to control the I/O line depends on the FUNC value.

Note that S_PIO_MSKRx and S_PIO_CFGRx must be used to program the FUNC field of a secure I/O line.

For more details, see PIO Configuration Register or Secure PIO Configuration Register for secure I/O line configuration.

Note that multiplexing of peripheral lines affects both input and output peripheral lines. When a peripheral is not selected on any I/O line, its inputs are assigned with constant default values defined at the product level. The user must ensure that only one I/O line is affected to a peripheral input at a time.

The reset value of the FUNC field of each I/O line is defined at the product level and depends on the multiplexing of the device.

### 33.5.4 Output Control

When the I/O line is assigned to a peripheral function, i.e., the corresponding FUNC field of the line configuration is not 0, the drive of the I/O line is controlled by the peripheral. According to the FUNC value, the selected peripheral determines whether the pin is driven or not.

When the FUNC field of a I/O line is 0, then the I/O line is set in General Purpose mode and the I/O line can be configured to be driven by the PIO Controller instead of the peripheral.

If the DIR bit of the I/O line configuration (PIO_CFGRx) is set (OUTPUT) then the I/O line can be driven by the PIO Controller. The level driven on an I/O line can be determined by writing in the PIO Set Output Data Register (PIO_SODRx) and the PIO Clear Output Data Register (PIO_CODRx). These write operations, respectively, set and clear the PIO Output Data Status Register (PIO_ODSRx), which represents the data driven on the I/O lines. Writing PIO_ODSRx directly is possible and only affects the I/O line set to 1 in PIO_MSKRx (see Synchronous Data Output).

When the DIR bit of the I/O line configuration is at zero, the corresponding I/O line is used as an input only.

The DIR bit has no effect if the corresponding line is assigned to a peripheral function, but writing the DIR bit is managed whether the pin is configured to be controlled by the PIO Controller or assigned to a peripheral function. This enables configuration of the I/O line prior to setting it to be managed by the PIO Controller.

Similarly, writing in PIO_SODRx and PIO_CODRx affects PIO_ODSRx. This is important as it defines the first level driven on the I/O line.

### 33.5.5 Synchronous Data Output

Clearing one or more PIO line(s) and setting another one or more PIO line(s) synchronously cannot be done by using PIO_SODRx and PIO_CODRx. It requires two successive write operations into two different registers. To overcome this, the PIO Controller offers a direct control of PIO outputs by single write access to PIO_ODSRx. Only I/O lines set to 1 in PIO_MSKRx are written.

### 33.5.6 Open-Drain Mode

Each I/O can be independently programmed in Open-Drain mode. This feature permits several drivers to be connected on the I/O line which is driven low only by each device. An external pull-up resistor (or enabling of the internal one) is generally required to guarantee a high level on the line.

The Open-Drain mode is controlled by the OPD bit in the I/O line configuration (PIO_CFGRx). An I/O line is switched in Open-Drain mode by setting the PIO_CFGRx.OPD bit. The Open-Drain mode can be selected if the I/O line is not controlled by a peripheral (the FUNC field must be cleared in PIO_CFGRx).

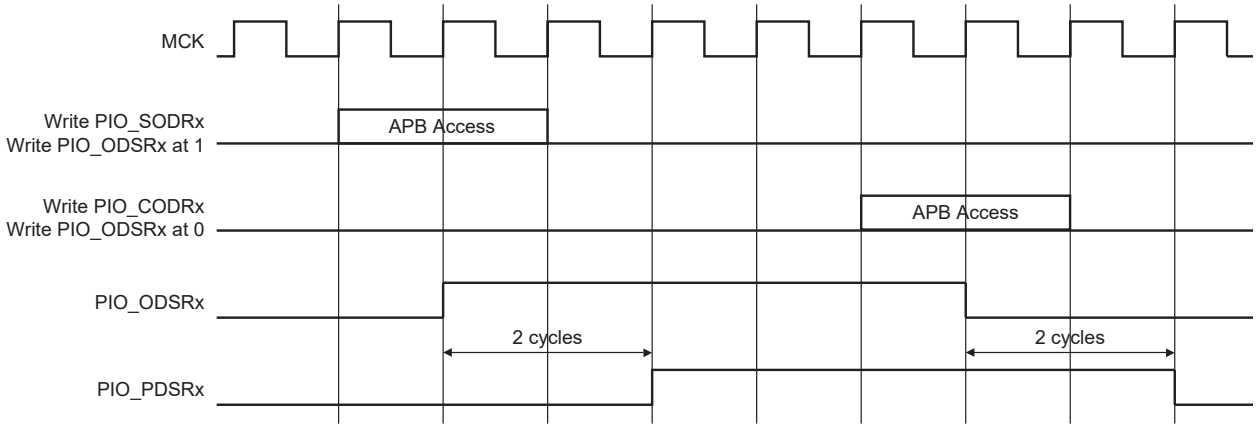
For more details concerning the Open-Drain mode, see PIO Configuration Register or Secure PIO Configuration Register for secure I/O line configuration.

After reset, the OPD bit of each I/O line is defined at the product level and depends on the multiplexing of the device.

### 33.5.7 Output Line Timings

The figure below shows how the outputs are driven either by writing PIO_SODRx or PIO_CODRx, or by directly writing PIO_ODSRx. This last case is valid only if the corresponding bit in PIO_MSKRx is set. The figure also shows when the feedback in the Pin Data Status Register (PIO_PDSRx) is available.

**Figure 33-3. Output Line Timings**



### 33.5.8 Inputs

The level on each I/O line of the I/O group x can be read through PIO_PDSRx. This register indicates the level of the I/O lines regardless of their configuration, whether uniquely as an input, or driven by the PIO Controller, or driven by a peripheral.

Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO_PDSRx reads the levels present on the I/O line at the time the clock was disabled.

### 33.5.9 Input Glitch and Debouncing Filters

Optional input glitch and debouncing filters are independently programmable on each I/O line.

The glitch filter can filter a glitch with a duration of less than 1/2 master clock (MCK) and the debouncing filter can filter a pulse of less than 1/2 period of a programmable divided slow clock.

The selection between glitch filtering or debounce filtering is done by writing the bit IFSCEN in the PIO Configuration Register (PIO_CFGRx). The selected filtering mode is applied to the I/O line(s) defined in PIO_MSKRx.

- If IFSCEN = 0: The glitch filter can filter a glitch with a duration of less than 1/2 master clock period.
- If IFSCEN = 1: The debouncing filter can filter a pulse with a duration of less than 1/2 programmable divided slow clock period.

For the debouncing filter, the period of the divided slow clock is performed by writing in the DIV field of the Secure PIO Slow Clock Divider Debouncing Register (S_PIO_SCDR): $t_{div_slck} = ((DIV + 1) \times 2) \times t_{slck}$.

When the glitch or debouncing filter is enabled, a glitch or pulse with a duration of less than 1/2 selected clock cycle (selected clock represents MCK or divided slow clock depending on IFSCEN bit programming) is automatically rejected, while a pulse with a duration of one selected clock (MCK or divided slow clock) cycle or more is accepted. For pulse durations between 1/2 selected clock cycle and one selected clock cycle, the pulse may or may not be taken into account, depending on the precise timing of its occurrence. Thus for a pulse to be visible, it must exceed one selected clock cycle, whereas for a glitch to be reliably filtered out, its duration must not exceed 1/2 selected clock cycle.

The filters also introduce some latencies, illustrated in the figures below .

The glitch filter of each I/O lines is controlled by the IFEN bit of the PIO Configuration Register (PIO_CFGRx). Setting the PIO_CFGRx.IFEN bit enables the glitch filter of the I/O line(s) defined in PIO_MSKRx.

When the glitch and/or debouncing filter is enabled, it does not modify the behavior of the inputs on the peripherals. It acts only on the value read in PIO_PDSRx and on the input change interrupt detection. The glitch and debouncing filters require that the PIO Controller clock is enabled.

**Figure 33-4. Input Glitch Filter Timing**

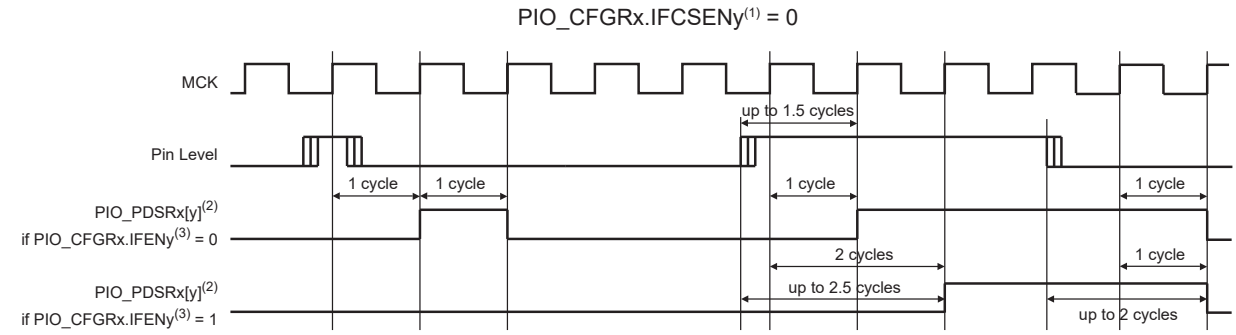


**Figure 33-5. Input Debouncing Filter Timing**

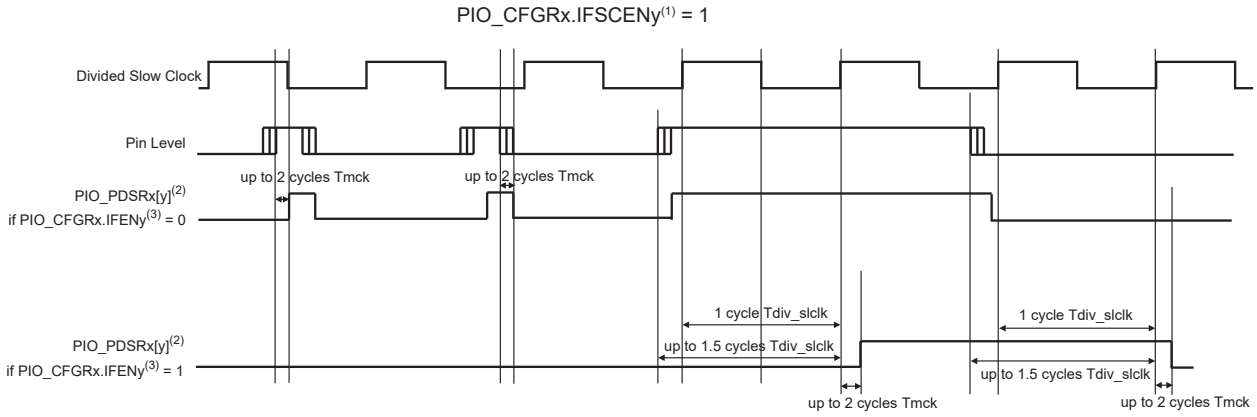


**Note:**

1. Means IFCSEN bit of the I/O line y of the I/O group x.
2. Means PIO Data Status value of the I/O line y of the I/O group x.
3. Means IFEN bit of the I/O line y of the I/O group x.

### 33.5.10 Input Edge/Level Interrupt

Each I/O group can be programmed to generate an interrupt when it detects an edge or a level on an I/O line. The Input Edge/Level interrupts are controlled by writing the PIO Interrupt Enable Register (PIO_IERx) and the PIO Interrupt Disable Register (PIO_IDRx), which enable and disable the input change interrupt respectively by setting and clearing the corresponding bit in the PIO Interrupt Mask Register (PIO_IMRx). For the Secure I/O lines, the Input Edge/Level interrupts are controlled by writing S_PIO_IERx and S_PIO_IDRx, which enable and disable input change interrupts respectively by setting and clearing the corresponding bit in the S_PIO_IMRx. As input change detection is possible only by comparing two successive samplings of the input of the I/O line, the PIO Controller clock must be enabled. The Input Change interrupt is available regardless of the configuration of the I/O line, i.e., configured as an input only, controlled by the PIO Controller or assigned to a peripheral function.

Each I/O group can generate a Non-Secure interrupt and a Secure interrupt according to the security level of the I/O line which triggers the interrupt.

According to the EVTSEL field value in the PIO Configuration Register (PIO_CFGRx) or the Secure PIO Configuration Register (S_PIO_CFGRx) in case of a Secure I/O line, the interrupt signal of the I/O group x can be generated on the following occurrence:

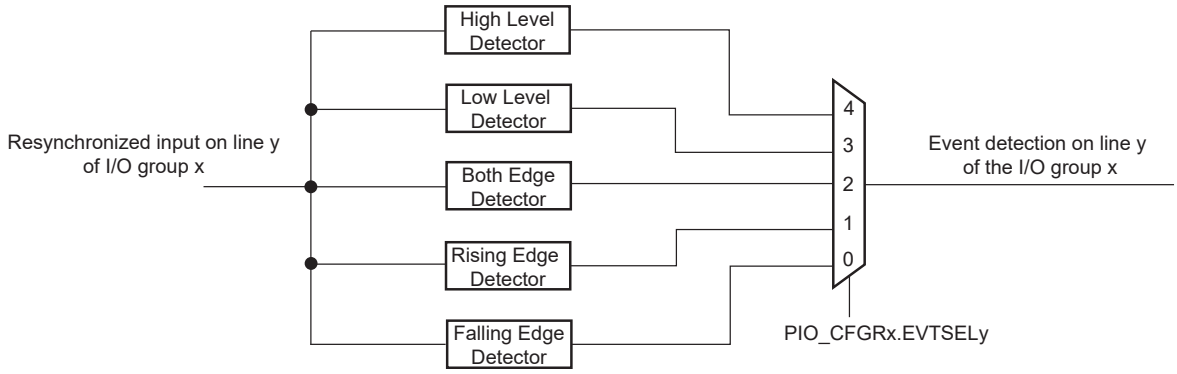
- (S_)PIO_CFGRx.EVTSELy = 0: The interrupt signal of the I/O group x is generated on the I/O line y falling edge detection (assuming that (S_)PIO_IMRx[y] = 1).
- (S_)PIO_CFGRx.EVTSELy = 1: The interrupt signal of the I/O group x is generated on the I/O line y rising edge detection (assuming that (S_)PIO_IMRx[y] = 1).
- (S_)PIO_CFGRx.EVTSELy = 2: The interrupt signal of the I/O group x is generated on the I/O line y both rising and falling edge detection (assuming that (S_)PIO_IMRx[y] = 1).
- (S_)PIO_CFGRx.EVTSELy = 3: The interrupt signal of the I/O group x is generated on the I/O line y low level detection (assuming that (S_)PIO_IMRx[y] = 1).
- (S_)PIO_CFGRx.EVTSELy = 4: The interrupt signal of the I/O group x is generated on the I/O line y high level detection (assuming that (S_)PIO_IMRx[y] = 1).

By default, the interrupt can be generated at any time a falling edge is detected on the input.

When an input edge or level is detected on an I/O line, the corresponding bit in the PIO Interrupt Status Register (PIO_ISRx), or in the Secure PIO Interrupt Status Register (S_PIO_ISRx) if the I/O line is Secure, is set. For a Non-Secure I/O line, if the corresponding bit in PIO_IMRx is set, the PIO Controller Non-Secure interrupt line of the I/O group x is asserted. For a Secure I/O line, if the corresponding bit in S_PIO_IMRx is set, the PIO Controller Secure interrupt line of the I/O group x is asserted.

When the software reads PIO_ISRx, all the Non-Secure interrupts of the I/O group x are automatically cleared. When the software reads S_PIO_ISRx, all the Secure interrupts of the I/O group x are automatically cleared. This signifies that all the interrupts that are pending when PIO_ISRx or S_PIO_ISRx is read must be handled. When an Interrupt is enabled on a “level”, the interrupt is generated as long as the interrupt source is not cleared, even if some read accesses in PIO_ISRx or S_PIO_ISRx are performed.

**Figure 33-6. Event Detector on Input Lines**



Example of interrupt generation on following lines:

- Rising edge on the Secure PIO line 0 of the I/O group 0 (PIOA)
- Low-level edge on the Secure PIO line 1of the I/O group 0 (PIOA)
- Rising edge on the Secure PIO line 2 of the I/O group 0 (PIOA)
- High-level on the Secure PIO line 3 of the I/O group 0 (PIOA)
- Low-level on the Non-Secure PIO line 4 of the I/O group 0 (PIOA)
- High-level on the Secure PIO line 0 of the I/O group 1 (PIOB)
- Falling edge on the Secure PIO line 1 of the I/O group 1 (PIOB)

© 2018 Microchip Technology Inc.

- Rising edge on the Secure PIO line 2 of the I/O group 1 (PIOB)
- Any edge on the other Non-Secure lines of the I/O group 1 (PIOB)

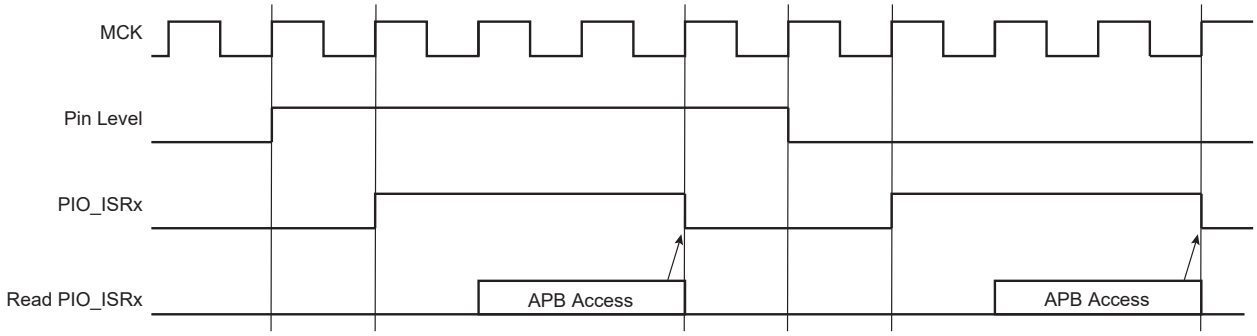
The table below details the required configuration for this example.

**Table 33-2. Configuration for Example Interrupt Generation**

| Configuration | Name |
|---|---|
| PIOA: I/O line security level | Define the I/O lines 0 to 3 of the PIOA as Secure by writing 32'h0000_000F in the S_PIO_SIOSR0 (offset 0x1034)<br>Define the I/O lines 4 of the PIOA as Non-Secure by writing 32'h0000_0010 in the S_PIO_SIONR0 (offset 0x1030) |
| PIOA: Interrupt Mode | Enable interrupt sources for lines 0 to 3 of PIOA by writing 32'h0000_000F in S_PIO_IER0 (offset 0x1020)<br>Enable interrupt source for the line 4 of PIOA by writing 32'h0000_0010 in PIO_IER0 (offset 0x20) |
| PIOA: Event Selection | Configure Rising Edge detection for Secure lines 0 and 2:<br>Write 32'h0000_0005 in S_PIO_MSKR0 (offset 0x1000)<br>Write 32'h0100_0000 in S_PIO_CFGR0 (offset 0x1004) |
| | Configure Low Level detection for Secure line 1:<br>Write 32'h0000_0002 in S_PIO_MSKR0 (offset 0x1000)<br>Write 32'h0300_0000 in S_PIO_CFGR0 (offset 0x1004) |
| | Configure High Level detection for Secure line 3:<br>Write 32'h0000_0008 in S_PIO_MSKR0 (offset 0x1000)<br>Write 32'h0400_0000 in S_PIO_CFGR0 (offset 0x1004) |
| | Configure Low Level detection for Non-Secure line 4:<br>Write 32'h0000_0010 in PIO_MSKR0 (offset 0x0)<br>Write 32'h0300_0000 in PIO_CFGR0 (offset 0x4) |
| PIOB: I/O line security level | Define the I/O lines 0 to 2 of the PIOB as Secure by writing 32'h0000_0007 in the S_PIO_SIOSR1 (offset 0x1074)<br>Define the other I/O lines of the PIOB as Non-Secure by writing 32'hFFFF_FFF8 in the S_PIO_SIONR1 (offset 0x1070) |
| PIOB: Interrupt Mode | Enable interrupt sources for lines 0 to 2 of PIOB by writing 32'h0000_0007 in S_PIO_IER1 (offset 0x1060)<br>Enable interrupt sources for all other lines of PIOB by writing 32'hFFFF_FFF8 in PIO_IER1 (offset 0x60) |

| .....continued | |
|---|---|
| **Configuration** | **Name** |
| PIOB: Event Selection | Configure High Level detection for Secure line 0:<br>Write 32'h0000_0001 in S_PIO_MSKR1 (offset 0x1040)<br>Write 32'h0400_0000 in S_PIO_CFGR1 (offset 0x1044) |
| | Configure Falling Edge detection for Secure line 1:<br>Write 32'h0000_0002 in S_PIO_MSKR1 (offset 0x1040)<br>Write 32'h0000_0000 in S_PIO_CFGR1 (offset 0x1044) |
| | Configure Rising Edge detection for Secure line 2:<br>Write 32'h0000_0004 in S_PIO_MSKR1 (offset 0x1040)<br>Write 32'h0100_000 in S_PIO_CFGR1 (offset 0x1044) |
| | Configure Low Level detection for Non-Secure lines:<br>Write 32'hFFFF_FFF8 in PIO_MSKR1 (offset 0x40)<br>Write 32'h0200_000 in PIO_CFGR1 (offset 0x44) |

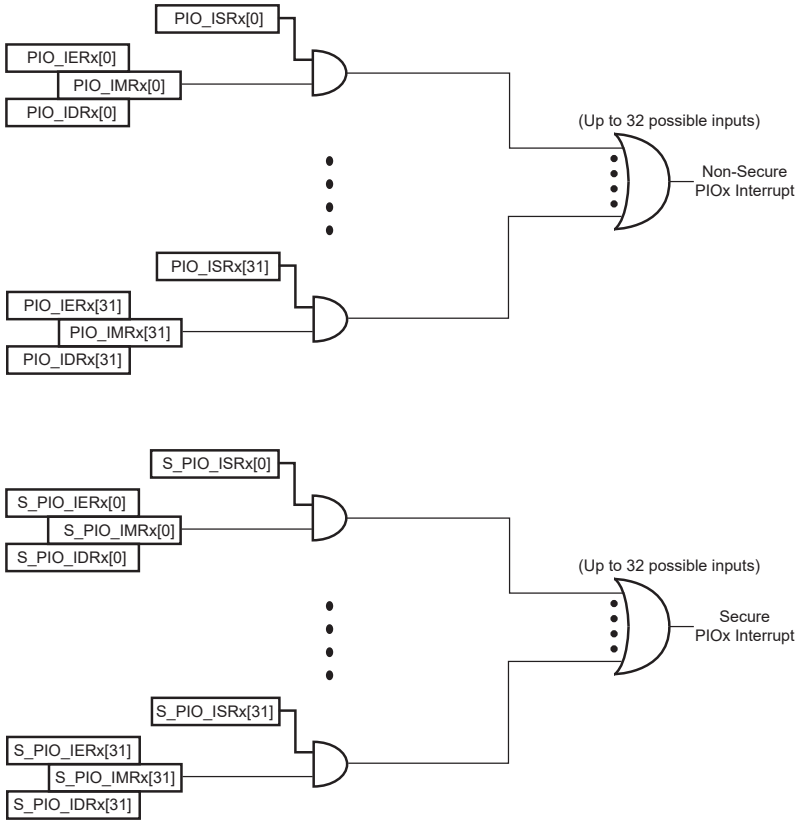
**Figure 33-7. Input Change Interrupt Timings When No Additional Interrupt Modes**



### 33.5.11 Interrupt Management

The PIO Controller can drive one secure interrupt signal and one non-secure interrupt signal per I/O group (refer to the block diagram). Secure interrupt signals are connected to the secure interrupt controller of the system. Non-secure interrupt signals are connected to the non-secure interrupt controller of the system.

**Figure 33-8. PIO Interrupt Management**



### 33.5.12 I/O Lines Lock

When an I/O line is controlled by a peripheral (particularly the Pulse Width Modulation Controller PWM), it can become locked by the action of this peripheral via an input of the PIO Controller. When an I/O line is locked, the following fields in PIO_CFGRx are locked and cannot be modified:

- FUNC: Peripheral selection cannot be changed when the corresponding I/O line is locked.
- PUEN: Pull-Up configuration cannot be changed when the corresponding I/O line is locked.
- PDEN: Pull-Down configuration cannot be changed when the corresponding I/O line is locked.
- OPD: Open Drain configuration cannot be changed when the corresponding I/O line is locked.

Writing to one of these fields while the corresponding I/O line is locked will have no effect.

The user can know at anytime which I/O line is locked by reading the PIO Lock Status Register (PIO_LOCKSR) or Secure PIO Lock Status Register (S_PIO_LOCKSR) for locked Secure I/O lines. Once an I/O line is locked, the only way to unlock it is to apply a hardware reset to the PIO Controller.

### 33.5.13 Programmable I/O Drive

It is possible to configure the I/O drive for pads PA0 to PD31. The I/O drive of the pad can be programmed by writing the DRVSTR field in the PIO Configuration Register (PIO_CFGRx) if the corresponding line is Non-Secure or the Secure PIO Configuration Register (S_PIO_CFGRx) if the I/O line is Secure. For any details, refer to the product electrical characteristics.

### 33.5.14 Programmable Schmitt Trigger

It is possible to configure each input for the Schmitt trigger. The Schmitt trigger can be enabled by setting the SCHMITT bit of the PIO Configuration Register (PIO_CFGRx) if the corresponding line is Non-Secure

or the Secure PIO Configuration Register (S_PIO_CFGRx) if the I/O line is Secure. By default the Schmitt trigger is active. Disabling the Schmitt trigger is requested when using the QTouch Library.

### 33.5.15 I/O Line Configuration Freeze

#### 33.5.15.1 Software Freeze

Once the I/O line configuration is done, it can be frozen by using the PIO I/O Freeze Configuration Register (PIO_IOFRx) of the corresponding group or the Secure PIO I/O Freeze Configuration Register (S_PIO_IOFRx) if the I/O line is Secure.

##### 33.5.15.1.1 Physical Freeze

Setting the FPHY bit of PIO_IOFRx freezes the following fields of the Non-Secure I/O lines defined in PIO_MSKRx:

- FUNC: I/O Line Function
- DIR: Direction
- PUEN: Pull-Up Enable
- PDEN: Pull-Down Enable
- OPD: Open-Drain
- SCHMITT: Schmitt Trigger
- DRVSTR: Drive Strength

For Secure I/O lines, use the FPHY bit of the S_PIO_IOFRx and the S_PIO_MSKRx to freeze the fields above.

When the physical freeze is currently active on an I/O line, the PCFS flag is set when reading the PIO_CFGRx of the I/O line (or the S_PIO_CFGRx if the I/O line is Secure).

Only a hardware reset can release fields listed above.

##### 33.5.15.1.2 Interrupt Freeze

Setting the FINT bit of the PIO_IOFRx will freeze the following fields of the Non-Secure I/O lines defined in the PIO_MSKRx:

- IFEN: Input Filter Enable
- IFSCEN: Input Filter Slow Clock Enable
- EVTSEL: Event Selection

For Secure I/O lines, use the FINT bit of the S_PIO_IOFRx and the S_PIO_MSKRx to freeze the fields above.

When the “Interrupt Freeze” is currently active on an I/O line, the ICFS flag is set when reading the PIO_CFGRx of the I/O line (or the S_PIO_CFGRx if the I/O line is Secure).

Only a hardware reset can release fields listed above.

### 33.5.16 Register Write Protection

To prevent any single software error from corrupting PIO behavior, certain registers in the address space can be write-protected by setting WPEN in the PIO Write Protection Mode Register (PIO_WPMR) or the Secure PIO Write Protection Mode Register (S_PIO_WPMR).

If a write access to a Non-Secure write-protected register is detected, the WPVS flag in the PIO Write Protection Status Register (PIO_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

If a write access to a Secure write-protected register is detected, the WPVS flag in the Secure PIO Write Protection Status Register (S_PIO_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The respective WPVS bit is automatically cleared after reading the PIO_WPSR or S_PIO_WPSR.

The following registers are write-protected when WPEN is set in PIO_WPMR:

- PIO Mask Register
- PIO Configuration Register

The following registers are write-protected when WPEN is set in S_PIO_WPMR:

- Secure PIO Mask Register
- Secure PIO Configuration Register
- Secure PIO Slow Clock Divider Debouncing Register

The following registers are write-protected when WPITEN is set in S_PIO_WPMR:

- Secure PIO Interrupt Enable Register
- Secure PIO Interrupt Disable Register

## 33.6 I/O Lines Programming Example

The programming example shown in the table below is used to obtain the following configurations:

- PIOA Configuration:
  - 4-bit output port on Secure I/O lines 0 to 3, open-drain, with pull-up resistor
  - Four output signals on Non-Secure I/O lines 4 to 7 (to drive LEDs for example), driven high and low, no pull-up resistor, no pull-down resistor
  - Secure I/O lines 16 to 19 assigned to peripheral A functions with pull-up resistor
  - Non-Secure I/O lines 20 to 23 assigned to peripheral B functions with pull-down resistor
- PIOB Configuration:
  - Four input signals on Secure I/O lines 0 to 3 (to read push-button states for example), with pull-up resistors, glitch filters and input change interrupts
  - Four input signals on Non-Secure I/O lines 12 to 15 to read an external device status (polled, thus no input change interrupt), no pull-up resistor, no glitch filter
  - Secure I/O lines 16 to 23 assigned to peripheral B functions with pull-down resistor
  - Non-Secure I/O lines 24 to 27 assigned to peripheral D with Input Change Interrupt, no pull-up resistor and no pull-down resistor

**Table 33-3. Programming Example**

| Action | Register | Value to be Written |
|---|---|---|
| PIOA: Set I/O lines 0 to 3 and 16 to 19 as Secure | S_PIO_SIOSR0 (offset 0x1034) | 0x000F_000F |
| PIOA: Set I/O lines 4 to 7 and 20 to 23 as Non-Secure | S_PIO_SIONR0 (offset 0x1030) | 0x00F0_00F0 |

.....continued

| Action | Register | Value to be Written |
|---|---|---|
| PIOA: 4-bit output port on Secure I/O lines 0 to 3, open-drain, with pull-up resistor | S_PIO_MSKR0 (offset 0x1000) | 0x0000_000F |
| | S_PIO_CFGR0 (offset 0x1004) | 0x0000_4300 |
| PIOA: Four output signals on Non-Secure I/O lines 4 to 7 (to drive LEDs for example), driven high and low, no pull-up resistor, no pull-down resistor | PIO_MSKR0 (offset 0x0) | 0x0000_00F0 |
| | PIO_CFGR0 (offset 0x4) | 0x0000_0100 |
| PIOA: Secure I/O lines 16 to 19 assigned to peripheral A functions with pull-up resistor | S_PIO_MSKR0 (offset 0x1000) | 0x000F_0000 |
| | S_PIO_CFGR0 (offset 0x1004) | 0x0000_0201 |
| PIOA: Non-Secure I/O lines 20 to 23 assigned to peripheral B functions with pull-down resistor | PIO_MSKR0 (offset 0x0) | 0x00F0_0000 |
| | PIO_CFGR0 (offset 0x4) | 0x0000_0402 |
| PIOB: Set I/O lines 0 to 3 and 16 to 23as Secure | S_PIO_SIOSR1 (offset 0x1074) | 0x00FF_000F |
| PIOB: Set I/O lines 12 to 15 and 24 to 27 as Non-Secure | S_PIO_SIONR1 (offset 0x1070) | 0x0F00_F000 |
| PIOB: Four input signals on Secure I/O lines 0 to 3 (to read push-button states for example), with pull-up resistors, glitch filters and interrupts on rising edge | S_PIO_MSKR1 (offset 0x1040) | 0x0000_000F |
| | S_PIO_CFGR1 (offset 0x1044) | 0x0100_1200 |
| PIOB: Four input signals on Non-Secure I/O line 12 to 15 to read an external device status (polled, thus no input change interrupt), no pull-up resistor, no glitch filter | PIO_MSKR1 (offset 0x40) | 0x0000_F000 |
| | PIO_CFGR1 (offset 0x44) | 0x0100_1200 |
| PIOB: Secure I/O lines 16 to 23 assigned to peripheral B functions with pull-down resistor | S_PIO_MSKR1 (offset 0x1040) | 0x00FF_0000 |
| | S_PIO_CFGR1 (offset 0x1044) | 0x0000_0402 |

| .....continued | | |
|---|---|---|
| **Action** | **Register** | **Value to be Written** |
| PIOB: Non-Secure I/O line 24 to 27 assigned to peripheral D with Input Interrupt on both edges, no pull-up resistor and no pull-down resistor | PIO_MSKR1 (offset 0x40) | 0x0F00_0000 |
| | PIO_CFGR1 (offset 0x44) | 0x0200_0004 |
| PIOB: Enable interrupt | S_PIO_IER1 (offset 0x1060) | 0x0000_000F |
| | PIO_IER1 (offset 0x60) | 0x0F00_0000 |

### 33.7.1 PIO Mask Register

**Name:** PIO_MSKRx
**Offset:** 0x00 + x*0x40 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – MSKy** PIO Line y Mask
These bits define the I/O lines to be configured when writing the PIO Configuration Register.

0 (DISABLED): Writing the PIO_CFGRx, PIO_ODSRx or PIO_IOFRx does not affect the corresponding I/O line configuration.

1 (ENABLED): Writing the PIO_CFGRx, PIO_ODSRx or PIO_IOFRx updates the corresponding I/O line configuration.

### 33.7.2 PIO Configuration Register

**Name:** PIO_CFGRx
**Offset:** 0x04 + x*0x40 [x=0..3]
**Reset:** 0x00000200
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

Writing this register will only affect I/O lines enabled in the PIO_MSKRx.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 30 – ICFS** Interrupt Configuration Freeze Status (read-only)
This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- IFEN: Input Filter Enable
- IFSCEN: Input Filter Slow Clock Enable
- EVTSEL: Event Selection

0 (NOT_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bit 29 – PCFS** Physical Configuration Freeze Status (read-only)
This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- FUNC: I/O Line Function
- DIR: Direction
- PUEN: Pull-Up Enable
- PDEN: Pull-Down Enable

• OPD: Open-Drain

• SCHMITT: Schmitt Trigger

• DRVSTR: Drive Strength

0 (NOT_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bits 26:24 – EVTSEL[2:0]** Event Selection
This field defines the type of event to detect on the I/O lines of the I/O group x according to the PIO Mask Register.

| Value | Name | Description |
|---|---|---|
| 0 | FALLING | Event detection on input falling edge |
| 1 | RISING | Event detection on input rising edge |
| 2 | BOTH | Event detection on input both edge |
| 3 | LOW | Event detection on low level input |
| 4 | HIGH | Event detection on high level input |
| 5 | – | Reserved |
| 6 | – | Reserved |
| 7 | – | Reserved |

**Bits 17:16 – DRVSTR[1:0]** Drive Strength
This field defines the drive strength of the I/O lines of the I/O group x according to the PIO Mask Register.

| Value | Name | Description |
|---|---|---|
| 0 | LO | Low drive |
| 1 | LO | Low drive |
| 2 | ME | Medium drive |
| 3 | HI | High drive |

**Bit 15 – SCHMITT** Schmitt Trigger
This bit defines the Schmitt trigger configuration of the I/O lines of the I/O group x according to the PIO Mask Register.

0 (ENABLED): Schmitt trigger is enabled for the selected I/O lines.

1 (DISABLED): Schmitt trigger is disabled for the selected I/O lines.

**Bit 14 – OPD** Open-Drain
This bit defines the open drain configuration of the I/O lines of the I/O group x according to the PIO Mask Register.

0 (DISABLED): The open-drain is disabled for the selected I/O lines. I/O lines are driven at high- and low-level.

1 (ENABLED): The open-drain is enabled for the selected I/O lines. I/O lines are driven at low-level only.

**Bit 13 – IFSCEN** Input Filter Slow Clock Enable
This bit defines the clock source of the glitch filtering for the I/O lines of the I/O group x according to the PIO Mask Register.

0 (DISABLED): The glitch filter is able to filter glitches with a duration < $t_{mck}/2$ for the selected I/O lines.

1 (ENABLED): The debouncing filter is able to filter pulses with a duration < $t_{div_slck}/2$ for the selected I/O lines.

**Bit 12 – IFEN** Input Filter Enable
This bit defines if the glitch filtering is used for the I/O lines of the I/O group x according to the PIO Mask Register.

0 (DISABLED): The input filter is disabled for the selected I/O lines.

1 (ENABLED): The input filter is enabled for the selected I/O lines.

**Bit 10 – PDEN** Pull-Down Enable
This bit defines the pull-down configuration of the I/O lines of the I/O group x according to the PIO Mask Register.

PDEN can be written to 1 only if PUEN is written to 0.

0 (DISABLED): Pull-Down is disabled for the selected I/O lines.

1 (ENABLED): Pull-Down is enabled for the selected I/O lines only if PUEN is 0.

**Bit 9 – PUEN** Pull-Up Enable
This bit defines the pull-up configuration of the I/O lines of the I/O group x according to the PIO Mask Register.

0 (DISABLED): Pull-Up is disabled for the selected I/O lines.

1 (ENABLED): Pull-Up is enabled for the selected I/O lines.

**Bit 8 – DIR** Direction
This bit defines the direction of the I/O lines of the I/O group x according to the PIO Mask Register.

0 (INPUT): The selected I/O lines are pure inputs.

1 (OUTPUT): The selected I/O lines are enabled in output.

**Bits 2:0 – FUNC[2:0]** I/O Line Function
This field defines the function for I/O lines of the I/O group x according to the PIO Mask Register.

| Value | Name | Description |
|---|---|---|
| 0 | GPIO | Select the PIO mode for the selected I/O lines. |
| 1 | PERIPH_A | Select the peripheral A for the selected I/O lines. |
| 2 | PERIPH_B | Select the peripheral B for the selected I/O lines. |
| 3 | PERIPH_C | Select the peripheral C for the selected I/O lines. |
| 4 | PERIPH_D | Select the peripheral D for the selected I/O lines. |
| 5 | PERIPH_E | Select the peripheral E for the selected I/O lines. |
| 6 | PERIPH_F | Select the peripheral F for the selected I/O lines. |

### 33.7.3 PIO Pin Data Status Register

**Name:** PIO_PDSRx
**Offset:** 0x08 + x*0x40 [x=0..3]
**Reset:** –
**Property:** Read-only

Reset value of PIO_PDSR depends on the level of the I/O lines. Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO_PDSR reads the levels present on the I/O line at the time the clock was disabled.

| Value | Name | Description |
|---|---|---|
| 0x504944F | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See Section 6.18 “Register Write Protection” for the list of registers that can be protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x50494F (“PIO” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x50494F (“PIO” in ASCII). |

### 33.7.14 PIO Write Protection Status Register

**Name:** PIO_WPSR
**Offset:** 0x5E4
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of the PIO_WPSR. |
| 1 | A write protection violation has occurred since the last read of the PIO_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

### 33.7.15 Secure PIO Mask Register

**Name:** S_PIO_MSKRx
**Offset:** 0x1000 + x*0x40 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Secure PIO Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – MSKy** PIO Line y Mask
These bits define the I/O lines to be configured when writing the Secure PIO Configuration Register.

0 (DISABLED): Writing the S_PIO_CFGRx, S_PIO_ODSRx or S_PIO_IOFRx does not affect the corresponding I/O line configuration.

1 (ENABLED): Writing the S_PIO_CFGRx, S_PIO_ODSRx or S_PIO_IOFRX updates the corresponding I/O line configuration.

### 33.7.16 Secure PIO Configuration Register

**Name:** S_PIO_CFGRx
**Offset:** 0x1004 + x*0x40 [x=0..3]
**Reset:** 0x00000200
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Secure PIO Write Protection Mode Register.

Writing this register will only affect I/O lines enabled in the S_PIO_MSKRx.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 30 – ICFS** Interrupt Configuration Freeze Status (read-only)
This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- IFEN: Input Filter Enable
- IFSCEN: Input Filter Slow Clock Enable
- EVTSEL: Event Selection

0 (NOT_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bit 29 – PCFS** Physical Configuration Freeze Status (read-only)
This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- FUNC: I/O Line Function
- DIR: Direction
- PUEN: Pull-Up Enable

• PDEN: Pull-Down Enable

• OPD: Open-Drain

• SCHMITT: Schmitt Trigger

• DRVSTR: Drive Strength

0 (NOT_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bits 26:24 – EVTSEL[2:0]** Event Selection
This field defines the type of event to detect on the I/O lines of the I/O group x according to the Secure PIO Mask Register.

| Value | Name | Description |
|---|---|---|
| 0 | FALLING | Event detection on input falling edge |
| 1 | RISING | Event detection on input rising edge |
| 2 | BOTH | Event detection on input both edge |
| 3 | LOW | Event detection on low level input |
| 4 | HIGH | Event detection on high level input |
| 5 | Reserved | |
| 6 | Reserved | |
| 7 | Reserved | |

**Bits 17:16 – DRVSTR[1:0]** Drive Strength
This field defines the drive strength of the I/O lines of the I/O group x according to the Secure PIO Mask Register.

| Value | Name | Description |
|---|---|---|
| 0 | LO | Low drive |
| 1 | LO | Low drive |
| 2 | ME | Medium drive |
| 3 | HI | High drive |

**Bit 15 – SCHMITT** Schmitt Trigger
This bit defines the Schmitt trigger configuration of the I/O lines of the I/O group x according to the Secure PIO Mask Register.

0 (ENABLED): Schmitt trigger is enabled for the selected I/O lines.

1 (DISABLED): Schmitt trigger is disabled for the selected I/O lines.

**Bit 14 – OPD** Open-Drain
This bit defines the open drain configuration of the I/O lines of the I/O group x according to the Secure PIO Mask Register.

0 (DISABLED): The open-drain is disabled for the selected I/O lines. I/O lines are driven at high- and low-level.

1 (ENABLED): The open-drain is enabled for the selected I/O lines. I/O lines are driven at low-level only.

**Bit 13 – IFSCEN** Input Filter Slow Clock Enable
This bit defines the clock source of the glitch filtering for the I/O lines of the I/O group x according to the Secure PIO Mask Register.

| Value | Description |
|---|---|
| 0 | The glitch filter is able to filter glitches with a duration < $t_{mck}/2$ for the selected I/O lines. |
| 1 | The debouncing filter is able to filter pulses with a duration < $t_{div_slck}/2$ for the selected I/O lines. |

**Bit 12 – IFEN** Input Filter Enable
This bit defines if the glitch filtering is used for the I/O lines of the I/O group x according to the Secure PIO Mask Register.

0 (DISABLED): The input filter is disabled for the selected I/O lines.

1 (ENABLED): The input filter is enabled for the selected I/O lines.

**Bit 10 – PDEN** Pull-Down Enable
This bit defines the pull-down configuration of the I/O lines of the I/O group x according to the Secure PIO Mask Register.

0 (DISABLED): Pull-Down is disabled for the selected I/O lines.

1 (ENABLED): Pull-Down is enabled for the selected I/O lines only if PUEN is 0[(1)].

Note: 1. PDEN can be written to 1 only if PUEN is written to 0.

**Bit 9 – PUEN** Pull-Up Enable
This bit defines the pull-up configuration of the I/O lines of the I/O group x according to the Secure PIO Mask Register.

0 (DISABLED): Pull-Up is disabled for the selected I/O lines.

1 (ENABLED): Pull-Up is enabled for the selected I/O lines.

**Bit 8 – DIR** Direction
This bit defines the direction of the I/O lines of the I/O group x according to the Secure PIO Mask Register.

0 (INPUT): The selected I/O lines are pure inputs.

1 (OUTPUT): The selected I/O lines are enabled in output.

**Bits 2:0 – FUNC[2:0]** I/O Line Function
This field defines the function for I/O lines of the I/O group x according to the Secure PIO Mask Register.

| Value | Name | Description |
|---|---|---|
| 0 | GPIO | Select the PIO mode for the selected I/O lines. |
| 1 | PERIPH_A | Select the peripheral A for the selected I/O lines. |
| 2 | PERIPH_B | Select the peripheral B for the selected I/O lines. |
| 3 | PERIPH_C | Select the peripheral C for the selected I/O lines. |
| 4 | PERIPH_D | Select the peripheral D for the selected I/O lines. |
| 5 | PERIPH_E | Select the peripheral E for the selected I/O lines. |
| 6 | PERIPH_F | Select the peripheral F for the selected I/O lines. |
| 7 | PERIPH_G | Select the peripheral G for the selected I/O lines. |

© 2018 Microchip Technology Inc.

### 33.7.17 Secure PIO Pin Data Status Register

**Name:** S_PIO_PDSRx
**Offset:** 0x1008 + x*0x40 [x=0..3]
**Reset:** –
**Property:** Read-only

Reset value of PIO_PDSR and S_PIO_PDSR depends on the level of the I/O lines. Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO_PDSR reads the levels present on the I/O line at the time the clock was disabled.

| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of the S_PIO_WPSR. |
| 1 | A write protection violation has occurred since the last read of the S_PIO_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 34. External Memories

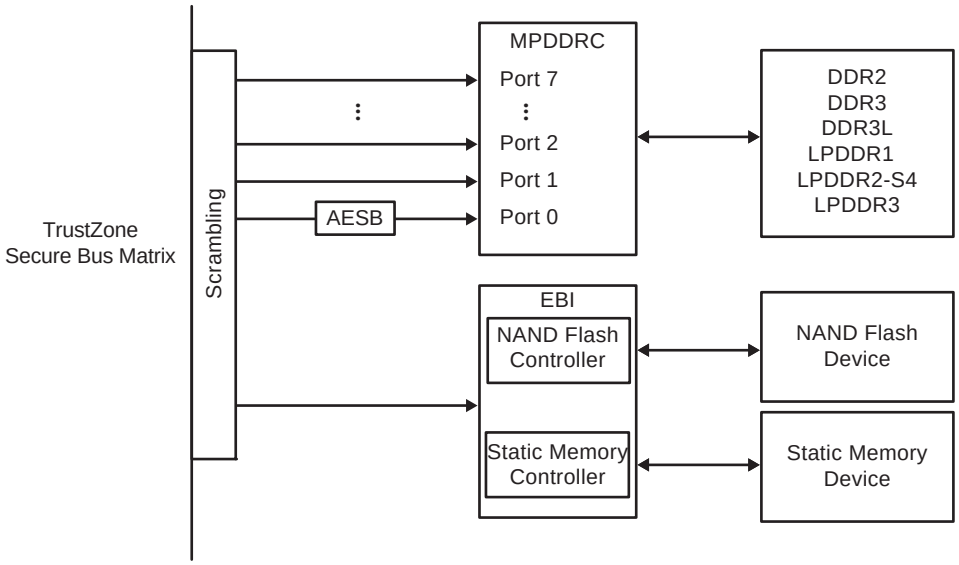
The product features:

- Multiport DDR-SDRAM Controller (MPDDRC)
- External Bus Interface (EBI) that embeds a NAND Flash controller and a Static Memory Controller (HSMC)

The MPDDRC is a multiport DDRSDR controller supporting DDR2, DDR3, DDR3L, LPDDR1, LPDDR2-S4 and LPDDR3 devices. The MPDDRC user interface is located at 0xF000C000. All the paths can be scrambled and Port 0 can be connected to an AES encryption/decryption engine.

The HSMC supports Static Memories and MLC/SLC NAND Flash. It embeds MultiBit ECC correction (PMECC). Its user interface is located at 0xF8014000. The HSMC buses can be scrambled.

**Figure 34-1. External Memory Controllers**



## 34.1 Multiport DDR-SDRAM Controller (MPDDRC)

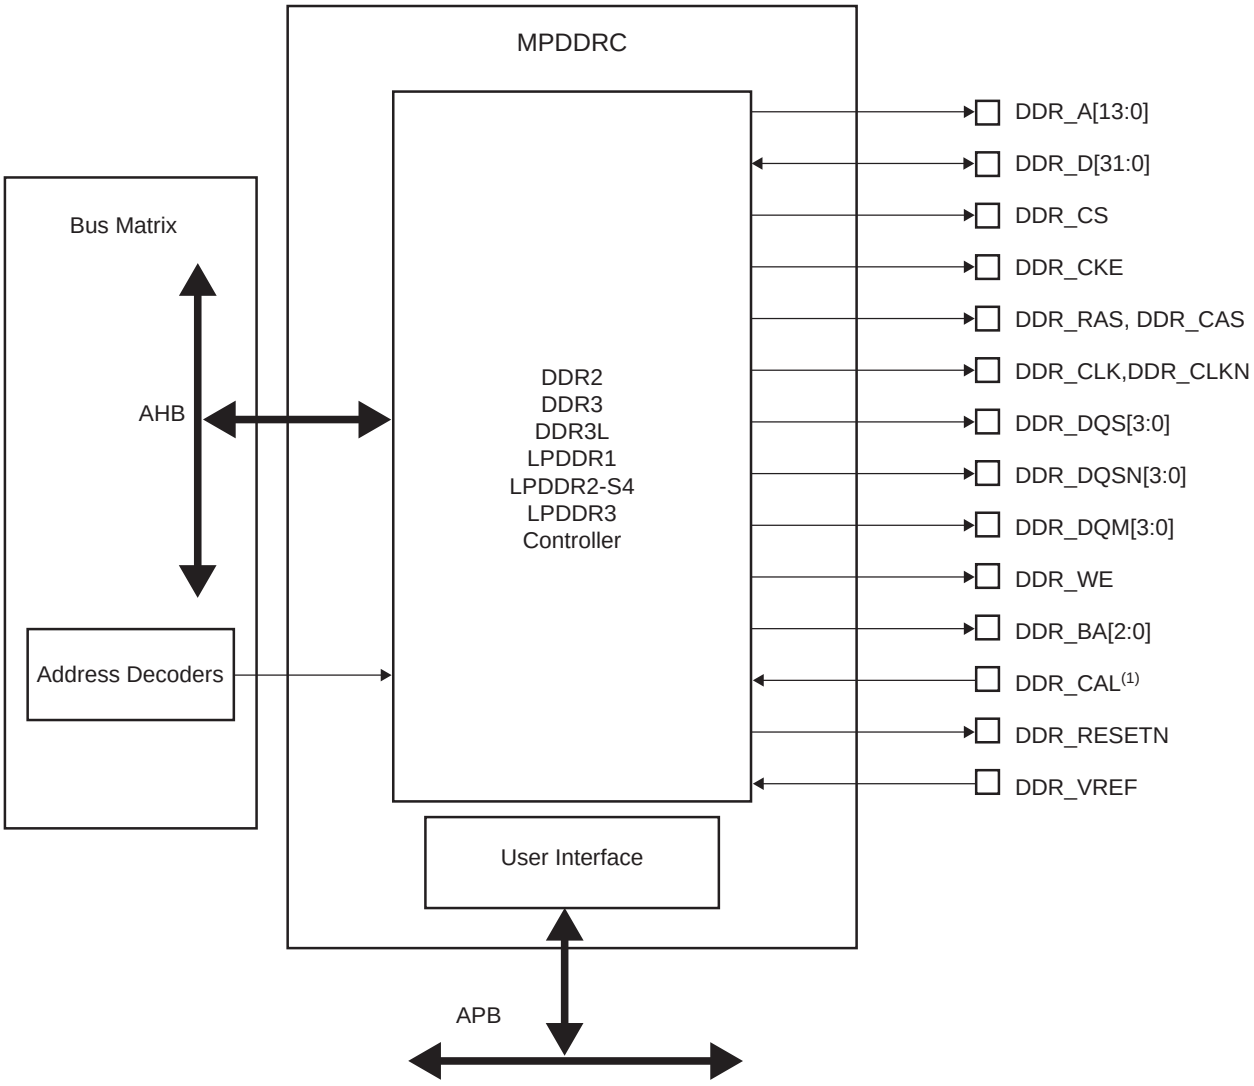
### 34.1.1 Description

The MPDDRC is an 8-port memory controller supporting DDR-SDRAM and low-power DDR devices. Data transfers are performed through a 16/32-bit data bus on one chip select. The controller operates with a 1.8V power supply for DDR2, DDR3, LPDDR1, 1.35V for DDR3L and 1.2V for LPDDR2, LPDDR3.

For full details, refer to the section “Multiport DDR-SDRAM Controller (MPDDRC)”.

### 34.1.2 MPDDR Controller Block Diagram

**Figure 34-2. MPDDRC Block Diagram**



**Note:** For more details, refer to the section ”DDR and SDMMC I/Os Calibration”.

### 34.1.3 IO Lines Description

**Table 34-1. DDR/LPDDR I/O Lines Description**

| Name | Function | Type | Active Level |
|---|---|---|---|
| **DDR/LPDDR Controller** | | | |

| Higher addresses | Higher CAs |

## 34.2 External Bus Interface (EBI)

### 34.2.1 Description

The External Bus Interface is designed to ensure the successful data transfer between several external devices and the Arm processor-based device. The External Bus Interface of the device consists of a Static Memory Controller (SMC).

### 34.2.2 Implementation Examples

The following hardware configurations are given for illustration only. The user should refer to the memory manufacturer website to check current device availability.

#### 34.2.2.1 8-bit NAND Flash

# 35. AHB Multiport DDR-SDRAM Controller (MPDDRC)

## 35.1 Description

The Multiport DDR-SDRAM Controller (MPDDRC) is a multiport memory controller. It comprises eight slave AHB interfaces. All simultaneous accesses (eight independent AHB ports) are interleaved to maximize memory bandwidth and minimize transaction latency due to DDR-SDRAM protocol.

The MPDDRC extends the memory capabilities of a chip by providing the interface to the external 16-bit or 32-bit DDR-SDRAM device. The page size supports ranges from 2048 to 16384 rows and from 256 to 4096 columns. It supports dword (64-bit), word (32-bit), half-word (16-bit), and byte (8-bit) accesses.

The MPDDRC supports a read or write burst length of eight locations. This enables the command and address bus to anticipate the next command, thus reducing latency imposed by the DDR-SDRAM protocol and improving the DDR-SDRAM bandwidth. Moreover, MPDDRC keeps track of the active row in each bank, thus maximizing DDR-SDRAM performance, e.g., the application may be placed in one bank and data in other banks. To optimize performance, avoid accessing different rows in the same bank. The MPDDRC supports a CAS latency of 2, 3, 5 or 6 and optimizes the read access depending on the frequency.

Self-refresh, Powerdown and Deep Powerdown modes minimize the consumption of the DDR-SDRAM device.

OCD (Off-chip Driver) and ODT (On-die Termination) modes are not supported.

The MPDDRC supports DDR3-SDRAM and DDR3L-SDRAM devices with DLL disabled, in DLL Off mode. In this mode, according to JEDEC standard, the maximum clock frequency is 125 MHz. However, check with memory suppliers for higher speed support. DDR3-SDRAM supports high capacity, 1 Gbit and more, and allows to reduce power consumption with a 1.5V supply (DDR3-SDRAM) or a 1.35V supply (DDR3L-SDRAM). The DLL Off mode sets the CAS Read Latency (CRL) and the CAS Write Latency (CWL) to 6. The latency is automatically set by the controller.

## 35.2 Embedded Characteristics

- Numerous Memory Devices Supported
  - Low-Power DDR1-SDRAM (LPDDR1)
  - Low-Cost LPDDR1 with 2 Internal Banks
  - DDR2-SDRAM
  - Low-Power DDR2-SDRAM-S4 (LPDDR2)
  - Low-Power DDR3-SDRAM (LPDDR3)
  - DDR3-SDRAM (DLL Off mode)
  - DDR3L-SDRAM (DLL Off mode)
- Arbitration Policies: Round-Robin, On Request, Bandwidth
- Eight Advanced High-Performance Bus (AHB) Interfaces, Management of all Accesses Maximizes Memory Bandwidth and Minimizes Transaction Latency
- Bus Transfer: dword, word, half word, byte Access
- Numerous Configurations Supported
  - 2K, 4K, 8K, 16K row address memory parts

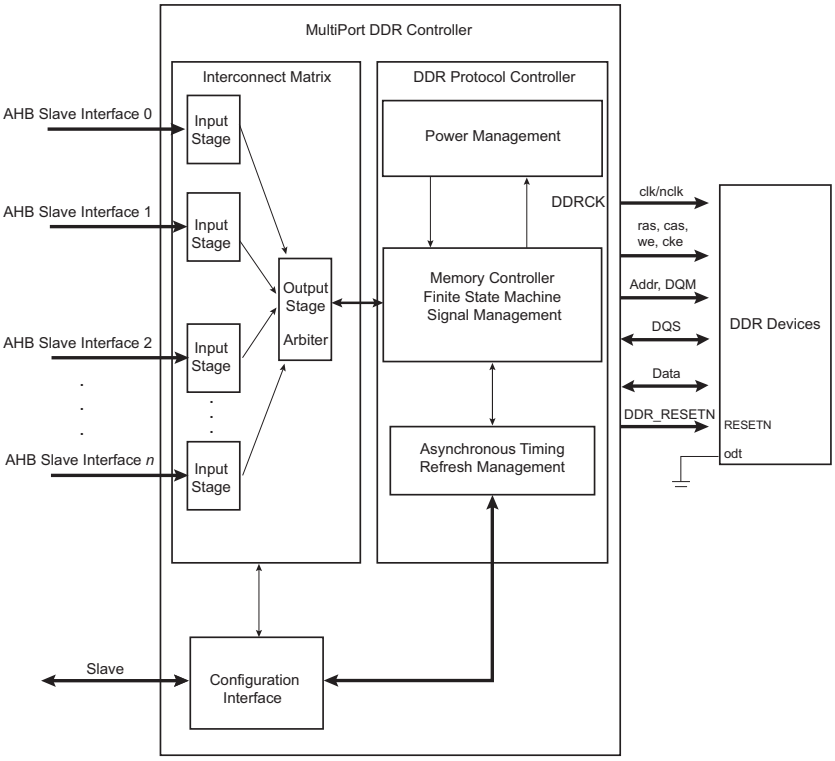
  - DDR-SDRAM with two or four internal banks (low-power DDR1-SDRAM)
  - DDR-SDRAM with four or eight internal banks (DDR2-SDRAM/Low-power DDR2-SDRAM-S4/ DDR3-SDRAM/DDR3L-SDRAM/Low-power DDR3-SDRAM)
  - DDR-SDRAM with 16-bit or 32-bit data
  - One chip select for SDRAM device (512-Mbyte address space, 256-Mbyte address space with 16-bit data path)
- Programming Facilities
  - Multibank ping-pong access (up to four or eight banks opened at the same time = reduced average latency of transactions)
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
  - Automatic update of DS, TCR and PASR parameters (low-power DDR-SDRAM devices)
- Energy-Saving Capabilities
  - Self-refresh, Powerdown, Active Powerdown and Deep Powerdown modes supported
- DDR-SDRAM Powerup Initialization by Software
- CAS Latency of 2, 3, 5 or 6 Supported
- Reset Function Supported (DDR2-SDRAM)
- Clock Frequency Change in Self-Refresh Mode Supported (Low-power DDR-SDRAM/DDR3-SDRAM/DDR3L-SDRAM)
- Autorefresh per Bank Supported (Low-Power DDR2-SDRAM-S4/Low-Power DDR3-SDRAM)
- Automatic Adjust Refresh Rate (Low-Power DDR2-SDRAM-S4/Low-Power DDR3-SDRAM)
- Autoprecharge Command Not Used
- OCD (Off-chip Driver) Mode, ODT (On-die Termination), Write leveling Are Not Supported
- Dynamic Scrambling with User Key (No Impact on Bandwidth)

## 35.3 Block Diagram

The MPDDRC is partitioned in two blocks (see figure below):

- Interconnect Matrix block that manages concurrent accesses on the AHB bus between four AHB masters and integrates an arbiter
- DDR controller that translates AHB requests (read/write) in the DDR-SDRAM protocol

**Figure 35-1. Block Diagram**



## 35.4 Product Dependencies, Initialization Sequence

### 35.4.1 Low-power DDR1-SDRAM Initialization

The initialization sequence is generated by software.

The low-power DDR1-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC_RD_DATA_PATH).
3. Program the features of the low-power DDR1-SDRAM device in the MPDDRC Configuration register (MPDDRC_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC_TPR0/1) (asynchronous timing (TRC, TRAS, etc.)).
4. Program Temperature Compensated Self-refresh (TCR), Partial Array Self-refresh (PASR) and Drive Strength (DS) parameters in the Low-power register (MPDDRC_LPR).
5. A NOP command is issued to the low-power DDR1-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command. The clocks which drive the low-power DDR1-SDRAM device are now enabled.
6. A pause of at least 200 µs must be observed before a signal toggle.
7. A NOP command is issued to the low-power DDR1-SDRAM. Program the NOP command in the MPDDRC_MR. The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write

access to any low-power DDR1-SDRAM address to acknowledge this command. A calibration request is now made to the I/O pad.

8. An All Banks Precharge command is issued to the low-power DDR1-SDRAM. Program All Banks Precharge command in the MPDDRC_MR. The application must configure the MODE field to 2 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command.
9. Two autorefresh (CBR) cycles are provided. Program the Autorefresh command (CBR) in the MPDDRC_MR. The application must configure the MODE field to 4 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM location twice to acknowledge these commands.
10. An Extended Mode Register Set (EMRS) cycle is issued to program the low-power DDR1-SDRAM parameters (TCSR, PASR, DS). The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and BA[0] is set to 0. For example: with a 16-bit, 128-Mbit, low-power DDR1-SDRAM (12 rows, 9 columns, 4 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x00800000; with a 32-bit, 1-Gbit, low-power DDR1-SDRAM (14 rows, 10 columns, 4 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x08000000. In the case of low-cost and low-density low-power DDR1-SDRAM (2 internal banks), the write address must be chosen so that signal BA[0] is set to 1. BA[1] is not used.
    **Note:** This address is given as an example only. The real address depends on implementation in the product.
11. A Mode Register Set (MRS) cycle is issued to program parameters of the low-power DDR1-SDRAM devices, in particular CAS latency. The application must configure the MODE field to 3 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the low-power DDR1-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example, the SDRAM write access should be done at the address: BASE_ADDRESS_DDR.
12. The application must enter Normal mode, write a zero to the MODE field in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access at any location in the low-power DDR1-SDRAM to acknowledge this command.
13. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC_RTR). To compute the value, see MPDDRC Refresh Timer Register.

After initialization, the low-power DDR1-SDRAM device is fully functional.

### 35.4.2 DDR2-SDRAM Initialization

The initialization sequence is generated by software. The DDR2-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC_RD_DATA_PATH).
3. Program features of the DDR2-SDRAM device in the Configuration register (MPDDRC_CR) (number of columns, rows, banks, CAS latency and output driver impedance control) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).

4. A NOP command is issued to the DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command. The clocks which drive the DDR2-SDRAM device are now enabled.
5. A pause of at least 200 µs must be observed before a signal toggle.
6. A NOP command is issued to the DDR2-SDRAM. Program the NOP command in the MPDDRC_MR. The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command. CKE is now driven high.
7. An All Banks Precharge command is issued to the DDR2-SDRAM. Program All Banks Precharge command in the MPDDRC_MR. The application must configure the MODE field to 2 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
8. An Extended Mode Register Set (EMRS2) cycle is issued to choose between commercial or high temperature operations. The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and signal BA[0] is set to 0. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x00800000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x08000000.
   **Note:** This address is given as an example only. The real address depends on implementation in the product.
9. An Extended Mode Register Set (EMRS3) cycle is issued to set the Extended Mode register to 0. The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x00C00000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x0C000000
10. An Extended Mode Register Set (EMRS1) cycle is issued to enable DLL and to program D.I.C. (Output Driver Impedance Control). The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x00400000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x04000000.
11. An additional 200 cycles of clock are required for locking DLL.
12. Write a ‘1’ to the DLL bit (enable DLL reset) in the Configuration register (MPDDRC_CR).
13. A Mode Register Set (MRS) cycle is issued to reset DLL. The application must configure the MODE field to 3 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this

command. The write address must be chosen so that signals BA[1:0] are set to 0. For example, the SDRAM write access should be done at the address: BASE_ADDRESS_DDR.

14. An All Banks Precharge command is issued to the DDR2-SDRAM. Program the All Banks Precharge command in the MPDDRC_MR. The application must configure the MODE field to 2 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
15. Two autorefresh (CBR) cycles are provided. Program the Autorefresh command (CBR) in the MPDDRC_MR. The application must configure the MODE field to 4 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM location twice to acknowledge these commands.
16. Write a '0' to the DLL bit (disable DLL reset) in the MPDDRC_CR.
17. A Mode Register Set (MRS) cycle is issued to program parameters of the DDR2-SDRAM device, in particular CAS latency and to disable DLL reset. The application must configure the MODE field to 3 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be done at the address: BASE_ADDRESS_DDR; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR.
18. Configure the OCD field (default OCD calibration) to 7 in the MPDDRC_CR.
19. An Extended Mode Register Set (EMRS1) cycle is issued to the default OCD value. The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x00400000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x04000000.
20. Configure the OCD field (exit OCD calibration mode) to 0 in the MPDDRC_CR.
21. An Extended Mode Register Set (EMRS1) cycle is issued to enable OCD exit. The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x00400000; with a 32-bit, 1-Gbit, DDR2-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x04000000.
22. A Normal Mode command is provided. Program the Normal mode in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
23. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC_RTR). To compute the value, see MPDDRC Refresh Timer Register.

After initialization, the DDR2-SDRAM devices are fully functional.

### 35.4.3 Low-power DDR2-SDRAM Initialization

The initialization sequence is generated by software.

The low-power DDR2-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC_RD_DATA_PATH).
3. Program features of the low-power DDR2-SDRAM device into and in the Configuration register (MPDDRC_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).
4. A NOP command is issued to the low-power DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The clocks which drive the Low-power DDR2-SDRAM devices are now enabled.
5. A pause of at least 100 ns must be observed before a signal toggle.
6. A NOP command is issued to the low-power DDR2-SDRAM. Program the NOP command in the MPDDRC_MR. The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. CKE is now driven high.
7. A pause of at least 200 µs must be observed before issuing a Reset command.
8. A Reset command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 63. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Reset command is now issued.
9. A pause of at least $t_{INIT5}$ must be observed before issuing any commands.
10. A Calibration command is issued to the low-power DDR2-SDRAM. Program the type of calibration in the Configuration register (MPDDRC_CR): configure the ZQ field to 3. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 10. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The ZQ Calibration command is now issued. Program the type of calibration in the MPDDRC_CR: configure the ZQ field to 2.
11. A Mode register Write command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 1. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
12. A Mode register Write command is issued to the low-power DDR2-SDRAM. In the MPDDRC_MR, configure the MODE field to 7 and the MRS field to 2. The Mode register Write command cycle is issued to program parameters of the low-power DDR2-SDRAM device, in particular CAS latency. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
13. A Mode register Write command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 3. The Mode register Write command cycle is issued to program parameters of the low-power DDR2-SDRAM device, in particular Drive Strength and Slew Rate. Read the MPDDRC_MR and add a memory barrier assembler instruction just after

the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.

14. A Mode register Write command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR configure the MODE field to 7 and the MRS field to 16. Mode register Write command cycle is issued to program parameters of the low-power DDR2-SDRAM device, in particular Partial Array Self Refresh (PASR). Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
15. In the DDR Configuration register (SFR_DDRCFG), the application must write a '1' to bits 17 and 16 to open the input buffers (refer to section "Special Function Registers (SFR)").
16. A NOP command is issued to the low-power DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command.
17. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 5. The Mode register Read command cycle is used to read the LPDDR2 Manufacturer ID from the low-power DDR2-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. The LPDDR2 Manufacturer ID is set in MPDDRC_MD. See MPDDRC Memory Device Register.
18. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 6. The Mode register Read command cycle is used to read Revision ID1 from the low-power DDR2-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Revision ID1 is set in register MPDDRC_MD. See MPDDRC Memory Device Register.
19. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 8. The Mode register Read command cycle is used to read the memory organization (I/O width, Density, Type) from the low-power DDR2-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Memory organization is set in register MPDDRC_MD. See MPDDRC Memory Device Register.
20. A Mode register Read command is issued to the low-power DDR2-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 0. The Mode register Read command cycle is used to read device information (RZQI, DAI) from the low-power DDR2-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Device information RZQI is set in register Timing Calibration (see MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register) and DAI is set in Mode register (see MPDDRC Mode Register).
21. A Normal Mode command is provided. Program the Normal mode in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR2-SDRAM address to acknowledge this command.

22. In the DDR configuration register (SFR_DDRCCFG), the application must write a '0' to bits 17 and 16 to close the input buffers. The buffers are then driven by the HMPDDRC controller.
23. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC_RTR). To compute the value, see MPDDRC Refresh Timer Register.

After initialization, the low-power DDR2-SDRAM devices are fully functional.

### 35.4.4 DDR3-SDRAM/DDR3L-SDRAM Initialization

The initialization sequence is generated by software. The DDR3-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC_RD_DATA_PATH)
3. Program features of the DDR3-SDRAM device in the Configuration register (MPDDRC_CR) (number of columns, rows, banks, CAS latency and output driver impedance control) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC_TPR0/1) (asynchronous timing - TRC, TRAS, etc.).
4. A NOP command is issued to the DDR3-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR3-SDRAM address to acknowledge this command. The clocks which drive the DDR3-SDRAM device are now enabled.
5. A pause of at least 500 µs must be observed before a signal toggle.
6. A NOP command is issued to the DDR3-SDRAM. Program the NOP command in the MPDDRC_MR. The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR3-SDRAM address to acknowledge this command. CKE is now driven high.
7. An Extended Mode Register Set (EMRS2) cycle is issued to choose between commercial or high temperature operations. The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[2] is set to 0, BA[1] is set to 1 and signal BA[0] is set to 0. For example: with a 16-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the DDR3-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x040000000; with a 32-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x08000000.
   **Note:** This address is given as an example only. The real address depends on the implementation in the product.
8. An Extended Mode Register Set (EMRS3) cycle is issued to set the Extended Mode register to 0. The application must configure the MODE field to 5 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[2] is set to 0, BA[1] is set to 1 and signal BA[0] is set to 1. For example: with a 16-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the DDR3-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x06000000; with a 32-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x0C000000.
9. An Extended Mode Register Set (EMRS1) cycle is issued to disable and to program ODS (output drive strength). The application must configure the MODE field to 5 in the MPDDRC_MR. Read the

MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[2:1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the DDR3-SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x02000000; with a 32-bit, 1-Gbit, DDR3-SDRAM (14 rows, 10 columns, 8 banks), the SDRAM write access should be done at the address: BASE_ADDRESS_DDR + 0x04000000.

10. Write a '1' to the DLL bit (enable DLL reset) in the Configuration register (MPDDRC_CR).
11. A Mode Register Set (MRS) cycle is issued to reset DLL. The application must configure the MODE field to 3 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[2:0] are set to 0. For example, the SDRAM write access should be done at the address: BASE_ADDRESS_DDR.
12. A Calibration command (MRS) is issued to calibrate RTT and RON values for the Process Voltage Temperature (PVT). The application must configure the MODE field to 6 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR3-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[2:0] are set to 0. For example, the SDRAM write access should be done at the address: BASE_ADDRESS_DDR.
13. A Normal Mode command is provided. Program the Normal mode in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR3-SDRAM address to acknowledge this command.
14. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC_RTR). To compute the value, see MPDDRC Refresh Timer Register.

After initialization, the DDR3-SDRAM devices are fully functional.

### 35.4.5 Low-power DDR3-SDRAM Initialization

The initialization sequence is generated by software. The low-power DDR3-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC_RD_DATA_PATH).
3. Program features of the low-power DDR3-SDRAM device into and in the Configuration register (MPDDRC_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).
4. A NOP command is issued to the low-power DDR3-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The clocks which drive the low-power DDR3-SDRAM devices are now enabled.
5. A pause of at least 100 ns must be observed before a signal toggle.
6. A NOP command is issued to the low-power DDR3-SDRAM. Program the NOP command in the MPDDRC_MR. The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. CKE is now driven high.
7. A pause of at least 200 µs must be observed before issuing a Reset command.

8. A Reset command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 63. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Reset command is now issued.
9. A pause of at least $t_{INIT5}$ must be observed before issuing any commands.
10. A Calibration command is issued to the low-power DDR3-SDRAM. Program the type of calibration in the Configuration register (MPDDRC_CR): set the ZQ field to 3. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 10. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The ZQ Calibration command is now issued. Program the type of calibration in the MPDDRC_CR: set the ZQ field to 2.
11. A Mode register Write command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 1. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
12. A Mode register Write command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 2. The Mode register Write command cycle is issued to program parameters of the low-power DDR3-SDRAM device, in particular CAS Latency. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
13. A Mode register Write command is issued to the low-power DDR3-SDRAM. In the MPDDRC_MR, configure the MODE field 7 and the MRS field to 3. The Mode register Write command cycle is issued to program parameters of the low-power DDR3-SDRAM device, in particular Drive Strength and Slew Rate. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
14. A Mode register Write command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 16. The Mode register Write command cycle is issued to program parameters of the low-power DDR3-SDRAM device, in particular Partial Array Self Refresh (PASR). Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Write command is now issued.
15. In the DDR Configuration register (SFR_DDRCFG), the application must write a ‘1’ to bits 17 and 16 to open the input buffers.
16. A NOP command is issued to the low-power DDR3-SDRAM. Program the NOP command in the Mode register (MPDDRC_MR). The application must configure the MODE field to 1 in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command.
17. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 5. The Mode register Read command cycle is used to read the LPDDR3 Manufacturer ID from the low-power DDR3-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. The LPDDR3 Manufacturer ID is set in register MPDDRC_MD. See MPDDRC Memory Device Register.

18. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 6. The Mode register Read command cycle is used to read the Revision ID1 from the low-power DDR3-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Revision ID1 is set in register MPDDRC_MD. See MPDDRC Memory Device Register.
19. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 8. The Mode register Read command cycle is used to read memory organization (I/O width, Density, Type) from the low-power DDR3-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Memory organization is set in register MPDDRC_MD. See MPDDRC Memory Device Register.
20. A Mode register Read command is issued to the low-power DDR3-SDRAM. In MPDDRC_MR, configure the MODE field to 7 and the MRS field to 0. The Mode register Read command cycle is used to read the device information (RZQI, DAI) from the low-power DDR3-SDRAM mode registers. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command. The Mode register Read command is now issued. Device information RZQI is set in register Timing Calibration (see MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register) and DAI is set in Mode register (see MPDDRC Mode Register).
21. A Normal Mode command is provided. Program the Normal mode in the MPDDRC_MR. Read the MPDDRC_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR3-SDRAM address to acknowledge this command.
22. In the DDR Configuration register (SFR_DDRCCFG), the application must write a ‘0’ to bits 17 and 16 to close the input buffers. The buffers are then driven by the HMPDDRC controller.
23. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC_RTR). To compute the value, see MPDDRC Refresh Timer Register.

After initialization, the low-power DDR3-SDRAM devices are fully functional.

## 35.5 Functional Description

### 35.5.1 DDR-SDRAM Controller Write Cycle

The MPDDRC provides burst access or single access in Normal mode (MPDDRC_MR.MODE = 0). Whatever the access type, the MPDDRC keeps track of the active row in each bank, thus maximizing performance.

The DDR-SDRAM device is programmed with a burst length (bl) equal to 8. This determines the length of a sequential data input by the write command that is set to 8. The latency from write command to data input depends on the memory type, as shown in the following table.

**Table 35-1. CAS Write Latency**

| Memory Devices | CAS Write Latency (CWL) |
|---|---|
| Low-power DDR1-SDRAM | 1 |
| Low-power DDR2-SDRAM | 1 |

| .....continued | |
|---|---|
| **Memory Devices** | **CAS Write Latency (CWL)** |
| DDR2-SDRAM | 2 |
| Low-power DDR3-SDRAM | 1/3 |
| DDR3-SDRAM (DLL Off) | 6 |

**Note:** In the case of low-power DDR3-SDRAM, the CAS Write Latency (CWL) of 1 is optional. The MPDDRC supports this feature. Refer to the low-power DDR3-SDRAM datasheet for details.

To initiate a single access, the MPDDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a write command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a write command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ($t_{RP}$) commands and active/write ($t_{RCD}$) commands. As the burst length is set to 8, in case of single access, it has to stop the burst, otherwise seven invalid values may be written. In case of the DDR-SDRAM device, the burst stop command is not supported for the burst write operation. Thus, in order to interrupt the write operation, the DM (data mask) input signal must be set to 1 to mask invalid data (see Figures Single Write Access, Row Closed, DDR-SDRAM Devices and Burst Write Access, Row Closed, DDR-SDRAM Devices), and DQS must continue to toggle.

To initiate a burst access, the MPDDRC uses the transfer type signal provided by the master requesting the access. If the next access is a sequential write access, writing to the DDR-SDRAM device is carried out. If the next access is a write non-sequential access, then an automatic access break is inserted, the MPDDRC generates a precharge command, activates the new row and initiates a write command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ($t_{RP}$) commands and active/write ($t_{RCD}$) commands.

For the definition of timing parameters, see MPDDRC Timing Parameter 0 Register.

Write accesses to the DDR-SDRAM device are burst oriented and the burst length is programmed to 8. It determines the maximum number of column locations that can be accessed for a given write command. When the write command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, thus the burst wraps within these eight columns if a boundary is reached. These eight columns are selected by addr[13:3]. addr[2:0] is used to select the starting location within the block.

In case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the DDR-SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is at 0x00. Since the boundary is reached, the burst is wrapped. The MPDDRC takes this feature of the DDR-SDRAM device into account. In case of a transfer starting at address 0x04/0x08/0x0C or starting at address 0x10/0x14/0x18/0x1C, two write commands are issued to avoid wrapping when the boundary is reached. The last write command is subject to DM input logic level. If DM is registered high, the corresponding data input is ignored and the write access is not done. This avoids additional writing.

**Figure 35-2. Single Write Access, Row Closed, DDR-SDRAM Devices**

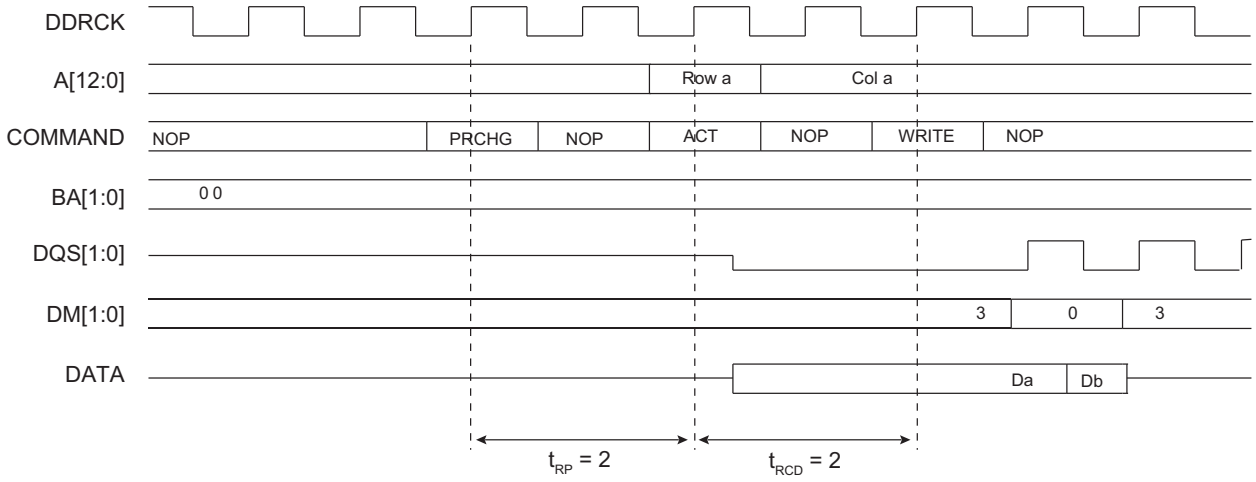


**Figure 35-3. Single Write Access, Row Closed, DDR2-SDRAM Devices**

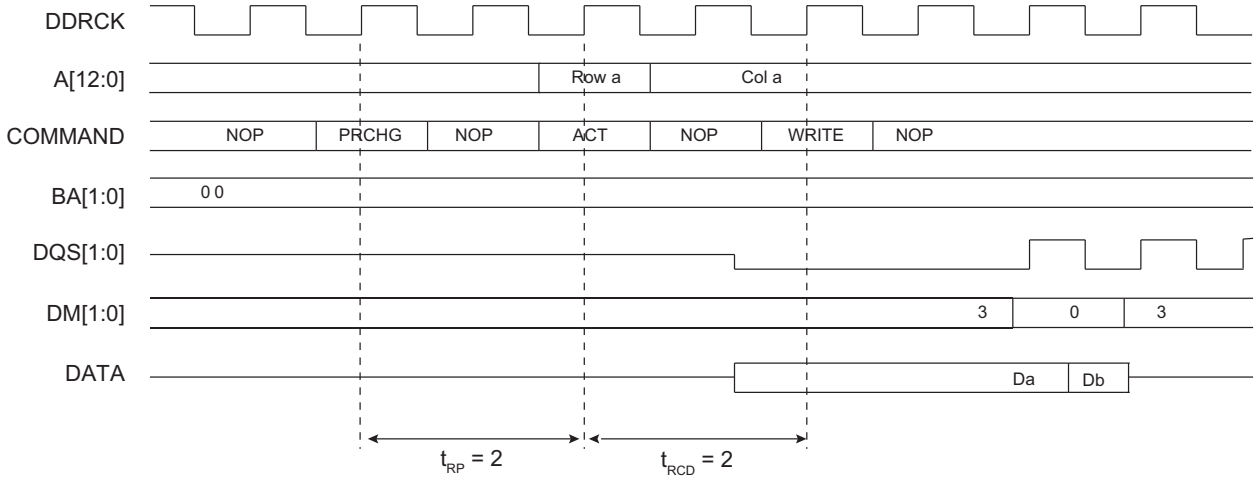

**Figure 35-4. Burst Write Access, Row Closed, DDR-SDRAM Devices**

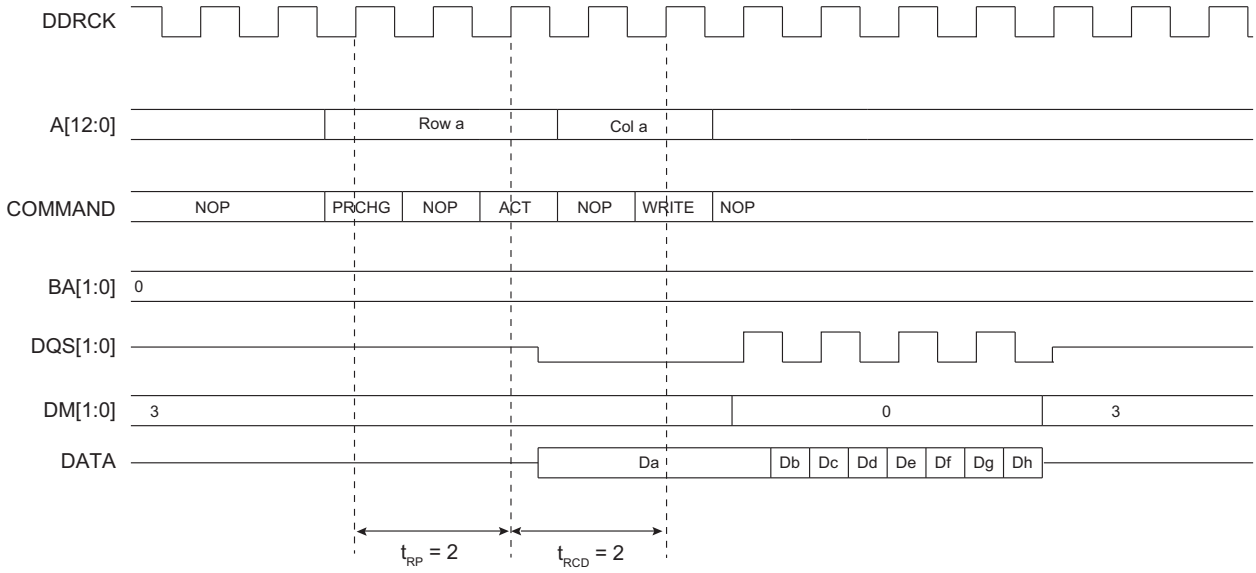

**Figure 35-5. Burst Write Access, Row Closed, DDR2-SDRAM Devices**

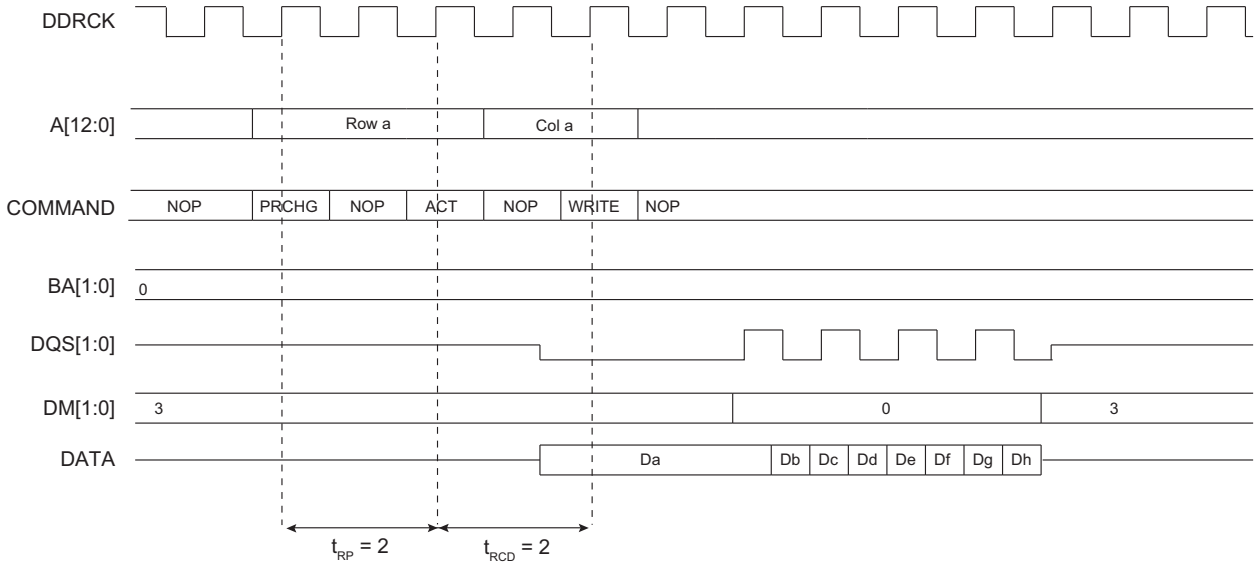
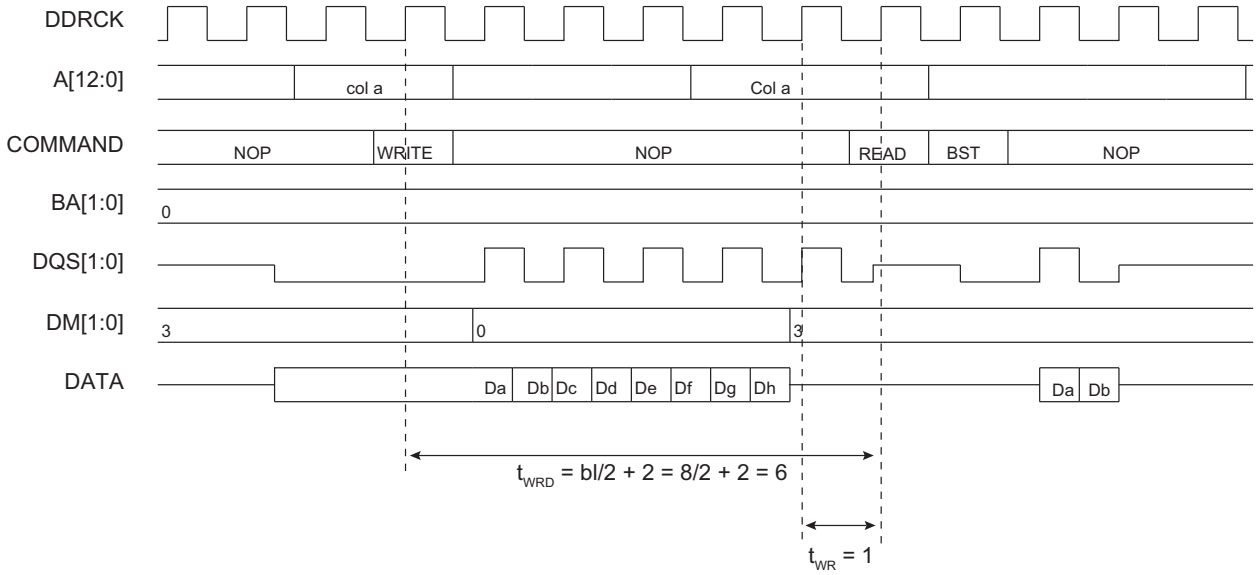


A write command can be followed by a read command. To avoid breaking the current write burst, $t_{WTR}$/ $t_{WRD}$ (bl/2 + 2 = 6 cycles) should be met. See the figure below.

**Figure 35-6. Write Command Followed by a Read Command without Burst Write Interrupt, DDR-SDRAM Devices**



In case of a single write access, write operation should be interrupted by a read access but DM must be input 1 cycle prior to the read command to avoid writing invalid data. See the figure below.

**Figure 35-7. Single Write Access Followed by a Read Access, DDR-SDRAM Devices**

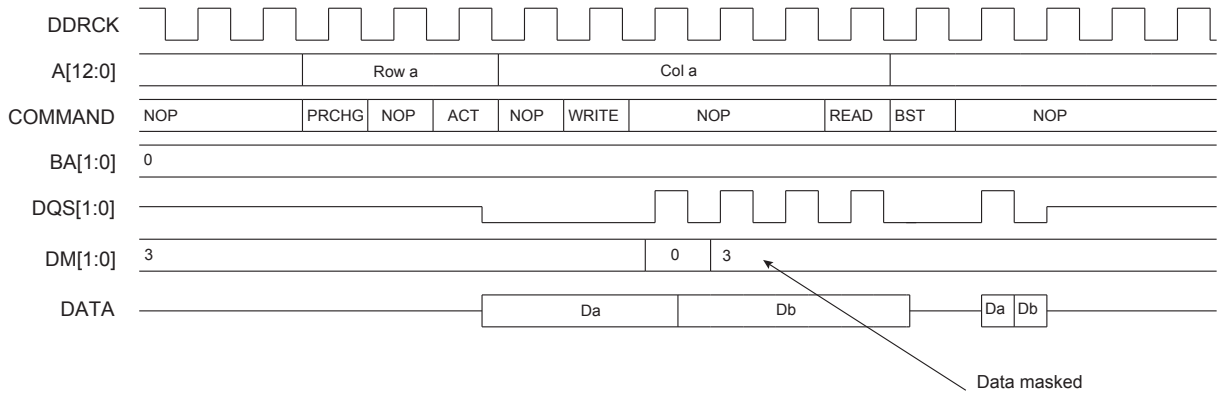


**Figure 35-8. Single Write Access Followed by a Read Access, DDR2-SDRAM Devices**

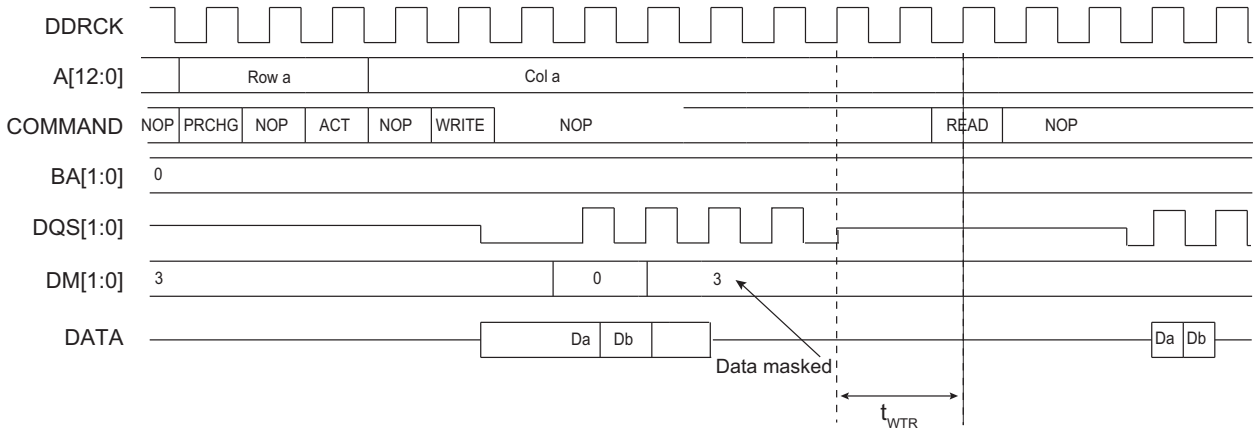

### 35.5.2 DDR-SDRAM Controller Read Cycle

The MPDDRC provides burst access or single access in Normal mode (MPDDRC_MR.MODE = 0). Whatever the access type, the MPDDRC keeps track of the active row in each bank, thus maximizing performance of the MPDDRC.

The DDR-SDRAM devices are programmed with a burst length equal to 8 which determines the length of a sequential data output by the read command that is set to 8. The latency from read command to data output depends on the memory type, as shown in the following table. This value is programmed during the initialization phase (see Product Dependencies, Initialization Sequence).

**Table 35-2. CAS Read Latency**

| Memory Devices | CAS Read Latency |
|---|---|
| Low-power DDR1-SDRAM | 2/3 |
| Low-power DDR2-SDRAM | 3 |
| DDR2-SDRAM | 3 |
| Low-power DDR3-SDRAM | 3/6 |
| DDR3-SDRAM (DLL Off) | 5/6 |

**Note:** In the case of low-power DDR3-SDRAM, the CAS Read Latency (CRL) of 3 is optional. The MPDDRC supports this feature. Refer to the low-power DDR3-SDRAM datasheet for details.

To initiate a single access, the MPDDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a read command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ($t_{RP}$) commands and active/read ($t_{RCD}$) commands. After a read command, additional wait states are generated to comply with CAS latency. The MPDDRC supports a CAS latency delay of 2, 3, 5 or 6 clock cycles. As the burst length is set to 8, in case of a single access or a burst access inferior to 8 data requests, it has to stop the burst, otherwise an additional seven or X values could be read. The Burst Stop command (BST) is used to stop output during a burst read. If the DDR2-SDRAM Burst Stop command is not supported by the JEDEC standard, in a single read access, an additional seven unwanted data will be read.

To initiate a burst access, the MPDDRC checks the transfer type signal. If the next accesses are sequential read accesses, reading to the SDRAM device is carried out. If the next access is a read non-sequential access, then an automatic page break can be inserted. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. If page access is already open, a read command is generated.

To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ($t_{RP}$) commands and active/read ($t_{RCD}$) commands. The MPDDRC supports a CAS latency delay of 2, 3, 5 or 6 clock cycles. During this delay, the controller uses internal signals to anticipate the next access and improve the performance of the controller. Depending on the latency, the MPDDRC anticipates 2, 3, 5 or 6 read accesses. In case of burst of specified length, accesses are not anticipated, but if the burst is broken (border, Busy mode, etc.), the next access is treated as an incrementing burst of unspecified length, and depending on the latency, the MPDDRC anticipates 2, 3, 5 or 6 read accesses.

For the definition of timing parameters, see MPDDRC Configuration Register.

Read accesses to the DDR-SDRAM are burst oriented and the burst length is programmed to 8. The burst length determines the maximum number of column locations that can be accessed for a given read command. When the read command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, meaning that the burst wraps within these eight columns if the boundary is reached. These eight columns are selected by addr[13:3]; addr[2:0] is used to select the starting location within the block.

In case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the DDR-SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is 0x00. Since the boundary is reached, the burst wraps. The MPDDRC takes into account this feature of the SDRAM device. In case of the DDR-SDRAM device, transfers start at address 0x04/0x08/0x0C. Two read commands are issued to avoid wrapping when the boundary is reached. The last read command may generate additional reading (1 read cmd = 4 DDR words).

To avoid additional reading, it is possible to use the burst stop command to truncate the read burst and to decrease power consumption. The DDR2-SDRAM devices do not support the burst stop command.

**Figure 35-9. Single Read Access, Row Closed, Latency = 2, DDR-SDRAM Devices**

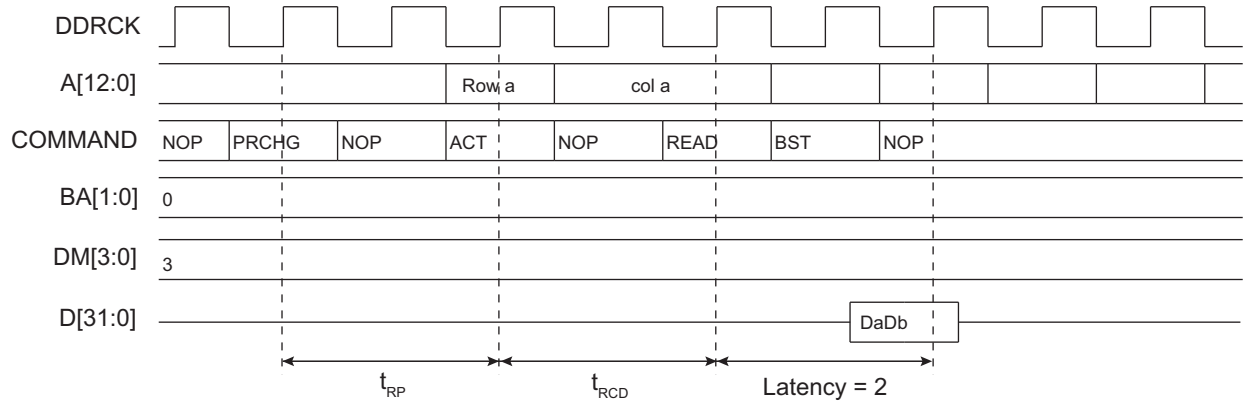

**Figure 35-10. Single Read Access, Row Closed, Latency = 3, DDR2-SDRAM Devices**

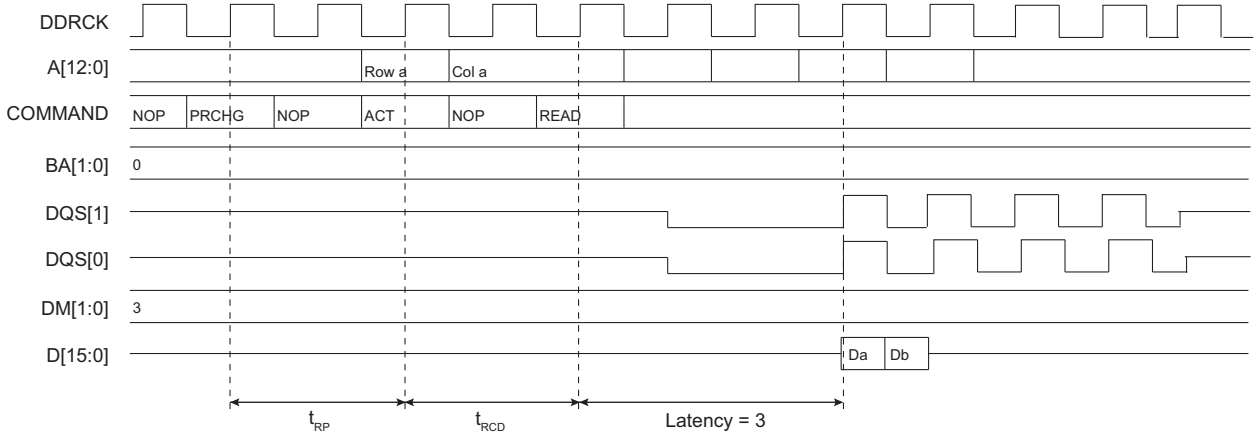

**Figure 35-11. Burst Read Access, Latency = 2, DDR-SDRAM Devices**

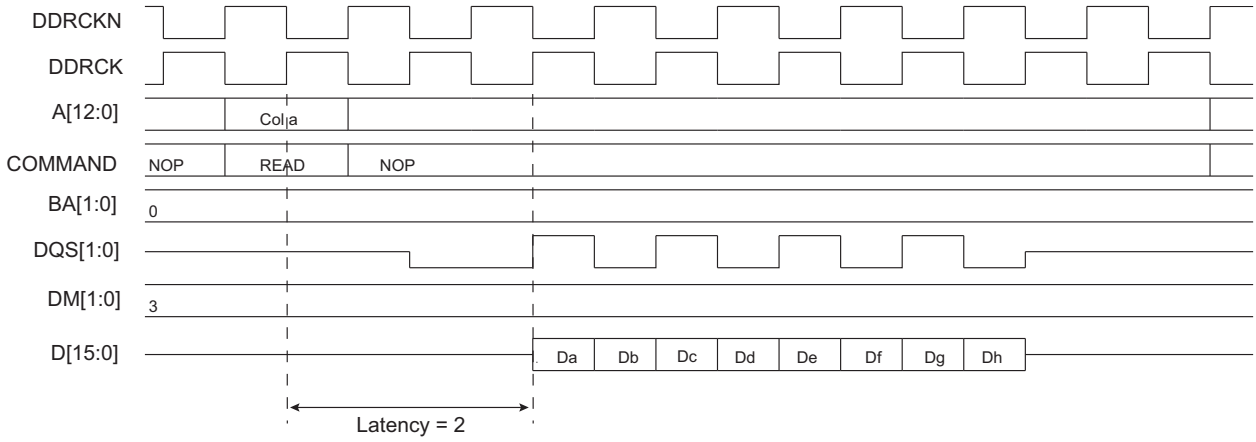

**Figure 35-12. Burst Read Access, Latency = 3, DDR2-SDRAM Devices**

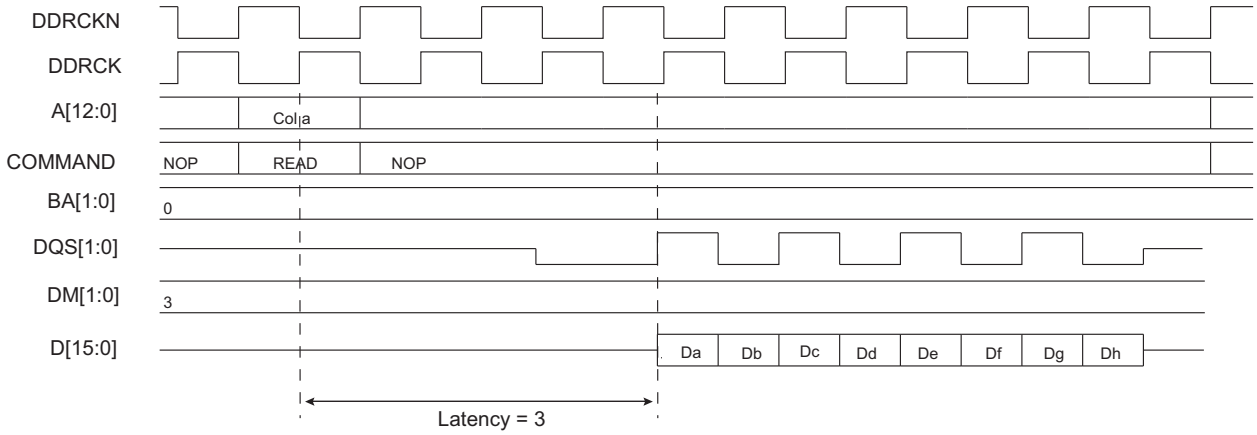

### 35.5.3 Refresh (Autorefresh Command)

#### 35.5.3.1 All Banks Autorefresh

The All Banks Autorefresh command performs a refresh operation on all banks. An autorefresh command is used to refresh the external device. Refresh addresses are generated internally by the DDR-SDRAM device and incremented after each autorefresh automatically. The MPDDRC generates these autorefresh commands periodically. A timer is loaded in the MPDDRC_RTR with the value that indicates the number of clock cycles between refresh cycles (see MPDDRC Refresh Timer Register). When the MPDDRC initiates a refresh of the DDR-SDRAM device, internal memory accesses are not delayed. However, if the CPU tries to access the DDR-SDRAM device, the slave indicates that the device is busy. A refresh request does not interrupt a burst transfer in progress. This feature is activated by setting Per-bank Refresh bit (REF_PB) to 0 in the MPDDRC_RTR (see MPDDRC Refresh Timer Register).

#### 35.5.3.2 Per-bank Autorefresh

The low-power DDR2-SDRAM and low-power DDR3-SDRAM embeds a new Per-bank Refresh command which performs a refresh operation on the bank scheduled by the bank counter in the memory device. The Per-bank Refresh command is executed in a fixed sequence order of round-robin type: “0-1-2-3-4-5-6-7-0-1-...”. The bank counter is automatically cleared upon issuing a RESET command or when exiting from Self-refresh mode, in order to ensure the synchronism between SDRAM memory device and the MPDDRC. The bank addressing for the Per-bank Refresh count is the same as established in the Single-bank Precharge command. This feature is activated by setting the Per-bank Refresh bit (REF_PB) to 1 in the MPDDRC_RTR (see MPDDRC Refresh Timer Register). This feature masks the latency due to the refresh procedure. The target bank is inaccessible during the Per-bank Refresh cycle period ($t_{RFCpb}$), however other banks within the device are accessible and may be addressed during the “Per-bank Refresh” cycle. During the REFpb operation, any bank other than the one being refreshed can be maintained in active state or accessed by a read or a write command. When the “Per-bank Refresh” cycle is completed, the affected bank will be in idle state.

#### 35.5.3.3 Adjust Autorefresh Rate

The low-power DDR2-SDRAM and low-power DDR3-SDRAM embeds an internal register, Mode register 19 (Refresh mode). The content of this register allows to adjust the interval of autorefresh operations according to temperature variation. This feature is activated by setting the Adjust Refresh bit [ADJ_REF] to 1 in the MPDDRC_RTR (see MPDDRC Refresh Timer Register). When this feature is enabled, a Mode Register Read (MRR) command is performed every 16 × $t_{REFI}$ (average time between REFRESH commands). Depending on the read value, the autorefresh interval will be modified. In case of high temperature, the interval is reduced and in case of low temperature, the interval is increased.

### 35.5.4 Power Management

#### 35.5.4.1 Self-refresh Mode

This mode is activated by configuring the Low-power Command bit (LPCB) to 1 in the MPDDRC Low-Power Register (MPDDRC_LPR).

Self-refresh mode is used in Powerdown mode, i.e., when no access to the DDR-SDRAM device is possible. In this case, power consumption is very low. In Self-refresh mode, the DDR-SDRAM device retains data without external clocking and provides its own internal clocking, thus performing its own autorefresh cycles. During the self-refresh period, CKE is driven low. As soon as the DDR-SDRAM device is selected, the MPDDRC provides a sequence of commands and exits Self-refresh mode.

The MPDDRC reenables Self-refresh mode as soon as the DDR-SDRAM device is not selected. It is possible to define when Self-refresh mode is to be enabled by configuring the TIMEOUT field in the MPDDRC_LPR:

0: Self-refresh mode is enabled as soon as the DDR-SDRAM device is not selected.

1: Self-refresh mode is enabled 64 clock cycles after completion of the last access.

2: Self-refresh mode is enabled 128 clock cycles after completion of the last access.

This controller also interfaces the low-power DDR-SDRAM. To optimize power consumption, the Low Power DDR SDRAM provides programmable self-refresh options comprised of Partial Array Self Refresh (full, half, quarter and 1/8 and 1/16 array).

Disabled banks are not refreshed in Self-refresh mode. This feature permits to reduce the self-refresh current. In case of low-power DDR1-SDRAM, the Extended Mode register controls this feature. It includes Temperature Compensated Self-refresh (TSCR) and Partial Array Self-refresh (PASR) parameters and the drive strength (DS) (see MPDDRC Low-Power Register). In case of low-power DDR2-SDRAM and low-power DDR3-SDRAM, the Mode Registers 16 and 17 control this feature, including PASR Bank Mask (BK_MASK) and PASR Segment Mask (SEG_MASK) parameters and drives strength (DS) (see MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register). These parameters are set during the initialization phase. After initialization, as soon as the PASR/DS/TCSR fields or BK_MASK/SEG_MASK/DS are modified, the memory device Extended Mode register or Mode registers 3/16/17 are automatically accessed. Thus if MPDDRC does not share an external bus with another controller, PASR/DS/TCSR and BK_MASK/SEG_MASK/DS bits are updated before entering Self-refresh mode or during a refresh command. If MPDDRC does share an external bus with another controller, PASR/DS/TCSR and BK_MASK/SEG_MASK/DS bits are also updated during a pending read or write access. This type of update depends on the UPD_MR bit (see MPDDRC Low-Power Register).

The low-power DDR1-SDRAM must remain in Self-refresh mode during the minimum of TRFC periods (see MPDDRC Timing Parameter 1 Register), and may remain in Self-refresh mode for an indefinite period.

The DDR2-SDRAM must remain in Self-refresh mode during the minimum of $t_{CKE}$ periods (see the memory device datasheet), and may remain in Self-refresh mode for an indefinite period.

The low-power DDR2-SDRAM and low-power DDR3-SDRAM must remain in Self-refresh mode for the minimum of $t_{CKESR}$ periods (see the memory device datasheet) and may remain in Self-refresh mode for an indefinite period.

The DDR3-SDRAM must remain in Self-refresh mode for the minimum of $t_{CKESR}$ periods (see the memory device datasheet) and may remain in Self-refresh mode for an indefinite period.

**Figure 35-13. Self-refresh Mode Entry, TIMEOUT = 0**

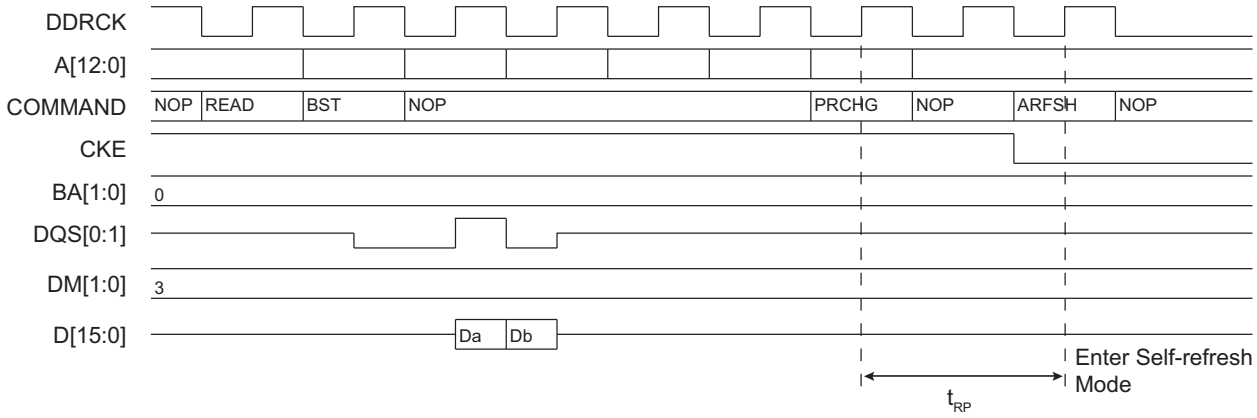

**Figure 35-14. Self-refresh Mode Entry, TIMEOUT = 1 or 2**

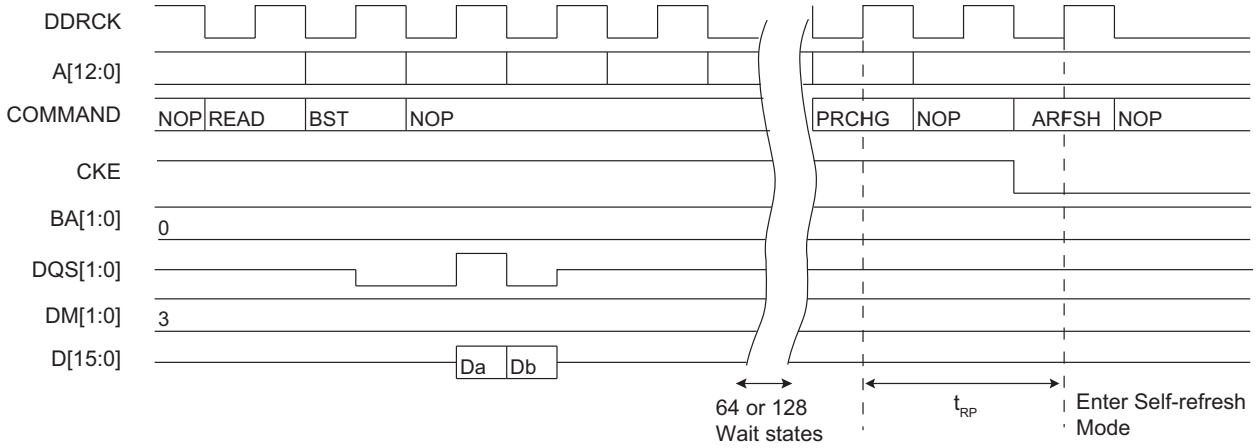

**Figure 35-15. Self-refresh Mode Exit**

### 35.5.4.2 Powerdown Mode

This mode is activated by configuring the Low-power Command bit (LPCB) to 2 in the MPDDRC Low-Power Register (MPDDRC_LPR).

Powerdown mode is used when no access to the DDR-SDRAM device is possible. In this mode, power consumption is greater than in Self-refresh mode. This state is similar to Normal mode (no Low-power

mode/no Self-refresh mode), but the CKE pin is low and the input and output buffers are deactivated as soon the DDR-SDRAM device is no longer accessible. In contrast to Self-refresh mode, the DDR-SDRAM device cannot remain in Low-power mode longer than one refresh period (64 ms/32 ms). As no autorefresh operations are performed in this mode, the MPDDRC carries out the refresh operation. For the low-power DDR-SDRAM devices, a NOP command must be generated for a minimum period defined in the TXP field of the Timing Parameter 1 register (MPDDRC_TPR1). For DDR-SDRAM devices, a NOP command must be generated for a minimum period defined in the TXP field of MPDDRC_TPR1 (see MPDDRC Timing Parameter 1 Register) and in the TXARD and TXARDS fields of MPDDRC_TPR2 (see MPDDRC Timing Parameter 2 Register) for DDR2_SDRAM devices. In addition, low-power DDR-SDRAM and DDR-SDRAM must remain in Powerdown mode for a minimum period corresponding to $t_{CKE}$, $t_{PD}$, etc. (refer to the memory device datasheet).

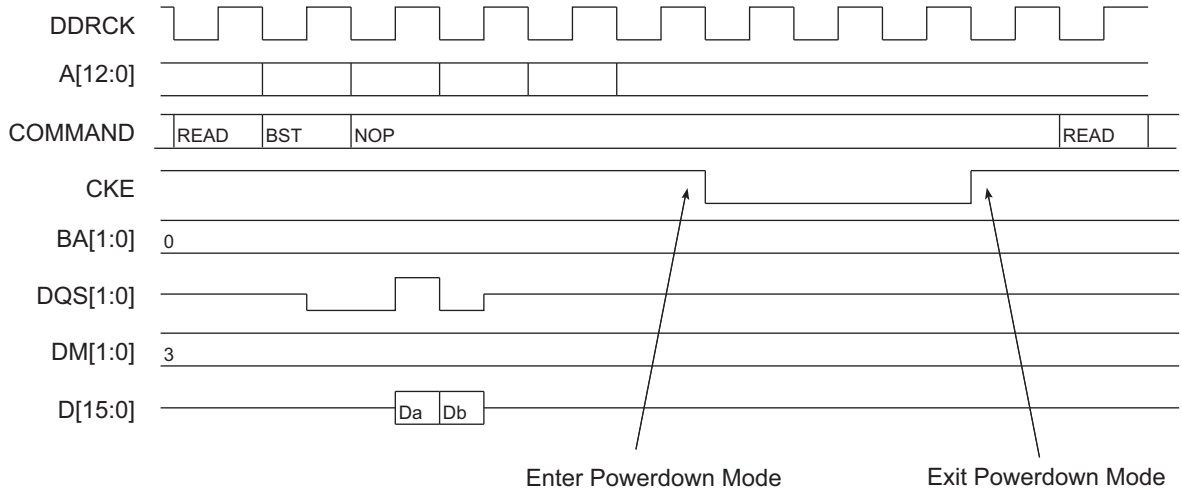
The exit procedure is faster than in Self-refresh mode. See the following figure. The MPDDRC returns to Powerdown mode as soon as the DDR-SDRAM device is not selected. It is possible to define when Powerdown mode is enabled by configuring the TIMEOUT field in the MPDDRC_LPR:

0: Powerdown mode is enabled as soon as the DDR-SDRAM device is not selected.

1: Powerdown mode is enabled 64 clock cycles after completion of the last access.

2: Powerdown mode is enabled 128 clock cycles after completion of the last access.

**Figure 35-16. Powerdown Entry/Exit, TIMEOUT = 0**



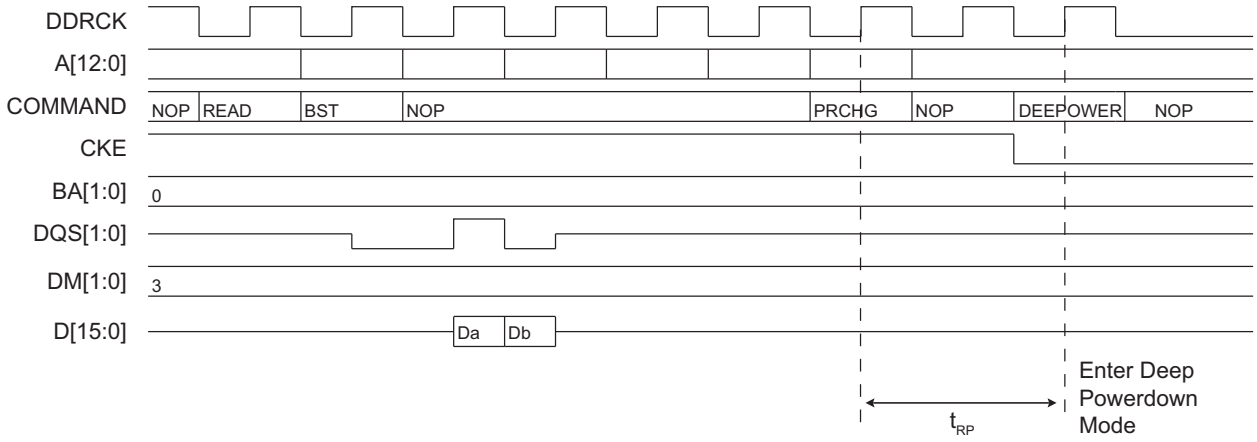
### 35.5.4.3 Deep Powerdown Mode

The Deep Powerdown mode is a feature of low-power DDR-SDRAM. When this mode is activated, all internal voltage generators inside the device are stopped and all data is lost.

Deep Powerdown mode is activated by configuring the Low-power Command bit (LPCB) to 3 in the MPDDRC Low-Power Register (MPDDRC_LPR). When this mode is enabled, the MPDDRC leaves Normal mode (MPDDRC_MR.MODE = 0) and the controller is frozen. The clock can be stopped during Deep Powerdown mode by setting the CLK_FR field to 1.

Before enabling this mode, the user must make sure there is no access in progress. To exit Deep Powerdown mode, the Low-power Command bit (LPCB) and Clock Frozen bit (CLK_FR) must be 0 and the initialization sequence must be generated by software. See Low-power DDR1-SDRAM Initialization or Low-power DDR2-SDRAM Initialization or Low-power DDR3-SDRAM Initialization.

**Figure 35-17. Deep Powerdown Mode Entry**



#### 35.5.4.4 Change Frequency During Self-Refresh Mode with Low-power DDR-SDRAM Devices and DDR3-SDRAM

To change frequency, Self-refresh mode must be activated. This is done by configuring the Low-power Command bit (LPCB) to 1 and writing a '1' to the Change Frequency Command bit (CHG_FR) in the Low-power register (MPDDRC_LPR).

Once the low-power DDR-SDRAM is in Self-refresh mode, the user must make sure there is no access in progress. Then, the user can change the clock frequency. The device input clock frequency changes only within minimum and maximum operating frequencies as specified by the low-power DDR-SDRAM and DDR3-SDRAM providers. Once the input clock frequency is changed, new stable clocks must be provided to the device before exiting from Self-refresh mode.

To exit from Self-refresh mode, the DDR-SDRAM device must be selected. The MPDDRC provides a sequence of commands and exits Self-refresh mode.

During a change frequency procedure, the Change Frequency Command bit (CHG_FR) is set to 0 automatically.

The Enable Read Measure feature is not supported during a change frequency procedure (see "ENRDM: Enable Read Measure").

It is not possible to change the frequency with DDR2-SDRAM devices.

#### 35.5.4.5 Reset Mode

The Reset mode is a feature of DDR2-SDRAM. This mode is activated by configuring the Low-power Command bit (LPCB) to 3 and writing a '1' to the Clock Frozen Command bit (CLK_FR) in the Low-power register (MPDDRC_LPR).

When this mode is enabled, the MPDDRC leaves Normal mode (MPDDRC_MR.MODE = 0) and the controller is frozen. Before enabling this mode, the user must make sure there is no access in progress.

To exit Reset mode, the Low-power Command bit (LPCB) must be configured to 0, the Clock Frozen Command bit (CLK_FR) must be written to '0' and the initialization sequence must be generated by software (see DDR2-SDRAM Initialization).

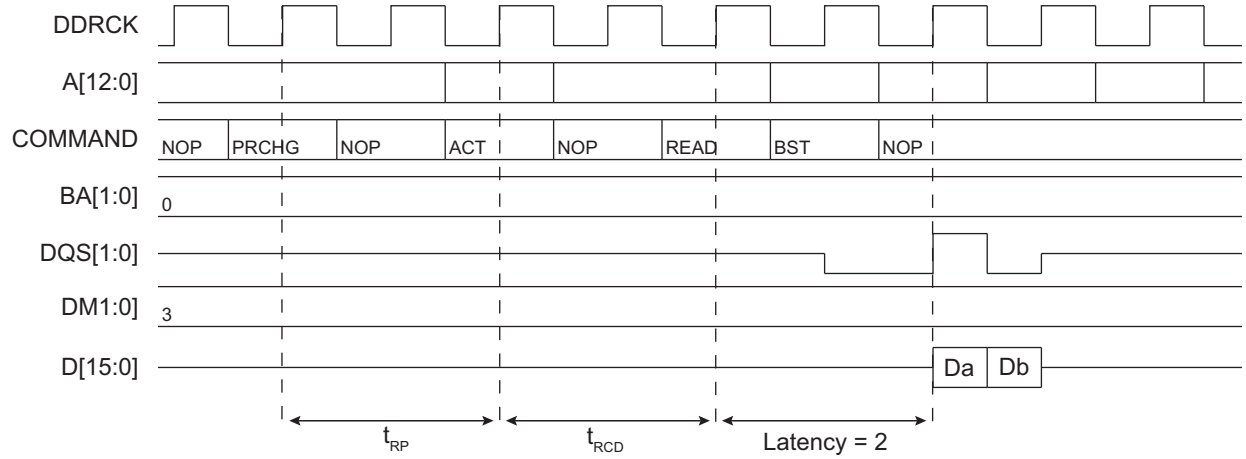
### 35.5.5 Multiport Functionality

The DDR-SDRAM protocol imposes a check of timings prior to performing a read or a write access, thus decreasing system performance. An access to DDR-SDRAM is performed if banks and rows are open (or active). To activate a row in a particular bank, the last open row must be deactivated and a new row must be open. Two DDR-SDRAM commands must be performed to open a bank: Precharge command and

Activate command with respect to $T_{RP}$ timing. Before performing a read or write command, $T_{RCD}$ timing must be checked.

This operation generates a significant bandwidth loss (see the following figure).

**Figure 35-18. $T_{RP}$ and $T_{RCD}$ Timings**

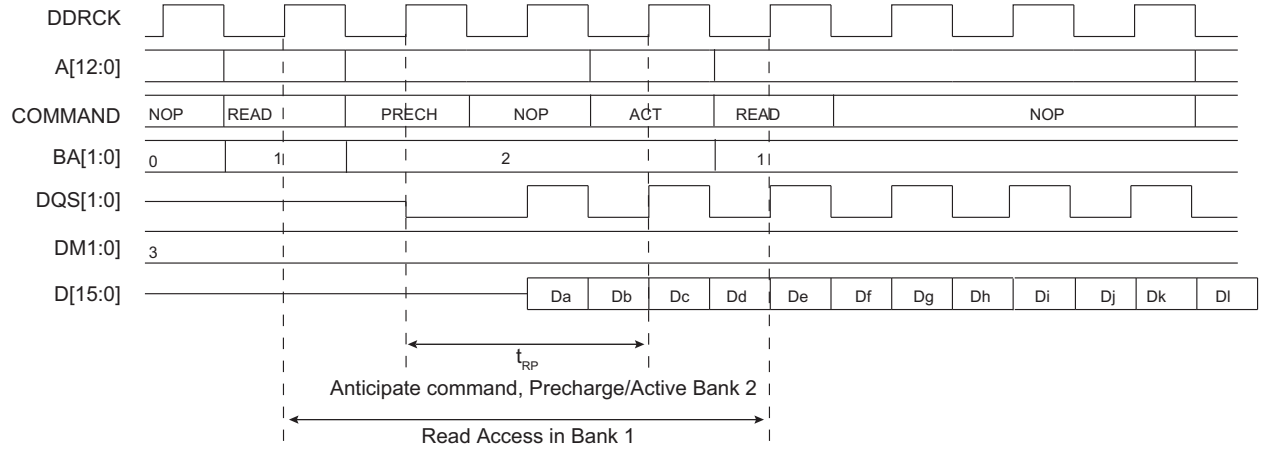


4 cycles before performing a read command

The multiport controller is designed to mask these timings and thus improve the system bandwidth.

The MPDDRC is a multiport controller whereby eight masters can simultaneously reach the controller. This feature improves the bandwidth of the system because it can detect eight requests on the AHB slave inputs and thus anticipate the commands that follow, Precharge command and Activate command in bank X during the current access in bank Y. This masks $t_{RP}$ and $t_{RCD}$ timings (see the following figure). In the best case, all accesses are done as if the banks and rows were already open. The best condition is met when the eight masters work in different banks. In the case of eight simultaneous read accesses, when the four or eight banks and associated rows are open, the controller reads with a continuous flow and masks the CAS latency for each access. To allow a continuous flow, the read command must be set at 2, 3, 5 or 6 cycles (CAS latency) before the end of the current access. The arbitration scheme must be changed since the round-robin arbitration cannot be respected. If the controller anticipates a read access, and thus a master with a high priority arises before the end of the current access, then this master will not be serviced.

**Figure 35-19. Anticipate Precharge/Activate Command in Bank 2 during Read Access in Bank 1**



MPDDRC is a multiport controller that embeds three arbitration mechanisms based on round-robin arbitration which allows to share the external device between different masters when two or more masters try to access the DDR-SDRAM device at the same time.

The three arbitration types are round-robin arbitration and two weighted round-robin arbitrations. For weighted round-robin arbitrations, the priority can be given either depending on the number of requests or words per port, or depending on the required bandwidth per port. The type of arbitration can be chosen by setting the ARB field in the Configuration Arbiter register (MPDDRC_CONF_ARBITER) (see MPDDRC Configuration Arbiter Register).

#### 35.5.5.1 Round-robin Arbitration

Round-robin arbitration is used when the ARB field is set to 0 (see MPDDRC Configuration Arbiter Register). This algorithm dispatches the requests from different masters to the DDR-SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is serviced first, then the others are serviced in a round-robin manner.

To avoid burst breaking and to provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Idle cycles: when no master is connected to the DDR-SDRAM device.
2. Single cycles: when a slave is currently doing a single access.
3. End of Burst cycles: when the current cycle is the last cycle of a burst transfer:
   - For bursts of defined length, predicted end of burst matches the size of the transfer.
   - For bursts of undefined length, predicted end of burst is generated at the end of each four-beat boundary inside the INCR transfer.
4. Anticipated Access: when an anticipated read access is done while the current access is not complete, the arbitration scheme can be changed if the anticipated access is not the next access serviced by the arbitration scheme.

#### 35.5.5.2 Request-word Weighted Round-robin Arbitration

In request-word weighted round-robin arbitration, the weight is the number of requests or the number of words per port.

This arbitration scheme is enabled by configuring the ARB field to 1 (see MPDDRC Configuration Arbiter Register). This algorithm grants a port for X(1) consecutive first transfer (htrans = NON SEQUENTIAL) of a burst or X single transfer, or for X word transfers. It is possible to choose between an arbitration scheme by request or by word per port by setting the RQ_WD_Px field (see MPDDRC Configuration Arbiter Register).

Note: 1. X is an integer value provided by some master modules to the arbiter.

It is also possible for the user to provide the number of requests or words (by overwriting the information provided by a master) on master basis by configuring the MA_PR_Px field. Depending on the application, it is possible to reduce or increase the number of these requests or words by configuring the NRD_NWD_BDW_Px fields (see MPDDRC Configuration Arbiter Register).

The TIMEOUT_Px field defines the delay between two accesses on the same port in number of cycles before rearbitrating the access to another port. This field allows to avoid a timeout on the system because some masters have the particularity to add idle cycles between two consecutive accesses (see MPDDRC Configuration Arbiter Register).

This algorithm dispatches the requests from different masters to the DDR-SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is

serviced first, then the others are serviced in a round-robin manner when the number of requests or words is reached or when the timeout value is reached.

To avoid burst breaking and to provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Timeout is reached: the delay between two accesses is equal to TIMEOUT_Px.
2. Number of requests or words is reached: when the current cycle is the last cycle of a transfer.

#### 35.5.5.3 Bandwidth Weighted Round-robin Arbitration

In bandwidth weighted round-robin arbitration, a minimum bandwidth is guaranteed per port.

This arbitration scheme is enabled when the ARB field is set to 2 (see MPDDRC Configuration Arbiter Register).

This algorithm grants to each port a percentage of the bandwidth. The NRD_NWD_BDW_Px field defines the percentage allocated to each port.

The percentage of the bandwidth is programmed with the NRD_NWD_BDW_Px fields (see MPDDRC Configuration Arbiter Register).

The TIMEOUT_Px field defines the delay between two accesses on the same port in number of cycles rearbitrating the access to another port. This field allows to avoid a timeout on the system because some masters have the particularity to add idle cycles between two consecutive accesses (see MPDDRC Configuration Arbiter Register).

This algorithm dispatches the requests from different masters to the DDR-SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is serviced first, then the others are serviced in a round-robin manner when the allocated bandwidth is reached or when the timeout value is reached.

The BDW_BURST field allows to arbitrate either when the current master reaches exactly the programmed bandwidth, or when the current master reaches exactly the programmed bandwidth and the current access is ended (see MPDDRC Configuration Arbiter Register).

To provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Timeout is reached: the delay between two accesses is equal to TIMEOUT_Px.
2. Allocated Bandwidth is reached although the current cycle is not ended.
3. Allocated Bandwidth is reached and the current cycle is the last cycle of a transfer.

### 35.5.6 Scrambling/Unscrambling Function

The external data bus can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling method depends on two user-configurable key registers, KEY1 in the “MPDDRC OCMS KEY1 Register” and KEY2 in the “MPDDRC OCMS KEY2 Register”. These key registers are only accessible in Write mode.

The key must be securely stored in a reliable non-volatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

The scrambling/unscrambling function can be enabled or disabled by programming the "MPDDRC OCMS Register".

### 35.5.7 Register Write Protection

To prevent any single software error from corrupting MPDDRC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the MPDDRC Write Protection Mode Register (MPDDRC_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the MPDDRC Write Protection Status Register (MPDDRC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading MPDDRC_WPSR.

The following registers are write-protected when the bit WPEN is set:

- MPDDRC Mode Register
- MPDDRC Refresh Timer Register
- MPDDRC Configuration Register
- MPDDRC Timing Parameter 0 Register
- MPDDRC Timing Parameter 1 Register
- MPDDRC Memory Device Register
- MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register
- MPDDRC OCMS Register
- MPDDRC OCMS KEY1 Register
- MPDDRC OCMS KEY2 Register

### 35.5.8 Monitor

The MPDDRC embeds a monitor which collects bus transaction information from four/eight ports of MPDDRC. This information, such as accumulated latency (MPDDRC Monitor Information Port x Register (TOTAL_LATENCY)) or number of transfers (MPDDRC Monitor Information Port x Register (NB_TRANSFERS)), can be used to calculate the average latency for each port.

Configuration registers ("MPDDRC Monitor Configuration Register", "MPDDRC Monitor Address High/Low Port x Register") are used to define the type of transaction collected (read, write or read/write) and the address range snooped.

Before enabling the monitor, the address range must be defined. This space will be snooped. To enable the monitor, the "EN_MONI: Enable Monitor" bit must be set to 1 and the "RUN: Control Monitor" bit must be set to 1.

## 35.6 Software Interface/SDRAM Organization, Address Mapping

The DDR-SDRAM address space is organized into banks, rows and columns. The MPDDRC maps different memory types depending on values set in the Configuration register (MPDDRC_CR) (see MPDDRC Configuration Register). The tables that follow illustrate the relation between CPU addresses and columns, rows and banks addresses for 16/32-bit memory data bus widths.

The MPDDRC supports address mapping in Linear mode.

Sequential mode is a method for address mapping where banks alternate at each last DDR-SDRAM page of the current bank.

Interleaved mode is a method for address mapping where banks alternate at each DDR-SDRAM end of page of the current bank.

The MPDDRC makes the DDR-SDRAM device access protocol transparent to the user. The tables that follow illustrate the DDR-SDRAM device memory mapping seen by the user in correlation with the device structure. Various configurations are illustrated.

### 35.6.1 DDR-SDRAM Address Mapping for 16-bit Memory Data Bus Width

### 35.7.1 MPDDRC Mode Register

**Name:** MPDDRC_MR
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | MRS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | DAI | | MODE[2:0] | | |
| Access | | | | R | | R/W | R/W | R/W |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bits 15:8 – MRS[7:0]** Mode Register Select LPDDR2/LPDDR3
Configure this 8-bit field to program all mode registers included in the low-power DDR2-SDRAM device. This field is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

**Bit 4 – DAI** Device Auto-initialization Status
This field reports when the device auto-initialization is complete. When Backup mode is used, this information is lost after Backup mode exit.

| Value | Name | Description |
|---|---|---|
| 0 | DAI_COMPLETE | DAI complete |
| 1 | DAI_IN_PROGESSS | DAI still in progress |

**Bits 2:0 – MODE[2:0]** MPDDRC Command Mode
This field defines the command issued by the MPDDRC when the SDRAM device is accessed. This register is used to initialize the SDRAM device and to activate Deep Powerdown mode.

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL_CMD | Normal Mode. Any access to the MPDDRC is decoded normally. To activate this mode, the command must be followed by a write to the DDR-SDRAM. |

| Value | Name | Description |
|---|---|---|
| 1 | NOP_CMD | The MPDDRC issues a NOP command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM. |
| 2 | PRCGALL_CMD | The MPDDRC issues the All Banks Precharge command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM. |
| 3 | LMR_CMD | The MPDDRC issues a Load Mode Register command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM. |
| 4 | RFSH_CMD | The MPDDRC issues an Autorefresh command when the DDR-SDRAM device is accessed regardless of the cycle. Previously, an All Banks Precharge command must be issued. To activate this mode, the command must be followed by a write to the DDR-SDRAM. |
| 5 | EXT_LMR_CMD | The MPDDRC issues an Extended Load Mode Register command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM. The write in the DDR-SDRAM must be done in the appropriate bank. |
| 6 | DEEP_CALIB_MD | Deep Power mode: Access to Deep Powerdown mode<br>Calibration command: to calibrate RTT and RON values for the Process Voltage Temperature (PVT) (DDR3-SDRAM device) |
| 7 | LPDDR2_LPDDR3_CMD | The MPDDRC issues an LPDDR2/LPDDR3 Mode Register command when the device is accessed regardless of the cycle. To activate this mode, the Mode Register command must be followed by a write to the low-power DDR2-SDRAM or to the low-power DDR3-SDRAM. |

### 35.7.2 MPDDRC Refresh Timer Register

**Name:** MPDDRC_RTR
**Offset:** 0x04
**Reset:** 0x00300000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | MR4_VALUE[2:0] | | | | | REF_PB | ADJ_REF |
| Access | | R | R | R | | | R/W | R/W |
| Reset | | 0 | 1 | 1 | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | COUNT[11:8] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 22:20 – MR4_VALUE[2:0]** Content of MR4 Register
This field gives the content of MR4 register. This field is updated when MRR command is generated and Adjust Refresh.

Rate bit is enabled. Update is done when read value is different from MR4_VALUE.

This mode is unique to the low-power DDR2-SDRAM devices and LPDDR3 JEDEC memory standards impose derating LPDDR2/LPDDR3 AC timings ($t_{RCD}$, $t_{RC}$, $t_{RAS}$, $t_{RP}$ and $t_{RRD}$) when the value of MR4 is equal to 6. If the application needs to work in extreme conditions, the derating value must be added to AC timings before the power up sequence.

This mode is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

**Bit 17 – REF_PB** Refresh Per Bank
This mode is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

| Value | Description |
|---|---|
| 0 | Refresh all banks during autorefresh operation. |
| 1 | Refresh the scheduled bank by the bank counter in the memory interface. |

**Bit 16 – ADJ_REF** Adjust Refresh Rate
This mode is unique to the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

| Value | Description |
|---|---|
| 0 | Adjust refresh rate is not enabled. |
| 1 | Adjust refresh rate is enabled. |

**Bits 11:0 – COUNT[11:0]** MPDDRC Refresh Timer Count
This 12-bit field is loaded into a timer which generates the refresh pulse. Each time the refresh pulse is generated, a refresh sequence is initiated.

The SDRAM requires Auto-refresh cycles at an average periodic interval of $T_{refi}$. The value to be loaded depends on the MPDDRC clock frequency MCK (Master Clock) and average periodic interval of $T_{refi}$.

For example, for an SDRAM with $T_{refi}$ = 7.8 µs and a 133 MHz (7.5 ns) Master clock, the value of the COUNT field is configured: $((7.8 \times 10^{-6}) / (7.5 \times 10^{-9})) = 1040$ or 0x0410.

Low-power DDR2-SDRAM and low-power DDR3-SDRAM devices support Per Bank Refresh operation. In this configuration, average time between refresh command is 0.975 µs. The value of the COUNT field is configured depending on this value. For example, the value of a 133 MHz Master clock refresh timer is 130 or 0x82.

### 35.7.3 MPDDRC Configuration Register

**Name:** MPDDRC_CR
**Offset:** 0x08
**Reset:** 0x00207024
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | UNAL | DECOD | NDQS | NB | LC_LPDDR1 | | ENRDM | DQMS |
| Access | R/W | R/W | R/W | R/W | R/W | | R/W | R/W |
| Reset | 0 | 0 | 1 | 0 | 0 | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | OCD[2:0] | | | ZQ[1:0] | | DIS_DLL | DIC_DS |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DLL | CAS[2:0] | | | NR[1:0] | | NC[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |

**Bit 23 – UNAL** This bit must always be written to 1

**Bit 22 – DECOD** Type of Decoding

| Value | Name | Description |
|---|---|---|
| 0 | SEQUENTIAL | Method for address mapping where banks alternate at each last DDR-SDRAM page of the current bank. |
| 1 | INTERLEAVED | Method for address mapping where banks alternate at each DDR-SDRAM end of page of the current bank. |

**Bit 21 – NDQS** Not DQS.
This bit is found only in the DDR2-SDRAM devices.

| Value | Name | Description |
|---|---|---|
| 0 | ENABLED | Not DQS is enabled |
| 1 | DISABLED | Not DQS is disabled |

**Bit 20 – NB** Number of Banks
LC_LPDDR1 is set to 1, NB is not relevant.

| Value | Name | Description |
|---|---|---|
| 0 | 4_BANKS | 4-bank memory devices |
| 1 | 8_BANKS | 8 banks. Only possible when using DDR2-SDRAM and low-power DDR2-SDRAM and DDR3-SDRAM and low-power DDR3-SDRAM devices. |

**Bit 19 – LC_LPDDR1** Low-cost Low-power DDR1

| Value | Name | Description |
|---|---|---|
| 0 | NOT_2_BANKS | Any type of memory devices except of low cost, low density Low Power DDR1. |
| 1 | 2_BANKS_LPDDR1 | Low-cost and low-density low-power DDR1. These devices have a density of 32 Mbits and are organized as two internal banks. To use this feature, the user has to define the type of memory and the data bus width (see 35.7.8 MPDDRC_MD).<br>The 16-bit memory device is organized as 2 banks, 9 columns and 11 rows.<br>The 32-bit memory device is organized as 2 banks, 8 columns and 11 rows.<br>It is impossible to use two 16-bit memory devices (2 x 32 Mbits) for creating one 32-bit memory device (64 Mbits). In this case, it is recommended to use one 32-bit memory device which embeds four internal banks. |

**Bit 17 – ENRDM** Enable Read Measure
This feature is not supported during a change frequency. See "CHG_FRQ: Change Clock Frequency During Self-refresh Mode".

| Value | Name | Description |
|---|---|---|
| 0 | OFF | DQS/DDR_DATA phase error correction is disabled |
| 1 | ON | DQS/DDR_DATA phase error correction is enabled |

**Bit 16 – DQMS** Mask Data is Shared

| Value | Name | Description |
|---|---|---|
| 0 | NOT_SHARED | DQM is not shared with another controller |
| 1 | SHARED | DQM is shared with another controller |

**Bits 14:12 – OCD[2:0]** Off-chip Driver
SDRAM Controller supports only two values for OCD (default calibration and exit from calibration). These values MUST always be programmed during the initialization sequence. The default calibration must be programmed first, after which the exit calibration and maintain settings must be programmed.

This field is found only in the DDR2-SDRAM devices.

| Value | Name | Description |
|---|---|---|
| 0 | DDR2_EXITCALIB | Exit from OCD Calibration mode and maintain settings |
| 7 | DDR2_DEFAULT_CALIB | OCD calibration default |

**Bits 11:10 – ZQ[1:0]** ZQ Calibration
This parameter is used to calibrate DRAM On resistance (Ron) values over PVT.

This field is found only in the low-power DDR2-SDRAM devices and low-power DDR3-SDRAM devices.

| Value | Name | Description |
|---|---|---|
| 0 | INIT | Calibration command after initialization |
| 1 | LONG | Long calibration |
| 2 | SHORT | Short calibration |
| 3 | RESET | ZQ Reset |

**Bit 9 – DIS_DLL** DISABLE DLL
This value is used during the powerup sequence. It is only found in the DDR2-SDRAM devices and DDR3-SDRAM devices and low-power DDR3-SDRAM devices.

| Value | Description |
|---|---|
| 0 | Enable DLL. |
| 1 | Disable DLL. |

**Bit 8 – DIC_DS** Output Driver Impedance Control (Drive Strength)
This bit name is described as “DS” in some memory datasheets. It defines the output drive strength. This value is used during the powerup sequence.

For DDR3-SDRAM devices, this field is equivalent to ODS, Output Drive Strength.

This bit is found only in the DDR2-SDRAM devices and DDR3-SDRAM devices.

| Value | Name | Description |
|---|---|---|
| 0 | DDR2_NORMALSTRENGTH_DDR3_RZQ_6 | Normal drive strength (DDR2) - RZQ_6 (40 [NOM], DDR3) |
| 1 | DDR2_WEAKSTRENGTH_DDR3_RZQ_7 | Weak drive strength (DDR2) - RZQ_7 (34 [NOM], DDR3) |

**Bit 7 – DLL** Reset DLL
This bit defines the value of Reset DLL.

This value is used during the powerup sequence.

This bit is found only in the DDR2-SDRAM devices and DDR3-SDRAM devices.

| Value | Name | Description |
|---|---|---|
| 0 | RESET_DISABLED | Disable DLL reset |
| 1 | RESET_ENABLED | Enable DLL reset |

**Bits 6:4 – CAS[2:0]** CAS Latency
In the case of DDR3-SDRAM devices, the CAS field must be set to 5 and the SHIFT_SAMPLING field must be set to 2. See “SHIFT_SAMPLING: Shift Sampling Point of Data”. This field is not used to set the DDR3-SDRAM. In the case of DDR3-SDRAM devices, the DLL Off mode sets the CAS Read Latency (CRL) and the CAS Write Latency (CWL) to 6. The latency is automatically set by the controller.

| Value | Name | Description |
|---|---|---|
| 2 | DDR_CAS2 | LPDDR1 CAS Latency 2 |
| 3 | DDR_CAS3 | LPDDR3/DDR2/LPDDR2/LPDDR1 CAS Latency 3 |
| 5 | DDR_CAS5 | DDR3 CAS Latency 5 |
| 6 | DDR_CAS6 | DDR3/LPDDR3 CAS Latency 6 |

© 2018 Microchip Technology Inc.

**Bits 3:2 – NR[1:0]** Number of Row Bits

| Value | Name | Description |
|---|---|---|
| 0 | 11_ROW_BITS | 11 bits to define the row number, up to 2048 rows |
| 1 | 12_ROW_BITS | 12 bits to define the row number, up to 4096 rows |
| 2 | 13_ROW_BITS | 13 bits to define the row number, up to 8192 rows |
| 3 | 14_ROW_BITS | 14 bits to define the row number, up to 16384 rows |

**Bits 1:0 – NC[1:0]** Number of Column Bits

| Value | Name | Description |
|---|---|---|
| 0 | DDR9_MDDR8_COL_BITS | 9 bits to define the column number, up to 512 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM<br>8 bits to define the column number, up to 256 columns, for LPDDR1-SDRAM |
| 1 | DDR10_MDDR9_COL_BITS | 10 bits to define the column number, up to 1024 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM<br>9 bits to define the column number, up to 512 columns, for LPDDR1-SDRAM |
| 2 | DDR11_MDDR10_COL_BITS | 11 bits to define the column number, up to 2048 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM<br>SDRAM<br>10 bits to define the column number, up to 1024 columns, for LPDDR1-SDRAM |
| 3 | DDR12_MDDR11_COL_BITS | 12 bits to define the column number, up to 4096 columns, for DDR2/DDR3/LPDDR2/LPDDR3-SDRAM<br>11 bits to define the column number, up to 2048 columns, for LPDDR1-SDRAM |

### 35.7.4 MPDDRC Timing Parameter 0 Register

**Name:** MPDDRC_TPR0
**Offset:** 0x0C
**Reset:** 0x20227225
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | TMRD[3:0] | | | | | TWTR[2:0] | | |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 1 | 0 | | 0 | 0 | 0 |

| | TRCD[3:0] | | | | TRAS[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |

**Bits 31:28 – TMRD[3:0]** Load Mode Register Command to Activate or Refresh Command
This field defines the delay between a Load mode register command and an Activate or Refresh command in number of DDRCK clock cycles. The number of cycles is between 0 and 15. For low-power DDR2-SDRAM and low-power DDR3-SDRAM, this field is equivalent to $t_{MRW}$.

**Bits 26:24 – TWTR[2:0]** Internal Write to Read Delay
This field defines the internal Write to Read command time in number of DDRCK clock cycles. The number of cycles is between 1 and 7.

**Bits 23:20 – TRRD[3:0]** Active BankA to Active BankB
This field defines the delay between an Activate command in BankA and an Activate command in BankB in number of DDRCK clock cycles. The number of cycles is between 1 and 15.

**Bits 19:16 – TRP[3:0]** Row Precharge Delay
This field defines the delay between a Precharge command and another command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 15:12 – TRC[3:0]** Row Cycle Delay
This field defines the delay between an Activate command and a Refresh command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 11:8 – TWR[3:0]** Write Recovery Delay
This field defines the Write Recovery Time in number of DDRCK clock cycles. The number of cycles is between 1 and 15.

**Bits 7:4 – TRCD[3:0]** Row to Column Delay
This field defines the delay between an Activate command and a Read/Write command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 3:0 – TRAS[3:0]** Active to Precharge Delay
This field defines the delay between an Activate command and a Precharge command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

### 35.7.5 MPDDRC Timing Parameter 1 Register

**Name:** MPDDRC_TPR1
**Offset:** 0x10
**Reset:** 0x03C80808
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | TXP[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 1 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | TXSNR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | TRFC[6:0] | | | | | | |
| Access | | | | | | | | |
| Reset | | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

**Bits 27:24 – TXP[3:0]** Exit Powerdown Delay to First Command
This field defines the delay between CKE set high and a valid command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 23:16 – TXSRD[7:0]** Exit Self-refresh Delay to Read Command
This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 255.

This field is found only in DDR2-SDRAM and DDR3-SDRAM devices.

In case of DDR3-SDRAM, this field is equivalent to $t_{XSDLL}$. In DLL Off mode, this timing is not used. The field must be set to 0.

**Bits 15:8 – TXSNR[7:0]** Exit Self-refresh Delay to Non-Read Command
This field defines the delay between CKE set high and a Non Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 255. This field is used by the DDR-SDRAM devices. In case of low-power DDR-SDRAM, this field is equivalent to $t_{XSR}$. In case of DDR3-SDRAM, this field is equivalent to $t_{XS}$.

**Bits 6:0 – TRFC[6:0]** Row Cycle Delay
This field defines the delay between a Refresh command or a Refresh and Activate command in number of DDRCK clock cycles. The number of cycles is between 0 and 127.

In case of low-power DDR2-SDRAM and low-power DDR3-SDRAM, this field is equivalent to $t_{RFCab}$. If the user enables the function “Refresh Per Bank” (see “REF_PB: Refresh Per Bank”), this field is equivalent to $t_{RFCpb}$.

### 35.7.6 MPDDRC Timing Parameter 2 Register

**Name:** MPDDRC_TPR2
**Offset:** 0x14
**Reset:** 0x00042062
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | TFAW[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 1 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | TRTP[2:0] | | | TRPA[3:0] | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXARDS[3:0] | | | | TXARD[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 0 |

**Bits 19:16 – TFAW[3:0]** Four Active Windows
DDR2 and DDR3 devices with eight banks (1 Gbit or larger) have an additional requirement concerning $t_{FAW}$ timing. This requires that no more than four Activate commands may be issued in any given $t_{FAW}$ (MIN) period.

The number of cycles is between 0 and 15.

This field is found only in DDR2-SDRAM and LPDDR2-SDRAM and DDR3-SDRAM and LPDDR3-SDRAM devices.

**Bits 14:12 – TRTP[2:0]** Read to Precharge
This field defines the delay between a Read command and a Precharge command in number of DDRCK clock cycles.

The number of cycles is between 0 and 7.

**Bits 11:8 – TRPA[3:0]** Row Precharge All Delay
This field defines the delay between a Precharge All Banks command and another command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

In the case of LPDDR2-SDRAM and LPDDR3-SDRAM, this field is equivalent to $t_{RPAB}$.

**Bits 7:4 – TXARDS[3:0]** Exit Active Power Down Delay to Read Command in Mode “Slow Exit”
This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

**Bits 3:0 – TXARD[3:0]** Exit Active Power Down Delay to Read Command in Mode “Fast Exit”
This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

### 35.7.7 MPDDRC Low-Power Register

**Name:** MPDDRC_LPR
**Offset:** 0x1C
**Reset:** 0x00010000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | SELF_DONE | CHG_FRQ |
| Access | | | | | | | R | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | UPD_MR[1:0] | | | | | APDE |
| Access | | | R/W | R/W | | | | R/W |
| Reset | | | 0 | 0 | | | | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | TIMEOUT[1:0] | | | DS[2:0] | | |
| Access | | | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | 0 | 0 | | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | PASR[2:0] | | | LPDDR2_LPDDR3_PWOFF | CLK_FR | LPCB[1:0] | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 25 – SELF_DONE** Self-refresh is Done
This bit indicates that external device is in Self-refresh mode.

**Bit 24 – CHG_FRQ** Change Clock Frequency During Self-refresh Mode
This mode allows to change the Low-power DDR-DRAM input clock frequency. This mode is unique to the Low-power DDR-DRAM devices.

**Bits 21:20 – UPD_MR[1:0]** Update Load Mode Register and Extended Mode Register
This bit is used to enable or disable automatic update of the Load Mode Register and Extended Mode Register. This update depends on the MPDDRC integration in a system. MPDDRC can either share or not an external bus with another controller.

| Value | Name | Description |
|---|---|---|
| 0 | NO_UPDATE | Update of Load Mode and Extended Mode registers is disabled. |
| 1 | UPDATE_SHAREDBUS | MPDDRC shares an external bus. Automatic update is done during a refresh command and a pending read or write access in the SDRAM device. |
| 2 | UPDATE_NOSHAREDBUS | MPDDRC does not share an external bus. Automatic update is done before entering Self-refresh mode. |

| Value | Name | Description |
|---|---|---|
| 3 | – | Reserved |

**Bit 16 – APDE** Active Power Down Exit Time
This mode is unique to the DDR2-SDRAM and DDR3-SDRAM devices.

This mode manages the active Powerdown mode which determines performance versus power saving.

After the initialization sequence, as soon as the APDE field is modified, the Extended Mode Register (located in the memory of the external device) is accessed automatically and APDE bits are updated. Depending on the UPD_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access

| Value | Name | Description |
|---|---|---|
| 0 | DDR2_FAST_EXIT | Fast Exit from Power Down. DDR2-SDRAM and DDR3-SDRAM devices only. |
| 1 | DDR2_SLOW_EXIT | Slow Exit from Power Down. DDR2-SDRAM and DDR3-SDRAM devices only. |

**Bits 13:12 – TIMEOUT[1:0]** Time Between Last Transfer and Low-Power Mode
This field defines when Low-power mode is activated.

| Value | Name | Description |
|---|---|---|
| 0 | NONE | SDRAM Low-power mode is activated immediately after the end of the last transfer. |
| 1 | DELAY_64_CLK | SDRAM Low-power mode is activated 64 clock cycles after the end of the last transfer. |
| 2 | DELAY_128_CLK | SDRAM Low-power mode is activated 128 clock cycles after the end of the last transfer. |
| 3 | – | Reserved |

**Bits 10:8 – DS[2:0]** Drive Strength
This field is unique to low-power DDR1-SDRAM. It selects the output drive strength.

After the initialization sequence, as soon as the DS field is modified, the Extended Mode Register is accessed automatically and DS bits are updated. Depending on the UPD_MR bit, update is done before entering self-refresh mode or during a refresh command and a pending read or write access.

| Value | Name | Description |
|---|---|---|
| 0 | DS_FULL | Full drive strength |
| 1 | DS_HALF | Half drive strength |
| 2 | DS_QUARTER | Quarter drive strength |
| 3 | DS_OCTANT | Octant drive strength |
| 4–7 | – | Reserved |

**Bits 6:4 – PASR[2:0]** Partial Array Self-refresh
This field is unique to low-power DDR1-SDRAM. It is used to specify whether only one-quarter, one-half or all banks of the DDR-SDRAM array are enabled. Disabled banks are not refreshed in Self-refresh mode.

The values of this field are dependent on the low-power DDR-SDRAM devices.

After the initialization sequence, as soon as the PASR field is modified, the Extended Mode Register in the external device memory is accessed automatically and PASR bits are updated. Depending on the UPD_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

**Bit 3 – LPDDR2_LPDDR3_PWOFF** LPDDR2/3 Power Off Bit
LPDDR2/3 power off sequence must be controlled to preserve the LPDDR2/3 device. The power failure is handled at system level (IRQ or FIQ) and the LPDDR2/3 power off sequence is applied using the LPDDR2_LPDDR3_PWOFF bit.

LPDDR2_LPDDR3_PWOFF bit is used to impose CKE low before a power off sequence. Uncontrolled power off sequence can be applied only up to 400 times in the life of a LPDDR2/3 device.

| Value | Name | Description |
|---|---|---|
| 0 | DISABLED | No power-off sequence applied to LPDDR2/3. |
| 1 | ENABLED | A power-off sequence is applied to the LPDDR2/3 device. CKE is forced low. |

**Bit 2 – CLK_FR** Clock Frozen Command Bit
This field sets the clock low during Powerdown mode. Some DDR-SDRAM devices do not support freezing the clock during Powerdown mode. Refer to the relevant DDR-SDRAM device datasheet for details.

| Value | Name | Description |
|---|---|---|
| 0 | DISABLED | Clock(s) is/are not frozen. |
| 1 | ENABLED | Clock(s) is/are frozen. |

**Bits 1:0 – LPCB[1:0]** Low-power Command Bit

| Value | Name | Description |
|---|---|---|
| 0 | NOLOWPOWER | Low-power feature is inhibited. No Powerdown, Self-refresh and Deep power modes are issued to the DDR-SDRAM device. |
| 1 | SELFREFRESH | The MPDDRC issues a self-refresh command to the DDR-SDRAM device, the clock(s) is/are deactivated and the CKE signal is set low. The DDR-SDRAM device leaves the Self-refresh mode when accessed and reenters it after the access. |
| 2 | POWERDOWN | The MPDDRC issues a Powerdown command to the DDR-SDRAM device after each access, the CKE signal is set low. The DDR-SDRAM device leaves the Powerdown mode when accessed and reenters it after the access. |
| 3 | DEEPPOWERDOWN | The MPDDRC issues a Deep Powerdown command to the low-power DDR-SDRAM device. |

### 35.7.8 MPDDRC Memory Device Register

**Name:** MPDDRC_MD
**Offset:** 0x20
**Reset:** 0x00000013
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 31:30 – IO_WIDTH[1:0]** Width of Memory
This field gives the width of the memory. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

| Value | Name | Description |
|---|---|---|
| 0 | WIDTH_32 | The data bus width is 32 bits. |
| 1 | WIDTH_16 | The data bus width is 16 bits. |
| 2 | WIDTH_8 | The data bus width is 8 bits. |
| 3 | NOT_USED | – |

**Bits 29:26 – DENSITY[3:0]** Density of Memory
This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit

This field gives the density of the memory.

| Value | Name | Description |
|---|---|---|
| 0 | DENSITY_64MBITS | The device density is 64 Mbits. |
| 1 | DENSITY_128MBITS | The device density is 128 Mbits. |
| 2 | DENSITY_256MBITS | The device density is 256 Mbits. |

| Value | Name | Description |
|---|---|---|
| 3 | DENSITY_512MBITS | The device density is 512 Mbits. |
| 4 | DENSITY_1GBITS | The device density is 1 Gbit. |
| 5 | DENSITY_2GBITS | The device density is 2 Gbits. |
| 6 | DENSITY_4GBITS | The device density is 4 Gbits. |
| 7 | DENSITY_8GBITS | The device density is 8 Gbits. |
| 8 | DENSITY_16GBITS | The device density is 16 Gbits. |
| 9 | DENSITY_32GBITS | The device density is 32 Gbits. |

**Bits 25:24 – TYPE[1:0]** DRAM Architecture
This field gives the DRAM architecture. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

| Value | Name | Description |
|---|---|---|
| 0 | S4_SDRAM | 4n prefetch architecture |
| 1 | S2_SDRAM | 2n prefetch architecture |
| 2 | NVM | Non-volatile device |
| 3 | S8_SDRAM | 8n prefetch architecture |

**Bits 23:16 – REV_ID[7:0]** Revision Identification
This field gives the revision ID. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

**Bits 15:8 – MANU_ID[7:0]** Manufacturer Identification
This field gives information concerning the Manufacturer ID. For more information concerning the Manufacturer ID, Refer to document JC-42.6 “Manufacturer Identification (ID) Code for Low Power Memories”. This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

**Bit 7 – RL3** Read Latency 3 Option Support
This field gives information concerning the read latency supported. Read latency 3 has been defined per Jedec for frequency ≤ 166 MHz. This feature is optional. If the LPDDR3 device does not support this feature, a CAS latency of 6 is used. This field is unique to low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

| Value | Name | Description |
|---|---|---|
| 0 | RL3_SUPPORT | Read latency of 3 is supported |
| 1 | RL3_NOT_SUPPORTED | Read latency of 3 is not supported |

**Bit 6 – WL** Write Latency
This field gives the write latency supported by the memory device. This field is unique to low-power DDR3-SDRAM. When Backup mode is used, this information is lost after Backup mode exit.

| Value | Name | Description |
|---|---|---|
| 0 | WL_SETA | Write Latency Set A |
| 1 | WL_SETB | Write Latency Set B |

**Bit 4 – DBW** Data Bus Width

| Value | Name | Description |
|---|---|---|
| 0 | DBW_32_BITS | Data bus width is 32 bits |

| Value | Name | Description |
|---|---|---|
| 1 | DBW_16_BITS | Data bus width is 16 bits. |

**Bits 2:0 – MD[2:0]** Memory Device

| Value | Name | Description |
|---|---|---|
| 3 | LPDDR_SDRAM | Low-power DDR1-SDRAM |
| 4 | DDR3_SDRAM | DDR3-SDRAM |
| 5 | LPDDR3_SDRAM | Low-power DDR3-SDRAM |
| 6 | DDR2_SDRAM | DDR2-SDRAM |
| 7 | LPDDR2_SDRAM | Low-power DDR2-SDRAM |

### 35.7.9 MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register

**Name:** MPDDRC_LPDDR23_LPR
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | DS[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|
| | BK_MASK_PASR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 27:24 – DS[3:0]** Drive Strength
After the initialization sequence, as soon as the DS field is modified, Mode Register 3 is accessed automatically and DS bits are updated. Depending on the UPD_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

This field is unique to low-power DDR2-SDRAM and low-power DDR3-SDRAM. It selects the I/O drive strength as shown in the table below.

In case of low-power DDR2-SDRAM or low-power DDR3-SDRAM, the RDIV field in the MPDDRC_IO_CALIBR register must be set to same value of DS field.

| Value | Name | Description |
|---|---|---|
| 0 | – | Reserved |
| 1 | DS_34_3 | 34.3 ohm typical |
| 2 | DS_40 | 40 ohm typical (default) |
| 3 | DS_48 | 48 ohm typical |
| 4 | DS_60 | 60 ohm typical |
| 5 | – | Reserved |
| 6 | DS_80 | 80 ohm typical |
| 7 | DS_120 | 120 ohm typical |
| 8–15 | – | Reserved |

**Bits 23:8 – SEG_MASK[15:0]** Segment Mask Bit
After the initialization sequence, as soon as the SEG_MASK field is modified, Mode Register 17 is accessed automatically and SEG_MASK bits are updated. Depending on the UPD_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

This mode is unique to the low-power DDR2-SDRAM-S4 and low-power DDR3-SDRAM devices. The number of Segment Mask bits differs with the density. For 1 Gbit density, 8 segments are used. In Self-refresh mode, when the Segment Mask bit is configured, the refresh operation is masked in the segment.

| Value | Description |
|---|---|
| 0 | Segment is refreshed (= unmasked). |
| 1 | Segment is not refreshed (= masked). |

**Bits 7:0 – BK_MASK_PASR[7:0]** Bank Mask Bit/PASR
Partial Array Self-Refresh (low-power DDR2-SDRAM-S4 devices and low-power DDR3-SDRAM only)

After the initialization sequence, as soon as the BK_MASK_PASR field is modified, Mode Register 16 is accessed automatically and BK_MASK_PASR bits are updated. Depending on the UPD_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

This mode is unique to the low-power DDR2-SDRAM-S4 and low-power DDR3-SDRAM devices. In Self-refresh mode, each bank of LPDDR2/LPDDR3 can be independently configured whether a self-refresh operation is taking place or not.

After the initialization sequence, as soon as the BK_MASK_PASR field is modified, the Extended Mode Register is accessed automatically and BK_MASK_PASR bits are updated. Depending on the UPD_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

| Value | Description |
|---|---|
| 0 | Refresh is enabled (= unmasked). |
| 1 | Refresh is disabled (= masked). |

### 35.7.10 MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register

**Name:** MPDDRC_LPDDR2_LPDDR3_DDR3_CAL_MR4
**Offset:** 0x2C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | MR4_READ[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | COUNT_CAL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – MR4_READ[15:0]** Mode Register 4 Read Interval
MR4_READ defines the time period between MR4 reads (for LPDDR2-SDRAM). The formula is (MR4_READ+1) × $t_{REF}$. The value to be loaded depends on the average time between REFRESH commands, $t_{REF}$. For example, for an LPDDR2-SDRAM with the time between refresh of 7.8 µs, if the MR4_READ value is 2, the time period between MR4 reads is 23.4 µs.

The LPDDR2-SDRAM and LPDDR3-SDRAM devices feature a temperature sensor whose status can be read from MR4 register. This sensor can be used to determine an appropriate refresh rate. Temperature sensor data may be read from MR4 register using the Mode Register Read protocol. The Adjust Refresh Rate bit (ADJ_REF) in the Refresh Timer Register (MPDDRC_RTR) must be written to a one to activate these reads.

**Bits 15:0 – COUNT_CAL[15:0]** LPDDR2 LPDDR3 and DDR3 Calibration Timer Count
This 16-bit field is loaded into a timer which generates the calibration pulse. Each time the calibration pulse is generated, a ZQCS calibration sequence is initiated.

The ZQCS Calibration command is used to calibrate DRAM Ron values over PVT.

One ZQCS command can effectively correct at least 1.5% of output impedance errors within $T_{zqcs}$.

One method for calculating the interval between ZQCS commands gives the temperature ($T_{driftrate}$) and voltage ($V_{driftrate}$) drift rates to which the SDRAM is subject in the application. The interval could be defined by the following formula:

ZQCorrection/(($T_{Sens}$ x $T_{driftrate}$) + ($V_{Sens}$ x $V_{driftrate}$))

where $T_{Sens}$ = max(dRONdTM) and $V_{Sens}$ = max(dRONdVM) define the SDRAM temperature and voltage sensitivities.

For example, if $T_{Sens}$ = 0.75%/C, $V_{Sens}$ = 0.2%/mV, $T_{driftrate}$ = 1C/sec and $V_{driftrate}$ = 15 mV/s, then the interval between ZQCS commands is calculated as:

1.5/((0.75 x 1) + (0.2 x 15)) = 0.4s

In this example, the devices require a calibration every 0.4s. The value to be loaded depends on average time between REFRESH commands, $t_{REF}$.

For example, for a device with the time between refresh of 7.8 µs, the value of the Calibration Timer Count field is programmed: (0.4/7.8 x $10^{-6}$) = 0xC852.

$T_{Sens}$ and $V_{Sens}$ are given by the manufacturer (Output Driver Sensitivity definition). $T_{driftrate}$ and $V_{driftrate}$ are defined by the end user.

### 35.7.11 MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register

**Name:** MPDDRC_LPDDR2_LPDDR3_DDR3_TIM_CAL
**Offset:** 0x30
**Reset:** 0x00000006
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |

**Bits 17:16 – RZQI[1:0]** Built-in Self-Test for RZQ Information
This field indicates whether the device has detected a resistor connection to the ZQ pin.

This mode is unique to low-power DDR3-SDRAM devices.

| Value | Name | Description |
|---|---|---|
| 0 | RZQ_NOT_SUPPORTED | RZQ self test not supported |
| 1 | ZQ_VDDCA_FLOAT | The ZQ pin can be connected to VDDCA or left floating. |
| 2 | ZQ_SHORTED_GROUND | The ZQ pin can be shorted to ground. |
| 3 | ZQ_SELF_TEST_OK | ZQ pin self test complete; no error condition detected |

**Bits 7:0 – ZQCS[7:0]** ZQ Calibration Short
This field defines the delay between the ZQ Calibration command and any valid command in number of DDRCK clock cycles.

The number of cycles is between 0 and 255. This field applies to LPDDR2, LPDDR3 and DDR3 devices.

### 35.7.12 MPDDRC I/O Calibration Register

**Name:** MPDDRC_IO_CALIBR
**Offset:** 0x34
**Reset:** 0x00870000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | EN_CALIB | | RDIV[2:0] | | |
| Access | | | | R/W | | R/W | R/W | R/W |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bits 23:20 – CALCODEN[3:0]** Number of N-type Transistors
This value gives the number of N-type transistors to perform the calibration.

**Bits 19:16 – CALCODEP[3:0]** Number of P-type Transistors
This value gives the number of P-type transistors to perform the calibration.

**Bits 14:8 – TZQIO[6:0]** IO Calibration
This field defines the delay between the start up of the amplifier and the beginning of the calibration in number of DDRCK clock cycles. The value of this field must be set to 600 ns.

The number of cycles is between 0 and 127.

The TZQIO configuration code must be set correctly depending on the clock frequency using the following formula:

TZQIO = (DDRCK × 600e-9) + 1

where DDRCK frequency is in Hz.

For example, for a frequency of 176 MHz, the value of the TZQIO field is configured (176 × 10e6) × (600e-9) + 1.

**Bit 4 – EN_CALIB** Enable Calibration
This field enables calibration for the LPDDR1 and DDR2 devices. When the calibration is enabled, it is recommended to define the COUNT_CAL field (see "COUNT_CAL: LPDDR2 LPDDR3 and DDR3 Calibration Timer Count").

This 16-bit field is loaded into a timer which generates the calibration pulse. Each time the calibration pulse is generated, a calibration sequence is initiated.

| Value | Name | Description |
|---|---|---|
| 0 | DISABLE_CALIBRATION | Calibration is disabled. |
| 1 | ENABLE_CALIBRATION | Calibration is enabled. |

**Bits 2:0 – RDIV[2:0]** Resistor Divider, Output Driver Impedance
RDIV is used with the external precision resistor RZQ to define the output driver impedance. The value of RZQ is either 24K ohms (LPDDR2/LPDDR3 device) or 23K ohms (DDR3L device) or 22K ohms (DDR3 device) or 21K ohms (DDR2/LPDDR1 device).

| Value | Name | Description |
|---|---|---|
| 0 | Reserved | Reserved |
| 2 | RZQ_40_RZQ_38_RZQ_37_RZQ_35 | LPDDR2 serial impedance line = 40 ohms,<br>LPDDR3 serial impedance line = 38 ohms,<br>DDR3 serial impedance line = 37 ohms,<br>DDR2/LPDDR1 serial impedance line = 35 ohms |
| 3 | RZQ_48_RZQ_46_RZQ_44_RZQ_43 | LPDDR2 serial impedance line = 48 ohms,<br>LPDDR3 serial impedance line = 46 ohms,<br>DDR3 serial impedance line = 44 ohms,<br>DDR2/LPDDR1 serial impedance line = 43 ohms |
| 4 | RZQ_60_RZQ_57_RZQ_55_RZQ_52 | LPDDR2 serial impedance line = 60 ohms,<br>LPDDR3 serial impedance line = 57 ohms,<br>DDR3 serial impedance line = 55 ohms,<br>DDR2/LPDDR1 serial impedance line = 52 ohms |
| 6 | RZQ_80_RZQ_77_RZQ_73_RZQ_70 | LPDDR2 serial impedance line = 80 ohms,<br>LPDDR3 serial impedance line = 77 ohms,<br>DDR3 serial impedance line = 73 ohms,<br>DDR2/LPDDR1 serial impedance line = 70 ohms |
| 7 | RZQ_120_RZQ_115_RZQ_110_RZQ_105 | LPDDR2 serial impedance line = 120 ohms,<br>LPDDR3 serial impedance line = 115 ohms,<br>DDR3 serial impedance line = 110 ohms,<br>DDR2/LPDDR1 serial impedance line = 105 ohms |

### 35.7.13 MPDDRC OCMS Register

**Name:** MPDDRC_OCMS
**Offset:** 0x38
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SCR_EN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – SCR_EN** Scrambling Enable

| Value | Description |
|---|---|
| 0 | Disables “Off-chip” scrambling for SDRAM access. |
| 1 | Enables “Off-chip” scrambling for SDRAM access. |

### 35.7.14 MPDDRC OCMS KEY1 Register

**Name:** MPDDRC_OCMS_KEY1
**Offset:** 0x3C
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the MPDDRC Write Protection Mode Register. The register can only be written once.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | | | | | BDW_MAX_CUR | | ARB[1:0] | |
| Access | | | | | R/W | | R/W | R/W |
| Reset | | | | | 0 | | 0 | 0 |

**Bits 24, 25, 26, 27, 28, 29, 30, 31 – BDW_BURST_Px** Bandwidth Arbitration Mode on Port X

| Value | Description |
|---|---|
| 0 | The arbitration is done when the bandwidth limit defined in MPDDRC_BDW_PORT_0123/4567.BDW_Px is reached. If the bandwidth limit is reached during a burst access, the burst is completed. |
| 1 | The arbitration is done when the bandwidth limit defined in MPDDRC_BDW_PORT_0123/4567.BDW_Px is reached. If the bandwidth limit is reached during a burst access, the burst is broken. |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – MA_PR_Px** Master or Software Provide Information

| Value | Description |
|---|---|
| 0 | Number of requests or words is provided by the master, if the master supports this feature. |
| 1 | Number of requests or words is provided by software, see “NRQ_NWD_BDW_Px: Number of Requests, Number of Words or Bandwidth Allocation from Port 0-1-2-3”. |

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – RQ_WD_Px** Request or Word from Port X

| Value | Description |
|---|---|
| 0 | Number of requests is selected. |
| 1 | Number of words is selected. |

**Bit 3 – BDW_MAX_CUR** Bandwidth Max or Current
This field displays the maximum of the bandwidth or the current bandwidth for each port.

The maximum of the bandwidth is computed when at least two ports of MPDDRC are used.

That information is given in MPDDRC Current/Maximum Bandwidth Port 0-1-2-3 Register and MPDDRC Current/Maximum Bandwidth Port 4-5-6-7 Register.

| Value | Description |
|---|---|
| 0 | Current bandwidth is displayed. |
| 1 | Maximum of the bandwidth is displayed. |

**Bits 1:0 – ARB[1:0]** Type of Arbitration
This field allows to choose the type of arbitration: round-robin, number of requests per port or bandwidth per port.

| Value | Name | Description |
|---|---|---|
| 0 | ROUND | Round-Robin Policy |
| 1 | NB_REQUEST | Request Policy |
| 2 | BANDWIDTH | Bandwidth Policy |
| 3 | – | Reserved |

### 35.7.17 MPDDRC Timeout Register

**Name:** MPDDRC_TIMEOUT
**Offset:** 0x48
**Reset:** 0x00000000
**Property:** Read/Write

| | TIMEOUT_P3[3:0] | | | | TIMEOUT_P2[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TIMEOUT_P1[3:0] | | | | TIMEOUT_P0[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – TIMEOUT_Px** Timeout for Ports 0, 1, 2, 3, 4, 5, 6, 7
Some masters have the particularity to insert idle state between two accesses. This field defines the delay between two accesses on the same port in number of DDRCK clock cycles before arbitration and handling the access over to another port.

This field is not used with round-robin and bandwidth arbitrations.

The number of cycles is between 1 and 15.

### 35.7.18 MPDDRC Request Port 0-1-2-3 Register

**Name:** MPDDRC_REQ_PORT_0123
**Offset:** 0x4C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | NRQ_NWD_BDW_P3[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NRQ_NWD_BDW_P2[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | NRQ_NWD_BDW_P1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NRQ_NWD_BDW_P0[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0:7, 8:15, 16:23, 24:31 – NRQ_NWD_BDW_Px** Number of Requests, Number of Words or Bandwidth Allocation from Port 0-1-2-3
The number of requests corresponds to the number of start transfers. For example, setting this field to 2 performs two burst accesses regardless of the burst type (INCR4, INCR8, etc.). The number of words corresponds exactly to the number of accesses; setting this field to 2 performs two accesses. In this example, burst accesses will be broken.

These values depend on scheme arbitration (see MPDDRC Configuration Arbiter Register).

In case of round-robin arbitration, this field is not used. In case of “bandwidth arbitration”, this field corresponds to percentage allocated for each port. In case of “request” arbitration, this field corresponds to number of start transfers or to number of accesses allocated for each port.

### 35.7.19 MPDDRC Request Port 4-5-6-7 Register

**Name:** MPDDRC_REQ_PORT_4567
**Offset:** 0x50
**Reset:** 0x00000000
**Property:** Read/Write

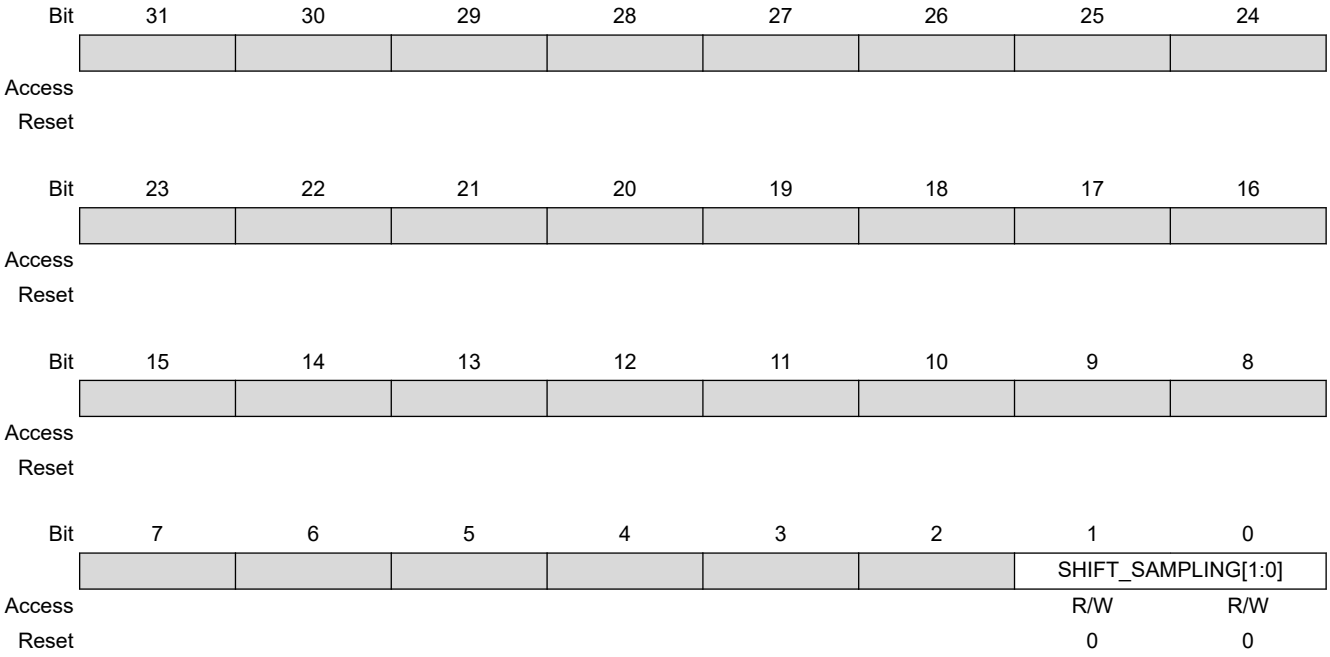
**Bits 0:7, 8:15, 16:23, 24:31 – BDW_Px** Current/Maximum Bandwidth from Port 4-5-6-7
This field displays the current bandwidth or the maximum bandwidth for each port. This information is given in the "BDW_MAX_CUR: Bandwidth Max or Current" field description.

### 35.7.22 MPDDRC Read Data Path Register

**Name:** MPDDRC_RD_DATA_PATH
**Offset:** 0x5C
**Reset:** 0x00000000
**Property:** Read/Write



**Bits 1:0 – SHIFT_SAMPLING[1:0]** Shift Sampling Point of Data
Shifts the sampling point of data coming from the memory device. The higher the memory device clock frequency, the higher the SHIFT_SAMPLING value. Refer to the section "Electrical Characteristics".

| Value | Name | Description |
|---|---|---|
| 0 | NO_SHIFT | Initial sampling point. |
| 1 | SHIFT_ONE_CYCLE | Sampling point is shifted by one cycle. |
| 2 | SHIFT_TWO_CYCLES | Sampling point is shifted by two cycles. |
| 3 | SHIFT_THREE_CYCLES | Sampling point is shifted by three cycles, unique for LPDDR2 and DDR3 and LPDDR3.<br>Not applicable for DDR2 and LPDDR1 devices. |

### 35.7.23 MPDDRC Monitor Configuration Register

**Name:** MPDDRC_MCFGR
**Offset:** 0x60
**Reset:** 0x00000000
**Property:** Read/Write

| | | | | RUN | | | SOFT_RESET | EN_MONI |
| Access | | | | R/W | | | R/W | R/W |
| Reset | | | | 0 | | | 0 | 0 |

**Bits 12:11 – INFO[1:0]** Information Type
This field reports information such as latency and the number of transfers monitored on port x [x = 0..7].

| Value | Name | Description |
|---|---|---|
| 0 | MAX_WAIT | Information concerning the transfer with the longest waiting time |
| 1 | NB_TRANSFERS | Number of transfers on the port |
| 2 | TOTAL_LATENCY | Total latency on the port |
| 3 | – | Reserved |

**Bit 10 – REFR_CALIB** Refresh Calibration

| Value | Description |
|---|---|
| 0 | Monitoring does not depend on Autorefresh mode, Self-refresh mode, Powerdown mode, DLL nor calibration impact. |
| 1 | Monitoring depends on Autorefresh mode, Self-refresh mode, Powerdown mode, DLL and calibration impact. |

**Bits 9:8 – READ_WRITE[1:0]** Read/Write Access
This field is used to monitor different types of access.

| Value | Name | Description |
|---|---|---|
| 0 | TRIG_RD_WR | Read and Write accesses are triggered. |

| Value | Name | Description |
|---|---|---|
| 1 | TRIG_WR | Only Write accesses are triggered. |
| 2 | TRIG_RD | Only Read accesses are triggered. |
| 3 | – | Reserved |

**Bit 4 – RUN** Control Monitor

| Value | Description |
|---|---|
| 0 | Monitoring is halted. All counters are stopped. |
| 1 | Monitoring is launched. |

**Bit 1 – SOFT_RESET** Soft Reset

| Value | Description |
|---|---|
| 0 | Soft reset is not performed. |
| 1 | Soft reset is performed. |

**Bit 0 – EN_MONI** Enable Monitor

| Value | Description |
|---|---|
| 0 | Monitor is disabled. |
| 1 | Monitor is enabled. |

### 35.7.24 MPDDRC Monitor Address High/Low Port x Register

**Name:** MPDDRC_MADDRx
**Offset:** 0x64 + x*0x04 [x=0..7]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 24 – READ_WRITE** Read or Write Access on Port x
This field reports the transfer direction for the maximum waiting time.

| Value | Description |
|---|---|
| 0 | Read transfer |
| 1 | Write transfer |

**Bits 22:20 – SIZE[2:0]** Transfer Size on Port x
This field reports the size of the transfer for the maximum waiting time.

| Value | Name | Description |
|---|---|---|
| 0 | 8BITS | Byte transfer |
| 1 | 16BITS | Halfword transfer |
| 2 | 32BITS | Word transfer |
| 3 | 64BITS | Dword transfer |

**Bits 18:16 – BURST[2:0]** Type of Burst on Port x
This field reports the type of burst for the maximum waiting time.

| Value | Name | Description |
|---|---|---|
| 0 | SINGLE | Single transfer |
| 1 | INCR | Incrementing burst of unspecified length |
| 2 | WRAP4 | 4-beat wrapping burst |
| 3 | INCR4 | 4-beat incrementing burst |
| 4 | WRAP8 | 8-beat wrapping burst |
| 5 | INCR8 | 8-beat incrementing burst |
| 6 | WRAP16 | 16-beat wrapping burst |
| 7 | INCR16 | 16-beat incrementing burst |

**Bits 15:0 – MAX_PORTx_WAITING[15:0]** Address High on Port x
This field reports the maximum waiting time and the associated type of transfer (burst, size, read or write).

### 35.7.26 MPDDRC Monitor Information Port x Register (NB_TRANSFERS)

**Name:** MPDDRC_MINFOx (NB_TRANSFERS)
**Offset:** 0x84 + x*0x04 [x=0..7]
**Reset:** 0x00000000
**Property:** Read-only

The following fields can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | Px_NB_TRANSFERS[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x444452 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x444452 (“DDR” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x444452 (“DDR” in ASCII). |

### 35.7.29 MPDDRC Write Protection Status Register

**Name:** MPDDRC_WPSR
**Offset:** 0xE8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Enable

| Value | Description |
|---|---|
| 0 | No write protection violation occurred since the last read of this register (MPDDRC_WPSR). |
| 1 | A write protection violation occurred since the last read of this register (MPDDRC_WPSR). If this violation is an unauthorized attempt to write a control register, the associated violation is reported into the WPVSRC field. |

# 36. Static Memory Controller (SMC)

## 36.1 Description

This Static Memory Controller (SMC) is capable of handling several types of external memory and peripheral devices, such as SRAM, PSRAM, PROM, EPROM, EEPROM, LCD Module, NOR Flash and NAND Flash.

The SMC generates the signals that control the access to external memory devices or peripheral devices. It has 4 Chip Selects and a 26-bit address bus. The 16-bit data bus can be configured to interface with 8- or 16-bit external devices. Separate read and write control signals allow for direct memory and peripheral interfacing. Read and write signal waveforms are fully parametrizable.

The SMC can manage wait requests from external devices to extend the current access. The SMC is provided with an automatic Slow Clock mode. In Slow Clock mode, it switches from user-programmed waveforms to slow-rate specific waveforms on read and write signals.

The SMC embeds a NAND Flash Controller (NFC). The NFC can handle automatic transfers, sending the commands and address cycles to the NAND Flash and transferring the contents of the page (for read and write) to the NFC SRAM. It minimizes the CPU overhead.

The SMC includes programmable hardware error correcting code with one-bit error correction capability and supports two-bit error detection. In order to improve the overall system performance, the DATA phase of the transfer can be DMA-assisted.

The External Data Bus can be scrambled/unscrambled by means of user keys.

## 36.2 Embedded Characteristics

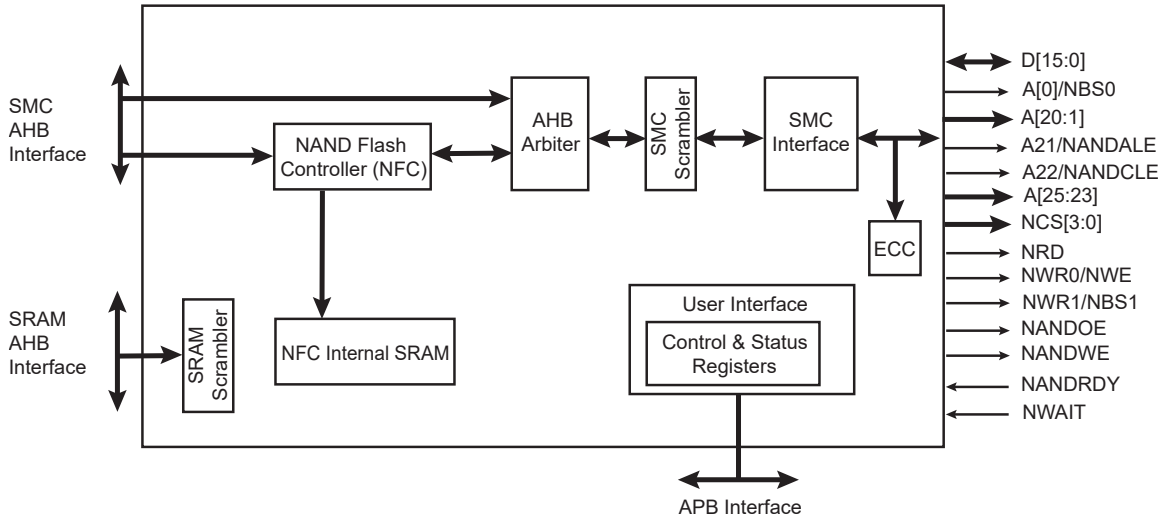
- 64-Mbyte Address Space per Chip Select
- 8- or 16-bit Data Bus
- Word, Halfword, Byte Transfers
- Byte Write or Byte Select Lines
- Programmable Setup, Pulse and Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse and Hold Time for Write Signals per Chip Select
- Programmable Data Float Time per Chip Select
- External Data Bus Scrambling/Unscrambling Function
- External Wait Request
- Automatic Switch to Slow Clock Mode
- Hardware Configurable Number of Chip Selects from 1 to 4
- Programmable Timing on a per Chip Select Basis
- NAND Flash Controller Supporting NAND Flash with Multiplexed Data/Address Buses
- Supports SLC and MLC NAND Flash Technology
- Supports NAND Flash Devices with 8 or 16-bit Data Paths
- Multibit Error Correcting Code (ECC) supporting NAND Flash devices with 8-bit only Data Path
- ECC Algorithm Based on Binary Shortened Bose, Chaudhuri and Hocquenghem (BCH) Codes
- Programmable Error Correcting Capability: 2, 4, 8, 12, 24 and 32 bits of Errors per Block

© 2018 Microchip Technology Inc.

- 9 Kbytes NFC SRAM
- Programmable Block Size: 512 bytes or 1024 bytes
- Programmable Number of Blocks per Page: 1, 2, 4 or 8 Blocks of Data per Page
- Programmable Spare Area Size up to 512 bytes
- Supports Spare Area ECC Protection
- Supports 8 Kbytes Page Size Using 1024 bytes/block and 4 Kbytes Page Size Using 512 bytes/block
- Multibit Error Detection Is Interrupt Driven
- Provides Hardware Acceleration for Determining Roots of Polynomials Defined over a Finite Field
- Programmable Finite Field GF(2^13) or GF(2^14)
- Finds Roots of Error-locator Polynomial
- Programmable Number of Roots
- Register Write Protection

## 36.3 Block Diagram

**Figure 36-1. Block Diagram**



## 36.4 I/O Lines Description

**Table 36-1. I/O Line Description**

| Name | Description | Type | Active Level |
|---|---|---|---|
| NCS[3:0] | Static Memory Controller Chip Select Lines | Output | Low |
| NRD | Read Signal | Output | Low |
| NWR0/NWE | Write 0/Write Enable Signal | Output | Low |
| A0/NBS0 | Address Bit 0/Byte 0 Select Signal | Output | Low |
| NWR1/NBS1 | Write 1/Byte 1 Select Signal | Output | Low |
| A[25:1] | Address Bus | Output | – |

.....continued

| Name | Description | Type | Active Level |
|---|---|---|---|
| D[15:0] | Data Bus | I/O | – |
| NWAIT | External Wait Signal | Input | Low |
| NANDRDY | NAND Flash Ready/Busy | Input | – |
| NANDWE | NAND Flash Write Enable | Output | Low |
| NANDOE | NAND Flash Output Enable | Output | Low |
| NANDALE | NAND Flash Address Latch Enable | Output | – |
| NANDCLE | NAND Flash Command Latch Enable | Output | – |

## 36.5 Multiplexed Signals

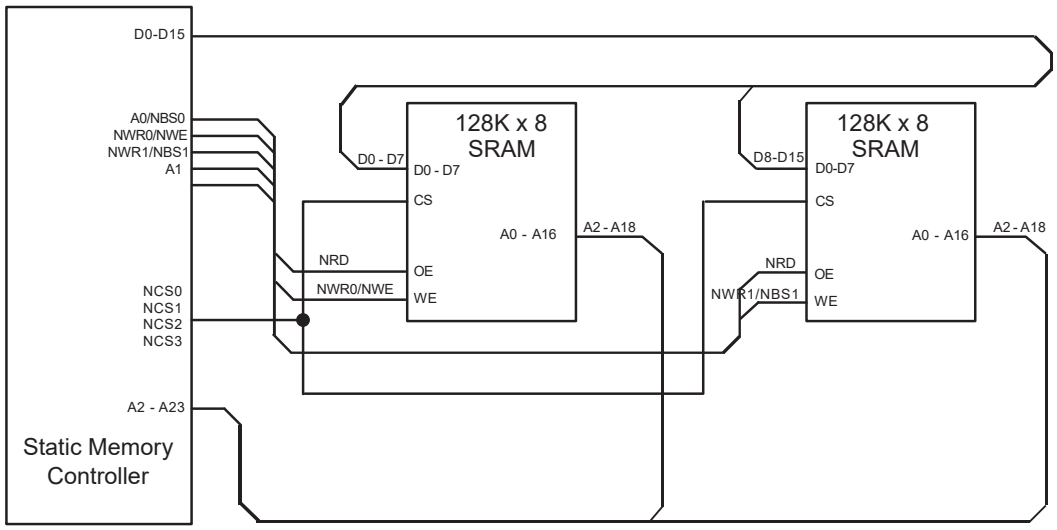
**Table 36-2. Static Memory Controller (SMC) Multiplexed Signals**

| Multiplexed Signals | | Related Function |
|---|---|---|
| NWR0 | NWE | Byte-write or Byte-select access, see "Byte Write Access" and "Byte Select Access" |
| A0 | NBS0 | 8-bit or 16-bit data bus, see "Data Bus Width" |
| A22 | NANDCLE | NAND Flash Command Latch Enable |
| A21 | NANDALE | NAND Flash Address Latch Enable |
| NWR1 | NBS1 | Byte-write or Byte-select access, see "Byte Write Access" and "Byte Select Access" |
| A1 | – | 8-/16-bit data bus, see "Data Bus Width"<br>Byte-write or Byte-select access, see "Byte Write Access" and "Byte Select Access" |

## 36.6 Application Example

### 36.6.1 Hardware Interface

**Figure 36-2. SMC Connections to Static Memory Devices**



## 36.7 Product Dependencies

### 36.7.1 I/O Lines

The pins used for interfacing the Static Memory Controller are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the Static Memory Controller pins to their peripheral function. If I/O lines of the SMC are not used by the application, they can be used for other purposes by the PIO controller.

### 36.7.2 Power Management

The SMC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SMC clock.

### 36.7.3 Interrupt Sources

The SMC has an interrupt line connected to the interrupt controller. Handling the SMC interrupt requires programming the interrupt controller before configuring the SMC.

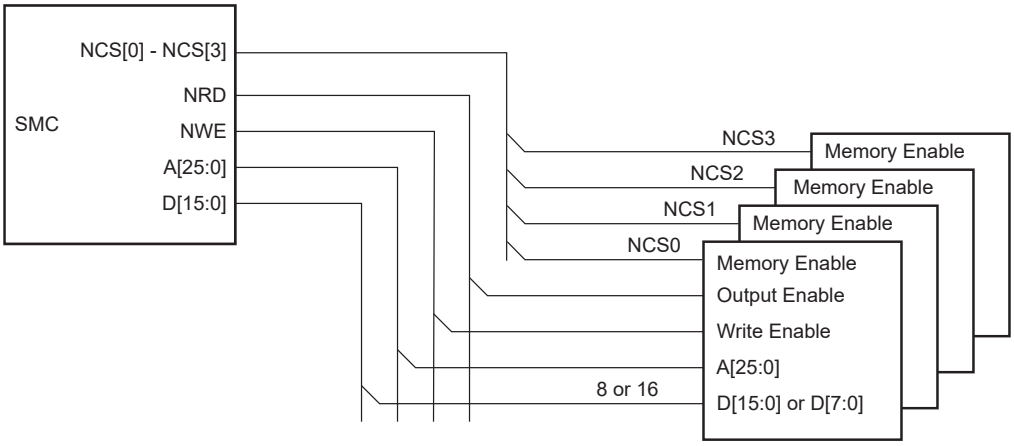
## 36.8 External Memory Mapping

The SMC provides up to 26 address lines, A[25:0]. This allows each chip select line to address up to 64 Mbytes of memory.

If the physical memory device connected on one chip select is smaller than 64 Mbytes, it wraps around and appears to be repeated within this space. The SMC correctly handles any valid access to the memory device within the page. See the figure below.

A[25:0] is only significant for 8-bit memory; A[25:1] is used for 16-bit memory.

**Figure 36-3. Memory Connections for External Devices**



## 36.9 Connection to External Devices

### 36.9.1 Data Bus Width

A data bus width of 8 or 16 bits can be selected for each chip select. This option is controlled by the bit DBW in the SMC Mode Register (HSMC_MODE) for the corresponding chip select.

"Memory Connection for an 8-bit Data Bus" shows how to connect a 512 KB x 8-bit memory on NCS2.
"Memory Connection for a 16-bit Data Bus" shows how to connect a 512 KB x 16-bit memory on NCS2.

**Figure 36-4. Memory Connection for an 8-bit Data Bus**

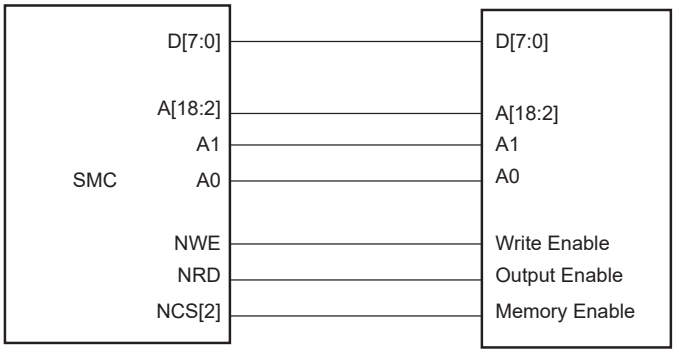


**Figure 36-5. Memory Connection for a 16-bit Data Bus**

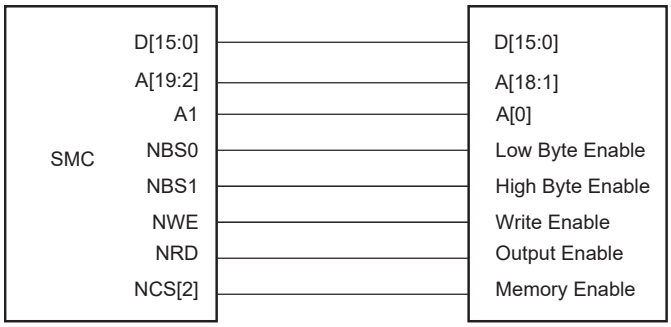


### 36.9.2 Byte Write or Byte Select Access

Each chip select with a 16-bit data bus can operate with one of two different types of write access: Byte Write or Byte Select. This is controlled by the BAT bit of the HSMC_MODE register for the corresponding chip select.

#### 36.9.2.1 Byte Write Access

Byte Write Access is used to connect 2 x 8-bit devices as a 16-bit memory, and supports one write signal per byte of the data bus and a single read signal.

Note that the SMC does not allow boot in Byte Write Access mode.

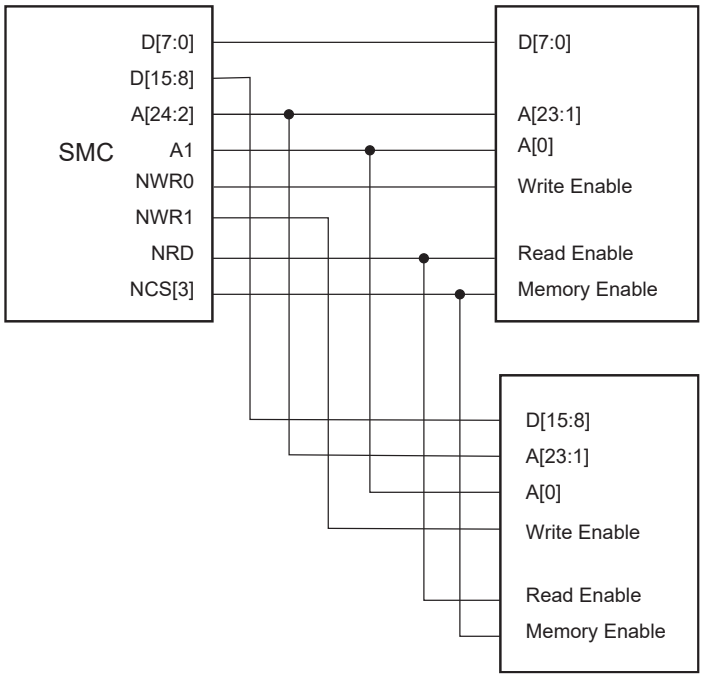
For 16-bit devices, the SMC provides NWR0 and NWR1 write signals for respectively Byte0 (lower byte) and Byte1 (upper byte) of a 16-bit bus. One single read signal (NRD) is provided.

#### 36.9.2.2 Byte Select Access

Byte Select Access is used to connect one 16-bit device. In this mode, read/write operations can be enabled/disabled at Byte level. One Byte-select line per byte of the data bus is provided. One NRD and one NWE signal control read and write.

For 16-bit devices, the SMC provides NBS0 and NBS1 selection signals for respectively Byte0 (lower byte) and Byte1 (upper byte) of a 16-bit bus.

**Figure 36-6. Connection of 2 x 8-bit Devices on a 16-bit Bus: Byte Write Option**



#### 36.9.2.3 Signal Multiplexing

Depending on the Byte Access Type (BAT), only the write signals or the byte select signals are used. To save IOs at the external bus interface, control signals at the SMC interface are multiplexed. The table below shows signal multiplexing depending on the data bus width and the Byte Access Type.

For 16-bit devices, bit A0 of address is unused. When Byte Select Option is selected, NWR1 is unused. When Byte Write option is selected, NBS0 is unused.

**Table 36-3. SMC Multiplexed Signal Translation**

| Device Type | Signal Name | | |
|---|---|---|---|
| | 16-bit Bus | | 8-bit Bus |
| | 1 x 16-bit | 2 x 8-bit | 1 x 8-bit |
| Byte Access Type (BAT) | Byte Select | Byte Write | – |
| NBS0_A0 | NBS0 | – | A0 |
| NWE_NWR0 | NWE | NWR0 | NWE |
| NBS1_NWR1 | NBS1 | NWR1 | – |
| A1 | A1 | A1 | A1 |

## 36.10 Standard Read and Write Protocols

In the following sections, the Byte Access Type is not considered. Byte select lines (NBS0 to NBS1) always have the same timing as the A address bus. NWE represents either the NWE signal in byte select access type or one of the byte write lines (NWR0 to NWR1) in byte write access type. NWR0 to NWR1 have the same timings and protocol as NWE. In the same way, NCS represents one of the NCS[0..3] chip select lines.

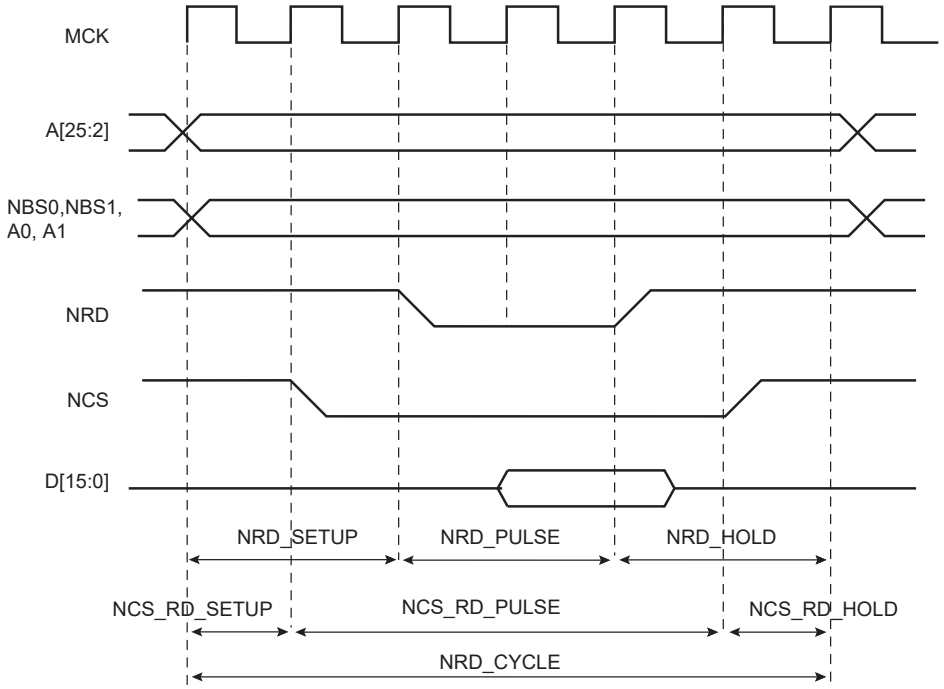
### 36.10.1 Read Waveforms

The read cycle is shown in the figure below.

The read cycle starts with the address setting on the memory address bus, i.e.,:

- {A[25:2], A1, A0} for 8-bit devices
- {A[25:2], A1} for 16-bit devices

**Figure 36-7. Standard Read Cycle**



#### 36.10.1.1 NRD Waveform

The NRD signal is characterized by a setup timing, a pulse width and a hold timing:

1. NRD_SETUP: The NRD setup time is defined as the setup of address before the NRD falling edge.
2. NRD_PULSE: The NRD pulse length is the time between NRD falling edge and NRD rising edge.
3. NRD_HOLD: The NRD hold time is defined as the hold time of address after the NRD rising edge.

#### 36.10.1.2 NCS Waveform

Similar to the NRD signal, the NCS signal can be divided into a setup time, pulse length and hold time:

- NCS_RD_SETUP: The NCS setup time is defined as the setup time of address before the NCS falling edge.
- NCS_RD_PULSE: The NCS pulse length is the time between NCS falling edge and NCS rising edge.
- NCS_RD_HOLD: The NCS hold time is defined as the hold time of address after the NCS rising edge.

#### 36.10.1.3 Read Cycle

The NRD_CYCLE time is defined as the total duration of the read cycle, that is, from the time where address is set on the address bus to the point where address may change. The total read cycle time is defined as:

- NRD_CYCLE = NRD_SETUP + NRD_PULSE + NRD_HOLD,

as well as

- NRD_CYCLE = NCS_RD_SETUP + NCS_RD_PULSE + NCS_RD_HOLD

All NRD and NCS timings are defined separately for each chip select as an integer number of Master Clock cycles. The NRD_CYCLE field is common to both the NRD and NCS signals, thus the timing period is of the same duration.

NRD_CYCLE, NRD_SETUP, and NRD_PULSE implicitly define the NRD_HOLD value as:

- NRD_HOLD = NRD_CYCLE - NRD SETUP - NRD PULSE

NRD_CYCLE, NCS_RD_SETUP, and NCS_RD_PULSE implicitly define the NCS_RD_HOLD value as:

- NCS_RD_HOLD = NRD_CYCLE - NCS_RD_SETUP - NCS_RD_PULSE

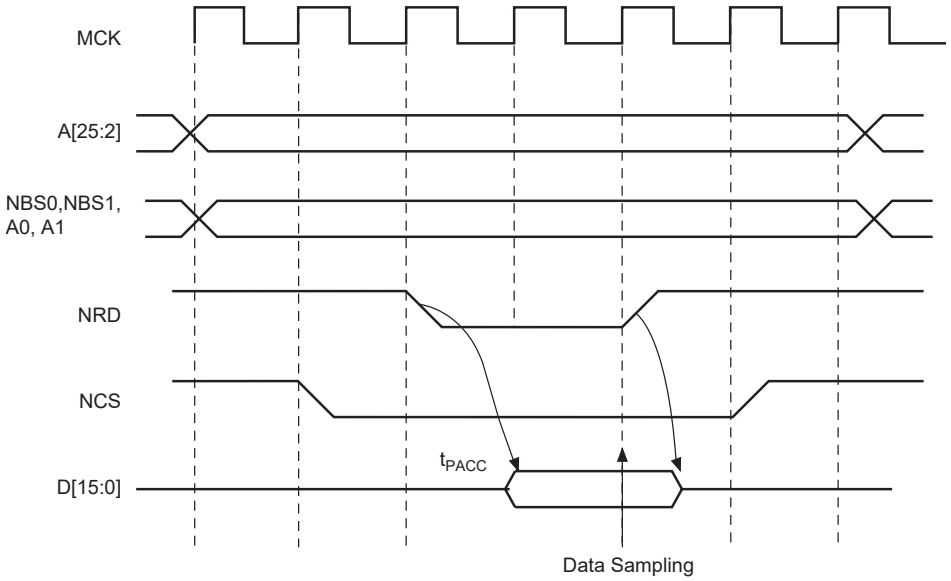
### 36.10.2 Read Mode

As NCS and NRD waveforms are defined independently of one another, the SMC needs to know when the read data is available on the data bus. The SMC does not compare NCS and NRD timings to know which signal rises first. The READ_MODE parameter in the HSMC_MODE register of the corresponding chip select indicates which signal of NRD and NCS controls the read operation.

#### 36.10.2.1 Read is Controlled by NRD (READ_MODE = 1)

The figure below shows the waveforms of a read operation of a typical asynchronous RAM. The read data is available $t_{PACC}$ after the falling edge of NRD, and turns to ‘Z’ after the rising edge of NRD. In this case, the READ_MODE must be set to 1 (read is controlled by NRD), to indicate that data is available with the rising edge of NRD. The SMC samples the read data internally on the rising edge of the Master Clock that generates the rising edge of NRD, whatever the programmed waveform of NCS.

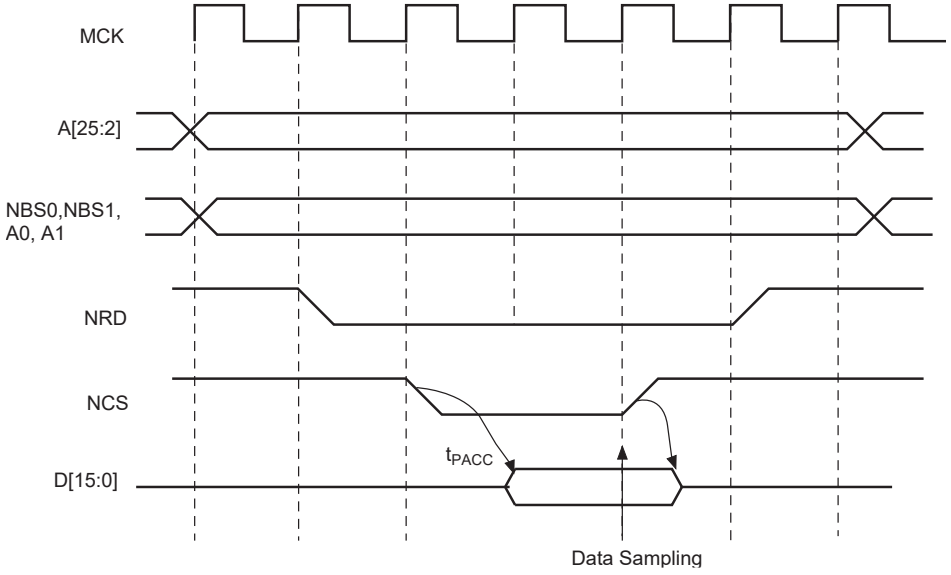
**Figure 36-8. READ_MODE = 1: Data is Sampled by SMC before the Rising Edge of NRD**



#### 36.10.2.2 Read is Controlled by NCS (READ_MODE = 0)

The figure below shows the typical read cycle. The read data is valid $t_{PACC}$ after the falling edge of the NCS signal and remains valid until the rising edge of NCS. Data must be sampled when NCS is raised. In that case, the READ_MODE must be configured to 0 (read is controlled by NCS): the SMC internally samples the data on the rising edge of the Master Clock that generates the rising edge of NCS, whatever the programmed waveform of NRD.

**Figure 36-9. READ_MODE = 0: Data is Sampled by SMC before the Rising Edge of NCS**



### 36.10.3 Write Waveforms

The write protocol is similar to the read protocol. It is depicted in the figure below. The write cycle starts with the address setting on the memory address bus.

#### 36.10.3.1 NWE Waveforms

The NWE signal is characterized by a setup timing, a pulse width and a hold timing:

- NWE_SETUP: The NWE setup time is defined as the setup of address and data before the NWE falling edge.
- NWE_PULSE: The NWE pulse length is the time between NWE falling edge and NWE rising edge.
- NWE_HOLD: The NWE hold time is defined as the hold time of address and data after the NWE rising edge.

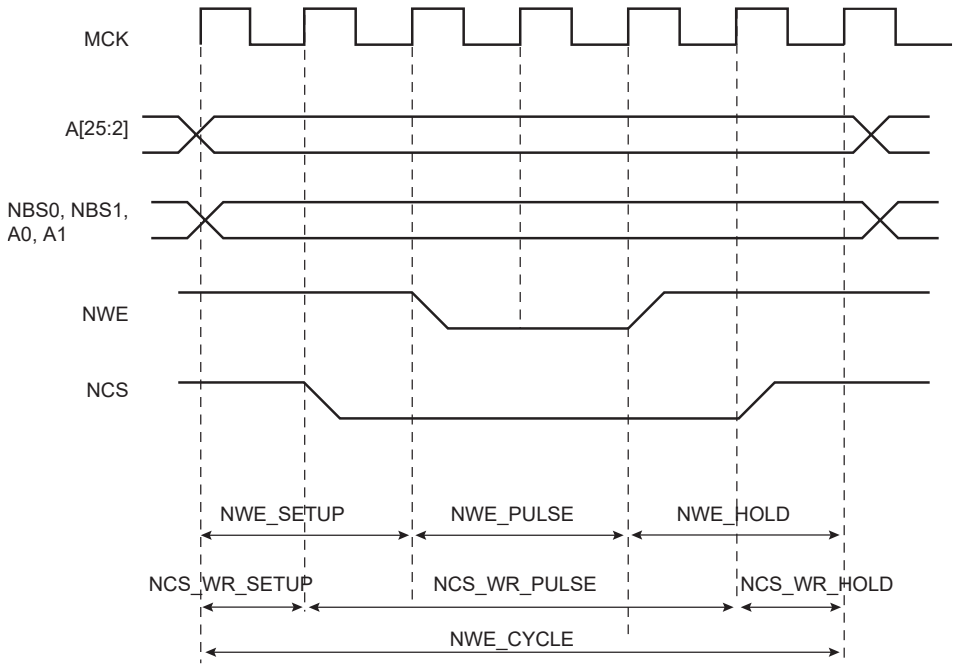
The NWE waveforms apply to all byte-write lines in Byte Write Access mode: NWR0 to NWR3.

#### 36.10.3.2 NCS Waveforms

The NCS signal waveforms in write operations are not the same as those applied in read operations, but are separately defined:

- NCS_WR_SETUP: The NCS setup time is defined as the setup time of address before the NCS falling edge.
- NCS_WR_PULSE: The NCS pulse length is the time between NCS falling edge and NCS rising edge.
- NCS_WR_HOLD: The NCS hold time is defined as the hold time of address after the NCS rising edge.

**Figure 36-10. Write Cycle**



#### 36.10.3.3 Write Cycle

The write cycle time is defined as the total duration of the write cycle, that is, from the time where address is set on the address bus to the point where address may change. The total write cycle time is equal to:

- NWE_CYCLE = NWE_SETUP + NWE_PULSE + NWE_HOLD,

as well as

- NWE_CYCLE = NCS_WR_SETUP + NCS_WR_PULSE + NCS_WR_HOLD

All NWE and NCS (write) timings are defined separately for each chip select as an integer number of Master Clock cycles. The NWE_CYCLE field is common to both the NWE and NCS signals, thus the timing period is of the same duration.

NWE_CYCLE, NWE_SETUP, and NWE_PULSE implicitly define the NWE_HOLD value as:

- NWE_HOLD = NWE_CYCLE - NWE_SETUP - NWE_PULSE

NWE_CYCLE, NCS_WR_SETUP, and NCS_WR_PULSE implicitly define the NCS_WR_HOLD value as:

- NCS_WR_HOLD = NWE_CYCLE - NCS_WR_SETUP - NCS_WR_PULSE

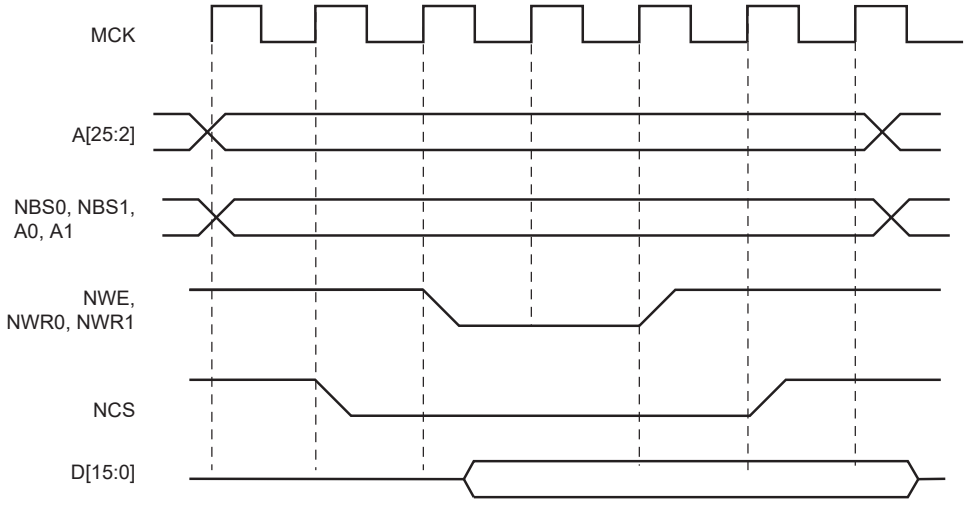
### 36.10.4 Write Mode

The WRITE_MODE parameter in the HSMC_MODE register of the corresponding chip select indicates which signal controls the write operation.

#### 36.10.4.1 Write is Controlled by NWE (WRITE_MODE = 1)

The figure below shows the waveforms of a write operation with WRITE_MODE set to 1. The data is put on the bus during the pulse and hold steps of the NWE signal. The internal data buffers are switched to Output mode after the NWE_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NCS.

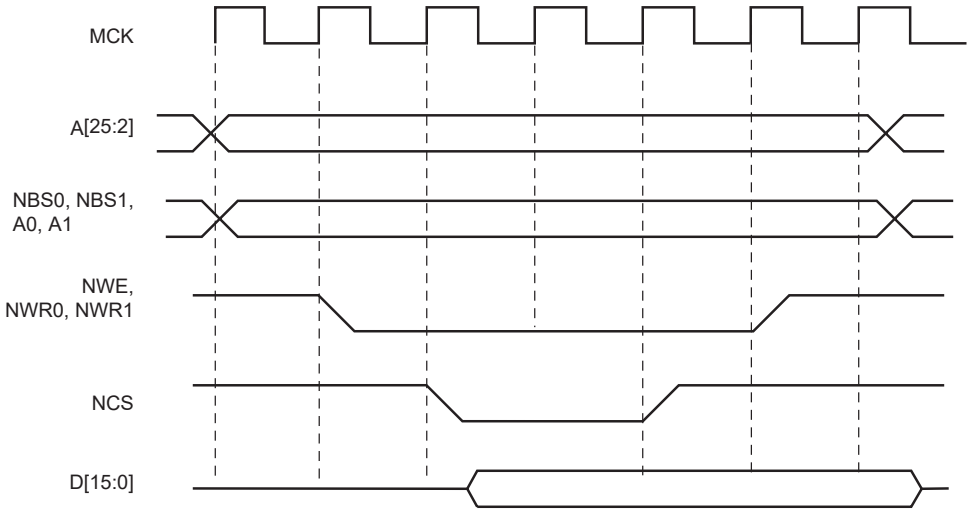
**Figure 36-11. WRITE_MODE = 1. The write operation is controlled by NWE**



#### 36.10.4.2 Write is Controlled by NCS (WRITE_MODE = 0)

The figure below shows the waveforms of a write operation with WRITE_MODE configured to 0. The data is put on the bus during the pulse and hold steps of the NCS signal. The internal data buffers are switched to Output mode after the NCS_WR_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NWE.

**Figure 36-12. WRITE_MODE = 0. The write operation is controlled by NCS**



### 36.10.5 Coding Timing Parameters

All timing parameters are defined for one chip select and are grouped together in one register according to their type:

- The HSMC_SETUP register groups the definition of all setup parameters: NRD_SETUP, NCS_RD_SETUP, NWE_SETUP, NCS_WR_SETUP
- The HSMC_PULSE register groups the definition of all pulse parameters: NRD_PULSE, NCS_RD_PULSE, NWE_PULSE, NCS_WR_PULSE
- The HSMC_CYCLE register groups the definition of all cycle parameters: NRD_CYCLE, NWE_CYCLE

The table below shows how the timing parameters are coded and their permitted range.

**Table 36-4. Coding and Range of Timing Parameters**

| Coded Value | Number of Bits | Effective Value | Permitted Range | |
|---|---|---|---|---|
| | | | Coded Value | Effective Value |
| setup [5:0] | 6 | 128 x setup[5] + setup[4:0] | 0 ≤ setup ≤ 31 | 0..31 |
| | | | 32 ≤ setup ≤ 63 | 128..(128 + 31) |
| pulse [6:0] | 7 | 256 x pulse[6] + pulse[5:0] | 0 ≤ pulse ≤ 63 | 0..63 |
| | | | 64 ≤ pulse ≤ 127 | 256..(256 + 63) |
| cycle[8:0] | 9 | 256 x cycle[8:7] + cycle[6:0] | 0 ≤ cycle ≤ 127 | 0..127 |
| | | | 128 ≤ cycle ≤ 255 | 256..(256 + 127) |
| | | | 256 ≤ cycle ≤ 383 | 512..(512 + 127) |
| | | | 384 ≤ cycle ≤ 511 | 768..(768 + 127) |

### 36.10.6 Reset Values of Timing Parameters

The table below gives the default value of timing parameters at reset.

**Table 36-5. Reset Values of Timing Parameters**

| Register | Reset Value | Description |
|---|---|---|
| HSMC_SETUP | 0x01010101 | All setup timings are set to 1 |
| HSMC_PULSE | 0x01010101 | All pulse timings are set to 1 |
| HSMC_CYCLE | 0x00030003 | The read and write operations last three Master Clock cycles and provide one hold cycle. |
| WRITE_MODE | 1 | Write is controlled with NWE |
| READ_MODE | 1 | Read is controlled with NRD |

### 36.10.7 Usage Restriction

The SMC does not check the validity of the user-programmed parameters. If the sum of SETUP and PULSE parameters is larger than the corresponding CYCLE parameter, this leads to an unpredictable behavior of the SMC.

#### 36.10.7.1 For Read Operations

Null but positive setup and hold of address and NRD and/or NCS cannot be guaranteed at the memory interface because of the propagation delay of these signals through external logic and pads. When positive setup and hold values must be verified, then it is strictly recommended to program non-null values so as to cover possible skews between address, NCS and NRD signals.

#### 36.10.7.2 For Write Operations

If a null hold value is programmed on NWE, the SMC can guarantee a positive hold of address, byte select lines, and NCS signal after the rising edge of NWE. This is true for WRITE_MODE = 1 only. See “Early Read Wait State”.

#### 36.10.7.3 For Read and Write Operations

A null value for pulse parameters is forbidden and may lead to an unpredictable behavior.

In read and write cycles, the setup and hold time parameters are defined in reference to the address bus. For external devices that require setup and hold time between NCS and NRD signals (read), or between NCS and NWE signals (write), these setup and hold times must be converted into setup and hold times in reference to the address bus.

## 36.11 Scrambling/Unscrambling Function

The external data bus D[15:0] can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling method depends on two user-configurable key registers, HSMC_KEY1 and HSMC_KEY2. These key registers are only accessible in Write mode.

The key must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

The scrambling/unscrambling function is enabled or disabled by configuring specific bits in the HSMC_OCMS and the HSMC_TIMINGSx registers. The bit configuration values to enable memory scrambling are summarized in the table below.

**Table 36-6. Scrambling Function Bit Encoding**

| Memories | Bit Values | | |
|---|---|---|---|
| | HSMC_OCMS.SMSE | HSMC_OCMS.SRSE | HSMC_TIMINGSx.OCMS |
| Off-chip Memories | 1 | 0 | 1 |
| NAND Flash with NFC | 0 | 1 | 0 |

When the NAND Flash memory content is scrambled, the on-chip NFC SRAM page buffer associated for the transfer is also scrambled.

## 36.12 Automatic Wait States

Under certain circumstances, the SMC automatically inserts idle cycles between accesses to avoid bus contention or operation conflict.

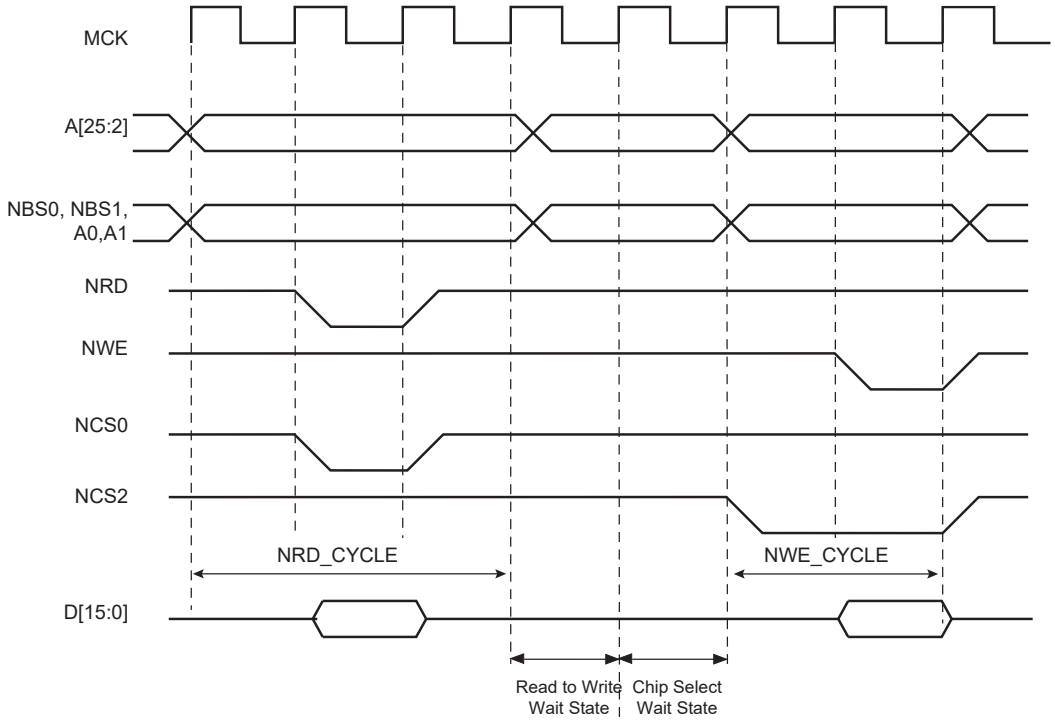
### 36.12.1 Chip Select Wait States

The SMC always inserts an idle cycle between two transfers on separate chip selects. This idle cycle ensures that there is no bus contention between the deactivation of one device and the activation of the next one.

During chip select wait state, all control lines are turned inactive: NBS0 to NBS1, NWR0 to NWR1, NCS[0..3], and NRD lines. They are all set to 1.

The figure below illustrates a chip select wait state between access on Chip Select 0 and Chip Select 2.

**Figure 36-13. Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS2**



### 36.12.2 Early Read Wait State

In some cases, the SMC inserts a wait state cycle between a write access and a read access to allow time for the write cycle to end before the subsequent read cycle begins. This wait state is not generated in addition to a chip select wait state. The early read cycle thus only occurs between a write and read access to the same memory device (same chip select).

An early read wait state is automatically inserted if at least one of the following conditions is valid:

- if the write controlling signal has no hold time and the read controlling signal has no setup time (see figure "Early Read Wait State: Write with No Hold Followed by Read with No Setup").
- in NCS Write Controlled mode (WRITE_MODE = 0), if there is no hold timing on the NCS signal and the NCS_RD_SETUP parameter is configured to 0, regardless of the Read mode (see figure "Early Read Wait State: NCS Controlled Write with No Hold Followed by a Read with No NCS Setup"). The write operation must end with an NCS rising edge. Without an Early Read Wait State, the write operation could not complete properly.
- in NWE Controlled mode (WRITE_MODE = 1) and if there is no hold timing (NWE_HOLD = 0), the feedback of the write control signal is used to control address, data, chip select and byte select lines. If the external write control signal is not inactivated as expected due to load capacitances, an Early Read Wait State is inserted and address, data and control signals are maintained one more cycle. See figure "Early Read Wait State: NWE-controlled Write with No Hold Followed by a Read with One Setup Cycle".

**Figure 36-14. Early Read Wait State: Write with No Hold Followed by Read with No Setup**

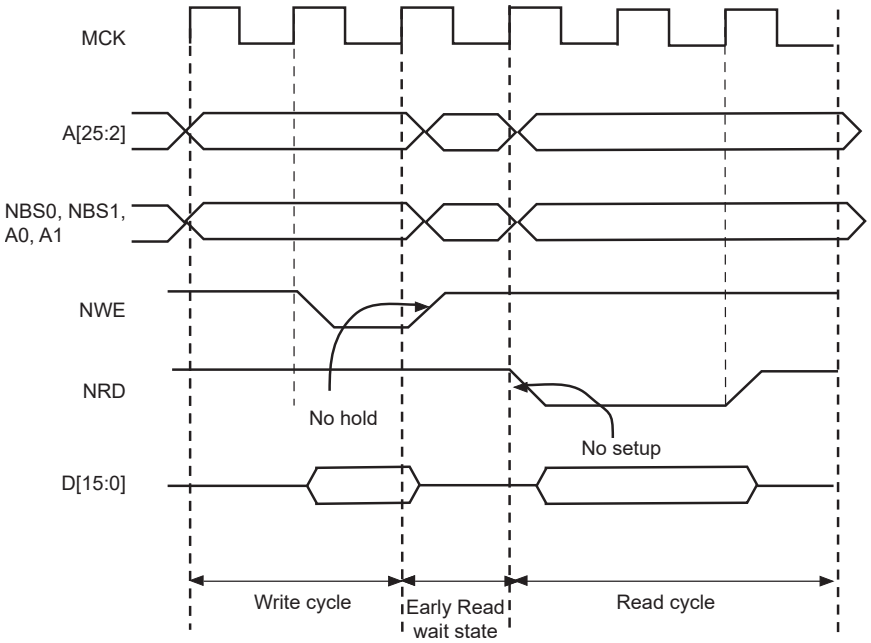


**Figure 36-15. Early Read Wait State: NCS Controlled Write with No Hold Followed by a Read with No NCS Setup**

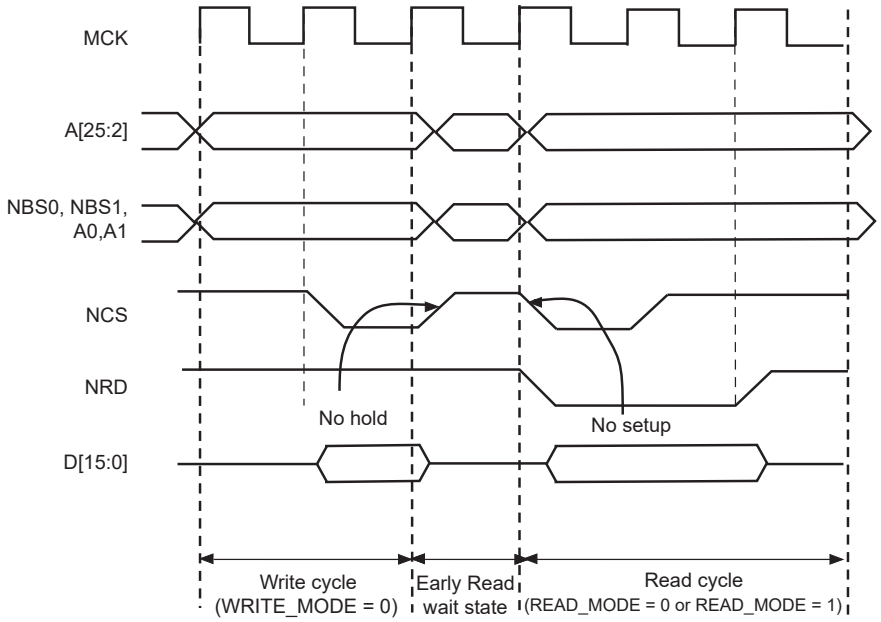

**Figure 36-16. Early Read Wait State: NWE-controlled Write with No Hold Followed by a Read with One Setup Cycle**

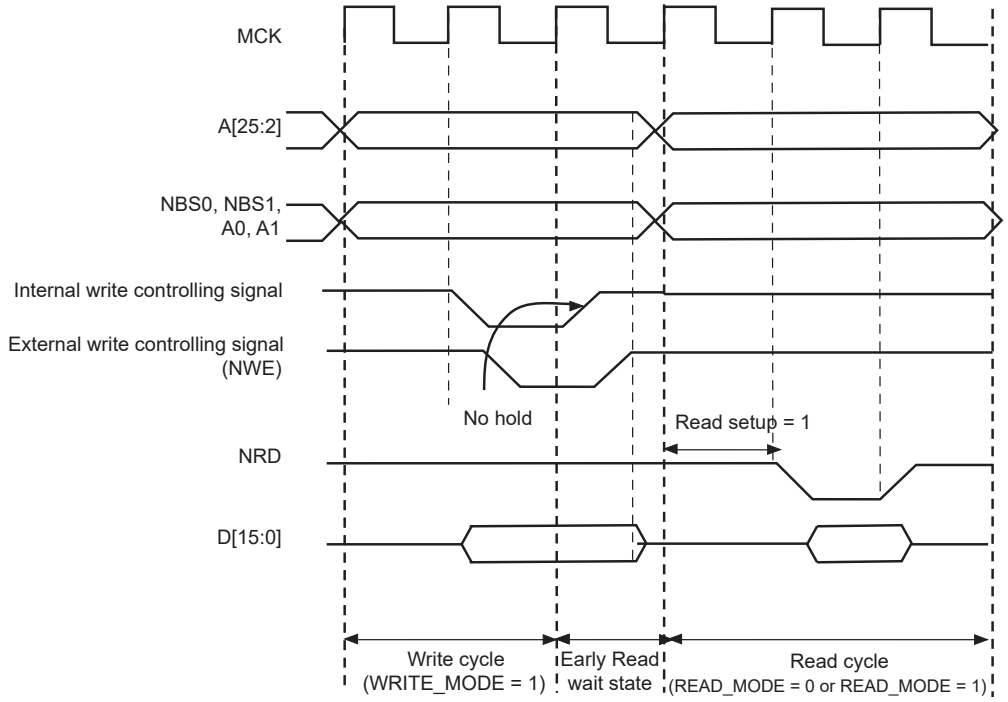

### 36.12.3 Reload User Configuration Wait State

The user may change any of the configuration parameters by writing the SMC user interface.

When detecting that a new user configuration has been written in the user interface, the SMC inserts a wait state before starting the next access. The so called “Reload User Configuration Wait State” is used by the SMC to load the new set of parameters to apply to next accesses.

The Reload Configuration Wait State is not applied in addition to the Chip Select Wait State. If accesses before and after reprogramming the user interface are made to different devices (Chip Selects), then one single Chip Select Wait State is applied.

On the other hand, if accesses before and after writing the user interface are made to the same device, a Reload Configuration Wait State is inserted, even if the change does not concern the current Chip Select.

#### 36.12.3.1 User Procedure

To insert a Reload Configuration Wait State, the SMC detects a write access to any HSMC_MODE register of the user interface. If only the timing registers are modified (HSMC_SETUP, HSMC_PULSE, HSMC_CYCLE registers) in the user interface, the user must validate the modification by writing the HSMC_MODE register, even if no change was made on the mode parameters.

#### 36.12.3.2 Slow Clock Mode Transition

A Reload Configuration Wait State is also inserted when the Slow Clock Mode is entered or exited, after the end of the current transfer (see “Slow Clock Mode”).

### 36.12.4 Read to Write Wait State

Due to an internal mechanism, a wait cycle is always inserted between consecutive read and write SMC accesses.

This wait cycle is referred to as a read to write wait state in this document.

This wait cycle is applied in addition to chip select and reload user configuration wait states when they are to be inserted. See figure “Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS2”.

## 36.13 Data Float Wait States

Some memory devices are slow to release the external bus. For such devices, it is necessary to add wait states (data float wait states) after a read access:

- before starting a read access to a different external memory
- before starting a write access to the same device or to a different external one.

The Data Float Output Time ($t_{DF}$) for each external memory device is programmed in the TDF_CYCLES field of the HSMC_MODE register for the corresponding chip select. The value of TDF_CYCLES indicates the number of data float wait cycles (between 0 and 15) before the external device releases the bus, and represents the time allowed for the data output to go to high impedance after the memory is disabled.

Data float wait states do not delay internal memory accesses. Hence, a single access to an external memory with long $t_{DF}$ will not slow down the execution of a program from internal memory.

The data float wait states management depends on the READ_MODE and the TDF_MODE bits of the HSMC_MODE register for the corresponding chip select.

### 36.13.1 READ_MODE

Setting READ_MODE to 1 indicates to the SMC that the NRD signal is responsible for turning off the tri-state buffers of the external memory device. The Data Float Period then begins after the rising edge of the NRD signal and lasts TDF_CYCLES MCK cycles.

When the read operation is controlled by the NCS signal (READ_MODE = 0), the TDF_CYCLES field in HSMC_MODEx gives the number of MCK cycles during which the data bus remains busy after the rising edge of NCS.

The figure "TDF Period in NRD Controlled Read Access (TDF = 2)" illustrates the Data Float Period in NRD-controlled mode (READ_MODE = 1), assuming a data float period of two cycles (TDF_CYCLES = 2). The figure "TDF Period in NCS Controlled Read Operation (TDF = 3)" shows the read operation when controlled by NCS (READ_MODE = 0) and the TDF_CYCLES parameter equals 3.

**Figure 36-17. TDF Period in NRD Controlled Read Access (TDF = 2)**

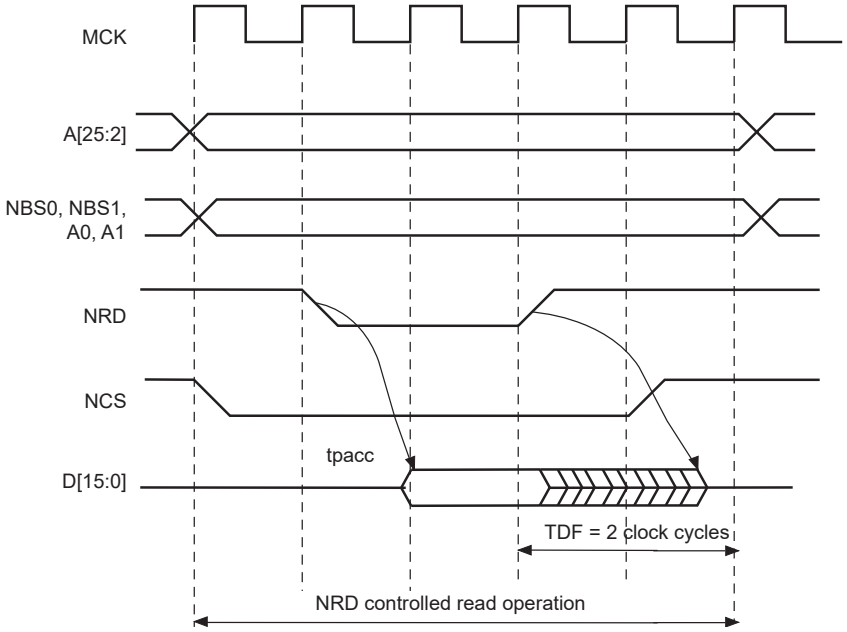

**Figure 36-18. TDF Period in NCS Controlled Read Operation (TDF = 3)**

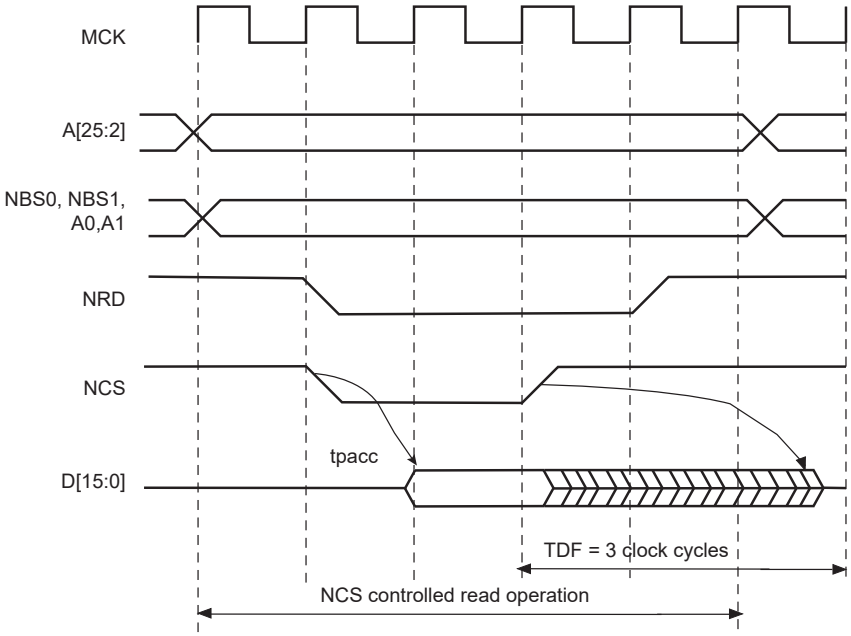


### 36.13.2 TDF Optimization Enabled (TDF_MODE = 1)

When the TDF_MODE of the HSMC_MODE register is set to 1 (TDF optimization is enabled), the SMC takes advantage of the setup period of the next access to optimize the number of wait states cycle to insert.

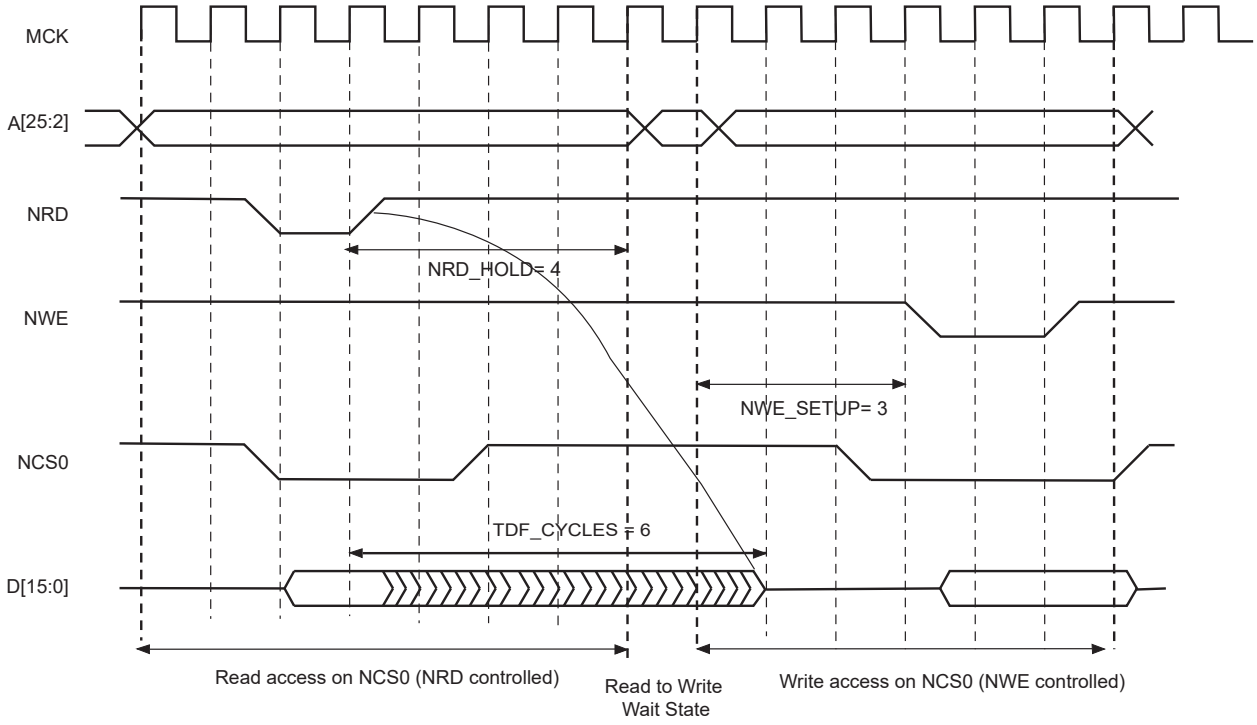
The figure below shows a read access controlled by NRD, followed by a write access controlled by NWE, on Chip Select 0. Chip Select 0 has been programmed with:

NRD_HOLD = 4; READ_MODE = 1 (NRD controlled)

NWE_SETUP = 3; WRITE_MODE = 1 (NWE controlled)

TDF_CYCLES = 6; TDF_MODE = 1 (optimization enabled).

**Figure 36-19. TDF Optimization: No TDF wait states are inserted if the TDF period is over when the next access begins**



### 36.13.3 TDF Optimization Disabled (TDF_MODE = 0)

When optimization is disabled, TDF wait states are inserted at the end of the read transfer, so that the data float period ends when the second access begins. If the hold period of the read1 controlling signal overlaps the data float period, no additional TDF wait states will be inserted.

The figures below illustrate the cases:

- read access followed by a read access on another chip select,
- read access followed by a write access on another chip select,
- read access followed by a write access on the same chip select,

with no TDF optimization.

**Figure 36-20. TDF Optimization Disabled (TDF Mode = 0). TDF wait states between 2 read accesses on different chip selects**

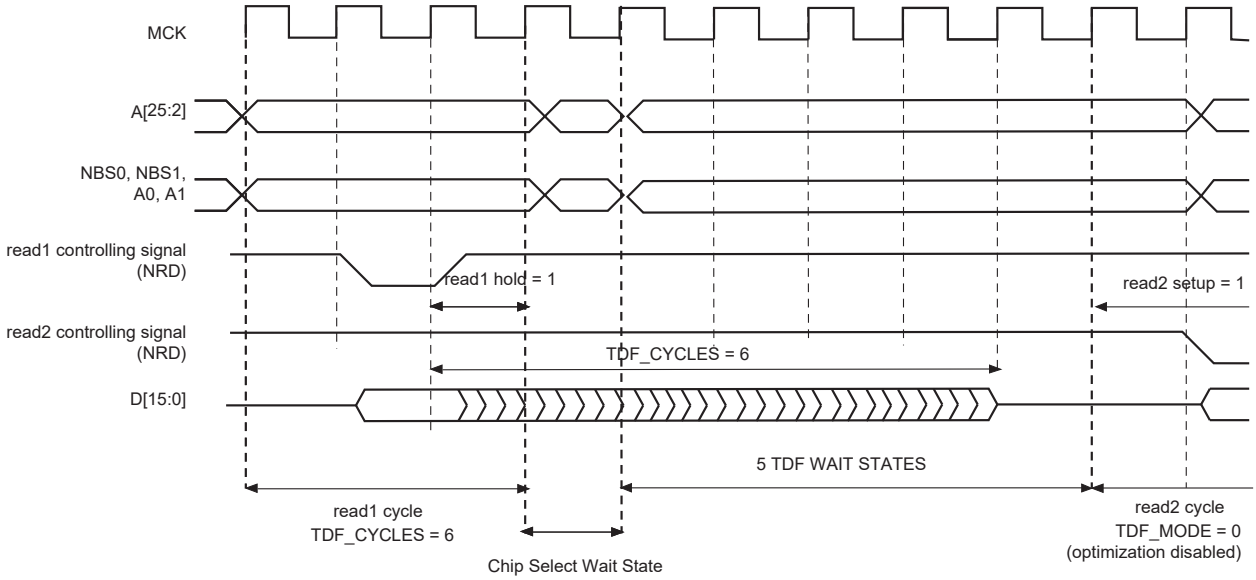


**Figure 36-21. TDF Mode = 0: TDF wait states between a read and a write access on different chip selects**

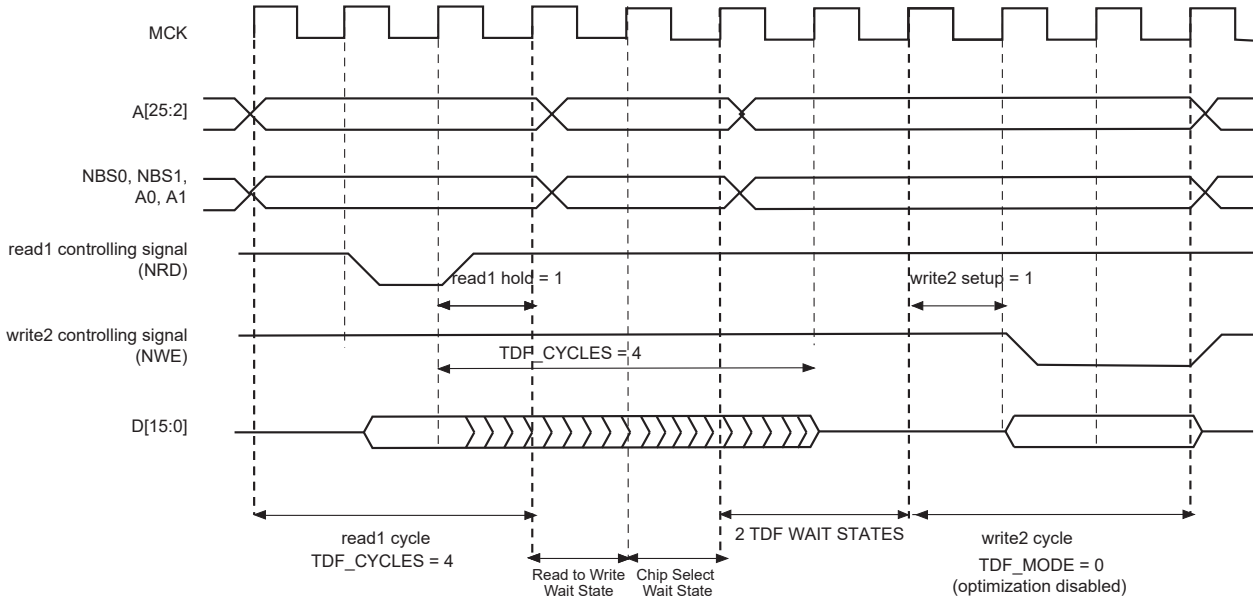

**Figure 36-22. TDF Mode = 0: TDF wait states between read and write accesses on the same chip select**

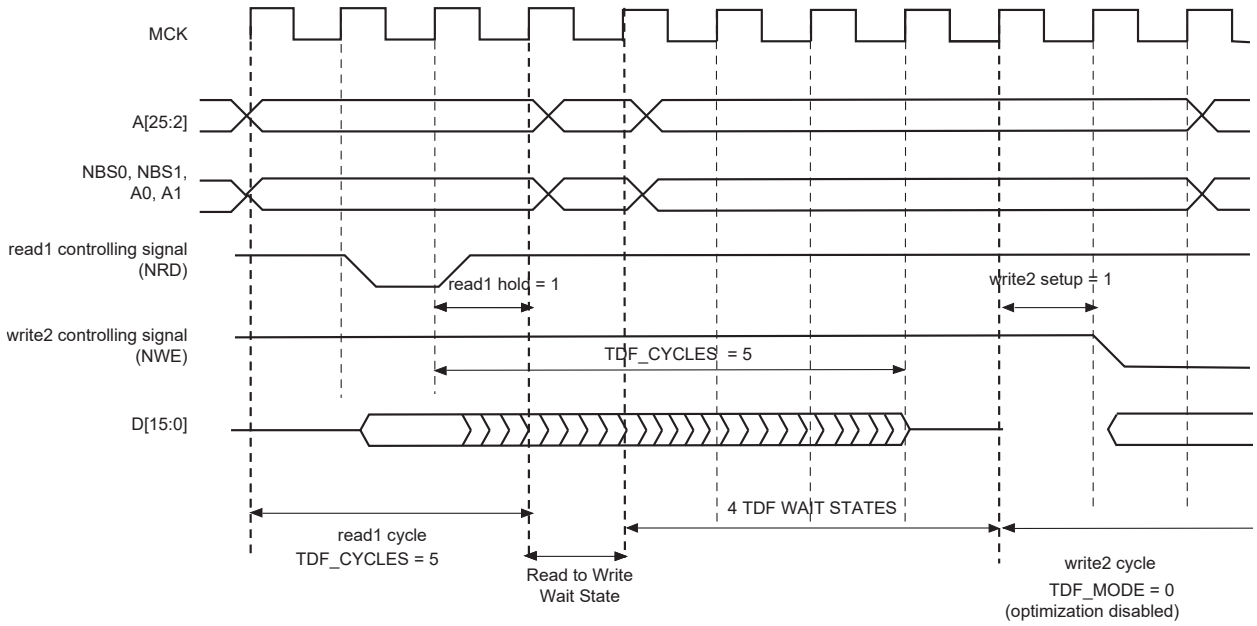

## 36.14 External Wait

Any access can be extended by an external device using the NWAIT input signal of the SMC. The EXNW_MODE field of the HSMC_MODE register on the corresponding chip select must be set to either ‘10’ (Frozen mode) or ‘11’ (Ready mode). When the EXNW_MODE is set to ‘00’ (disabled), the NWAIT signal is simply ignored on the corresponding chip select. The NWAIT signal delays the read or write operation in regards to the read or write controlling signal, depending on the Read and Write modes of the corresponding chip select.

### 36.14.1 Restriction

When one of the EXNW_MODE is enabled, it is mandatory to program at least one hold cycle for the read/write controlling signal. For that reason, the NWAIT signal cannot be used in Slow Clock Mode (see “Slow Clock Mode”).

The NWAIT signal is assumed to be a response of the external device to the read/write request of the SMC. NWAIT is then examined by the SMC in the pulse state of the read or write controlling signal. The assertion of the NWAIT signal outside the expected period has no impact on the SMC behavior.

### 36.14.2 Frozen Mode

When the external device asserts the NWAIT signal (active low), and after an internal synchronization of this signal, the SMC state is frozen, i.e., SMC internal counters are frozen, and all control signals remain unchanged. When the resynchronized NWAIT signal is deasserted, the SMC completes the access, resuming the access from the point where it was stopped. See the figure below. This mode must be selected when the external device uses the NWAIT signal to delay the access and to freeze the SMC.

The assertion of the NWAIT signal outside the expected period is ignored as illustrated in the figure “Read Access with NWAIT Assertion in Frozen Mode (EXNW_MODE = 10)”.

**Figure 36-23. Write Access with NWAIT Assertion in Frozen Mode (EXNW_MODE = 10)**

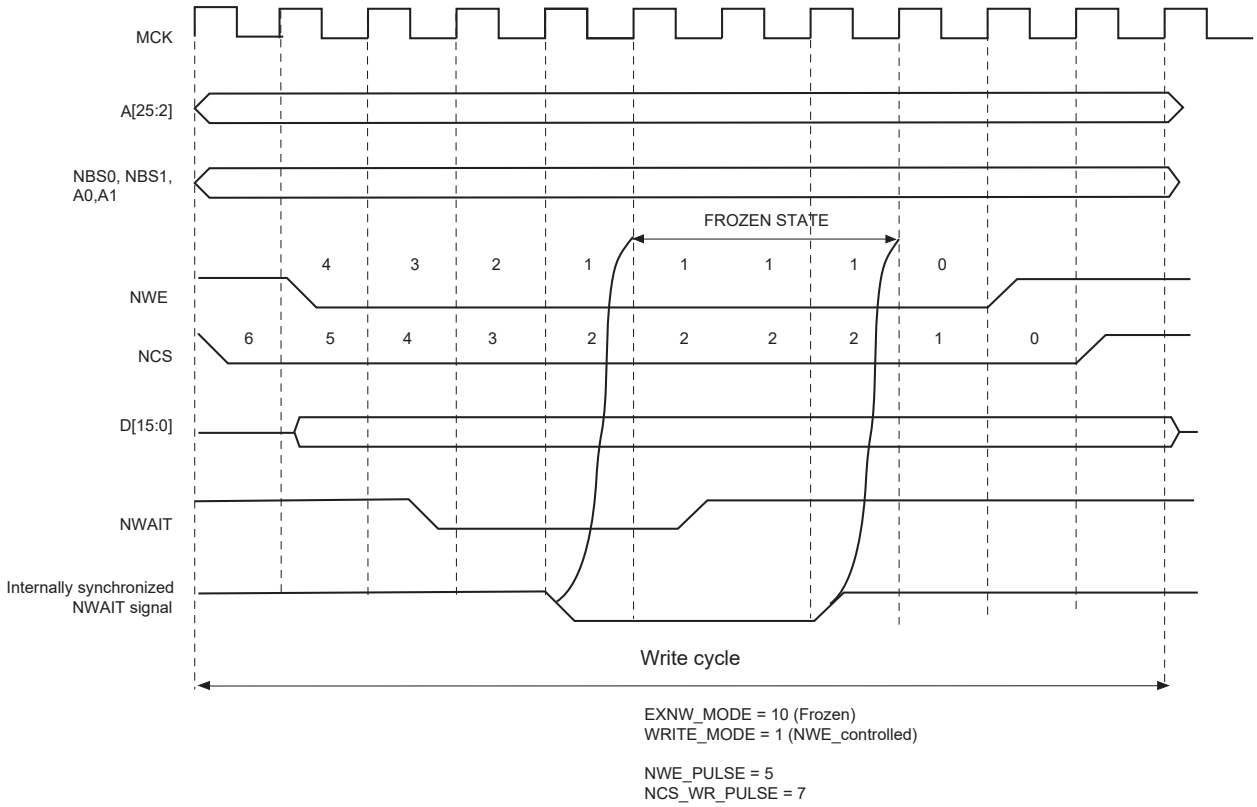

**Figure 36-24. Read Access with NWAIT Assertion in Frozen Mode (EXNW_MODE = 10)**

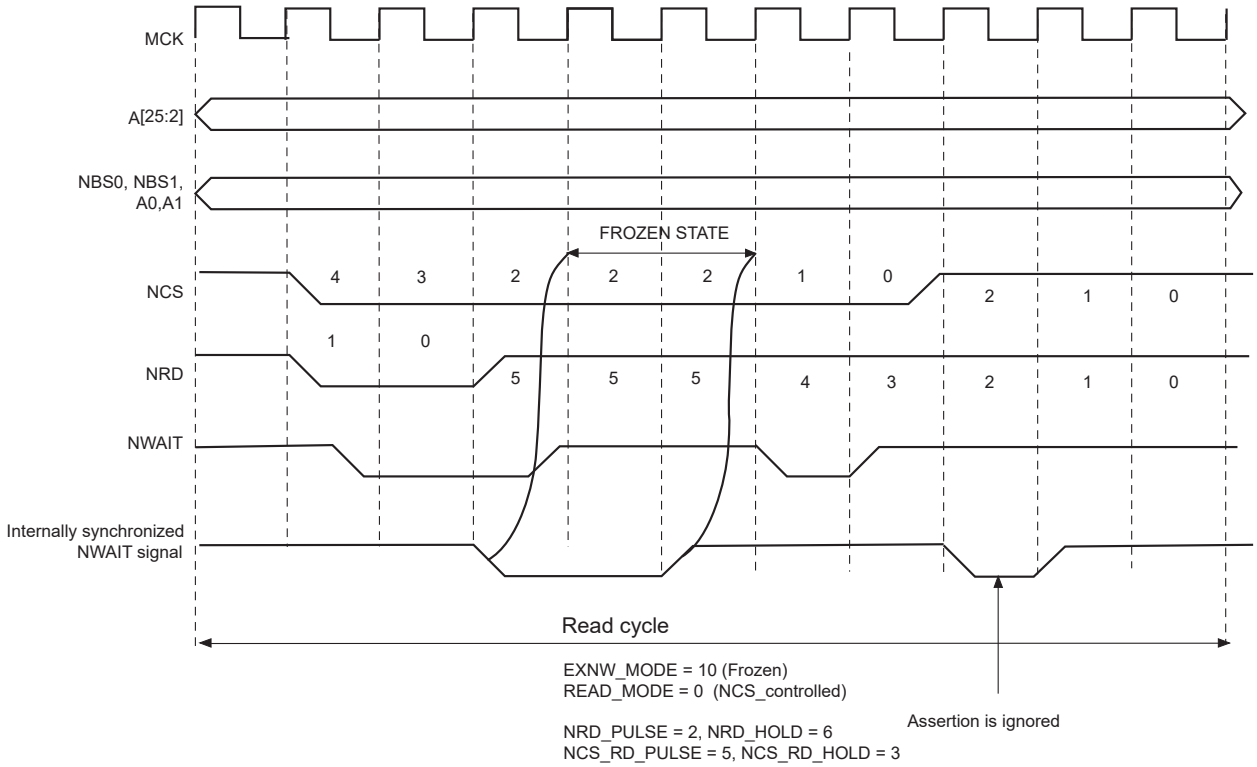

### 36.14.3 Ready Mode

In Ready mode (EXNW_MODE = 11), the SMC behaves differently. Normally, the SMC begins the access by down counting the setup and pulse counters of the read/write controlling signal. In the last cycle of the pulse phase, the resynchronized NWAIT signal is examined.

If asserted, the SMC suspends the access as shown in the figures below. After deassertion, the access is completed: the hold step of the access is performed.

This mode must be selected when the external device uses deassertion of the NWAIT signal to indicate its ability to complete the read or write operation.

If the NWAIT signal is deasserted before the end of the pulse, or asserted after the end of the pulse of the controlling read/write signal, it has no impact on the access length as shown in the figure “NWAIT Assertion in Read Access: Ready Mode (EXNW_MODE = 11)”.

**Figure 36-25. NWAIT Assertion in Write Access: Ready Mode (EXNW_MODE = 11)**

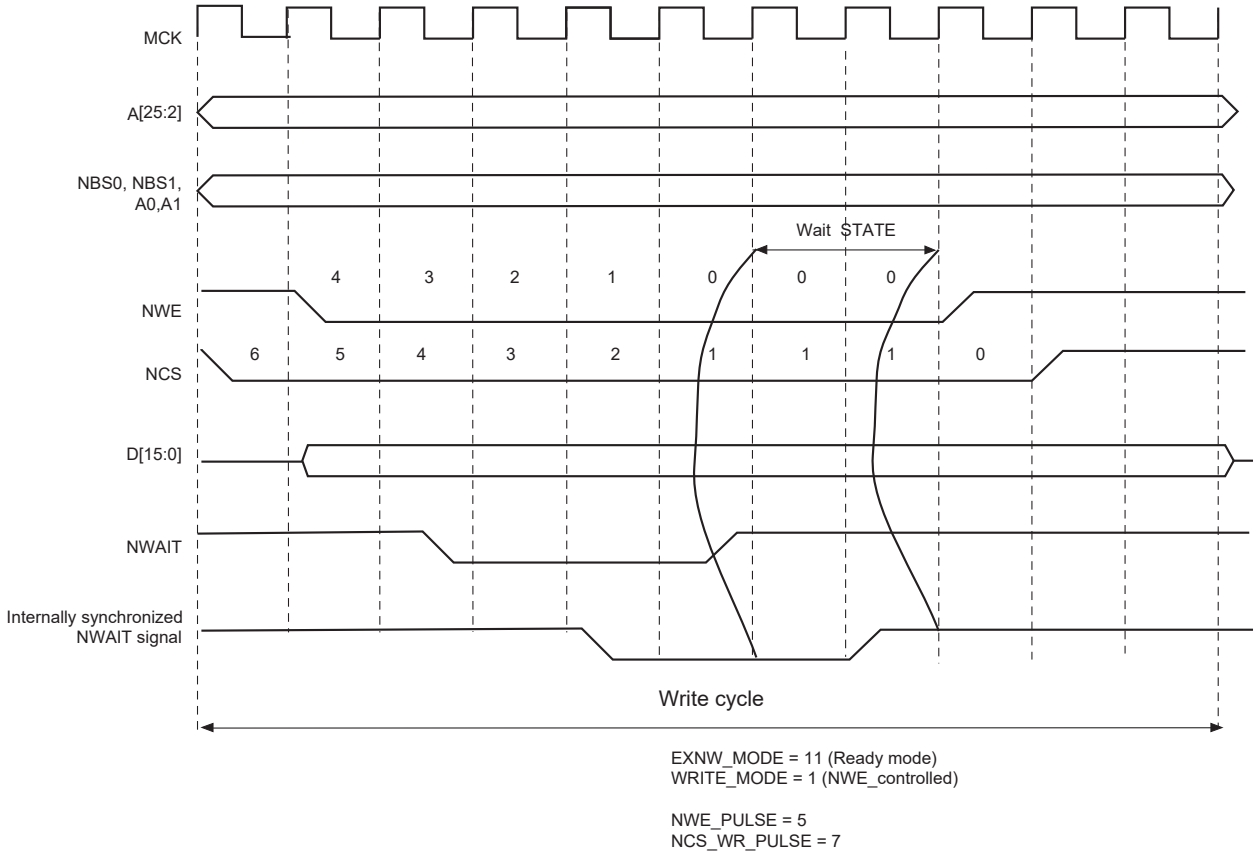

**Figure 36-26. NWAIT Assertion in Read Access: Ready Mode (EXNW_MODE = 11)**

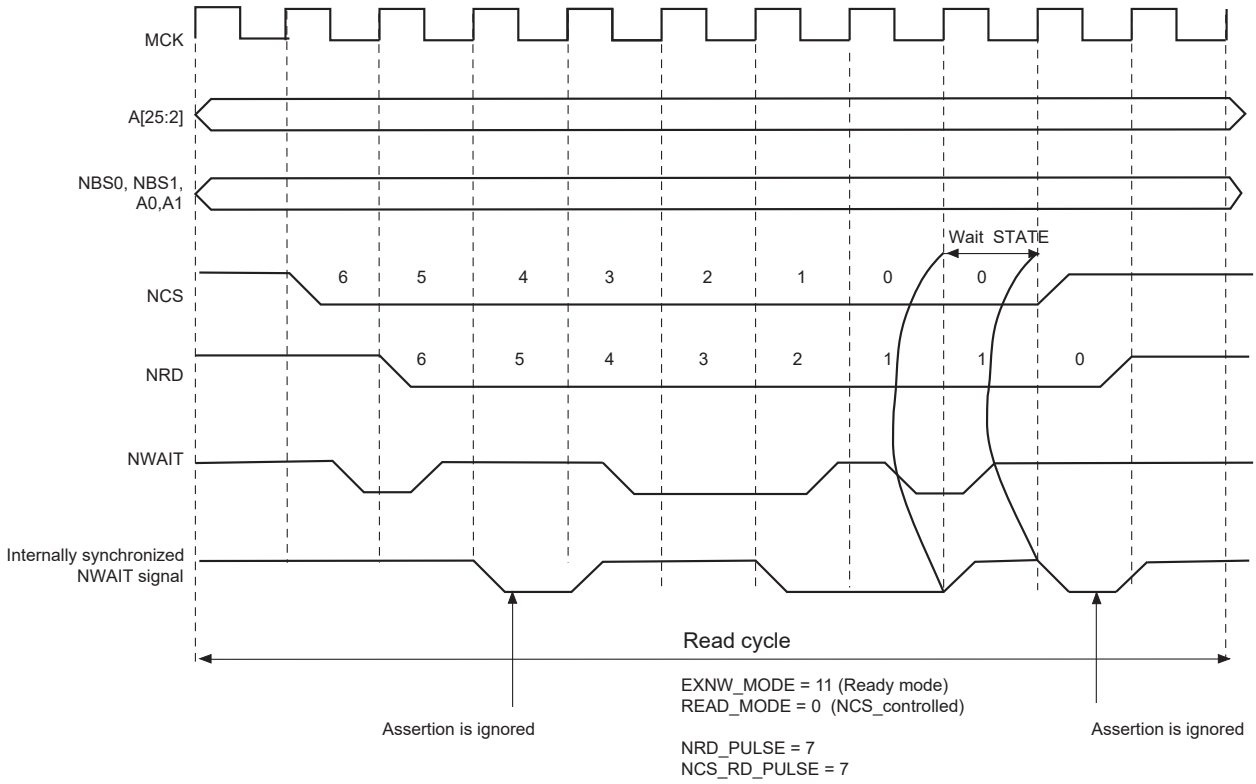


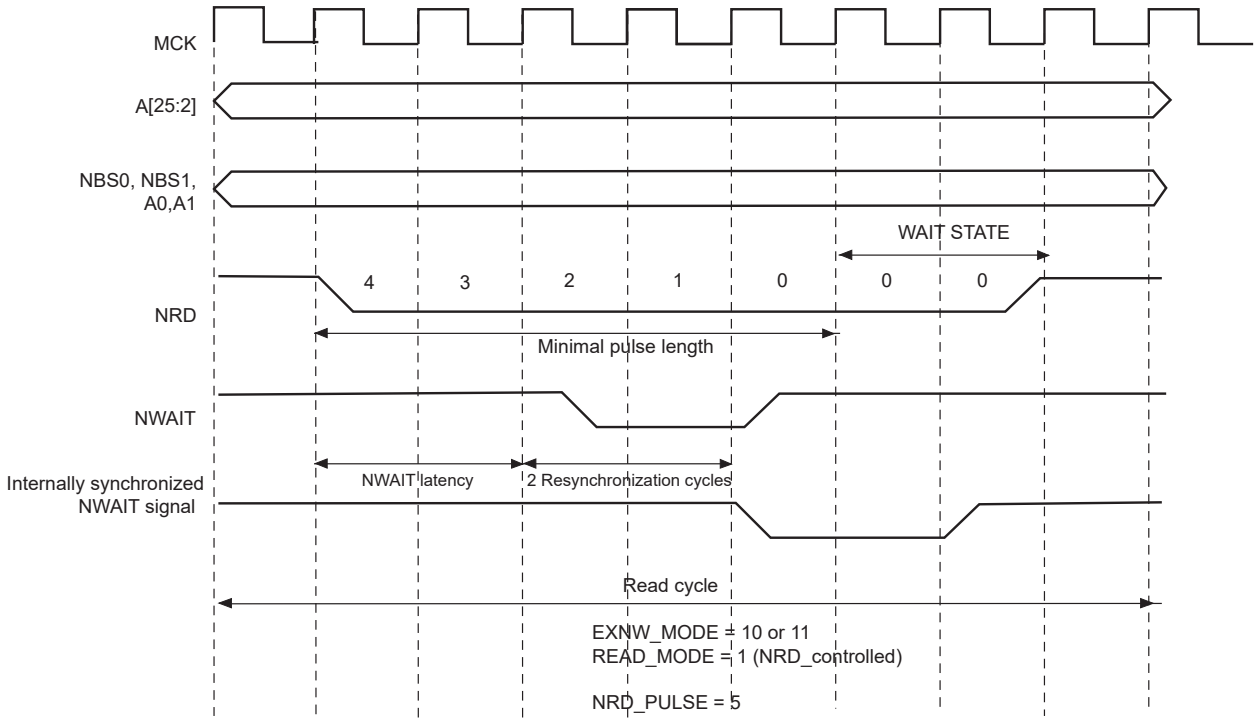
### 36.14.4 NWAIT Latency and Read/Write Timings

There may be a latency between the assertion of the read/write controlling signal and the assertion of the NWAIT signal by the device. The programmed pulse length of the read/write controlling signal must be at least equal to this latency plus the 2 cycles of resynchronization + 1 cycle. Otherwise, the SMC may enter the hold state of the access without detecting the NWAIT signal assertion. This is true in Frozen mode as well as in Ready mode. This is illustrated in the figure below.

When EXNW_MODE is enabled (ready or frozen), the user must program a pulse length of the read and write controlling signal of at least:

minimal pulse length = NWAIT latency + 2 resynchronization cycles + 1 cycle

**Figure 36-27. NWAIT Latency**



## 36.15 Slow Clock Mode

The SMC is able to automatically apply a set of “Slow Clock mode” read/write waveforms when an internal signal driven by the Power Management Controller is asserted because MCK has been turned to a very slow clock rate (typically 32 kHz clock rate). In this mode, the user-programmed waveforms are ignored and the Slow Clock mode waveforms are applied. This mode is provided so as to avoid reprogramming the User Interface with appropriate waveforms at very slow clock rate. When activated, the Slow mode is active on all chip selects.

### 36.15.1 Slow Clock Mode Waveforms

The figure below illustrates the read and write operations in Slow Clock mode. They are valid on all chip selects. The table below indicates the value of read and write parameters in Slow Clock mode.

**Figure 36-28. Write/Read Cycles in Slow Clock Mode**

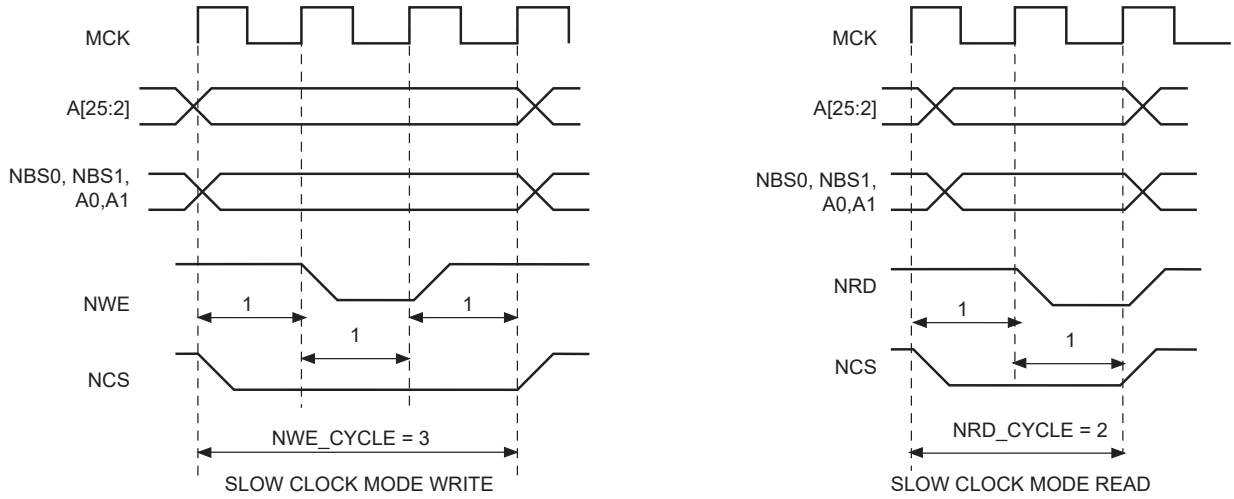


**Table 36-7. Read and Write Timing Parameters in Slow Clock Mode**

| Read Parameters | Duration (cycles) | Write Parameters | Duration (cycles) |
|---|---|---|---|
| NRD_SETUP | 1 | NWE_SETUP | 1 |
| NRD_PULSE | 1 | NWE_PULSE | 1 |
| NCS_RD_SETUP | 0 | NCS_WR_SETUP | 0 |
| NCS_RD_PULSE | 2 | NCS_WR_PULSE | 3 |
| NRD_CYCLE | 2 | NWE_CYCLE | 3 |

### 36.15.2 Switching from (to) Slow Clock Mode to (from) Normal Mode

When switching from Slow Clock mode to Normal mode, the current Slow Clock mode transfer is completed at high clock rate, with the set of Slow Clock mode parameters. See the figure "Clock Rate Transition occurs while the SMC is performing a Write Operation". The external device may not be fast enough to support such timings.

The figure "Recommended Procedure to Switch from Slow Clock Mode to Normal Mode or from Normal Mode to Slow Clock Mode" illustrates the recommended procedure to properly switch from one mode to the other.

**Figure 36-29. Clock Rate Transition occurs while the SMC is performing a Write Operation**

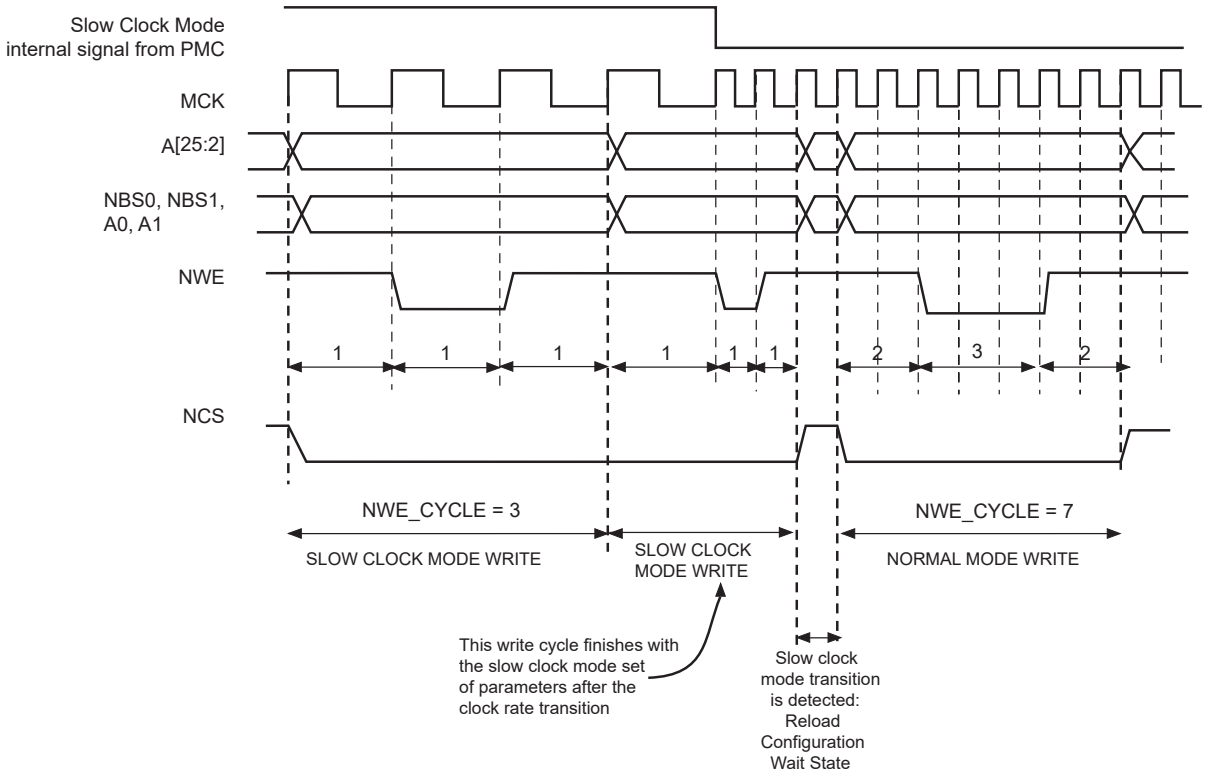

**Figure 36-30. Recommended Procedure to Switch from Slow Clock Mode to Normal Mode or from Normal Mode to Slow Clock Mode**

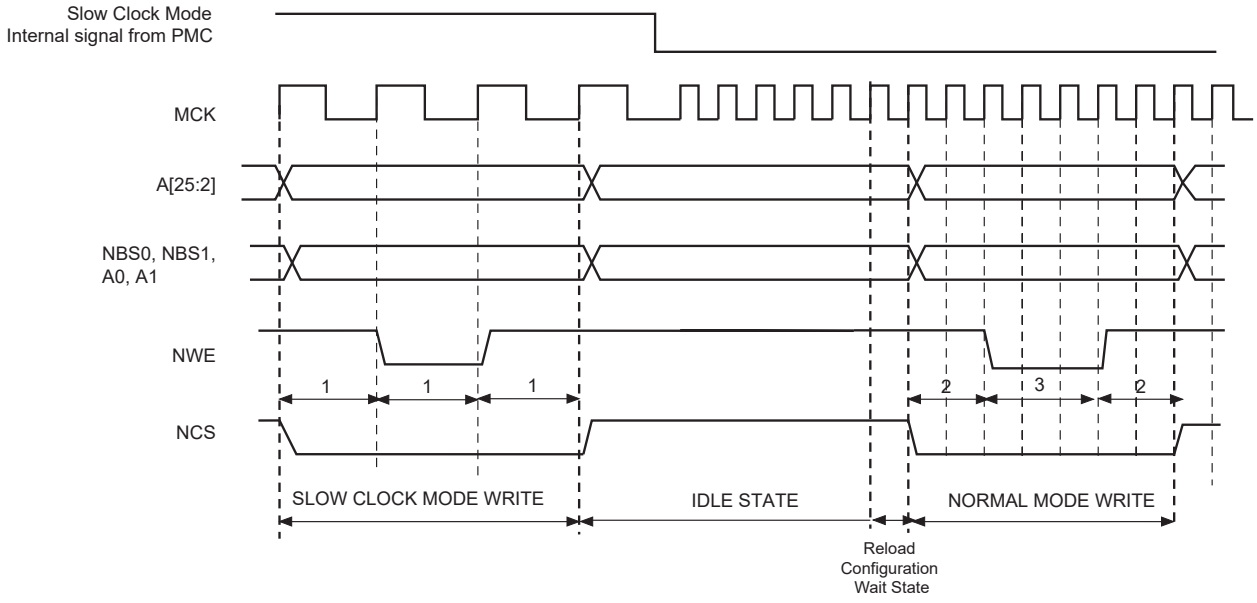


## 36.16 Register Write Protection

To prevent any single software error that may corrupt SMC behavior, selected registers can be write-protected by setting the WPEN bit in the Write Protection Mode Register (HSMC_WPMR).

If a write access in a write-protected register is detected, then the WPVS flag in the Write Protection Status Register (HSMC_WPSR) is set and the field WPVSRC indicates in which register the write access has been attempted.

The WPVS flag is automatically reset after reading the HSMC_WPSR.

The following registers can be write-protected:

- Setup Register
- Pulse Register
- Cycle Register
- Timings Register
- Mode Register

## 36.17 NFC Operations

### 36.17.1 NFC Overview

The NFC handles all the command, address and data sequences of the NAND low level protocol. An SRAM is used as an internal read/write buffer when data is transferred from or to the NAND.

### 36.17.2 NFC Control Registers

NAND Flash Read and NAND Flash Program operations can be performed through the NFC Command Registers. In order to minimize CPU intervention and latency, commands are posted in a command buffer. This buffer provides zero wait state latency.

The NFC handles an automatic transfer between the external NAND Flash and the chip via the NFC SRAM. The transfer is done by programming NFC Command Registers.

The NFC Command Registers are very efficient to use. When writing to these registers:

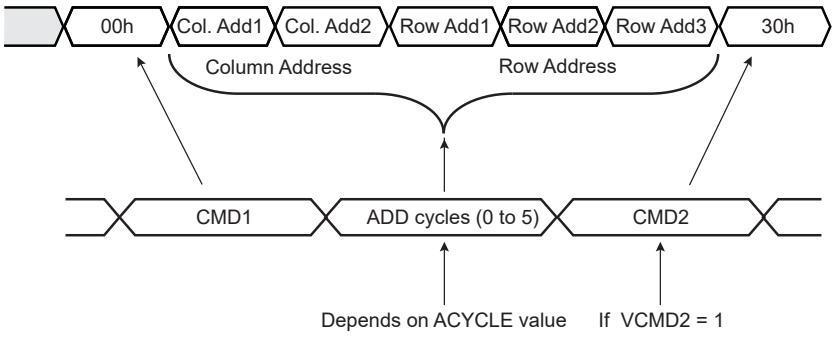
- the address of the register (NFCADDR_CMD) is the command used
- the data of the register (NFCDATA_ADDT) is the address to be sent to the NAND Flash

In one single access the command is sent and immediately executed by the NFC. Two commands can even be programmed within a single access (CMD1, CMD2) depending on the VCMD2 value.

The NFC can send up to five address cycles.

The figure below shows a typical NAND Flash Page Read Command of a NAND Flash Memory and correspondence with NFC Address Command Register.

**Figure 36-31. NFC/NAND Flash Access Example**



For more details, refer to 36.17.2.2 NFCADDR_CMD.

Reading the NFC Command Register (to any address) will give the status of the NFC. This is especially useful to know if the NFC is busy, for example.

#### 36.17.2.1 Building NFC Address Command Example

The base address is made of HOST_ADDR address.

Page read operation example:

```
// Build the Address Command (NFCADDR_CMD)
AddressCommand = (HOST_ADDR |
  NFCWR=0    | // NFC Read Data from NAND Flash
  DATAEN=1   | // NFC Data phase Enable.
  CSID=1     | // Chip Select ID = 1
  ACYCLE= 5  | // Number of address cycle.
  VCMD2=1    | // CMD2 is sent after Address Cycles
  CMD2=0x30  | // CMD2 = 30h
  CMD1=0x0) // CMD1 = Read Command = 00h
 // Set the Address for Cycle 0
 HSMC_ADDR = Col. Add1
 // Write command with the Address Command built above
*AddressCommand = (Col. Add2 | // ADDR_CYCLE1
  Row Add1   | // ADDR_CYCLE2
  Row Add2   | // ADDR_CYCLE3
  Row Add3 )   // ADDR_CYCLE4
```

#### 36.17.2.2 NFC Address Command

**Name:** NFCADDR_CMD
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | NFCWR | DATAEN | CSID[2:2] |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CSID[1:0] | | ACYCLE[2:0] | | | VCMD2 | CMD2[7:6] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CMD2[5:0] | | | | | | CMD1[7:6] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CMD1[5:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | | | | | | | | |

**Bit 26 – NFCWR** NFC Write Enable

| Value | Description |
|---|---|
| 0 | NFC reads data from the NAND Flash. |
| 1 | NFC writes data into the NAND Flash. |

**Bit 25 – DATAEN** NFC Data Phase Enable
When set to true, the NFC will automatically read or write data after the command.

**Bits 24:22 – CSID[2:0]** Chip Select Identifier
Chip select used.

**Bits 21:19 – ACYCLE[2:0]** Number of Address Required for the Current Command
When ACYCLE field is different from zero, ACYCLE Address cycles are performed after Command Cycle 1. The maximum number of cycles is 5.

**Bit 18 – VCMD2** Valid Cycle 2 Command
When set to true, the CMD2 field is issued after the address cycle.

**Bits 17:10 – CMD2[7:0]** Command Register Value for Cycle 2
When a write access occurs with the VCMD2 field set, the NFC sends this command after CMD1.

**Bits 9:2 – CMD1[7:0]** Command Register Value for Cycle 1
When a write access occurs, the NFC sends this command.

#### 36.17.2.3 NFC Data Address

**Name:** NFCDATA_ADDT
**Property:** Write-only

If five address cycles are used, the first address cycle is ADDR_CYCLE0. Refer to HSMC_ADDR register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ADDR_CYCLE4[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ADDR_CYCLE3[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ADDR_CYCLE2[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ADDR_CYCLE1[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

**Bits 31:24 – ADDR_CYCLE4[7:0]** NAND Flash Array Address Cycle 4
When less than five address cycles are used, ADDR_CYCLE4 is the fourth byte written to the NAND Flash.
When five address cycles are used, ADDR_CYCLE4 is the fifth byte written to NAND Flash.

**Bits 23:16 – ADDR_CYCLE3[7:0]** NAND Flash Array Address Cycle 3
When less than five address cycles are used, ADDR_CYCLE3 is the third byte written to the NAND Flash.
When five address cycles are used, ADDR_CYCLE3 is the fourth byte written to NAND Flash.

**Bits 15:8 – ADDR_CYCLE2[7:0]** NAND Flash Array Address Cycle 2
When less than five address cycles are used, ADDR_CYCLE2 is the second byte written to the NAND Flash.
When five address cycles are used, ADDR_CYCLE2 is the third byte written to NAND Flash.

**Bits 7:0 – ADDR_CYCLE1[7:0]** NAND Flash Array Address Cycle 1
When less than five address cycles are used, ADDR_CYCLE1 is the first byte written to the NAND Flash.
When five address cycles are used, ADDR_CYCLE1 is the second byte written to NAND Flash.

#### 36.17.2.4 NFC Data Status

**Name:** NFCDATA_STATUS
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | NFCBUSY | NFCWR | DATAEN | CSID[2:2] |
| Access | | | | | R | R | R | R |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CSID[1:0] | | ACYCLE[2:0] | | | VCMD2 | CMD2[7:6] | |
| Access | R | R | R | R | R | R | R | R |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CMD2[5:0] | | | | | | CMD1[7:6] | |
| Access | R | R | R | R | R | R | R | R |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CMD1[5:0] | | | | | | | |
| Access | R | R | R | R | R | R | | |
| Reset | | | | | | | | |

**Bit 27 – NFCBUSY** NFC Busy Status Flag
If set to true, it indicates that the NFC is busy.

**Bit 26 – NFCWR** NFC Write Enable

| Value | Description |
|---|---|
| 0 | NFC is in Read mode. |
| 1 | NFC is in Write mode. |

**Bit 25 – DATAEN** NFC Data Phase Enable
When set to true, the NFC data phase is enabled.

**Bits 24:22 – CSID[2:0]** Chip Select Identifier
Chip select used.

**Bits 21:19 – ACYCLE[2:0]** Number of Address Required for the Current Command
When ACYCLE is different from zero, ACYCLE Address cycles are performed after Command Cycle 1.

**Bit 18 – VCMD2** Valid Cycle 2 Command
When set to true, the CMD2 field is issued after the address cycle.

**Bits 17:10 – CMD2[7:0]** Command Register Value for Cycle 2
When VCMD2 bit is set to true, the Physical Memory Interface drives the IO bus with CMD2 field during the Command Latch cycle 2.

**Bits 9:2 – CMD1[7:0]** Command Register Value for Cycle 1
When a Read or Write Access occurs, the Physical Memory Interface drives the IO bus with CMD1 field during the Command Latch cycle 1.

### 36.17.3 NFC Initialization

Prior to any Command and Data Transfer, the SMC User Interface must be configured to meet the device timing requirements.

- Write Enable Configuration

Use NWE_SETUP, NWE_PULSE and NWE_CYCLE to define the write enable waveform according to the external device datasheet.

Use HSMC_TIMINGS.TADL to configure the timing between the last address latch cycle and the first rising edge of WEN for data input.

**Figure 36-32. Write Enable Timing Configuration**

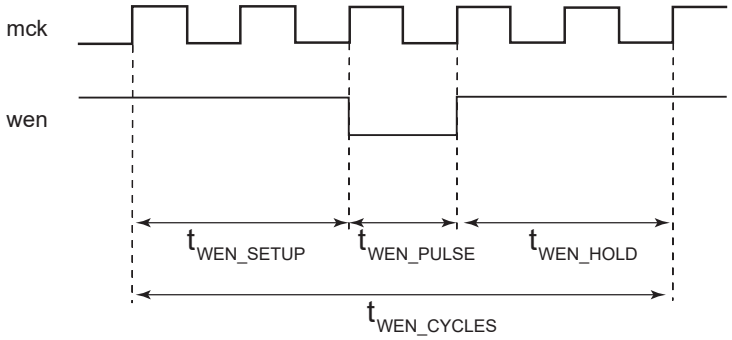


**Figure 36-33. Write Enable Timing for NAND Flash Device Data Input Mode**

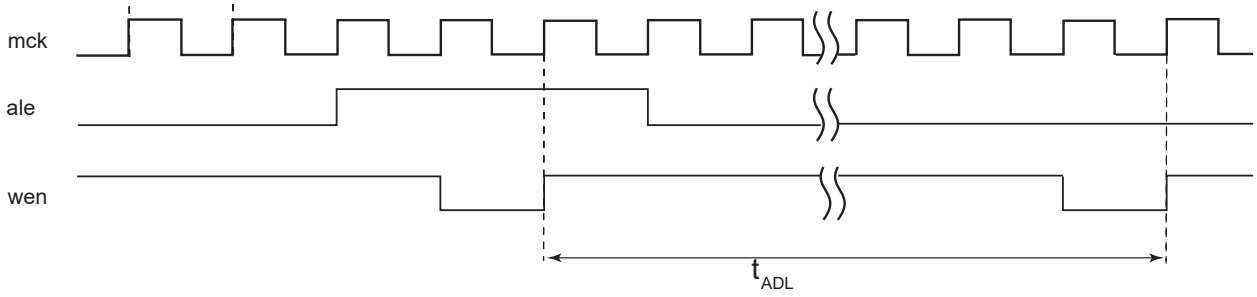


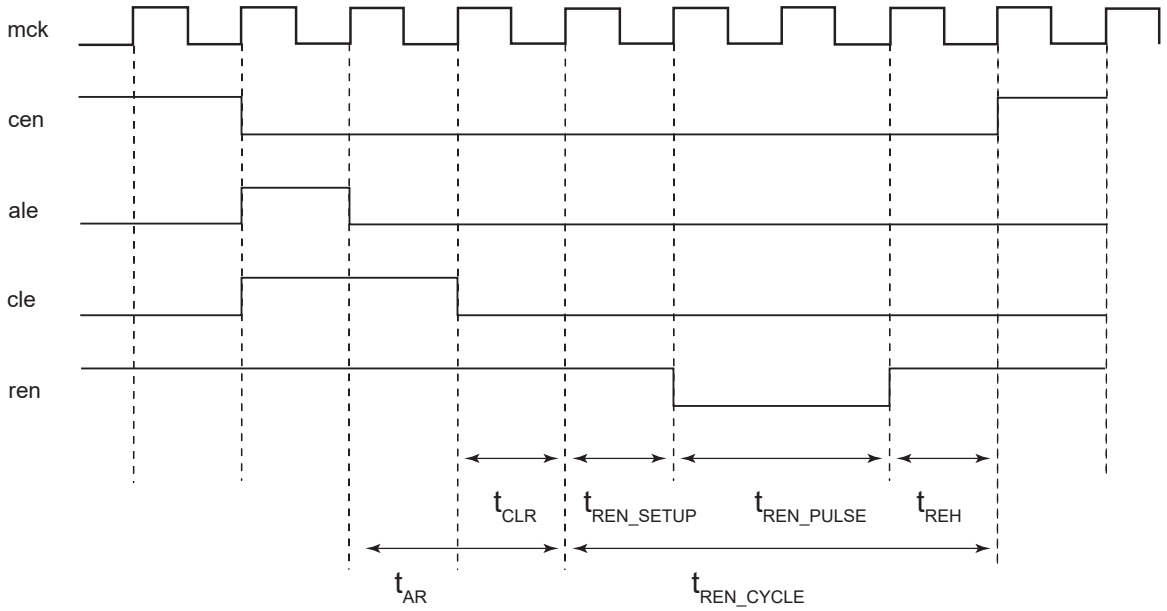
- Read Enable Configuration

Use NRD_SETUP, NRD_PULSE and NRD_CYCLE to define the read enable waveform according to the external device datasheet.

Use HSMC_TIMINGS.TAR to configure the timings between the address latch enable falling edge to read the enable falling edge.

Use HSMC_TIMINGS.TCLR to configure the timings between the command latch enable falling edge to read the enable falling edge.

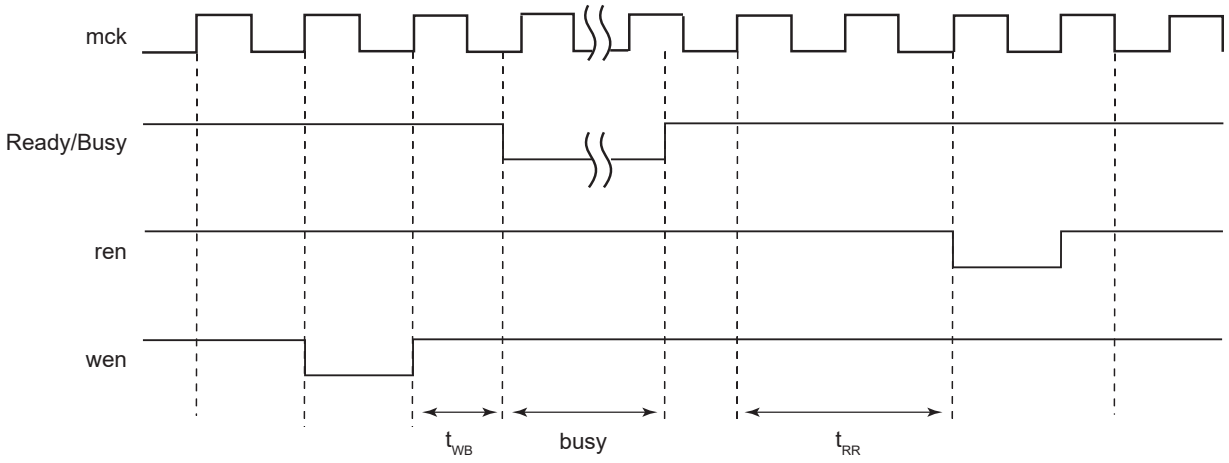
**Figure 36-34. Read Enable Timing Configuration Working with NAND Flash Device**



- Ready/Busy Signal Timing Configuration with a NAND Flash Device

Use HSMC_TIMINGS.TWB to configure the maximum elapsed time between the rising edge of the wen signal and the falling edge of the Ready/Busy signal. Use TRR field in the HSMC_TIMINGS register to program the number of clock cycles between the rising edge of the Ready/Busy signal and the falling edge of the ren signal.

**Figure 36-35. Ready/Busy Timing Configuration**

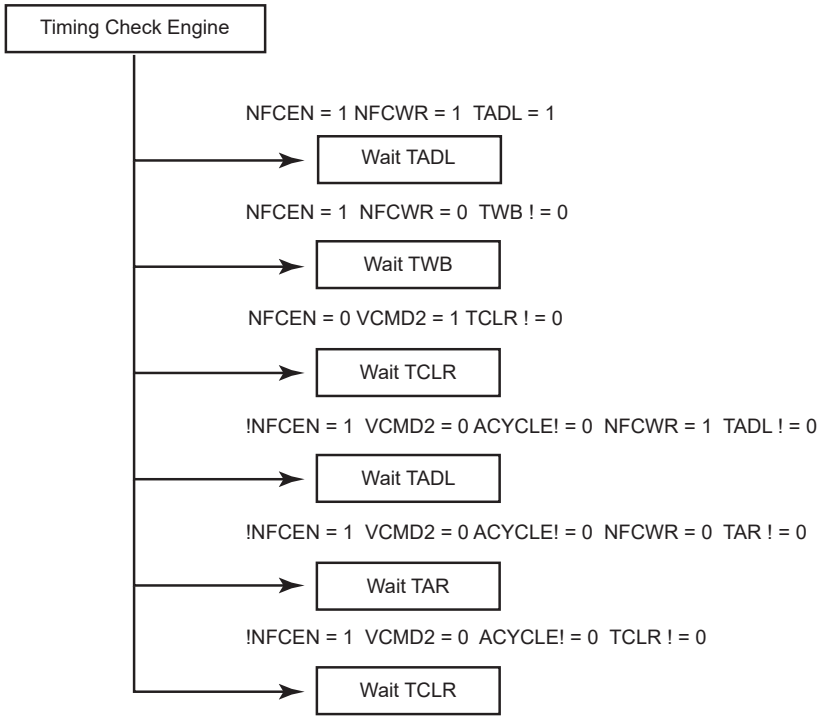


#### 36.17.3.1 NFC Timing Engine

When the NFC Command register is written, the NFC issues a NAND Flash Command and optionally performs a data transfer between the NFC SRAM and the NAND Flash device. The NFC Timing Engine guarantees valid NAND Flash timings, depending on the set of parameters decoded from the address bus. These timings are defined in the HSMC_TIMINGS register.

For information on the timing used depending on the command, see the figure below.

**Figure 36-36. NFC Timing Engine**



See the register descriptions 36.17.2.2 NFCADDR_CMD and 36.20.36 HSMC_TIMINGSx.

### 36.17.4 NFC SRAM

#### 36.17.4.1 NFC SRAM Mapping

If the NFC is used to read and write data from and to the NAND Flash, the configuration depends on the page size (PAGESIZE field in HSMC_CFG register). See the tables below for detailed mapping.

The NFC can handle the NAND Flash with a page size of 8 Kbytes or lower (such as 2 Kbytes, for example). In case of a 4 Kbyte or lower page size, the NFC SRAM can be split into two banks. The BANK bit in the HSMC_BANK register is used to select where NAND flash data are written or read. For an 8 Kbyte page size this field is not relevant.

Note that a “Ping-Pong” mode (write or read to a bank while the NFC writes or reads to another bank) is accessible with the NFC (using two different banks).

If the NFC is not used, the NFC SRAM can be used for a general purpose by the application.

**Table 36-8. NFC SRAM Bank Mapping for 512 bytes**

| Offset | Use | Access |
|---|---|---|
| 0x00000000–0x000001FF | Main Area Bank 0 | Read/Write |
| 0x00000200–0x000003FF | Spare Area Bank 0 | Read/Write |
| 0x00001200–0x000013FF | Main Area Bank 1 | Read/Write |
| 0x00001400–0x000015FF | Spare Area Bank 1 | Read/Write |

**Table 36-9. NFC SRAM Bank Mapping for 1 Kbyte**

| Offset | Use | Access |
|---|---|---|
| 0x00000000–0x000003FF | Main Area Bank 0 | Read/Write |
| 0x00000400–0x000005FF | Spare Area Bank 0 | Read/Write |
| 0x00001200–0x000015FF | Main Area Bank 1 | Read/Write |
| 0x00001600–0x000017FF | Spare Area Bank 1 | Read/Write |

**Table 36-10. NFC SRAM Bank Mapping for 2 Kbytes**

| Offset | Use | Access |
|---|---|---|
| 0x00000000–0x000007FF | Main Area Bank 0 | Read/Write |
| 0x00000800–0x000009FF | Spare Area Bank 0 | Read/Write |
| 0x00001200–0x000019FF | Main Area Bank 1 | Read/Write |
| 0x00001A00–0x00001BFF | Spare Area Bank 1 | Read/Write |

**Table 36-11. NFC SRAM Bank Mapping for 4 Kbytes**

| Offset | Use | Access |
|---|---|---|
| 0x00000000–0x00000FFF | Main Area Bank 0 | Read/Write |
| 0x00001000–0x000011FF | Spare Area Bank 0 | Read/Write |
| 0x00001200–0x000021FF | Main Area Bank 1 | Read/Write |
| 0x00002200–0x000023FF | Spare Area Bank 1 | Read/Write |

**Table 36-12. NFC SRAM Bank Mapping for 8 Kbytes, only one bank is available**

| Offset | Use | Access |
|---|---|---|
| 0x00000000–0x00001FFF | Main Area Bank 0 | Read/Write |
| 0x00002000–0x000023FF | Spare Area Bank 0 | Read/Write |

#### 36.17.4.2 NFC SRAM Access Prioritization Algorithm

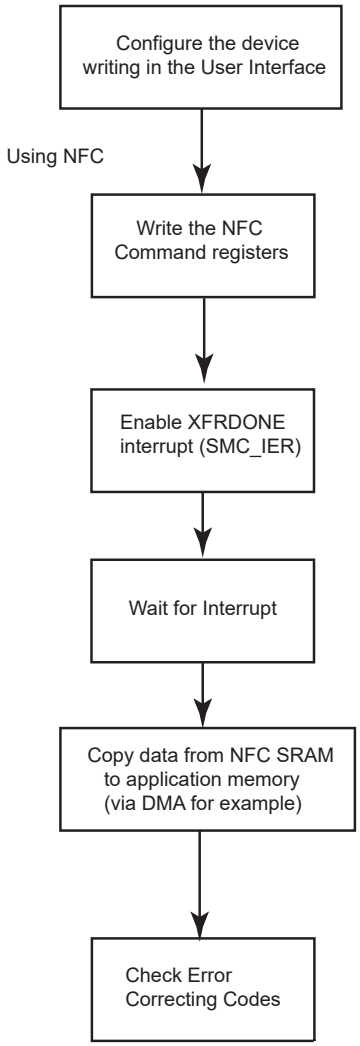
When the NFC is reading from or writing to an NFC SRAM bank, the other bank is available. If an NFC SRAM access occurs when the NFC performs a read or write operation in the same bank, then the access is discarded. The write operation is not performed. The read operation returns undefined data. If this situation is encountered, the AWB status flag located in the NFC Status Register is raised and indicates that a shared resource access violation has occurred.

### 36.17.5 NAND Flash Operations

This section describes the software operations needed to issue commands to the NAND Flash device and to perform data transfers using the NFC.

#### 36.17.5.1 Page Read

**Figure 36-37. Page Read Flow Chart**

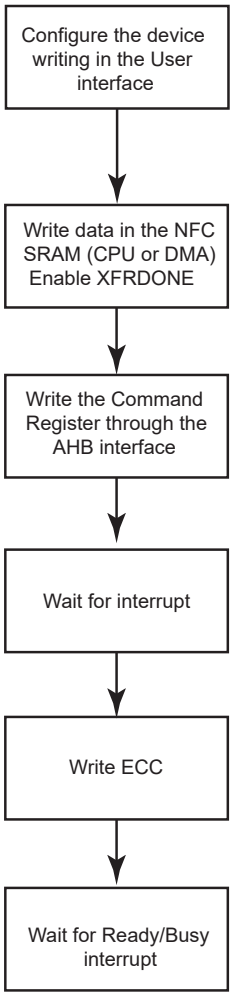


Instead of using the interrupt, the NFCBUSY flag can be polled.

For more information on the NFC Control register, see 36.17.2.2 NFCADDR_CMD.

#### 36.17.5.2 Program Page

**Figure 36-38. Program Page Flow Chart**



Writing the ECC cannot be done using the NFC; it needs to be done “manually”.

Instead of using the interrupt, the NFCBUSY flag can be polled.

For more information on the NFC Control register, see 36.17.2.2 NFCADDR_CMD .

## 36.18 PMECC Controller Functional Description

The Programmable Multibit Error Correcting Code (PMECC) controller is a programmable binary BCH (Bose, Chaudhuri and Hocquenghem) encoder/decoder. This controller can be used to generate redundancy information for both SLC and MLC NAND devices. It supports redundancy for correction of 2, 4, 8, 12, 24, or 32 errors per sector of data. The sector size is programmable and can be set to 512 bytes or 1024 bytes. The PMECC module generates redundancy at encoding time, when a NAND write page operation is performed. The redundancy is appended to the page and written in the spare area. This operation is performed by the processor. It moves the content of the PMECCX registers into the NAND flash memory. The number of registers depends on the selected error correction capability (see the table “Relevant Redundancy Registers”). This operation shall be executed for each sector. At decoding time, the PMECC module generates the remainders of the received codeword by the minimal polynomials.

When all remainders for a given sector are set to zero, no error occurred. When the remainders are different from zero, the codeword is corrupted and further processing is required.

The PMECC module generates an interrupt indicating that an error occurred. The processor must read the PMECC Interrupt Status Register (HSMC_PMECCISR). This register indicates which sector is corrupted.

The processor must execute the following decoding steps to find the error location within a sector:

1. Syndrome computation.
2. Finding the error location polynomial.
3. Finding the roots of the error location polynomial.

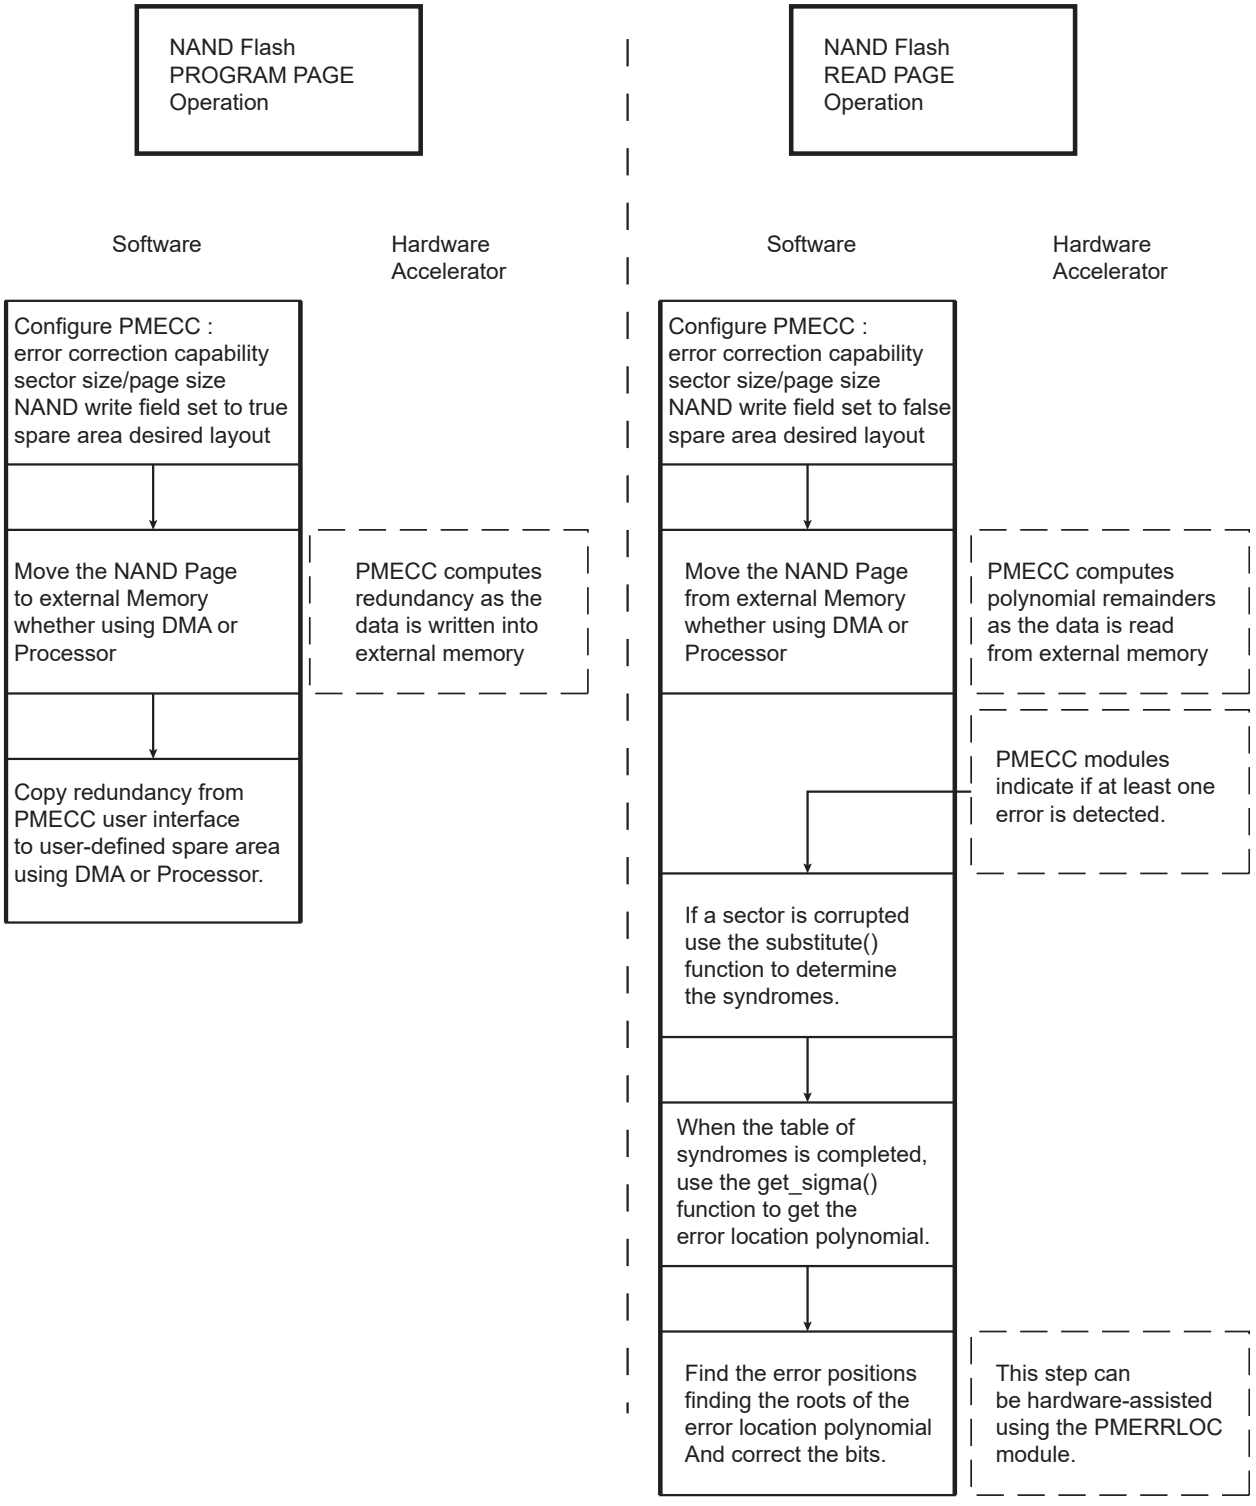
All decoding steps involve finite field computation. It means that a library of finite field arithmetic must be available to perform addition, multiplication and inversion. These arithmetic operations can be performed through the use of a memory mapped lookup table, or direct software implementation. The software implementation presented is based on lookup tables. Two tables named gf_log and gf_antilog are used. If alpha is the primitive element of the field, then a power of alpha is in the field. Assuming that beta = alpha ^ index, then beta belongs to the field, and gf_log(beta) = gf_log(alpha ^ index) = index. The gf_antilog table provides exponent inverse of the element; if beta = alpha ^ index, then gf_antilog(index) = beta.

The first step consists in the syndrome computation. The PMECC module computes the remainders and the software must substitute the power of the primitive element. The procedure implementation is given in the section “Remainder Substitution Procedure”.

The second step is the most software intensive. It is the Berlekamp’s iterative algorithm for finding the error-location polynomial. The procedure implementation is given in the section “Finding the Error Location Polynomial Sigma(x)”.

The Last step is finding the root of the error location polynomial. This step can be very software intensive. Indeed there is no straightforward method of finding the roots, except evaluating each element of the field in the error location polynomial. However, a hardware accelerator can be used to find the roots of the polynomial. The PMERRLOC module provides this kind of hardware acceleration.

**Figure 36-39. Software Hardware Multibit Error Correction Dataflow**



### 36.18.1 MLC/SLC Write Page Operation Using PMECC

When an MLC write page operation is performed, the PMECC controller is configured with the NANDWR bit of the PMECCFG register set to one. When the NAND spare area contains file system information and redundancy (PMECCx), the spare area is error protected, then the SPAREEN bit of the PMECCFG

register is set. When the NAND spare area contains only redundancy information, the SPAREEN bit is cleared.

When the write page operation is terminated, the user writes the redundancy in the NAND spare area. This operation can be done with DMA assistance.

**Table 36-13. Relevant Redundancy Registers**

| BCH_ERR Field | Sector Size Set to 512 Bytes | Sector Size Set to 1024 Bytes |
|---|---|---|
| 0 | PMECC0 | PMECC0 |
| 1 | PMECC0, PMECC1 | PMECC0, PMECC1 |
| 2 | PMECC0, PMECC1, PMECC2, PMECC3 | PMECC0, PMECC1, PMECC2, PMECC3 |
| 3 | PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6 | PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6 |
| 4 | PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9 | PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9, PMECC10 |
| 5 | PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9, PMECC10, PMECC11, PMECC12 | PMECC0, PMECC1, PMECC2, PMECC3, PMECC4, PMECC5, PMECC6, PMECC7, PMECC8, PMECC9, PMECC10, PMECC11, PMECC12, PMECC13 |

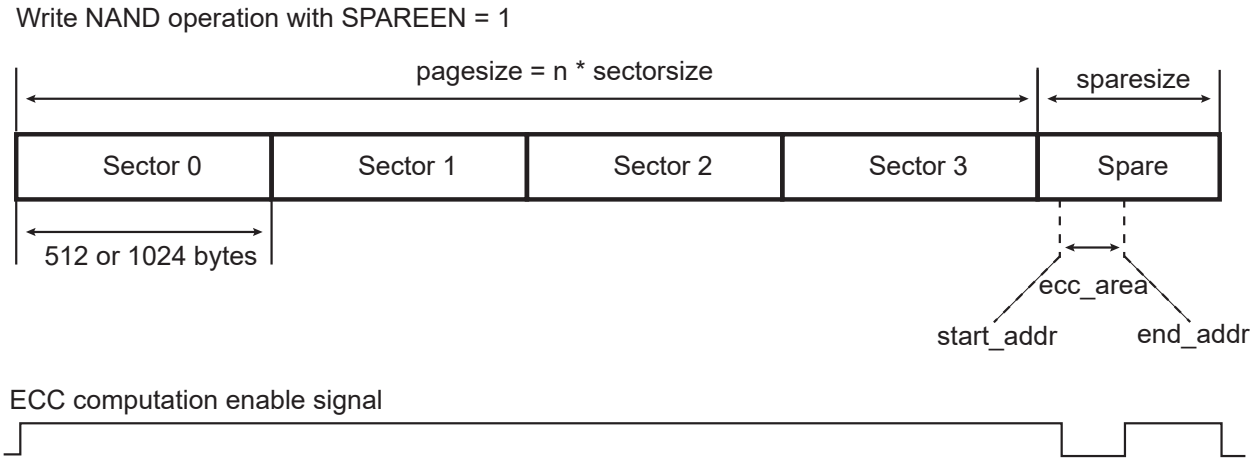
| BCH_ERR Field | Sector Size Set to 512 Bytes | Sector Size Set to 1024 Bytes |
|---|---|---|
| 0 | 4 bytes | 4 bytes |
| 1 | 7 bytes | 7 bytes |
| 2 | 13 bytes | 14 bytes |
| 3 | 20 bytes | 21 bytes |
| 4 | 39 bytes | 42 bytes |
| 5 | 52 bytes | 56 bytes |

#### 36.18.1.1 SLC/MLC Write Operation with Spare Enable Bit Set

When the SPAREEN bit of the PMECCFG register is set, the spare area of the page is encoded with the stream of data of the last sector of the page. This mode is entered by setting the DATA bit of the PMECCTRL register. When the encoding process is over, the redundancy shall be written to the spare area in User mode. The USER bit of the PMECCTRL register must be set.

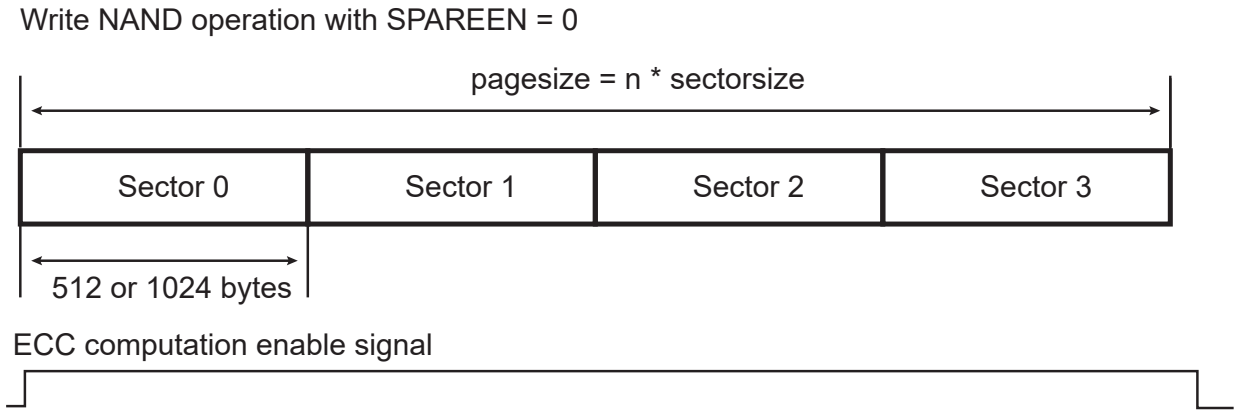
**Figure 36-40. NAND Write Operation with Spare Encoding**



### 36.18.1.2 SLC/MLC Write Operation with Spare Disable

When the SPAREEN bit of PMECCFG is cleared, the spare area is not encoded with the stream of data. This mode is entered by setting the DATA bit of the PMECCTRL register.

**Figure 36-41. NAND Write Operation**



### 36.18.2 MLC/SLC Read Page Operation Using PMECC

**Table 36-15. Relevant Remainder Registers**

| BCH_ERR Field | Sector Size Set to 512 Bytes | Sector Size Set to 1024 Bytes |
|---|---|---|
| 0 | PMECCREM0 | PMECCREM0 |
| 1 | PMECCREM0, PMECCREM1 | PMECCREM0, PMECCREM1 |
| 2 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3 |
| 3 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, PMECCREM4, PMECCREM5, PMECCREM6, PMECCREM7 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, PMECCREM4, PMECCREM5, PMECCREM6, PMECCREM7 |

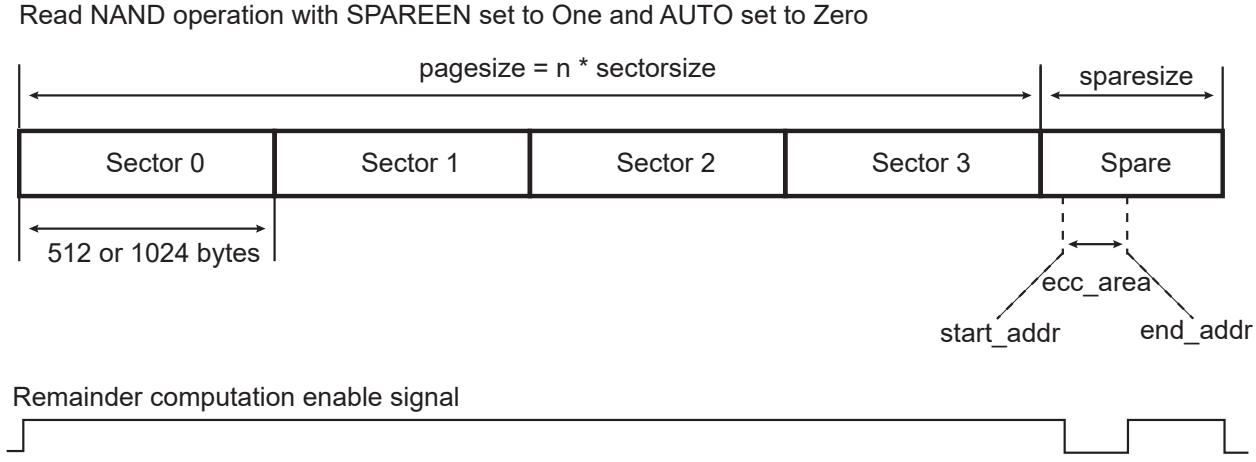
.....continued

| BCH_ERR Field | Sector Size Set to 512 Bytes | Sector Size Set to 1024 Bytes |
|---|---|---|
| 4 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, PMECCREM4, PMECCREM5, PMECCREM6, PMECCREM7, PMECCREM8, PMECCREM9, PMECCREM10, PMECCREM11 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, PMECCREM4, PMECCREM5, PMECCREM6, PMECCREM7, PMECCREM8, PMECCREM9, PMECCREM10, PMECCREM11 |
| 5 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, PMECCREM4, PMECCREM5, PMECCREM6, PMECCREM7, PMECCREM8, PMECCREM9, PMECCREM10, PMECCREM11, PMECCREM12, PMECCREM13, PMECCREM14, PMECCREM15 | PMECCREM0, PMECCREM1, PMECCREM2, PMECCREM3, PMECCREM4, PMECCREM5, PMECCREM6, PMECCREM7, PMECCREM8, PMECCREM9, PMECCREM10, PMECCREM11, PMECCREM12, PMECCREM13, PMECCREM14, PMECCREM15 |

#### 36.18.2.1 MLC/SLC Read Operation with Spare Decoding

When the spare area is protected, it contains valid data. As the redundancy may be included in the middle of the information stream, the user shall program the start address and the end address of the ECC area. The controller will automatically skip the ECC area. This mode is entered writing a 1 in the DATA bit of the PMECCTRL register. When the page has been fully retrieved from the NAND, the ECC area shall be read using the User mode, writing a 1 to the USER bit of the PMECCTRL register.

**Figure 36-42. Read Operation with Spare Decoding**

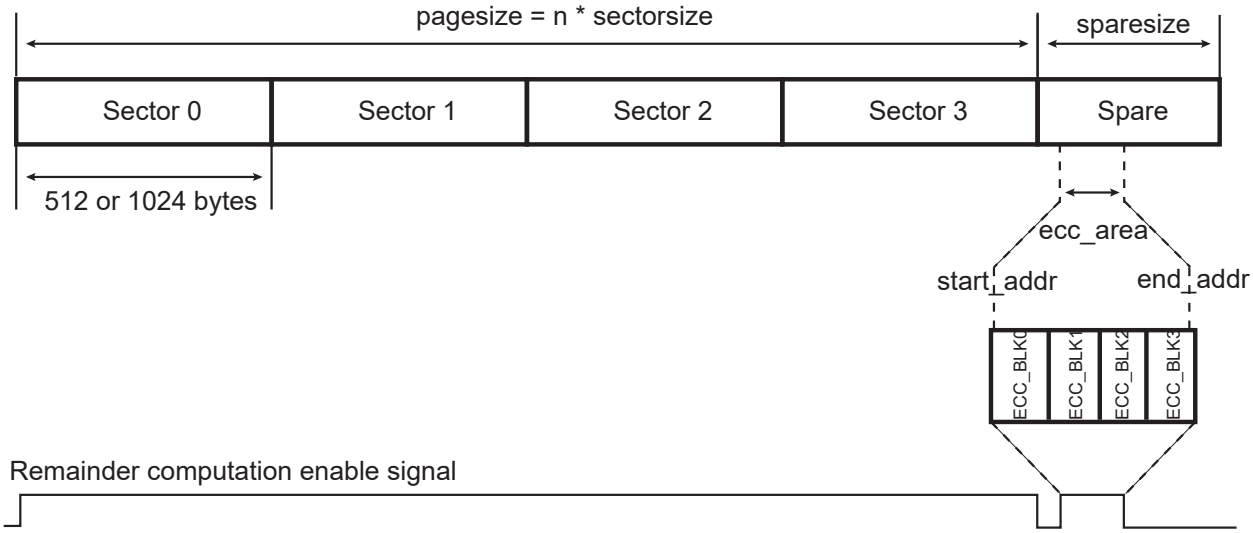


#### 36.18.2.2 MLC/SLC Read Operation

If the spare area is not protected with the error correcting code, the redundancy area is retrieved directly. This mode is entered writing a 1 in the DATA bit of the PMECCTRL register. When AUTO field is set to one, the ECC is retrieved automatically; otherwise, the ECC must be read using the User mode.

**Figure 36-43. Read Operation**

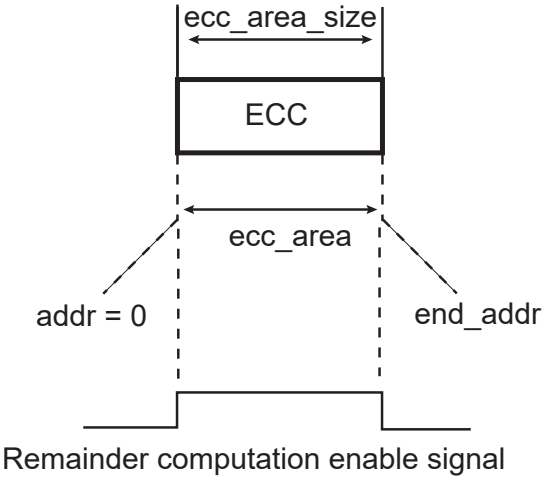
Read NAND operation with SPAREEN set to Zero and AUTO set to One



### 36.18.2.3 MLC/SLC User Read ECC Area

This mode allows a manual retrieve of the ECC. It is entered writing a 1 in the USER field of the PMECCTRL register.

**Figure 36-44. Read User Mode**



### 36.18.2.4 MLC Controller Working with NFC

**Table 36-16. MLC Controller Configuration when the Host Controller is Used**

| Transfer Type | NFC | | PMECC | | |
|---|---|---|---|---|---|
| | RSPARE | WSPARE | SPAREEN | AUTO | User Mode |
| Program Page main area is protected,<br>spare is not protected,<br>spare is written manually | 0 | 0 | 0 | 0 | Not used |

.....continued

| Transfer Type | NFC | | PMECC | | |
|---|---|---|---|---|---|
| | RSPARE | WSPARE | SPAREEN | AUTO | User Mode |
| Program Page main area is protected,<br>spare is protected,<br>spare is written by NFC | 0 | 1 | 1 | 0 | Not used |
| Read Page main area is protected,<br>spare is not protected,<br>spare is not retrieved by NFC | 0 | 0 | 0 | 0 | Used |
| Read Page main area is protected,<br>spare is not protected,<br>spare is retrieved by NFC | 1 | 0 | 0 | 1 | Not used |
| Read Page main area is protected,<br>spare is protected,<br>spare is retrieved by NFC | 1 | 0 | 1 | 0 | Used |

## 36.19 Software Implementation

### 36.19.1 Remainder Substitution Procedure

The substitute function evaluates the remainder polynomial, with different values of the field primitive element. The addition arithmetic operation is performed with the exclusive OR. The multiplication arithmetic operation is performed through the gf_log and gf_antilog lookup tables.

The REM2NP1 and REMN2NP3 fields of the PMECCREMN registers contain only odd remainders. Each bit indicates whether the coefficient of the remainder polynomial is set to zero or not.

NB_ERROR_MAX defines the maximum value of the error correcting capability.

NB_ERROR defines the error correcting capability selected at encoding/decoding time.

NB_FIELD_ELEMENTS defines the number of elements in the field.

si[] is a table that holds the current syndrome value. An element of that table belongs to the field. This is also a shared variable for the next step of the decoding operation.

oo[] is a table that contains the degree of the remainders.

```
int substitute()
{
int i;
int j;
for (i = 1; i < 2 * NB_ERROR_MAX; i++)
{
   si[i] = 0;
}
for (i = 1; i < 2*NB_ERROR; i++)
{
   for (j = 0; j < oo[i]; j++)
 {
     if (REM2NPX[i][j])
    {
      si[i] = gf_antilog[(i * j)%NB_FIELD_ELEMENTS] ^ si[i];
```

```
      }
    }
}
return 0;
}
```

### 36.19.2 Finding the Error Location Polynomial Sigma(x)

The sample code below gives a Berlekamp iterative procedure for finding the value of the error location polynomial.

The input of the procedure is the si[] table defined in the remainder substitution procedure.

The output of the procedure is the error location polynomial named smu (sigma mu). The polynomial coefficients belong to the field. The smu[NB_ERROR+1][] is a table that contains all these coefficients.

NB_ERROR_MAX defines the maximum value of the error correcting capability.

NB_ERROR defines the error correcting capability selected at encoding/decoding time.

NB_FIELD_ELEMENTS defines the number of elements in the field.

```
int get_sigma()
    {
    int i;
    int j;
    int k;
    /* mu          */
    int mu[NB_ERROR_MAX+2];
    /* sigma ro   */
    int sro[2*NB_ERROR_MAX+1];
    /* discrepancy */
    int dmu[NB_ERROR_MAX+2];
    /* delta order   */
    int delta[NB_ERROR_MAX+2];
    /* index of largest delta */
    int ro;
    int largest;
    int diff;
    /*                    */
    /*     First Row      */
    /*                    */
    /* Mu */
    mu[0]  = -1; /* Actually -1/2  */
    /* Sigma(x) set to 1  */
    for (i = 0; i < (2*NB_ERROR_MAX+1); i++)
     smu[0][i] = 0;
    smu[0][0] = 1;
    /* discrepancy set to 1 */
    dmu[0] = 1;
    /* polynom order set to 0 */
    lmu[0] = 0;
    /* delta set to -1 */
    delta[0]  = (mu[0] * 2 - lmu[0]) >> 1;
    /*                    */
    /*     Second Row     */
    /*                    */
    /* Mu */
    mu[1]  = 0;
    /* Sigma(x) set to 1 */
    for (i = 0; i < (2*NB_ERROR_MAX+1); i++)
     smu[1][i] = 0;
    smu[1][0] = 1;
    /* discrepancy set to Syndrome 1 */
    dmu[1] = si[1];
    /* polynom order set to 0 */
    lmu[1] = 0;
    /* delta set to 0 */
    delta[1]  = (mu[1] * 2 - lmu[1])>> 1;
    for (i=1; i <= NB_ERROR; i++)
    {
```

```
     mu[i+1] = i << 1;
    /*********************************************/
     /*                                           */
     /*                                           */
     /*          Compute Sigma (Mu+1)             */
     /*          And L(mu)                        */
     /* check if discrepancy is set to 0 */
     if (dmu[i] == 0)
     {
     /* copy polynom */
     for (j=0; j<2*NB_ERROR_MAX+1; j++)
     {
      smu[i+1][j] =
      smu[i][j];
     }
     /* copy previous polynom order to the next */
     lmu[i+1] = lmu[i];
     }
     else
     {
     ro      = 0;
     largest = -1;
     /* find largest delta with dmu != 0 */
     for (j=0; j<i; j++)
      {
      if (dmu[j])
       {
       if (delta[j] > largest)
        {
        largest = delta[j];
        ro   = j;
        }
       }
      }
     /* initialize signal ro */
     for (k = 0; k < 2*NB_ERROR_MAX+1; k ++)
     {
      sro[k] = 0;
     }
     /* compute difference */
     diff = (mu[i] - mu[ro]);
     /* compute X ^ (2(mu-ro)) */
     for (k = 0; k < (2*NB_ERROR_MAX+1); k ++)
     {
      sro[k+diff] =  smu[ro][k];
     }
     /* multiply by dmu * dmu[ro]^-1 */
     for (k = 0; k < 2*NB_ERROR_MAX+1; k ++)
     {
      /* dmu[ro] is not equal to zero by definition */
      /* check that operand are different from 0    */
      if (sro[k] && dmu[i])
      {
       /* galois inverse  */
       sro[k] = gf_antilog[(gf_log[dmu[i]] + (NB_FIELD_ELEMENTS-gf_log[dmu[ro]]) +
gf_log[sro[k]]) %
  NB_FIELD_ELEMENTS];
      }
     }
     /* multiply by dmu * dmu[ro]^-1 */
     for (k = 0; k < 2*NB_ERROR_MAX+1; k++)
     {
      smu[i+1][k] = smu[i][k] ^ sro[k];
      if (smu[i+1][k])
      {
       /* find the order of the polynom */
       lmu[i+1] = k << 1;
      }
     }
    }
    /*                                           */
    /*                                           */
    /*      End Compute Sigma (Mu+1)             */
    /*      And L(mu)                            */
    /*********************************************/
    /* In either case compute delta  */
```

```
delta[i+1]  = (mu[i+1] * 2 - lmu[i+1]) >> 1;
/* In either case compute the discrepancy */
for (k = 0 ; k <= (lmu[i+1]>>1); k++)
{
 if (k == 0)
 dmu[i+1] = si[2*(i-1)+3];
 /* check if one operand of the multiplier is null, its index is -1 */
 else if (smu[i+1][k] && si[2*(i-1)+3-k])
 dmu[i+1] = gf_antilog[(gf_log[smu[i+1][k]] + gf_log[si[2*(i-1)+3-k]])%nn] ^ dmu[i+1];
}
}
return 0;
}
```

### 36.19.3 Finding the Error Position

The output of the get_sigma() procedure is a polynomial stored in the smu[NB_ERROR+1][] table. The error positions are the roots of that polynomial. The degree of that polynomial is a very important information, as it gives the number of errors. PMERRLOC module provides hardware accelerator for that step.

#### 36.19.3.1 Error Location

The PMECC Error Location controller provides hardware acceleration for determining roots of polynomials over two finite fields: GF(2^13) and GF(2^14). It integrates 32 fully programmable coefficients. These coefficients belong to GF(2^13) or GF(2^14). The coefficient programmed in the PMERRLOC{i} is the coefficient of X ^ i in the polynomial.

The search operation is started as soon as a write access is detected in the ELEN register and can be disabled writing to the ELDIS register. The ENINIT field of the ELEN register shall be initialized with the number of galois field elements to test. The set of the roots can be limited to a valid range.

**Table 36-17. ENINIT Field Value for a Sector Size of 512 Bytes**

| Error Correcting Capability | ENINIT Value |
|---|---|
| 2 | 4122 |
| 4 | 4148 |
| 8 | 4200 |
| 12 | 4252 |
| 24 | 4408 |
| 32 | 4512 |

**Table 36-18. ENINIT Field Value for a Sector Size of 1024 Bytes**

| Error Correcting Capability | ENINIT Value |
|---|---|
| 2 | 8220 |
| 4 | 8248 |
| 8 | 8304 |
| 12 | 8360 |
| 24 | 8528 |
| 32 | 8640 |

When the PMECC engine is searching for roots, the BUSY field of the ELSR register remains asserted. An interrupt is asserted at the end of the computation, and the DONE bit of the PMECC Error Location Interrupt Status Register (HSMC_ELSIR) is set. The ERR_CNT field of the HSMC_ELISR indicates the number of errors. The error position can be read in the PMERRLOCX registers.

## 36.20 Register Summary

**Note:** The blocks of registers listed below are instanced 8 times in the user interface:

- HSMC_PMECCx[x=0..13]
- HSMCC_REMx[x=0..15]

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | HSMC_CFG | 7:0 | | | | | | PAGESIZE[2:0] | | |
| | | 15:8 | | | RBEDGE | EDGECTRL | | | RSPARE | WSPARE |

**Bits 30:24 – NFCSPARESIZE[6:0]** NAND Flash Spare Area Size Retrieved by the Host Controller
The spare size is set to (NFCSPARESIZE + 1) * 4 bytes. The spare area is only retrieved when RSPARE or WSPARE is activated.

**Bits 22:20 – DTOMUL[2:0]** Data Timeout Multiplier
These fields determine the maximum number of Master Clock cycles that the SMC waits until the detection of a rising edge on Ready/Busy signal.

If the data timeout set by DTOCYC and DTOMUL has been exceeded, the Data Timeout Error flag (DTOE) in the NFC Status Register (NFC_SR) raises.

Data Timeout Multiplier is defined by DTOMUL as shown in the following table:

| Value | Name | Description |
|---|---|---|
| 0 | X1 | DTOCYC |
| 1 | X16 | DTOCYC x 16 |
| 2 | X128 | DTOCYC x 128 |
| 3 | X256 | DTOCYC x 256 |
| 4 | X1024 | DTOCYC x 1024 |
| 5 | X4096 | DTOCYC x 4096 |
| 6 | X65536 | DTOCYC x 65536 |
| 7 | X1048576 | DTOCYC x 1048576 |

**Bits 19:16 – DTOCYC[3:0]** Data Timeout Cycle Number

**Bit 13 – RBEDGE** Ready/Busy Signal Edge Detection

| Value | Description |
|---|---|
| 0 | Indicates the level of the Ready/Busy line. |
| 1 | Iindicates that a transition has occurred on the Ready/Busy line. |

**Bit 12 – EDGECTRL** Rising/Falling Edge Detection Control

| Value | Description |
|---|---|
| 0 | Rising edge is detected. |
| 1 | Falling edge is detected. |

**Bit 9 – RSPARE** Read Spare Area

| Value | Description |
|---|---|
| 0 | The NFC skips the spare area in Read mode. |
| 1 | The NFC reads both main area and spare area in Read mode. |

**Bit 8 – WSPARE** Write Spare Area

| Value | Description |
|---|---|
| 0 | The NFC skips the spare area in Write mode. |
| 1 | The NFC writes both main area and spare area in Write mode. |

**Bits 2:0 – PAGESIZE[2:0]** Page Size of the NAND Flash Device

| Value | Name | Description |
|---|---|---|
| 0 | PS512 | Main area 512 bytes |
| 1 | PS1024 | Main area 1024 bytes |
| 2 | PS2048 | Main area 2048 bytes |
| 3 | PS4096 | Main area 4096 bytes |
| 4 | PS8192 | Main area 8192 bytes |

### 36.20.2 NFC Control Register

**Name:** HSMC_CTRL
**Offset:** 0x004
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | NFCDIS | NFCEN |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

**Bit 1 – NFCDIS** NAND Flash Controller Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the NAND Flash controller. |

**Bit 0 – NFCEN** NAND Flash Controller Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the NAND Flash controller. |

### 36.20.3 NFC Status Register

**Name:** HSMC_SR
**Offset:** 0x008
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RB_EDGE0 |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NFCASE | AWB | UNDEF | DTOE | | | CMDDONE | XFRDONE |
| Access | R | R | R | R | | | R | R |
| Reset | 0 | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | NFCSID[2:0] | | | NFCWR | | | NFCBUSY |
| Access | | R | R | R | R | | | R |
| Reset | | 0 | 0 | 0 | 0 | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RB_FALL | RB_RISE | | | | SMCSTS |
| Access | | | R | R | | | | R |
| Reset | | | 0 | 0 | | | | 0 |

**Bit 24 – RB_EDGE0** Ready/Busy Line 0 Edge Detected
If set to one, this flag indicates that an edge has been detected on the Ready/Busy Line 0. Depending on HSMC_CFG.EDGECTRL, only rising or falling edge is detected. This flag is reset after a status read operation.

**Bit 23 – NFCASE** NFC Access Size Error
If set to one, this flag indicates that an illegal access has been detected in the NFC Memory Area. Only Word Access is allowed within the NFC memory area. This flag is reset after a status read operation.

**Bit 22 – AWB** Accessing While Busy
If set to one, this flag indicates that an AHB master has performed an access during the busy phase. This flag is reset after a status read operation.

**Bit 21 – UNDEF** Undefined Area Error
When set to one, this flag indicates that the processor performed an access in an undefined memory area. This flag is reset after a status read operation.

**Bit 20 – DTOE** Data Timeout Error
When set to one, this flag indicates that the Data timeout set be by DTOMUL and DTOCYC has been exceeded. This flag is reset after a status read operation.

**Bit 17 – CMDDONE** Command Done
When set to one, this flag indicates that the NFC has terminated the Command. This flag is reset after a status read operation.

**Bit 16 – XFRDONE** NFC Data Transfer Terminated
When set to one, this flag indicates that the NFC has terminated the Data Transfer. This flag is reset after a status read operation.

**Bits 14:12 – NFCSID[2:0]** NFC Chip Select ID (this field cannot be reset)
When a command is issued, this field indicates the value of the targeted chip select.

**Bit 11 – NFCWR** NFC Write/Read Operation (this field cannot be reset)
When a command is issued, this field indicates the current Read or Write Operation.

**Bit 8 – NFCBUSY** NFC Busy (this field cannot be reset)
When set to one, this flag indicates that the Controller is activated and accesses the memory device.

**Bit 5 – RB_FALL** Selected Ready Busy Falling Edge Detected
When set to one, this flag indicates that a falling edge on the Ready/Busy Line has been detected. This flag is reset after a status read operation. The Ready/Busy line is selected through the decoding of field HSMC_SR.NFCSID.

**Bit 4 – RB_RISE** Selected Ready Busy Rising Edge Detected
When set to one, this flag indicates that a rising edge on the Ready/Busy Line has been detected. This flag is reset after a status read operation. The Ready/Busy line is selected through the decoding of field HSMC_SR.NFCSID.

**Bit 0 – SMCSTS** NAND Flash Controller Status (this field cannot be reset)

| Value | Description |
|---|---|
| 0 | NAND Flash Controller disabled. |
| 1 | NAND Flash Controller enabled. |

### 36.20.4 NFC Interrupt Enable Register

**Name:** HSMC_IER
**Offset:** 0x00C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RB_EDGE0 |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NFCASE | AWB | UNDEF | DTOE | | | CMDDONE | XFRDONE |
| Access | W | W | W | W | | | W | W |
| Reset | – | – | – | – | | | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RB_FALL | RB_RISE | | | | |
| Access | | | W | W | | | | |
| Reset | | | – | – | | | | |

**Bit 24 – RB_EDGE0** Ready/Busy Line 0 Interrupt Enable

**Bit 23 – NFCASE** NFC Access Size Error Interrupt Enable

**Bit 22 – AWB** Accessing While Busy Interrupt Enable

**Bit 21 – UNDEF** Undefined Area Access Interrupt Enable

**Bit 20 – DTOE** Data Timeout Error Interrupt Enable

**Bit 17 – CMDDONE** Command Done Interrupt Enable

**Bit 16 – XFRDONE** Transfer Done Interrupt Enable

**Bit 5 – RB_FALL** Ready Busy Falling Edge Detection Interrupt Enable

**Bit 4 – RB_RISE** Ready Busy Rising Edge Detection Interrupt Enable

### 36.20.5 NFC Interrupt Disable Register

**Name:** HSMC_IDR
**Offset:** 0x010
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RB_EDGE0 |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NFCASE | AWB | UNDEF | DTOE | | | CMDDONE | XFRDONE |
| Access | W | W | W | W | | | W | W |
| Reset | – | – | – | – | | | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RB_FALL | RB_RISE | | | | |
| Access | | | W | W | | | | |
| Reset | | | – | – | | | | |

**Bit 24 – RB_EDGE0** Ready/Busy Line 0 Interrupt Disable

**Bit 23 – NFCASE** NFC Access Size Error Interrupt Disable

**Bit 22 – AWB** Accessing While Busy Interrupt Disable

**Bit 21 – UNDEF** Undefined Area Access Interrupt Disable

**Bit 20 – DTOE** Data Timeout Error Interrupt Disable

**Bit 17 – CMDDONE** Command Done Interrupt Disable

**Bit 16 – XFRDONE** Transfer Done Interrupt Disable

**Bit 5 – RB_FALL** Ready Busy Falling Edge Detection Interrupt Disable

**Bit 4 – RB_RISE** Ready Busy Rising Edge Detection Interrupt Disable

### 36.20.6 NFC Interrupt Mask Register

**Name:** HSMC_IMR
**Offset:** 0x014
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:
0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RB_EDGE0 |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NFCASE | AWB | UNDEF | DTOE | | | CMDDONE | XFRDONE |
| Access | R | R | R | R | | | R | R |
| Reset | 0 | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RB_FALL | RB_RISE | | | | |
| Access | | | R | R | | | | |
| Reset | | | 0 | 0 | | | | |

**Bit 24 – RB_EDGE0** Ready/Busy Line 0 Interrupt Mask

**Bit 23 – NFCASE** NFC Access Size Error Interrupt Mask

**Bit 22 – AWB** Accessing While Busy Interrupt Mask

**Bit 21 – UNDEF** Undefined Area Access Interrupt Mask5

**Bit 20 – DTOE** Data Timeout Error Interrupt Mask

**Bit 17 – CMDDONE** Command Done Interrupt Mask

**Bit 16 – XFRDONE** Transfer Done Interrupt Mask

**Bit 5 – RB_FALL** Ready Busy Falling Edge Detection Interrupt Mask

**Bit 4 – RB_RISE** Ready Busy Rising Edge Detection Interrupt Mask

© 2018 Microchip Technology Inc.

### 36.20.7 NFC Address Cycle Zero Register

**Name:** HSMC_ADDR
**Offset:** 0x018
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ADDR_CYCLE0[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 7:0 – ADDR_CYCLE0[7:0]** NAND Flash Array Address Cycle 0
When five address cycles are used, ADDR_CYCLE0 is the first byte written to the NAND Flash (used by the NFC).

### 36.20.8 NFC Bank Register

**Name:** HSMC_BANK
**Offset:** 0x01C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | BANK |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – BANK** Bank Identifier

| Value | Description |
|---|---|
| 0 | Bank 0 is used. |
| 1 | Bank 1 is used. |

### 36.20.9 PMECC Configuration Register

**Name:** HSMC_PMECCFG
**Offset:** 0x070
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | AUTO | | | | SPAREEN |
| Access | | | | R/W | | | | R/W |
| Reset | | | | 0 | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | NANDWR | | | PAGESIZE[1:0] | |
| Access | | | | R/W | | | R/W | R/W |
| Reset | | | | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | SECTORSZ | | BCH_ERR[2:0] | | |
| Access | | | | R/W | | | | |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bit 20 – AUTO** Automatic Mode Enable
This bit is only relevant in NAND Read Mode, when spare enable is activated.

| Value | Description |
|---|---|
| 0 | Indicates that the spare area is not protected. In that case, the ECC computation takes into account the ECC area located in the spare area. (within the start address and the end address). |
| 1 | Indicates that the spare area is error protected. In this case, the ECC computation takes into account the whole spare area minus the ECC area in the ECC computation operation. |

**Bit 16 – SPAREEN** Spare Enable
For NAND write access:
0: The spare area is skipped

1: The spare area is protected with the last sector of data.

For NAND read access:

0: The spare area is skipped.

1: The spare area contains protected data or only redundancy information.

**Bit 12 – NANDWR** NAND Write Access

| Value | Description |
|---|---|
| 0 | NAND read access. |
| 1 | NAND write access. |

**Bits 9:8 – PAGESIZE[1:0]** Number of Sectors in the Page

| Value | Name | Description |
|---|---|---|
| 0 | PAGESIZE_1SEC | 1 sector for main area (512 or 1024 bytes). |
| 1 | PAGESIZE_2SEC | 2 sectors for main area (1024 or 2048 bytes). |
| 2 | PAGESIZE_4SEC | 4 sectors for main area (2048 or 4096 bytes). |
| 3 | PAGESIZE_8SEC | 8 sectors for main area (4096 or 8192 bytes). |

**Bit 4 – SECTORSZ** Sector Size

| Value | Description |
|---|---|
| 0 | The ECC computation is based on a sector of 512 bytes. |
| 1 | The ECC computation is based on a sector of 1024 bytes. |

**Bits 2:0 – BCH_ERR[2:0]** Error Correcting Capability

| Value | Name | Description |
|---|---|---|
| 0 | BCH_ERR2 | 2 errors |
| 1 | BCH_ERR4 | 4 errors |
| 2 | BCH_ERR8 | 8 errors |
| 3 | BCH_ERR12 | 12 errors |
| 4 | BCH_ERR24 | 24 errors |
| 5 | BCH_ERR32 | 32 errors |

### 36.20.10 PMECC Spare Area Size Register

**Name:** HSMC_PMECCSAREA
**Offset:** 0x074
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SPARESIZE[8:8] |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPARESIZE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 8:0 – SPARESIZE[8:0]** Spare Area Size
Number of bytes in the spare area. The spare area size is equal to (SPARESIZE + 1) bytes.

### 36.20.11 PMECC Start Address Register

**Name:** HSMC_PMECCSADDR
**Offset:** 0x078
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | STARTADDR[8:8] |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | STARTADDR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 8:0 – STARTADDR[8:0]** ECC Area Start Address
This register is programmed with the start ECC start address. When STARTADDR is equal to 0, then the first ECC byte is located at the first byte of the spare area.

### 36.20.12 PMECC End Address Register

**Name:** HSMC_PMECCEADDR
**Offset:** 0x07C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | ENDADDR[8:8] |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ENDADDR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 8:0 – ENDADDR[8:0]** ECC Area End Address
This register is programmed with the start ECC end address. When ENDADDR is equal to N, then the first ECC byte is located at byte N of the spare area.

### 36.20.13 PMECC Control Register

**Name:** HSMC_PMECCTRL
**Offset:** 0x084
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | DISABLE | ENABLE | | USER | DATA | RST |
| Access | | | W | W | | W | W | W |
| Reset | | | – | – | | – | – | – |

**Bit 5 – DISABLE** PMECC Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the PMECC controller. |

**Bit 4 – ENABLE** PMECC Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the PMECC controller. |

**Bit 2 – USER** Start a User Mode Phase

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The PMECC controller enters a User mode phase. |

**Bit 1 – DATA** Start a Data Phase

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The PMECC controller enters a Data phase. |

**Bit 0 – RST** Reset the PMECC Module

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the PMECC controller. |

### 36.20.14 PMECC Status Register

**Name:** HSMC_PMECCSR
**Offset:** 0x088
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

|---|---|---|---|---|---|---|---|---|
| | ECC[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ECC[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ECC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ECC[31:0]** BCH Redundancy
This register contains the remainder of the division of the codeword by the generator polynomial.

### 36.20.20 PMECC Remainder x Register

**Name:** HSMC_REMx
**Offset:** 0x02B0 + x*0x04 [x=0..15]
**Reset:** 0x00000000
**Property:** Read-only

**Note:** The block of registers HSMC_REMx[x=0..15] is instanced 8 times in the user interface.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | REM2NP3[13:8] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | REM2NP3[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | REM2NP1[13:8] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | REM2NP1[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 29:16 – REM2NP3[13:0]** BCH Remainder 2 * N + 3
When sector size is set to 512 bytes, bit REM2NP3[29] is not used and read as zero.

If bit i of the REM2NP3 field is set to one, then the coefficient of the $X^i$ is set to one; otherwise, the coefficient is zero.

**Bits 13:0 – REM2NP1[13:0]** BCH Remainder 2 * N + 1
When sector size is set to 512 bytes, bit REM2NP1[13] is not used and read as zero.

If bit i of the REM2NP1 field is set to one, then the coefficient of the $X^i$ is set to one; otherwise, the coefficient is zero.

### 36.20.21 PMECC Error Location Configuration Register

**Name:** HSMC_ELCFG
**Offset:** 0x500
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | ERRNUM[4:0] | | | | |
| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

**Bits 13:0 – ERRLOCN[13:0]** Error Position within the Set {sector area, spare area}
ERRLOCN points to 1 when the first bit of the main area is corrupted.

If the sector size is set to 512 bytes, the ERRLOCN points to 4096 when the last bit of the sector area is corrupted.

If the sector size is set to 1024 bytes, the ERRLOCN points to 8192 when the last bit of the sector area is corrupted.

If the sector size is set to 512 bytes, the ERRLOCN points to 4097 when the first bit of the spare area is corrupted.

If the sector size is set to 1024 bytes, the ERRLOCN points to 8193 when the first bit of the spare area is corrupted.

### 36.20.33 Setup Register

**Name:** HSMC_SETUPx
**Offset:** 0x0700 + x*0x14 [x=0..3]
**Reset:** 0x01010101
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | NCS_RD_SETUP[5:0] | | | | | |

| Reset | | | 0 | 0 | 0 | 0 | 0 | 1 |

**Bits 29:24 – NCS_RD_SETUP[5:0]** NCS Setup Length in Read Access
In Read access, the NCS signal setup length is defined as:

NCS setup length = (128 * NCS_RD_SETUP[5] + NCS_RD_SETUP[4:0]) clock cycles.

**Bits 21:16 – NRD_SETUP[5:0]** NRD Setup Length
The NRD signal setup length is defined as:

NRD setup length = (128 * NRD_SETUP[5] + NRD_SETUP[4:0]) clock cycles.

**Bits 13:8 – NCS_WR_SETUP[5:0]** NCS Setup Length in Write Access
In write access, the NCS signal setup length is defined as:

NCS setup length = (128 * NCS_WR_SETUP[5] + NCS_WR_SETUP[4:0]) clock cycles.

**Bits 5:0 – NWE_SETUP[5:0]** NWE Setup Length
The NWE signal setup length is defined as:

NWE setup length = (128 * NWE_SETUP[5] + NWE_SETUP[4:0]) clock cycles.

### 36.20.34 Pulse Register

**Name:** HSMC_PULSEx
**Offset:** 0x0704 + x*0x14 [x=0..3]
**Reset:** 0x01010101
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

**Bits 30:24 – NCS_RD_PULSE[6:0]** NCS Pulse Length in READ Access
In READ mode, The NCS signal pulse length is defined as:

NCS pulse length = (256 * NCS_RD_PULSE[6] + NCS_RD_PULSE[5:0]) clock cycles.

**Bits 22:16 – NRD_PULSE[6:0]** NRD Pulse Length
The NRD signal pulse length is defined as:

NRD pulse length = (256 * NRD_PULSE[6] + NRD_PULSE[5:0]) clock cycles.

The NRD pulse width must be as least 1 clock cycle.

**Bits 14:8 – NCS_WR_PULSE[6:0]** NCS Pulse Length in WRITE Access
In Write access, The NCS signal pulse length is defined as:

NCS pulse length = (256 * NCS_WR_PULSE[6] + NCS_WR_PULSE[5:0]) clock cycles.

The NCS pulse must be at least one clock cycle.

**Bits 6:0 – NWE_PULSE[6:0]** NWE Pulse Length
The NWE signal pulse length is defined as:

NWE pulse length = (256 * NWE_PULSE[6]+NWE_PULSE[5:0]) clock cycles.

The NWE pulse must be at least one clock cycle.

### 36.20.35 Cycle Register

**Name:** HSMC_CYCLEx
**Offset:** 0x0708 + x*0x14 [x=0..3]
**Reset:** 0x00030003
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | NRD_CYCLE[8:8] |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

**Bits 24:16 – NRD_CYCLE[8:0]** Total Read Cycle Length
The total read cycle length is the total duration in clock cycles of the read cycle. It is equal to the sum of the setup, pulse and hold steps of the NRD and NCS signals. It is defined as:

Read cycle length = (NRD_CYCLE[8:7] * 256) + NRD_CYCLE[6:0] clock cycles.

**Bits 8:0 – NWE_CYCLE[8:0]** Total Write Cycle Length
The total write cycle length is the total duration in clock cycles of the write cycle. It is equal to the sum of the setup, pulse and hold steps of the NWE and NCS signals. It is defined as:

Write cycle length = (NWE_CYCLE[8:7] * 256) + NWE_CYCLE[6:0] clock cycles.

### 36.20.36 Timings Register

**Name:** HSMC_TIMINGSx
**Offset:** 0x070C + x*0x14 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | NFSEL | | | | TWB[3:0] | | | |
| Access | R/W | | | | R/W | R/W | R/W | R/W |
| Reset | 0 | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TADL[3:0] | | | | TCLR[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – NFSEL** NAND Flash Selection
If this bit is set to one, the chip select is assigned to NAND Flash write enable and read enable lines drive the Error Correcting Code module.

**Bits 27:24 – TWB[3:0]** WEN High to REN to Busy
Write Enable rising edge to Ready/Busy falling edge timing.

Write Enable to Read/Busy = (TWB[3] * 64) + TWB[2:0] clock cycles.

**Bits 19:16 – TRR[3:0]** Ready to REN Low Delay
Ready/Busy signal to Read Enable falling edge timing.

Read to REN = (TRR[3] * 64) + TRR[2:0] clock cycles.

**Bit 12 – OCMS** Off Chip Memory Scrambling Enable
When set to one, the memory scrambling is activated. (Value must be zero if external memory is NAND Flash and NFC is used).

**Bits 11:8 – TAR[3:0]** ALE to REN Low Delay
Address Latch Enable falling edge to Read Enable falling edge timing.

Address Latch Enable to Read Enable = (TAR[3] * 64) + TAR[2:0] clock cycles.

**Bits 7:4 – TADL[3:0]** ALE to Data Start
Last address latch cycle to the first rising edge of WEN for data input.

Last address latch to first rising edge of WEN = (TADL[3] * 64) + TADL[2:0] clock cycles.

**Bits 3:0 – TCLR[3:0]** CLE to REN Low Delay
Command Latch Enable falling edge to Read Enable falling edge timing.

Latch Enable Falling to Read Enable Falling = (TCLR[3] * 64) + TCLR[2:0] clock cycles.

### 36.20.37 Mode Register

**Name:** HSMC_MODEx
**Offset:** 0x0710 + x*0x14 [x=0..3]
**Reset:** 0x00001003
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| | | | EXNW_MODE[1:0] | | | | WRITE_MODE | READ_MODE |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 1 | 1 |

**Bit 20 – TDF_MODE** TDF Optimization

| Value | Description |
|---|---|
| 0 | TDF optimization disabled<br>– The number of TDF wait states is inserted before the next access begins. |
| 1 | TDF optimization enabled<br>– The number of TDF wait states is optimized using the setup period of the next read/write access. |

**Bits 19:16 – TDF_CYCLES[3:0]** Data Float Time
This field gives the integer number of clock cycles required by the external device to release the data after the rising edge of the read controlling signal. The SMC always provide one full cycle of bus turnaround after the TDF_CYCLES period. The external bus cannot be used by another chip select during TDF_CYCLES + 1 cycles. From 0 up to 15 TDF_CYCLES can be set.

**Bit 12 – DBW** Data Bus Width

| Value | Name | Description |
|---|---|---|
| 0 | BIT_8 | 8-bit bus |
| 1 | BIT_16 | 16-bit bus |

**Bit 8 – BAT** Byte Access Type
This field is used only if DBW defines a 16-bit data bus.

| Value | Name | Description |
|---|---|---|
| 0 | BYTE_SELECT | Byte select access type:<br>- Write operation is controlled using NCS, NWE, NBS0, NBS1.<br>- Read operation is controlled using NCS, NRD, NBS0, NBS1. |
| 1 | BYTE_WRITE | Byte write access type:<br>- Write operation is controlled using NCS, NWR0, NWR1.<br>- Read operation is controlled using NCS and NRD. |

**Bits 5:4 – EXNW_MODE[1:0]** NWAIT Mode
The NWAIT signal is used to extend the current read or write signal. It is only taken into account during the pulse phase Read and Write controlling signal. When the use of NWAIT is enabled, at least one cycle hold duration must be programmed for the read and write controlling signal.

| Value | Name | Description |
|---|---|---|
| 0 | DISABLED | Disabled—The NWAIT input signal is ignored on the corresponding Chip Select. |
| 1 | – | Reserved |
| 2 | FROZEN | Frozen Mode—If asserted, the NWAIT signal freezes the current read or write cycle. After deassertion, the read/write cycle is resumed from the point where it was stopped. |
| 3 | READY | Ready Mode—The NWAIT signal indicates the availability of the external device at the end of the pulse of the controlling read or write signal, to complete the access. If high, the access normally completes. If low, the access is extended until NWAIT returns high. |

**Bit 1 – WRITE_MODE** Selection of the Control Signal for Write Operation

| Value | Name | Description |
|---|---|---|
| 0 | NCS_CTRL | The Write operation is controller by the NCS signal. |
| 1 | NWE_CTRL | The Write operation is controlled by the NWE signal |

**Bit 0 – READ_MODE** Selection of the Control Signal for Read Operation

| Value | Name | Description |
|---|---|---|
| 0 | NCS_CTRL | The Read operation is controlled by the NCS signal. |
| 1 | NRD_CTRL | The Read operation is controlled by the NRD signal. |

### 36.20.38 Off Chip Memory Scrambling Register

**Name:** HSMC_OCMS
**Offset:** 0x7A0
**Reset:** 0x00000000
**Property:** Read/Write

**Bit 1 – SRSE** NFC Internal SRAM Scrambling Enable

| Value | Description |
|---|---|
| 0 | Disable Scrambling for NFC internal SRAM access. |
| 1 | Enable Scrambling for NFC internal SRAM access. (OCMS bit must be cleared in the corresponding HSMC_TIMINGSx register.) |

**Bit 0 – SMSE** Static Memory Controller Scrambling Enable

| Value | Description |
|---|---|
| 0 | Disable “Off Chip” Scrambling for SMC access. |
| 1 | Enable “Off Chip” Scrambling for SMC access. (If OCMS bit is set in the corresponding HSMC_TIMINGSx register.) |

### 36.20.39 Off Chip Memory Scrambling Key1 Register

**Name:** HSMC_KEY1
**Offset:** 0x7A4
**Reset:** 0x00000000
**Property:** Write-once

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protect violation has occurred since the last read of the HSMC_WPSR. |
| 1 | A write protect violation has occurred since the last read of the HSMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 37. DMA Controller (XDMAC)

## 37.1 Description

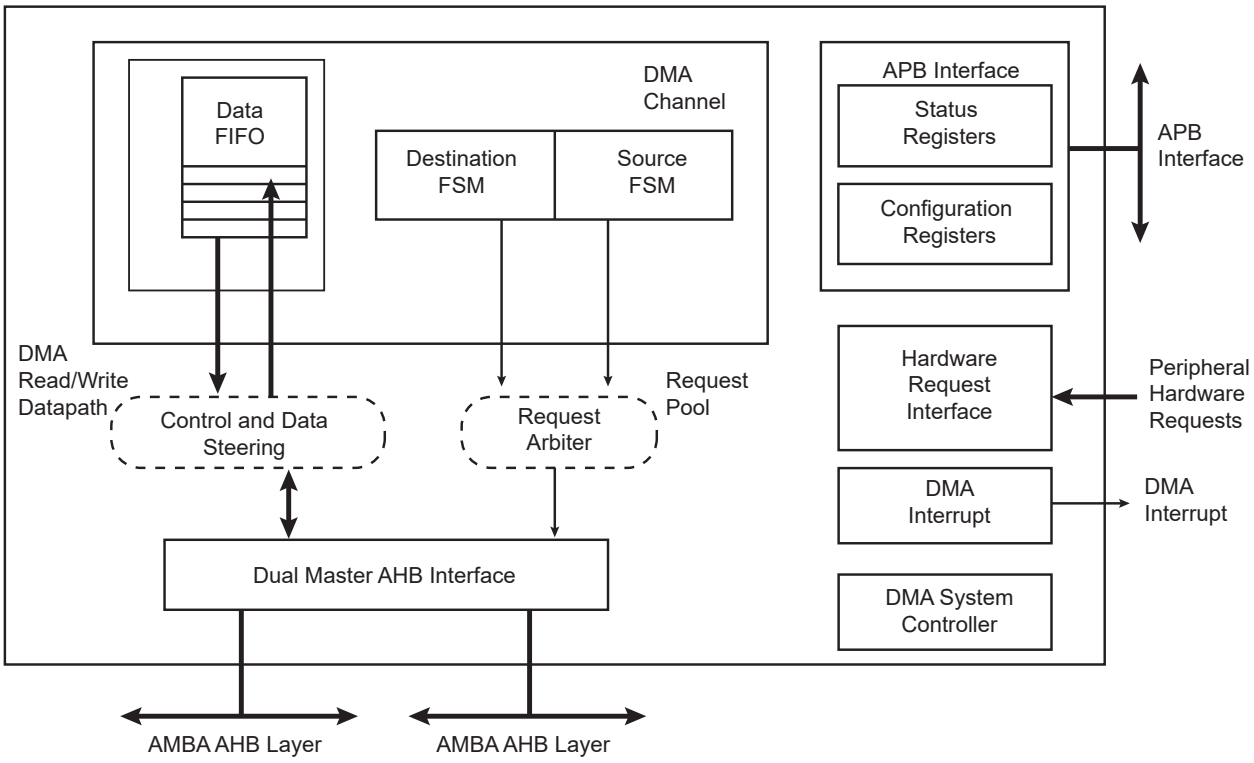
The DMA Controller (XDMAC) is a AHB-protocol central direct memory access controller. It performs peripheral data transfer and memory move operations over one or two bus ports through the unidirectional communication channel. Each channel is fully programmable and provides both peripheral or memory-to-memory transfers. The channel features are configurable at implementation.

## 37.2 Embedded Characteristics

- 2 Master Interfaces
- 16 DMA Channels
- 51 Hardware Requests
- 4 Kbytes Embedded FIFO
- Supports Peripheral-to-Memory, Memory-to-Peripheral, or Memory-to-Memory Transfer Operations
- Peripheral DMA Operation Runs on Bytes (8-bit), Half-Word (16-bit) and Word (32-bit)
- Memory DMA Operation Runs on Bytes (8 bit), Half-Word (16-bit), Word (32-bit) and Double-Word (64-bit)
- Supports Hardware and Software Initiated Transfers
- Supports Linked List Operations
- Supports Incrementing or Fixed Addressing Mode
- Supports Programmable Independent Data Striding for Source and Destination
- Supports Programmable Independent Microblock Striding for Source and Destination
- Configurable Priority Group and Arbitration Policy
- Programmable AHB Burst Length
- Configuration Interface Accessible through APB Interface
- XDMAC Architecture Includes Multiport FIFO
- Supports Multiple View Channel Descriptor
- Automatic Flush of Channel Trailing Bytes
- Automatic Coarse-Grain and Fine-Grain Clock Gating
- Hardware Acceleration of Memset Pattern

## 37.3 Block Diagram

**Figure 37-1. DMA Controller (XDMAC) Block Diagram**



## 37.4 DMA Controller Peripheral Connections

The SAMA5D2 features two DMACs: XDMAC0 and XDMAC1. Both have the same features:

- Programmable secure access
- Two 64-bit masters
- 16 channels and 55 hardware requests embedded
- Sixteen 64-bit-word FIFOs on all channels
- Linked list support with status write back operation at end of transfer
- Word, half-word, byte transfer support
- Memory-to-memory transfer
- Peripheral-to-memory transfer
- Memory-to-peripheral transfer

The DMA controller can handle the transfer between peripherals and memory and so receives the triggers from the peripherals below.

The following table gives an overview of the different access when secure/non-secure DMA needs to access a secure/non-secure peripheral, and when a secure/non-secure peripheral needs to access secure/non-secure DMA.

**Table 37-1. DMA Configuration vs. Peripheral**

| Peripheral | DMA | |
|---|---|---|
| | Secure | Non-secure |
| Secure | x | – |
| Non-secure | x | x |

DMA Controller 0 manages transfers between peripherals and memory, and receives the triggers from the peripherals listed ine following table.

**Table 37-2. DMA Channels Definition (XDMAC0)**

| Instance Name | Channel T/R | Interface Number | XDMAC_CCx.CSIZE Required Value |
|---|---|---|---|
| TWIHS0 | Transmit | 0 | 0 |
| TWIHS0 | Receive | 1 | |
| TWIHS1 | Transmit | 2 | 0 |
| TWIHS1 | Receive | 3 | |
| QSPI0 | Transmit | 4 | 0 |
| QSPI0 | Receive | 5 | |
| SPI0 | Transmit | 6 | 0 |
| SPI0 | Receive | 7 | |
| SPI1 | Transmit | 8 | 0 |
| SPI1 | Receive | 9 | |
| PWM | Transmit | 10 | 0 |
| FLEXCOM0 | Transmit | 11 | 0 |
| FLEXCOM0 | Receive | 12 | |

| FLEXCOM2 | Transmit | 15 | 0 |
| FLEXCOM2 | Receive | 16 | |
| FLEXCOM3 | Transmit | 17 | 0 |
| FLEXCOM3 | Receive | 18 | |
| FLEXCOM4 | Transmit | 19 | 0 |
| FLEXCOM4 | Receive | 20 | |
| SSC0 | Transmit | 21 | 0 |
| SSC0 | Receive | 22 | |

.....continued

| Instance Name | Channel T/R | Interface Number | XDMAC_CCx.CSIZE Required Value |
|---|---|---|---|
| SSC1 | Transmit | 23 | 0 |
| SSC1 | Receive | 24 | |
| ADC | Receive | 25 | 0 |
| AES | Transmit | 26 | 0 or 2 (refer to chapter AES, section Start Mode, subsection DMA Mode) |
| AES | Receive | 27 | |
| TDES | Transmit | 28 | 0 |
| TDES | Receive | 29 | |
| SHA | Transmit | 30 | 4 |
| I2SC0 | Transmit | 31 | 0 |
| I2SC0 | Receive | 32 | |
| I2SC1 | Transmit | 33 | 0 |
| I2SC1 | Receive | 34 | |
| UART0 | Transmit | 35 | 0 |
| UART0 | Receive | 36 | |
| UART1 | Transmit | 37 | 0 |
| UART1 | Receive | 38 | |
| UART2 | Transmit | 39 | 0 |
| UART2 | Receive | 40 | |
| UART3 | Transmit | 41 | 0 |
| UART3 | Receive | 42 | |
| UART4 | Transmit | 43 | 0 |
| UART4 | Receive | 44 | |
| TC0 | Receive | 45 | 0 |
| TC1 | Receive | 46 | |
| CLASSD | Transmit | 47 | 0 |
| QSPI1 | Transmit | 48 | 0 |
| QSPI1 | Receive | 49 | |
| PDMIC | Receive | 50 | 0 |

DMA Controller 1 manages transfers between peripherals and memory, and receives the triggers from the peripherals listed in the following table.

**Table 37-3. DMA Channels Definition (XDMAC1)**

| Instance Name | Channel T/R | Interface Number | XDMAC_CCx.CSIZE Required Value |
|---|---|---|---|
| TWIHS0 | Transmit | 0 | 0 |
| TWIHS0 | Receive | 1 | |
| TWIHS1 | Transmit | 2 | 0 |
| TWIHS1 | Receive | 3 | |
| QSPI0 | Transmit | 4 | 0 |
| QSPI0 | Receive | 5 | |
| SPI0 | Transmit | 6 | 0 |
| SPI0 | Receive | 7 | |
| SPI1 | Transmit | 8 | 0 |
| SPI1 | Receive | 9 | |
| PWM | Transmit | 10 | 0 |
| FLEXCOM0 | Transmit | 11 | 0 |
| FLEXCOM0 | Receive | 12 | |
| FLEXCOM1 | Transmit | 13 | 0 |
| FLEXCOM1 | Receive | 14 | |
| FLEXCOM2 | Transmit | 15 | 0 |
| FLEXCOM2 | Receive | 16 | |
| FLEXCOM3 | Transmit | 17 | 0 |
| FLEXCOM3 | Receive | 18 | |

| QSPI1 | Receive | 49 | |
| PDMIC | Receive | 50 | 0 |

## 37.5 Functional Description

### 37.5.1 Basic Definitions

**Source Peripheral**: Slave device, memory mapped on the interconnection network, from where the XDMAC reads data. The source peripheral teams up with a destination peripheral to form a channel. A data read operation is scheduled when the peripheral transfer request is asserted.

**Destination Peripheral**: Slave device, memory mapped on the interconnection network, to which the XDMAC writes. A write data operation is scheduled when the peripheral transfer request is asserted.

**Channel**: The data movement between source and destination creates a logical channel.

**Stride**: Number of address locations between successive elements/data measured in bytes.

**Transfer Type**: The transfer is hardware-synchronized when it is paced by the peripheral hardware request, otherwise the transfer is self-triggered (memory to memory transfer).

**XDMAC Master Transfer**: The Master Transfer is composed of a linked list of blocks. The channel address, control and configuration registers can be modified at the inter block boundary. The descriptor structure modifies the channel registers conditionally. Interrupts can be generated on a per block basis or when the end of linked list event occurs.

**XDMAC Block**: An XDMAC block is composed of a programmable number of microblocks. The channel configuration registers remain unchanged at the inter microblock boundary. The source and destination addresses are conditionally updated with a programmable signed number.

**XDMAC Microblock**: The microblock is composed of a programmable number of data. The channel configuration registers remain unchanged at the data boundary. The data address may be fixed (a FIFO location, a peripheral transmit or receive register), incrementing (a memory-mapped area) by a programmable signed number.

**XDMAC Burst and Incomplete Burst**: In order to improve the overall performance when accessing dynamic external memory, burst access is mandatory. Each data of the microblock is considered as a part of a memory burst. The programmable burst value indicates the largest memory burst allowed on a per channel basis. When the microblock length is not an integral multiple of the burst size, an incomplete burst is performed to read or write the last trailing bytes.

**XDMAC Chunk and Incomplete Chunk**: When a peripheral synchronized transfer is activated, the microblock splits into a number of data chunks. The chunk size is programmable. The larger the chunk is, the better the performance is. When the transfer size is not a multiple of the chunk size, the last chunk may be incomplete.

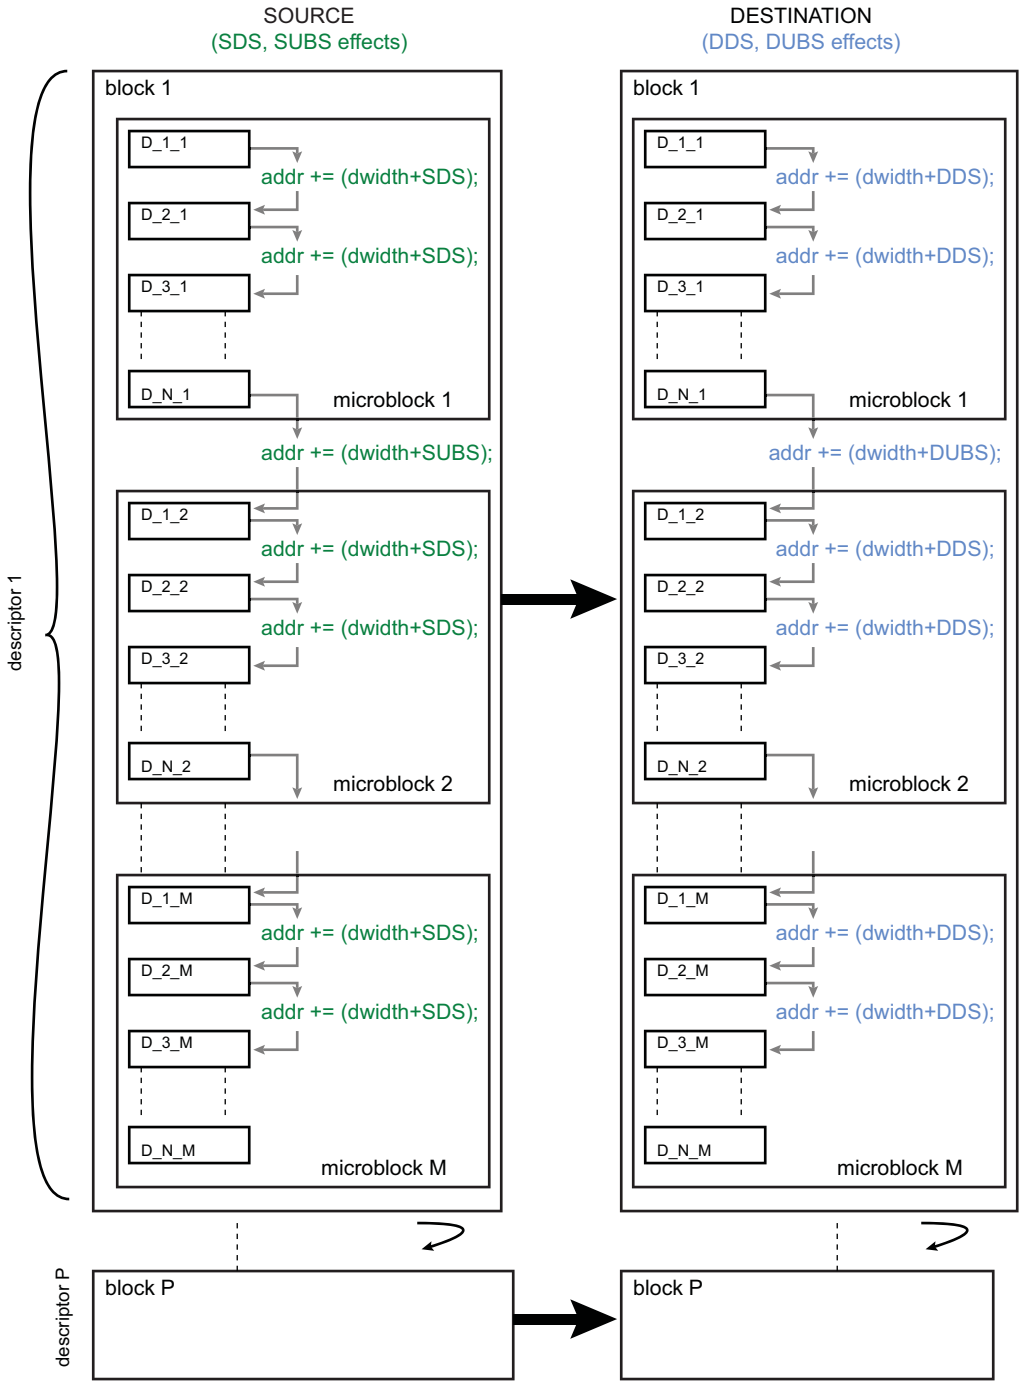
### 37.5.2 Data Striding Diagram

**Figure 37-2. Data Striding Diagram**



### 37.5.3 Transfer Hierarchy Diagrams

**Figure 37-3. XDMAC Memory Transfer Hierarchy**

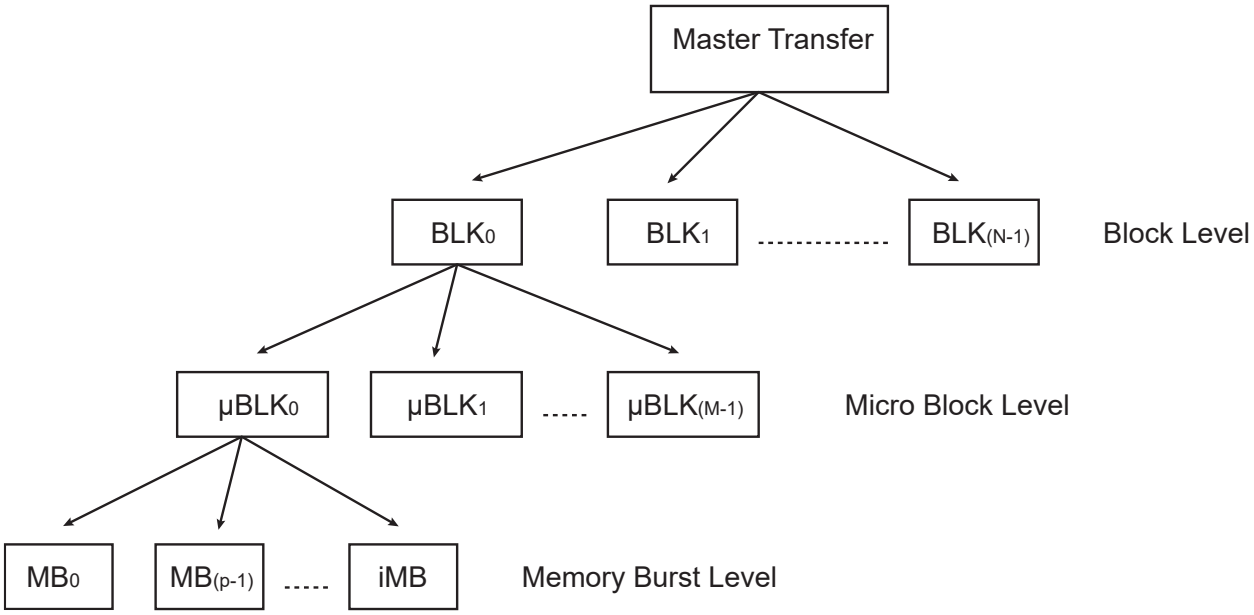


**Figure 37-4. XDAMC Peripheral Transfer Hierarchy**

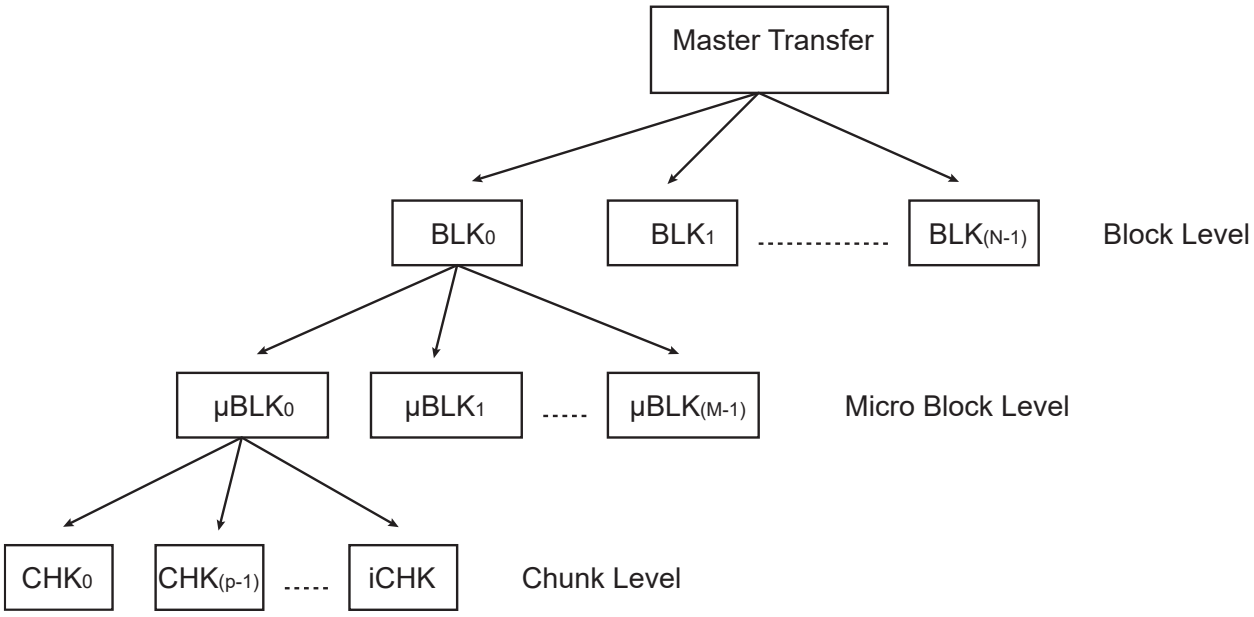

### 37.5.4 Peripheral Synchronized Transfer

A peripheral hardware request interface is used to control the pace of the chunk transfer. When a peripheral is ready to transmit or receive a chunk of data, it asserts its request line and the DMA Controller transfers a data to or from the memory to the peripheral.

#### 37.5.4.1 Software Triggered Synchronized Transfer

The Peripheral hardware request can be software controlled using the SWREQ field of the XDMAC Global Channel Software Request Register (XDMAC_GSWR). The peripheral synchronized transfer is paced using a processor write access in the XDMAC_GSWR. Each bit of that register triggers a transfer

request. The XDMAC Global Channel Software Request Status Register (XDMAC_GSWS) indicates the status of the request; when set, the request is still pending.

### 37.5.5 XDMAC Transfer Software Operation

**Note:**
When a memory-to-memory transfer is performed, configure the field XDMAC_CCx.PERID (where 'x' is the index of the channel used for transfer) to an unused peripheral ID (refer to table "Peripheral Identifiers").

#### 37.5.5.1 Single Block Transfer With Single Microblock

1. Read the XDMAC Global Channel Status Register (XDMAC_GS) to select a free channel.
2. Clear the pending Interrupt Status bit(s) by reading the selected XDMAC Channel x Interrupt Status Register (XDMAC_CISx).
3. Write the XDMAC Channel x Source Address Register (XDMAC_CSAx) for channel x.
4. Write the XDMAC Channel x Destination Address Register (XDMAC_CDAx) for channel x.
5. Program field UBLEN in the XDMAC Channel x Microblock Control Register (XDMAC_CUBCx) with the number of data.
6. Program the XDMAC Channel x Configuration Register (XDMAC_CCx):
    6.1. Clear XDMAC_CCx.TYPE for a memory-to-memory transfer, otherwise set this bit.
    6.2. Configure XDMAC_CCx.MBSIZE to the memory burst size used.
    6.3. Configure XDMAC_CCx.SAM and DAM to Memory Addressing mode.
    6.4. Configure XDMAC_CCx.DSYNC to select the peripheral transfer direction.
    6.5. Set XDMAC_CCx.PROT to activate a secure channel.
    6.6. Configure XDMAC_CCx.CSIZE to configure the channel chunk size (only relevant for peripheral synchronized transfer).
    6.7. Configure XDMAC_CCx.DWIDTH to configure the transfer data width.
    6.8. Configure XDMAC_CCx.SIF, XDMAC_CCx.DIF to configure the master interface used to read data and write data, respectively.
    6.9. Configure XDMAC_CCx.PERID to select the active hardware request line (only relevant for a peripheral synchronized transfer).
    6.10. Set XDMAC_CCx.SWREQ to use a software request (only relevant for a peripheral synchronized transfer).
7. Clear the following five registers:
    – XDMAC Channel x Next Descriptor Control Register (XDMAC_CNDCx)
    – XDMAC Channel x Block Control Register (XDMAC_CBCx)
    – XDMAC Channel x Data Stride Memory Set Pattern Register (XDMAC_CDS_MSPx)
    – XDMAC Channel x Source Microblock Stride Register (XDMAC_CSUSx)
    – XDMAC Channel x Destination Microblock Stride Register (XDMAC_CDUSx)
    This indicates that the linked list is disabled, there is only one block and striding is disabled.
8. Enable the Microblock interrupt by writing a '1' to bit BIE in the XDMAC Channel x Interrupt Enable Register (XDMAC_CIEx). Enable the Channel x Interrupt Enable bit by writing a '1' to bit IEx in the XDMAC Global Interrupt Enable Register (XDMAC_GIE).
9. Enable channel x by writing a '1' to bit ENx in the XDMAC Global Channel Enable Register (XDMAC_GE). XDMAC_GS.STx (XDMAC Channel x Status bit) is set by hardware.

10. Once completed, the DMA channel sets XDMAC_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 37.5.5.2 Single Block Transfer With Multiple Microblock

1. Read the XDMAC_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC_CISx register.
3. Write the XDMAC_CSAx register for channel x.
4. Write the XDMAC_CDAx register for channel x.
5. Program XDMAC_CUBCx.UBLEN with the number of data.
6. Program XDMAC_CCx register (see "Single Block Transfer With Single Microblock").
7. Program XDMAC_CBCx.BLEN with the number of microblocks of data.
8. Clear the following registers:
   - XDMAC_CNDCx
   - XDMAC_CDS_MSPx
   - XDMAC_CSUSx XDMAC_CDUSx
     This indicates that the linked list is disabled and striding is disabled.
9. Enable the Block interrupt by writing a '1' to XDMAC_CIEx.BIE, enable the Channel x Interrupt Enable bit by writing a '1' to XDMAC_GIEx.IEx.
10. Enable channel x by writing a '1' to the XDMAC_GE.ENx. XDMAC_GS.STx is set by hardware.
11. Once completed, the DMA channel sets XDMAC_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 37.5.5.3 Master Transfer

1. Read the XDMAC_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC_CISx register.
3. Build a linked list of transfer descriptors in memory. The descriptor view is programmable on a per descriptor basis. The linked list items structure must be word aligned. MBR_UBC.NDE must be configured to 0 in the last descriptor to terminate the list.
4. Configure field NDA in the XDMAC Channel x Next Descriptor Address Register (XDMAC_CNDAx) with the first descriptor address and bit XDMAC_CNDAx.NDAIF with the master interface identifier.
5. Configure the XDMAC_CNDCx register:
   5.1. Set XDMAC_CNDCx.NDE to enable the descriptor fetch.
   5.2. Set XDMAC_CNDCx.NDSUP to update the source address at the descriptor fetch time, otherwise clear this bit.
   5.3. Set XDMAC_CNDCx.NDDUP to update the destination address at the descriptor fetch time, otherwise clear this bit.
   5.4. Configure XDMAC_CNDCx.NDVIEW to define the length of the first descriptor.
6. Enable the End of Linked List interrupt by writing a '1' to XDMAC_CIEx.LIE.
7. Enable channel x by writing a '1' to XDMAC_GE.ENx. XDMAC_GS.STx is set by hardware.
8. Once completed, the DMA channel sets XDMAC_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 37.5.5.4 Disabling A Channel Before Transfer Completion

Under normal operation, the software enables a channel by writing a ‘1’ to XDMAC_GE.ENx, then the hardware disables a channel on transfer completion by clearing bit XDMAC_GS.STx. To disable a channel, write a ‘1’ to bit XDMAC_GD.DIx and poll the XDMAC_GS register.

## 37.6 Linked List Descriptor Operation

### 37.6.1 Linked List Descriptor View

#### 37.6.1.1 Channel Next Descriptor View 0–3 Structures

**Table 37-4. Channel Next Descriptor View 0–3 Structures**

**Bits 28:27 – NVIEW[1:0]** Next Descriptor View

| Value | Name | Description |
|---|---|---|
| 0 | NDV0 | Next Descriptor View 0 |
| 1 | NDV1 | Next Descriptor View 1 |
| 2 | NDV2 | Next Descriptor View 2 |
| 3 | NDV3 | Next Descriptor View 3 |

**Bit 26 – NDEN** Next Descriptor Destination Update

| Value | Description |
|---|---|
| 0 | Destination parameters remain unchanged. |
| 1 | Destination parameters are updated when the descriptor is retrieved. |

**Bit 25 – NSEN** Next Descriptor Source Update

| Value | Description |
|---|---|
| 0 | Source parameters remain unchanged. |
| 1 | Source parameters are updated when the descriptor is retrieved. |

**Bit 24 – NDE** Next Descriptor Enable

| Value | Description |
|---|---|
| 0 | Descriptor fetch is disabled. |
| 1 | Descriptor fetch is enabled. |

**Bits 23:0 – UBLEN[23:0]** Microblock Length
This field indicates the number of data in the microblock. The microblock contains UBLEN data.

## 37.7 XDMAC Maintenance Software Operations

### 37.7.1 Disabling a Channel

A disable channel request occurs when a write operation is performed in the XDMAC_GD register. If the channel is source peripheral synchronized (bit XDMAC_CCx.TYPE is set and bit XDMAC_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC_CISx.DIS is set. XDMAC_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### 37.7.2 Suspending a Channel

A disable channel request occurs when a write operation is performed in the XDMAC_GD register. If the channel is source peripheral synchronized (bit XDMAC_CCx.TYPE is set and bit XDMAC_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC_CISx.DIS is set. XDMAC_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### 37.7.3 Flushing a Channel

A FIFO flush command is issued by writing to the XDMAC_SWF register. The content of the FIFO is written to memory. XDMAC_CISx.FIS (End of Flush Interrupt Status bit) is set when the last byte is successfully transferred to memory. The channel is not disabled. The flush operation is not blocking, meaning that read operation can be scheduled during the flush write operation. The flush operation is only relevant for peripheral to memory transfer where pending peripheral bytes are buffered into the channel FIFO.

### 37.7.4 Maintenance Operation Priority

#### 37.7.4.1 Disable Operation Priority

- When a disable request occurs on a suspended channel, the XDMAC_GWS.WSx (Channel x Write Suspend bit) is cleared. If the transfer is source peripheral synchronized, the pending bytes are drained to memory. The bit XDMAC_CISx.DIS is set.
- When a disable request follows a flush request, if the flush last transaction is not yet scheduled, the flush request is discarded and the disable procedure is applied. Bit XDMAC_CISx.FIS is not set. Bit XDMAC_CISx.DIS is set when the disable request is completed. If the flush request transaction is already scheduled, the XDMAC_CISx.FIS is set. XDMAC_CISx.DIS is also set when the disable request is completed.

#### 37.7.4.2 Flush Operation Priority

- When a flush request occurs on a suspended channel, if there are pending bytes in the FIFO, they are written out to memory, XDMAC_CISx.FIS is set. If the FIFO is empty, XDMAC_CISx.FIS is also set.
- If the flush operation is performed after a disable request, the flush command is ignored. XDMAC_CISx.FIS is not set.

#### 37.7.4.3 Suspend Operation Priority

If the suspend operation is performed after a disable request, the write suspend operation is ignored.

## 37.8 XDMAC Software Requirements

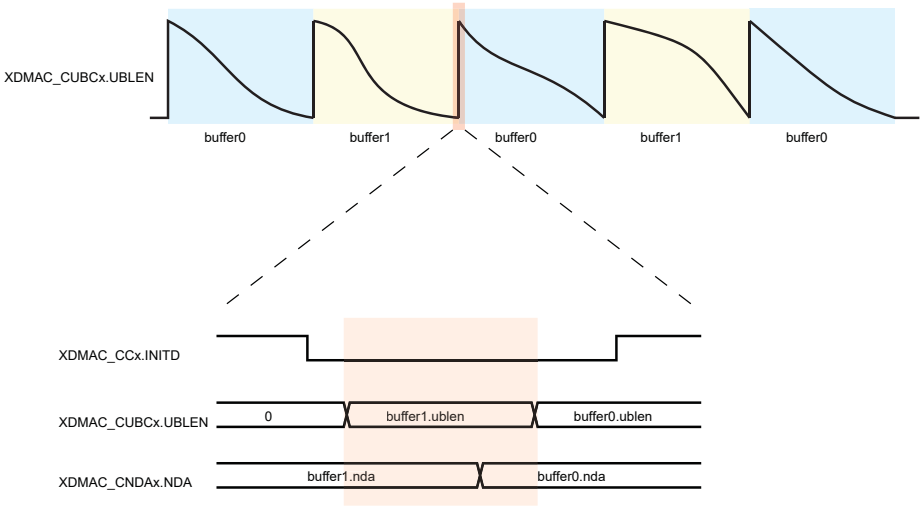
- Write operations to channel registers are not be performed in an active channel after the channel is enabled. If any channel parameters must be reprogrammed, this can only be done after disabling the XDMAC channel.
- XDMAC_CSAx and XDMAC_CDAx channel registers must be programmed with a byte, half-word, word or double-word aligned address depending on the Channel x Data Width field (DWIDTH) of the XDMAC Channel x Configuration Register. When a memory-to-peripheral transfer is performed, the XDMAC_CSAx address register has no alignment requirement.
- When a memory-to-memory transfer is performed, configure the field XDMAC_CCx.PERID (where ‘x’ is the index of the channel used for the transfer) to an unused peripheral ID (refer to table “Peripheral Identifiers”).
- When XDMAC_CC.INITD is set to 0, XDMAC_CUBC.UBLEN and XDMAC_CNDA.NDA field values are unreliable when the descriptor is being updated. The following procedure applies to get the buffer descriptor identifier and the residual bytes:

```
Read XDMAC_CNDAx.NDA(nda0)
Read XDMAC_CCx.INITD(initd0)
Read XDMAC_CCx.INITD(initd0)
Read XDMAC_CUBCx.UBLEN(ublen)
Read XDMAC_CCx.INITD(initd1)
Read XDMA_CNDAx.NDA(nda1)
If (nda0 == nda1 && initd0 == 1 && initd1 == 1).
Then the ublen is correct, the buffer id is nda.
Else retry
```

  See the figure below.

- Each DMA channel can be configured in either Secure or Non-secure mode independently. When a DMA channel is secure, its configuration registers cannot be modified by non-secure software. The configuration registers of a secure channel are read as zero by non-secure software and the read-only registers are also read as zero.

**Figure 37-5. INITD Timing Diagram**



## 37.9 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | XDMAC_GTYPE | 7:0 | FIFO_SZ[2:0] | | | NB_CH[4:0] | | | | |
| | | 15:8 | FIFO_SZ[10:3] | | | | | | | |
| | | 23:16 | | NB_REQ[6:0] | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x04 | XDMAC_GCFG | 7:0 | | | | | CGDISIF | CGDISFIFO | CGDISPIPE | CGDISREG |
| | | 15:8 | | | | | | | | BXKBEN |
| | | 23:16 | | | | | | | | |

| | | | | | CGDISIF | CGDISFIFO | CGDISPIPE | CGDISREG |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 8 – BXKBEN** Boundary X Kilobyte Enable

| Value | Description |
|---|---|
| 0 | The 1 Kbyte boundary is used. |
| 1 | The controller does not meet the AHB specification. |

**Bit 3 – CGDISIF** Bus Interface Clock Gating Disable

| Value | Description |
|---|---|
| 0 | The automatic clock gating is enabled for the system bus interface. |
| 1 | The automatic clock gating is disabled for the system bus interface. |

**Bit 2 – CGDISFIFO** FIFO Clock Gating Disable

| Value | Description |
|---|---|
| 0 | The automatic clock gating is enabled for the main FIFO. |
| 1 | The automatic clock gating is disabled for the main FIFO. |

**Bit 1 – CGDISPIPE** Pipeline Clock Gating Disable

| Value | Description |
|---|---|
| 0 | The automatic clock gating is enabled for the main pipeline. |
| 1 | The automatic clock gating is disabled for the main pipeline. |

**Bit 0 – CGDISREG** Configuration Registers Clock Gating Disable

| Value | Description |
|---|---|
| 0 | The automatic clock gating is enabled for the configuration registers. |
| 1 | The automatic clock gating is disabled for the configuration registers. |

### 37.9.3 XDMAC Global Weighted Arbiter Configuration Register

**Name:** XDMAC_GWAC
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:12 – PW3[3:0]** Pool Weight 3
This field indicates the weight of pool 3 in the arbitration scheme of the DMA scheduler.

**Bits 11:8 – PW2[3:0]** Pool Weight 2
This field indicates the weight of pool 2 in the arbitration scheme of the DMA scheduler.

**Bits 7:4 – PW1[3:0]** Pool Weight 1
This field indicates the weight of pool 1 in the arbitration scheme of the DMA scheduler.

**Bits 3:0 – PW0[3:0]** Pool Weight 0
This field indicates the weight of pool 0 in the arbitration scheme of the DMA scheduler.

### 37.9.4 XDMAC Global Interrupt Enable Register

**Name:** XDMAC_GIE
**Offset:** 0x0C
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IE** XDMAC Channel x Interrupt Enable

| Value | Description |
|---|---|
| 0 | This bit has no effect. The Channel x Interrupt Mask bit (XDMAC_GIM.IMx) is not modified. |
| 1 | The corresponding mask bit is set. The XDMAC Channel x Interrupt Status register (XDMAC_GIS) can generate an interrupt. |

### 37.9.5 XDMAC Global Interrupt Disable Register

**Name:** XDMAC_GID
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| 0 | Bus error interrupt is masked. |
| 1 | Bus error interrupt is activated. |

**Bit 3 – FIM** End of Flush Interrupt Mask

| Value | Description |
|---|---|
| 0 | End of flush interrupt is masked. |
| 1 | End of flush interrupt is activated. |

**Bit 2 – DIM** End of Disable Interrupt Mask

| Value | Description |
|---|---|
| 0 | End of disable interrupt is masked. |
| 1 | End of disable interrupt is activated. |

**Bit 1 – LIM** End of Linked List Interrupt Mask

| Value | Description |
|---|---|
| 0 | End of linked list interrupt is masked. |
| 1 | End of linked list interrupt is activated. |

**Bit 0 – BIM** End of Block Interrupt Mask

| Value | Description |
|---|---|
| 0 | Block interrupt is masked. |
| 1 | Block interrupt is activated. |

### 37.9.21 XDMAC Channel x Interrupt Status Register [x = 0..15]

**Name:** XDMAC_CIS
**Offset:** 0x5C + n*0x40 [n=0..15]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | ROIS | WBEIS | RBEIS | FIS | DIS | LIS | BIS |
| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 6 – ROIS** Request Overflow Error Interrupt Status

| Value | Description |
|---|---|
| 0 | Overflow condition has not occurred. |
| 1 | Overflow condition has occurred at least once. (This information is only relevant for peripheral synchronized transfers.) |

**Bit 5 – WBEIS** Write Bus Error Interrupt Status

| Value | Description |
|---|---|
| 0 | Write bus error condition has not occurred. |
| 1 | At least one bus error has been detected in a write access since the last read of the Status register. |

**Bit 4 – RBEIS** Read Bus Error Interrupt Status

| Value | Description |
|---|---|
| 0 | Read bus error condition has not occurred. |
| 1 | At least one bus error has been detected in a read access since the last read of the Status register. |

**Bit 3 – FIS** End of Flush Interrupt Status

| Value | Description |
|---|---|
| 0 | End of flush condition has not occurred. |
| 1 | End of flush condition has occurred since the last read of the Status register. |

**Bit 2 – DIS** End of Disable Interrupt Status

| Value | Description |
|---|---|
| 0 | End of disable condition has not occurred. |
| 1 | End of disable condition has occurred since the last read of the Status register. |

**Bit 1 – LIS** End of Linked List Interrupt Status

| Value | Description |
|---|---|
| 0 | End of linked list condition has not occurred. |
| 1 | End of linked list condition has occurred since the last read of the Status register. |

**Bit 0 – BIS** End of Block Interrupt Status

| Value | Description |
|---|---|
| 0 | End of block interrupt has not occurred. |
| 1 | End of block interrupt has occurred since the last read of the Status register. |

### 37.9.22 XDMAC Channel x Source Address Register [x = 0..15]

| Access | R/W | R/W | R/W | R/W | R/W | R/W | | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | 0 |

**Bits 31:2 – NDA[29:0]** Channel x Next Descriptor Address
The 30-bit width of the NDA field represents the next descriptor address range 31:2. The descriptor is word-aligned and the two least significant register bits 1:0 are ignored.

**Bit 0 – NDAIF** Channel x Next Descriptor Interface

| Value | Description |
|---|---|
| 0 | The channel descriptor is retrieved through system interface 0. |
| 1 | The channel descriptor is retrieved through system interface 1. |

### 37.9.25 XDMAC Channel x Next Descriptor Control Register [x = 0..15]

**Name:** XDMAC_CNDC
**Offset:** 0x6C + n*0x40 [n=0..15]
**Reset:** 0x00000000
**Property:** Read/Write

| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

**Bits 4:3 – NDVIEW[1:0]** Channel x Next Descriptor View

| Value | Name | Description |
|---|---|---|
| 0 | NDV0 | Next Descriptor View 0 |
| 1 | NDV1 | Next Descriptor View 1 |
| 2 | NDV2 | Next Descriptor View 2 |
| 3 | NDV3 | Next Descriptor View 3 |

**Bit 2 – NDDUP** Channel x Next Descriptor Destination Update
0 (DST_PARAMS_UNCHANGED): Destination parameters remain unchanged.

1 (DST_PARAMS_UPDATED): Destination parameters are updated when the descriptor is retrieved.

**Bit 1 – NDSUP** Channel x Next Descriptor Source Update
0 (SRC_PARAMS_UNCHANGED): Source parameters remain unchanged.

1 (SRC_PARAMS_UPDATED): Source parameters are updated when the descriptor is retrieved.

**Bit 0 – NDE** Channel x Next Descriptor Enable
0 (DSCR_FETCH_DIS): Descriptor fetch is disabled.

1 (DSCR_FETCH_EN): Descriptor fetch is enabled.

### 37.9.26 XDMAC Channel x Microblock Control Register [x = 0..15]

**Name:** XDMAC_CUBC
**Offset:** 0x70 + n*0x40 [n=0..15]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | MEMSET | SWREQ | PROT | DSYNC | | MBSIZE[1:0] | | TYPE |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 30:24 – PERID[6:0]** Channel x Peripheral Hardware Request Line Identifier
This field contains the peripheral hardware request line identifier. PERID refers to identifiers defined in "DMA Controller Peripheral Connections".

**Note:** When a memory-to-memory transfer is performed, configure PERID to an unused peripheral ID (refer to table "Peripheral Identifiers").

**Bit 23 – WRIP** Write in Progress (this bit is read-only)
0 (DONE): No active write transaction on the bus.

1 (IN_PROGRESS): A write transaction is in progress.

**Bit 22 – RDIP** Read in Progress (this bit is read-only)
0 (DONE): No active read transaction on the bus.

1 (IN_PROGRESS): A read transaction is in progress.

**Bit 21 – INITD** Channel Initialization Done (this bit is read-only)
0 (IN_PROGRESS): Channel initialization is in progress.

1 (TERMINATED): Channel initialization is completed.

Note: When set to 0, XDMAC_CUBC.UBLEN and XDMAC_CNDA.NDA field values are unreliable each time a descriptor is being updated. See 37.8 XDMAC Software Requirements.

**Bits 19:18 – DAM[1:0]** Channel x Destination Addressing Mode

| Value | Name | Description |
|---|---|---|
| 0 | FIXED_AM | The address remains unchanged. |
| 1 | INCREMENTED_AM | The addressing mode is incremented (the increment size is set to the data size). |
| 2 | UBS_AM | The microblock stride is added at the microblock boundary. |
| 3 | UBS_DS_AM | The microblock stride is added at the microblock boundary; the data stride is added at the data boundary. |

**Bits 17:16 – SAM[1:0]** Channel x Source Addressing Mode

| Value | Name | Description |
|---|---|---|
| 0 | FIXED_AM | The address remains unchanged. |
| 1 | INCREMENTED_AM | The addressing mode is incremented (the increment size is set to the data size). |
| 2 | UBS_AM | The microblock stride is added at the microblock boundary. |
| 3 | UBS_DS_AM | The microblock stride is added at the microblock boundary, the data stride is added at the data boundary. |

**Bit 14 – DIF** Channel x Destination Interface Identifier
0 (AHB_IF0): The data is written through system bus interface 0.

1 (AHB_IF1): The data is written though system bus interface 1.

**Bit 13 – SIF** Channel x Source Interface Identifier
0 (AHB_IF0): The data is read through system bus interface 0.

1 (AHB_IF1): The data is read through system bus interface 1.

**Bits 12:11 – DWIDTH[1:0]** Channel x Data Width

| Value | Name | Description |
|---|---|---|
| 0 | BYTE | The data size is set to 8 bits |
| 1 | HALFWORD | The data size is set to 16 bits |
| 2 | WORD | The data size is set to 32 bits |
| 3 | DWORD | The data size is set to 64 bits |

**Bits 10:8 – CSIZE[2:0]** Channel x Chunk Size

| Value | Name | Description |
|---|---|---|
| 0 | CHK_1 | 1 data transferred |
| 1 | CHK_2 | 2 data transferred |
| 2 | CHK_4 | 4 data transferred |
| 3 | CHK_8 | 8 data transferred |
| 4 | CHK_16 | 16 data transferred |

**Bit 7 – MEMSET** Channel x Fill Block of Memory
0 (NORMAL_MODE): Memset is not activated.

1 (HW_MODE): Sets the block of memory pointed by DA field to the specified value. This operation is performed on 8-, 16- or 32-bit basis.

**Bit 6 – SWREQ** Channel x Software Request Trigger
0 (HWR_CONNECTED): Hardware request line is connected to the peripheral request line.

1 (SWR_CONNECTED): Software request is connected to the peripheral request line.

**Bit 5 – PROT** Channel x Protection
When a descriptor is loaded, the PROT bit cannot be modified. If PROT=0 for a channel, the configuration and status registers of this channel cannot be modified by unsecure software.
0 (SEC): Channel is secured.

1 (UNSEC): Channel is unsecured.

**Bit 4 – DSYNC** Channel x Synchronization
0 (PER2MEM): Peripheral-to-memory transfer.

1 (MEM2PER): Memory-to-peripheral transfer.

**Bits 2:1 – MBSIZE[1:0]** Channel x Memory Burst Size

| Value | Name | Description |
|---|---|---|
| 0 | SINGLE | The memory burst size is set to one. |
| 1 | FOUR | The memory burst size is set to four. |
| 2 | EIGHT | The memory burst size is set to eight. |
| 3 | SIXTEEN | The memory burst size is set to sixteen. |

**Bit 0 – TYPE** Channel x Transfer Type
0 (MEM_TRAN): Self-triggered mode (memory-to-memory transfer).

1 (PER_TRAN): Synchronized mode (peripheral-to-memory or memory-to-peripheral transfer).

### 37.9.29 XDMAC Channel x Data Stride Memory Set Pattern Register [x = 0..15]

**Name:** XDMAC_CDS_MSP
**Offset:** 0x7C + n*0x40 [n=0..15]
**Reset:** 0x00000000
**Property:** Read/Write

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – DDS_MSP[15:0]** Channel x Destination Data Stride or Memory Set Pattern
When XDMAC_CCx.MEMSET = 0, this field indicates the destination data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous (see Data Striding Diagram).

The DDS_MSP field is only relevant when XDMAC_CCx.SAM=UBS_DS_AM.

When XDMAC_CCx.MEMSET = 1, this field indicates the memory set pattern.

**Bits 15:0 – SDS_MSP[15:0]** Channel x Source Data Stride or Memory Set Pattern
When XDMAC_CCx.MEMSET = 0, this field indicates the source data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous (see Data Striding Diagram).

The SDS_MSP field is only relevant when XDMAC_CCx.SAM=UBS_DS_AM.

When XDMAC_CCx.MEMSET = 1, this field indicates the memory set pattern.

### 37.9.30 XDMAC Channel x Source Microblock Stride Register [x = 0..15]

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:0 – SUBS[23:0]** Channel x Source Microblock Stride
Number of bytes for the microblock stride for channel x (two's complement). If the field is set to zero the data is contiguous (see Figure 37-2).

The SUBS field is only relevant when XDMAC_CCx.SAM=UBS_AM or XDMAC_CCx.SAM=UBS_DS_AM.

### 37.9.31 XDMAC Channel x Destination Microblock Stride Register [x = 0..15]

**Name:** XDMAC_CDUS
**Offset:** 0x84 + n*0x40 [n=0..15]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DUBS[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | DUBS[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DUBS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:0 – DUBS[23:0]** Channel x Destination Microblock Stride
Number of bytes for the microblock stride for channel x (two's complement). If the field is set to zero the data is contiguous (see Figure 37-2).

The DUBS field is only relevant when XDMAC_CCx.SAM=UBS_AM or XDMAC_CCx.SAM=UBS_DS_AM.

# 38. LCD Controller (LCDC)

## 38.1 Description

The LCD Controller (LCDC) consists of logic for transferring LCD image data from an external display buffer to an LCD module. The LCD has one display input buffer per overlay that fetches pixels through the dual AHB master interface and a lookup table to allow palletized display configurations. The LCD controller is programmable on a per overlay basis, and supports different LCD resolutions, window sizes, image formats and pixel depths.

The LCD is connected to the Arm Advanced High Performance Bus (AHB) as a master for reading pixel data. It also integrates an APB interface to configure its registers.

## 38.2 Embedded Characteristics

- Dual AHB Master Interface
- Supports Single Scan Active TFT Display
- Supports 12-, 16-, 18- and 24-bit Output Mode through the Spatial Dithering Unit
- Asynchronous Output Mode Supported
- 1, 2, 4, 8 bits per Pixel (Palletized)
- 12, 16, 18, 19, 24, 25 and 32 bits per Pixel (Non-palletized)
- Supports One Base Layer (Background)
- Supports One Overlay 1 Layer Window
- Supports One Overlay 2 Layer Window
- Supports One High-End Overlay (HEO) Window
- Little Endian Memory Organization
- Programmable Timing Engine, with Integer Clock Divider
- Programmable Polarity for Data, Line Synchro and Frame Synchro
- Up to 1024x768 (XGA) with Overlay (Application-Dependent). Still Image up to WXGA.
- Color Lookup Table with up to 256 Entries and Predefined 8-bit Alpha
- Programmable Negative and Positive Row Striding for all Layers
- Programmable Negative and Positive Pixel Striding for Layers
- High-End Overlay supports 4:2:0 Planar Mode and Semiplanar Mode
- High-End Overlay supports 4:2:2 Planar Mode, Semiplanar Mode and Packed
- High-End Overlay includes Chroma Upsampling Unit
- Horizontal and Vertical Rescaling Unit with Edge Interpolation and Independent Non-Integer Ratio, up to 1024x768
- Hidden Layer Removal supported
- Integrates Fully Programmable Color Space Conversion
- Blender Function Supports Arbitrary 8-bit Alpha Value and Chroma Keying
- DMA User Interface uses Linked List Structure and Add-to-queue Structure

## 38.4 I/O Lines Description

**Table 38-1. I/O Lines Description**

| Name | Description | Type |
|---|---|---|
| LCDPWM | Contrast control signal, using Pulse Width Modulation | Output |
| LCDHSYNC | Horizontal Synchronization Pulse | Output |
| LCDVSYNC | Vertical Synchronization Pulse | Output |
| LCDDAT[23:0] | LCD 24-bit data bus | Output |
| LCDDEN | Data Enable | Output |

| .....continued | | |
|---|---|---|
| **Name** | **Description** | **Type** |
| LCDDISP | Display Enable signal | Output |
| LCDPCLK | Pixel Clock | Output |

## 38.5 Product Dependencies

### 38.5.1 I/O Lines

The pins used for interfacing the LCD Controller may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the LCD Controller are not used by the application, they can be used for other purposes by the PIO Controller.

### 38.5.2 Power Management

The LCD Controller is not continuously clocked. The user must first enable the LCD Controller clock in the Power Management Controller (PMC_PCER) before using it.

### 38.5.3 Interrupt Sources

The LCD Controller interrupt line is connected to one of the internal sources of the interrupt controller. Using the LCD Controller interrupt requires prior programming of the interrupt controller.

## 38.6 Functional Description

The LCD module integrates the following digital blocks:

- DMA Engine Address Generation (DEAG)—this block performs data prefetch and requests access to the AHB interface.
- Input Overlay FIFO—stores the stream of pixels
- Color Lookup Table (CLUT)—these 256 RAM-based lookup table entries are selected when the color depth is set to 1, 2, 4 or 8 bpp.
- Chroma Upsampling Engine (CUE)—this block is selected when the input image sampling format is YUV (Y'CbCr) 4:2:0 and converts it to higher quality 4:4:4 image.
- Color Space Conversion (CSC)—changes the color space from YUV to RGB
- Two Dimension Scaler (2DSC)—resizes the image
- Global Alpha Blender (GAB)—performs programmable 256-level alpha blending
- Output FIFO—stores the blended pixel prior to display
- LCD Timing Engine—provides a fully programmable HSYNC-VSYNC interface

The DMA controller reads the image through the AHB master interface. The LCD controller engine formats the display data, then the GAB performs alpha blending if required, and writes the final pixel into the output FIFO. The programmable timing engine drives a valid pixel onto the LCDDAT[23:0] display bus.

### 38.6.1 Timing Engine Configuration

#### 38.6.1.1 Pixel Clock Period Configuration

The pixel clock (LCDPCLK) generated by the timing engine is the source clock divided by the field CLKDIV in the LCDC_LCDCFG0 register. The source clock can be selected between the system clock and the 2x system clock with the field CLKSEL located in the LCDC_LCDCFG0 register.

Pixel clock period formula:

$$\text{LCD_PCLK} = \frac{\text{source clock}}{\text{CLKDIV}+2}$$

The pixel clock polarity is also programmable.

#### 38.6.1.2 Horizontal and Vertical Synchronization Configuration

The following fields are used to configure the timing engine:

- LCDC_LCDCFG1.HSPW
- LCDC_LCDCFG1.VSPW
- LCDC_LCDCFG2.VFPW
- LCDC_LCDCFG2.VBPW
- LCDC_LCDCFG3.HFPW
- LCDC_LCDCFG3.HBPW
- LCDC_LCDCFG4.PPL
- LCDC_LCDCFG4.RPF

The polarity of output signals is also programmable.

#### 38.6.1.3 Timing Engine Powerup Software Operation

The following sequence is used to enable the display:

1. Configure LCD timing parameters, signal polarity and clock period.
2. Enable the pixel clock by writing a one to bit LCDC_LCDEN.CLKEN.
3. Poll bit LCDC_LCDSR.CLKSTS to check that the clock is running.
4. Enable Horizontal and Vertical Synchronization by writing a one to bit LCDC_LCDEN.SYNCEN.
5. Poll bit LCDC_LCDSR.LCDSTS to check that the synchronization is up.
6. Enable the display power signal by writing a one to bit LCDC_LCDEN.DISPEN.
7. Poll bit LCDC_LCDSR.DISPSTS to check that the power signal is activated.

The field LCDC_LCDCFG5.GUARDTIME is used to configure the number of frames before the assertion of the DISP signal.

#### 38.6.1.4 Timing Engine Powerdown Software Operation

The following sequence is used to disable the display:

1. Disable the DISP signal by writing bit LCDC_LCDDIS.DISPDIS.
2. Poll bit LCDC_LCDSR.DISPSTS to verify that the DISP is no longer activated.
3. Disable the HSYNC and VSYNC signals by writing a one to bit LCDC_LCDDIS.SYNCDIS.
4. Poll bit LCDC_LCDSR.LCDSTS to check that the synchronization is off.
5. Disable the pixel clock by writing a one to bit LCDC_LCDDIS.CLKDIS.

### 38.6.2 DMA Software Operations

#### 38.6.2.1 DMA Channel Descriptor (DSCR) Alignment and Structure

The DMA Channel Descriptor (DSCR) must be aligned on a 64-bit boundary.

The DMA Channel Descriptor structure contains three fields:

- DSCR.CHXADDR: Frame Buffer base address register
- DSCR.CHXCTRL: Transfer Control register

- DSCR.CHXNEXT: Next Descriptor Address register

**Table 38-2. DMA Channel Descriptor Structure**

| System Memory | Structure Field for Channel CHX |
|---|---|
| DSCR + 0x0 | ADDR |
| DSCR + 0x4 | CTRL |
| DSCR + 0x8 | NEXT |

#### 38.6.2.2 Enabling a DMA Channel

Follow the steps below to enable a DMA channel:

1. Check the status of the channel by reading the CHXCHSR register.
2. Write the channel descriptor (DSCR) structure in the system memory by writing DSCR.CHXADDR Frame base address, DSCR.CHXCTRL channel control and DSCR.CHXNEXT next descriptor location.
3. If more than one descriptor is expected, the field DFETCH of DSCR.CHXCTRL is set to ‘1’ to enable the descriptor fetch operation.
4. Write the DSCR.CHXNEXT register with the address location of the descriptor structure and set DFETCH field of the DSCR.CHXCTRL register to ‘1’.
5. Enable the relevant channel by writing one to the CHEN field of the CHXCHER register.
6. An interrupt may be raised if unmasked when the descriptor has been loaded.

#### 38.6.2.3 Disabling a DMA Channel

Follow the steps below to disable a DMA channel:

1. Clearing the DFETCH bit in the DSCR.CHXCTRL field of the DSCR structure disables the channel at the end of the frame.
2. Setting the DSCR.CHXNEXT field of the DSCR structure disables the channel at the end of the frame.
3. Writing one to the CHDIS field of the CHXCHDR register disables the channel at the end of the frame.
4. Writing one to the CHRST field of the CHXCHDR register disables the channel immediately. This may occur in the middle of the image.
5. Polling CHSR field in the CHXCHSR register until the channel is successfully disabled.

#### 38.6.2.4 DMA Dynamic Linking of a New Transfer Descriptor

1. Write the new descriptor structure in the system memory.
2. Write the address of the new structure in the CHXHEAD register.
3. Add the new structure to the queue of descriptors by writing one to the A2QEN field of the CHXCHER register.
4. The new descriptor is added to the queue on the next frame.
5. An interrupt is raised if unmasked, when the head descriptor structure has been loaded by the DMA channel.

#### 38.6.2.5 DMA Interrupt Generation

The DMA Controller operation sets the following interrupt flags in the Interrupt Status register CHXISR:

- DMA field indicates that the DMA transfer is completed.
- DSCR field indicates that the descriptor structure is loaded in the DMA controller.

- ADD field indicates that a descriptor has been added to the descriptor queue.
- DONE field indicates that the channel transfer has terminated and the channel is automatically disabled.

#### 38.6.2.6 DMA Address Alignment Requirements

When programming the DSCR.CHXADDR field of the DSCR structure, the following requirement must be met.

**Table 38-3. DMA Address Alignment when CLUT Mode is Selected**

| CLUT Mode | DMA Address Alignment |
|---|---|
| 1 bpp | 8 bits |
| 2 bpp | 8 bits |
| 4 bpp | 8 bits |
| 8 bpp | 8 bits |

**Table 38-4. DMA Address Alignment when RGB Mode is Selected**

| RGB Mode | DMA Address Alignment |
|---|---|
| 12 bpp RGB 444 | 16 bits |
| 16 bpp ARGB 4444 | 16 bits |
| 16 bpp RGBA 4444 | 16 bits |
| 16 bpp RGB 565 | 16 bits |
| 16 bpp TRGB 1555 | 16 bits |
| 18 bpp RGB 666 | 32 bits |
| 18 bpp RGB 666 PACKED | 8 bits |
| 19 bpp TRGB 1666 | 32 bits |
| 19 bpp TRGB 1666 | 8 bits |
| 24 bpp RGB 888 | 32 bits |
| 24 bpp RGB 888 PACKED | 8 bits |
| 25 bpp TRGB 1888 | 32 bits |
| 32 bpp ARGB 8888 | 32 bits |
| 32 bpp RGBA 8888 | 32 bits |

**Table 38-5. DMA Address Alignment when YUV Mode is Selected**

| YUV Mode | DMA Address Alignment |
|---|---|
| 32 bpp AYCrCb | 32 bits |
| 16 bpp YCrCb 4:2:2 | 32 bits |

| .....continued | |
|---|---|
| **YUV Mode** | **DMA Address Alignment** |
| 16 bpp semiplanar YCrCb 4:2:2 | Y 8 bits |
| | CrCb 16 bits |
| 16 bpp planar YCrCb 4:2:2 | Y 8 bits |
| | Cr 8 bits |
| | Cb 8 bits |
| 12 bpp YCrCb 4:2:0 | Y 8 bits |
| | CrCb 16 bits |
| 12 bpp YCrCb 4:2:0 | Y 8 bits |
| | Cr 8 bits |
| | Cb 8 bits |

### 38.6.3 Overlay Software Configuration

#### 38.6.3.1 System Bus Access Attributes

These attributes are defined to improve bandwidth of the overlay.

- LOCKDIS bit—When set to ‘1’, the AHB lock signal is not asserted when the PSTRIDE value is different from zero (rotation in progress).
- ROTDIS bit—When set to ‘1’, the Pixel Striding optimization is disabled.
- DLBO bit—When set to ‘1’, only defined burst lengths are performed when the DMA channel retrieves the data from the memory.
- BLEN field—Defines the maximum burst length of the DMA channel.
- SIF bit—Defines the targeted DMA interface.

#### 38.6.3.2 Color Attributes

- CLUTMODE field—Selects the Color Lookup Table mode.
- RGBMODE field—Selects the RGB mode.
- YUVMODE field—Selects the Luminance Chrominance mode.

#### 38.6.3.3 Window Position, Size, Scaling and Striding Attributes

- XPOS and YPOS fields—Defines the position of the overlay window.
- XSIZE and YSIZE fields—Defines the size of the displayed window.
- XMEMSIZE and YMEMSIZE fields—Defines the size of the image frame buffer.
- XSTRIDE and PSTRIDE fields—Defines the line and pixel striding.
- XFACTOR and YFACTOR fields—Defines the scaling ratio.

The position and size attributes are to be programmed to keep the window within the display area.

When the Color Lookup Table mode is enabled, the restrictions detailed in the following table apply on the horizontal and vertical window sizes.

**Table 38-6. Color Lookup Table Mode and Window Size**

| CLUT Mode | X-Y Size Requirement |
|---|---|
| 1 bpp | Multiple of 8 pixels |
| 2 bpp | Multiple of 4 pixels |
| 4 bpp | Multiple of 2 pixels |
| 8 bpp | Free size |

Pixel striding is disabled when CLUT mode is enabled.

When YUV mode is enabled, the restrictions detailed in the following table apply on the window size.

**Table 38-7. YUV Mode and Window Size**

| YUV Mode | X-Y Requirement, Scaling Turned Off | X-Y Requirement, Scaling Turned On |
|---|---|---|
| AYUV | Free size | X-Y size is greater than 5 |
| YUV 4:2:2 packed | XSIZE is greater than 2 pixels | X-Y size is greater than 5 |
| YUV 4:2:2 semiplanar | XSIZE is greater than 2 pixels | X-Y size is greater than 5 |
| YUV 4:2:2 planar | XSIZE is greater than 2 pixels | X-Y size is greater than 5 |
| YUV 4:2:0 semiplanar | XSIZE is greater that 2 pixels | X-Y size is greater than 5 |
| YUV 4:2:0 planar | XSIZE is greater than 2 pixels | X-Y size is greater than 5 |

In RGB mode, there is no restriction on the line length.

#### 38.6.3.4 Overlay Blender Attributes

When two or more video layers are used, alpha blending is performed to define the final image displayed. Each window has its own blending attributes.

- CRKEY bit—Enables the chroma keying and match logic.
- INV bit—Performs bit inversion at pixel level.
- ITER2BL bit—When written to ‘1’, the iterated data path is selected.
- ITER bit—When written to ‘1’, the iterated value is used in the iterated data path, otherwise the iterated value is set to 0.
- REVALPHA bit—Uses the reverse alpha value.
- GAEN bit—Enables the global alpha value in the data path.
- LAEN bit—Enables the local alpha value from the pixel.
- OVR bit—When written to ‘1’, the overlay is selected as an input of the blender.
- DMA bit—The DMA data path is activated.
- REP bit—Enables the bit replication to fill the 24-bit internal data path.
- DSTKEY bit—When written to ‘1’, Destination keying is enabled.
- GA field—Defines the global alpha value.

#### 38.6.3.5 Overlay Attributes Software Operation

1. When required, write the overlay attributes configuration registers.
2. Set UPDATEEN field of the CHXCHER register.
3. Poll UPDATESR field in the CHXCHSR, the update applies when that field is reset.

### 38.6.6 Chrominance Upsampling Unit

Both the 4:2:2 and the 4:2:0 input formats are supported by the LCD module. In 4:2:2, the two chrominance components are sampled at half the luminance sample rate. The horizontal chrominance resolution is halved. When this input format is selected, the chrominance upsampling unit uses two chrominances to interpolate the missing component.

In 4:2:0, Cr and Cb components are subsampled at a factor of two vertically and horizontally. When this input mode is selected, the chrominance upsampling unit uses two and four chroma components to generate the missing horizontal and vertical components.

**Figure 38-2. 4:2:2 Upsampling Algorithm**

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 0 or 180 degrees

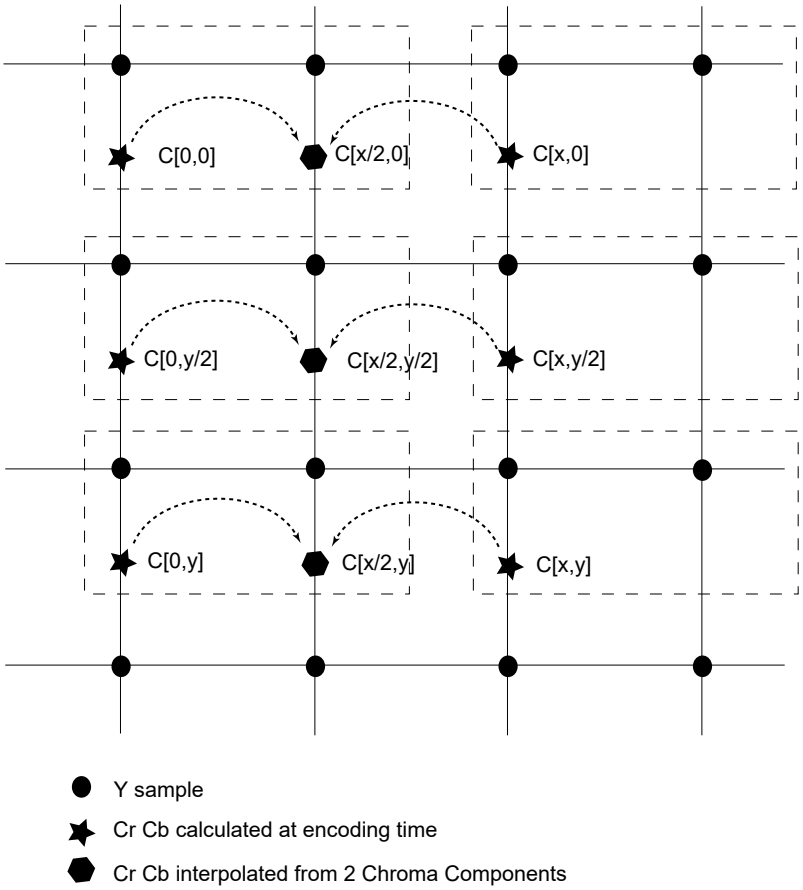

**Figure 38-3. 4:2:2 Packed Upsampling Algorithm**

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 90 or 270 degrees

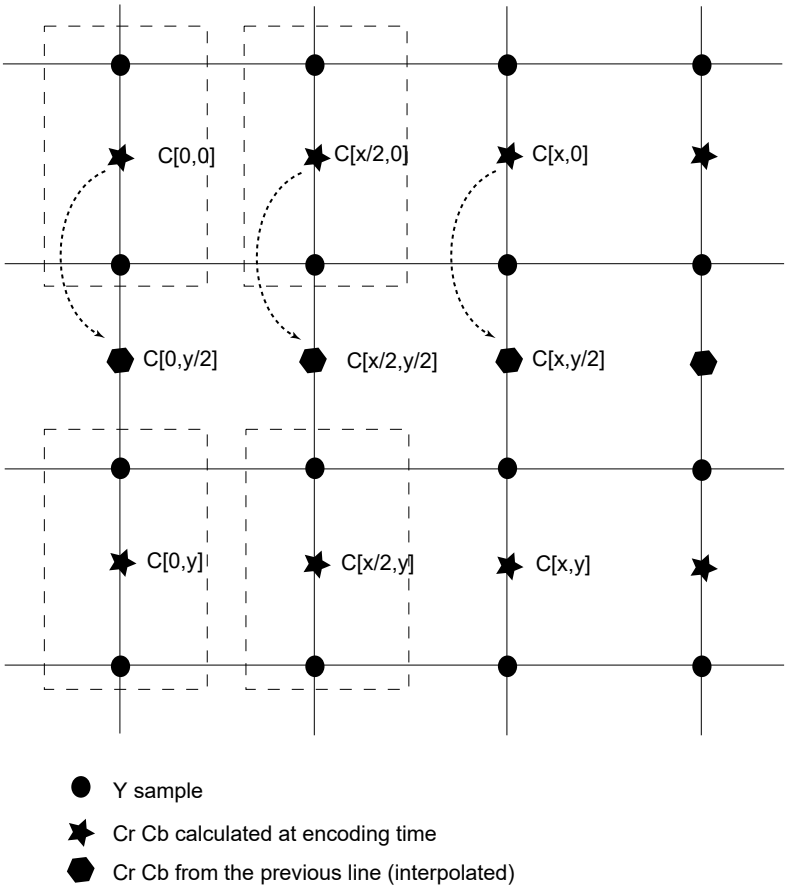

**Figure 38-4. 4:2:2 Semiplanar and Planar Upsampling Algorithm - 90 or 270 Degree R Rotation Activated**

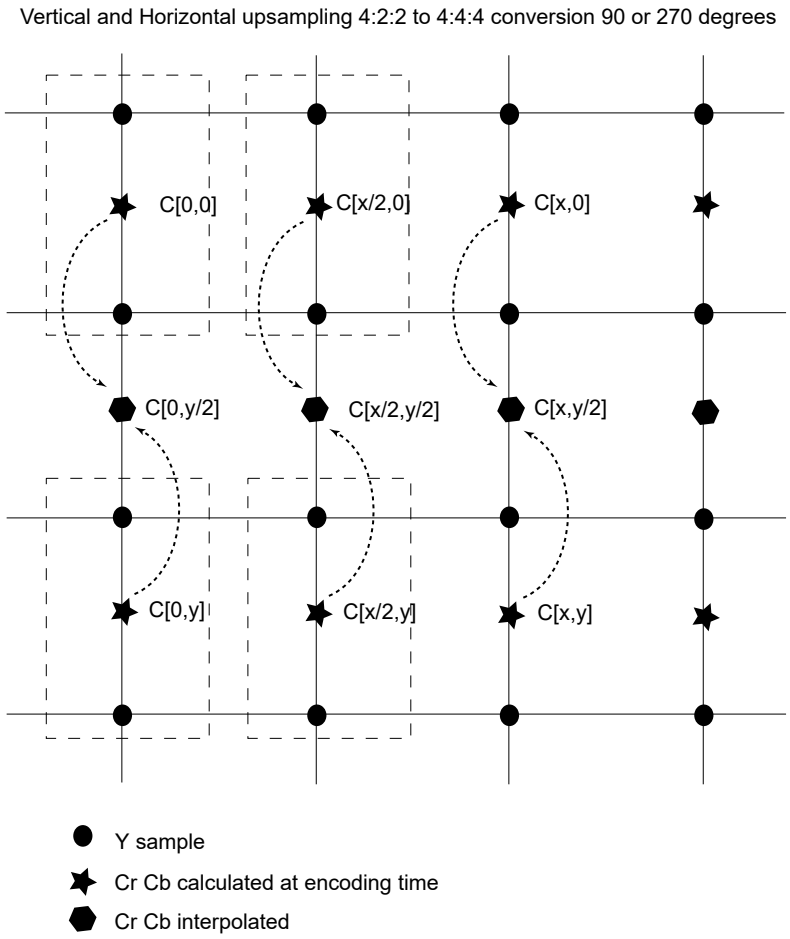

**Figure 38-5. 4:2:0 Upsampling Algorithm**

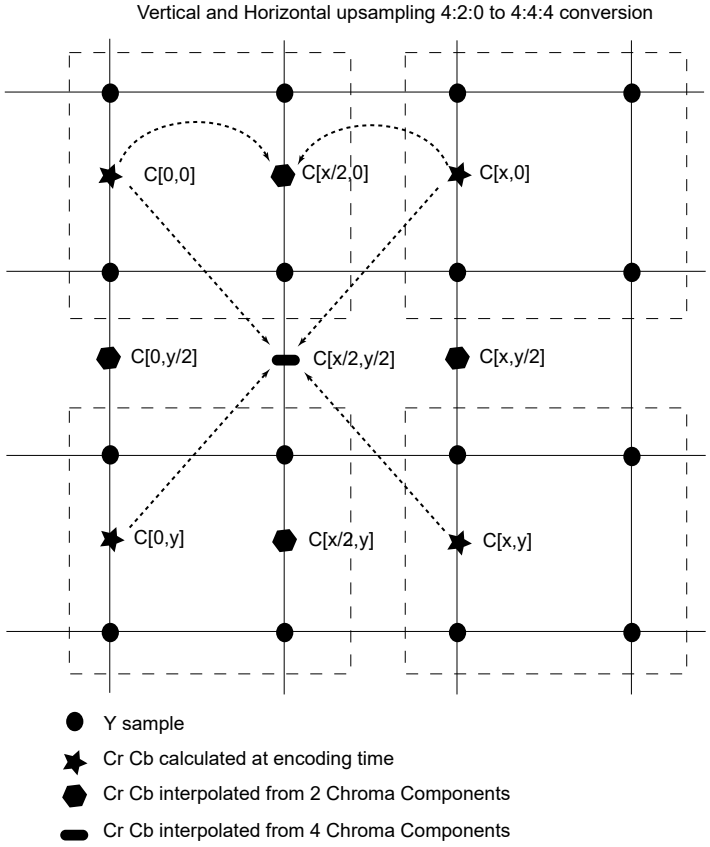


$$\text{Chroma}\left[\frac{x}{2}, 0\right] = \frac{\text{Cr}[0,0] + \text{Cr}[0,x]}{2}$$

$$\text{Chroma}\left[0, \frac{y}{2}\right] = \frac{\text{Cr}[0,0] + C[0,y]}{2}$$

$$\text{Chroma}\left[\frac{x}{2}, \frac{y}{2}\right] = \frac{\text{Cr}[0,0] + \text{Cr}[x,0] + \text{Cr}[y,0] + \text{Cr}[x,y]}{4}$$

$$\text{Chroma}\left[x, \frac{y}{2}\right] = \frac{\text{Cr}[x,0] + \text{Cr}[x,y]}{2}$$

$$\text{Chroma}\left[\frac{x}{2}, y\right] = \frac{\text{Cr}[0,y] + \text{Cr}[x,y]}{2}$$

#### 38.6.6.1 Chrominance Upsampling Algorithm

1. Read line n from chrominance cache and interpolate [x/2,0] chrominance component filling the 1 x 2 kernel with line n. If the chrominance cache is empty, then fetch the first line from external memory and interpolate from the external memory. Duplicate the last chrominance at the end of line.
2. Fetch line n+1 from external memory, write line n + 1 to chrominance cache, read line n from the chrominance cache. Interpolate [0,y/2], [x/2,y/2] and [x, y/2] filling the 2x2 kernel with lines n and n +1. Duplicate the last chrominance line to generate the last interpolated line.
3. Repeat step 1 and step 2.

### 38.6.7 Line and Pixel Striding

The LCD module includes a technique to increment the memory address by a programmable amount when the end of line has been reached. This offset is referred to as XSTRIDE and is defined on a per overlay basis. Additionally, the PSTRIDE field allows a programmable jump at the pixel level. Pixel stride is the value from one pixel to the next.

#### 38.6.7.1 Line Striding

When the end of line has been reached, the DMA address counter points to the next pixel address. The channel DMA address register is added to the XSTRIDE field, and then updated. If XSTRIDE is set to '0', the DMA address register remains unchanged. The XSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The XSTRIDE field is a two's complement number. The following formula applies at the line boundary and indicates how the DMA controller computes the next pixel address. The function Sizeof() returns the number of bytes required to store a pixel.

$$\text{NextPixelAddress} = \text{CurrentPixelAddress} + \text{Sizeof}(\text{pixel}) + \text{XSTRIDE}$$

#### 38.6.7.2 Pixel Striding

The DMA channel engine may optionally fetch non-contiguous pixels. The channel DMA address register is added to the PSTRIDE field and then updated. If PSTRIDE is set to zero, the DMA address register remains unchanged and pixels are contiguous. The PSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The PSTRIDE is a two's complement number. The following formula applies at the pixel boundary and indicates how the DMA controller computes the next pixel address. The function Sizeof() returns the number of bytes required to store a pixel.

$$\text{NextPixelAddress} = \text{CurrentPixelAddress} + \text{Sizeof}(\text{pixel}) + \text{PSTRIDE}$$

### 38.6.8 Color Space Conversion Unit

The color space conversion unit converts Luminance Chrominance color space into the Red Green Blue color space. The conversion matrix is defined below and is fully programmable through the LCD user interface.

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} \text{CSCRY} & \text{CSCRU} & \text{CSCRV} \\ \text{CSCGY} & \text{CSCGU} & \text{CSCGV} \\ \text{CSCBY} & \text{CSCBU} & \text{CSCBV} \end{bmatrix} \cdot \begin{bmatrix} Y - \text{Yoff} \\ \text{Cb} - \text{Cboff} \\ \text{Cr} - \text{Croff} \end{bmatrix}$$

Color space conversion coefficients are defined with the following equation:

$$\text{CSC}_{\text{ij}} = \frac{1}{2^7} \cdot \left[ -2^9 \cdot c_9 + \sum_{n=0}^{8} c_n \cdot 2^n \right]$$

Color space conversion coefficients are defined with one sign bit, 2 integer bits and 7 fractional bits. The range of the CSCij coefficients is defined below with a step of 1/128.

$$-4 \leq \text{CSC}_{\text{ij}} \leq 3.9921875$$

Additionally, a set scaling factor {Yoff, Cboff, Croff} can be applied.

### 38.6.9 Two-Dimension Scaler

The High-End Overlay (HEO) data path includes a hardware scaler that allows an image resize in both the horizontal and the vertical directions.

#### 38.6.9.1 Video Scaler Description

The scaling operation is based on a vertical and horizontal resampling algorithm. The sampling rate of the original image is increased when the video is upscaled, and decreased when the video is downscaled. A Vertical resampler is used to perform a vertical interpolation by a factor of vI, and a decimation by a factor

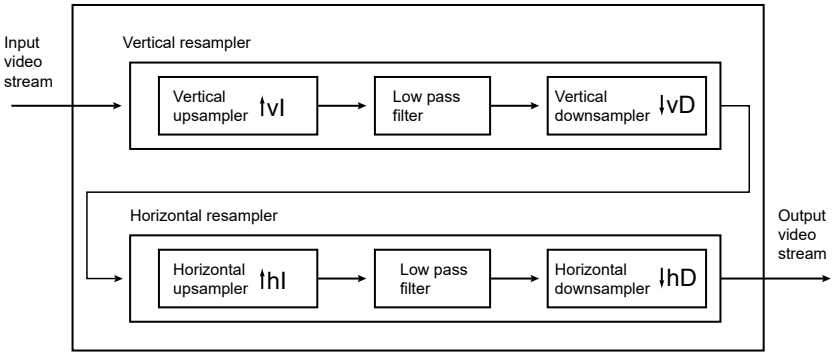
of vD. A Horizontal resampler is used to perform a vertical interpolation by a factor of hI, and a decimation by a factor of hD. The horizontal and vertical low pass filters are both designed to minimize the aliasing effect. The frequency response of the low pass filter has the following characteristics:

$$H(\omega) = \begin{cases} I & \text{when } 0 \le |\omega| \le \min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) \\ 0 & \text{otherwise} \end{cases}$$

Taking into account the linear phase condition and anticipating the filter length M, the desired frequency response is modified.

$$H(\omega) = \begin{cases} Ie^{-j\omega\frac{M}{2}} & \text{when } 0 \le |\omega| \le \min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) \\ 0 & \text{otherwise} \end{cases}$$

**Figure 38-6. Video Resampler Architecture**



The impulse response of the defined low pass filter is:

$$h(n) = \begin{cases} I \times \frac{\omega_c}{\pi} \text{ when } n = 0 \\ I \times \frac{\omega_c}{\pi} \times \frac{\sin\omega cn}{\omega_c n} \text{otherwise} \end{cases}$$

Or, for the filter of length M:

$$h(n) = \begin{cases} I \times \frac{\omega_c}{\pi} \text{ when } n = \frac{M}{2} \\ I \times \frac{\omega_c}{\pi} \times \frac{\sin\omega cn - M2}{\omega_c\left(n - \frac{M}{2}\right)} \text{otherwise} \end{cases}$$

This ideal filter is non-causal and cannot be realized. The unit sample response h(n) is infinite in duration and must be truncated depending on the expected length M of the filter. This truncation is equivalent to the multiplication of the impulse response by a window function w(n).

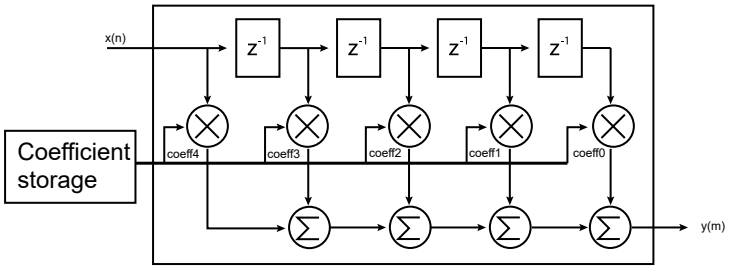
**Table 38-46. Window Function for a Filter Length M**

| Name of Window Function | Time Domain Sequence w(n) |
|---|---|
| Barlett | $1 - \frac{2 \times \left\lvert n - \frac{M-1}{2} \right\rvert}{M-1}$ |
| Blackman | $0.42 - 0.5 \times \cos\frac{2\pi n}{M-1} + 0.08 \times \cos\frac{4\pi n}{M-1}$ |

| .....continued | |
|---|---|
| **Name of Window Function** | **Time Domain Sequence w(n)** |
| Hamming | $0.54 - 0.46 \times \cos\frac{2\pi n}{M-1}$ |
| Hanning | $0.5 - 0.5 \times \cos\frac{2\pi n}{M-1}$ |

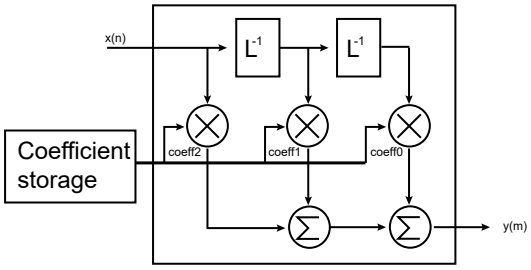
The horizontal resampler includes an 8-phase 5-tap filter equivalent to a 40-tap FIR described in the figure below.

**Figure 38-7. Horizontal Resampler Filter Architecture**



The vertical resampler includes an 8-phase 3-tap filter equivalent to a 24-tap FIR described in the figure below.

**Figure 38-8. Vertical Resampler Filter Architecture**



### 38.6.9.2 Horizontal Scaler

The XMEMSIZE field of the LCDC_HEOCFG4 register indicates the horizontal size minus one of the image in the system memory. The XSIZE field of the LCDC_HEOCFG3 register contains the horizontal size minus one of the window. The SCALEN bit of the LCDC_HEOCFG13 register is set to '1'. The scaling factor is programmed in the XFACTOR field of the LCDC_HEOCFG13 register. Use the following algorithm to find the XFACTOR value:

$$\mathrm{XFACTO}R_{1\mathrm{st}} = \mathrm{floor}\left(\frac{8 \times 256 \times \mathrm{XMEMSIZE} - 256 \times \mathrm{XPHIDEF}}{\mathrm{XSIZE}}\right)$$

$$\mathrm{XFACTO}R_{1\mathrm{st}} = \mathrm{XFACTO}R_{1\mathrm{st}} + 1$$

$$\mathrm{XMEMSIZE}_{\max} = \mathrm{floor}\left(\frac{\mathrm{XFACTO}R_{1\mathrm{st}} \times \mathrm{XSIZE} + 256 \times \mathrm{XPHIDEF}}{2048}\right)$$

$$\begin{cases} \mathrm{XFACTOR} = \mathrm{XFACTO}R_{1\mathrm{st}} - 1 \mathrm{when}(\mathrm{XMEMSIZE}_{\max} > \mathrm{XMEMSIZE}) \\ \mathrm{XFACTOR} = \mathrm{XFACTO}R_{1\mathrm{st}} \mathrm{otherwise} \end{cases}$$

#### 38.6.9.3 Vertical Scaler

The YMEMSIZE field of the LCDC_HEOCFG4 register indicates the vertical size minus one of the image in the system memory. The YSIZE field of the LCDC_HEOCFG3 register contains the vertical size minus one of the window. The SCALEN bit of the LCDC_HEOCFG13 register is set to one. The scaling factor is programmed in the YFACTOR field of the LCDC_HEOCFG13 register.

$$\mathrm{YFACTO}R_{1\mathrm{st}} = \mathrm{floor}\left(\frac{8 \times 256 \times \mathrm{YMEMSIZE} - 256 \times \mathrm{YPHIDEF}}{\mathrm{YSIZE}}\right)$$

$$\mathrm{YFACTO}R_{1\mathrm{st}} = \mathrm{YFACTO}R_{1\mathrm{st}} + 1$$

$$\mathrm{YMEMSIZE}_{\max} = \mathrm{floor}\left(\frac{\mathrm{YFACTO}R_{1\mathrm{st}} \times \mathrm{YSIZE} + 256 \times \mathrm{YPHIDEF}}{2048}\right)$$

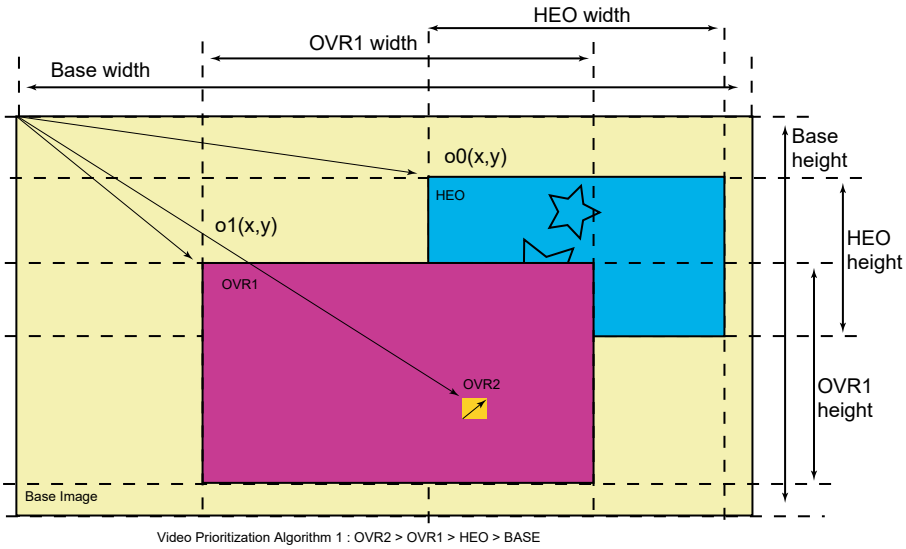
$$\begin{cases} \mathrm{YFACTOR} = \mathrm{YFACTO}R_{1\mathrm{st}} - 1 \mathrm{when}(\mathrm{YMEMSIZE}_{\max} > \mathrm{YMEMSIZE}) \\ \mathrm{YFACTOR} = \mathrm{YFACTO}R_{1\mathrm{st}} \mathrm{otherwise} \end{cases}$$

### 38.6.10 Color Combine Unit

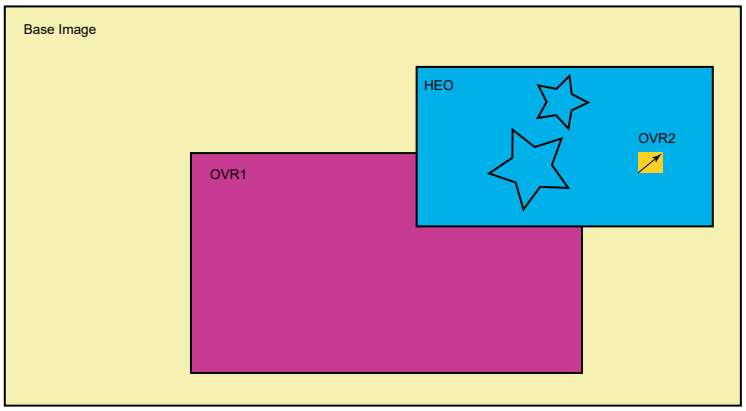
#### 38.6.10.1 Window Overlay

The LCD module provides hardware support for multiple “overlay plane” that can be used to display windows on top of the image without destroying the image located below. The overlay image can use any color depth. Using the overlay alleviates the need to re-render the occluded portion of the image. When pixels are combined together through the alpha blending unit, a new color is created. This new pixel is called an iterated pixel and is passed to the next blending stage. Then, this pixel may be combined again with another pixel. The VIDPRI bit located in the LCDC_HEOCFG12 register configures the video priority algorithm used to display the layers. When the VIDPRI bit is written to ‘0’, the OVR1 layer is located above the HEO layer. When the VIDPRI bit is written to ‘1’, OVR1 is located below the HEO layer.

**Figure 38-9. Overlay Example with Two Different Video Prioritization Algorithms**



Video Prioritization Algorithm 1 : OVR2 > OVR1 > HEO > BASE



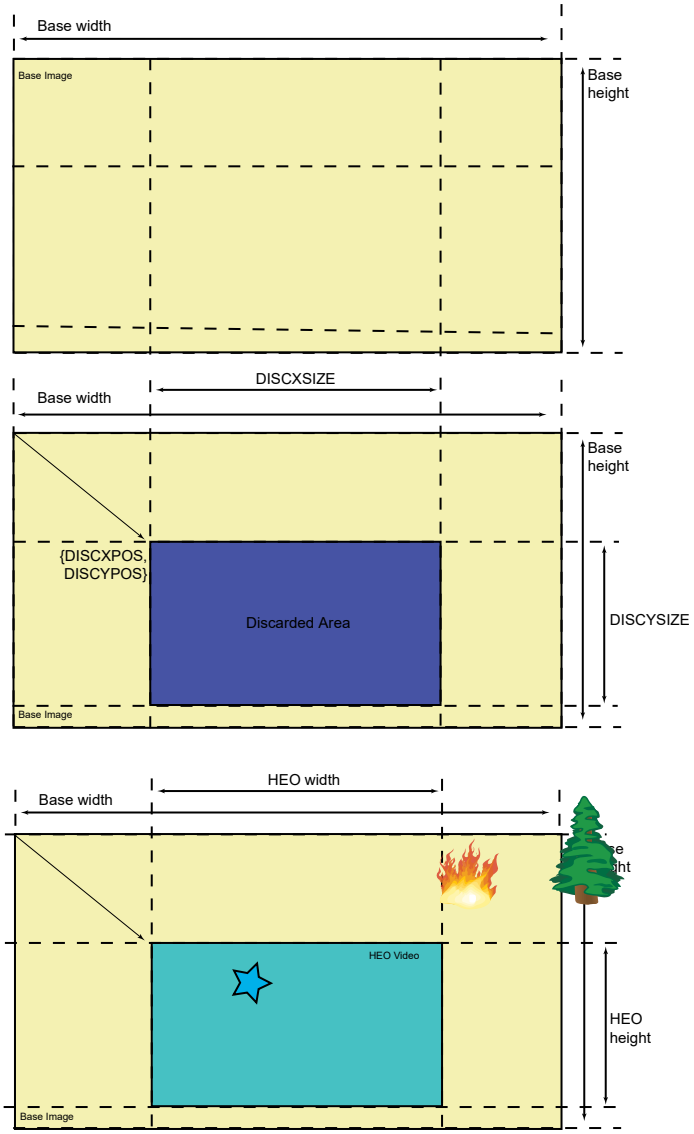
Video Prioritization Algorithm 2 : OVR2 > HEO > OVR1 > BASE

### 38.6.10.2 Base Layer with Window Overlay Optimization

When the base layer is combined with at least one active overlay, the whole base layer frame is retrieved from the memory though it is not visible. A set of registers is used to disable the Base DMA when this condition is met. These registers are the following:

- LCDC_BASECFG5:
  - field DISCXPOS (Discard Area Horizontal Position)
  - field DISCYPOS (Discard Area Vertical Position)
- LCDC_BASECFG6:
  - field DISCXSIZE (Discard Area Horizontal Size)
  - field DISCYSIZE (Discard Area Vertical Size)
- LCDC_BASECFG4: bit DISCEN (Discard Area Enable)

**Figure 38-10. Base Layer Discard Area**



### 38.6.10.3 Overlay Blending

The blending function requires two pixels (one iterated from the previous blending stage and one from the current overlay color) and a set of blending configuration parameters. These parameters define the color operation.

**Figure 38-11. Alpha Blender Function**

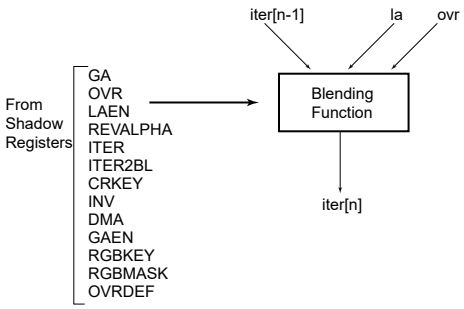


**Figure 38-12. Alpha Blender Database**

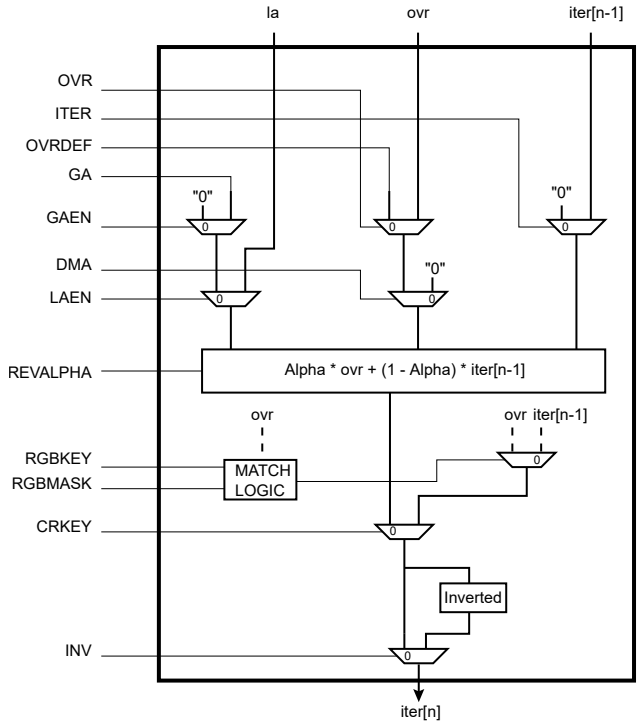
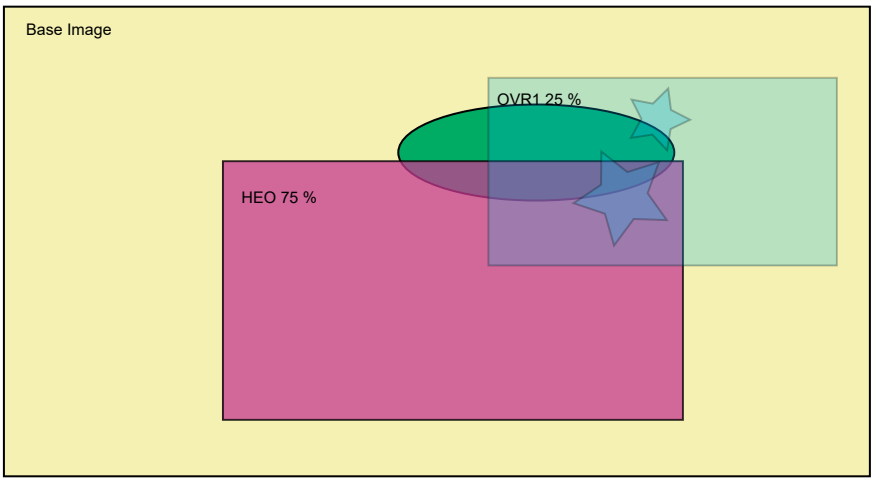


### 38.6.10.4 Window Blending

**Figure 38-13. 256-level Alpha Blending**



Video Prioritization Algorithm 1: OVR1 > HEO > BASE

### 38.6.10.5 Color Keying

Color keying involves a method of bit-block image transfer (Blit). This entails blitting one image onto another where not all the pixels are copied. Blitting usually involves two bitmaps: a source bitmap and a destination bitmap. A raster operation (ROP) is performed to define whether the iterated color or the overlay color is to be visible or not.

#### 38.6.10.5.1 Source Color Keying

If the masked overlay color matches the color key, the iterated color is selected and Source Color Keying is activated using the following configuration sequence:

1. Select the overlay to blit.
2. Write a ‘0’ to DSTKEY.
3. Activate Color Keying by writing a ‘1’ to CRKEY.
4. Configure the Color Key by writing RKEY, GKEY and BKEY fields.
5. Configure the Color Mask by writing RKEY, GKEY and BKEY fields.

When the field RMASK, GMASK, or BMASK is configured to ‘0’, the comparison is disabled and the raster operation is activated.

#### 38.6.10.5.2 Destination Color Keying

If the iterated masked color matches the color key then the overlay color is selected, Destination Color Keying is activated using the following configuration sequence:

1. Select the overlay to blit.
2. Write a ‘1’ to DSTKEY.
3. Activate Color Keying by writing a ‘1’ to CRKEY bit
4. Configure the Color Key by writing RKEY, GKEY and BKEY fields.
5. Configure the Color Mask by writing RKEY, GKEY and BKEY fields.

When the field RMASK, GMASK, or BMASK is configured to ‘0’, the comparison is disabled and the raster operation is activated.

### 38.6.11 LCDC PWM Controller

This block generates the LCD contrast control signal (LCDPWM) to make possible the control of the display's contrast by software. This is an 8-bit PWM (Pulse Width Modulation) signal that can be converted to an analog voltage with a simple passive filter.

The PWM module has a free-running counter whose value is compared against a compare register (PWMCVAL field of the LCDC_LCDCFG6 register). If the value in the counter is less than that in the register, the output brings the value of the signal polarity (PWMPOL) bit in the PWM control register: LCDC_LCDCFG6. Otherwise, the opposite value is output. Thus, a periodic waveform with a pulse width proportional to the value in the compare register is generated.

Due to the comparison mechanism, the output pulse has a width between zero and 255 PWM counter cycles. Thus by adding a simple passive filter outside the chip, an analog voltage between 0 and (255/256) × $V_{DD}$ can be obtained (for the positive polarity case, or between (1/256) × $V_{DD}$ and $V_{DD}$ for the negative polarity case). Other voltage values can be obtained by adding active external circuitry.

For PWM mode, the counter frequency can be adjusted to four different values using the PWMPS field of the LCDC_LCDCFG6 register.

The PWM module can be fed with the slow clock or the system clock, depending on the CLKPWMSEL bit of the LCDC_CFG0 register.

LCD display panels have different backlight specifications in terms of minimum/maximum values for PWM frequency. if the LCDC PWM frequency range does not match the LCD display panel, it is possible to use the product standalone PWM controller to drive the backlight.

### 38.6.12 Post Processing Controller

The output stream of pixels can be either displayed on the screen or written to the memory using the Post Processing Controller (PPC). When the PPC is used, the screen display is disabled, but synchronization signals remain active (if enabled). The stream of pixel can be written in RGB mode or encoded in YCbCr 422 mode. A programmable color space conversion stage is available.

$$\begin{bmatrix} Y \\ U \\ V \end{bmatrix} = \begin{bmatrix} \text{CSCYR} & \text{CSCYG} & \text{CSCYB} \\ \text{CSCUR} & \text{CSCUG} & \text{CSCUB} \\ \text{CSCVR} & \text{CSCVG} & \text{CSCUB} \end{bmatrix} \cdot \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} \text{Yoff} \\ \text{Uoff} \\ \text{Voff} \end{bmatrix}$$

### 38.6.13 LCD Overall Performance

#### 38.6.13.1 Color Lookup Table (CLUT)

**Table 38-47. CLUT Pixel Performance**

| CLUT Mode | Pixels/Cycle | Rotation | Scaling |
|---|---|---|---|
| 1 bpp | 64 | Not supported | Supported |
| 2 bpp | 32 | Not supported | Supported |
| 3 bpp | 16 | Not supported | Supported |
| 4 bpp | 8 | Not supported | Supported |

#### 38.6.13.2 RGB Mode Fetch Performance

**Table 38-48. RGB Mode Performance**

| RGB Mode | Pixels/Cycle Memory Burst Mode | Rotation Peak Random Memory Access (pixels/cycle) | | Scaling Burst Mode or Rotation Optimization Available |
|---|---|---|---|---|
| | | Rotation Optimization (see table footnote) | Normal Mode | |
| 12 bpp | 4 | 1 | 0.2 | Supported |
| 16 bpp | 4 | 1 | 0.2 | Supported |
| 18 bpp | 2 | 1 | 0.2 | Supported |
| 18 bpp RGB PACKED | 2.666 | Not supported | 0.2 | Supported |
| 19 bpp | 2 | 1 | 0.2 | Supported |
| 19 bpp PACKED | 2.666 | Not Supported | 0.2 | Supported |
| 24 bpp | 2 | 1 | 0.2 | Supported |
| 24 bpp PACKED | 2.666 | Not Supported | 0.2 | Supported |
| 25 bpp | 2 | 1 | 0.2 | Supported |
| 32 bpp | 2 | 1 | 0.2 | Supported |

**Note:** Rotation optimization = AHB lock asserted on consecutive single access.

#### 38.6.13.3 YUV Mode Fetch Performance

**Table 38-49. Single Stream for 0 Wait State Memory**

| YUV Mode | Pixels/Cycle Memory Burst Mode | Rotation Peak Random Memory Access (pixels/cycle) | | Scaling Burst Mode or Rotation Optimization Is Available |
|---|---|---|---|---|
| | | Rotation Optimization (see Note 1) | Normal Mode | |
| 32 bpp AYUV | 2 | 1 | 0.2 | Supported |
| 16 bpp 422 | 4 | Not Supported | Not Supported | Supported |

**Note:**

1. Rotation optimization = AHB lock asserted on consecutive single access.

**Table 38-50. Multiple Stream for 0 Wait State Memory**

| YUV Mode | Comp/Cycle Memory Burst Mode | Rotation Peak Random Memory Access (pixels/cycle) | | Scaling Burst Mode or Rotation Optimization Is Available |
|---|---|---|---|---|
| | | Rotation Optimization | Normal Mode | |
| 16 bpp 422 semiplanar | 8 Y, 4 UV | 1 Y, 1 UV (2 streams) | 0.2 Y 0.2 UV (2 streams) | Supported |
| 16 bpp 422 planar | 8 Y, 8 U, 8 V | 1 Y, 1 U, 1 V (3 streams) | 0.2 Y, 0.2 U, 0.2 V (3 streams) | Supported |
| 12 bpp 4:2:0 semiplanar | 8 Y, 4 UV | 1 Y, 1 UV (2 streams) | 0.2 Y 0.2 UV (2 streams) | Supported |
| 12 bpp 4:2:0 planar | 8 Y, 8 U, 8 V | 1 Y, 1 U, 1 V (3 streams) | 0.2 Y, 0.2 U, 0.2 V (3 streams) | Supported |

**Note:** In order to provide more bandwidth when multiple streams are used to transfer Y, UV, U or V components, two AHB interfaces are recommended or multiple AXI IDs are required.

**Table 38-51. YUV Planar Overall Performance 1 AHB Interface for 0 Wait State Memory**

| YUV Mode | Pix/Cycle Memory Burst Mode | Rotation Peak Random Memory Access (pixels/cycle) | | Scaling Burst Mode or Rotation Optimization Is Available |
|---|---|---|---|---|
| | | Rotation Optimization | Normal Mode | |
| 16 bpp 422 semiplanar | 4 | 0.66 | 0.132 | Supported |
| 16 bpp 422 planar | 4 | 0.5 | 0.1 | Supported |
| 12 bpp 4:2:0 semiplanar | 5.32 | 0.8 | 0.16 | Supported |
| 12 bpp 4:2:0 planar | 5.32 | 0.66 | 0.132 | Supported |

**Note:** To provide more bandwidth when multiple streams are used to transfer Y, UV, U or V components, two AHB interfaces are recommended or multiple AXI IDs are required.

### 38.6.14 Input FIFO

The LCD module includes one input FIFO per overlay. These input FIFOs are used to buffer the AHB burst and serialize the stream of pixels.

### 38.6.15 Output FIFO

The LCD module includes one output FIFO that stores the blended pixel.

### 38.6.16 Output Timing Generation

#### 38.6.16.1 Active Display Timing Mode

**Figure 38-14. Active Display Timing**

**Bits 23:16 – CLKDIV[7:0]** LCD Controller Clock Divider
8-bit width clock divider for pixel clock (LCDPCLK). The pixel clock period formula is:

LCDPCLK = source clock / (CLKDIV+2)

where source clock is the system clock when CLKSEL is written to ‘0’, and 2x system_clock when CLKSEL is written to ‘1’.

**Bit 13 – CGDISPP** Clock Gating Disable Control for the Post Processing Layer

| Value | Description |
|---|---|
| 0 | Automatic Clock Gating is enabled for the Post Processing Layer. |
| 1 | Clock is running continuously. |

**Bit 11 – CGDISHEO** Clock Gating Disable Control for the High-End Overlay

| Value | Description |
|---|---|
| 0 | Automatic Clock Gating is enabled for the High-End Overlay Layer. |
| 1 | Clock is running continuously. |

**Bit 10 – CGDISOVR2** Clock Gating Disable Control for the Overlay 2 Layer

| Value | Description |
|---|---|
| 0 | Automatic Clock Gating is enabled for the Overlay 2 Layer. |
| 1 | Clock is running continuously. |

**Bit 9 – CGDISOVR1** Clock Gating Disable Control for the Overlay 1 Layer

| Value | Description |
|---|---|
| 0 | Automatic Clock Gating is enabled for the Overlay 1 Layer. |
| 1 | Clock is running continuously. |

**Bit 8 – CGDISBASE** Clock Gating Disable Control for the Base Layer

| Value | Description |
|---|---|
| 0 | Automatic Clock Gating is enabled for the Base Layer. |
| 1 | Clock is running continuously. |

**Bit 3 – CLKPWMSEL** LCD Controller PWM Clock Source Selection

| Value | Description |
|---|---|
| 0 | The slow clock is selected and feeds the PWM module. |
| 1 | The system clock is selected and feeds the PWM module. |

**Bit 2 – CLKSEL** LCD Controller Clock Source Selection

| Value | Description |
|---|---|
| 0 | The asynchronous output stage of the LCD controller is fed by the System Clock. |
| 1 | The asynchronous output state of the LCD controller is fed by the 2x System Clock. |

**Bit 0 – CLKPOL** LCD Controller Clock Polarity

| Value | Description |
|---|---|
| 0 | Data/Control signals are launched on the rising edge of the pixel clock. |
| 1 | Data/Control signals are launched on the falling edge of the pixel clock. |

**Bits 23:16 – GUARDTIME[7:0]** LCD DISPLAY Guard Time
Number of frames inserted during startup before LCDDISP assertion.

Number of frames inserted after LCDDISP reset.

**Bit 13 – VSPHO** LCD Controller Vertical synchronization Pulse Hold Configuration

| Value | Description |
|---|---|
| 0 | The vertical synchronization pulse is asserted synchronously with horizontal pulse edge. |
| 1 | The vertical synchronization pulse is held active one pixel clock cycle after the horizontal pulse. |

**Bit 12 – VSPSU** LCD Controller Vertical synchronization Pulse Setup Configuration

| Value | Description |
|---|---|
| 0 | The vertical synchronization pulse is asserted synchronously with horizontal pulse edge. |
| 1 | The vertical synchronization pulse is asserted one pixel clock cycle before the horizontal pulse. |

**Bit 10 – PP** Post Processing Enable

| Value | Description |
|---|---|
| 0 | The blended pixel is pushed into the output FIFO. |

| Value | Description |
|---|---|
| 1 | The blended pixel is written back to memory, the post-processing stage is enabled. |

**Bits 9:8 – MODE[1:0]** LCD Controller Output Mode

| Value | Name | Description |
|---|---|---|
| 0 | OUTPUT_12BPP | LCD Output mode is set to 12 bits per pixel |
| 1 | OUTPUT_16BPP | LCD Output mode is set to 16 bits per pixel |
| 2 | OUTPUT_18BPP | LCD Output mode is set to 18 bits per pixel |
| 3 | OUTPUT_24BPP | LCD Output mode is set to 24 bits per pixel |

**Bit 7 – DISPDLY** LCD Controller Display Power Signal Synchronization

| Value | Description |
|---|---|
| 0 | The LCDDISP signal is asserted synchronously with the second active edge of the horizontal pulse. |
| 1 | The LCDDISP signal is asserted asynchronously with both edges of the horizontal pulse. |

**Bit 6 – DITHER** LCD Controller Dithering

| Value | Description |
|---|---|
| 0 | Dithering logical unit is disabled |
| 1 | Dithering logical unit is activated |

**Bit 4 – DISPPOL** Display Signal Polarity

| Value | Description |
|---|---|
| 0 | Active High |
| 1 | Active Low |

**Bit 3 – VSPDLYE** Vertical Synchronization Pulse End

| Value | Description |
|---|---|
| 0 | The second active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse. |
| 1 | The second active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse. |

**Bit 2 – VSPDLYS** Vertical Synchronization Pulse Start

| Value | Description |
|---|---|
| 0 | The first active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse. |
| 1 | The first active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse. |

**Bit 1 – VSPOL** Vertical Synchronization Pulse Polarity

| Value | Description |
|---|---|
| 0 | Active High |
| 1 | Active Low |

**Bit 0 – HSPOL** Horizontal Synchronization Pulse Polarity

| Value | Description |
|---|---|
| 0 | Active High |
| 1 | Active Low |

### 38.7.7 LCD Controller Configuration Register 6

**Name:** LCDC_LCDCFG6
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | PWMCVAL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | PWMPOL | | PWMPS[2:0] | | |
| Access | | | | R/W | | R/W | R/W | R/W |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bits 15:8 – PWMCVAL[7:0]** LCD Controller PWM Compare Value
PWM compare value. Used to adjust the analog value obtained after an external filter to control the contrast of the display.

**Bit 4 – PWMPOL** LCD Controller PWM Signal Polarity
This bit defines the polarity of the PWM output signal.

| Value | Description |
|---|---|
| 0 | The output pulses are low level. |
| 1 | The output pulses are high level (the output is high whenever the value in the counter is less than value CVAL). |

**Bits 2:0 – PWMPS[2:0]** PWM Clock Prescaler
Selects the configuration of the counter prescaler module.

| Value | Name | Description |
|---|---|---|
| 000 | DIV_1 | The counter advances at a rate of $f_{COUNTER} = f_{PWM_SELECTED_CLOCK}$ |
| 001 | DIV_2 | The counter advances at a rate of $f_{COUNTER} = f_{PWM_SELECTED_CLOCK/2}$ |
| 010 | DIV_4 | The counter advances at a rate of $f_{COUNTER} = f_{PWM_SELECTED_CLOCK/4}$ |
| 011 | DIV_8 | The counter advances at a rate of $f_{COUNTER} = f_{PWM_SELECTED_CLOCK/8}$ |
| 100 | DIV_16 | The counter advances at a rate of $f_{COUNTER} = f_{PWM_SELECTED_CLOCK/16}$ |
| 101 | DIV_32 | The counter advances at a of rate $f_{COUNTER} = f_{PWM_SELECTED_CLOCK/32}$ |

| Value | Name | Description |
|---|---|---|
| 110 | DIV_64 | The counter advances at a of rate $f_{COUNTER} = f_{PWM_SELECTED_CLOCK/64}$ |

### 38.7.8 LCD Controller Enable Register

**Name:** LCDC_LCDEN
**Offset:** 0x20
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| | | | | | PWMEN | DISPEN | SYNCEN | CLKEN |
| Access | | | | | W | W | | W |
| Reset | | | | | – | – | – | – |

**Bit 3 – PWMEN** LCD Controller Pulse Width Modulation Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | PWM is enabled. |

**Bit 2 – DISPEN** LCD Controller DISP Signal Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | LCDDISP signal is generated. |

**Bit 1 – SYNCEN** LCD Controller Horizontal and Vertical Synchronization Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Both horizontal and vertical synchronization (LCDVSYNC and LCDHSYNC) signals are generated. |

**Bit 0 – CLKEN** LCD Controller Pixel Clock Enable

| Value | Description |
|---|---|
| 0 | No effect |

| Value | Description |
|---|---|
| 1 | Pixel clock logical unit is activated. |

### 38.7.9 LCD Controller Disable Register

**Name:** LCDC_LCDDIS
**Offset:** 0x24
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PWMRST | DISPRST | SYNCRST | CLKRST |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PWMDIS | DISPDIS | SYNCDIS | CLKDIS |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | – | – | – | – |

**Bit 11 – PWMRST** LCD Controller PWM Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the PWM module. The duty cycle may be violated. |

**Bit 10 – DISPRST** LCD Controller DISP Signal Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the DISP signal. |

**Bit 9 – SYNCRST** LCD Controller Horizontal and Vertical Synchronization Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the timing engine. The horizontal and vertical pulse widths are both violated. |

**Bit 8 – CLKRST** LCD Controller Clock Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the pixel clock generator module. The pixel clock duty cycle may be violated. |

**Bit 3 – PWMDIS** LCD Controller Pulse Width Modulation Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the pulse width modulation signal. |

**Bit 2 – DISPDIS** LCD Controller DISP Signal Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the DISP signal. |

**Bit 1 – SYNCDIS** LCD Controller Horizontal and Vertical Synchronization Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the synchronization signals after the end of the frame. |

**Bit 0 – CLKDIS** LCD Controller Pixel Clock Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the pixel clock. |

### 38.7.10 LCD Controller Status Register

**Name:** LCDC_LCDSR
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| | | | | SIPSTS | PWMSTS | DISPSTS | LCDSTS | CLKSTS |
| Access | | | | R | R | R | R | R |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

**Bit 4 – SIPSTS** Synchronization In Progress

| Value | Description |
|---|---|
| 0 | Clock domain synchronization is terminated. |
| 1 | Synchronization is in progress. Access to the registers LCDC_LCDCCFG[0..6], LCDC_LCDEN and LCDC_LCDDIS has no effect. |

**Bit 3 – PWMSTS** LCD Controller PWM Signal Status

| Value | Description |
|---|---|
| 0 | PWM is disabled. |
| 1 | PWM signal is activated. |

**Bit 2 – DISPSTS** LCD Controller DISP Signal Status

| Value | Description |
|---|---|
| 0 | DISP is disabled. |
| 1 | DISP signal is activated. |

**Bit 1 – LCDSTS** LCD Controller Synchronization status

| Value | Description |
|---|---|
| 0 | Timing engine is disabled. |

| Value | Description |
|---|---|
| 1 | Timing engine is running. |

**Bit 0 – CLKSTS** Clock Status

| Value | Description |
|---|---|
| 0 | Pixel clock is disabled. |
| 1 | Pixel clock is running. |

### 38.7.11 LCD Controller Interrupt Enable Register

**Name:** LCDC_LCDIER
**Offset:** 0x2C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Enables the corresponding interrupt.

| | | | | FIFOERR | | DISP | DIS | SOF |
| Access | | | | R | | R | R | R |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bit 13 – PP** Post Processing Raw Interrupt Status

| Value | Description |
|---|---|
| 0 | No Post Processing interrupt detected since last read of LCDC_PPISR |
| 1 | Indicates that Post Processing interrupt is pending. This flag is reset as soon as the LCDC_PPISR is read. |

**Bit 11 – HEO** High-End Overlay Raw Interrupt Status

| Value | Description |
|---|---|
| 0 | No High-End layer interrupt detected since last read of LCDC_HEOISR. |
| 1 | Indicates that a High-End layer interrupt is pending. This flag is reset as soon as the LCDC_HEOISR is read. |

**Bit 10 – OVR2** Overlay 2 Raw Interrupt Status

| Value | Description |
|---|---|
| 0 | No Overlay 2 layer interrupt detected since last read of LCDC_OVR2ISR. |
| 1 | Indicates that an Overlay 2 layer interrupt is pending. This flag is reset as soon as the LCDC_OVR2ISR is read. |

**Bit 9 – OVR1** Overlay 1 Raw Interrupt Status

| Value | Description |
|---|---|
| 0 | No Overlay 1 layer interrupt detected since last read of LCDC_OVR1ISR. |
| 1 | Indicates that an Overlay 1 layer interrupt is pending. This flag is reset as soon as the LCDC_OVR1ISR is read. |

**Bit 8 – BASE** Base Layer Raw Interrupt Status

| Value | Description |
|---|---|
| 0 | No base layer interrupt detected since last read of LCDC_BASEISR. |
| 1 | Indicates that a base layer interrupt is pending. This flag is reset as soon as the LCDC_BASEISR is read. |

**Bit 4 – FIFOERR** Output FIFO Error

| Value | Description |
|---|---|
| 0 | No underflow has occurred in the output FIFO since last read of LCDC_LCDISR. |
| 1 | Indicates that an underflow has occurred in the output FIFO. This flag is reset after a read operation. |

**Bit 2 – DISP** Powerup/Powerdown Sequence Terminated Interrupt Status

| Value | Description |
|---|---|
| 0 | Powerup sequence or powerdown sequence has not yet terminated. |
| 1 | Indicates the powerup sequence or powerdown sequence has terminated. This flag is reset after a read operation. |

**Bit 1 – DIS** LCD Disable Interrupt Status

| Value | Description |
|---|---|
| 0 | Horizontal and vertical timing generator has not yet been disabled. |
| 1 | Indicates that the horizontal and vertical timing generator has been disabled. This flag is reset after a read operation. |

**Bit 0 – SOF** Start of Frame Interrupt Status

| Value | Description |
|---|---|
| 0 | No detection since last read of LCDC_LCDISR. |
| 1 | Indicates that a start of frame event has been detected. This flag is reset after a read operation. |

### 38.7.15 LCD Controller Attribute Register

**Name:** LCDC_ATTR
**Offset:** 0x3C
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | | | W | | W | W | W | W |
| Reset | | | – | | – | – | – | – |

**Bit 13 – PPA2Q** Post-Processing Update Add To Queue

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Add the descriptor pointed to by the LCDC_PPHEAD register to the descriptor list. |

**Bit 11 – HEOA2Q** High-End Overlay Update Add To Queue

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Add the descriptor pointed to by the LCDC_HEOHEAD register to the descriptor list. |

**Bit 10 – OVR2A2Q** Overlay 2 Update Add to Queue

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Add the descriptor pointed to by the LCDC_OVR2HEAD register to the descriptor list. |

**Bit 9 – OVR1A2Q** Overlay 1 Update Add To Queue

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Add the descriptor pointed to by the LCDC_OVR1HEAD register to the descriptor list. |

**Bit 8 – BASEA2Q** Base Layer Update Add To Queue

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Add the descriptor pointed to by the LCDC_BASEHEAD register to the descriptor list. |

**Bit 5 – PP** Post-Processing Update Attribute

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Update the PP window attribute. |

**Bit 3 – HEO** High-End Overlay Update Attribute

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Update the HEO window attribute. |

**Bit 2 – OVR2** Overlay 2 Update Attribute

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Update the OVR2 window attribute. |

**Bit 1 – OVR1** Overlay 1 Update Attribute

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Update the OVR1 window attribute. |

**Bit 0 – BASE** Base Layer Update Attribute

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Update the BASE window attributes. |

### 38.7.16 Base Layer Channel Enable Register

**Name:** LCDC_BASECHER
**Offset:** 0x00000040
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | A2QEN | UPDATEEN | CHEN |
| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

**Bit 2 – A2QEN** Add To Queue Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list. |

**Bit 1 – UPDATEEN** Update Overlay Attributes Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Updates windows attributes on the next start of frame. |

**Bit 0 – CHEN** Channel Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Enables the DMA channel |

### 38.7.17 Base Layer Channel Disable Register

**Name:** LCDC_BASECHDR
**Offset:** 0x00000040
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – CHRST** Channel Reset

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Resets the layer immediately. The frame is aborted. |

**Bit 0 – CHDIS** Channel Disable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Disables the layer at the end of the current frame. The frame is completed. |

### 38.7.18 Base Layer Channel Status Register

**Name:** LCDC_BASECHSR
**Offset:** 0x00000048
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| | | | | | | A2QSR | UPDATESR | CHSR |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – A2QSR** Add To Queue Status

| Value | Description |
|---|---|
| 0 | Add to queue not pending |
| 1 | Add to queue pending |

**Bit 1 – UPDATESR** Update Overlay Attributes In Progress Status

| Value | Description |
|---|---|
| 0 | No update pending |
| 1 | Overlay attributes will be updated on the next frame |

**Bit 0 – CHSR** Channel Status

| Value | Description |
|---|---|
| 0 | Layer disabled |
| 1 | Layer enabled |

### 38.7.19 Base Layer Interrupt Enable Register

**Name:** LCDC_BASEIER
**Offset:** 0x0000004C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

| | | OVR | DONE | ADD | DSCR | DMA | | |
| Access | | W | W | W | W | W | | |
| Reset | | – | – | – | – | – | | |

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

### 38.7.21 Base Layer Interrupt Mask Register

**Name:** LCDC_BASEIMR
**Offset:** 0x00000054
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:
0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | OVR | DONE | ADD | DSCR | DMA | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

### 38.7.22 Base Layer Interrupt Status Register

**Name:** LCDC_BASEISR
**Offset:** 0x00000058
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | OVR | DONE | ADD | DSCR | DMA | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

**Bit 6 – OVR** Overflow Detected

| Value | Description |
|---|---|
| 0 | No overflow occurred since last read of LCDC_BASEISR |
| 1 | An overflow occurred. This flag is reset after a read operation. |

**Bit 5 – DONE** End of List Detected

| Value | Description |
|---|---|
| 0 | No End of List condition occurred since last read of LCDC_BASEISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 4 – ADD** Head Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_BASEISR |
| 1 | The descriptor pointed to by the LCDC_BASEHEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 3 – DSCR** DMA Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_BASEISR |

| Value | Description |
|---|---|
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 2 – DMA** End of DMA Transfer

| Value | Description |
|---|---|
| 0 | No end of DMA transfer has been detected since last read of LCDC_BASEISR |
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

### 38.7.23 Base DMA Head Register

**Name:** LCDC_BASEHEAD
**Offset:** 0x0000005C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | HEAD[29:22] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | HEAD[21:14] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | HEAD[13:6] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | HEAD[5:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

**Bits 31:2 – HEAD[29:0]** DMA Head Pointer
The Head Pointer points to a new descriptor.

### 38.7.24 Base DMA Address Register

**Name:** LCDC_BASEADDR
**Offset:** 0x00000060
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ADDR[31:24] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | DONEIEN | ADDIEN | DSCRIEN | DMAIEN | LFETCH | DFETCH |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – DONEIEN** End of List Interrupt Enable

| Value | Description |
|---|---|
| 0 | End of list interrupt is disabled |
| 1 | End of list interrupt is enabled |

**Bit 4 – ADDIEN** Add Head Descriptor to Queue Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor added to queue interrupt is enabled |
| 1 | Transfer descriptor added to queue interrupt is enabled |

**Bit 3 – DSCRIEN** Descriptor Loaded Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor loaded interrupt is enabled |
| 1 | Transfer descriptor loaded interrupt is disabled |

**Bit 2 – DMAIEN** End of DMA Transfer Interrupt Enable

| Value | Description |
|---|---|
| 0 | DMA transfer completed interrupt is enabled |
| 1 | DMA transfer completed interrupt is disabled |

**Bit 1 – LFETCH** Lookup Table Fetch Enable

| Value | Description |
|---|---|
| 0 | Lookup Table DMA fetch is disabled |
| 1 | Lookup Table DMA fetch is enabled |

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

| Value | Description |
|---|---|
| 0 | Transfer Descriptor fetch is disabled |
| 1 | Transfer Descriptor fetch is enabled |

### 38.7.26 Base DMA Next Register

**Name:** LCDC_BASENEXT
**Offset:** 0x00000068
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[23:16] | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – NEXT[31:0]** DMA Descriptor Next Address
The transfer descriptor address must be aligned on a 64-bit boundary.

### 38.7.27 Base Layer Configuration Register 0

**Name:** LCDC_BASECFG0
**Offset:** 0x0000006C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DLBO |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | BLEN[1:0] | | | | | SIF |
| Access | | | R/W | R/W | | | | R/W |
| Reset | | | 0 | 0 | | | | 0 |

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

| Value | Description |
|---|---|
| 0 | Undefined length INCR burst is used for a burst of 2 and 3 beats. |
| 1 | Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16). |

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

| Value | Name | Description |
|---|---|---|
| 0 | AHB_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 1 | AHB_INCR4 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 2 | AHB_INCR8 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats. |

| Value | Name | Description |
|---|---|---|
| 3 | AHB_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |

**Bit 0 – SIF** Source Interface

| Value | Description |
|---|---|
| 0 | Base Layer data is retrieved through AHB interface 0. |
| 1 | Base Layer data is retrieved through AHB interface 1. |

### 38.7.28 Base Layer Configuration Register 1

**Name:** LCDC_BASECFG1
**Offset:** 0x00000070
**Reset:** 0x00000000
**Property:** Read/Write

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 11 – DISCEN** Discard Area Enable

| Value | Description |
|---|---|
| 0 | The whole frame is retrieved from memory. |
| 1 | The DMA channel discards the area located at screen coordinate {DISCXPOS, DISCYPOS}. |

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

| Value | Description |
|---|---|
| 0 | When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0. |
| 1 | When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb. |

**Bit 8 – DMA** Use DMA Data Path

| Value | Description |
|---|---|
| 0 | The default color is used on the Base Layer. |
| 1 | The DMA channel retrieves the pixels stream from the memory. |

### 38.7.32 Base Layer Configuration Register 5

**Name:** LCDC_BASECFG5

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 26:16 – DISCYSIZE[10:0]** Discard Area Vertical Size
Discard Vertical size in pixels. The Discard size is set to (DISCYSIZE + 1) pixels vertically.

**Bits 10:0 – DISCXSIZE[10:0]** Discard Area Horizontal Size
Discard Horizontal size in pixels. The Discard size is set to (DISCXSIZE + 1) pixels horizontally.

### 38.7.34 Overlay 1 Channel Enable Register

**Name:** LCDC_OVR1CHER
**Offset:** 0x00000140
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

**Bit 2 – A2QEN** Add To Queue Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list. |

**Bit 1 – UPDATEEN** Update Overlay Attributes Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Updates window attributes (size, alpha blending, etc.) on the next start of frame. |

**Bit 0 – CHEN** Channel Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Enables the DMA channel |

### 38.7.35 Overlay 1 Channel Disable Register

**Name:** LCDC_OVR1CHDR
**Offset:** 0x00000144
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – CHRST** Channel Reset

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Resets the layer immediately. The frame is aborted. |

**Bit 0 – CHDIS** Channel Disable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Disables the layer at the end of the current frame. The frame is completed. |

### 38.7.36 Overlay 1 Channel Status Register

**Name:** LCDC_OVR1CHSR
**Offset:** 0x00000148
**Reset:** 0x00000000
**Property:** Read-only

| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – A2QSR** Add To Queue Status

| Value | Description |
|---|---|
| 0 | Add to queue not pending |
| 1 | Add to queue pending |

**Bit 1 – UPDATESR** Update Overlay Attributes In Progress Status

| Value | Description |
|---|---|
| 0 | No update pending |
| 1 | Overlay attributes will be updated on the next frame |

**Bit 0 – CHSR** Channel Status

| Value | Description |
|---|---|
| 0 | Layer disabled |
| 1 | Layer enabled |

### 38.7.37 Overlay 1 Interrupt Enable Register

**Name:** LCDC_OVR1IER
**Offset:** 0x0000014C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

**Bit 6 – OVR** Overflow Detected

| Value | Description |
|---|---|
| 0 | No overflow occurred since last read of LCDC_OVR1ISR |
| 1 | An overflow occurred. This flag is reset after a read operation. |

**Bit 5 – DONE** End of List Detected

| Value | Description |
|---|---|
| 0 | No End of List condition has occurred since last read of LCDC_OVR1ISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 4 – ADD** Head Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_OVR1ISR |
| 1 | The descriptor pointed to by the LCDC_OVR1HEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 3 – DSCR** DMA Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_OVR1ISR |

| Value | Description |
|---|---|
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 2 – DMA** End of DMA Transfer

| Value | Description |
|---|---|
| 0 | No End of Transfer has been detected since last read of LCDC_OVR1ISR |
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

### 38.7.41 Overlay 1 Head Register

**Name:** LCDC_OVR1HEAD
**Offset:** 0x0000015C
**Reset:** 0x00000000

**Bit 5 – DONEIEN** End of List Interrupt Enable

| Value | Description |
|---|---|
| 0 | End of list interrupt is disabled |
| 1 | End of list interrupt is enabled |

**Bit 4 – ADDIEN** Add Head Descriptor to Queue Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor added to queue interrupt is enabled |
| 1 | Transfer descriptor added to queue interrupt is enabled |

**Bit 3 – DSCRIEN** Descriptor Loaded Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor loaded interrupt is enabled |
| 1 | Transfer descriptor loaded interrupt is disabled |

**Bit 2 – DMAIEN** End of DMA Transfer Interrupt Enable

| Value | Description |
|---|---|
| 0 | DMA transfer completed interrupt is enabled |
| 1 | DMA transfer completed interrupt is disabled |

**Bit 1 – LFETCH** Lookup Table Fetch Enable

| Value | Description |
|---|---|
| 0 | Lookup Table DMA fetch is disabled |
| 1 | Lookup Table DMA fetch is enabled |

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

| Value | Description |
|---|---|
| 0 | Transfer Descriptor fetch is disabled |
| 1 | Transfer Descriptor fetch is enabled |

**Bit 13 – LOCKDIS** Hardware Rotation Lock Disable

| Value | Description |
|---|---|
| 0 | AHB lock signal is asserted when a rotation is performed. |
| 1 | AHB lock signal is cleared when a rotation is performed. |

**Bit 12 – ROTDIS** Hardware Rotation Optimization Disable

| Value | Description |
|---|---|
| 0 | Rotation optimization is enabled. |
| 1 | Rotation optimization is disabled. |

**Bit 8 – DLBO** Defined Length Burst Only for Channel Bus Transaction

| Value | Description |
|---|---|
| 0 | Undefined length INCR burst is used for a burst of 2 and 3 beats. |
| 1 | Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16). |

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

| Value | Name | Description |
|---|---|---|
| 0 | AHB_BLEN_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 1 | AHB_BLEN_INCR4 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 2 | AHB_BLEN_INCR8 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 3 | AHB_BLEN_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |

**Bit 0 – SIF** Source Interface

| Value | Description |
|---|---|
| 0 | Base Layer data is retrieved through AHB interface 0. |
| 1 | Base Layer data is retrieved through AHB interface 1. |

**Bits 23:16 – GA[7:0]** Blender Global Alpha
Global alpha blender for the current layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

| Value | Description |
|---|---|
| 0 | Source Chroma keying is enabled. |
| 1 | Destination Chroma keying is used. |

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

| Value | Description |
|---|---|
| 0 | When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0. |
| 1 | When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb. |

**Bit 8 – DMA** Blender DMA Layer Enable

| Value | Description |
|---|---|
| 0 | The default color is used on the Overlay 1 Layer. |
| 1 | The DMA channel retrieves the pixels stream from the memory. |

**Bit 7 – OVR** Blender Overlay Layer Enable

| Value | Description |
|---|---|
| 0 | Overlay pixel color is set to the default overlay pixel color. |
| 1 | Overlay pixel color is set to the DMA channel pixel color. |

**Bit 6 – LAEN** Blender Local Alpha Enable

| Value | Description |
|---|---|
| 0 | Local alpha blending coefficient is disabled. |
| 1 | Local alpha blending coefficient is enabled. |

**Bit 5 – GAEN** Blender Global Alpha Enable

| Value | Description |
|---|---|
| 0 | Global alpha blending coefficient is disabled. |
| 1 | Global alpha blending coefficient is enabled. |

**Bit 4 – REVALPHA** Blender Reverse Alpha

| Value | Description |
|---|---|
| 0 | Pixel difference is multiplied by alpha. |
| 1 | Pixel difference is multiplied by 1 - alpha. |

**Bit 3 – ITER** Blender Use Iterated Color

| Value | Description |
|---|---|
| 0 | Pixel difference is set to 0. |
| 1 | Pixel difference is set to the iterated pixel value. |

**Bit 2 – ITER2BL** Blender Iterated Color Enable

| Value | Description |
|---|---|
| 0 | Final adder stage operand is set to 0. |
| 1 | Final adder stage operand is set to the iterated pixel value. |

**Bit 1 – INV** Blender Inverted Blender Output Enable

| Value | Description |
|---|---|
| 0 | Iterated pixel is the blended pixel. |
| 1 | Iterated pixel is the inverted pixel. |

**Bit 0 – CRKEY** Blender Chroma Key Enable

| Value | Description |
|---|---|
| 0 | Chroma key matching is disabled. |
| 1 | Chroma key matching is enabled. |

### 38.7.55 Overlay 2 Channel Enable Register

**Name:** LCDC_OVR2CHER
**Offset:** 0x00000240
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

**Bit 2 – A2QEN** Add To Queue Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list. |

**Bit 1 – UPDATEEN** Update Overlay Attributes Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Updates windows attributes on the next start of frame. |

**Bit 0 – CHEN** Channel Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Enables the DMA channel |

### 38.7.56 Overlay 2 Channel Disable Register

**Name:** LCDC_OVR2CHDR
**Offset:** 0x00000244
**Reset:** –
**Property:** Write-only

| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

**Bit 6 – OVR** Overflow Detected

| Value | Description |
|---|---|
| 0 | No overflow occurred since last read of LCDC_OVR2ISR |
| 1 | An overflow occurred. This flag is reset after a read operation. |

**Bit 5 – DONE** End of List Detected

| Value | Description |
|---|---|
| 0 | No End of List condition occurred since last read of LCDC_OVR2ISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 4 – ADD** Head Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_OVR2ISR |
| 1 | The descriptor pointed to by the LCDC_OVR2HEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 3 – DSCR** DMA Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_OVR2ISR |

| Value | Description |
|---|---|
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 2 – DMA** End of DMA Transfer

| Value | Description |
|---|---|
| 0 | No End of Transfer has been detected since last read of LCDC_OVR2ISR |
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

### 38.7.62 Overlay 2 Head Register

**Bit 5 – DONEIEN** End of List Interrupt Enable

| Value | Description |
|---|---|
| 0 | End of list interrupt is disabled. |
| 1 | End of list interrupt is enabled. |

**Bit 4 – ADDIEN** Add Head Descriptor to Queue Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor added to queue interrupt is enabled. |
| 1 | Transfer descriptor added to queue interrupt is enabled. |

**Bit 3 – DSCRIEN** Descriptor Loaded Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor loaded interrupt is enabled. |
| 1 | Transfer descriptor loaded interrupt is disabled. |

**Bit 2 – DMAIEN** End of DMA Transfer Interrupt Enable

| Value | Description |
|---|---|
| 0 | DMA transfer completed interrupt is enabled. |
| 1 | DMA transfer completed interrupt is disabled. |

**Bit 1 – LFETCH** Lookup Table Fetch Enable

| Value | Description |
|---|---|
| 0 | Lookup Table DMA fetch is disabled. |
| 1 | Lookup Table DMA fetch is enabled. |

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

| Value | Description |
|---|---|
| 0 | Transfer Descriptor fetch is disabled. |
| 1 | Transfer Descriptor fetch is enabled. |

### 38.7.65 Overlay 2 Next Register

**Name:** LCDC_OVR2NEXT

| Reset | | | 0 | 0 | | | | |

**Bit 13 – LOCKDIS** Hardware Rotation Lock Disable

| Value | Description |
|---|---|
| 0 | AHB lock signal is asserted when a rotation is performed. |
| 1 | AHB lock signal is cleared when a rotation is performed. |

**Bit 12 – ROTDIS** Hardware Rotation Optimization Disable

| Value | Description |
|---|---|
| 0 | Rotation optimization is enabled. |
| 1 | Rotation optimization is disabled. |

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

| Value | Description |
|---|---|
| 0 | Undefined length INCR burst is used for 2 and 3 beats burst. |
| 1 | Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16). |

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

| Value | Name | Description |
|---|---|---|
| 0 | AHB_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 1 | AHB_INCR4 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 2 | AHB_INCR8 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 3 | AHB_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |

**Bits 23:16 – GA[7:0]** Blender Global Alpha
Global alpha blender for the current layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

| Value | Description |
|---|---|
| 0 | Source Chroma keying is enabled. |
| 1 | Destination Chroma keying is used. |

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

| Value | Description |
|---|---|
| 0 | When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0. |
| 1 | When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb. |

**Bit 8 – DMA** Blender DMA Layer Enable

| Value | Description |
|---|---|
| 0 | The default color is used on the Overlay 1 Layer. |
| 1 | The DMA channel retrieves the pixels stream from the memory. |

**Bit 7 – OVR** Blender Overlay Layer Enable

| Value | Description |
|---|---|
| 0 | Overlay pixel color is set to the default overlay pixel color. |
| 1 | Overlay pixel color is set to the DMA channel pixel color. |

**Bit 6 – LAEN** Blender Local Alpha Enable

| Value | Description |
|---|---|
| 0 | Local alpha blending coefficient is disabled. |
| 1 | Local alpha blending coefficient is enabled. |

**Bit 5 – GAEN** Blender Global Alpha Enable

| Value | Description |
|---|---|
| 0 | Global alpha blending coefficient is disabled. |
| 1 | Global alpha blending coefficient is enabled. |

**Bit 4 – REVALPHA** Blender Reverse Alpha

| Value | Description |
|---|---|
| 0 | Pixel difference is multiplied by alpha. |
| 1 | Pixel difference is multiplied by 1 - alpha. |

**Bit 3 – ITER** Blender Use Iterated Color

| Value | Description |
|---|---|
| 0 | Pixel difference is set to 0. |
| 1 | Pixel difference is set to the iterated pixel value. |

**Bit 2 – ITER2BL** Blender Iterated Color Enable

| Value | Description |
|---|---|
| 0 | Final adder stage operand is set to 0. |
| 1 | Final adder stage operand is set to the iterated pixel value. |

**Bit 1 – INV** Blender Inverted Blender Output Enable

| Value | Description |
|---|---|
| 0 | Iterated pixel is the blended pixel. |
| 1 | Iterated pixel is the inverted pixel. |

**Bit 0 – CRKEY** Blender Chroma Key Enable

| Value | Description |
|---|---|
| 0 | Chroma key matching is disabled. |
| 1 | Chroma key matching is enabled. |

### 38.7.76 High-End Overlay Channel Enable Register

**Name:** LCDC_HEOCHER

**Bit 2 – A2QEN** Add To Queue Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list. |

**Bit 1 – UPDATEEN** Update Overlay Attributes Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Updates windows attributes on the next start of frame. |

**Bit 0 – CHEN** Channel Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Enables the DMA channel |

### 38.7.77 High-End Overlay Channel Disable Register

**Name:** LCDC_HEOCHDR
**Offset:** 0x00000344

### 38.7.79 High-End Overlay Interrupt Enable Register

**Name:** LCDC_HEOIER
**Offset:** 0x0000034C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | VOVR | VDONE | VADD | VDSCR | VDMA | | |
| Access | | W | W | W | W | W | | |
| Reset | | – | – | – | – | – | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | UOVR | UDONE | UADD | UDSCR | UDMA | | |
| Access | | W | W | W | W | W | | |
| Reset | | – | – | – | – | – | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | OVR | DONE | ADD | DSCR | DMA | | |
| Access | | W | W | W | W | W | | |
| Reset | | – | – | – | – | – | | |

**Bit 22 – VOVR** Overflow for V Chrominance Interrupt Enable

**Bit 21 – VDONE** End of List for V Chrominance Interrupt Enable

**Bit 20 – VADD** Head Descriptor Loaded for V Chrominance Interrupt Enable

**Bit 19 – VDSCR** Descriptor Loaded for V Chrominance Interrupt Enable

**Bit 18 – VDMA** End of DMA for V Chrominance Transfer Interrupt Enable

**Bit 14 – UOVR** Overflow for U or UV Chrominance Interrupt Enable

**Bit 13 – UDONE** End of List for U or UV Chrominance Interrupt Enable

**Bit 12 – UADD** Head Descriptor Loaded for U or UV Chrominance Interrupt Enable

**Bit 11 – UDSCR** Descriptor Loaded for U or UV Chrominance Interrupt Enable

**Bit 10 – UDMA** End of DMA Transfer for U or UV Chrominance Interrupt Enable

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

### 38.7.80 High-End Overlay Interrupt Disable Register

**Name:** LCDC_HEOIDR
**Offset:** 0x00000350
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 22 – VOVR** Overflow for V Chrominance Component Interrupt Disable

**Bit 21 – VDONE** End of List for V Chrominance Component Interrupt Disable

**Bit 20 – VADD** Head Descriptor Loaded for V Chrominance Component Interrupt Disable

**Bit 19 – VDSCR** Descriptor Loaded for V Chrominance Component Interrupt Disable

**Bit 18 – VDMA** End of DMA Transfer for V Chrominance Component Interrupt Disable

**Bit 14 – UOVR** Overflow Interrupt for U or UV Chrominance Component Disable

**Bit 13 – UDONE** End of List Interrupt for U or UV Chrominance Component Disable

**Bit 12 – UADD** Head Descriptor Loaded for U or UV Chrominance Component Interrupt Disable

**Bit 11 – UDSCR** Descriptor Loaded for U or UV Chrominance Component Interrupt Disable

© 2018 Microchip Technology Inc.

**Bit 10 – UDMA** End of DMA Transfer for U or UV Chrominance Component Interrupt Disable

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

### 38.7.81 High-End Overlay Interrupt Mask Register

**Name:** LCDC_HEOIMR
**Offset:** 0x00000354
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:
0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | VOVR | VDONE | VADD | VDSCR | VDMA | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | UOVR | UDONE | UADD | UDSCR | UDMA | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | OVR | DONE | ADD | DSCR | DMA | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

**Bit 22 – VOVR** Overflow for V Chrominance Interrupt Mask

**Bit 21 – VDONE** End of List for V Chrominance Component Mask

**Bit 20 – VADD** Head Descriptor Loaded for V Chrominance Component Mask

**Bit 19 – VDSCR** Descriptor Loaded for V Chrominance Component Interrupt Mask

**Bit 18 – VDMA** End of DMA Transfer for V Chrominance Component Interrupt Mask

**Bit 14 – UOVR** Overflow for U Chrominance Interrupt Mask

**Bit 13 – UDONE** End of List for U or UV Chrominance Component Mask

**Bit 12 – UADD** Head Descriptor Loaded for U or UV Chrominance Component Mask

**Bit 11 – UDSCR** Descriptor Loaded for U or UV Chrominance Component Interrupt Mask

**Bit 10 – UDMA** End of DMA Transfer for U or UV Chrominance Component Interrupt Mask

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

### 38.7.82 High-End Overlay Interrupt Status Register

**Name:** LCDC_HEOISR
**Offset:** 0x00000358
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | OVR | DONE | ADD | DSCR | DMA | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

**Bit 22 – VOVR** Overflow Detected for V Component

| Value | Description |
|---|---|
| 0 | No overflow occurred since last read of LCDC_HEOISR |
| 1 | An overflow occurred. This flag is reset after a read operation. |

**Bit 21 – VDONE** End of List Detected for V Component

| Value | Description |
|---|---|
| 0 | No End of List condition occurred since last read of LCDC_HEOISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 20 – VADD** Head Descriptor Loaded for V Component

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_HEOISR |
| 1 | The descriptor pointed to by the LCDC_HEOVHEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 19 – VDSCR** DMA Descriptor Loaded for V Component

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_HEOISR |

| Value | Description |
|---|---|
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 18 – VDMA** End of DMA Transfer for V Component

| Value | Description |
|---|---|
| 0 | No End of Transfer has been detected since last read of LCDC_HEOISR |
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

**Bit 14 – UOVR** Overflow Detected for U Component

| Value | Description |
|---|---|
| 0 | No overflow occurred since last read of LCDC_HEOISR |
| 1 | An overflow occurred. This flag is reset after a read operation. |

**Bit 13 – UDONE** End of List Detected for U Component

| Value | Description |
|---|---|
| 0 | No End of List condition occurred since last read of LCDC_HEOISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 12 – UADD** Head Descriptor Loaded for U Component

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_HEOISR |
| 1 | The descriptor pointed to by the LCDC_HEOUHEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 11 – UDSCR** DMA Descriptor Loaded for U Component

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_HEOISR |
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 10 – UDMA** End of DMA Transfer for U Component

| Value | Description |
|---|---|
| 0 | No End of Transfer has been detected since last read of LCDC_HEOISR |
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

**Bit 6 – OVR** Overflow Detected

| Value | Description |
|---|---|
| 0 | No overflow occurred since last read of LCDC_HEOISR |
| 1 | An overflow occurred. This flag is reset after a read operation. |

**Bit 5 – DONE** End of List Detected

| Value | Description |
|---|---|
| 0 | No End of List condition occurred since last read of LCDC_HEOISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 4 – ADD** Head Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_HEOISR |
| 1 | The descriptor pointed to by the LCDC_HEOHEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 3 – DSCR** DMA Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_HEOISR |
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 2 – DMA** End of DMA Transfer

| Value | Description |
|---|---|
| 0 | No end of transfer has been detected since last read of LCDC_HEOISR |
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

### 38.7.83 High-End Overlay DMA Head Register

**Name:** LCDC_HEOHEAD
**Offset:** 0x0000035C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | HEAD[29:22] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – DONEIEN** End of List Interrupt Enable

| Value | Description |
|---|---|
| 0 | End of list interrupt is disabled. |
| 1 | End of list interrupt is enabled. |

**Bit 4 – ADDIEN** Add Head Descriptor to Queue Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor added to queue interrupt is enabled. |
| 1 | Transfer descriptor added to queue interrupt is enabled. |

**Bit 3 – DSCRIEN** Descriptor Loaded Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor loaded interrupt is enabled. |
| 1 | Transfer descriptor loaded interrupt is disabled. |

**Bit 2 – DMAIEN** End of DMA Transfer Interrupt Enable

| Value | Description |
|---|---|
| 0 | DMA transfer completed interrupt is enabled. |
| 1 | DMA transfer completed interrupt is disabled. |

**Bit 1 – LFETCH** Lookup Table Fetch Enable

| Value | Description |
|---|---|
| 0 | Lookup Table DMA fetch is disabled. |
| 1 | Lookup Table DMA fetch is enabled. |

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

| Value | Description |
|---|---|
| 0 | Transfer Descriptor fetch is disabled. |
| 1 | Transfer Descriptor fetch is enabled. |

### 38.7.86 High-End Overlay DMA Next Register

**Name:** LCDC_HEONEXT
**Offset:** 0x00000368
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 5 – UDONEIEN** End of List Interrupt Enable

| Value | Description |
|---|---|
| 0 | End of list interrupt is disabled. |
| 1 | End of list interrupt is enabled. |

**Bit 4 – UADDIEN** Add Head Descriptor to Queue Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor added to queue interrupt is enabled. |
| 1 | Transfer descriptor added to queue interrupt is enabled. |

**Bit 3 – UDSCRIEN** Descriptor Loaded Interrupt Enable

| Value | Description |
|---|---|
| 0 | Transfer descriptor loaded interrupt is enabled. |
| 1 | Transfer descriptor loaded interrupt is disabled. |

**Bit 2 – UDMAIEN** End of DMA Transfer Interrupt Enable

| Value | Description |
|---|---|
| 0 | DMA transfer completed interrupt is enabled. |
| 1 | DMA transfer completed interrupt is disabled. |

**Bit 0 – UDFETCH** Transfer Descriptor Fetch Enable

| Value | Description |
|---|---|
| 0 | Transfer Descriptor fetch is disabled. |
| 1 | Transfer Descriptor fetch is enabled. |

### 38.7.90 High-End Overlay U-UV DMA Next Register

**Name:** LCDC_HEOUNEXT
**Offset:** 0x00000378
**Reset:** 0x00000000
**Property:** Read/Write

| Reset | 0 | 0 | 0 | 0 | | | | 0 |

**Bit 13 – LOCKDIS** Hardware Rotation Lock Disable

| Value | Description |
|---|---|
| 0 | AHB lock signal is asserted when a rotation is performed. |
| 1 | AHB lock signal is cleared when a rotation is performed. |

**Bit 12 – ROTDIS** Hardware Rotation Optimization Disable

| Value | Description |
|---|---|
| 0 | Rotation optimization is enabled. |
| 1 | Rotation optimization is disabled. |

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

| Value | Description |
|---|---|
| 0 | Undefined length INCR burst is used for a burst of 2 and 3 beats. |
| 1 | Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16). |

**Bits 7:6 – BLENUV[1:0]** AHB Burst Length for U-V Channel

| Value | Name | Description |
|---|---|---|
| 0 | AHB_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 1 | AHB_INCR4 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 2 | AHB_INCR8 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 3 | AHB_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

| Value | Name | Description |
|---|---|---|
| 0 | AHB_BLEN_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 1 | AHB_BLEN_INCR4 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 2 | AHB_BLEN_INCR8 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 3 | AHB_BLEN_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |

**Bit 0 – SIF** Source Interface

| Value | Description |
|---|---|
| 0 | Base Layer data is retrieved through AHB interface 0. |
| 1 | Base Layer data is retrieved through AHB interface 1. |

### 38.7.96 High-End Overlay Configuration Register 1

**Name:** LCDC_HEOCFG1

**Bit 20 – DSCALEOPT** Down Scaling Bandwidth Optimization

| Value | Description |
|---|---|
| 0 | Scaler Optimization is disabled. |
| 1 | Scaler Optimization is enabled; only relevant pixels are retrieved from memory to fill the scaler filter. |

**Bit 17 – YUV422SWP** YUV 4:2:2 Swap

| Value | Description |
|---|---|
| 0 | The two Y components of the YUV 4:2:2 packed data stream are not swapped |
| 1 | The two Y components of the YUV 4:2:2 packed data stream are swapped |

**Bit 16 – YUV422ROT** YUV 4:2:2 Rotation
This bit is relevant only when a rotation angle of 90 degrees or 270 degrees is used.

| Value | Description |
|---|---|
| 0 | Chroma Upsampling kernel is configured to use 0 and 180 degrees algorithm |
| 1 | Chroma Upsampling kernel is configured to use the 4:2:2 Rotation Algorithm. |

**Bits 15:12 – YUVMODE[3:0]** YUV Mode Input Selection

| Value | Name | Description |
|---|---|---|
| 0 | 32BPP_AYCBCR | 32 bpp AYCbCr 444 |
| 1 | 16BPP_YCBCR_MODE0 | 16 bpp Cr(n)Y(n+1)Cb(n)Y(n) 422 |
| 2 | 16BPP_YCBCR_MODE1 | 16 bpp Y(n+1)Cr(n)Y(n)Cb(n) 422 |
| 3 | 16BPP_YCBCR_MODE2 | 16 bpp Cb(n)Y(+1)Cr(n)Y(n) 422 |
| 4 | 16BPP_YCBCR_MODE3 | 16 bpp Y(n+1)Cb(n)Y(n)Cr(n) 422 |
| 5 | 16BPP_YCBCR_SEMIPLANAR | 16 bpp Semiplanar 422 YCbCr |
| 6 | 16BPP_YCBCR_PLANAR | 16 bpp Planar 422 YCbCr |
| 7 | 12BPP_YCBCR_SEMIPLANAR | 12 bpp Semiplanar 420 YCbCr |
| 8 | 12BPP_YCBCR_PLANAR | 12 bpp Planar 420 YCbCr |

**Bits 9:8 – CLUTMODE[1:0]** Color Lookup Table Mode Input Selection

| Value | Name | Description |
|---|---|---|
| 0 | CLUT_1BPP | Color Lookup Table mode set to 1 bit per pixel |
| 1 | CLUT_2BPP | Color Lookup Table mode set to 2 bits per pixel |
| 2 | CLUT_4BPP | Color Lookup Table mode set to 4 bits per pixel |
| 3 | CLUT_8BPP | Color Lookup Table mode set to 8 bits per pixel |

**Bits 7:4 – RGBMODE[3:0]** RGB Mode Input Selection

| Value | Name | Description |
|---|---|---|
| 0 | 12BPP_RGB_444 | 12 bpp RGB 444 |
| 1 | 16BPP_ARGB_4444 | 16 bpp ARGB 4444 |

| 13 | 32BPP_RGBA_8888 | 32 bpp RGBA 8888 |

**Bit 1 – YUVEN** YUV Color Space Enable
Color Space is YUV

| Value | Description |
|---|---|
| 0 | Color space is RGB |
| 1 | Color space is YUV |

**Bit 0 – CLUTEN** Color Lookup Table Mode Enable

| Value | Description |
|---|---|
| 0 | RGB mode is selected. |
| 1 | Color Lookup Table mode is selected. |

### 38.7.97 High-End Overlay Configuration Register 2

**Bits 23:16 – GA[7:0]** Blender Global Alpha
Global alpha blender for the current layer.

**Bit 12 – VIDPRI** Video Priority

| Value | Description |
|---|---|
| 0 | OVR1 layer is above HEO layer. |
| 1 | OVR1 layer is below HEO layer. |

**Bit 10 – DSTKEY** Destination Chroma Keying

| Value | Description |
|---|---|
| 0 | Source Chroma keying is enabled. |
| 1 | Destination Chroma keying is used. |

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

| Value | Description |
|---|---|
| 0 | When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0. |
| 1 | When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb. |

**Bit 8 – DMA** Blender DMA Layer Enable

| Value | Description |
|---|---|
| 0 | The default color is used on the Overlay 1 Layer. |
| 1 | The DMA channel retrieves the pixels stream from the memory. |

**Bit 7 – OVR** Blender Overlay Layer Enable

| Value | Description |
|---|---|
| 0 | Overlay pixel color is set to the default overlay pixel color. |
| 1 | Overlay pixel color is set to the DMA channel pixel color. |

**Bit 6 – LAEN** Blender Local Alpha Enable

| Value | Description |
|---|---|
| 0 | Local alpha blending coefficient is disabled. |
| 1 | Local alpha blending coefficient is enabled. |

**Bit 5 – GAEN** Blender Global Alpha Enable

| Value | Description |
|---|---|
| 0 | Global alpha blending coefficient is disabled. |
| 1 | Global alpha blending coefficient is enabled. |

**Bit 4 – REVALPHA** Blender Reverse Alpha

| Value | Description |
|---|---|
| 0 | Pixel difference is multiplied by alpha. |
| 1 | Pixel difference is multiplied by 1 - alpha. |

**Bit 3 – ITER** Blender Use Iterated Color

| Value | Description |
|---|---|
| 0 | Pixel difference is set to 0. |
| 1 | Pixel difference is set to the iterated pixel value. |

**Bit 2 – ITER2BL** Blender Iterated Color Enable

| Value | Description |
|---|---|
| 0 | Final adder stage operand is set to 0. |
| 1 | Final adder stage operand is set to the iterated pixel value. |

**Bit 1 – INV** Blender Inverted Blender Output Enable

| Value | Description |
|---|---|
| 0 | Iterated pixel is the blended pixel. |
| 1 | Iterated pixel is the inverted pixel. |

**Bit 0 – CRKEY** Blender Chroma Key Enable

| Value | Description |
|---|---|
| 0 | Chroma key matching is disabled. |
| 1 | Chroma key matching is enabled. |

### 38.7.108 High-End Overlay Configuration Register 13

**Bit 30 – CSCYOFF** Color Space Conversion Offset

| Value | Description |
|---|---|
| 0 | Offset is set to 0. |
| 1 | Offset is set to 16. |

**Bits 29:20 – CSCRV[9:0]** Color Space Conversion V coefficient for Red Component 1:2:7 format
Color Space Conversion coefficient format is 1 sign bit, 2 magnitude bits and 7 fractional bits.

**Bits 19:10 – CSCRU[9:0]** Color Space Conversion U coefficient for Red Component 1:2:7 format
Color Space Conversion coefficient format is 1 sign bit, 2 magnitude bits and 7 fractional bits.

**Bits 9:0 – CSCRY[9:0]** Color Space Conversion Y coefficient for Red Component 1:2:7 format
Color Space Conversion coefficient format is 1 sign bit, 2 magnitude bits and 7 fractional bits.

**Bit 30 – CSCUOFF** Color Space Conversion Offset

| Value | Description |
|---|---|
| 0 | Offset is set to 0. |
| 1 | Offset is set to 128. |

**Bits 29:20 – CSCGV[9:0]** Color Space Conversion V coefficient for Green Component 1:2:7 format
Color Space Conversion coefficient format is 1 sign bit, 2 magnitude bits and 7 fractional bits.

**Bits 19:10 – CSCGU[9:0]** Color Space Conversion U coefficient for Green Component 1:2:7 format
Color Space Conversion coefficient format is 1 sign bit, 2 magnitude bits and 7 fractional bits.

**Bits 9:0 – CSCGY[9:0]** Color Space Conversion Y coefficient for Green Component 1:2:7 format
Color Space Conversion coefficient format is 1 sign bit, 2 magnitude bits and 7 fractional bits.

**Bits 23:16 – YPHI7COEFF2[7:0]** Vertical Coefficient for phase 7 tap 2
Coefficient format is 1 sign bit and 7 fractional bits.

**Bits 15:8 – YPHI7COEFF1[7:0]** Vertical Coefficient for phase 7 tap 1
Coefficient format is 1 magnitude bit and 7 fractional bits.

**Bits 7:0 – YPHI7COEFF0[7:0]** Vertical Coefficient for phase 7 tap 0
Coefficient format is 1 sign bit and 7 fractional bits.

### 38.7.136 High-End Overlay Configuration Register 41

**Name:** LCDC_HEOCFG41
**Offset:** 0x00000430
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | XPHIDEF[2:0] | | |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 18:16 – YPHIDEF[2:0]** Vertical Filter Phase Offset
XPHIDEF defines the index of the first coefficient set used when the vertical resampling operation is started.

**Bits 2:0 – XPHIDEF[2:0]** Horizontal Filter Phase Offset
XPHIDEF defines the index of the first coefficient set used when the horizontal resampling operation is started.

### 38.7.137 Post Processing Channel Enable Register

**Name:** LCDC_PPCHER
**Offset:** 0x00000540
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | | | | | – | – | – |

**Bit 2 – A2QEN** Add To Queue Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list. |

**Bit 1 – UPDATEEN** Update Overlay Attributes Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Updates windows attributes on the next start of frame. |

**Bit 0 – CHEN** Channel Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Enables the DMA channel |

### 38.7.138 Post Processing Channel Disable Register

**Name:** LCDC_PPCHDR
**Offset:** 0x00000544
**Reset:** –
**Property:** Write-only

| | | | DONE | ADD | DSCR | DMA | | |
| Access | | | R | R | R | R | | |
| Reset | | | 0 | 0 | 0 | 0 | | |

**Bit 5 – DONE** End of List Detected

| Value | Description |
|---|---|
| 0 | No End of List condition has occurred since last read of LCDC_PPISR |
| 1 | End of List condition has occurred. This flag is reset after a read operation. |

**Bit 4 – ADD** Head Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_PPISR |
| 1 | The descriptor pointed to by the LCDC_PPHEAD register has been loaded successfully. This flag is reset after a read operation. |

**Bit 3 – DSCR** DMA Descriptor Loaded

| Value | Description |
|---|---|
| 0 | No descriptor has been loaded since last read of LCDC_PPISR |
| 1 | A descriptor has been loaded successfully. This flag is reset after a read operation. |

**Bit 2 – DMA** End of DMA Transfer

| Value | Description |
|---|---|
| 0 | No End of Transfer has been detected since last read of LCDC_PPISR |

| Value | Description |
|---|---|
| 1 | End of Transfer has been detected. This flag is reset after a read operation. |

### 38.7.144 Post Processing Head Register

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

| Value | Description |
|---|---|
| 0 | Undefined length INCR burst is used for 2 and 3 beats burst. |
| 1 | Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16). |

**Bits 5:4 – BLEN[1:0]** AHB Burst Length

| Value | Name | Description |
|---|---|---|
| 0 | AHB_BLEN_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 1 | AHB_BLEN_INCR4 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. An AHB INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats. |
| 2 | AHB_BLEN_INCR8 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats. |

| Value | Name | Description |
|---|---|---|
| 3 | AHB_BLEN_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. An AHB INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats. |

**Bit 0 – SIF** Source Interface

| Value | Description |
|---|---|
| 0 | Base Layer data is retrieved through AHB interface 0. |
| 1 | Base Layer data is retrieved through AHB interface 1. |

# 39. Ethernet MAC (GMAC)

## 39.1 Description

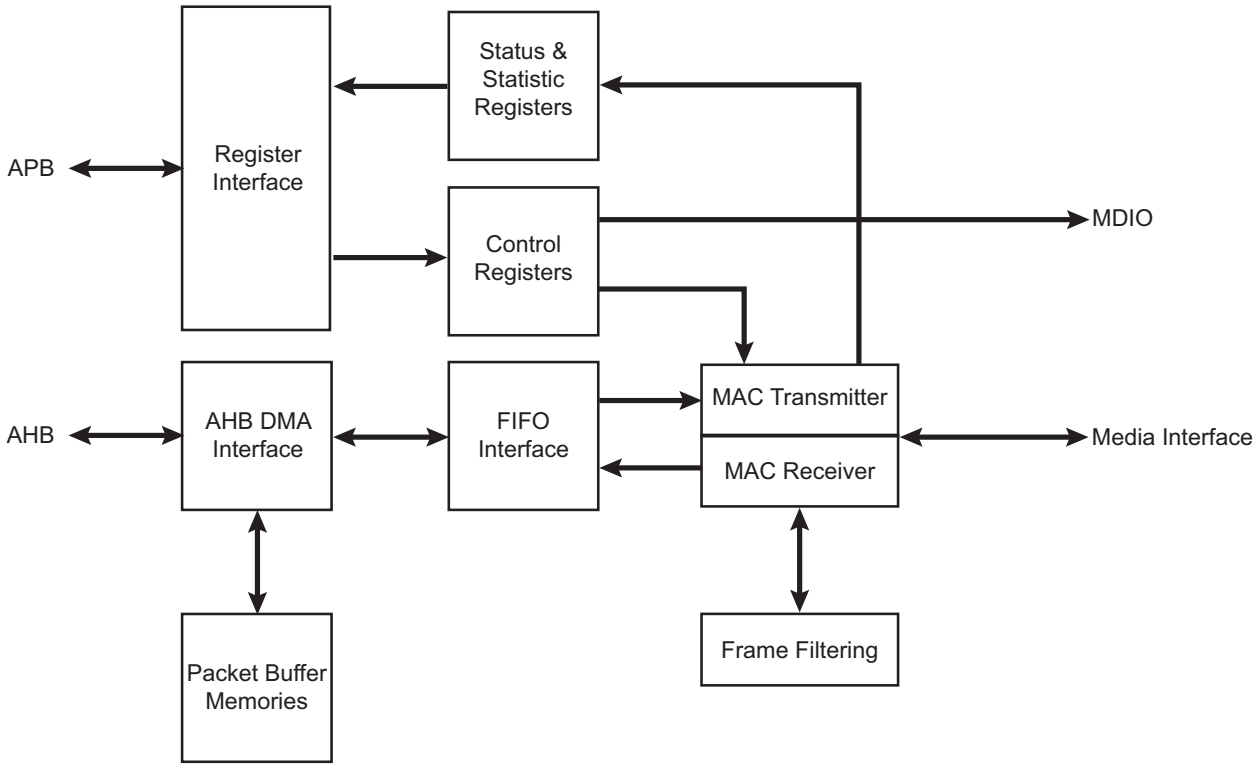
The Ethernet MAC (GEMAC) module implements a 10/100 Mbps Ethernet MAC compatible with the IEEE 802.3 standard. The GEMAC can operate in either half or full duplex mode at all supported speeds. The GMAC Network Configuration Register is used to select the speed, duplex mode and interface type (MII, RMII).

## 39.2 Embedded Characteristics

- Compatible with IEEE Standard 802.3
- 10, 100 Mbps Operation
- Full and Half Duplex Operation at all Supported Speeds of Operation
- Statistics Counter Registers for RMON/MIB
- MII/RMII Interface to the Physical Layer
- Integrated Physical Coding
- Direct Memory Access (DMA) Interface to External Memory
- Support for 3 Priority Queues
- 8 Kbytes Transmit RAM and 4 Kbytes Receive RAM (refer to Table 39-4 for queue-specific sizes)
- Programmable Burst Length and Endianism for DMA
- Interrupt Generation to Signal Receive and Transmit Completion, Errors or Other Events
- Automatic Pad and Cyclic Redundancy Check (CRC) Generation on Transmitted Frames
- Automatic Discard of Frames Received with Errors
- Receive and Transmit IP, TCP and UDP Checksum Offload. Both IPv4 and IPv6 Packet Types Supported
- Address Checking Logic for Four Specific 48-bit Addresses, Four Type IDs, Promiscuous Mode, Hash Matching of Unicast and Multicast Destination Addresses and Wake-on-LAN
- Management Data Input/Output (MDIO) Interface for Physical Layer Management
- Support for Jumbo Frames up to 10240 Bytes
- Full Duplex Flow Control with Recognition of Incoming Pause Frames and Hardware Generation of Transmitted Pause Frames
- Half Duplex Flow Control by Forcing Collisions on Incoming Frames
- Support for 802.1Q VLAN Tagging with Recognition of Incoming VLAN and Priority Tagged Frames
- Support for 802.1Qbb Priority-based Flow Control
- Programmable Inter Packet Gap (IPG) Stretch
- Recognition of IEEE 1588 PTP Frames
- IEEE 1588 Timestamp Unit (TSU)
- Support for 802.1AS Timing and Synchronization
- Supports 802.1Qav Traffic Shaping on Two Highest Priority Queues

## 39.3 Block Diagram

**Figure 39-1. Block Diagram**



## 39.4 Signal Interfaces

The GEMAC includes the following signal interfaces:

- MII, RMII to an external PHY
- MDIO interface for external PHY management
- Slave APB interface for accessing GEMAC registers
- Master AHB interface for memory access
- GTSUCOMP signal for TSU timer count value comparison

**Table 39-1. GEMAC Connections in Different Modes**

| Signal Name | Function | MII | RMII |
|---|---|---|---|
| GTXCK[(1)] | Transmit Clock or Reference Clock | TXCK | REFCK |
| GTXEN | Transmit Enable | TXEN | TXEN |
| GTX[3..0] | Transmit Data | TXD[3:0] | TXD[1:0] |
| GTXER | Transmit Coding Error | TXER | Not Used |
| GRXCK | Receive Clock | RXCK | Not Used |
| GRXDV | Receive Data Valid | RXDV | CRSDV |
| GRX[3..0] | Receive Data | RXD[3:0] | RXD[1:0] |

| .....continued | | | |
|---|---|---|---|
| **Signal Name** | **Function** | **MII** | **RMII** |
| GRXER | Receive Error | RXER | RXER |
| GCRS | Carrier Sense and Data Valid | CRS | Not Used |
| GCOL | Collision Detect | COL | Not Used |
| GMDC | Management Data Clock | MDC | MDC |
| GMDIO | Management Data Input/Output | MDIO | MDIO |

**Note:**

1. Input only. GTXCK must be provided with a 25 MHz / 50 MHz external crystal oscillator for MII / RMII interfaces, respectively.

## 39.5 Product Dependencies

### 39.5.1 I/O Lines

The pins used for interfacing the GEMAC may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the GEMAC are not used by the application, they can be used for other purposes by the PIO Controller.

### 39.5.2 Power Management

The GEMAC is not continuously clocked. The user must first enable the GEMAC clock in the Power Management Controller before using it.

### 39.5.3 Interrupt Sources

The GEMAC interrupt line is connected to one of the internal sources of the interrupt controller. Using the GEMAC interrupt requires prior programming of the interrupt controller.

The GEMAC features 3 interrupt sources. Refer to the table “Peripheral Identifiers” in the section “Peripherals” for the interrupt numbers for GEMAC priority queues.

## 39.6 Functional Description

### 39.6.1 Media Access Controller

The Media Access Controller (MAC) transmit block takes data from FIFO, adds preamble and, if necessary, pad and frame check sequence (FCS). Both half duplex and full duplex Ethernet modes of operation are supported. When operating in half duplex mode, the MAC transmit block generates data according to the carrier sense multiple access with collision detect (CSMA/CD) protocol. The start of transmission is deferred if carrier sense (CRS) is active. If collision (COL) becomes active during transmission, a jam sequence is asserted and the transmission is retried after a random backoff. The CRS and COL signals have no effect in full duplex mode.

The MAC receive block checks for valid preamble, FCS, alignment and length, and presents received frames to the MAC address checking block and FIFO. Software can configure the GMAC to receive jumbo frames up to 10240 bytes. It can optionally strip CRC from the received frame prior to transfer to FIFO.

The address checker recognizes four specific 48-bit addresses, can recognize four different type ID values, and contains a 64-bit Hash register for matching multicast and unicast addresses as required. It can recognize the broadcast address of all ones and copy all frames. The MAC can also reject all frames that are not VLAN tagged and recognize Wake on LAN events.

The MAC receive block supports offloading of IP, TCP and UDP checksum calculations (both IPv4 and IPv6 packet types supported), and can automatically discard bad checksum frames.

### 39.6.2 1588 Timestamp Unit

The 1588 timestamp unit (TSU) is implemented as a 94-bit timer.

The 48 upper bits [93:46] of the timer count seconds and are accessible in the GMAC 1588 Timer Seconds High Register (GMAC_TSH) and GMAC 1588 Timer Seconds Low Register (GMAC_TSL). The 30 lower bits [45:16] of the timer count nanoseconds and are accessible in the GMAC 1588 Timer Nanoseconds Register (GMAC_TN). The lowest 16 bits [15:0] of the timer count sub-nanoseconds.

The 46 lower bits roll over when they have counted to one second. The timer increments by a programmable period (to approximately 15.2 femtoseconds resolution) with each MCK period and can also be adjusted in 1ns resolution (incremented or decremented) through APB register accesses.

### 39.6.3 AHB Direct Memory Access Interface

The GEMAC DMA controller is connected to the MAC FIFO interface and provides a scatter-gather type capability for packet data storage.

The DMA implements packet buffering where dual-port memories are used to buffer multiple frames.

#### 39.6.3.1 Packet Buffer DMA

- Easier to guarantee maximum line rate due to the ability to store multiple frames in the packet buffer, where the number of frames is limited by the amount of packet buffer memory and Ethernet frame size
- Full store and forward, or partial store and forward programmable options (partial store will cater for shorter latency requirements)
- Support for Transmit TCP/IP checksum offload
- Support for priority queueing
- When a collision on the line occurs during transmission, the packet will be automatically replayed directly from the packet buffer memory rather than having to re-fetch through the AHB (full store and forward ONLY)
- Received error packets are automatically dropped before any of the packet is presented to the AHB (full store and forward ONLY), thus reducing AHB activity
- Supports manual RX packet flush capabilities
- Optional RX packet flush when there is lack of AHB resource

#### 39.6.3.2 Partial Store and Forward Using Packet Buffer DMA

The DMA uses SRAM-based packet buffers, and can be programmed into a low latency mode, known as Partial Store and Forward. This allows for a reduced latency as the full packet is not buffered before forwarding. Note that this option is only available when the device is configured for full duplex operation.

This feature is enabled via the programmable TX and RX Partial Store and Forward registers. When the transmit Partial Store and Forward mode is activated, the transmitter will only begin to forward the packet to the MAC when there is enough packet data stored in the packet buffer. Likewise, when the receive Partial Store and Forward mode is activated, the receiver will only begin to forward the packet to the AHB when enough packet data is stored in the packet buffer. The amount of packet data required to activate

the forwarding process is programmable via watermark registers which are located at the same address as the partial store and forward enable bits.

Note that the minimum operational value for the TX partial store and forward watermark is 20. There is no operational limit for the RX partial store and forward watermark. Enabling partial store and forward is a useful means to reduce latency, but there are performance implications.

The GEMAC DMA uses separate transmit and receive lists of buffer descriptors, with each descriptor describing a buffer area in memory. This allows Ethernet packets to be broken up and scattered around the AHB memory space.

#### 39.6.3.3 Receive AHB Buffers

Received frames, optionally including FCS, are written to receive AHB buffers stored in memory. The receive buffer depth is programmable in the range of 64 bytes to 16 Kbytes through the DMA Configuration register, with the default being 128 bytes.

The start location for each receive AHB buffer is stored in memory in a list of receive buffer descriptors at an address location pointed to by the receive buffer queue pointer. The base address for the receive buffer queue pointer is configured in software using the Receive Buffer Queue Base Address register.

Each list entry consists of two words. The first is the address of the receive AHB buffer and the second the receive status. If the length of a receive frame exceeds the AHB buffer length, the status word for the used buffer is written with zeroes except for the “start of frame” bit, which is always set for the first buffer in a frame. Bit zero of the address field is written to 1 to show the buffer has been used. The receive buffer manager then reads the location of the next receive AHB buffer and fills that with the next part of the received frame data. AHB buffers are filled until the frame is complete and the final buffer descriptor status word contains the complete frame status. Refer to the table below for details of the receive buffer descriptor list.

Each receive AHB buffer start location is a word address. The start of the first AHB buffer in a frame can be offset by up to three bytes, depending on the value written to bits 14 and 15 of the Network Configuration register. If the start location of the AHB buffer is offset, the available length of the first AHB buffer is reduced by the corresponding number of bytes.

**Table 39-2. Receive Buffer Descriptor Entry**

| Bit | Function |
|---|---|
| Word 0 | |
| 31:2 | Address of beginning of buffer |
| 1 | Wrap—marks last descriptor in receive buffer descriptor list. |
| 0 | Ownership—needs to be zero for the GEMAC to write data to the receive buffer. The GEMAC sets this to one once it has successfully written a frame to memory.<br>Software has to clear this bit before the buffer can be used again. |
| Word 1 | |
| 31 | Global all ones broadcast address detected |
| 30 | Multicast hash match |
| 29 | Unicast hash match |
| 28 | – |

| .....continued | |
|---|---|
| **Bit** | **Function** |
| 27 | Specific Address Register match found, bit 25 and bit 26 indicate which Specific Address Register causes the match. |
| 26:25 | Specific Address Register match. Encoded as follows:<br>00: Specific Address Register 1 match<br>01: Specific Address Register 2 match<br>10: Specific Address Register 3 match<br>11: Specific Address Register 4 match<br>If more than one specific address is matched only one is indicated with priority 4 down to 1. |
| 24 | This bit has a different meaning depending on whether RX checksum offloading is enabled.<br>**With RX checksum offloading disabled:** (bit 24 clear in Network Configuration Register)<br>Type ID register match found, bit 22 and bit 23 indicate which type ID register causes the match.<br>**With RX checksum offloading enabled:** (bit 24 set in Network Configuration Register)<br>0: The frame was not SNAP encoded and/or had a VLAN tag with the Canonical Format Indicator (CFI) bit set.<br>1: The frame was SNAP encoded and had either no VLAN tag or a VLAN tag with the CFI bit not set. |
| 23:22 | This bit has a different meaning depending on whether RX checksum offloading is enabled.<br>**With RX checksum offloading disabled:** (bit 24 clear in Network Configuration)<br>Type ID register match. Encoded as follows:<br>00: Type ID register 1 match<br>01: Type ID register 2 match<br>10: Type ID register 3 match<br>11: Type ID register 4 match<br>If more than one Type ID is matched only one is indicated with priority 4 down to 1.<br>**With RX checksum offloading enabled:** (bit 24 set in Network Configuration Register)<br>00: Neither the IP header checksum nor the TCP/UDP checksum was checked.<br>01: The IP header checksum was checked and was correct. Neither the TCP nor UDP checksum was checked.<br>10: Both the IP header and TCP checksum were checked and were correct.<br>11: Both the IP header and UDP checksum were checked and were correct. |
| 21 | VLAN tag detected—type ID of 0x8100. For packets incorporating the stacked VLAN processing feature, this bit will be set if the second VLAN tag has a type ID of 0x8100 |

| .....continued | |
|---|---|
| **Bit** | **Function** |
| 20 | Priority tag detected—type ID of 0x8100 and null VLAN identifier. For packets incorporating the stacked VLAN processing feature, this bit will be set if the second VLAN tag has a type ID of 0x8100 and a null VLAN identifier. |
| 19:17 | VLAN priority—only valid if bit 21 is set. |
| 16 | Canonical format indicator (CFI) bit (only valid if bit 21 is set). |
| 15 | End of frame—when set the buffer contains the end of a frame. If end of frame is not set, then the only valid status bit is start of frame (bit 14). |
| 14 | Start of frame—when set the buffer contains the start of a frame. If both bits 15 and 14 are set, the buffer contains a whole frame. |
| 13 | This bit has a different meaning depending on whether jumbo frames and ignore FCS modes are enabled. If neither mode is enabled this bit will be zero.<br>**With jumbo frame mode enabled:** (bit 3 set in Network Configuration Register) Additional bit for length of frame (bit[13]), that is concatenated with bits[12:0]<br>**With ignore FCS mode enabled and jumbo frames disabled:** (bit 26 set in Network Configuration Register and bit 3 clear in Network Configuration Register) This indicates per frame FCS status as follows:<br>0: Frame had good FCS<br>1: Frame had bad FCS, but was copied to memory as ignore FCS enabled. |
| 12:0 | These bits represent the length of the received frame which may or may not include FCS depending on whether FCS discard mode is enabled.<br>**With FCS discard mode disabled:** (bit 17 clear in Network Configuration Register)<br>Least significant 12 bits for length of frame including FCS. If jumbo frames are enabled, these 12 bits are concatenated with bit[13] of the descriptor above.<br>**With FCS discard mode enabled:** (bit 17 set in Network Configuration Register)<br>Least significant 12 bits for length of frame excluding FCS. If jumbo frames are enabled, these 12 bits are concatenated with bit[13] of the descriptor above. |

To receive frames, the AHB buffer descriptors must be initialized by writing an appropriate address to bits 31:2 in the first word of each list entry. Bit 0 must be written with zero. Bit 1 is the wrap bit and indicates the last entry in the buffer descriptor list.

The start location of the receive buffer descriptor list must be written with the receive buffer queue base address before reception is enabled (receive enable in the Network Control register). Once reception is enabled, any writes to the Receive Buffer Queue Base Address register are ignored. When read, it will return the current pointer position in the descriptor list, though this is only valid and stable when receive is disabled.

If the filter block indicates that a frame should be copied to memory, the receive data DMA operation starts writing data into the receive buffer. If an error occurs, the buffer is recovered.

An internal counter within the GEMAC represents the receive buffer queue pointer and it is not visible through the CPU interface. The receive buffer queue pointer increments by two words after each buffer

has been used. It re-initializes to the receive buffer queue base address if any descriptor has its wrap bit set.

As receive AHB buffers are used, the receive AHB buffer manager sets bit zero of the first word of the descriptor to logic one indicating the AHB buffer has been used.

Software should search through the “used” bits in the AHB buffer descriptors to find out how many frames have been received, checking the start of frame and end of frame bits.

When the DMA is configured in the packet buffer Partial Store And Forward mode, received frames are written out to the AHB buffers as soon as enough frame data exists in the packet buffer. For both cases, this may mean several full AHB buffers are used before some error conditions can be detected. If a receive error is detected the receive buffer currently being written will be recovered. Previous buffers will not be recovered. As an example, when receiving frames with cyclic redundancy check (CRC) errors or excessive length, it is possible that a frame fragment might be stored in a sequence of AHB receive buffers. Software can detect this by looking for start of frame bit set in a buffer following a buffer with no end of frame bit set.

To function properly, a 10/100/1000 Ethernet system should have no excessive length frames or frames greater than 128 bytes with CRC errors. Collision fragments will be less than 128 bytes long, therefore it will be a rare occurrence to find a frame fragment in a receive AHB buffer, when using the default value of 128 bytes for the receive buffers size.

When in packet buffer full store and forward mode, only good received frames are written out of the DMA, so no fragments will exist in the AHB buffers due to MAC receiver errors. There is still the possibility of fragments due to DMA errors, for example used bit read on the second buffer of a multi-buffer frame.

If bit zero of the receive buffer descriptor is already set when the receive buffer manager reads the location of the receive AHB buffer, then the buffer has been already used and cannot be used again until software has processed the frame and cleared bit zero. In this case, the “buffer not available” bit in the Receive Status register is set and an interrupt triggered. The Receive Resource Error statistics register is also incremented.

When the DMA is configured in the packet buffer full store and forward mode, the user can optionally select whether received frames should be automatically discarded when no AHB buffer resource is available. This feature is selected via bit 24 of the DMA Configuration register (by default, the received frames are not automatically discarded). If this feature is off, then received packets will remain to be stored in the SRAM-based packet buffer until AHB buffer resource next becomes available. This may lead to an eventual packet buffer overflow if packets continue to be received when bit zero (used bit) of the receive buffer descriptor remains set. Note that after a used bit has been read, the receive buffer manager will re-read the location of the receive buffer descriptor every time a new packet is received. When the DMA is not configured in the packet buffer full store and forward mode and a used bit is read, the frame currently being received will be automatically discarded.

When the DMA is configured in the packet buffer full store and forward mode, a receive overrun condition occurs when the receive SRAM-based packet buffer is full, or because HRESP was not OK. In all other modes, a receive overrun condition occurs when either the AHB bus was not granted quickly enough, or because HRESP was not OK, or because a new frame has been detected by the receive block, but the status update or write back for the previous frame has not yet finished. For a receive overrun condition, the receive overrun interrupt is asserted and the buffer currently being written is recovered. The next frame that is received whose address is recognized reuses the buffer.

In any packet buffer mode, a write to bit 18 of GMAC_NCR will force a packet from the external SRAM-based receive packet buffer to be flushed. This feature is only acted upon when the RX DMA is not

currently writing packet data out to AHB, i.e., it is in an IDLE state. If the RX DMA is active, a write to this bit is ignored.

#### 39.6.3.4 Transmit AHB Buffers

Frames to transmit are stored in one or more transmit AHB buffers. Transmit frames can be between 1 and 16384 bytes long, so it is possible to transmit frames longer than the maximum length specified in the IEEE 802.3 standard. It should be noted that zero length AHB buffers are allowed and that the maximum number of buffers permitted for each transmit frame is 128.

The start location for each transmit AHB buffer is stored in memory in a list of transmit buffer descriptors at a location pointed to by the transmit buffer queue pointer. The base address for this queue pointer is set in software using the Transmit Buffer Queue Base Address register. Each list entry consists of two words. The first is the byte address of the transmit buffer and the second containing the transmit control and status. For the packet buffer DMA, the start location for each AHB buffer is a byte address, the bottom bits of the address being used to offset the start of the data from the data-word boundary (i.e., bits 2,1 and 0 are used to offset the address for 64-bit datapaths).

Frames can be transmitted with or without automatic CRC generation. If CRC is automatically generated, pad will also be automatically generated to take frames to a minimum length of 64 bytes. When CRC is not automatically generated (as defined in word 1 of the transmit buffer descriptor), the frame is assumed to be at least 64 bytes long and pad is not generated.

An entry in the transmit buffer descriptor list is described in the table below.

To transmit frames, the buffer descriptors must be initialized by writing an appropriate byte address to bits [31:0] in the first word of each descriptor list entry.

The second word of the transmit buffer descriptor is initialized with control information that indicates the length of the frame, whether or not the MAC is to append CRC and whether the buffer is the last buffer in the frame.

After transmission the status bits are written back to the second word of the first buffer along with the used bit. Bit 31 is the used bit which must be zero when the control word is read if transmission is to take place. It is written to one once the frame has been transmitted. Bits[29:20] indicate various transmit error conditions. Bit 30 is the wrap bit which can be set for any buffer within a frame. If no wrap bit is encountered the queue pointer continues to increment.

The Transmit Buffer Queue Base Address register can only be updated while transmission is disabled or halted; otherwise any attempted write will be ignored. When transmission is halted the transmit buffer queue pointer will maintain its value. Therefore when transmission is restarted the next descriptor read from the queue will be from immediately after the last successfully transmitted frame. while transmit is disabled (bit 3 of the Network Control register set low), the transmit buffer queue pointer resets to point to the address indicated by the Transmit Buffer Queue Base Address register. Note that disabling receive does not have the same effect on the receive buffer queue pointer.

Once the transmit queue is initialized, transmit is activated by writing to the transmit start bit (bit 9) of the Network Control register. Transmit is halted when a buffer descriptor with its used bit set is read, a transmit error occurs, or by writing to the transmit halt bit of the Network Control register. Transmission is suspended if a pause frame is received while the pause enable bit is set in the Network Configuration register. Rewriting the start bit while transmission is active is allowed. This is implemented with TXGO variable which is readable in the Transmit Status register at bit location 3. The TXGO variable is reset when:

- Transmit is disabled.
- A buffer descriptor with its ownership bit set is read.

- Bit 10, THALT, of the Network Control register is written.
- There is a transmit error such as too many retries or a transmit underrun.

To set TXGO, write TSTART to the bit 9 of the Network Control register. Transmit halt does not take effect until any ongoing transmit finishes.

If the DMA is configured for packet buffer Partial Store and Forward mode and a collision occurs during transmission of a multi-buffer frame, transmission will automatically restart from the first buffer of the frame. For packet buffer mode, the entire contents of the frame are read into the transmit packet buffer memory, so the retry attempt will be replayed directly from the packet buffer memory rather than having to re-fetch through the AHB.

If a used bit is read midway through transmission of a multi-buffer frame, this is treated as a transmit error. Transmission stops, GTXER is asserted and the FCS will be bad.

If transmission stops due to a transmit error or a used bit being read, transmission restarts from the first buffer descriptor of the frame being transmitted when the transmit start bit is rewritten.

**Table 39-3. Transmit Buffer Descriptor Entry**

| Bit | Function |
|---|---|
| Word 0 | |
| 31:0 | Byte address of buffer |
| Word 1 | |
| 31 | Used—must be zero for the GEMAC to read data to the transmit buffer. The GEMAC sets this to one for the first buffer of a frame once it has been successfully transmitted. Software must clear this bit before the buffer can be used again. |
| 30 | Wrap—marks last descriptor in transmit buffer descriptor list. This can be set for any buffer within the frame. |
| 29 | Retry limit exceeded, transmit error detected |
| 28 | Reserved. |
| 27 | Transmit frame corruption due to AHB error—set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted).<br>Also set if single frame is too large for configured packet buffer memory size. |
| 26 | Late collision, transmit error detected. |
| 25:23 | Reserved |

| .....continued | |
|---|---|
| **Bit** | **Function** |
| 22:20 | Transmit IP/TCP/UDP checksum generation offload errors:<br>000: No Error.<br>001: The Packet was identified as a VLAN type, but the header was not fully complete, or had an error in it.<br>010: The Packet was identified as a SNAP type, but the header was not fully complete, or had an error in it.<br>011: The Packet was not of an IP type, or the IP packet was invalidly short, or the IP was not of type IPv4/IPv6.<br>100: The Packet was not identified as VLAN, SNAP or IP.<br>101: Non supported packet fragmentation occurred. For IPv4 packets, the IP checksum was generated and inserted.<br>110: Packet type detected was not TCP or UDP. TCP/UDP checksum was therefore not generated. For IPv4 packets, the IP checksum was generated and inserted.<br>111: A premature end of packet was detected and the TCP/UDP checksum could not be generated. |
| 19:17 | Reserved |
| 16 | No CRC to be appended by MAC. When set, this implies that the data in the buffers already contains a valid CRC, hence no CRC or padding is to be appended to the current frame by the MAC.<br>This control bit must be set for the first buffer in a frame and will be ignored for the subsequent buffers of a frame.<br>Note that this bit must be clear when using the transmit IP/TCP/UDP checksum generation offload, otherwise checksum generation and substitution will not occur. |
| 15 | Last buffer, when set this bit will indicate the last buffer in the current frame has been reached. |
| 14 | Reserved |
| 13:0 | Length of buffer |

#### 39.6.3.5 DMA Bursting on the AHB

The DMA will always use SINGLE, or INCR type AHB accesses for buffer management operations. When performing data transfers, the AHB burst length used can be programmed using bits 4:0 of the DMA Configuration register so that either SINGLE, INCR or fixed length incrementing bursts (INCR4, INCR8 or INCR16) are used where possible.

When there is enough space and enough data to be transferred, the programmed fixed length bursts will be used. If there is not enough data or space available, for example when at the beginning or the end of a buffer, SINGLE type accesses are used. Also SINGLE type accesses are used at 1024 byte boundaries, so that the 1 Kbyte boundaries are not burst over as per AHB requirements.

The DMA will not terminate a fixed length burst early, unless an error condition occurs on the AHB or if receive or transmit are disabled in the Network Control register.

#### 39.6.3.6 DMA Packet Buffer

The DMA uses packet buffers for both transmit and receive paths. This mode allows multiple packets to be buffered in both transmit and receive directions. This allows the DMA to withstand far greater access latencies on the AHB and make more efficient use of the AHB bandwidth. There are two modes of operation—Full Store and Forward and Partial Store and Forward.

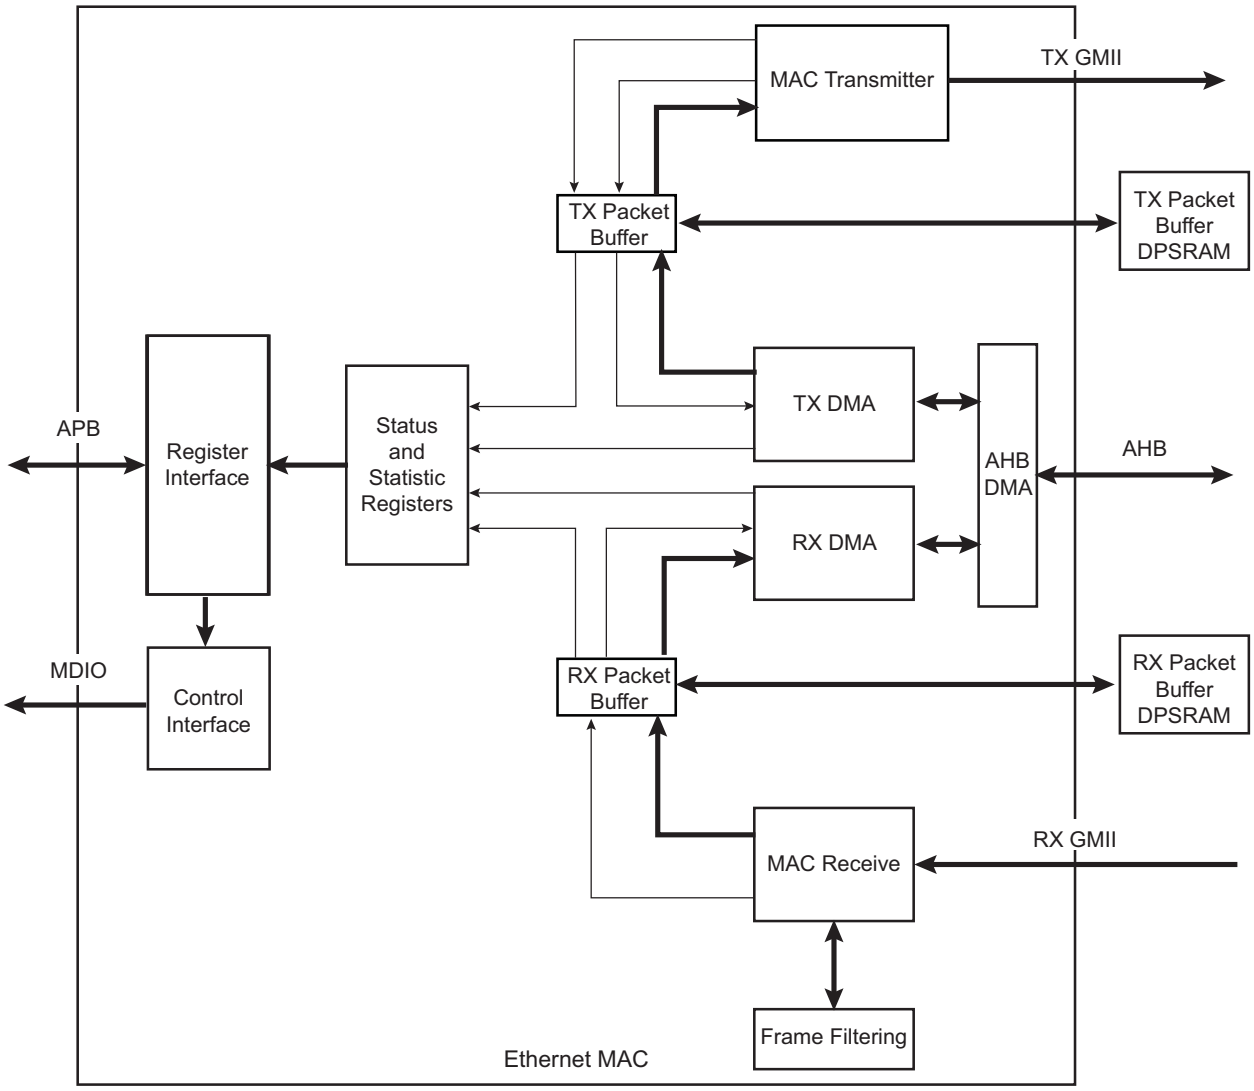
As described in section Partial Store and Forward Using Packet Buffer DMA, the DMA can be programmed into a low latency mode, known as Partial Store and Forward.

When the DMA is in full store and forward mode, full packets are buffered which provides the possibility to:

- Discard packets with error on the receive path before they are partially written out of the DMA, thus saving AHB bus bandwidth and driver processing overhead,
- Retry collided transmit frames from the buffer, thus saving AHB bus bandwidth,
- Implement transmit IP/TCP/UDP checksum generation offload.

With the packet buffers included, the structure of the GEMAC data paths is shown in the figure below.

**Figure 39-2. Data Paths with Packet Buffers Included**



#### 39.6.3.7 Transmit Packet Buffer

The transmitter packet buffer will continue attempting to fetch frame data from the AHB system memory until the packet buffer itself is full, at which point it will attempt to maintain its full level.

To accommodate the status and statistics associated with each frame, three words per packet are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet. Storing the status in the DPRAM is required in order to decouple the DMA interface of the buffer from the MAC interface, to update the MAC status/ statistics and to generate interrupts in the order in which the packets that they represent were fetched from the AHB memory.

If any errors occur on the AHB while reading the transmit frame, the fetching of packet data from AHB memory is halted. The MAC transmitter will continue to fetch packet data, thereby emptying the packet buffer and allowing any good non-errored frames to be transmitted successfully. Once these have been fully transmitted, the status/statistics for the errored frame will be updated and software will be informed via an interrupt that an AHB error occurred. This way, the error is reported in the correct packet order.

The transmit packet buffer will only attempt to read more frame data from the AHB when space is available in the packet buffer memory. If space is not available it must wait until the a packet fetched by the MAC completes transmission and is subsequently removed from the packet buffer memory. Note that if full store and forward mode is active and if a single frame is fetched that is too large for the packet buffer memory, the frame is flushed and the DMA halted with an error status. This is because a complete frame must be written into the packet buffer before transmission can begin, and therefore the minimum packet buffer memory size should be chosen to satisfy the maximum frame to be transmitted in the application.

In full store and forward mode, once the complete transmit frame is written into the packet buffer memory, a trigger is sent across to the MAC transmitter, which will then begin reading the frame from the packet buffer memory. Since the whole frame is present and stable in the packet buffer memory an underflow of the transmitter is not possible. The frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received the frame is flushed from memory to make room for a new frame to be fetched from AHB system memory.

In Partial Store and Forward mode, a trigger is sent across to the MAC transmitter as soon as sufficient packet data is available, which will then begin fetching the frame from the packet buffer memory. If, after this point, the MAC transmitter is able to fetch data from the packet buffer faster than the AHB DMA can fill it, an underflow of the transmitter is possible. In this case, the transmission is terminated early, and the packet buffer is completely flushed. Transmission can only be restarted by writing to the transmit START bit.

In half duplex mode, the frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received the frame is flushed from memory to make room for a new frame to be fetched from AHB system memory.

In full duplex mode, the frame is removed from the packet buffer on the fly.

Other than underflow, the only MAC related errors that can occur are due to collisions during half duplex transmissions. When a collision occurs the frame still exists in the packet buffer memory so can be retried directly from there. Only once the MAC transmitter has failed to transmit after sixteen attempts is the frame finally flushed from the packet buffer.

#### 39.6.3.8 Receive Packet Buffer

The receive packet buffer stores frames from the MAC receiver along with their status and statistics. Frames with errors are flushed from the packet buffer memory, while good frames are pushed onto the DMA AHB interface.

The receiver packet buffer monitors the FIFO write interface from the MAC receiver and translates the FIFO pushes into packet buffer writes. At the end of the received frame the status and statistics are buffered so that the information can be used when the frame is read out. When programmed in full store and forward mode, if the frame has an error the frame data is immediately flushed from the packet buffer memory allowing subsequent frames to utilise the freed up space. The status and statistics for bad frames are still used to update the GEMAC registers.

To accommodate the status and statistics associated with each frame, three words per packet (or two if configured in 64-bit datapath mode) are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet.

The receiver packet buffer will also detect a full condition so that an overflow condition can be detected. If this occurs, subsequent packets are dropped and an RX overflow interrupt is raised.

For full store and forward, the DMA only begins packet fetches once the status and statistics for a frame are available. If the frame has a bad status due to a frame error, the status and statistics are passed on to the GEMAC registers. If the frame has a good status, the information is used to read the frame from the packet buffer memory and burst onto the AHB using the DMA buffer management protocol. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GEMAC registers.

If Partial Store and Forward mode is active, the DMA will begin fetching the packet data before the status is available. As soon as the status becomes available, the DMA will fetch this information as soon as possible before continuing to fetch the remainder of the frame. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GEMAC registers.

#### 39.6.3.9 Priority Queueing in the DMA

The DMA by default uses a single transmit and receive queue. This means the list of transmit/receive buffer descriptors point to data buffers associated with a single transmit/receive data stream. The GEMAC can select up to 3 priority queues. Each queue has an independent list of buffer descriptors pointing to separate data streams.

The table below gives the DPRAM size associated with each queue:

**Table 39-4. Queue Size**

| Queue Number | Queue Size |
|---|---|
| 2 | 4 KB |
| 1 | 2 KB |
| 0 (lowest priority) | 2 KB |

In the transmit direction, higher priority queues are always serviced before lower priority queues, with Q0 as lowest priority and Q2 as highest priority. This strict priority scheme requires the user to ensure that high priority traffic is constrained so that lower priority traffic will have required bandwidth. The GEMAC DMA will determine the next queue to service by initiating a sequence of buffer descriptor reads interrogating the ownership bits of each. The buffer descriptor corresponding to the highest priority queue is read first. As an example, if the ownership bit of this descriptor is set, then the DMA will progress to

reading the 2nd highest priority queue's descriptor. If that ownership bit read of this lower priority queue is set, then the DMA will read the 3rd highest priority queue's descriptor. If all the descriptors return an ownership bit set, then a resource error has occurred, an interrupt is generated and transmission is automatically halted. Transmission can only be restarted by setting the START bit in the Network Control register. The GEMAC DMA will need to identify the highest available queue to transmit from when the START bit in the Network Control register is written to and the TX is in a halted state, or when the last word of any packet has been fetched from external AHB memory.

The GEMAC transmit DMA maximizes the effectiveness of priority queuing by ensuring that high priority traffic be transmitted as early as possible after being fetched from AHB. High priority traffic fetched from AHB will be pushed to the MAC layer, depending on traffic shaping being enabled and the associated credit value for that queue, before any lower priority traffic that may pre-exist in the transmit SRAM-based packet buffer. This is achieved by separating the transmit SRAM-based packet buffer into regions, one region per queue. The size of each region determines the amount of SRAM space allocated per queue.

For each queue, there is an associated Transmit Buffer Queue Base Address register. For the lowest priority queue (or the only queue when only one queue is selected), the Transmit Buffer Queue Base Address is located at address 0x1C. For all other queues, the Transmit Buffer Queue Base Address registers are located at sequential addresses starting at address 0x440.

In the receive direction each packet is written to AHB data buffers in the order that it is received. For each queue, there is an independent set of receive AHB buffers for each queue. There is therefore a separate Receive Buffer Queue Base Address register for each queue. For the lowest priority queue (or the only queue when only one queue is selected), the Receive Buffer Queue Base Address is located at address 0x18. For all other queues, the Receive Buffer Queue Base Address registers are located at sequential addresses starting at address 0x480. Every received packet will pass through a programmable screening algorithm which will allocate a particular queue to that frame. The user interface to the screeners is through two types of programmable registers:

- Screening Type 1 registers—The module features 4 Screening Type 1 registers. Screening Type 1 registers hold values to match against specific IP and UDP fields of the received frames. The fields matched against are DS (Differentiated Services field of IPv4 frames), TC (Traffic class field of IPv6 frames) and/or the UDP destination port.
- Screening Type 2 registers—The module features 8 Screening Type 2 registers GMAC_ST2RPQ. Screening Type 2 registers operate independently of Screening Type 1 registers and offer additional match capabilities. Screening Type 2 allows a screen to be configured that is the combination of all or any of the following comparisons:

1. An enable bit VLAN priority, VLANE. A VLAN priority match will be performed if the VLAN priority enable is set. The extracted priority field in the VLAN header is compared against VLANP in the GMAC_ST2RPQ register itself.
2. An enable bit EtherType, ETHE. The EtherType field I2ETH inside GMAC_ST2RPQ maps to one of 4 EtherType match registers, GMAC_ST2ER. The extracted EtherType is compared against GMAC_ST2ER designated by this EtherType field.
3. An enable bit Compare A, COMPAE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC_ST2CW0/1.
4. An enable bit Compare B, COMPBE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC_ST2CW0/1.
5. An enable bit Compare C, COMPCE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC_ST2CW0/1.

Each screener type has an enable bit, a match pattern and a queue number. If a received frame matches on an enabled Screening register, then the frame will be tagged with the queue value in the associated Screening register, and forwarded onto the DMA and subsequently into the external memory associated with that queue. If two screeners are matched, then the one which resides at the lowest register address will take priority so care must be taken on the selection of the screener location.

When the priority queuing feature is enabled, the number of interrupt outputs from the GEMAC core is increased to match the number of supported queues. The number of Interrupt Status registers is increased by the same number. Only DMA related events are reported using the individual interrupt outputs, as the GEMAC can relate these events to specific queues. All other events generated within the GEMAC are reported in the interrupt associated with the lowest priority queue. For the lowest priority queue (or the only queue when only 1 queue is selected), the Interrupt Status register is located at address 0x24. For all other queues, the Interrupt Status register is located at sequential addresses starting at address 0x400.

**Note:** The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See MAC Filtering Block for more details.

The additional screening done by the functions Compare A, B, and C each have an enable bit and compare register field. COMPA, COMPB and COMPC in GMAC_ST2RPQ are pointers to a configured offset (OFFSVAL), value (COMPVAL), and mask (MASKVAL). If enabled, the compare is true if the data at the offset into the frame, ANDed with MASKVAL, is equal to the value of COMPVAL ANDed with MASKVAL. A 16-bit word comparison is done. The byte at the offset number of bytes from the index start is compared to bits 7:0 of the configured COMPVAL and MASKVAL. The byte at the offset number of bytes + 1 from the index start is compared to bits 15:8 of the configured COMPVAL and MASKVAL.

The offset value in bytes, OFFSVAL, ranges from 0 to 127 bytes from either the start of the frame, the byte after the EtherType field, the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header. Note the logic to decode the IP header or the TCP/UDP header is reused from the TCP/UDP/IP checksum offload logic and therefore has the same restrictions on use (the main limitation is that IP fragmentation is not supported). Refer to the Checksum Offload for IP, TCP and UDP section of this documentation for further details.

Compare A, B, and C use a common set of 24 GMAC_ST2CW0/1 registers, thus all COMPA, COMPB and COMPC fields in the registers GMAC_ST2RPQ point to a single pool of 24 GMAC_ST2CW0/1 registers.

Note that Compare A, B and C together allow matching against an arbitrary 48 bits of data and so can be used to match against a MAC address.

All enabled comparisons are ANDed together to form the overall type 2 screening match.

### 39.6.4 MAC Transmit Block

The MAC transmitter can operate in either half duplex or full duplex mode and transmits frames in accordance with the Ethernet IEEE 802.3 standard. In half duplex mode, the CSMA/CD protocol of the IEEE 802.3 specification is followed.

A small input buffer receives data through the FIFO interface which will extract data in 32-bit form. All subsequent processing prior to the final output is performed in bytes.

Transmit data can be output using the MII interface.

Frame assembly starts by adding preamble and the start frame delimiter. Data is taken from the transmit FIFO interface a word at a time.

If necessary, padding is added to take the frame length to 60 bytes. CRC is calculated using an order 32-bit polynomial. This is inverted and appended to the end of the frame taking the frame length to a minimum of 64 bytes. If the no CRC bit is set in the second word of the last buffer descriptor of a transmit frame, neither pad nor CRC are appended. The no CRC bit can also be set through the FIFO interface.

In full duplex mode (at all data rates), frames are transmitted immediately. Back to back frames are transmitted at least 96 bit times apart to guarantee the interframe gap.

In half duplex mode, the transmitter checks carrier sense. If asserted, the transmitter waits for the signal to become inactive, and then starts transmission after the interframe gap of 96 bit times. If the collision signal is asserted during transmission, the transmitter will transmit a jam sequence of 32 bits taken from the data register and then retry transmission after the backoff time has elapsed. If the collision occurs during either the preamble or Start Frame Delimiter (SFD), then these fields will be completed prior to generation of the jam sequence.

The backoff time is based on an XOR of the 10 least significant bits of the data coming from the transmit FIFO interface and a 10-bit pseudo random number generator. The number of bits used depends on the number of collisions seen. After the first collision 1 bit is used, then the second 2 bits and so on up to the maximum of 10 bits. All 10 bits are used above ten collisions. An error will be indicated and no further attempts will be made if 16 consecutive attempts cause collision. This operation is compliant with the description in Clause 4.2.3.2.5 of the IEEE 802.3 standard which refers to the truncated binary exponential backoff algorithm.

In 10/100 mode, both collisions and late collisions are treated identically, and backoff and retry will be performed up to 16 times. This condition is reported in the transmit buffer descriptor word 1 (late collision, bit 26) and also in the Transmit Status register (late collision, bit 7). An interrupt can also be generated (if enabled) when this exception occurs, and bit 5 in the Interrupt Status register will be set.

In all modes of operation, if the transmit DMA underruns, a bad CRC is automatically appended using the same mechanism as jam insertion and the GTXER signal is asserted. For a properly configured system this should never happen and also it is impossible if configured to use the DMA with packet buffers, as the complete frame is buffered in local packet buffer memory.

By setting when bit 28 is set in the Network Configuration register, the Inter Packet Gap (IPG) may be stretched beyond 96 bits depending on the length of the previously transmitted frame and the value written to the IPG Stretch register (GMAC_IPGS). The least significant 8 bits of the IPG Stretch register multiply the previous frame length (including preamble). The next significant 8 bits (+1 so as not to get a divide by zero) divide the frame length to generate the IPG. IPG stretch only works in full duplex mode and when bit 28 is set in the Network Configuration register. The IPG Stretch register cannot be used to shrink the IPG below 96 bits.

### 39.6.5 MAC Receive Block

All processing within the MAC receive block is implemented using a 16-bit data path. The MAC receive block checks for valid preamble, FCS, alignment and length, presents received frames to the FIFO interface and stores the frame destination address for use by the address checking block.

If, during the frame reception, the frame is found to be too long, a bad frame indication is sent to the FIFO interface. The receiver logic ceases to send data to memory as soon as this condition occurs.

At end of frame reception the receive block indicates to the DMA block whether the frame is good or bad. The DMA block will recover the current receive buffer if the frame was bad.

Ethernet frames are normally stored in DMA memory complete with the FCS. Setting the FCS remove bit in the network configuration (bit 17) causes frames to be stored without their corresponding FCS. The reported frame length field is reduced by four bytes to reflect this operation.

The receive block signals to the register block to increment the alignment, CRC (FCS), short frame, long frame, jabber or receive symbol errors when any of these exception conditions occur.

If bit 26 is set in the network configuration, CRC errors will be ignored and CRC errored frames will not be discarded, though the Frame Check Sequence Errors statistic register will still be incremented. Additionally, if not enabled for jumbo frames mode, then bit[13] of the receiver descriptor word 1 will be updated to indicate the FCS validity for the particular frame. This is useful for applications such as EtherCAT whereby individual frames with FCS errors must be identified.

Received frames can be checked for length field error by setting the length field error frame discard bit of the Network Configuration register (bit-16). When this bit is set, the receiver compares a frame's measured length with the length field (bytes 13 and 14) extracted from the frame. The frame is discarded if the measured length is shorter. This checking procedure is for received frames between 64 bytes and 1518 bytes in length.

Each discarded frame is counted in the 10-bit Length Field Frame Error statistics register. Frames where the length field is greater than or equal to 0x0600 hex will not be checked.

### 39.6.6 Checksum Offload for IP, TCP and UDP

The GEMAC can be programmed to perform IP, TCP and UDP checksum offloading in both receive and transmit directions, which is enabled by setting bit 24 in the Network Configuration register for receive and bit 11 in the DMA Configuration register for transmit.

IPv4 packets contain a 16-bit checksum field, which is the 16-bit 1’s complement of the 1’s complement sum of all 16-bit words in the header. TCP and UDP packets contain a 16-bit checksum field, which is the 16-bit 1’s complement of the 1’s complement sum of all 16-bit words in the header, the data and a conceptual IP pseudo header.

To calculate these checksums in software requires each byte of the packet to be processed. For TCP and UDP this can use a large amount of processing power. Offloading the checksum calculation to hardware can result in significant performance improvements.

For IP, TCP or UDP checksum offload to be useful, the operating system containing the protocol stack must be aware that this offload is available so that it can make use of the fact that the hardware can either generate or verify the checksum.

#### 39.6.6.1 Receiver Checksum Offload

When receive checksum offloading is enabled in the GEMAC, the IPv4 header checksum is checked as per RFC 791, where the packet meets the following criteria:

- If present, the VLAN header must be four octets long and the CFI bit must not be set.
- Encapsulation must be RFC 894 Ethernet Type Encoding or RFC 1042 SNAP Encoding.
- IPv4 packet
- IP header is of a valid length

The GEMAC also checks the TCP checksum as per RFC 793, or the UDP checksum as per RFC 768, if the following criteria are met:

- IPv4 or IPv6 packet
- Good IP header checksum (if IPv4)

- No IP fragmentation
- TCP or UDP packet

When an IP, TCP or UDP frame is received, the receive buffer descriptor gives an indication if the GEMAC was able to verify the checksums. There is also an indication if the frame had SNAP encapsulation. These indication bits will replace the type ID match indication bits when the receive checksum offload is enabled. For details of these indication bits, refer to Receive Buffer Descriptor Entry.

If any of the checksums are verified as incorrect by the GEMAC, the packet is discarded and the appropriate statistics counter incremented.

#### 39.6.6.2 Transmitter Checksum Offload

The transmitter checksum offload is only available if the full store and forward mode is enabled. This is because the complete frame to be transmitted must be read into the packet buffer memory before the checksum can be calculated and written back into the headers at the beginning of the frame.

Transmitter checksum offload is enabled by setting bit [11] in the DMA Configuration register. When enabled, it will monitor the frame as it is written into the transmitter packet buffer memory to automatically detect the protocol of the frame. Protocol support is identical to the receiver checksum offload.

For transmit checksum generation and substitution to occur, the protocol of the frame must be recognized and the frame must be provided without the FCS field, by making sure that bit [16] of the transmit descriptor word 1 is clear. If the frame data already had the FCS field, this would be corrupted by the substitution of the new checksum fields.

If these conditions are met, the transmit checksum offload engine will calculate the IP, TCP and UDP checksums as appropriate. Once the full packet is completely written into packet buffer memory, the checksums will be valid and the relevant DPRAM locations will be updated for the new checksum fields as per standard IP/TCP and UDP packet structures.

If the transmitter checksum engine is prevented from generating the relevant checksums, bits [22:20] of the transmitter DMA writeback status will be updated to identify the reason for the error. Note that the frame will still be transmitted but without the checksum substitution, as typically the reason that the substitution did not occur was that the protocol was not recognized.

### 39.6.7 MAC Filtering Block

The filter block determines which frames should be written to the FIFO interface and on to the DMA.

Whether a frame is passed depends on what is enabled in the Network Configuration register, the state of the external matching pins, the contents of the specific address, type and Hash registers and the frame's destination address and type field.

If bit 25 of the Network Configuration register is not set, a frame will not be copied to memory if the GEMAC is transmitting in half duplex mode at the time a destination address is received.

Ethernet frames are transmitted a byte at a time, least significant bit first. The first six bytes (48 bits) of an Ethernet frame make up the destination address. The first bit of the destination address, which is the LSB of the first byte of the frame, is the group or individual bit. This is one for multicast addresses and zero for unicast. The all ones address is the broadcast address and a special case of multicast.

The GEMAC supports recognition of four specific addresses. Each specific address requires two registers, Specific Address Bottom register and Specific Address Top register. Specific Address Bottom register stores the first four bytes of the destination address and Specific Address Top register contains the last two bytes. The addresses stored can be specific, group, local or universal.

The destination address of received frames is compared against the data stored in the Specific Address registers once they have been activated. The addresses are deactivated at reset or when their corresponding Specific Address Bottom register is written. They are activated when Specific Address Top register is written. If a receive frame address matches an active address, the frame is written to the FIFO interface and on to DMA memory.

Frames may be filtered using the type ID field for matching. Four type ID registers exist in the register address space and each can be enabled for matching by writing a one to the MSB (bit 31) of the respective register. When a frame is received, the matching is implemented as an OR function of the various types of match.

The contents of each type ID register (when enabled) are compared against the length/type ID of the frame being received (e.g., bytes 13 and 14 in non-VLAN and non-SNAP encapsulated frames) and copied to memory if a match is found. The encoded type ID match bits (Word 0, Bit 22 and Bit 23) in the receive buffer descriptor status are set indicating which type ID register generated the match, if the receive checksum offload is disabled.

The reset state of the type ID registers is zero, hence each is initially disabled.

The following example illustrates the use of the address and type ID match registers for a MAC address of 21:43:65:87:A9:CB:

| | |
|---|---|
| Preamble | 55 |
| SFD | D5 |
| DA (Octet 0 - LSB) | 21 |
| DA (Octet 1) | 43 |
| DA (Octet 2) | 65 |
| DA (Octet 3) | 87 |
| DA (Octet 4) | A9 |
| DA (Octet 5 - MSB) | CB |
| SA (LSB) | 00(1) |
| SA | 00(1) |
| SA | 00(1) |
| SA | 00(1) |
| SA | 00(1) |
| SA (MSB) | 00(1) |
| Type ID (MSB) | 43 |
| Type ID (LSB) | 21 |

**Note:**

1. Contains the address of the transmitting device.

The sequence above shows the beginning of an Ethernet frame. Byte order of transmission is from top to bottom as shown. For a successful match to specific address 1, the following address matching registers must be set up:

- Specific Address 1 Bottom register (GMAC_SAB1) (Address 0x088) 0x87654321
- Specific Address 1 Top register (GMAC_SAT1) (Address 0x08C) 0x0000CBA9

For a successful match to the type ID, the following Type ID Match 1 register must be set up:

- Type ID Match 1 register (GMAC_TIDM1) (Address 0x0A8) 0x80004321

### 39.6.8 Broadcast Address

Frames with the broadcast address of 0xFFFFFFFFFFFF are stored to memory only if the 'no broadcast' bit in the Network Configuration register is set to zero.

### 39.6.9 Hash Addressing

The hash address register is 64 bits long and takes up two locations in the memory map. The least significant bits are stored in Hash Register Bottom and the most significant bits in Hash Register Top.

The unicast hash enable and the multicast hash enable bits in the Network Configuration register enable the reception of hash matched frames. The destination address is reduced to a 6-bit index into the 64-bit Hash register using the following hash function: The hash function is an XOR of every sixth bit of the destination address.

```
hash_index[05] = da[05] ^ da[11] ^ da[17] ^ da[23] ^ da[29] ^ da[35] ^ da[41] ^ da[47]
hash_index[04] = da[04] ^ da[10] ^ da[16] ^ da[22] ^ da[28] ^ da[34] ^ da[40] ^ da[46]
hash_index[03] = da[03] ^ da[09] ^ da[15] ^ da[21] ^ da[27] ^ da[33] ^ da[39] ^ da[45]
hash_index[02] = da[02] ^ da[08] ^ da[14] ^ da[20] ^ da[26] ^ da[32] ^ da[38] ^ da[44]
hash_index[01] = da[01] ^ da[07] ^ da[13] ^ da[19] ^ da[25] ^ da[31] ^ da[37] ^ da[43]
hash_index[00] = da[00] ^ da[06] ^ da[12] ^ da[18] ^ da[24] ^ da[30] ^ da[36] ^ da[42]
da[0]
```

represents the least significant bit of the first byte received, that is, the multicast/unicast indicator, and `da[47]` represents the most significant bit of the last byte received.

If the hash index points to a bit that is set in the Hash register then the frame will be matched according to whether the frame is multicast or unicast.

A multicast match will be signalled if the multicast hash enable bit is set, `da[0]` is logic 1 and the hash index points to a bit set in the Hash register.

A unicast match will be signalled if the unicast hash enable bit is set, `da[0]` is logic 0 and the hash index points to a bit set in the Hash register.

To receive all multicast frames, the Hash register should be set with all ones and the multicast hash enable bit should be set in the Network Configuration register.

### 39.6.10 Copy all Frames (Promiscuous Mode)

If the Copy All Frames bit is set in the Network Configuration register then all frames except those that are too long, too short, have FCS errors or have GRXER asserted during reception will be copied to memory. Frames with FCS errors will be copied if bit 26 is set in the Network Configuration register.

### 39.6.11 Disable Copy of Pause Frames

Pause frames can be prevented from being written to memory by setting the disable copying of pause frames control bit 23 in the Network Configuration register. When set, pause frames are not copied to memory regardless of the Copy All Frames bit, whether a hash match is found, a type ID match is identified or if a destination address match is found.

### 39.6.12 VLAN Support

The following table describes an Ethernet encoded 802.1Q VLAN tag.

**Table 39-5. 802.1Q VLAN Tag**

| TPID (Tag Protocol Identifier) 16 bits | TCI (Tag Control Information) 16 bits |
|---|---|
| 0x8100 | First 3 bits priority, then CFI bit, last 12 bits VID |

The VLAN tag is inserted at the 13th byte of the frame adding an extra four bytes to the frame. To support these extra four bytes, the GEMAC can accept frame lengths up to 1536 bytes by setting bit 8 in the Network Configuration register.

If the VID (VLAN identifier) is null (0x000) this indicates a priority-tagged frame.

The following bits in the receive buffer descriptor status word give information about VLAN tagged frames:-

- Bit 21 set if receive frame is VLAN tagged (i.e., type ID of 0x8100).
- Bit 20 set if receive frame is priority tagged (i.e., type ID of 0x8100 and null VID). (If bit 20 is set, bit 21 will be set also.)
- Bit 19, 18 and 17 set to priority if bit 21 is set.
- Bit 16 set to CFI if bit 21 is set.

The GEMAC can be configured to reject all frames except VLAN tagged frames by setting the discard non-VLAN frames bit in the Network Configuration register.

### 39.6.13 Wake on LAN Support

The receive block supports Wake on LAN by detecting the following events on incoming receive frames:

- Magic packet
- Address Resolution Protocol (ARP) request to the device IP address
- Specific address 1 filter match
- Multicast hash filter match

These events can be individually enabled through bits [19:16] of the Wake on LAN register. Also, for Wake on LAN detection to occur, receive enable must be set in the Network Control register, however a receive buffer does not have to be available.

In case of an ARP request, specific address 1 or multicast filter events will occur even if the frame is errored. For magic packet events, the frame must be correctly formed and error free.

A magic packet event is detected if all of the following are true:

- Magic packet events are enabled through bit 16 of the Wake on LAN register
- The frame's destination address matches specific address 1
- The frame is correctly formed with no errors
- The frame contains at least 6 bytes of 0xFF for synchronization
- There are 16 repetitions of the contents of Specific Address 1 register immediately following the synchronization

An ARP request event is detected if all of the following are true:

- ARP request events are enabled through bit 17 of the Wake on LAN register
- Broadcasts are allowed by bit 5 in the Network Configuration register
- The frame has a broadcast destination address (bytes 1 to 6)
- The frame has a type ID field of 0x0806 (bytes 13 and 14)

- The frame has an ARP operation field of 0x0001 (bytes 21 and 22)
- The least significant 16 bits of the frame's ARP target protocol address (bytes 41 and 42) match the value programmed in bits[15:0] of the Wake on LAN register

The decoding of the ARP fields adjusts automatically if a VLAN tag is detected within the frame. The reserved value of 0x0000 for the Wake on LAN target address value will not cause an ARP request event, even if matched by the frame.

A specific address 1 filter match event will occur if all of the following are true:

- Specific address 1 events are enabled through bit 18 of the Wake on LAN register
- The frame's destination address matches the value programmed in the Specific Address 1 registers

A multicast filter match event will occur if all of the following are true:

- Multicast hash events are enabled through bit 19 of the Wake on LAN register
- Multicast hash filtering is enabled through bit 6 of the Network Configuration register
- The frame destination address matches against the multicast hash filter
- The frame destination address is not a broadcast

### 39.6.14 IEEE 1588 Support

IEEE 1588 is a standard for precision time synchronization in local area networks. It works with the exchange of special Precision Time Protocol (PTP) frames. The PTP messages can be transported over IEEE 802.3/Ethernet, over Internet Protocol Version 4 or over Internet Protocol Version 6 as described in the annex of IEEE P1588.D2.1.

The GEMAC indicates the message timestamp point (asserted on the start packet delimiter and de-asserted at end of frame) for all frames and the passage of PTP event frames (asserted when a PTP event frame is detected and de-asserted at end of frame).

IEEE 802.1AS is a subset of IEEE 1588. One difference is that IEEE 802.1AS uses the Ethernet multicast address 0180C200000E for sync frame recognition whereas IEEE 1588 does not. GEMAC is designed to recognize sync frames with both IEEE 802.1AS and IEEE 1588 addresses and so can support both 1588 and 802.1AS frame recognition simultaneously.

Synchronization between master and slave clocks is a two stage process.

First, the offset between the master and slave clocks is corrected by the master sending a sync frame to the slave with a follow up frame containing the exact time the sync frame was sent. Hardware assist modules at the master and slave side detect exactly when the sync frame was sent by the master and received by the slave. The slave then corrects its clock to match the master clock.

Second, the transmission delay between the master and slave is corrected. The slave sends a delay request frame to the master which sends a delay response frame in reply. Hardware assist modules at the master and slave side detect exactly when the delay request frame was sent by the slave and received by the master. The slave will now have enough information to adjust its clock to account for delay. For example, if the slave was assuming zero delay, the actual delay will be half the difference between the transmit and receive time of the delay request frame (assuming equal transmit and receive times) because the slave clock will be lagging the master clock by the delay time already.

The timestamp is taken when the message timestamp point passes the clock timestamp point. This can generate an interrupt if enabled (GMAC_IER). However, MAC Filtering configuration is needed to actually ‘copy’ the message to memory. For Ethernet, the message timestamp point is the SFD and the clock timestamp point is the MII interface. (The IEEE 1588 specification refers to sync and delay_req messages as event messages as these require timestamping. These events are captured in the registers

GMAC_EFTx and GMAC_EFRx, respectively. Follow up, delay response and management messages do not require timestamping and are referred to as general messages.)

1588 version 2 defines two additional PTP event messages. These are the peer delay request (Pdelay_Req) and peer delay response (Pdelay_Resp) messages. These events are captured in the registers GMAC_PEFTx and GMAC_PEFRx, respectively. These messages are used to calculate the delay on a link. Nodes at both ends of a link send both types of frames (regardless of whether they contain a master or slave clock). The Pdelay_Resp message contains the time at which a Pdelay_Req was received and is itself an event message. The time at which a Pdelay_Resp message is received is returned in a Pdelay_Resp_Follow_Up message.

1588 version 2 introduces transparent clocks of which there are two kinds, peer-to-peer (P2P) and end-to-end (E2E). Transparent clocks measure the transit time of event messages through a bridge and amend a correction field within the message to allow for the transit time. P2P transparent clocks additionally correct for the delay in the receive path of the link using the information gathered from the peer delay frames. With P2P transparent clocks delay_req messages are not used to measure link delay. This simplifies the protocol and makes larger systems more stable.

The GEMAC recognizes four different encapsulations for PTP event messages:

1. 1588 version 1 (UDP/IPv4 multicast)
2. 1588 version 2 (UDP/IPv4 multicast)
3. 1588 version 2 (UDP/IPv6 multicast)
4. 1588 version 2 (Ethernet multicast)

**Table 39-6. Example of Sync Frame in 1588 Version 1 Format**

| Frame Segment | Value |
|---|---|
| Preamble/SFD | 55555555555555D5 |
| DA (Octets 0–5) | – |
| SA (Octets 6–11) | – |
| Type (Octets 12–13) | 0800 |
| IP stuff (Octets 14–22) | – |
| UDP (Octet 23) | 11 |
| IP stuff (Octets 24–29) | – |
| IP DA (Octets 30–32) | E00001 |
| IP DA (Octet 33) | 81 or 82 or 83 or 84 |
| Source IP port (Octets 34–35) | – |
| Dest IP port (Octets 36–37) | 013F |
| Other stuff (Octets 38–42) | – |
| Version PTP (Octet 43) | 01 |
| Other stuff (Octets 44–73) | – |
| Control (Octet 74) | 00 |
| Other stuff (Octets 75–168) | – |

**Table 39-7. Example of Delay Request Frame in 1588 Version 1 Format**

| Frame Segment | Value |
|---|---|
| Preamble/SFD | 55555555555555D5 |
| DA (Octets 0–5) | – |
| SA (Octets 6–11) | – |
| Type (Octets 12–13) | 0800 |
| IP stuff (Octets 14–22) | – |
| UDP (Octet 23) | 11 |
| IP stuff (Octets 24–29) | – |
| IP DA (Octets 30–32) | E00001 |
| IP DA (Octet 33) | 81 or 82 or 83 or 84 |
| Source IP port (Octets 34–35) | – |
| Dest IP port (Octets 36–37) | 013F |
| Other stuff (Octets 38–42) | – |
| Version PTP (Octet 43) | 01 |
| Other stuff (Octets 44–73) | – |
| Control (Octet 74) | 01 |
| Other stuff (Octets 75–168) | – |

For 1588 version 1 messages, sync and delay request frames are indicated by the GEMAC if the frame type field indicates TCP/IP, UDP protocol is indicated, the destination IP address is 224.0.1.129/130/131 or 132, the destination UDP port is 319 and the control field is correct.

The control field is 0x00 for sync frames and 0x01 for delay request frames.

For 1588 version 2 messages, the type of frame is determined by looking at the message type field in the first byte of the PTP frame. Whether a frame is version 1 or version 2 can be determined by looking at the version PTP field in the second byte of both version 1 and version 2 PTP frames.

In version 2 messages sync frames have a message type value of 0x0, delay_req have 0x1, Pdelay_Req have 0x2 and Pdelay_Resp have 0x3.

**Table 39-8. Example of Sync Frame in 1588 Version 2 (UDP/IPv4) Format**

| SA (Octets 6–11) | – |
| Type (Octets 12–13) | 88F7 |
| Message type (Octet 14) | 00 |
| Version PTP (Octet 15) | 02 |

### 39.6.15 Timestamp Unit

The TSU consists of a timer and registers to capture the time at which PTP event frames cross the message timestamp point. An interrupt is issued when a capture register is updated.

The timer is implemented as a 94-bit register with the upper 48 bits counting seconds, the next 30 bits counting nanoseconds and the lowest 16 bits counting sub-nanoseconds. The lower 46 bits rolls over when they have counted to one second. An interrupt is generated when the seconds increment. The timer value can be read, written and adjusted through the APB interface. The timer is clocked by MCK.

The amount by which the timer increments each clock cycle is controlled by the timer increment registers (GMAC_TI). Bits 7:0 are the default increment value in nanoseconds and an additional 16 bits of sub-nanosecond resolution are available using the Timer Increment Sub-nanoseconds register (GMAC_TISUBN). If the rest of the register is written with zero, the timer increments by the value in [7:0], plus the value of GMAC_TISUBN, each clock cycle.

The GMAC_TISUBN register allows a resolution of approximately 15 femtoseconds.

Bits 15:8 of the increment register are the alternative increment value in nanoseconds and bits 23:16 are the number of increments after which the alternative increment value is used. If 23:16 are zero then the alternative increment value will never be used.

Taking the example of 10.2 MHz, there are 102 cycles every ten microseconds or 51 every five microseconds. So a timer with a 10.2 MHz clock source is constructed by incrementing by 98 ns for fifty cycles and then incrementing by 100 ns (98 × 50 + 100 = 5000). This is programmed by setting the 1588 Timer Increment register to 0x00326462.

For a 49.8 MHz clock source it would be 20 ns for 248 cycles followed by an increment of 40 ns (20 × 248 + 40 = 5000) programmed as 0x00F82814.

Having eight bits for the “number of increments” field allows frequencies up to 50 MHz to be supported with 200 kHz resolution.

Without the alternative increment field the period of the clock would be limited to an integer number of nanoseconds, resulting in supported clock frequencies of 8, 10, 20, 25, 40, 50, 100, 125, 200 and 250 MHz.

There are eight additional 80-bit registers that capture the time at which PTP event frames are transmitted and received. An interrupt is issued when these registers are updated. The TSU timer count value can be compared to a programmable comparison value. For the comparison, the 48 bits of the seconds value and the upper 22 bits of the nanoseconds value are used. A signal (GTSUCOMP) is provided to indicate when the TSU timer count value is equal to the comparison value stored in the TSU timer comparison value registers (0x0DC, 0x0E0, and 0x0E4). The GTSUCOMP signal can be routed to the Timer peripheral to automatically toggle pin TOIA11/PD21. This can be used as the reference clock for an external PLL to regenerate the audio clock in Ethernet AVB. An interrupt can also be generated (if enabled) when the TSU timer count value and comparison value are equal, mapped to bit 29 of the Interrupt Status register.

### 39.6.16 MAC 802.3 Pause Frame Support

**Note:** See Clause 31, and Annex 31A and 31B of the IEEE standard 802.3 for a full description of MAC 802.3 pause operation.

The following table shows the start of a MAC 802.3 pause frame.

**Table 39-14. Start of an 802.3 Pause Frame**

| Address | | Type (MAC Control Frame) | Pause | |
|---|---|---|---|---|
| Destination | Source | | Opcode | Time |
| 0x0180C2000001 | 6 bytes | 0x8808 | 0x0001 | 2 bytes |

The GEMAC supports both hardware controlled pause of the transmitter, upon reception of a pause frame, and hardware generated pause frame transmission.

#### 39.6.16.1 802.3 Pause Frame Reception

Bit 13 of the Network Configuration register is the pause enable control for reception. If this bit is set, transmission pauses if a non zero pause quantum frame is received.

If a valid pause frame is received, then the Pause Time register is updated with the new frame's pause time, regardless of whether a previous pause frame is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register.

Once the Pause Time register is loaded and the frame currently being transmitted has been sent, no new frames are transmitted until the pause time reaches zero. The loading of a new pause time, and hence the pausing of transmission, only occurs when the GEMAC is configured for full duplex operation. If the GEMAC is configured for half duplex there will be no transmission pause, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of

0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0001.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. 802.3 Pause frames that are received after Priority-based Flow Control (PFC) has been negotiated will also be discarded. Valid pause frames received will increment the Pause Frames Received statistic register.

The Pause Time register decrements every 512 bit times once transmission has stopped. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GTXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

#### 39.6.16.2 802.3 Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit pause frame bits of the Network Control register. If either bit 11 or bit 12 of the Network Control register is written with logic 1, an 802.3 pause frame will be transmitted, providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 00-01
- A Pause Quantum register
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The pause quantum used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 11 is written with a one, the pause quantum will be taken from the Transmit Pause Quantum register. The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.
- If bit 12 is written with a one, the pause quantum will be zero.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only the statistics register Pause Frames Transmitted is incremented.

Pause frames can also be transmitted by the MAC using normal frame transmission methods.

### 39.6.17 MAC PFC Priority-based Pause Frame Support

**Note:** Refer to the 802.1Qbb standard for a full description of priority-based pause operation.

The following table shows the start of a Priority-based Flow Control (PFC) pause frame.

**Table 39-15. Start of a PFC Pause Frame**

| Address | | Type (Mac Control Frame) | Pause Opcode | Priority Enable Vector | Pause Time |
|---|---|---|---|---|---|
| Destination | Source | | | | |
| 0x0180C2000001 | 6 bytes | 0x8808 | 0x1001 | 2 bytes | 8 × 2 bytes |

The GEMAC supports PFC priority-based pause transmission and reception. Before PFC pause frames can be received, bit 16 of the Network Control register must be set.

#### 39.6.17.1 PFC Pause Frame Reception

The ability to receive and decode priority-based pause frames is enabled by setting bit 16 of the Network Control register. When this bit is set, the GEMAC will match either classic 802.3 pause frames or PFC priority-based pause frames. Once a priority-based pause frame has been received and matched, then from that moment on the GEMAC will only match on priority-based pause frames (this is an 802.1Qbb requirement, known as PFC negotiation). Once priority-based pause has been negotiated, any received 802.3x format pause frames will not be acted upon.

If a valid priority-based pause frame is received then the GEMAC will decode the frame and determine which, if any, of the eight priorities require to be paused. Up to eight Pause Time registers are then updated with the eight pause times extracted from the frame regardless of whether a previous pause operation is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register. The loading of a new pause time only occurs when the GEMAC is configured for full duplex operation. If the GEMAC is configured for half duplex, the pause time counters will not be loaded, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of 0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0101.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. Valid pause frames received will increment the Pause Frames Received Statistic register.

The Pause Time registers decrement every 512 bit times immediately following the PFC frame reception. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GRXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

#### 39.6.17.2 PFC Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit priority-based pause frame bit of the Network Control register. If bit 17 of the Network Control register is written with logic 1, a PFC pause frame will be transmitted providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register. When bit 17 of the Network Control register is set, the fields of the priority-based pause frame will be built using the values stored in the Transmit PFC Pause register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 01-01
- A priority enable vector taken from Transmit PFC Pause register
- 8 Pause Quantum registers
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The Pause Quantum registers used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 17 of the Network Control register is written with a one, then the priority enable vector of the priority-based pause frame will be set equal to the value stored in the Transmit PFC Pause register [7:0]. For each entry equal to zero in the Transmit PFC Pause register [15:8], the pause quantum field of the pause frame associated with that entry will be taken from the Transmit Pause Quantum register. For each entry equal to one in the Transmit PFC Pause register [15:8], the pause quantum associated with that entry will be zero.
- The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only statistics register that will be incremented will be the Pause Frames Transmitted register.

PFC Pause frames can also be transmitted by the MAC using normal frame transmission methods.

### 39.6.18 Energy-efficient Ethernet Support

IEEE 802.3az adds support for energy efficiency to Ethernet. These are the key features of 802.3az:

- Allows a system’s transmit path to enter a low power mode if there is nothing to transmit.
- Allows a PHY to detect whether its link partner’s transmit path is in low power mode, therefore allowing the system’s receive path to enter low power mode.
- Link remains up during lower power mode and no frames are dropped.
- Asymmetric, one direction can be in low power mode while the other is transmitting normally.
- LPI (Low Power Idle) signaling is used to control entry and exit to and from low power modes.
- LPI signaling can only take place if both sides have indicated support for it through auto-negotiation.

These are the key features of 802.3az operation:

- Low power control is done at the MII (reconciliation sublayer).
- As an architectural convenience in writing the 802.3az it is assumed that transmission is deferred by asserting carrier sense, in practice it will not be done this way. This system will know when it has nothing to transmit and only enter low power mode when it is not transmitting.
- LPI should not be requested unless the link has been up for at least one second.
- LPI is signaled on the transmit path by asserting 0x01 on txd with tx_en low and tx_er high.
- A PHY on seeing LPI requested on the MII will send the sleep signal before going quiet. After going quiet it will periodically transmit refresh signals.

- LPI mode ends by transmitting normal idle for the wake time. There is a default time for this but it can be adjusted in software using the Link Layer Discovery Protocol (LLDP) described in Clause 79 of 802.3az.
- LPI is indicated at the receive side when sleep and refresh signaling has been detected.

### 39.6.19 802.1Qav Support - Credit-based Shaping

A credit-based shaping algorithm is available on the two highest priority queues and is defined in the standard 802.1Qav: Forwarding and Queuing Enhancements for Time-Sensitive Streams. This allows traffic on these queues to be limited and to allow other queues to transmit.

Traffic shaping is enabled via the CBS (Credit Based Shaping) Control register. This enables a counter which stores the amount of transmit 'credit', measured in bytes that a particular queue has. A queue may only transmit if it has non-negative credit. If a queue has data to send, but is held off from doing as another queue is transmitting, then credit will accumulate in the credit counter at the rate defined in the IdleSlope register (GMAC_CBSISQx) for that queue.

**portTransmitRate** is the transmission rate, in bits per second, that the underlying MAC service that supports transmission through the Port provides. The value of this parameter is determined by the operation of the MAC.

**IdleSlope** is the rate of change of increasing credit when waiting to transmit and must be less than the value of the portTransmitRate.

The max value of IdleSlope (or sendSlope) is (portTransmitRate / bits_per_MII_Clock).

In case of 100Mbps, maximum IdleSlope = (100Mbps / 4) = 0x17D7840.

When this queue is transmitting, the credit counter is decremented at the rate of sendSlope, which is defined as (portTransmitRate - IdleSlope). A queue can accumulate negative credit when transmitting which will hold off any other transfers from that queue until credit returns to a non-negative value. No transfers are halted when a queue's credit becomes negative; it will accumulate negative credit until the transfer completes.

The highest priority queue always has priority regardless of which queue has the most credit.

### 39.6.20 LPI Operation in the GEMAC

It is best to use firmware to control LPI. LPI operation happens at the system level. Firmware gives maximum control and flexibility of operation. LPI operation is straightforward and firmware should be capable of responding within the required timeframes.

Autonegotiation:

1. Indicate EEE capability using next page autonegotiation.

For the transmit path:

1. If the link has been up for 1 second and there is nothing being transmitted, write to the TXLPIEN bit in the Network Control register.
2. Wake up by clearing the TXLPIEN bit in the Network Control register.

For the receive path:

1. Enable RXLPISBC bit in GMAC_IER. The bit RXLPIS is set in Network Status Register triggering an interrupt.
2. Wait for an interrupt to indicate that LPI has been received.
3. Disable relevant parts of the receive path if desired.

4. The RXLPIS bit in Network Status Register gets cleared to indicate that regular idle has been received. This triggers an interrupt.
5. Re-enable the receive path.

### 39.6.21 PHY Interface

Different PHY interfaces are supported by the Ethernet MAC:

- MII
- RMII

The MII interface is provided for 10/100 operation and uses txd[3:0] and rxd[3:0]. The RMII interface is provided for 10/100 operation and uses txd[1:0] and rxd[1:0].

### 39.6.22 10/100 Operation

The 10/100Mbps speed bit in the Network Configuration register is used to select between 10Mbps and 100Mbps.

### 39.6.23 Jumbo Frames

The jumbo frames enable bit in the Network Configuration register allows the GEMAC, in its default configuration, to receive jumbo frames up to 10240 bytes in size. This operation does not form part of the IEEE 802.3 specification and is normally disabled. When jumbo frames are enabled, frames received with a frame size greater than 10240 bytes are discarded.

## 39.7 Programming Interface

### 39.7.1 Initialization

#### 39.7.1.1 Configuration

Initialization of the GEMAC configuration (e.g., loop back mode, frequency ratios) must be done while the transmit and receive circuits are disabled. See the description of the Network Control register and Network Configuration register earlier in this document.

To change loop back mode, the following sequence of operations must be followed:

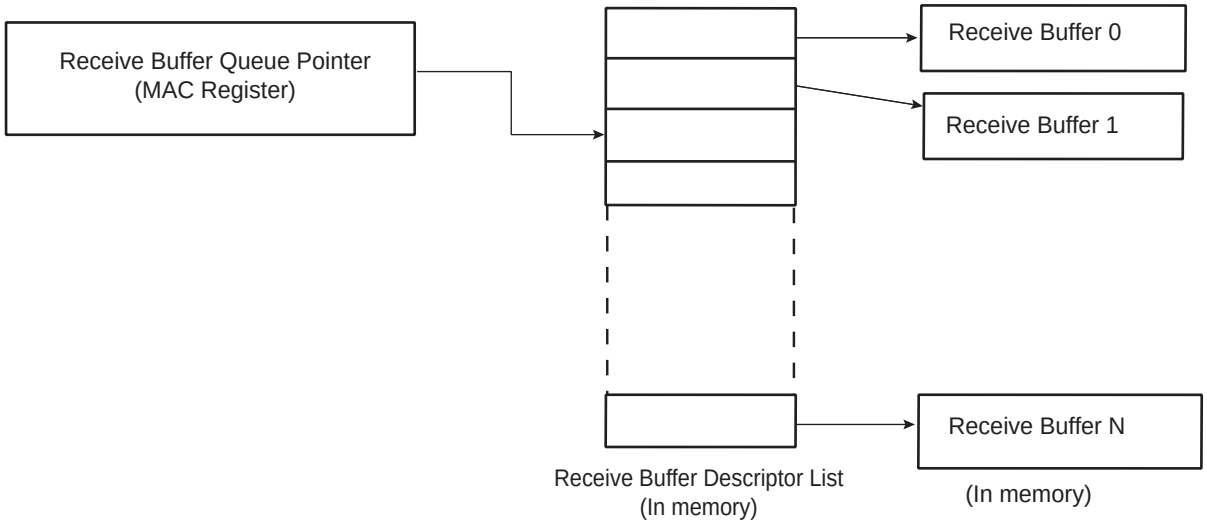
1. Write to Network Control register to disable transmit and receive circuits.
2. Write to Network Control register to change loop back mode.
3. Write to Network Control register to re-enable transmit or receive circuits.
   **Note:** These writes to the Network Control register cannot be combined in any way.

#### 39.7.1.2 Receive Buffer List

Receive data is written to areas of data (i.e., buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (receive buffer queue) is a sequence of descriptor entries as defined in Receive Buffer Descriptor Entry.

The Receive Buffer Queue Pointer register points to this data structure.

**Figure 39-3. Receive Buffer List**



To create the list of buffers:

1. Allocate a number (N) of buffers of X bytes in system memory, where X is the DMA buffer length programmed in the DMA Configuration register.
2. Allocate an area 8N bytes for the receive buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GEMAC, i.e., bit 0 of word 0 set to 0.
3. Mark the last descriptor in the queue with the wrap bit (bit 1 in word 0 set to 1).
4. Write address of receive buffer descriptor list and control information to GEMAC register receive buffer queue pointer
5. The receive circuits can then be enabled by writing to the address recognition registers and the Network Control register.
   **Note:** The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

#### 39.7.1.3 Transmit Buffer List

Transmit data is read from areas of data (the buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (Transmit Buffer Queue) is a sequence of descriptor entries as defined in Transmit Buffer Descriptor Entry.

The Transmit Buffer Queue Pointer register points to this data structure.

To create this list of buffers:

1. Allocate a number (N) of buffers of between 1 and 2047 bytes of data to be transmitted in system memory. Up to 128 buffers per frame are allowed.
2. Allocate an area 8N bytes for the transmit buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GEMAC, i.e., bit 31 of word 1 set to 0.
3. Mark the last descriptor in the queue with the wrap bit (bit 30 in word 1 set to 1).
4. Write address of transmit buffer descriptor list and control information to GEMAC register transmit buffer queue pointer.
5. The transmit circuits can then be enabled by writing to the Network Control register.
   **Note:** The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

#### 39.7.1.4 Address Matching

The GEMAC Hash register pair and the four Specific Address register pairs must be written with the required values. Each register pair comprises of a bottom register and top register, with the bottom register being written first. The address matching is disabled for a particular register pair after the bottom register has been written and re-enabled when the top register is written. Each register pair may be written at any time, regardless of whether the receive circuits are enabled or disabled.

As an example, to set Specific Address 1 register to recognize destination address 21:43:65:87:A9:CB, the following values are written to Specific Address 1 Bottom register and Specific Address 1 Top register:

- Specific Address 1 Bottom register bits 31:0 (0x98): 0x8765_4321.
- Specific Address 1 Top register bits 31:0 (0x9C): 0x0000_CBA9.

**Note:** The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See Priority Queueing in the DMA for more details.

#### 39.7.1.5 PHY Maintenance

The PHY Maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit two is set in the Network Status register (about 2000 MCK cycles later when bits 18:16 are set to 010 in the Network Configuration register). An interrupt is generated as this bit is set.

During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each Management Data Clock (MDC) cycle. This causes the transmission of a PHY management frame on MDIO. See section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation will return the current contents of the shift register. At the end of the management operation the bits will have shifted back to their original locations. For a read operation the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The Management Data Clock (MDC) should not toggle faster than 2.5 MHz (minimum period of 400 ns), as defined by the IEEE 802.3 standard. MDC is generated by dividing down MCK. Three bits in the Network Configuration register determine by how much MCK should be divided to produce MDC.

#### 39.7.1.6 Interrupts

There are 18 interrupt conditions that are detected within the GEMAC. The conditions are ORed to make multiple interrupts. Depending on the overall system design this may be passed through a further level of interrupt collection (interrupt controller). On receipt of the interrupt signal, the CPU enters the interrupt handler. Refer to the device interrupt controller documentation to identify that it is the GEMAC that is generating the interrupt. To ascertain which interrupt, read the Interrupt Status register. Note that in the default configuration this register will clear itself after being read, though this may be configured to be write-one-to-clear if desired.

At reset all interrupts are disabled. To enable an interrupt, write to Interrupt Enable register with the pertinent interrupt bit set to 1. To disable an interrupt, write to Interrupt Disable register with the pertinent interrupt bit set to 1. To check whether an interrupt is enabled or disabled, read Interrupt Mask register. If the bit is set to 1, the interrupt is disabled.

#### 39.7.1.7 Transmitting Frames

The procedure to set up a frame for transmission is the following:

1. Enable transmit in the Network Control register.

2. Allocate an area of system memory for transmit data. This does not have to be contiguous, varying byte lengths can be used if they conclude on byte borders.
3. Set-up the transmit buffer list by writing buffer addresses to word zero of the transmit buffer descriptor entries and control and length to word one.
4. Write data for transmission into the buffers pointed to by the descriptors.
5. Write the address of the first buffer descriptor to transmit buffer descriptor queue pointer.
6. Enable appropriate interrupts.
7. Write to the transmit start bit (TSTART) in the Network Control register.

#### 39.7.1.8 Receiving Frames

When a frame is received and the receive circuits are enabled, the GEMAC checks the address and, in the following cases, the frame is written to system memory:

- If it matches one of the four Specific Address registers.
- If it matches one of the four Type ID registers.
- If it matches the hash address function.
- If it is a broadcast address (0xFFFFFFFFFFFF) and broadcasts are allowed.
- If the GEMAC is configured to “copy all frames”.

The register receive buffer queue pointer points to the next entry in the receive buffer descriptor list and the GEMAC uses this as the address in system memory to write the frame to.

Once the frame has been completely and successfully received and written to system memory, the GEMAC then updates the receive buffer descriptor entry (see Receive Buffer Descriptor Entry) with the reason for the address match and marks the area as being owned by software. Once this is complete, a receive complete interrupt is set. Software is then responsible for copying the data to the application area and releasing the buffer (by writing the ownership bit back to 0).

If the GEMAC is unable to write the data at a rate to match the incoming frame, then a receive overrun interrupt is set. If there is no receive buffer available, i.e., the next buffer is still owned by software, a receive buffer not available interrupt is set. If the frame is not successfully received, a statistics register is incremented and the frame is discarded without informing software.

### 39.7.2 Statistics Registers

Statistics registers are described in the User Interface beginning with GMAC Octets Transmitted Low Register and ending with GMAC UDP Checksum Errors Register.

The statistics register block begins at 0x100 and runs to 0x1B0, and comprises the registers listed below.

| | |
|---|---|
| Octets Transmitted Low Register | Broadcast Frames Received Register |
| Octets Transmitted High Register | Multicast Frames Received Register |
| Frames Transmitted Register | Pause Frames Received Register |
| Broadcast Frames Transmitted Register | 64 Byte Frames Received Register |
| Multicast Frames Transmitted Register | 65 to 127 Byte Frames Received Register |
| Pause Frames Transmitted Register | 128 to 255 Byte Frames Received Register |
| 64 Byte Frames Transmitted Register | 256 to 511 Byte Frames Received Register |
| 65 to 127 Byte Frames Transmitted Register | 512 to 1023 Byte Frames Received Register |

| | |
|---|---|
| 128 to 255 Byte Frames Transmitted Register | 1024 to 1518 Byte Frames Received Register |
| 256 to 511 Byte Frames Transmitted Register | 1519 to Maximum Byte Frames Received Register |
| 512 to 1023 Byte Frames Transmitted Register | Undersize Frames Received Register |
| 1024 to 1518 Byte Frames Transmitted Register | Oversize Frames Received Register |
| Greater Than 1518 Byte Frames Transmitted Register | Jabbers Received Register |
| Transmit Underruns Register | Frame Check Sequence Errors Register |
| Single Collision Frames Register | Length Field Frame Errors Register |
| Multiple Collision Frames Register | Receive Symbol Errors Register |
| Excessive Collisions Register | Alignment Errors Register |
| Late Collisions Register | Receive Resource Errors Register |
| Deferred Transmission Frames Register | Receive Overrun Register |
| Carrier Sense Errors Register | IP Header Checksum Errors Register |
| Octets Received Low Register | TCP Checksum Errors Register |
| Octets Received High Register | UDP Checksum Errors Register |
| Frames Received Register | |

These registers reset to zero on a read and stick at all ones when they count to their maximum value. They should be read frequently enough to prevent loss of data.

The receive statistics registers are only incremented when the receive enable bit (RXEN) is set in the Network Control register.

Once a statistics register has been read, it is automatically cleared. When reading the Octets Transmitted and Octets Received registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

## 39.8 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | GMAC_NCR | 7:0 | WESTAT | INCSTAT | CLRSTAT | MPE | TXEN | RXEN | LBL | |

|---|---|---|---|---|---|---|---|---|
| | SRTSM | | | TXZQPF | TXPF | THALT | TSTART | BP |
| Access | R/W | | | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WESTAT | INCSTAT | CLRSTAT | MPE | TXEN | RXEN | LBL | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

**Bit 19 – TXLPIEN** Enable LPI Transmission
When set, LPI (low power idle) is immediately transmitted.

**Bit 18 – FNP** Flush Next Packet
Flush the next packet from the external RX DPRAM. Writing one to this bit will only have an effect if the DMA is not currently writing a packet already stored in the DPRAM to memory.

**Bit 17 – TXPBPF** Transmit PFC Priority-based Pause Frame
Takes the values stored in the Transmit PFC Pause Register.

**Bit 16 – ENPBPR** Enable PFC Priority-based Pause Reception
Enables PFC Priority Based Pause Reception capabilities. Setting this bit enables PFC negotiation and recognition of priority-based pause frames.

**Bit 15 – SRTSM** Store Receive Timestamp to Memory

| Value | Description |
|---|---|
| 0 | Normal operation. |
| 1 | Causes the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message timestamp point. Note that bit RFCS in register GMAC_NCFGR may not be set to 1 when the timer should be captured. |

**Bit 12 – TXZQPF** Transmit Zero Quantum Pause Frame
Writing one to this bit causes a pause frame with zero quantum to be transmitted.

**Bit 11 – TXPF** Transmit Pause Frame
Writing one to this bit causes a pause frame to be transmitted.

**Bit 10 – THALT** Transmit Halt
Writing one to this bit halts transmission as soon as any ongoing frame transmission ends.

**Bit 9 – TSTART** Start Transmission
Writing one to this bit starts transmission.

**Bit 8 – BP** Back pressure
If set in 10M or 100M half duplex mode, forces collisions on all received frames.

**Bit 7 – WESTAT** Write Enable for Statistics Registers
Setting this bit to one makes the statistics registers writable for functional test purposes.

**Bit 6 – INCSTAT** Increment Statistics Registers
This bit is write-only. Writing a one increments all the statistics registers by one for test purposes.

**Bit 5 – CLRSTAT** Clear Statistics Registers
This bit is write-only. Writing a one clears the statistics registers.

**Bit 4 – MPE** Management Port Enable
Set to one to enable the management port. When zero, forces MDIO to high impedance state and MDC low.

**Bit 3 – TXEN** Transmit Enable
When set, TXEN enables the GMAC transmitter to send data. When reset transmission will stop immediately, the transmit pipeline and control registers will be cleared and the Transmit Queue Pointer Register will reset to point to the start of the transmit descriptor list.

**Bit 2 – RXEN** Receive Enable
When set, RXEN enables the GMAC to receive data. When reset frame reception stops immediately and the receive pipeline will be cleared. The Receive Queue Pointer Register is unaffected.

**Bit 1 – LBL** Loop Back Local
Connects GTX to GRX, GTXEN to GRXDV and forces full duplex mode. GRXCK and GTXCK may malfunction as the GMAC is switched into and out of internal loop back. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loop back.

|---|---|---|---|---|---|---|---|---|
| | DCPF | DBW[1:0] | | CLK[2:0] | | | RFCS | LFERD |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RXBUFO[1:0] | | PEN | RTY | | | | MAXFS |
| Access | R/W | R/W | R/W | R/W | | | | R/W |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNIHEN | MTIHEN | NBC | CAF | JFRAME | DNVLAN | FD | SPD |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 30 – IRXER** Ignore IPG GRXER
When set, GRXER has no effect on the GMAC's operation when GRXDV is low.

**Bit 29 – RXBP** Receive Bad Preamble
When set, frames with non-standard preamble are not rejected.

**Bit 28 – IPGSEN** IP Stretch Enable
When set, the transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG Stretch Register.

**Bit 26 – IRXFCS** Ignore RX FCS
When set, frames with FCS/CRC errors will not be rejected. FCS error statistics will still be collected for frames with bad FCS and FCS status will be recorded in frame’s DMA descriptor. For normal operation this bit must be set to zero.

**Bit 25 – EFRHD** Enable Frames Received in Half Duplex
Enable frames to be received in half-duplex mode while transmitting.

**Bit 24 – RXCOEN** Receive Checksum Offload Enable
When set, the receive checksum engine is enabled. Frames with bad IP, TCP or UDP checksums are discarded.

**Bit 23 – DCPF** Disable Copy of Pause Frames
Set to one to prevent valid pause frames being copied to memory. When set, pause frames are not copied to memory regardless of the state of the Copy All Frames bit, whether a hash match is found or whether a type ID match is identified. If a destination address match is found, the pause frame will be copied to memory. Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required.

**Bits 22:21 – DBW[1:0]** Data Bus Width
Should always be written to '0'.

**Bits 20:18 – CLK[2:0]** MDC CLock Division
Set according to MCK speed. These three bits determine the number MCK will be divided by to generate Management Data Clock (MDC). For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

| Value | Name | Description |
|---|---|---|
| 0 | MCK_8 | MCK divided by 8 (MCK up to 20 MHz) |
| 1 | MCK_16 | MCK divided by 16 (MCK up to 40 MHz) |
| 2 | MCK_32 | MCK divided by 32 (MCK up to 80 MHz) |
| 3 | MCK_48 | MCK divided by 48 (MCK up to 120 MHz) |
| 4 | MCK_64 | MCK divided by 64 (MCK up to 160 MHz) |
| 5 | MCK_96 | MCK divided by 96 (MCK up to 240 MHz) |

**Bit 17 – RFCS** Remove FCS
Setting this bit will cause received frames to be written to memory without their frame check sequence (last 4 bytes). The frame length indicated will be reduced by four bytes in this mode.

**Bit 16 – LFERD** Length Field Error Frame Discard
Setting this bit causes frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame) to be discarded. This only applies to frames with a length field less than 0x0600.

**Bits 15:14 – RXBUFO[1:0]** Receive Buffer Offset
Indicates the number of bytes by which the received data is offset from the start of the receive buffer

**Bit 13 – PEN** Pause Enable
When set, transmission will pause if a non-zero 802.3 classic pause frame is received and PFC has not been negotiated.

**Bit 12 – RTY** Retry Test
Must be set to zero for normal operation. If set to one the backoff between collisions will always be one slot time. Setting this bit to one helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every GRXCK cycle.

**Bit 8 – MAXFS** 1536 Maximum Frame Size
Setting this bit means the GMAC will accept frames up to 1536 bytes in length. Normally the GMAC would reject any frame above 1518 bytes.

**Bit 7 – UNIHEN** Unicast Hash Enable
When set, unicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

**Bit 6 – MTIHEN** Multicast Hash Enable
When set, multicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

**Bit 5 – NBC** No Broadcast
When set to logic one, frames addressed to the broadcast address of all ones will not be accepted.

**Bit 4 – CAF** Copy All Frames
When set to logic one, all valid frames will be accepted.

**Bit 3 – JFRAME** Jumbo Frame Size
Set to one to enable jumbo frames up to 10240 bytes to be accepted. The default length is 10240 bytes.

**Bit 2 – DNVLAN** Discard Non-VLAN FRAMES
When set only VLAN tagged frames will be passed to the address matching logic.

**Bit 1 – FD** Full Duplex
If set to logic one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

**Bit 0 – SPD** Speed
Set to logic one to indicate 100 Mbps operation, logic zero for 10 Mbps.

### 39.8.3 GMAC Network Status Register

**Name:** GMAC_NSR
**Offset:** 0x008
**Reset:** 0x000001x0
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RXLPIS | | | | | IDLE | MDIO | |
| Access | R | | | | | R | R | |
| Reset | 0 | | | | | 0 | 0 | |

**Bit 7 – RXLPIS** LPI Indication
Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes.

**Bit 2 – IDLE** PHY Management Logic Idle
The PHY management logic is idle (i.e., has completed).

**Bit 1 – MDIO** MDIO Input Status
Returns status of the MDIO pin.

### 39.8.4 GMAC User Register

**Name:** GMAC_UR
**Offset:** 0x00C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | TXCOEN | TXPBMS | RXBMS[1:0] | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ESPA | ESMA | | FBDLO[4:0] | | | | |
| Access | R/W | R/W | | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | | 0 | 0 | 0 | 0 | 0 |

**Bit 24 – DDRP** DMA Discard Receive Packets
When set, the GMAC DMA will automatically discard receive packets from the receiver packet buffer memory when no AHB resource is available.

When low, the received packets will remain to be stored in the SRAM based packet buffer until AHB buffer resource next becomes available.

A write to this bit is ignored if the DMA is not configured in the packet buffer full store and forward mode.

**Bits 23:16 – DRBS[7:0]** DMA Receive Buffer Size
DMA receive buffer size in AHB system memory. The value defined by these bits determines the size of buffer to use in main AHB system memory when writing received data.

The value is defined in multiples of 64 bytes, thus a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.

For example:

– 0x02: 128 bytes

– 0x18: 1536 bytes (1 × max length frame/buffer)

– 0xA0: 10240 bytes (1 × 10K jumbo frame/buffer)

Note that this value should never be written as zero.

**Bit 11 – TXCOEN** Transmitter Checksum Generation Offload Enable
Transmitter IP, TCP and UDP checksum generation offload enable. When set, the transmitter checksum generation engine is enabled to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected.

**Bit 10 – TXPBMS** Transmitter Packet Buffer Memory Size Select
Having this bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GMAC. It is important to set this bit to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes.

| Value | Description |
|---|---|
| 0 | Do not use top address bit (2 Kbytes). |
| 1 | Use full configured addressable space (4 Kbytes). |

**Bits 9:8 – RXBMS[1:0]** Receiver Packet Buffer Memory Size Select
The default receive packet buffer size is 4 Kbytes. The table below shows how to configure this memory to FULL, HALF, QUARTER or EIGHTH of the default size.

| Value | Name | Description |
|---|---|---|
| 0 | EIGHTH | 4/8 Kbyte Memory Size |
| 1 | QUARTER | 4/4 Kbytes Memory Size |
| 2 | HALF | 4/2 Kbytes Memory Size |
| 3 | FULL | 4 Kbytes Memory Size |

**Bit 7 – ESPA** Endian Swap Mode Enable for Packet Data Accesses
When set, selects swapped endianism for AHB transfers. When clear, selects little endian mode.

**Bit 6 – ESMA** Endian Swap Mode Enable for Management Descriptor Accesses
When set, selects swapped endianism for AHB transfers. When clear, selects little endian mode.

**Bits 4:0 – FBDLO[4:0]** Fixed Burst Length for DMA Data Operations
Selects the burst length to attempt to use on the AHB when transferring frame data. Not used for DMA management operations and only used where space and data size allow. Otherwise SINGLE type AHB transfers are used.
One-hot priority encoding enforced automatically on register writes as follows, where ‘x’ represents don’t care:

| Value | Name | Description |
|---|---|---|
| 0 | – | Reserved |
| 1 | SINGLE | 00001: Always use SINGLE AHB bursts |
| 2 | – | Reserved |
| 4 | INCR4 | 001xx: Attempt to use INCR4 AHB bursts (Default) |
| 8 | INCR8 | 01xxx: Attempt to use INCR8 AHB bursts |
| 16 | INCR16 | 1xxxx: Attempt to use INCR16 AHB bursts |

### 39.8.6 GMAC Transmit Status Register

**Name:** GMAC_TSR
**Offset:** 0x014
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | HRESP |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TXCOMP | TFC | TXGO | RLE | COL | UBR |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 8 – HRESP** HRESP Not OK
Set when the DMA block sees HRESP not OK. Writing a one clears this bit.

**Bit 5 – TXCOMP** Transmit Complete
Set when a frame has been transmitted. Writing a one clears this bit.

**Bit 4 – TFC** Transmit Frame Corruption Due to AHB Error
Transmit frame corruption due to AHB error. Set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted).

Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size.

Writing a one clears this bit.

**Bit 3 – TXGO** Transmit Go
Transmit go, if high transmit is active. When using the DMA interface, this bit represents the TXGO variable as specified in the transmit buffer description.

**Bit 2 – RLE** Retry Limit Exceeded
Writing a one clears this bit.

**Bit 1 – COL** Collision Occurred
Set by the assertion of collision. Writing a one clears this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision.

**Bit 0 – UBR** Used Bit Read
Set when a transmit buffer descriptor is read with its used bit set. Writing a one clears this bit.

### 39.8.7 GMAC Receive Buffer Queue Base Address Register

**Name:** GMAC_RBQB
**Offset:** 0x018
**Reset:** 0x00000000
**Property:** Read/Write

This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the Network Control Register. Once reception is enabled, any write to the Receive Buffer Queue Base Address Register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the "used" bits.

In terms of AMBA AHB operation, the descriptors are read from memory using a single 32-bit AHB access. The descriptors should be aligned at 32-bit boundaries and the descriptors are written to using two individual non sequential accesses.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ADDR[29:22] | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ADDR[5:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

**Bits 31:2 – ADDR[29:0]** Receive Buffer Queue Base Address
Written with the address of the start of the receive queue.

### 39.8.8 GMAC Transmit Buffer Queue Base Address Register

**Name:** GMAC_TBQB
**Offset:** 0x01C
**Reset:** 0x00000000
**Property:** Read/Write

This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The Transmit Buffer Queue Base Address Register must be initialized before transmit is started through bit 9 of the Network Control Register. Once transmission has started, any write to the Transmit Buffer Queue Base Address Register is illegal and therefore ignored.

Note that due to clock boundary synchronization, it takes a maximum of four MCK cycles from the writing of the transmit start bit before the transmitter is active. Writing to the Transmit Buffer Queue Base Address Register during this time may produce unpredictable results.

Reading this register returns the location of the descriptor currently being accessed. Since the DMA handles two frames at once, this may not necessarily be pointing to the current frame being transmitted.

In terms of AMBA AHB operation, the descriptors are written to memory using a single 32-bit AHB access. The descriptors should be aligned at 32-bit boundaries and the descriptors are read from memory using two individual non sequential accesses.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ADDR[29:22] | | | | | | | |

**Bits 31:2 – ADDR[29:0]** Transmit Buffer Queue Base Address
Written with the address of the start of the transmit queue.

### 39.8.9 GMAC Receive Status Register

**Name:** GMAC_RSR
**Offset:** 0x020
**Reset:** 0x00000000
**Property:** Read/Write

This register, when read, provides receive status details. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to 1 by writing to the register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | HNO | RXOVR | REC | BNA |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 3 – HNO** HRESP Not OK
Set when the DMA block sees HRESP not OK. Writing a one clears this bit.

**Bit 2 – RXOVR** Receive Overrun
This bit is set if the receive status was not taken at the end of the frame. This bit is also set if the packet buffer overflows. The buffer will be recovered if an overrun occurs. Writing a one clears this bit.

**Bit 1 – REC** Frame Received
One or more frames have been received and placed in memory. Writing a one clears this bit.

**Bit 0 – BNA** Buffer Not Available
An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will re-read the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Writing a one clears this bit.

### 39.8.10 GMAC Interrupt Status Register

**Name:** GMAC_ISR
**Offset:** 0x024
**Reset:** 0x00000000
**Property:** Read-only

This register indicates the source of the interrupt. In order that the bits of this register read 1, the corresponding interrupt source must be enabled in the mask register. If any bit is set in this register, the GMAC interrupt signal will be asserted in the system.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | TSUTIMCOMP | WOL | RXLPISBC | SRI | PDRSFT | PDRQFT |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PDRSFR | PDRQFR | SFT | DRQFT | SFR | DRQFR | | |
| Access | R | R | R | R | R | R | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | PFTR | PTZ | PFNZ | HRESP | ROVR | | |
| Access | | R | R | R | R | R | | |
| Reset | | 0 | 0 | 0 | 0 | 0 | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TCOMP | TFC | RLEX | TUR | TXUBR | RXUBR | RCOMP | MFS |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 29 – TSUTIMCOMP** TSU Timer Comparison
Indicates when TSU timer count value is equal to programmed value. Cleared on read.

**Bit 28 – WOL** Wake On LAN
WOL interrupt. Indicates a WOL event has been received.

**Bit 27 – RXLPISBC** Receive LPI indication Status Bit Change
Receive LPI indication status bit change. Cleared on read.

**Bit 26 – SRI** TSU Seconds Register Increment
Indicates the register has incremented. Cleared on read.

**Bit 25 – PDRSFT** PDelay Response Frame Transmitted
Indicates a PTP pdelay_resp frame has been transmitted. Cleared on read.

**Bit 24 – PDRQFT** PDelay Request Frame Transmitted
Indicates a PTP pdelay_req frame has been transmitted. Cleared on read.

**Bit 23 – PDRSFR** PDelay Response Frame Received
Indicates a PTP pdelay_resp frame has been received. Cleared on read.

**Bit 22 – PDRQFR** PDelay Request Frame Received
Indicates a PTP pdelay_req frame has been received. Cleared on read.

**Bit 21 – SFT** PTP Sync Frame Transmitted
Indicates a PTP sync frame has been transmitted. Cleared on read.

**Bit 20 – DRQFT** PTP Delay Request Frame Transmitted
Indicates a PTP delay_req frame has been transmitted. Cleared on read.

**Bit 19 – SFR** PTP Sync Frame Received
Indicates a PTP sync frame has been received. Cleared on read.

**Bit 18 – DRQFR** PTP Delay Request Frame Received
Indicates a PTP delay_req frame has been received. Cleared on read.

**Bit 14 – PFTR** Pause Frame Transmitted
Indicates a pause frame has been successfully transmitted after being initiated from the Network Control register. Cleared on read.

**Bit 13 – PTZ** Pause Time Zero
Set when either the Pause Time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field. Cleared on read.

**Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received
Indicates a valid pause has been received that has a non-zero pause quantum field. Cleared on read.

**Bit 11 – HRESP** HRESP Not OK
Set when the DMA block sees HRESP not OK. Cleared on read.

**Bit 10 – ROVR** Receive Overrun
Set when the receive overrun status bit is set. Cleared on read.

**Bit 7 – TCOMP** Transmit Complete
Set when a frame has been transmitted. Cleared on read.

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error
Transmit frame corruption due to AHB error. Set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame.

**Bit 5 – RLEX** Retry Limit Exceeded
Transmit error. Cleared on read.

**Bit 4 – TUR** Transmit Underrun
This interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable.

This interrupt is set if a transmitter status write back has not completed when another status write back is attempted.

This interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the AHB bus was not granted in time for further data, or because an AHB not OK response was returned, or because the used bit was read.

**Bit 3 – TXUBR** TX Used Bit Read
Set when a transmit buffer descriptor is read with its used bit set. Cleared on read.

**Bit 2 – RXUBR** RX Used Bit Read
Set when a receive buffer descriptor is read with its used bit set. Cleared on read.

**Bit 1 – RCOMP** Receive Complete
A frame has been stored in memory. Cleared on read.

**Bit 0 – MFS** Management Frame Sent
The PHY Maintenance Register has completed its operation. Cleared on read.

© 2018 Microchip Technology Inc.

### 39.8.11 GMAC Interrupt Enable Register

**Name:** GMAC_IER
**Offset:** 0x028
**Reset:** –
**Property:** Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | TSUTIMCOMP | WOL | RXLPISBC | SRI | PDRSFT | PDRQFT |
| Access | | | W | W | W | W | W | W |
| Reset | | | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PDRSFR | PDRQFR | SFT | DRQFT | SFR | DRQFR | | |
| Access | W | W | W | W | W | W | | |
| Reset | – | – | – | – | – | – | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | EXINT | PFTR | PTZ | PFNZ | HRESP | ROVR | | |
| Access | W | W | W | W | W | W | | |
| Reset | – | – | – | – | – | – | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TCOMP | TFC | RLEX | TUR | TXUBR | RXUBR | RCOMP | MFS |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 29 – TSUTIMCOMP** TSU Timer Comparison

**Bit 28 – WOL** Wake On LAN

**Bit 27 – RXLPISBC** Enable RX LPI Indication

**Bit 26 – SRI** TSU Seconds Register Increment

**Bit 25 – PDRSFT** PDelay Response Frame Transmitted

**Bit 24 – PDRQFT** PDelay Request Frame Transmitted

**Bit 23 – PDRSFR** PDelay Response Frame Received

**Bit 22 – PDRQFR** PDelay Request Frame Received

**Bit 21 – SFT** PTP Sync Frame Transmitted

**Bit 20 – DRQFT** PTP Delay Request Frame Transmitted

**Bit 19 – SFR** PTP Sync Frame Received

**Bit 18 – DRQFR** PTP Delay Request Frame Received

**Bit 15 – EXINT** External Interrupt

**Bit 14 – PFTR** Pause Frame Transmitted

**Bit 13 – PTZ** Pause Time Zero

**Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

**Bit 5 – RLEX** Retry Limit Exceeded or Late Collision

**Bit 4 – TUR** Transmit Underrun

**Bit 3 – TXUBR** TX Used Bit Read

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

**Bit 0 – MFS** Management Frame Sent

### 39.8.12 GMAC Interrupt Disable Register

**Name:** GMAC_IDR
**Offset:** 0x02C
**Reset:** –
**Property:** Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | TSUTIMCOMP | WOL | RXLPISBC | SRI | PDRSFT | PDRQFT |

| | TCOMP | TFC | RLEX | TUR | TXUBR | RXUBR | RCOMP | MFS |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 29 – TSUTIMCOMP** TSU Timer Comparison

**Bit 28 – WOL** Wake On LAN

**Bit 27 – RXLPISBC** Enable RX LPI Indication

**Bit 26 – SRI** TSU Seconds Register Increment

**Bit 25 – PDRSFT** PDelay Response Frame Transmitted

**Bit 24 – PDRQFT** PDelay Request Frame Transmitted

**Bit 23 – PDRSFR** PDelay Response Frame Received

**Bit 22 – PDRQFR** PDelay Request Frame Received

**Bit 21 – SFT** PTP Sync Frame Transmitted

**Bit 20 – DRQFT** PTP Delay Request Frame Transmitted

**Bit 19 – SFR** PTP Sync Frame Received

**Bit 18 – DRQFR** PTP Delay Request Frame Received

**Bit 15 – EXINT** External Interrupt

**Bit 14 – PFTR** Pause Frame Transmitted

**Bit 13 – PTZ** Pause Time Zero

**Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

**Bit 5 – RLEX** Retry Limit Exceeded or Late Collision

**Bit 4 – TUR** Transmit Underrun

**Bit 3 – TXUBR** TX Used Bit Read

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

**Bit 0 – MFS** Management Frame Sent

### 39.8.13 GMAC Interrupt Mask Register

**Name:** GMAC_IMR
**Offset:** 0x030
**Reset:** 0x07FFFFFF
**Property:** Read/Write

The Interrupt Mask Register is a read-only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the Interrupt Enable Register or set individually by writing to the Interrupt Disable Register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the Interrupt Mask Register.

For test purposes there is a write-only function to this register that allows the bits in the Interrupt Status Register to be set or cleared, regardless of the state of the mask register. A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register when read:

0: The corresponding interrupt is enabled.

1: The corresponding interrupt is not enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | TSUTIMCOMP | WOL | RXLPISBC | SRI | PDRSFT | PDRQFT |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 1 | 1 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PDRSFR | PDRQFR | SFT | DRQFT | SFR | DRQFR | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | | |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Bit 29 – TSUTIMCOMP** TSU Timer Comparison

**Bit 28 – WOL** Wake On LAN

**Bit 27 – RXLPISBC** Enable RX LPI Indication

**Bit 26 – SRI** TSU Seconds Register Increment

**Bit 25 – PDRSFT** PDelay Response Frame Transmitted

**Bit 24 – PDRQFT** PDelay Request Frame Transmitted

**Bit 23 – PDRSFR** PDelay Response Frame Received

**Bit 22 – PDRQFR** PDelay Request Frame Received

**Bit 21 – SFT** PTP Sync Frame Transmitted

**Bit 20 – DRQFT** PTP Delay Request Frame Transmitted

**Bit 19 – SFR** PTP Sync Frame Received

**Bit 18 – DRQFR** PTP Delay Request Frame Received

**Bit 15 – EXINT** External Interrupt

**Bit 14 – PFTR** Pause Frame Transmitted

**Bit 13 – PTZ** Pause Time Zero

**Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

**Bit 5 – RLEX** Retry Limit Exceeded

**Bit 4 – TUR** Transmit Underrun

**Bit 3 – TXUBR** TX Used Bit Read

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

**Bit 0 – MFS** Management Frame Sent

### 39.8.14 GMAC PHY Maintenance Register

**Name:** GMAC_MAN
**Offset:** 0x034
**Reset:** 0x00000000
**Property:** Read/Write

The PHY Maintenance Register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit 2 is set in the Network Status Register. It takes about 2000 MCK cycles to complete, when MDC is set for MCK divide by 32 in the Network Configuration Register. An interrupt is generated upon completion.

During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation returns the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. To write clause 45 PHYs, bits 31:28 should be written as 0x0001. See the table below.

**Table 39-16. Clause 22/Clause 45 PHYs Read/Write Access Configuration (GMAC_MAN Bits 31:28)**

| PHY | Access | Bit Value | | | |
|---|---|---|---|---|---|
| | | WZO | CLTTO | OP[1] | OP[0] |
| Clause 22 | Read | 0 | 1 | 1 | 0 |
| | Write | 0 | 1 | 0 | 1 |
| Clause 45 | Read | 0 | 0 | 1 | 1 |
| | Write | 0 | 0 | 0 | 1 |
| | Read + Address | 0 | 0 | 1 | 0 |

For a description of MDC generation, see GMAC Network Configuration Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WZO | CLTTO | OP[1:0] | | PHYA[4:1] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| | DATA[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – WZO** Write ZERO
Must be written with 0.

**Bit 30 – CLTTO** Clause 22 Operation

| Value | Description |
|---|---|
| 0 | Clause 45 operation |
| 1 | Clause 22 operation |

**Bits 29:28 – OP[1:0]** Operation

| Value | Description |
|---|---|
| 01 | Write |
| 10 | Read |

**Bits 27:23 – PHYA[4:0]** PHY Address

**Bits 22:18 – REGA[4:0]** Register Address
Specifies the register in the PHY to access.

**Bits 17:16 – WTN[1:0]** Write Ten
Must be written to 10.

**Bits 15:0 – DATA[15:0]** PHY Data
For a write operation this field is written with the data to be written to the PHY. After a read operation this field contains the data read from the PHY.

### 39.8.15 GMAC Receive Pause Quantum Register

**Name:** GMAC_RPQ
**Offset:** 0x038
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | IP[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 19 – MTI** Multicast Hash Event Enable
Wake on LAN multicast hash event enable.

**Bit 18 – SA1** Specific Address Register 1 Event Enable
Wake on LAN Specific Address Register 1 event enable.

**Bit 17 – ARP** ARP Request Event Enable
Wake on LAN ARP request event enable.

**Bit 16 – MAG** Magic Packet Event Enable
Wake on LAN magic packet event enable.

**Bits 15:0 – IP[15:0]** ARP Request IP Address
Wake on LAN ARP request IP address. Written to define the least significant 16 bits of the target IP address that is matched to generate a Wake on LAN event. A value of zero will not generate an event, even if this is matched by the received frame.

### 39.8.35 GMAC IPG Stretch Register

**Name:** GMAC_IPGS
**Offset:** 0x0BC
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

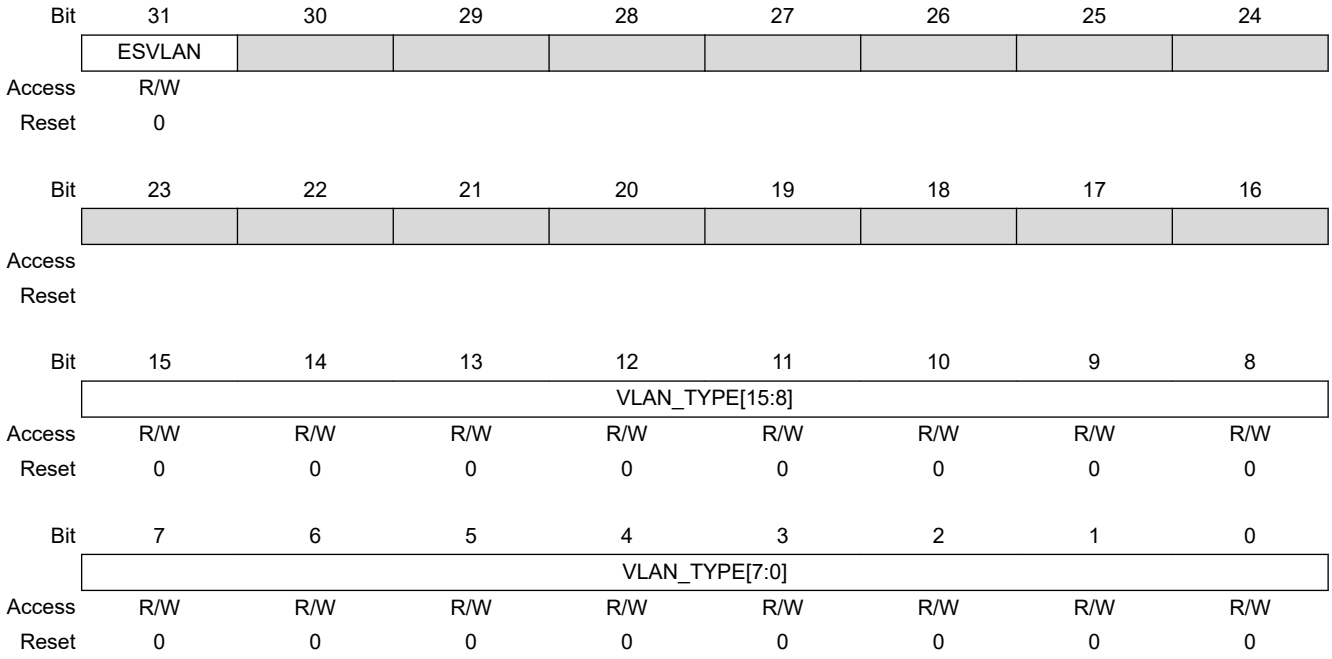
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | FL[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:0 – FL[15:0]** Frame Length
Bits 7:0 are multiplied with the previously transmitted frame length (including preamble). Bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the Network Configuration Register then the resulting number is used for the transmit inter-packet-gap. 1 is added to bits 15:8 to prevent a divide by zero. See MAC Transmit Block.

### 39.8.36 GMAC Stacked VLAN Register

**Name:** GMAC_SVLAN
**Offset:** 0x0C0
**Reset:** 0x00000000
**Property:** Read/Write



| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ESVLAN | | | | | | | |
| Access | R/W | | | | | | | |
| Reset | 0 | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | VLAN_TYPE[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VLAN_TYPE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – ESVLAN** Enable Stacked VLAN Processing Mode

| Value | Description |
|---|---|
| 0 | Disable the stacked VLAN processing mode |
| 1 | Enable the stacked VLAN processing mode |

**Bits 15:0 – VLAN_TYPE[15:0]** User Defined VLAN_TYPE Field
User defined VLAN_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN_TYPE, OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN_TYPE field equals 0x8100.

### 39.8.37 GMAC Transmit PFC Pause Register

**Name:** GMAC_TPFCP
**Offset:** 0x0C4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | PQ[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PEV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:8 – PQ[7:0]** Pause Quantum
If bit 17 of the Network Control Register is written with a one then for each entry equal to zero in the Transmit PFC Pause Register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the Transmit Pause Quantum Register. For each entry equal to one in the Transmit PFC Pause Register [15:8], the pause quantum associated with that entry will be zero.

**Bits 7:0 – PEV[7:0]** Priority Enable Vector
If bit 17 of the Network Control Register is written with a one then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0].

### 39.8.38 GMAC Specific Address 1 Mask Bottom Register

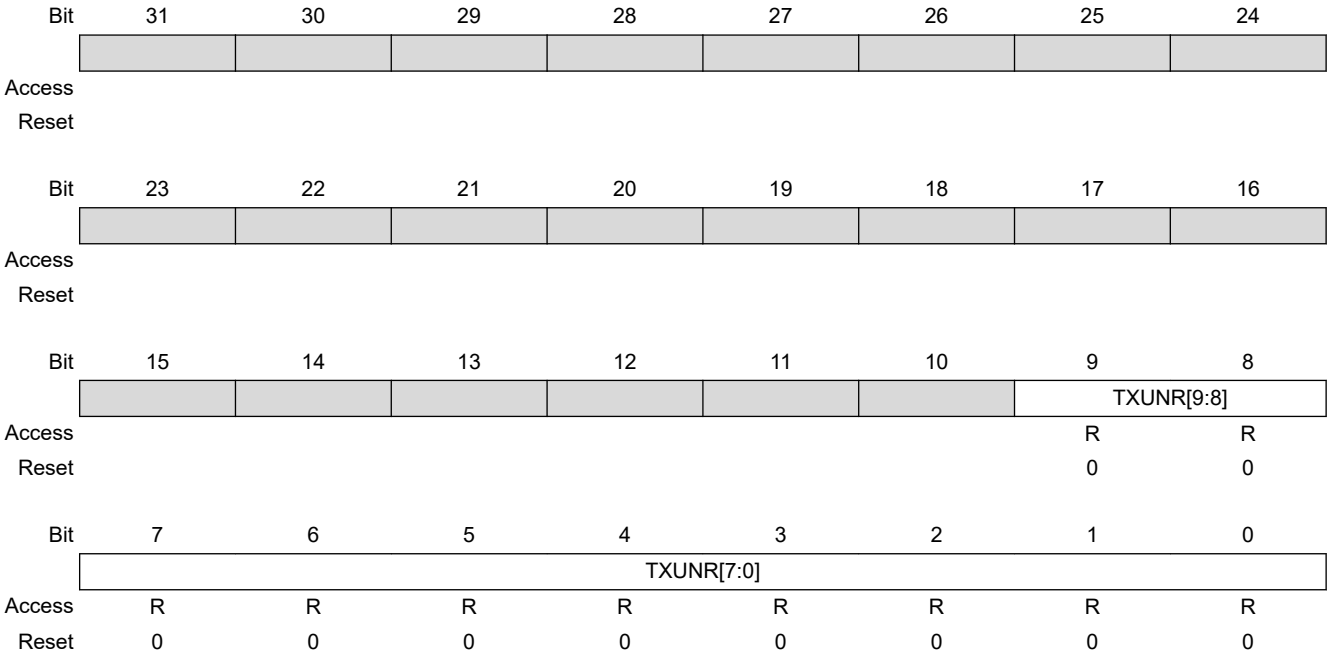
**Bits 31:0 – NFTX[31:0]** Greater than 1518 Byte Frames Transmitted without Error
This register counts the number of 1518 or above byte frames successfully transmitted without error i.e., no underrun and not too many retries.

### 39.8.60 GMAC Transmit Underruns Register

**Name:** GMAC_TUR
**Offset:** 0x134
**Reset:** 0x00000000
**Property:** Read-only



**Bits 9:0 – TXUNR[9:0]** Transmit Underruns
This register counts the number of frames not transmitted due to a transmit underrun. If this register is incremented then no other statistics register is incremented.

### 39.8.61 GMAC Single Collision Frames Register

**Name:** GMAC_SCF
**Offset:** 0x138
**Reset:** 0x00000000
**Property:** Read-only

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

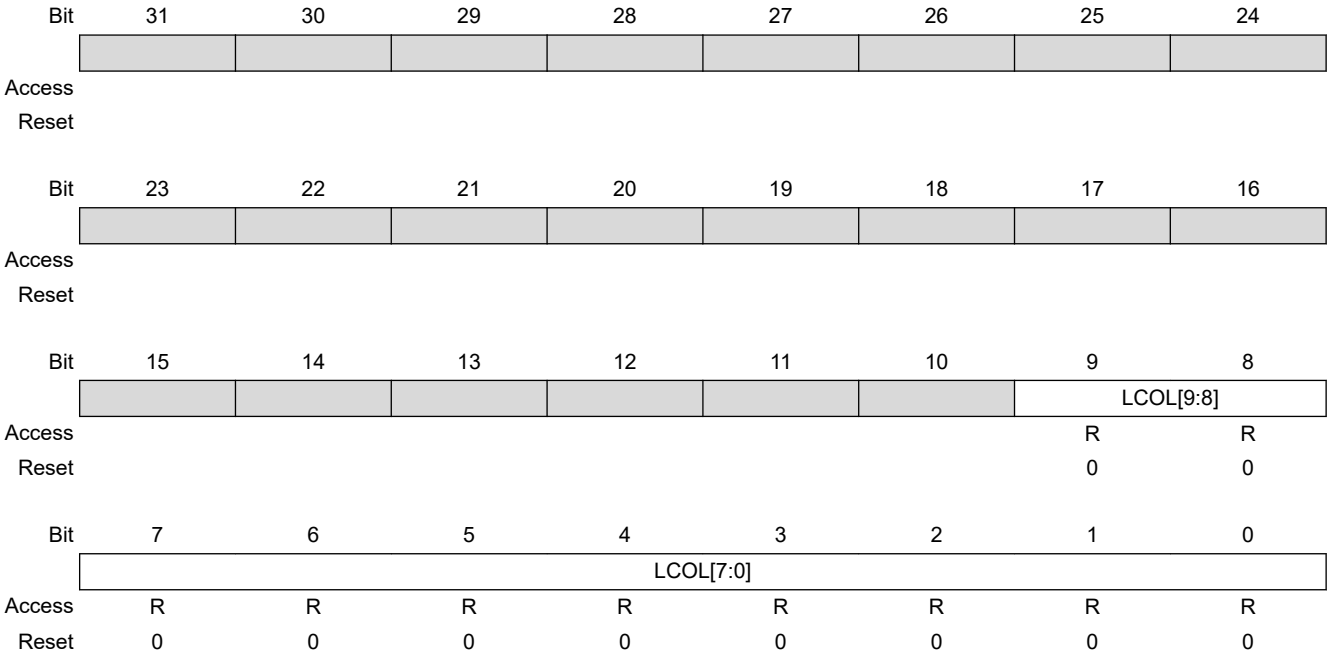
**Bits 9:0 – XCOL[9:0]** Excessive Collisions
This register counts the number of frames that failed to be transmitted because they experienced 16 collisions.

### 39.8.64 GMAC Late Collisions Register

**Name:** GMAC_LC
**Offset:** 0x144
**Reset:** 0x00000000
**Property:** Read-only



**Bits 9:0 – LCOL[9:0]** Late Collisions
This register counts the number of late collisions occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e., both as a collision and a late collision.

### 39.8.65 GMAC Deferred Transmission Frames Register

**Name:** GMAC_DTF
**Offset:** 0x148
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 9:0 – CSR[9:0]** Carrier Sense Error
This register counts the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in half duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

### 39.8.67 GMAC Octets Received Low Register

**Name:** GMAC_ORLO
**Offset:** 0x150
**Reset:** 0x00000000
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits [31:0] should be read prior to bits [47:32] to ensure reliable operation.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – RXO[31:0]** Received Octets
Received octets in frame without errors [31:0]. The number of octets received in valid frames of any type. This counter is 48-bits and is read through two registers. This count does not include octets from pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

### 39.8.68 GMAC Octets Received High Register

**Name:** GMAC_ORHI
**Offset:** 0x154
**Reset:** 0x00000000
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

**Bits 31:0 – NFRX[31:0]** 1519 to Maximum Byte Frames Received without Error
This register counts the number of 1519 byte or above frames successfully received without error. Maximum frame size is determined by the Network Configuration Register bit 8 (1536 maximum frame size) or bit 3 (jumbo frame size). Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory. See GMAC Network Configuration Register.

### 39.8.80 GMAC Undersized Frames Received Register

**Name:** GMAC_UFR
**Offset:** 0x184
**Reset:** 0x00000000
**Property:** Read-only

|---|---|---|---|---|---|---|---|---|
| | FCKR[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 9:0 – FCKR[9:0]** Frame Check Sequence Errors
The register counts frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.

This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the Network Configuration Register. See GMAC Network Configuration Register.

### 39.8.84 GMAC Length Field Frame Errors Register

**Name:** GMAC_LFFE
**Offset:** 0x194
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 9:0 – LFER[9:0]** Length Field Frame Errors
This register counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the Network Configuration Register. See GMAC Network Configuration Register.

### 39.8.85 GMAC Receive Symbol Errors Register

**Name:** GMAC_RSE
**Offset:** 0x198
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

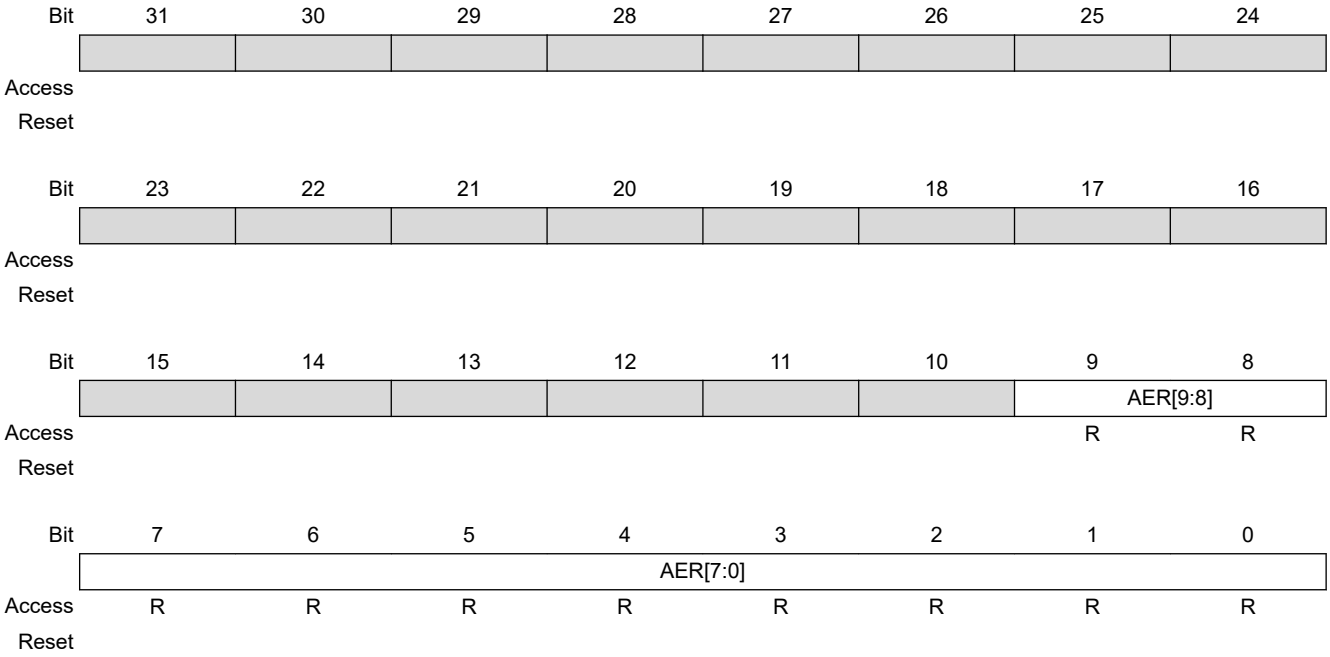
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 9:0 – RXSE[9:0]** Receive Symbol Errors
This register counts the number of frames that had GRXER asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register). If the frame is larger it will be recorded as a jabber error. See GMAC Network Configuration Register.

### 39.8.86 GMAC Alignment Errors Register

**Name:** GMAC_AE
**Offset:** 0x19C
**Reset:** 0x0000'0000
**Property:** Read-only



**Bits 9:0 – AER[9:0]** Alignment Errors
This register counts the frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes. See GMAC Network Configuration Register.

### 39.8.87 GMAC Receive Resource Errors Register

**Name:** GMAC_RRE
**Offset:** 0x1A0

**Bits 7:0 – UCKER[7:0]** UDP Checksum Errors
This register counts the number of frames discarded due to an incorrect UDP checksum, but are between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register) and do not have a CRC error, an alignment error, nor a symbol error.

### 39.8.92 GMAC 1588 Timer Increment Sub-nanoseconds Register

**Name:** GMAC_TISUBN
**Offset:** 0x1BC
**Reset:** 0x00000000
**Property:** Read/Write

**Bits 15:0 – LSBTIR[15:0]** Lower Significant Bits of Timer Increment Register
Lower significant bits of Timer Increment Register[15:0] giving a 24-bit timer_increment counter. These bits are the sub-ns value which the 1588 timer will be incremented each clock cycle. Bit n = $2^{(n-16)}$ nsec giving a resolution of approximately 15.2E$^{-15}$ sec.

### 39.8.93 GMAC 1588 Timer Seconds High Register

**Name:** GMAC_TSH
**Offset:** 0x1C0
**Reset:** 0x00000000
**Property:** Read/Write

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

**Bits 15:0 – RBS[15:0]** Receive Buffer Size
DMA receive buffer size in AHB system memory. The value defined by these bits determines the size of buffer to use in main AHB system memory when writing received data.

The value is defined in multiples of 64 bytes such that a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.

For example:

0x02: 128bytes

0x18: 1536bytes (1 × max length frame/buffer)

0xA0: 10240bytes (1 × 10K jumbo frame/buffer)

Note that this value should never be written as zero.

### 39.8.114 GMAC Credit-Based Shaping Control Register

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – IS[31:0]** IdleSlope
IdleSlope value for queue A in bytes/second.

The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 32'h017D7840

If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 32'h017D7840 / 2.

### 39.8.116 GMAC Credit-Based Shaping IdleSlope Register for Queue B

**Name:** GMAC_CBSISQB
**Offset:** 0x4C4
**Reset:** 0x00000000
**Property:** Read/Write

Credit-based shaping must be disabled in GMAC_CBSCR before updating this register.

| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bit 29 – UDPE** UDP Port Match Enable
When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

**Bit 28 – DSTCE** Differentiated Services or Traffic Class Match Enable
When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

**Bits 27:12 – UDPM[15:0]** UDP Port Match
When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

**Bits 11:4 – DSTCM[7:0]** Differentiated Services or Traffic Class Match
When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

**Bits 2:0 – QNB[2:0]** Queue Number (0–2)
If a match is successful, then the queue value programmed in bits 2:0 is allocated to the frame.

### 39.8.118 GMAC Screening Type 2 Register x Priority Queue

**Name:** GMAC_ST2RPQx
**Offset:** 0x0540 + x*0x04 [x=0..7]
**Reset:** 0x00000000
**Property:** Read/Write

Screening type 2 registers are used to allocate up to 3 priority queues to received frames based on the VLAN priority field of received ethernet frames.

**Bit 30 – COMPCE** Compare C Enable

| Value | Description |
|---|---|
| 0 | Comparison via the register designated by index COMPC is disabled. |
| 1 | Comparison via the register designated by index COMPC is enabled. |

**Bits 29:25 – COMPC[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPC is a pointer to the compare registers GMAC_ST2CW0x and GMAC_ST2CW1x. When COMPCE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

**Bit 24 – COMPBE** Compare B Enable

| Value | Description |
|---|---|
| 0 | Comparison via the register designated by index COMPB is disabled. |
| 1 | Comparison via the register designated by index COMPB is enabled. |

**Bits 23:19 – COMPB[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPB is a pointer to the compare registers GMAC_ST2CW0x and GMAC_ST2CW1x. When COMPBE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

**Bit 18 – COMPAE** Compare A Enable

| Value | Description |
|---|---|
| 0 | Comparison via the register designated by index COMPA is disabled. |
| 1 | Comparison via the register designated by index COMPA is enabled. |

**Bits 17:13 – COMPA[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x
COMPA is a pointer to the compare registers GMAC_ST2CW0x and GMAC_ST2CW1x. When COMPAE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

**Bit 12 – ETHE** EtherType Enable

| Value | Description |
|---|---|
| 0 | EtherType match with bits 15:0 in the register designated by the value of I2ETH is disabled. |
| 1 | EtherType match with bits 15:0 in the register designated by the value of I2ETH is enabled. |

**Bits 11:9 – I2ETH[2:0]** Index of Screening Type 2 EtherType register x
When ETHE is set (bit 12), the field EtherType (last EtherType in the header if the frame is VLAN tagged) is compared with bits 15:0 in the register designated by the value of I2ETH.

**Bit 8 – VLANE** VLAN Enable

| Value | Description |
|---|---|
| 0 | VLAN match is disabled. |
| 1 | VLAN match is enabled. |

**Bits 6:4 – VLANP[2:0]** VLAN Priority
When VLAN match enable is set (bit 8), the VLAN priority field of the received frame is matched against bits 7:4 of this register.

**Bits 2:0 – QNB[2:0]** Queue Number (0–2)
If a match is successful, then the queue value programmed in QNB is allocated to the frame.

### 39.8.119 GMAC Interrupt Enable Register Priority Queue x

**Name:** GMAC_IERPQx
**Offset:** 0x05FC + x*0x04 [x=0..1]
**Reset:** –
**Property:** Write-only

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 1 – RCOMP** Receive Complete

### 39.8.121 GMAC Interrupt Mask Register Priority Queue x

**Name:** GMAC_IMRPQx
**Offset:** 0x063C + x*0x04 [x=0..1]
**Reset:** 0x00000000
**Property:** Read/Write

A read of this register returns the value of the receive complete interrupt mask.

A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register:

0: Corresponding interrupt is enabled.

1: Corresponding interrupt is disabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | OFFSSTRT[0:0] | OFFSVAL[6:0] | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 8:7 – OFFSSTRT[1:0]** Ethernet Frame Offset Start

| Value | Name | Description |
|---|---|---|
| 0 | FRAMESTART | Offset from the start of the frame |
| 1 | ETHERTYPE | Offset from the byte after the EtherType field |
| 2 | IP | Offset from the byte after the IP header field |
| 3 | TCP_UDP | Offset from the byte after the TCP/UDP header field |

**Bits 6:0 – OFFSVAL[6:0]** Offset Value in Bytes
The value of OFFSVAL ranges from 0 to 127 bytes, and is counted from either the start of the frame, the byte after the EtherType field (last EtherType in the header if the frame is VLAN tagged), the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header.

# 40. USB High Speed Device Port (UDPHS)

## 40.1 Description

The USB High Speed Device Port (UDPHS) is compliant with the Universal Serial Bus (USB), rev 2.0 High Speed device specification.

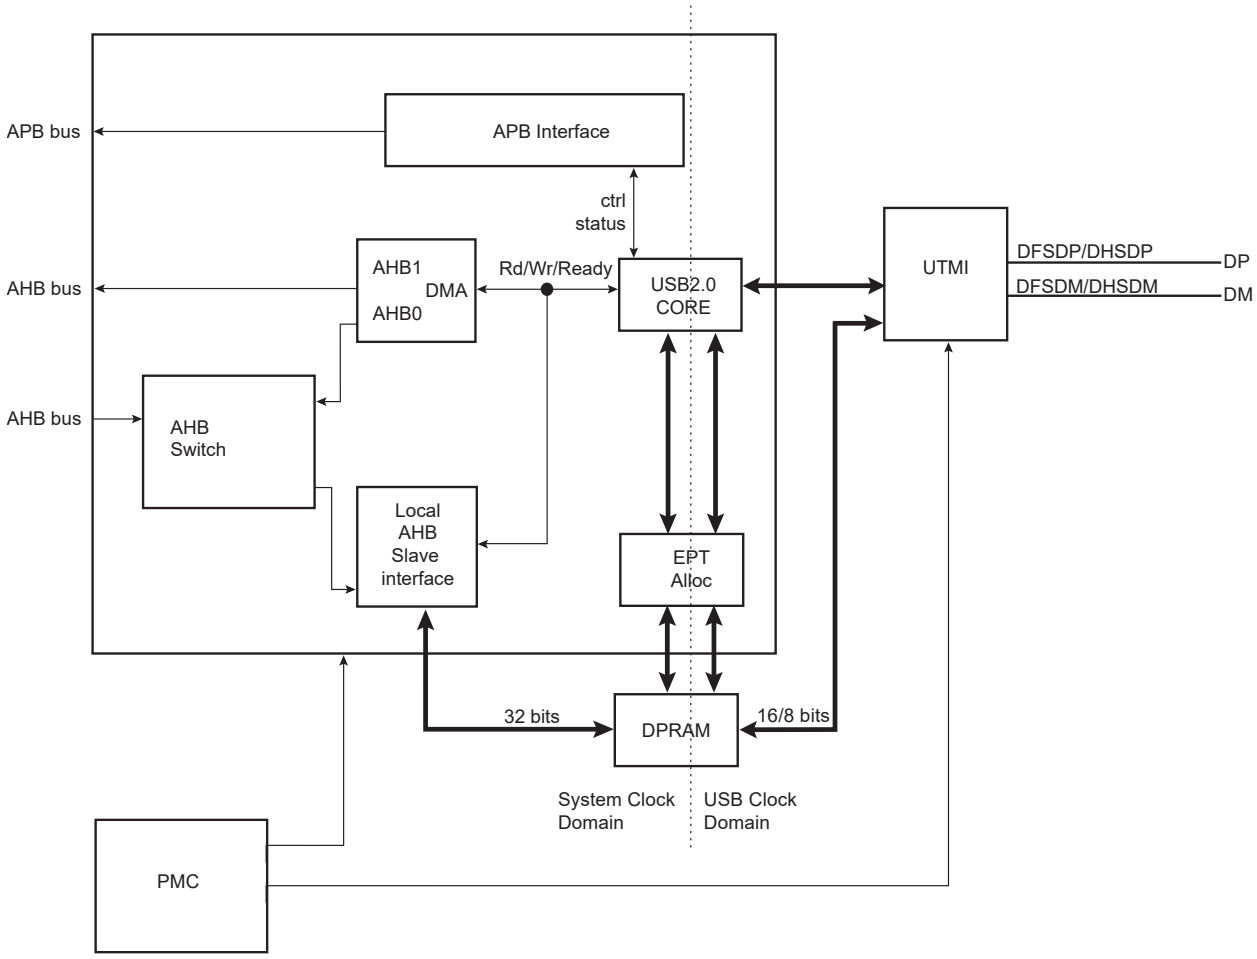
Each endpoint can be configured in one of several USB transfer types. It can be associated with one, two or three banks of a Dual-port RAM used to store the current data payload. If two or three banks are used, one DPR bank is read or written by the processor, while the other is read or written by the USB device peripheral. This feature is mandatory for isochronous endpoints.

## 40.2 Embedded Characteristics

- 1 High-speed Device
- 1 UTMI transceiver shared between Host and Device
- USB v2.0 High Speed (480 Mbits/s) Compliant
- 16 Endpoints up to 1024 bytes
- Embedded Dual-port RAM for Endpoints
- Suspend/Resume Logic (Command of UTMI)
- Up to Three Memory Banks for Endpoints (Not for Control Endpoint)
- 8 Kbytes of DPRAM

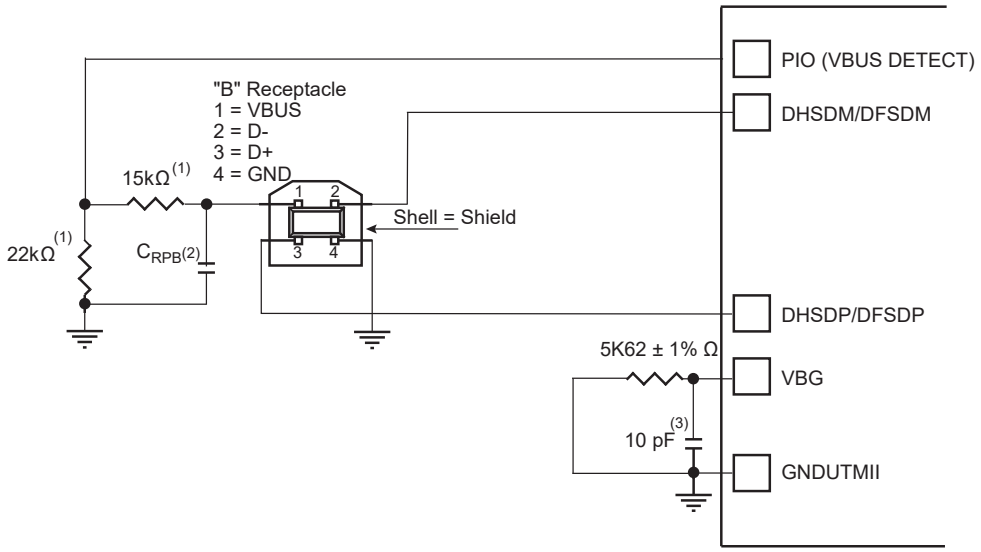
## 40.3 Block Diagram

**Figure 40-1. Block Diagram**



## 40.4 Typical Connection

**Figure 40-2. Board Schematic**



**Note:**

1. The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3V3-supplied PIOs.
2. CRPB: Upstream Facing Port Bypass Capacitance of 1 µF to 10 µF (refer to “DC Electrical Characteristics” in Universal Serial Bus Specification Rev. 2)
3. 10 pF capacitor on VBG is a provision and may not be populated.

## 40.5 Product Dependencies

### 40.5.1 Power Management

The UDPHS is not continuously clocked.

To use the UDPHS, the programmer must first enable the UDPHS Clock in the Power Management Controller Peripheral Clock Enable Register (PMC_PCER), then enable the PLL in the PMC UTMI Clock Configuration Register (CKGR_UCKR). Finally, the programmer must enable BIAS in CKGR_UCKR.

However, if the application does not require UDPHS operations, the UDPHS clock can be stopped when not needed and restarted later.

### 40.5.2 Interrupt Sources

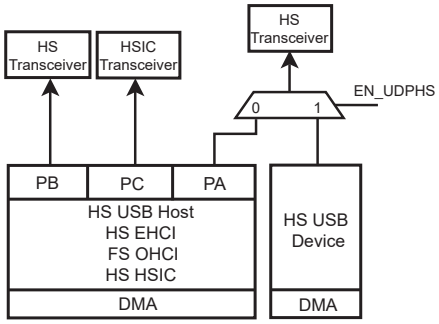
The UDPHS interrupt line is connected on one of the internal sources of the interrupt controller. Using the UDPHS interrupt requires the interrupt controller to be programmed first.

## 40.6 Functional Description

### 40.6.1 UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

**Figure 40-3. USB Selection**



### 40.6.2 USB V2.0 High Speed Device Port Introduction

The USB V2.0 High Speed Device Port provides communication services between host and attached USB devices. Each device is offered with a collection of communication flows (pipes) associated with each endpoint. Software on the host communicates with a USB Device through a set of communication flows.

### 40.6.3 USB V2.0 High Speed Transfer Types

A communication flow is carried over one of four transfer types defined by the USB device.

A device provides several logical communication pipes with the host. To each logical pipe is associated an endpoint. Transfer through a pipe belongs to one of the four transfer types:

- Control Transfers: Used to configure a device at attach time and can be used for other device-specific purposes, including control of other pipes on the device.
- Bulk Data Transfers: Generated or consumed in relatively large burst quantities and have wide dynamic latitude in transmission constraints.
- Interrupt Data Transfers: Used for timely but reliable delivery of data, for example, characters or coordinates with human-perceptible echo or feedback response characteristics.
- Isochronous Data Transfers: Occupy a prenegotiated amount of USB bandwidth with a prenegotiated delivery latency. (Also called streaming real time transfers.)

As indicated below, transfers are sequential events carried out on the USB bus.

Endpoints must be configured according to the transfer type they handle.

**Table 40-1. USB Communication Flow**

| Transfer | Direction | Bandwidth | Endpoint Size | Error Detection | Retrying |
|---|---|---|---|---|---|
| Control | Bidirectional | Not guaranteed | 8, 16, 32, 64 | Yes | Automatic |
| Isochronous | Unidirectional | Guaranteed | 8–1024 | Yes | No |
| Interrupt | Unidirectional | Not guaranteed | 8–1024 | Yes | Yes |
| Bulk | Unidirectional | Not guaranteed | 8–512 | Yes | Yes |

### 40.6.4 USB Transfer Event Definitions

A transfer is composed of one or several transactions as shown in the table below.

**Table 40-2. USB Transfer Events**

| Transfer | | Transaction |
|---|---|---|
| Direction | Type | |
| CONTROL (bidirectional) | Control Transfer (1) | • Setup transaction → Data IN transactions → Status OUT transaction<br>• Setup transaction → Data OUT transactions → Status IN transaction<br>• Setup transaction → Status IN transaction |
| IN (device toward host) | Bulk IN Transfer | • Data IN transaction → Data IN transaction |
| | Interrupt IN Transfer | • Data IN transaction → Data IN transaction |
| | Isochronous IN Transfer (2) | • Data IN transaction → Data IN transaction |
| OUT (host toward device) | Bulk OUT Transfer | • Data OUT transaction → Data OUT transaction |
| | Interrupt OUT Transfer | • Data OUT transaction → Data OUT transaction |
| | Isochronous OUT Transfer (2) | • Data OUT transaction → Data OUT transaction |

**Note:**

1. Control transfer must use endpoints with one bank and can be aborted using a stall handshake.
2. Isochronous transfers must use endpoints configured with two or three banks.

An endpoint handles all transactions related to the type of transfer for which it has been configured.

**Table 40-3. UDPHS Endpoint Description**

| Endpoint # | Mnemonic | Nb Bank | DMA | High Band Width | Max. Endpoint Size | Endpoint Type |
|---|---|---|---|---|---|---|
| 0 | EPT_0 | 1 | N | N | 64 | Control |
| 1 | EPT_1 | 3 | Y | Y | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 2 | EPT_2 | 3 | Y | Y | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 3 | EPT_3 | 2 | Y | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 4 | EPT_4 | 2 | Y | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 5 | EPT_5 | 2 | Y | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 6 | EPT_6 | 2 | Y | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 7 | EPT_7 | 2 | Y | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 8 | EPT_8 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 9 | EPT_9 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 10 | EPT_10 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 11 | EPT_11 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |

| .....continued | | | | | | |
|---|---|---|---|---|---|---|
| Endpoint # | Mnemonic | Nb Bank | DMA | High Band Width | Max. Endpoint Size | Endpoint Type |
| 12 | EPT_12 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 13 | EPT_13 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 14 | EPT_14 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |
| 15 | EPT_15 | 2 | N | N | 1024 | Ctrl/Bulk/Iso(1)/Interrupt |

**Note:**

1. In Isochronous (Iso) mode, it is preferable that High Band Width capability is available.

The size of the internal DPRAM is 8 Kbytes.

Suspend and resume are automatically detected by the UDPHS device, which notifies the processor by raising an interrupt.

### 40.6.5 USB V2.0 High Speed BUS Transactions

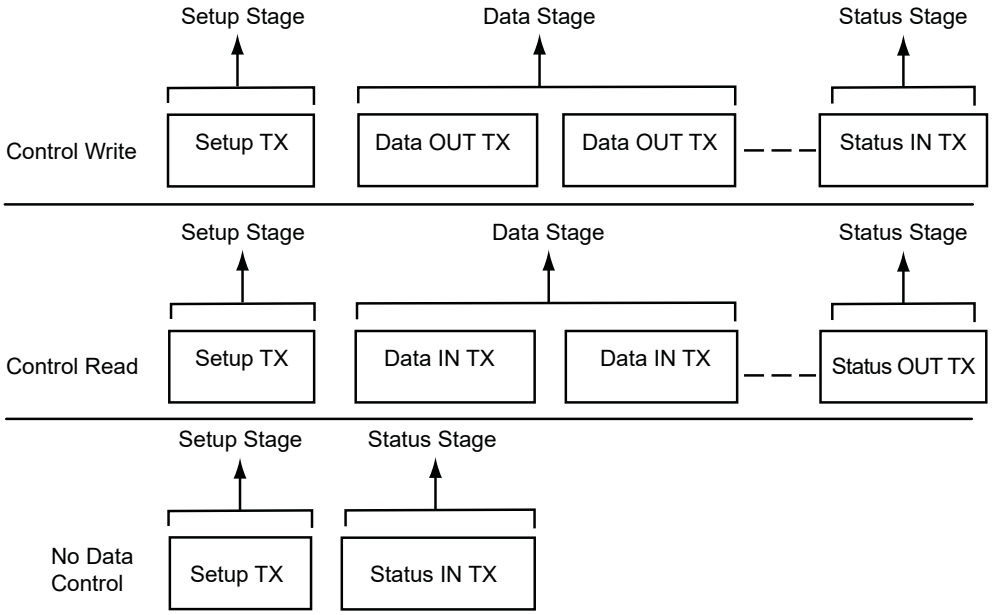
Each transfer results in one or more transactions over the USB bus.

There are five kinds of transactions flowing across the bus in packets:

1. Setup Transaction
2. Data IN Transaction
3. Data OUT Transaction
4. Status IN Transaction
5. Status OUT Transaction

A status IN or OUT transaction is identical to a data IN or OUT transaction.

**Figure 40-4. Control Read and Write Sequences**



### 40.6.6 Endpoint Configuration

The endpoint 0 is always a control endpoint, it must be programmed and active in order to be enabled when the End Of Reset interrupt occurs.

To configure the endpoints:

- Fill the configuration register (UDPHS_EPTCFG) with the endpoint size, direction (IN or OUT), type (CTRL, Bulk, IT, ISO) and the number of banks.
- Fill the number of transactions (NB_TRANS) for isochronous endpoints.

Note: For control endpoints the direction has no effect.

- Verify that the EPT_MAPD flag is set. This flag is set if the endpoint size and the number of banks are correct for this endpoint and compared to the FIFO maximum capacity and the maximum number of allowed banks.
- Configure control flags of the endpoint and enable it in UDPHS_EPTCTLENBx according to the section UDPHS Endpoint Control Disable Register (Isochronous Endpoint).

Control endpoints can generate interrupts and use only 1 bank.

All endpoints (except endpoint 0) can be configured either as Bulk, Interrupt or Isochronous. Refer to the table UDPHS Endpoint Description.

The maximum packet size they can accept corresponds to the maximum endpoint size.

**Note:** The endpoint size of 1024 is reserved for isochronous endpoints.

The size of the DPRAM is 8 Kbytes. The DPR is shared by all active endpoints. The memory size required by the active endpoints must not exceed the size of the DPRAM.

SIZE_DPRAM = SIZE _EPT0

+ NB_BANK_EPT1 x SIZE_EPT1

+ NB_BANK_EPT2 x SIZE_EPT2

+ NB_BANK_EPT3 x SIZE_EPT3

+ NB_BANK_EPT4 x SIZE_EPT4

+ NB_BANK_EPT5 x SIZE_EPT5

+ NB_BANK_EPT6 x SIZE_EPT6

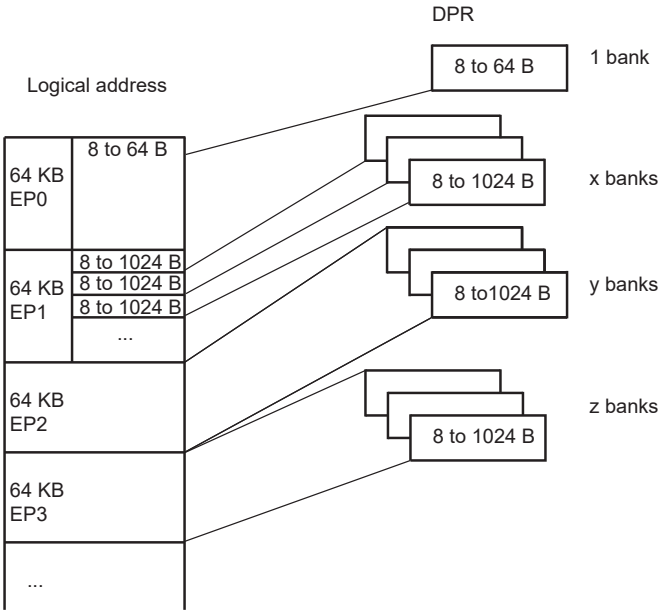
+... (refer to UDPHS Endpoint Configuration Register)

If a user tries to configure endpoints with a size the sum of which is greater than the DPRAM, then the EPT_MAPD is not set.

The application has access to the physical block of DPR reserved for the endpoint through a 64-Kbyte logical address space.

The physical block of DPR reserved for the endpoint is remapped all along the 64-Kbyte logical address space. The application can write a 64-Kbyte buffer linearly.

**Figure 40-5. Logical Address Space for DPR Access**



Configuration examples of UDPHS_EPTCTLx (UDPHS Endpoint Control Disable Register (Isochronous Endpoint)) for Bulk IN endpoint type follow below.

- With DMA
  - AUTO_VALID: Automatically validate the packet and switch to the next bank.
  - EPT_ENABL: Enable endpoint.
- Without DMA:
  - TXRDY: An interrupt is generated after each transmission.
  - EPT_ENABL: Enable endpoint.

Configuration examples of Bulk OUT endpoint type follow below.

- With DMA
  - AUTO_VALID: Automatically validate the packet and switch to the next bank.
  - EPT_ENABL: Enable endpoint.
- Without DMA
  - RXRDY_TXKL: An interrupt is sent after a new packet has been stored in the endpoint FIFO.
  - EPT_ENABL: Enable endpoint.

### 40.6.7 DPRAM Management

Endpoints can only be allocated in ascending order, from the endpoint 0 to the last endpoint to be allocated. The user shall therefore configure them in the same order.

The allocation of an endpoint x starts when the Number of Banks field in the UDPHS Endpoint Configuration Register (UDPHS_EPTCFGx.BK_NUMBER) is different from zero. Then, the hardware allocates a memory area in the DPRAM and inserts it between the x - 1 and x+ 1 endpoints. The x+ 1 endpoint memory window slides up and its data is lost. Note that the following endpoint memory windows (from x+ 2) do not slide.

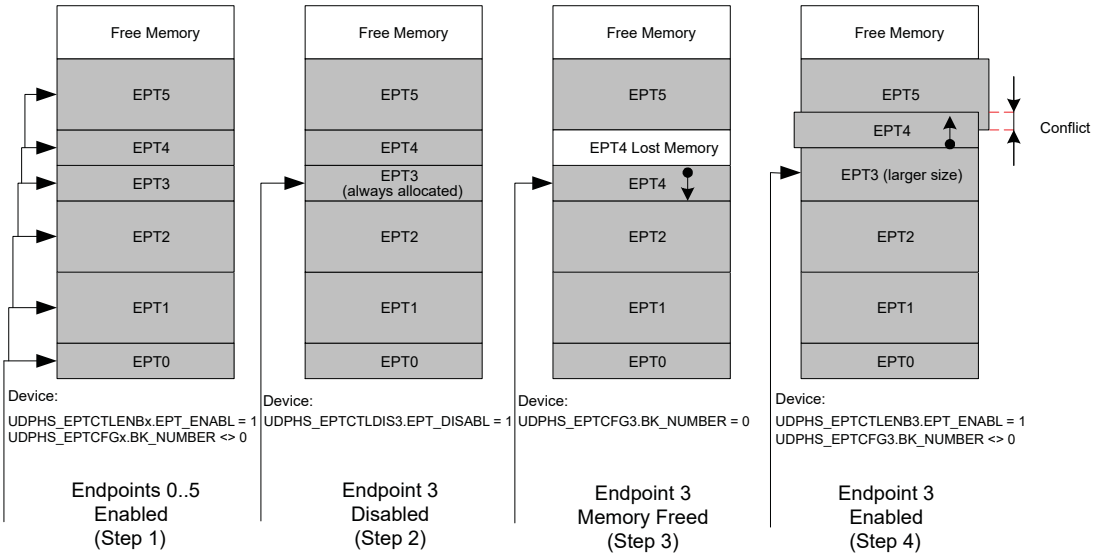
Disabling an endpoint, by writing a one to the Endpoint Disable bit in the UDPHS Endpoint Control Disable Register (UDPHS_EPTCTLDISx.EPT_DISABL), does not reset its configuration:

- Endpoint Banks (UDPHS_EPTCFGx.BK_NUMBER)
- Endpoint Size (UDPHS_EPTCFGx.EPT_SIZE)
- Endpoint Direction (UDPHS_EPTCFGx.EPT_DIR)
- Endpoint Type (UDPHS_EPTCFGx.EPT_TYPE)

To free its memory, the user shall write a zero to the UDPHS_EPTCFGx.BK_NUMBER field. The x+ 1 endpoint memory window then slides down and its data is lost. Note that the following endpoint memory windows (from x + 2) do not slide.

The following figure illustrates the allocation and reorganization of the DPRAM in a typical example.

**Figure 40-6. Example of DPRAM Allocation and Reorganization**



DPRAM allocation sequence:

1. The endpoints 0 to 5 are enabled, configured and allocated in ascending order. Each endpoint then owns a memory area in the DPRAM.
2. The endpoint 3 is disabled, but its memory is kept allocated by the controller.
3. In order to free its memory, its UDPHS_EPTCFGx.BK_NUMBER field is written to zero. The endpoint 4 memory window slides down, but the endpoint 5 does not move.
4. If the user chooses to reconfigure the endpoint 3 with a larger size, the controller allocates a memory area after the endpoint 2 memory area and automatically slides up the endpoint 4 memory window. The endpoint 5 does not move and a memory conflict appears as the memory windows of the endpoints 4 and 5 overlap. The data of these endpoints is potentially lost.

**Note:**

1. There is no way the data of the endpoint 0 can be lost (except if it is de-allocated) as the memory allocation and de-allocation may affect only higher endpoints.
2. Deactivating then reactivating the same endpoint with the same configuration only modifies temporarily the controller DPRAM pointer and size for this endpoint. Nothing changes in the DPRAM, higher endpoints seem not to have been moved and their data is preserved as far as nothing has been written or received into them while changing the allocation state of the first endpoint.
3. When the user writes a value different from zero to the UDPHS_EPTCFGx.BK_NUMBER field, the Endpoint Mapped bit (UDPHS_EPTCFGx.EPT_MAPD) is set only if the configured size and

number of banks are correct as compared to the endpoint maximal allowed values and to the maximal FIFO size (i.e., the DPRAM size). The UDPHS_EPTCFGx.EPT_MAPD value does not consider memory allocation conflicts.

### 40.6.8 Transfer With DMA

USB packets of any length may be transferred when required by the UDPHS device. These transfers always feature sequential addressing.

Packet data AHB bursts may be locked on a DMA buffer basis for drastic overall AHB bus bandwidth performance boost with paged memories. These clock-cycle consuming memory row (or bank) changes will then likely not occur, or occur only once instead of several times, during a single big USB packet DMA transfer in case another AHB master addresses the memory. The locked bursts result in up to 128-word single-cycle unbroken AHB bursts for bulk endpoints and 256-word single-cycle unbroken bursts for isochronous endpoints.

This maximum burst length is then controlled by the lowest programmed USB endpoint size (EPT_SIZE field in the UDPHS_EPTCFGx register) and DMA Size (BUFF_LENGTH field in the UDPHS_DMACONTROLx register).
