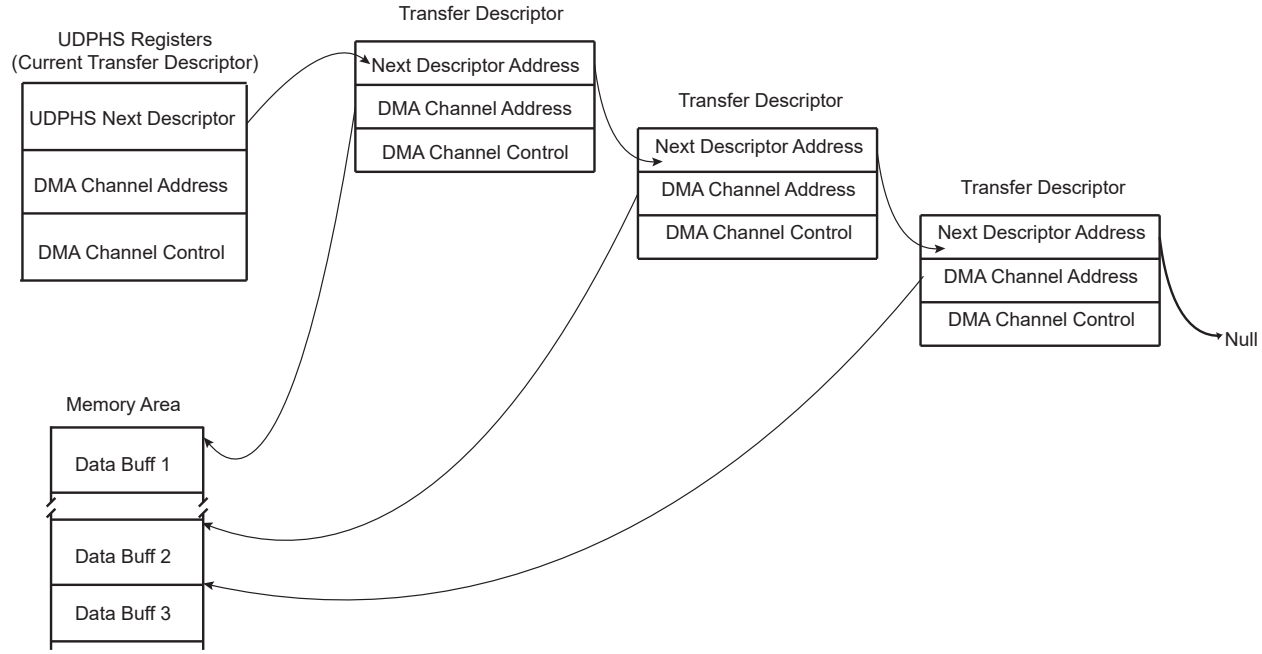
The USB 2.0 device average throughput may be up to nearly 60 Mbyte/s. Its internal slave average access latency decreases as burst length increases due to the 0 wait-state side effect of unchanged endpoints. If at least 0 wait-state word burst capability is also provided by the external DMA AHB bus slaves, each of both DMA AHB busses need less than 50% bandwidth allocation for full USB 2.0 bandwidth usage at 30 MHz, and less than 25% at 60 MHz.

The UDPHS DMA Channel Transfer Descriptor is described in the section UDPHS DMA Channel Transfer Descriptor.

**Note:** In case of debug, be careful to address the DMA to an SRAM address even if a remap is done.

**Figure 40-7. Example of DMA Chained List**



### 40.6.9 Transfer Without DMA

**Important:** If the DMA is not to be used, it is necessary to disable it, otherwise it can be enabled by previous versions of software without warning. If this should occur, the DMA can process data before an interrupt without knowledge of the user.

The recommended means to disable DMA are as follows:

```
// Reset IP UDPHS
  AT91C_BASE_UDPHS->UDPHS_CTRL &= ~AT91C_UDPHS_EN_UDPHS;
  AT91C_BASE_UDPHS->UDPHS_CTRL |= AT91C_UDPHS_EN_UDPHS;//
With OR without DMA !!!
  for( i=1; i<=((AT91C_BASE_UDPHS->UDPHS_IPFEATURES &
AT91C_UDPHS_DMA_CHANNEL_NBR)>>4); i++ ) {
// RESET endpoint canal DMA:
    // DMA stop channel command
   AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Disable endpoint
  AT91C_BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLDIS |= 0XFFFFFFFF;
// Reset endpoint config
  AT91C_BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLCFG = 0;
// Reset DMA channel (Buff count and Control field)
  AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0x02; // NON
STOP command
// Reset DMA channel 0 (STOP)
  AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Clear DMA channel status (read the register for clear it)
  AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS =
  AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS;
}
```

### 40.6.10 Handling Transactions with USB V2.0 Device Peripheral

#### 40.6.10.1 Setup Transaction

The setup packet is valid in the DPR while RX_SETUP is set. Once RX_SETUP is cleared by the application, the UDPHS accepts the next packets sent over the device endpoint.

When a valid setup packet is accepted by the UDPHS:

- The UDPHS device automatically acknowledges the setup packet (sends an ACK response)
- Payload data is written in the endpoint
- Sets the RX_SETUP interrupt
- The BYTE_COUNT field in the UDPHS_EPTSTAx register is updated

An endpoint interrupt is generated while RX_SETUP in the UDPHS_EPTSTAx register is not cleared. This interrupt is carried out to the microcontroller if interrupts are enabled for this endpoint.

Thus, firmware must detect RX_SETUP polling UDPHS_EPTSTAx or catching an interrupt, read the setup packet in the FIFO, then clear the RX_SETUP bit in the UDPHS_EPTCLRSTA register to acknowledge the setup stage.

If STALL_SNT was set to 1, then this bit is automatically reset when a setup token is detected by the device. Then, the device still accepts the setup stage. (See the section STALL).

#### 40.6.10.2 NYET

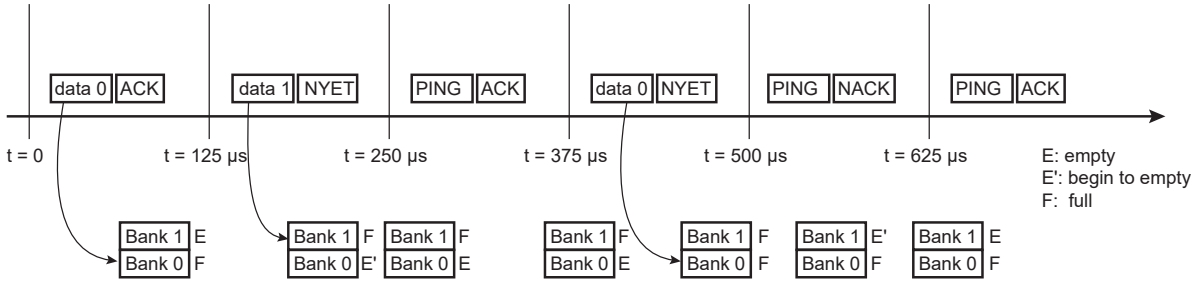
NYET is a High Speed only handshake. It is returned by a High Speed endpoint as part of the PING protocol.

High Speed devices must support an improved NAK mechanism for Bulk OUT and control endpoints (except setup stage). This mechanism allows the device to tell the host whether it has sufficient endpoint space for the next OUT transfer (refer to USB 2.0 spec 8.5.1 NAK Limiting via Ping Flow Control).

The NYET/ACK response to a High Speed Bulk OUT transfer and the PING response are automatically handled by hardware in the UDPHS_EPTCTLx register (except when the user wants to force a NAK response by using the NYET_DIS bit).

If the endpoint responds instead to the OUT/DATA transaction with an NYET handshake, this means that the endpoint accepted the data but does not have room for another data payload. The host controller must return to using a PING token until the endpoint indicates it has space available.

**Figure 40-8. NYET Example with Two Endpoint Banks**



### 40.6.10.3 Data IN

• Bulk IN or Interrupt IN

Data IN packets are sent by the device during the data or the status stage of a control transfer or during an (interrupt/bulk/isochronous) IN transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

There are three ways for an application to transfer a buffer in several packets over the USB:

- packet by packet (see Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host) below)
- 64 Kbytes (see Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host) below)
- DMA (see Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) below)
  • Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)

• Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)

The application can write one or several banks.

A simple algorithm can be used by the application to send packets regardless of the number of banks associated to the endpoint.

**Algorithm Description for Each Packet**

- The application waits for the TXRDY flag to be cleared in the UDPHS_EPTSTAx register before it can perform a write access to the DPR.
- The application writes one USB packet of data in the DPR through the 64 Kbytes endpoint logical memory window.
- The application sets TXRDY flag in the UDPHS_EPTSETSTAx register.

The application is notified that it is possible to write a new packet to the DPR by the TXRDY interrupt. This interrupt can be enabled or masked by setting the TXRDY bit in the UDPHS_EPTCTLENB/ UDPHS_EPTCTLDIS register.

**Algorithm Description to Fill Several Packets**

Using the previous algorithm, the application is interrupted for each packet. It is possible to reduce the application overhead by writing linearly several banks at the same time. The AUTO_VALID bit in the UDPHS_EPTCTLx must be set by writing the AUTO_VALID bit in the UDPHS_EPTCTLENBx register.

The auto-valid-bank mechanism allows the transfer of data (IN and OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY_TXKL bit) is done by hardware.

- The application checks the BUSY_BANK_STA field in the UDPHS_EPTSTAx register. The application must wait that at least one bank is free.
- The application writes a number of bytes inferior to the number of free DPR banks for the endpoint. Each time the application writes the last byte of a bank, the TXRDY signal is automatically set by the UDPHS.
- If the last packet is incomplete (i.e., the last byte of the bank has not been written) the application must set the TXRDY bit in the UDPHS_EPTSETSTAx register.

The application is notified that all banks are free, so that it is possible to write another burst of packets by the BUSY_BANK interrupt. This interrupt can be enabled or masked by setting the BUSY_BANK flag in the UDPHS_EPTCTLENB and UDPHS_EPTCTLDIS registers.

This algorithm must not be used for isochronous transfer. In this case, the ping-pong mechanism does not operate.

A Zero Length Packet can be sent by setting just the TXRDY flag in the UDPHS_EPTSETSTAx register.

• Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host)

The UDPHS integrates a DMA host controller. This DMA controller can be used to transfer a buffer from the memory to the DPR or from the DPR to the processor memory under the UDPHS control. The DMA can be used for all transfer types except control transfer.

Example DMA configuration:

1. Program UDPHS_DMAADDRESS x with the address of the buffer that should be transferred.
2. Enable the interrupt of the DMA in UDPHS_IEN
3. Program UDPHS_ DMACONTROLx:
   - Size of buffer to send: size of the buffer to be sent to the host.
   - END_B_EN: The endpoint can validate the packet (according to the values programmed in the AUTO_VALID and SHRT_PCKT fields of UDPHS_EPTCTLx.) (see section UDPHS Endpoint Control Disable Register (Isochronous Endpoint) and Figure 40-13)
   - END_BUFFIT: generate an interrupt when the BUFF_COUNT in UDPHS_DMASTATUSx reaches 0.
   - CHANN_ENB: Run and stop at end of buffer

The auto-valid-bank mechanism allows the transfer of data (IN & OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY_TXKL bit) is done by hardware.

A transfer descriptor can be used. Instead of programming the register directly, a descriptor should be programmed and the address of this descriptor is then given to UDPHS_DMANXTDSC to be processed after setting the LDNXT_DSC field (Load Next Descriptor Now) in UDPHS_DMACONTROLx register.

The structure that defines this transfer descriptor must be aligned.

Each buffer to be transferred must be described by a DMA Transfer descriptor (see section UDPHS DMA Channel Transfer Descriptor). Transfer descriptors are chained. Before executing transfer of the buffer, the UDPHS may fetch a new transfer descriptor from the memory address pointed by the UDPHS_DMANXTDSCx register. Once the transfer is complete, the transfer status is updated in the UDPHS_DMASTATUSx register.

To chain a new transfer descriptor with the current DMA transfer, the DMA channel must be stopped. To do so, INTDIS_DMA and TXRDY may be set in the UDPHS_EPTCTLENBx register. It is also possible for the application to wait for the completion of all transfers. In this case the LDNXT_DSC bit in the last transfer descriptor UDPHS_DMACONTROLx register must be set to 0 and the CHANN_ENB bit set to 1.

Then the application can chain a new transfer descriptor.

The INTDIS_DMA can be used to stop the current DMA transfer if an enabled interrupt is triggered. This can be used to stop DMA transfers in case of errors.

The application can be notified at the end of any buffer transfer (ENB_BUFFIT bit in the UDPHS_DMACONTROLx register).

**Figure 40-9. Data IN Transfer for Endpoint with One Bank**

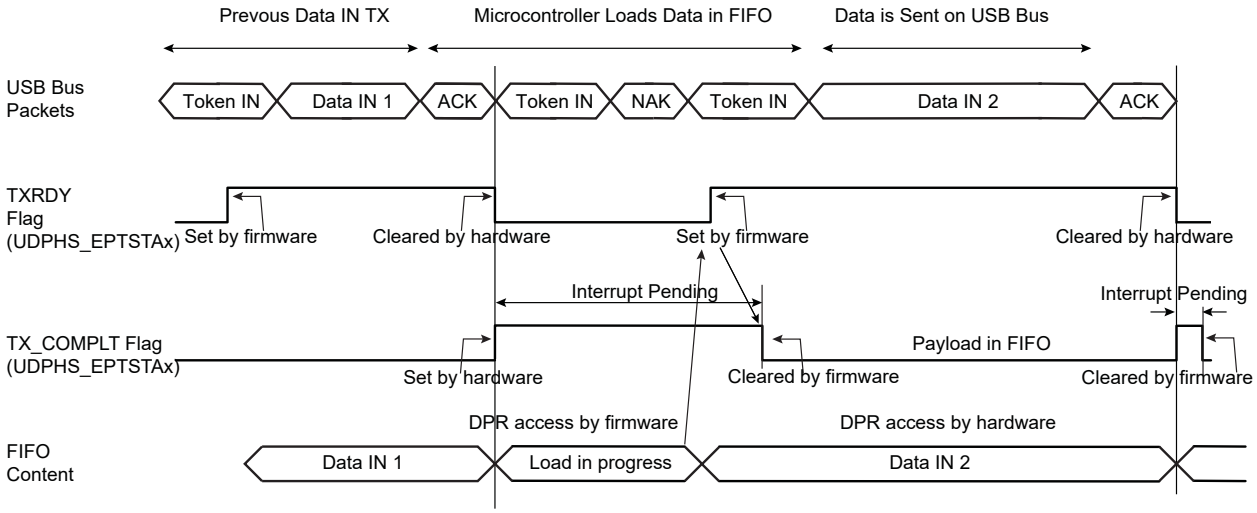


**Figure 40-10. Data IN Transfer for Endpoint with Two Banks**

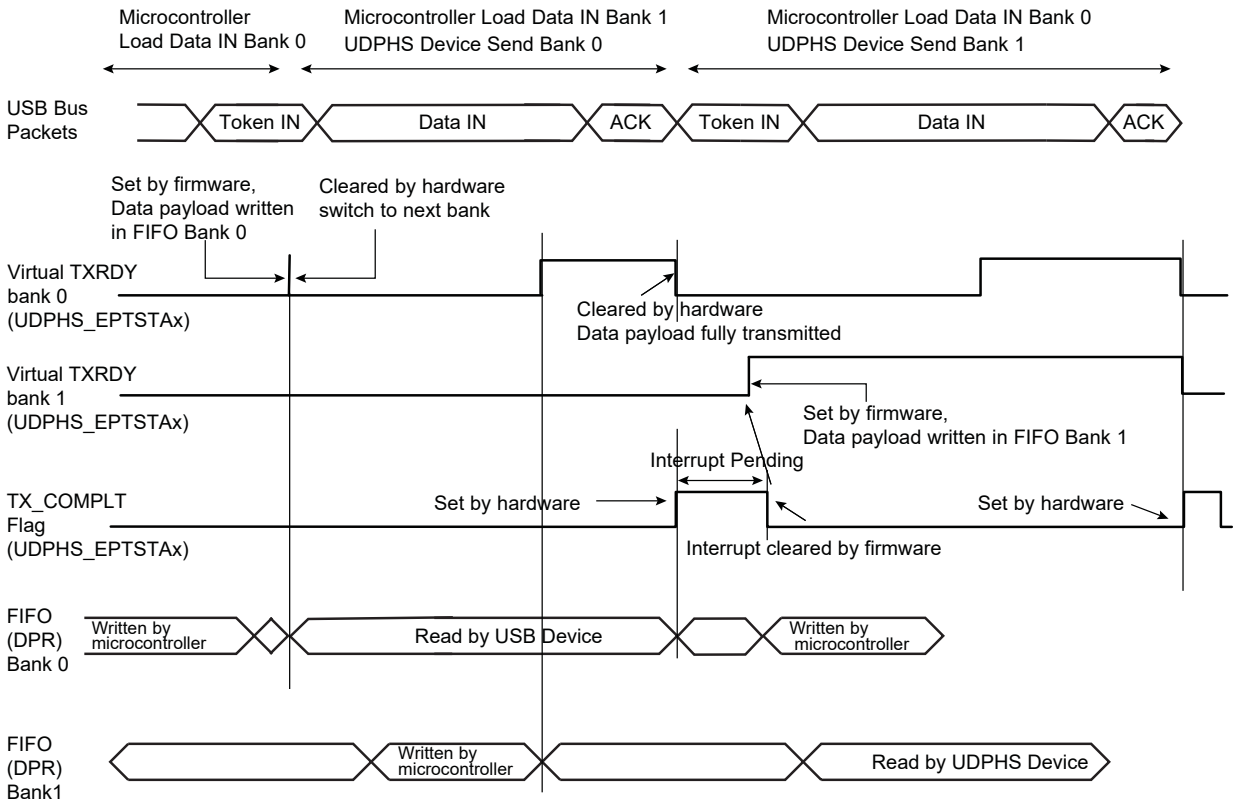

**Figure 40-11. Data IN Followed By Status OUT Transfer at the End of a Control Transfer**

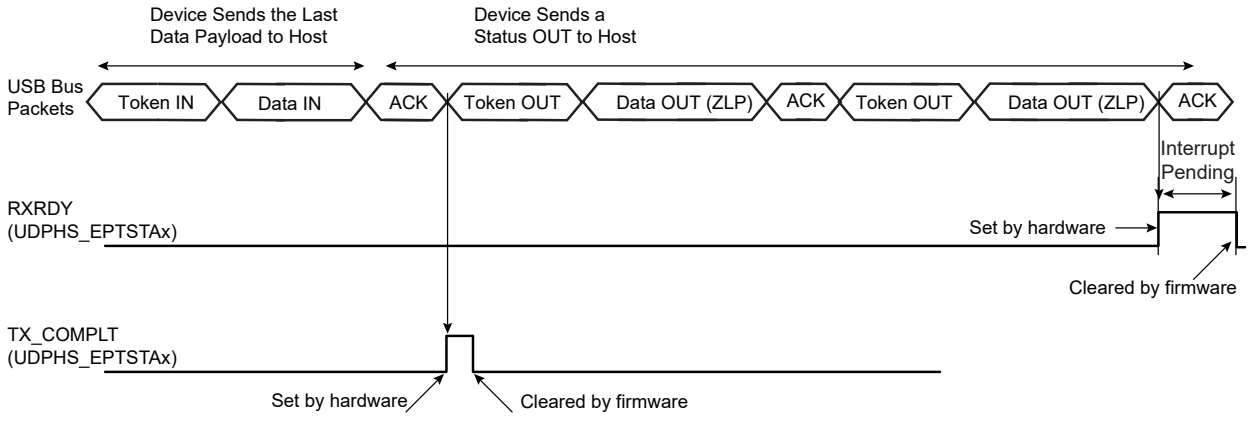
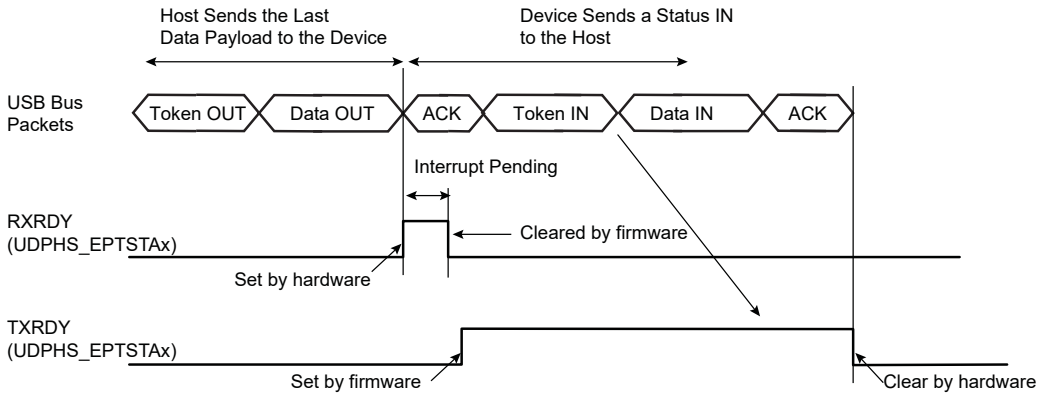


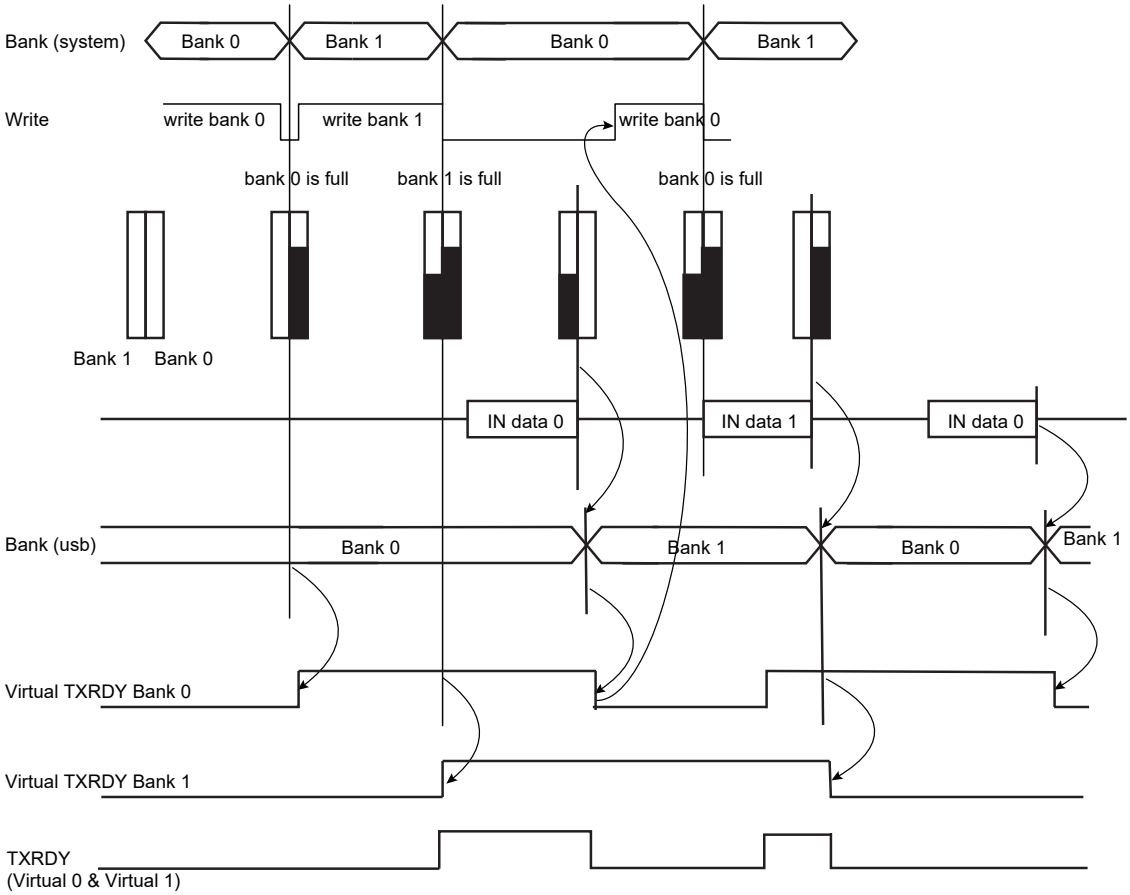
**Note:** A NAK handshake is always generated at the first status stage token.

**Figure 40-12. Data OUT Followed by Status IN Transfer**



**Note:** Before proceeding to the status stage, the software should determine that there is no risk of extra data from the host (data stage). If not certain (non-predictable data stage length), then the software should wait for a NAK-IN interrupt before proceeding to the status stage. This precaution should be taken to avoid collision in the FIFO.

**Figure 40-13. Autovalid with DMA**



**Note:** In the illustration above Autovalid validates a bank as full, although this might not be the case, in order to continue processing data and to send to DMA.

• Isochronous IN

Isochronous-IN is used to transmit a stream of data whose timing is implied by the delivery rate. Isochronous transfer provides periodic, continuous communication between host and device.

It guarantees bandwidth and low latencies appropriate for telephony, audio, video, etc.

If the endpoint is not available (TXRDY_TRER = 0), then the device does not answer to the host. An ERR_FL_ISO interrupt is generated in the UDPHS_EPTSTAx register and once enabled, then sent to the CPU.

The STALL_SNT command bit is not used for an ISO-IN endpoint.

• High Bandwidth Isochronous Endpoint Handling: IN Example

For high bandwidth isochronous endpoints, the DMA can be programmed with the number of transactions (BUFF_LENGTH field in UDPHS_DMACONTROLx) and the system should provide the required number of packets per microframe, otherwise, the host will notice a sequencing problem.

A response should be made to the first token IN recognized inside a microframe under the following conditions:

- If at least one bank has been validated, the correct DATAx corresponding to the programmed Number Of Transactions per Microframe (NB_TRANS) should be answered. In case of a subsequent missed or corrupted token IN inside the microframe, the USB 2.0 Core available data bank(s) that should normally have been transmitted during that microframe shall be flushed at its end. If this flush occurs, an error condition is flagged (ERR_FLUSH is set in UDPHS_EPTSTAx).
- If no bank is validated yet, the default DATA0 ZLP is answered and underflow is flagged (ERR_FL_ISO is set in UDPHS_EPTSTAx). Then, no data bank is flushed at microframe end.
- If no data bank has been validated at the time when a response should be made for the second transaction of NB_TRANS = 3 transactions microframe, a DATA1 ZLP is answered and underflow is flagged (ERR_FL_ISO is set in UDPHS_EPTSTAx). If and only if remaining untransmitted banks for that microframe are available at its end, they are flushed and an error condition is flagged (ERR_FLUSH is set in UDPHS_EPTSTAx).
- If no data bank has been validated at the time when a response should be made for the last programmed transaction of a microframe, a DATA0 ZLP is answered and underflow is flagged (ERR_FL_ISO is set in UDPHS_EPTSTAx). If and only if the remaining untransmitted data bank for that microframe is available at its end, it is flushed and an error condition is flagged (ERR_FLUSH is set in UDPHS_EPTSTAx).
- If at the end of a microframe no valid token IN has been recognized, no data bank is flushed and no error condition is reported.

At the end of a microframe in which at least one data bank has been transmitted, if less than NB_TRANS banks have been validated for that microframe, an error condition is flagged (ERR_TRANS is set in UDPHS_EPTSTAx).

Cases of Error (in UDPHS_EPTSTAx)

- ERR_FL_ISO: There was no data to transmit inside a microframe, so a ZLP is answered by default.
- ERR_FLUSH: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of transactions actually validated (TXRDY_TRER) and likewise with the NB_TRANS programmed.

- ERR_TRANS: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of programmed NB_TRANS transactions and the packets not requested were not validated.
- ERR_FL_ISO + ERR_FLUSH: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs.
- ERR_FL_ISO + ERR_TRANS: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs and the data can be discarded at the microframe end.
- ERR_FLUSH + ERR_TRANS: The first token IN has been answered and it was the only one received, a second bank has been validated but not the third, whereas NB_TRANS was waiting for three transactions.
- ERR_FL_ISO + ERR_FLUSH + ERR_TRANS: The first token IN has been treated, the data for the second Token IN was not available in time, but the second bank has been validated before the end of the microframe. The third bank has not been validated, but three transactions have been set in NB_TRANS.

#### 40.6.10.4 Data OUT

• Bulk OUT or Interrupt OUT

Like data IN, data OUT packets are sent by the host during the data or the status stage of control transfer or during an interrupt/bulk/isochronous OUT transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

• Bulk OUT or Interrupt OUT: Receiving a Packet Under Application Control (Host to Device)

**Algorithm Description for Each Packet:**

- The application enables an interrupt on RXRDY_TXKL.
- When an interrupt on RXRDY_TXKL is received, the application knows that UDPHS_EPTSTAx register BYTE_COUNT bytes have been received.
- The application reads the BYTE_COUNT bytes from the endpoint.
- The application clears RXRDY_TXKL.
  **Note:** If the application does not know the size of the transfer, it may not be a good option to use AUTO_VALID. Because if a zero-length-packet is received, the RXRDY_TXKL is automatically cleared by the AUTO_VALID hardware and if the endpoint interrupt is triggered, the software will not find its originating flag when reading the UDPHS_EPTSTAx register.

**Algorithm to Fill Several Packets**

- The application enables the interrupts of BUSY_BANK and AUTO_VALID.
- When a BUSY_BANK interrupt is received, the application knows that all banks available for the endpoint have been filled. Thus, the application can read all banks available.

If the application does not know the size of the receive buffer, instead of using the BUSY_BANK interrupt, the application must use RXRDY_TXKL.

• Bulk OUT or Interrupt OUT: Sending a Buffer Using DMA (Host To Device)

To use the DMA setting, the AUTO_VALID field is mandatory.

See Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) for more information.

DMA Configuration Example:

1. First program UDPHS_DMAADDRESSx with the address of the buffer that should be transferred.

2. Enable the interrupt of the DMA in UDPHS_IEN
3. Program the DMA Channelx Control Register:
   - Size of buffer to be sent.
   - END_B_EN: Can be used for OUT packet truncation (discarding of unbuffered packet data) at the end of DMA buffer.
   - END_BUFFIT: Generate an interrupt when BUFF_COUNT in the UDPHS_DMASTATUSx register reaches 0.
   - END_TR_EN: End of transfer enable, the UDPHS device can put an end to the current DMA transfer, in case of a short packet.
   - END_TR_IT: End of transfer interrupt enable, an interrupt is sent after the last USB packet has been transferred by the DMA, if the USB transfer ended with a short packet. (Beneficial when the receive size is unknown.)
   - CHANN_ENB: Run and stop at end of buffer.

For OUT transfer, the bank will be automatically cleared by hardware when the application has read all the bytes in the bank (the bank is empty).

**Note:**

1. When a zero-length-packet is received, RXRDY_TXKL bit in UDPHS_EPTSTAx is cleared automatically by AUTO_VALID, and the application knows of the end of buffer by the presence of the END_TR_IT.
2. If the host sends a zero-length packet, and the endpoint is free, then the device sends an ACK. No data is written in the endpoint, the RXRDY_TXKL interrupt is generated, and the BYTE_COUNT field in UDPHS_EPTSTAx is null.

**Figure 40-14. Data OUT Transfer for Endpoint with One Bank**

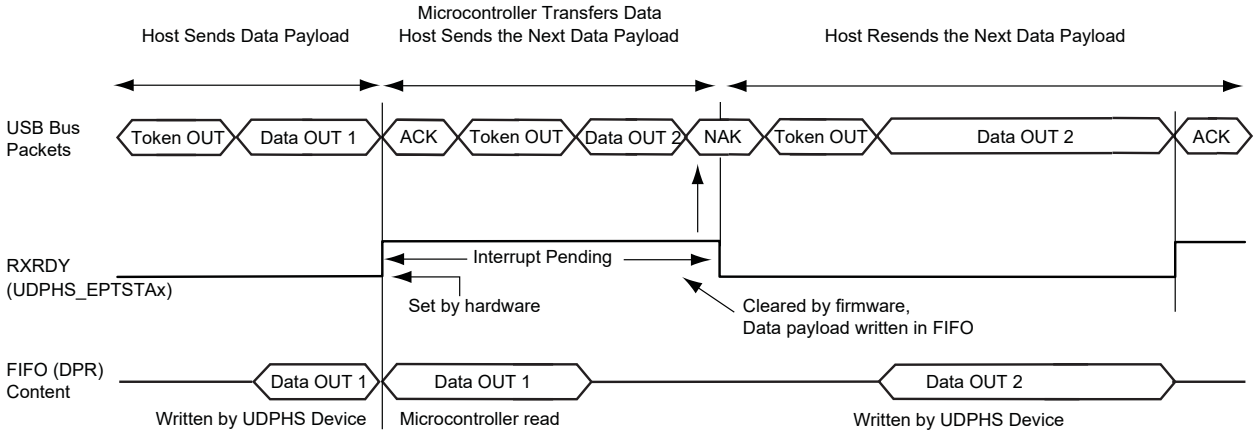


**Figure 40-15. Data OUT Transfer for an Endpoint with Two Banks**

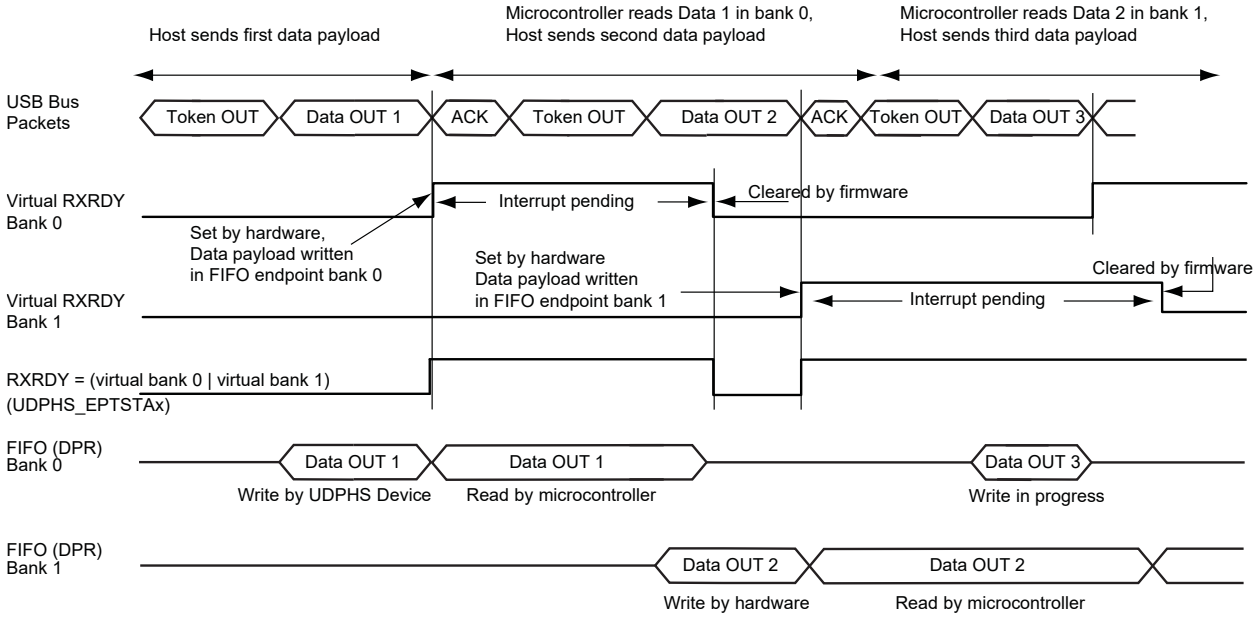


• High Bandwidth Isochronous Endpoint OUT

USB 2.0 supports individual High Speed isochronous endpoints that require data rates up to 192 Mb/s (24 MB/s): 3x1024 data bytes per microframe.

To support such a rate, two or three banks may be used to buffer the three consecutive data packets. The microcontroller (or the DMA) should be able to empty the banks very rapidly (at least 24 MB/s on average).

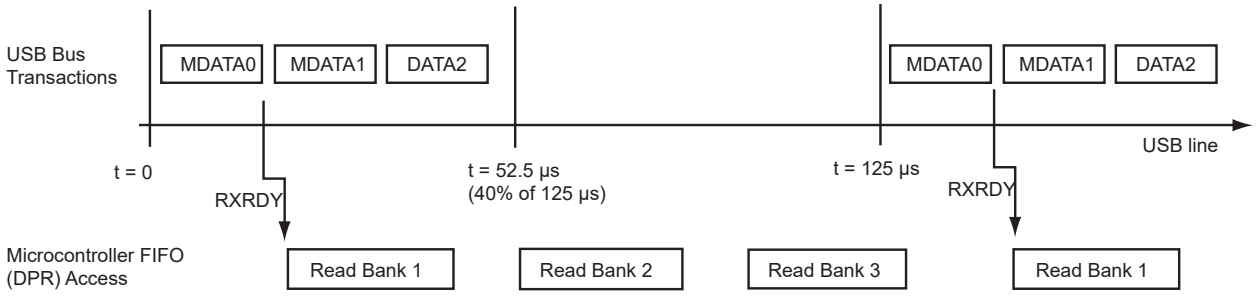
NB_TRANS field in UDPHS_EPTCFGx register = Number Of Transactions per Microframe.

If NB_TRANS > 1 then it is High Bandwidth.

Example:

- If NB_TRANS = 3, the sequence should be either
  - MData0
  - MData0/Data1
  - MData0/Data1/Data2
- If NB_TRANS = 2, the sequence should be either
  - MData0
  - MData0/Data1
- If NB_TRANS = 1, the sequence should be
  - Data0

**Figure 40-16. Bank Management, Example of Three Transactions per Microframe**



• Isochronous Endpoint Handling: OUT Example

The user can ascertain the bank status (free or busy), and the toggle sequencing of the data packet for each bank with the UDPHS_EPTSTAx register in the three fields as follows:

- TOGGLESQ_STA: PID of the data stored in the current bank
- CURBK: Number of the bank currently being accessed by the microcontroller.
- BUSY_BANK_STA: Number of busy bank

This is particularly useful in case of a missing data packet.

If the inter-packet delay between the OUT token and the Data is greater than the USB standard, then the ISO-OUT transaction is ignored. (Payload data is not written, no interrupt is generated to the CPU.)

If there is a data CRC (Cyclic Redundancy Check) error, the payload is, none the less, written in the endpoint. The ERR_CRC_NTR flag is set in UDPHS_EPTSTAx register.

If the endpoint is already full, the packet is not written in the DPRAM. The ERR_FL_ISO flag is set in UDPHS_EPTSTAx.

If the payload data is greater than the maximum size of the endpoint, then the ERR_OVFLW flag is set. It is the task of the CPU to manage this error. The data packet is written in the endpoint (except the extra data).

If the host sends a Zero Length Packet, and the endpoint is free, no data is written in the endpoint, the RXRDY_TXKL flag is set, and the BYTE_COUNT field in UDPHS_EPTSTAx register is null.

The FRCESTALL command bit is unused for an isochronous endpoint.

Otherwise, payload data is written in the endpoint, the RXRDY_TXKL interrupt is generated and the BYTE_COUNT in UDPHS_EPTSTAx register is updated.

#### 40.6.10.5 STALL

STALL is returned by a function in response to an IN token or after the data phase of an OUT or in response to a PING transaction. STALL indicates that a function is unable to transmit or receive data, or that a control pipe request is not supported.

- OUT

To stall an endpoint, set the FRCESTALL bit in UDPHS_EPTSETSTAx register and after the STALL_SNT flag has been set, set the TOGGLE_SEG bit in the UDPHS_EPTCLRSTAx register.

- IN

Set the FRCESTALL bit in UDPHS_EPTSETSTAx register.

**Figure 40-17. Stall Handshake Data OUT Transfer**

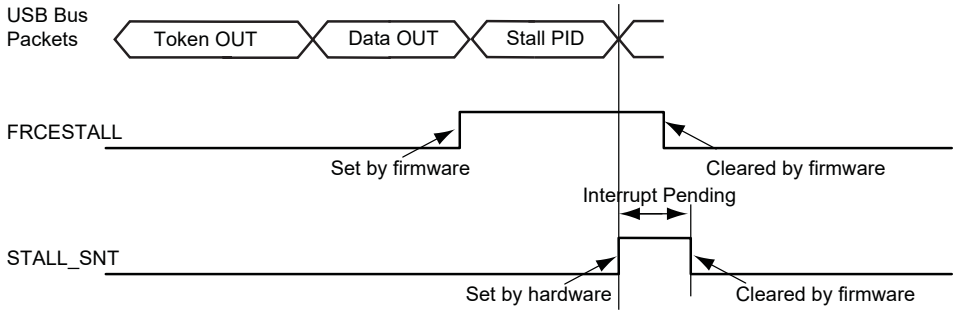


**Figure 40-18. Stall Handshake Data IN Transfer**

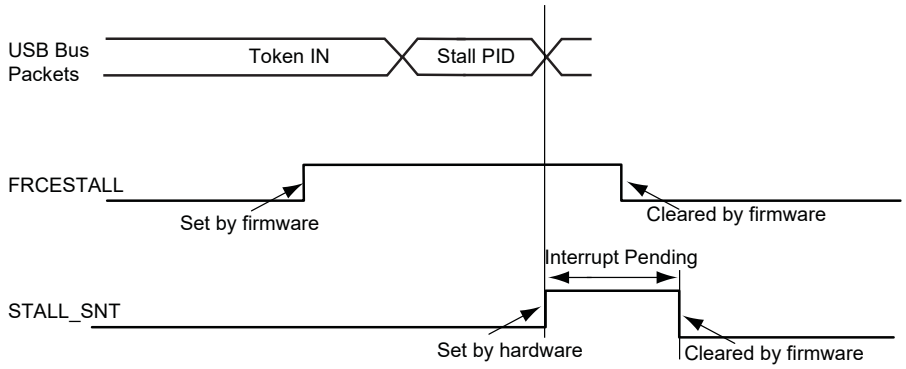


### 40.6.11 Speed Identification

The high speed reset is managed by hardware.

At the connection, the host makes a reset which could be a classic reset (full speed) or a high speed reset.

At the end of the reset process (full or high), the ENDRESET interrupt is generated.

Then the CPU should read the SPEED bit in UDPHS_INTSTAx to ascertain the speed mode of the device.

### 40.6.12 USB V2.0 High Speed Global Interrupt

Interrupts are defined in UDPHS Interrupt Enable Register (UDPHS_IEN) and in UDPHS Interrupt Status Register (UDPHS_INTSTA).

### 40.6.13 Endpoint Interrupts

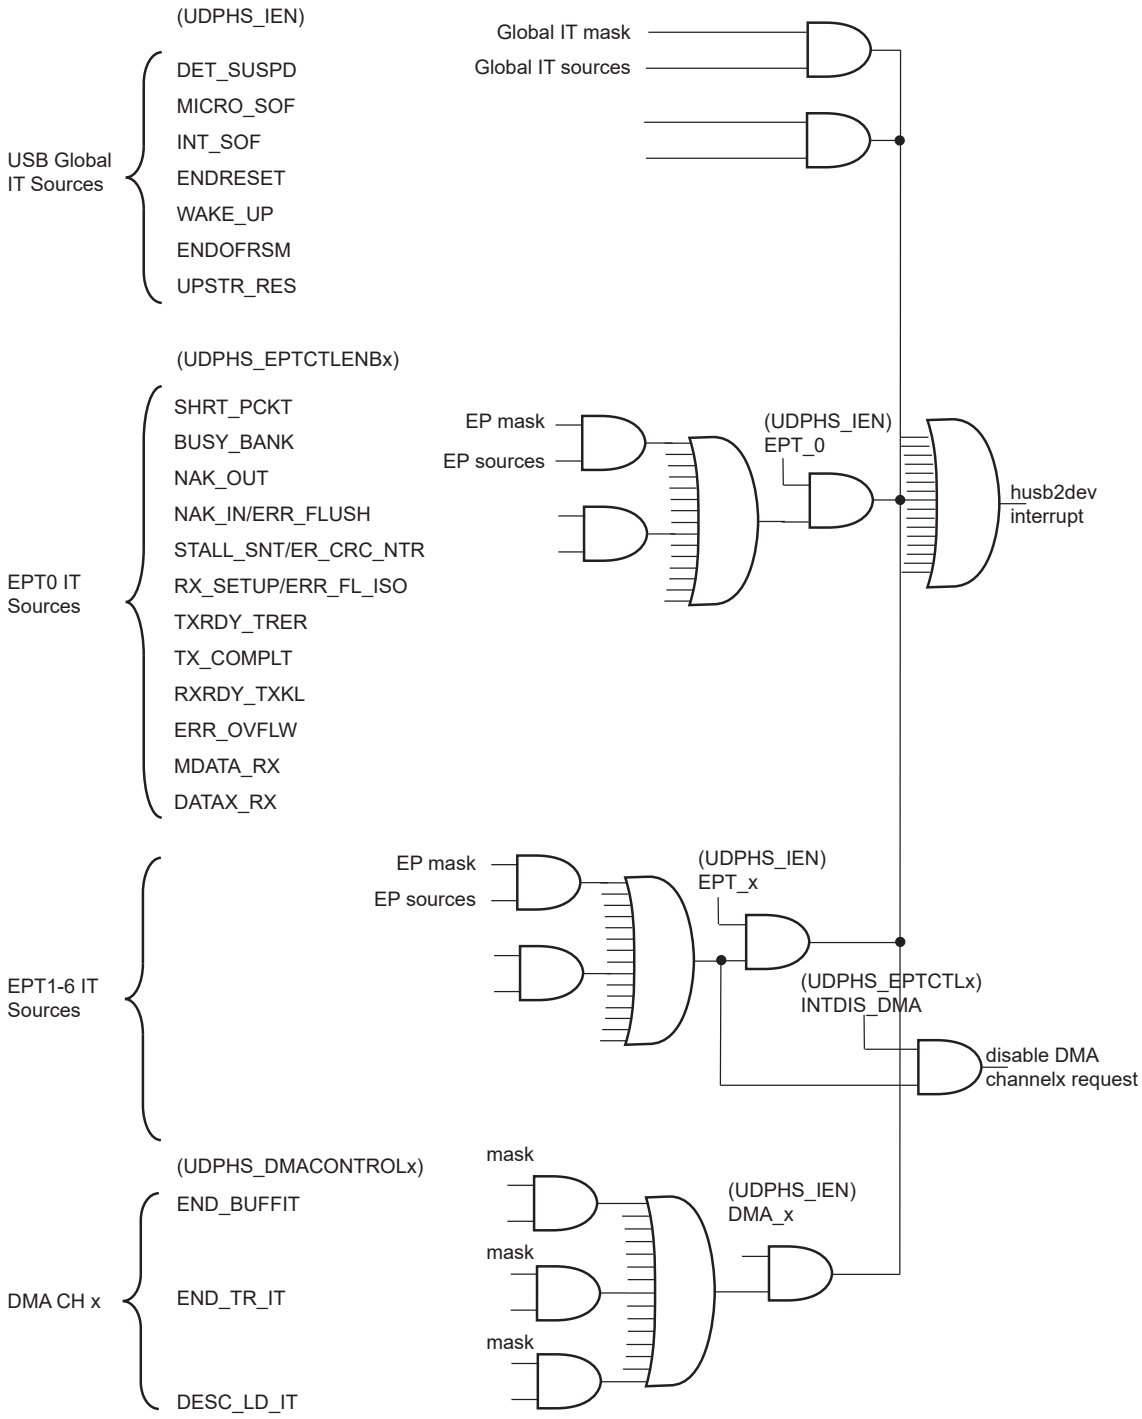
Interrupts are enabled in UDPHS_IEN (see UDPHS Interrupt Enable Register) and individually masked in UDPHS_EPTCTLENBx (see UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints)).

**Table 40-4. Endpoint Interrupt Source Masks**

| | |
|---|---|
| SHRT_PCKT | Short Packet Interrupt |
| BUSY_BANK | Busy Bank Interrupt |
| NAK_OUT | NAKOUT Interrupt |
| NAK_IN/ERR_FLUSH | NAKIN/Error Flush Interrupt |

| | |
|---|---|
| STALL_SNT/ERR_CRC_NTR | Stall Sent/CRC error/Number of Transaction Error Interrupt |
| RX_SETUP/ERR_FL_ISO | Received SETUP/Error Flow Interrupt |
| TXRDY_TRER | TX Packet Read/Transaction Error Interrupt |
| TX_COMPLT | Transmitted IN Data Complete Interrupt |
| RXRDY_TXKL | Received OUT Data Interrupt |
| ERR_OVFLW | Overflow Error Interrupt |
| MDATA_RX | MDATA Interrupt |
| DATAX_RX | DATAx Interrupt |

**Figure 40-19. UDPHS Interrupt Control Interface**

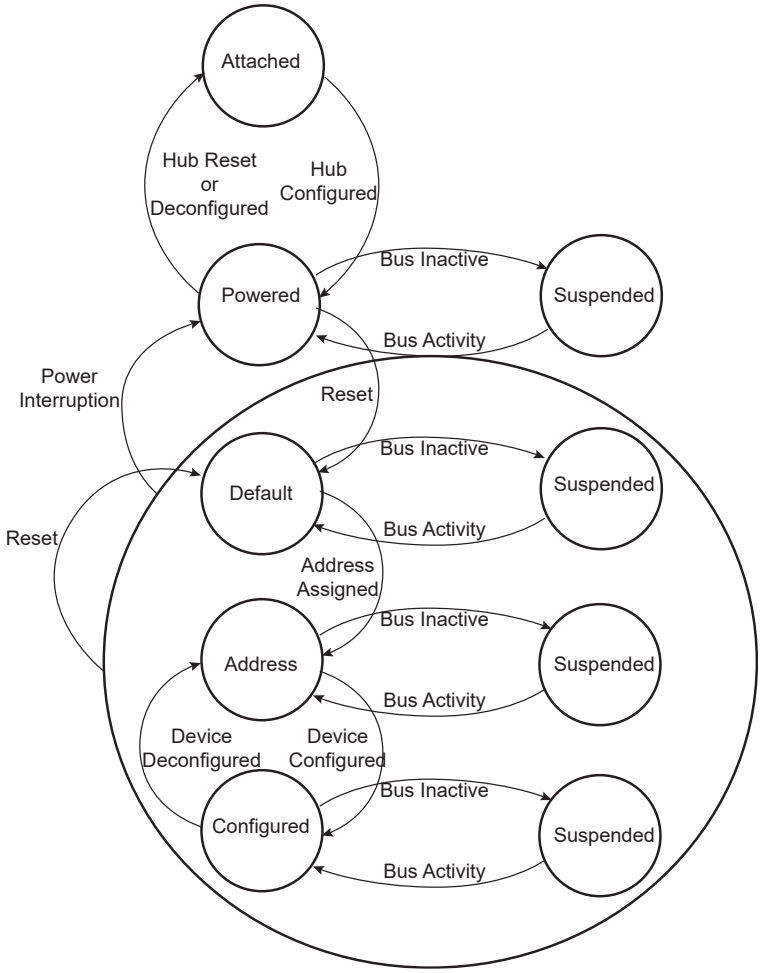


### 40.6.14 Power Modes

#### 40.6.14.1 Controlling Device States

A USB device has several possible states. Refer to Chapter 9 (USB Device Framework) of the Universal Serial Bus Specification, Rev 2.0.

**Figure 40-20. UDPHS Device State Diagram**



Movement from one state to another depends on the USB bus state or on standard requests sent through control transactions via the default endpoint (endpoint 0).

After a period of bus inactivity, the USB device enters Suspend mode. Accepting Suspend/Resume requests from the USB host is mandatory. Constraints in Suspend mode are very strict for bus-powered applications; devices may not consume more than 500 µA on the USB bus.

While in Suspend mode, the host may wake up a device by sending a resume signal (bus activity) or a USB device may send a wakeup request to the host, e.g., waking up a PC by moving a USB mouse.

The wakeup feature is not mandatory for all devices and must be negotiated with the host.

#### 40.6.14.2 Not Powered State

Self powered devices can detect 5V VBUS using a PIO. When the device is not connected to a host, device power consumption can be reduced by the DETACH bit in UDPHS_CTRL. Disabling the transceiver is automatically done. HSDM, HSDP, FSDP and FSDP lines are tied to GND pulldowns integrated in the hub downstream ports.

#### 40.6.14.3 Entering Attached State

When no device is connected, the USB FSDP and FSDM signals are tied to GND by 15 KΩ pulldowns integrated in the hub downstream ports. When a device is attached to an hub downstream port, the device connects a 1.5 KΩ pullup on FSDP. The USB bus line goes into IDLE state, FSDP is pulled up by the device 1.5 KΩ resistor to 3.3V and FSDM is pulled down by the 15 KΩ resistor to GND of the host.

After pullup connection, the device enters the powered state. The transceiver remains disabled until bus activity is detected.

In case of low power consumption need, the device can be stopped. When the device detects the VBUS, the software must enable the USB transceiver by enabling the EN_UDPHS bit in UDPHS_CTRL register.

The software can detach the pullup by setting DETACH bit in UDPHS_CTRL register.

#### 40.6.14.4 From Powered State to Default State (Reset)

After its connection to a USB host, the USB device waits for an end-of-bus reset. The unmasked flag ENDRESET is set in the UDPHS_IEN register and an interrupt is triggered.

Once the ENDRESET interrupt has been triggered, the device enters Default State. In this state, the UDPHS software must:

- Enable the default endpoint, setting the EPT_ENABL flag in the UDPHS_EPTCTLENB[0] register and, optionally, enabling the interrupt for endpoint 0 by writing 1 in EPT_0 of the UDPHS_IEN register. The enumeration then begins by a control transfer.
- Configure the Interrupt Mask Register which has been reset by the USB reset detection
- Enable the transceiver.

In this state, the EN_UDPHS bit in UDPHS_CTRL register must be enabled.

#### 40.6.14.5 From Default State to Address State (Address Assigned)

After a Set Address standard device request, the USB host peripheral enters the address state.

**⚠WARNING** Before the device enters address state, it must achieve the Status IN transaction of the control transfer, i.e., the UDPHS device sets its new address once the TX_COMPLT flag in the UDPHS_EPTCTL[0] register has been received and cleared.

To move to address state, the driver software sets the DEV_ADDR field and the FADDR_EN flag in the UDPHS_CTRL register.

#### 40.6.14.6 From Address State to Configured State (Device Configured)

Once a valid Set Configuration standard request has been received and acknowledged, the device enables endpoints corresponding to the current configuration. This is done by setting the BK_NUMBER, EPT_TYPE, EPT_DIR and EPT_SIZE fields in the UDPHS_EPTCFGx registers and enabling them by setting the EPT_ENABL flag in the UDPHS_EPTCTLENBx registers, and, optionally, enabling corresponding interrupts in the UDPHS_IEN register.

#### 40.6.14.7 Entering Suspend State (Bus Activity)

When a Suspend (no bus activity on the USB bus) is detected, the DET_SUSPD signal in the UDPHS_STA register is set. This triggers an interrupt if the corresponding bit is set in the UDPHS_IEN register. This flag is cleared by writing to the UDPHS_CLRINT register. Then the device enters Suspend mode.

In this state bus powered devices must drain less than 500 µA from the 5V VBUS. As an example, the microcontroller switches to slow clock, disables the PLL and main oscillator, and goes into Idle mode. It may also switch off other devices on the board.

The UDPHS device peripheral clocks can be switched off. Resume event is asynchronously detected.

#### 40.6.14.8 Receiving a Host Resume

In Suspend mode, a resume event on the USB bus line is detected asynchronously, transceiver and clocks disabled (however, the pullup should not be removed).

Once the resume is detected on the bus, the signal WAKE_UP in the UDPHS_INTSTA is set. It may generate an interrupt if the corresponding bit in the UDPHS_IEN register is set. This interrupt may be used to wake up the core, enable PLL and main oscillators and configure clocks.

#### 40.6.14.9 Sending an External Resume

In Suspend State it is possible to wake up the host by sending an external resume.

The device waits at least 5 ms after being entered in Suspend State before sending an external resume.

The device must force a K state from 1 to 15 ms to resume the host.

### 40.6.15 Test Mode

A device must support the TEST_MODE feature when in the Default, Address or Configured High Speed device states.

TEST_MODE can be:

- Test_J
- Test_K
- Test_Packet
- Test_SEO_NAK

(See UDPHS Test Register for definitions of each test mode.)

```
const char test_packet_buffer[] = {
0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,                // JKJKJKJK * 9
0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,                     // JJKKJJKK * 8
0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,                     // JJKKJJKK * 8
0xFE,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF, // JJJJJJJKKKKKKK * 8
0x7F,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,                          // JJJJJJJK * 8
0xFC,0x7E,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,0x7E                 // {JKKKKKKK * 10}, JK
};
```

## 40.7 Register Summary

**Note:**
The registers below have two modes: Control, Bulk, Interrupt Endpoints mode and Isochronous Endpoints mode.

In this register summary, both modes are displayed at the same offset.

- UDPHS_EPTCTLENB
- UDPHS_EPTCTLDIS

### 40.7.1 UDPHS Control Register

**Name:** UDPHS_CTRL
**Offset:** 0x00
**Reset:** 0x00000200
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PULLD_DIS | REWAKEUP | DETACH | EN_UDPHS |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 1 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FADDR_EN | DEV_ADDR[6:0] | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 11 – PULLD_DIS** Pulldown Disable (cleared upon USB reset)
When set, there is no pulldown on DP & DM. (DM Pulldown = DP Pulldown = 0).

**Note:** If the DETACH bit is also set, device DP & DM are left in high impedance state.

(See description of bit “DETACH”.)

| DETACH | PULLD_DIS | DP | DM | Condition |
|---|---|---|---|---|
| 0 | 0 | Pullup | Pulldown | Not recommended |
| 0 | 1 | Pullup | High impedance state | VBUS present |
| 1 | 0 | Pulldown | Pulldown | No VBUS |
| 1 | 1 | High impedance state | High impedance state | VBUS present & software disconnect |

**Bit 10 – REWAKEUP** Send Remote Wakeup (cleared upon USB reset)
An Upstream Resume is sent only after the UDPHS bus has been in SUSPEND state for at least 5 ms.

This bit is automatically cleared by hardware at the end of the Upstream Resume.

| Value | Description |
|---|---|
| 0 | Remote Wakeup is disabled (read), or this bit has no effect (write). |

| Value | Description |
|---|---|
| 1 | Remote Wakeup is enabled (read), or this bit forces an external interrupt on the UDPHS controller for Remote Wakeup purposes. |

**Bit 9 – DETACH** Detach Command
See description of bit “PULL_DIS”.

| Value | Description |
|---|---|
| 0 | UDPHS is attached (read), or this bit pulls up the DP line (attach command) (write). |
| 1 | UDPHS is detached, UTMI transceiver is suspended (read), or this bit simulates a detach on the UDPHS line and forces the UTMI transceiver into suspend state (Suspend M = 0) (write). |

**Bit 8 – EN_UDPHS** UDPHS Enable

| Value | Description |
|---|---|
| 0 | UDPHS is disabled (read), or this bit disables and resets the UDPHS controller (write). Switch the host to UTMI. |
| 1 | UDPHS is enabled (read), or this bit enables the UDPHS controller (write). Switch the host to UTMI. |

**Bit 7 – FADDR_EN** Function Address Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Device is not in address state (read), or only the default function address is used (write). |
| 1 | Device is in address state (read), or this bit is set by the device firmware after a successful status phase of a SET_ADDRESS transaction (write). When set, the only address accepted by the UDPHS controller is the one stored in the UDPHS Address field. It will not be cleared afterwards by the device firmware. It is cleared by hardware on hardware reset, or when UDPHS bus reset is received. |

**Bits 6:0 – DEV_ADDR[6:0]** UDPHS Address (cleared upon USB reset)
This field contains the default address (0) after power-up or UDPHS bus reset (read), or it is written with the value set by a SET_ADDRESS request received by the device firmware (write).

### 40.7.2 UDPHS Frame Number Register

**Name:** UDPHS_FNUM
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FNUM_ERR | | | | | | | |
| Access | R | | | | | | | |
| Reset | 0 | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | FRAME_NUMBER[10:5] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FRAME_NUMBER[4:0] | | | | | MICRO_FRAME_NUM[2:0] | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – FNUM_ERR** Frame Number CRC Error (cleared upon USB reset)
This bit is set by hardware when a corrupted Frame Number in Start of Frame packet (or Micro SOF) is received.

This bit and the INT_SOF (or MICRO_SOF) interrupt are updated at the same time.

**Bits 13:3 – FRAME_NUMBER[10:0]** Frame Number as defined in the Packet Field Formats (cleared upon USB reset)
This field is provided in the last received SOF packet (see INT_SOF in the UDPHS Interrupt Status Register).

**Bits 2:0 – MICRO_FRAME_NUM[2:0]** Microframe Number (cleared upon USB reset)
Number of the received microframe (0 to 7) in one frame.This field is reset at the beginning of each new frame (1 ms).

One microframe is received each 125 microseconds (1 ms/8).

### 40.7.3 UDPHS Interrupt Enable Register

**Name:** UDPHS_IEN
**Offset:** 0x10
**Reset:** 0x00000010
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DMA_7 | DMA_6 | DMA_5 | DMA_4 | DMA_3 | DMA_2 | DMA_1 | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UPSTR_RES | ENDOFRSM | WAKE_UP | ENDRESET | INT_SOF | MICRO_SOF | DET_SUSPD | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | |
| Reset | 0 | 0 | 0 | 1 | 0 | 0 | 0 | |

**Bits 25, 26, 27, 28, 29, 30, 31 – DMA_x** DMA Channel x Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable the interrupts for this channel. |
| 1 | Enable the interrupts for this channel. |

**Bits 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 – EPT_x** Endpoint x Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable the interrupts for this endpoint. |
| 1 | Enable the interrupts for this endpoint. |

**Bit 7 – UPSTR_RES** Upstream Resume Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable Upstream Resume Interrupt. |
| 1 | Enable Upstream Resume Interrupt. |

**Bit 6 – ENDOFRSM** End Of Resume Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable Resume Interrupt. |

| Value | Description |
|---|---|
| 1 | Enable Resume Interrupt. |

**Bit 5 – WAKE_UP** Wake Up CPU Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable Wake-up CPU Interrupt. |
| 1 | Enable Wake-up CPU Interrupt. |

**Bit 4 – ENDRESET** End Of Reset Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable End Of Reset Interrupt. |
| 1 | Enable End Of Reset Interrupt. Automatically enabled after USB reset. |

**Bit 3 – INT_SOF** SOF Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable SOF Interrupt. |
| 1 | Enable SOF Interrupt. |

**Bit 2 – MICRO_SOF** Micro-SOF Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable Micro-SOF Interrupt. |
| 1 | Enable Micro-SOF Interrupt. |

**Bit 1 – DET_SUSPD** Suspend Interrupt Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Disable Suspend Interrupt. |
| 1 | Enable Suspend Interrupt. |

### 40.7.4 UDPHS Interrupt Status Register

**Name:** UDPHS_INTSTA
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DMA_7 | DMA_6 | DMA_5 | DMA_4 | DMA_3 | DMA_2 | DMA_1 | |
| Access | R | R | R | R | R | R | R | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

|---|---|---|---|---|---|---|---|---|
| | EPT_15 | EPT_14 | EPT_13 | EPT_12 | EPT_11 | EPT_10 | EPT_9 | EPT_8 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | EPT_7 | EPT_6 | EPT_5 | EPT_4 | EPT_3 | EPT_2 | EPT_1 | EPT_0 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UPSTR_RES | ENDOFRSM | WAKE_UP | ENDRESET | INT_SOF | MICRO_SOF | DET_SUSPD | SPEED |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 25, 26, 27, 28, 29, 30, 31 – DMA_x** DMA Channel x Interrupt

| Value | Description |
|---|---|
| 0 | Reset when the UDPHS_DMASTATUSx interrupt source is cleared. |
| 1 | Set by hardware when an interrupt is triggered by the DMA Channelx and this endpoint interrupt is enabled by the DMA_x bit in UDPHS_IEN. |

**Bits 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 – EPT_x** Endpoint x Interrupt (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Reset when the UDPHS_EPTSTAx interrupt source is cleared. |
| 1 | Set by hardware when an interrupt is triggered by the UDPHS_EPTSTAx register and this endpoint interrupt is enabled by the EPT_x bit in UDPHS_IEN. |

**Bit 7 – UPSTR_RES** Upstream Resume Interrupt

| Value | Description |
|---|---|
| 0 | Cleared by setting the UPSTR_RES bit in UDPHS_CLRINT. |
| 1 | Set by hardware when the UDPHS controller is sending a resume signal called “upstream resume”. This triggers a UDPHS interrupt when the UPSTR_RES bit is set in UDPHS_IEN. |

**Bit 6 – ENDOFRSM** End Of Resume Interrupt

| Value | Description |
|---|---|
| 0 | Cleared by setting the ENDOFRSM bit in UDPHS_CLRINT. |
| 1 | Set by hardware when the UDPHS controller detects a good end of resume signal initiated by the host. This triggers a UDPHS interrupt when the ENDOFRSM bit is set in UDPHS_IEN. |

**Bit 5 – WAKE_UP** Wake Up CPU Interrupt

| Value | Description |
|---|---|
| 0 | Cleared by setting the WAKE_UP bit in UDPHS_CLRINT. |
| 1 | Set by hardware when the UDPHS controller is in SUSPEND state and is re-activated by a filtered non-idle signal from the UDPHS line (not by an upstream resume). This triggers a UDPHS interrupt when the WAKE_UP bit is set in UDPHS_IEN register. When receiving this interrupt, the user has to enable the device controller clock prior to operation.<br>**Note:** this interrupt is generated even if the device controller clock is disabled. |

**Bit 4 – ENDRESET** End Of Reset Interrupt

| Value | Description |
|---|---|
| 0 | Cleared by setting the ENDRESET bit in UDPHS_CLRINT. |
| 1 | Set by hardware when an End Of Reset has been detected by the UDPHS controller. This triggers a UDPHS interrupt when the ENDRESET bit is set in UDPHS_IEN. |

**Bit 3 – INT_SOF** Start Of Frame Interrupt
**Note:** The Micro Start Of Frame Interrupt (MICRO_SOF), and the Start Of Frame Interrupt (INT_SOF) are not generated at the same time.

| Value | Description |
|---|---|
| 0 | Cleared by setting the INT_SOF bit in UDPHS_CLRINT. |
| 1 | Set by hardware when an UDPHS Start Of Frame PID (SOF) has been detected (every 1 ms) or synthesized by the macro. This triggers a UDPHS interrupt when the INT_SOF bit is set in UDPHS_IEN register. In case of detected SOF, in High Speed mode, the MICRO_FRAME_NUMBER field is cleared in UDPHS_FNUM register and the FRAME_NUMBER field is updated. |

**Bit 2 – MICRO_SOF** Micro Start Of Frame Interrupt
**Note:** The Micro Start Of Frame Interrupt (MICRO_SOF), and the Start Of Frame Interrupt (INT_SOF) are not generated at the same time.

| Value | Description |
|---|---|
| 0 | Cleared by setting the MICRO_SOF bit in UDPHS_CLRINT register. |
| 1 | Set by hardware when an UDPHS micro start of frame PID (SOF) has been detected (every 125 us) or synthesized by the macro. This triggers a UDPHS interrupt when the MICRO_SOF bit is set in UDPHS_IEN. In case of detected SOF, the MICRO_FRAME_NUM field in UDPHS_FNUM register is incremented and the FRAME_NUMBER field does not change. |

**Bit 1 – DET_SUSPD** Suspend Interrupt

| Value | Description |
|---|---|
| 0 | Cleared by setting the DET_SUSPD bit in UDPHS_CLRINT register. |
| 1 | Set by hardware when a UDPHS Suspend (Idle bus for three frame periods, a J state for 3 ms) is detected. This triggers a UDPHS interrupt when the DET_SUSPD bit is set in UDPHS_IEN register. |

**Bit 0 – SPEED** Speed Status

| Value | Description |
|---|---|
| 0 | Reset by hardware when the hardware is in Full Speed mode. |
| 1 | Set by hardware when the hardware is in High Speed mode. |

### 40.7.5 UDPHS Clear Interrupt Register

**Name:** UDPHS_CLRINT
**Offset:** 0x18
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UPSTR_RES | ENDOFRSM | WAKE_UP | ENDRESET | INT_SOF | MICRO_SOF | DET_SUSPD | |
| Access | W | W | W | W | W | W | W | |
| Reset | – | – | – | – | – | – | – | |

**Bit 7 – UPSTR_RES** Upstream Resume Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the UPSTR_RES bit in UDPHS_INTSTA. |

**Bit 6 – ENDOFRSM** End Of Resume Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the ENDOFRSM bit in UDPHS_INTSTA. |

**Bit 5 – WAKE_UP** Wake Up CPU Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the WAKE_UP bit in UDPHS_INTSTA. |

**Bit 4 – ENDRESET** End Of Reset Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the ENDRESET bit in UDPHS_INTSTA. |

**Bit 3 – INT_SOF** Start Of Frame Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the INT_SOF bit in UDPHS_INTSTA. |

**Bit 2 – MICRO_SOF** Micro Start Of Frame Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the MICRO_SOF bit in UDPHS_INTSTA. |

**Bit 1 – DET_SUSPD** Suspend Interrupt Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the DET_SUSPD bit in UDPHS_INTSTA. |

### 40.7.6 UDPHS Endpoints Reset Register

**Name:** UDPHS_EPTRST
**Offset:** 0x1C
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | EPT_15 | EPT_14 | EPT_13 | EPT_12 | EPT_11 | EPT_10 | EPT_9 | EPT_8 |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | EPT_7 | EPT_6 | EPT_5 | EPT_4 | EPT_3 | EPT_2 | EPT_1 | EPT_0 |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – EPT_x** Endpoint x Reset
Setting this bit clears all bits in the Endpoint status UDPHS_EPTSTAx register except the TOGGLESQ_STA field.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Reset the Endpointx state. |

### 40.7.7 UDPHS Test Register

**Name:** UDPHS_TST
**Offset:** 0xE0
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | OPMODE2 | TST_PKT | TST_K | TST_J | SPEED_CFG[1:0] | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – OPMODE2** OpMode2
**Note:** For the Test mode, Test_SE0_NAK (refer to Universal Serial Bus Specification, Revision 2.0: 7.1.20, Test Mode Support). Force the device in High Speed mode, and configure a bulk-type endpoint. Do not fill this endpoint for sending NAK to the host.
Upon command, a port's transceiver must enter the High Speed Receive mode and remain in that mode until the exit action is taken. This enables the testing of output impedance, low level output voltage and loading characteristics. In addition, while in this mode, upstream facing ports (and only upstream facing ports) must respond to any IN token packet with a NAK handshake (only if the packet CRC is determined to be correct) within the normal allowed device response time. This enables testing of the device squelch level circuitry and, additionally, provides a general purpose stimulus/response test for basic functional testing.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Set to force the OpMode signal (UTMI interface) to "10", to disable the bit-stuffing and the NRZI encoding. |

**Bit 4 – TST_PKT** Test Packet Mode

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Set to repetitively transmit the packet stored in the current bank. This enables the testing of rise and fall times, eye patterns, jitter, and any other dynamic waveform specifications. |

**Bit 3 – TST_K** Test K Mode

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Set to send the K state on the UDPHS line. This enables the testing of the high output drive level on the D- line. |

**Bit 2 – TST_J** Test J Mode

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Set to send the J state on the UDPHS line. This enables the testing of the high output drive level on the D+ line. |

**Bits 1:0 – SPEED_CFG[1:0]** Speed Configuration

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Normal mode: The macro is in Full Speed mode, ready to make a High Speed identification, if the host supports it and then to automatically switch to High Speed mode. |
| 1 | – | Reserved |
| 2 | HIGH_SPEED | Force High Speed: Set this value to force the hardware to work in High Speed mode. Only for debug or test purpose. |
| 3 | FULL_SPEED | Force Full Speed: Set this value to force the hardware to work only in Full Speed mode. In this configuration, the macro will not respond to a High Speed reset handshake. |

### 40.7.8 UDPHS Endpoint Configuration Register

**Name:** UDPHS_EPTCFGx
**Offset:** 0x0100 + x*0x20 [x=0..15]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | EPT_MAPD | | | | | | | |
| Access | R/W | | | | | | | |
| Reset | 0 | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | NB_TRANS[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BK_NUMBER[1:0] | | EPT_TYPE[1:0] | | EPT_DIR | EPT_SIZE[2:0] | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – EPT_MAPD** Endpoint Mapped (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | The user should reprogram the register with correct values. |
| 1 | Set by hardware when the endpoint size (EPT_SIZE) and the number of banks (BK_NUMBER) are correct regarding:<br>– The max endpoint size for this endpoint<br>– The number of allowed banks for this endpoint<br>– The number of endpoints/banks already allocated<br>– The FIFO max capacity (FIFO_MAX_SIZE in UDPHS_IPFEATURES register) |

**Bits 9:8 – NB_TRANS[1:0]** Number Of Transactions per Microframe (cleared upon USB reset)
The number of transactions per microframe is set by software.

**Note:** Meaningful for high bandwidth isochronous endpoint only.

**Bits 7:6 – BK_NUMBER[1:0]** Number of Banks (cleared upon USB reset)
Set this field according to the endpoint's number of banks (see section Endpoint Configuration).

| Value | Name | Description |
|---|---|---|
| 0 | 0 | Zero bank, the endpoint is not mapped in memory |

| Value | Name | Description |
|---|---|---|
| 1 | 1 | One bank (bank 0) |
| 2 | 2 | Double bank (Ping-Pong: bank0/bank1) |
| 3 | 3 | Triple bank (bank0/bank1/bank2) |

**Bits 5:4 – EPT_TYPE[1:0]** Endpoint Type (cleared upon USB reset)
Set this field according to the endpoint type (see section Endpoint Configuration).

(Endpoint 0 should always be configured as control).

| Value | Name | Description |
|---|---|---|
| 0 | CTRL8 | Control endpoint |
| 1 | ISO | Isochronous endpoint |
| 2 | BULK | Bulk endpoint |
| 3 | INT | Interrupt endpoint |

**Bit 3 – EPT_DIR** Endpoint Direction (cleared upon USB reset)
For Control endpoints this bit has no effect and should be left at zero.

| Value | Description |
|---|---|
| 0 | Clear this bit to configure OUT direction for Bulk, Interrupt and Isochronous endpoints. |
| 1 | Set this bit to configure IN direction for Bulk, Interrupt and Isochronous endpoints. |

**Bits 2:0 – EPT_SIZE[2:0]** Endpoint Size (cleared upon USB reset)
Set this field according to the endpoint size in bytes (see the section Endpoint Configuration). Note that 1024 bytes is only for isochronous endpoints.

| Value | Name | Description |
|---|---|---|
| 0 | 8 | 8 bytes |
| 1 | 16 | 16 bytes |
| 2 | 32 | 32 bytes |
| 3 | 64 | 64 bytes |
| 4 | 128 | 128 bytes |
| 5 | 256 | 256 bytes |
| 6 | 512 | 512 bytes |
| 7 | 1024 | 1024 bytes |

### 40.7.9 UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS_EPTCTLENBx
**Offset:** 0x0104 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SHRT_PCKT | | | | | | | |
| Access | W | | | | | | | |
| Reset | – | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | BUSY_BANK | | |
| Access | | | | | | W | | |
| Reset | | | | | | – | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | NAK_OUT | NAK_IN | STALL_SNT | RX_SETUP | TXRDY | TX_COMPLT | RXRDY_TXKL | ERR_OVFLW |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | NYET_DIS | INTDIS_DMA | | AUTO_VALID | EPT_ENABL |
| Access | | | | W | W | | W | W |
| Reset | | | | – | – | | – | – |

**Bit 31 – SHRT_PCKT** Short Packet Send/Short Packet Interrupt Enable
For IN endpoints: Guarantees short packet at end of DMA Transfer if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTOVALID bits are also set.

For OUT endpoints:

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Short Packet Interrupt. |

**Bit 18 – BUSY_BANK** Busy Bank Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Busy Bank Interrupt. |

**Bit 15 – NAK_OUT** NAKOUT Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable NAKOUT Interrupt. |

**Bit 14 – NAK_IN** NAKIN Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable NAKIN Interrupt. |

**Bit 13 – STALL_SNT** Stall Sent Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Stall Sent Interrupt. |

**Bit 12 – RX_SETUP** Received SETUP

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable RX_SETUP Interrupt. |

**Bit 11 – TXRDY** TX Packet Ready Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable TX Packet Ready/Transaction Error Interrupt. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Transmitted IN Data Complete Interrupt. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Received OUT Data Interrupt. |

**Bit 8 – ERR_OVFLW** Overflow Error Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Overflow Error Interrupt. |

**Bit 4 – NYET_DIS** NYET Disable (Only for High Speed Bulk OUT endpoints)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response. |

**Bit 3 – INTDIS_DMA** Interrupts Disable DMA

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled. |

**Bit 1 – AUTO_VALID** Packet Auto-Valid Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers. |

**Bit 0 – EPT_ENABL** Endpoint Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable endpoint according to the device configuration. |

### 40.7.10 UDPHS Endpoint Control Enable Register (Isochronous Endpoints)

**Name:** UDPHS_EPTCTLENBx
**Offset:** 0x0104 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x1 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Control Register (Isochronous Endpoint).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 31 – SHRT_PCKT** Short Packet Send/Short Packet Interrupt Enable
For IN endpoints: Guarantees short packet at end of DMA Transfer if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTOVALID bits are also set.

For OUT endpoints:

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Short Packet Interrupt. |

**Bit 18 – BUSY_BANK** Busy Bank Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Busy Bank Interrupt. |

**Bit 14 – ERR_FLUSH** Bank Flush Error Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Bank Flush Error Interrupt. |

**Bit 13 – ERR_CRC_NTR** ISO CRC Error/Number of Transaction Error Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Error CRC ISO/Error Number of Transaction Interrupt. |

**Bit 12 – ERR_FL_ISO** Error Flow Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Error Flow ISO Interrupt. |

**Bit 11 – TXRDY_TRER** TX Packet Ready/Transaction Error Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable TX Packet Ready/Transaction Error Interrupt. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Transmitted IN Data Complete Interrupt. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Received OUT Data Interrupt. |

**Bit 8 – ERR_OVFLW** Overflow Error Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable Overflow Error Interrupt. |

**Bit 7 – MDATA_RX** MDATA Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable MDATA Interrupt. |

**Bit 6 – DATAX_RX** DATAx Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable DATAx Interrupt. |

**Bit 3 – INTDIS_DMA** Interrupts Disable DMA

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled. |

**Bit 1 – AUTO_VALID** Packet Auto-Valid Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers. |

**Bit 0 – EPT_ENABL** Endpoint Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable endpoint according to the device configuration. |

### 40.7.11 UDPHS Endpoint Control Disable Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS_EPTCTLDISx
**Offset:** 0x0108 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SHRT_PCKT | | | | | | | |
| Access | W | | | | | | | |
| Reset | – | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | BUSY_BANK | | |
| Access | | | | | | W | | |
| Reset | | | | | | – | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

| | | | | NYET_DIS | INTDIS_DMA | | AUTO_VALID | EPT_DISABL |
| Access | | | | W | W | | W | W |
| Reset | | | | – | – | | – | – |

**Bit 31 – SHRT_PCKT** Short Packet Interrupt Disable
For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.

For OUT endpoints:

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Short Packet Interrupt. |

**Bit 18 – BUSY_BANK** Busy Bank Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Busy Bank Interrupt. |

**Bit 15 – NAK_OUT** NAKOUT Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Disable NAKOUT Interrupt. |

**Bit 14 – NAK_IN** NAKIN Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable NAKIN Interrupt. |

**Bit 13 – STALL_SNT** Stall Sent Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Stall Sent Interrupt. |

**Bit 12 – RX_SETUP** Received SETUP Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable RX_SETUP Interrupt. |

**Bit 11 – TXRDY** TX Packet Ready Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable TX Packet Ready/Transaction Error Interrupt. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Transmitted IN Data Complete Interrupt. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Received OUT Data Interrupt. |

**Bit 8 – ERR_OVFLW** Overflow Error Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Overflow Error Interrupt. |

**Bit 4 – NYET_DIS** NYET Enable (Only for High Speed Bulk OUT endpoints)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Let the hardware handle the handshake response for the High Speed Bulk OUT transfer. |

**Bit 3 – INTDIS_DMA** Interrupts Disable DMA

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable the “Interrupts Disable DMA”. |

**Bit 1 – AUTO_VALID** Packet Auto-Valid Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable this bit to not automatically validate the current packet. |

**Bit 0 – EPT_DISABL** Endpoint Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable endpoint. |

### 40.7.12 UDPHS Endpoint Control Disable Register (Isochronous Endpoint)

**Name:** UDPHS_EPTCTLDISx
**Offset:** 0x0108 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x1 in UDPHS Endpoint Configuration Register.

For additional information, see “UDPHS Endpoint Control Register (Isochronous Endpoint)”.

**Bit 31 – SHRT_PCKT** Short Packet Interrupt Disable
For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.

For OUT endpoints:

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Short Packet Interrupt. |

**Bit 18 – BUSY_BANK** Busy Bank Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Busy Bank Interrupt. |

**Bit 14 – ERR_FLUSH** bank flush error Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Disable Bank Flush Error Interrupt. |

**Bit 13 – ERR_CRC_NTR** ISO CRC Error/Number of Transaction Error Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Error CRC ISO/Error Number of Transaction Interrupt. |

**Bit 12 – ERR_FL_ISO** Error Flow Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Error Flow ISO Interrupt. |

**Bit 11 – TXRDY_TRER** TX Packet Ready/Transaction Error Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable TX Packet Ready/Transaction Error Interrupt. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Transmitted IN Data Complete Interrupt. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Received OUT Data Interrupt. |

**Bit 8 – ERR_OVFLW** Overflow Error Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable Overflow Error Interrupt. |

**Bit 7 – MDATA_RX** MDATA Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable MDATA Interrupt. |

**Bit 6 – DATAX_RX** DATAx Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable DATAx Interrupt. |

**Bit 3 – INTDIS_DMA** Interrupts Disable DMA

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable the “Interrupts Disable DMA”. |

**Bit 1 – AUTO_VALID** Packet Auto-Valid Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable this bit to not automatically validate the current packet. |

**Bit 0 – EPT_DISABL** Endpoint Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable endpoint. |

### 40.7.13 UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS_EPTCTLx
**Offset:** 0x010C + x*0x20 [x=0..15]
**Reset:** 0x00000000
**Property:** Read-only

This register view is relevant only if EPT_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

The reset value for UDPHS_EPTCTL0 is 0x00000001.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SHRT_PCKT | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | NAK_OUT | NAK_IN | STALL_SNT | RX_SETUP | TXRDY | TX_COMPLT | RXRDY_TXKL | ERR_OVFLW |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | NYET_DIS | INTDIS_DMA | | AUTO_VALID | EPT_ENABL |
| Access | | | | R | R | | R | R |
| Reset | | | | 0 | 0 | | 0 | 0 |

**Bit 31 – SHRT_PCKT** Short Packet Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: sends an Interrupt when a Short Packet has been received.

For IN endpoints: a Short Packet transmission is guaranteed upon end of the DMA Transfer, thus signaling a BULK or INTERRUPT end of transfer, but only if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTO_VALID bits are also set.

| Value | Description |
|---|---|
| 0 | Short Packet Interrupt is masked. |
| 1 | Short Packet Interrupt is enabled. |

**Bit 18 – BUSY_BANK** Busy Bank Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: an interrupt is sent when all banks are busy.

For IN endpoints: an interrupt is sent when all banks are free.

| Value | Description |
|---|---|
| 0 | BUSY_BANK Interrupt is masked. |
| 1 | BUSY_BANK Interrupt is enabled. |

**Bit 15 – NAK_OUT** NAKOUT Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | NAKOUT Interrupt is masked. |
| 1 | NAKOUT Interrupt is enabled. |

**Bit 14 – NAK_IN** NAKIN Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | NAKIN Interrupt is masked. |
| 1 | NAKIN Interrupt is enabled. |

**Bit 13 – STALL_SNT** Stall Sent Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Stall Sent Interrupt is masked. |
| 1 | Stall Sent Interrupt is enabled. |

**Bit 12 – RX_SETUP** Received SETUP Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Received SETUP is masked. |
| 1 | Received SETUP is enabled. |

**Bit 11 – TXRDY** TX Packet Ready Interrupt Enabled (cleared upon USB reset)

**⚠ CAUTION** Interrupt source is active as long as the corresponding UDPHS_EPTSTAx register TXRDY flag remains low. If there are no more banks available for transmitting after the software has set UDPHS_EPTSTAx/TXRDY for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS_EPTSTAx/TXRDY hardware clear.

| Value | Description |
|---|---|
| 0 | TX Packet Ready Interrupt is masked. |
| 1 | TX Packet Ready Interrupt is enabled. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Transmitted IN Data Complete Interrupt is masked. |
| 1 | Transmitted IN Data Complete Interrupt is enabled. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Received OUT Data Interrupt is masked. |
| 1 | Received OUT Data Interrupt is enabled. |

**Bit 8 – ERR_OVFLW** Overflow Error Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Overflow Error Interrupt is masked. |
| 1 | Overflow Error Interrupt is enabled. |

**Bit 4 – NYET_DIS** NYET Disable (Only for High Speed Bulk OUT Endpoints) (cleared upon USB reset)
**Note:** According to the Universal Serial Bus Specification, Rev 2.0 (8.5.1.1 NAK Responses to OUT/ DATA During PING Protocol), a NAK response to an HS Bulk OUT transfer is expected to be an unusual occurrence.

| Value | Description |
|---|---|
| 0 | Lets the hardware handle the handshake response for the High Speed Bulk OUT transfer. |
| 1 | Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response. |

**Bit 3 – INTDIS_DMA** Interrupt Disables DMA (cleared upon USB reset)
If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS_IEN register EPT_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (NAK_IN, NAK_OUT, etc.), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet.

**Bit 1 – AUTO_VALID** Packet Auto-Valid Enabled (Not for CONTROL Endpoints) (cleared upon USB reset)
Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

**For IN Transfer:**

If this bit is set, the UDPHS_EPTSTAx register TXRDY bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set.

The user may still set the UDPHS_EPTSTAx register TXRDY bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

**For OUT Transfer:**

If this bit is set, the UDPHS_EPTSTAx register RXRDY_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS_EPTSTAx register RXRDY_TXKL bit, for example, after completing a DMA buffer by software if UDPHS_DMACONTROLx register END_B_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

**Bit 0 – EPT_ENABL** Endpoint Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration. |
| 1 | The endpoint is enabled according to the device configuration. |

### 40.7.14 UDPHS Endpoint Control Register (Isochronous Endpoint)

**Name:** UDPHS_EPTCTLx
**Offset:** 0x010C + x*0x20 [x=0..15]
**Reset:** 0x00000000
**Property:** Read-only

This register view is relevant only if EPT_TYPE = 0x1 in UDPHS Endpoint Configuration Register.

The reset value for UDPHS_EPTCTL0 is 0x00000001.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SHRT_PCKT | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | MDATA_RX | DATAX_RX | | | INTDIS_DMA | | AUTO_VALID | EPT_ENABL |
| Access | R | R | | | R | | R | R |
| Reset | 0 | 0 | | | 0 | | 0 | 0 |

**Bit 31 – SHRT_PCKT** Short Packet Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: Send an Interrupt when a Short Packet has been received.

For IN endpoints: A Short Packet transmission is guaranteed upon end of the DMA Transfer, thus signaling an end of isochronous (micro-)frame data, but only if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTO_VALID bits are also set.

| Value | Description |
|---|---|
| 0 | Short Packet Interrupt is masked. |
| 1 | Short Packet Interrupt is enabled. |

**Bit 18 – BUSY_BANK** Busy Bank Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: An interrupt is sent when all banks are busy.

For IN endpoints: An interrupt is sent when all banks are free.

| Value | Description |
|---|---|
| 0 | BUSY_BANK Interrupt is masked. |
| 1 | BUSY_BANK Interrupt is enabled. |

**Bit 14 – ERR_FLUSH** Bank Flush Error Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Bank Flush Error Interrupt is masked. |
| 1 | Bank Flush Error Interrupt is enabled. |

**Bit 13 – ERR_CRC_NTR** ISO CRC Error/Number of Transaction Error Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | ISO CRC error/number of Transaction Error Interrupt is masked. |
| 1 | ISO CRC error/number of Transaction Error Interrupt is enabled. |

**Bit 12 – ERR_FL_ISO** Error Flow Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Error Flow Interrupt is masked. |
| 1 | Error Flow Interrupt is enabled. |

**Bit 11 – TXRDY_TRER** TX Packet Ready/Transaction Error Interrupt Enabled (cleared upon USB reset)

⚠ CAUTION Interrupt source is active as long as the corresponding UDPHS_EPTSTAx register TXRDY_TRER flag remains low. If there are no more banks available for transmitting after the software has set UDPHS_EPTSTAx/TXRDY_TRER for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS_EPTSTAx/TXRDY_TRER hardware clear.

| Value | Description |
|---|---|
| 0 | TX Packet Ready/Transaction Error Interrupt is masked. |
| 1 | TX Packet Ready/Transaction Error Interrupt is enabled. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Transmitted IN Data Complete Interrupt is masked. |
| 1 | Transmitted IN Data Complete Interrupt is enabled. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Received OUT Data Interrupt is masked. |
| 1 | Received OUT Data Interrupt is enabled. |

**Bit 8 – ERR_OVFLW** Overflow Error Interrupt Enabled (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | Overflow Error Interrupt is masked. |
| 1 | Overflow Error Interrupt is enabled. |

**Bit 7 – MDATA_RX** MDATA Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Send an interrupt when an MDATA packet has been received and so at least one packet of the microframe data payload has been received. |

**Bit 6 – DATAX_RX** DATAx Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Send an interrupt when a DATA2, DATA1 or DATA0 packet has been received meaning the whole microframe data payload has been received. |

**Bit 3 – INTDIS_DMA** Interrupt Disables DMA (cleared upon USB reset)
If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS_IEN register EPT_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (ex: ERR_FL_ISO), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet, or to perform buffer truncation on ERR_FL_ISO interrupt for adaptive rate.

**Bit 1 – AUTO_VALID** Packet Auto-Valid Enabled (cleared upon USB reset)
Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

**For IN Transfer:**
If this bit is set, the UDPHS_EPTSTAx register TXRDY_TRER bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set.

The user may still set the UDPHS_EPTSTAx register TXRDY_TRER bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

**For OUT Transfer:**
If this bit is set, the UDPHS_EPTSTAx register RXRDY_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS_EPTSTAx register RXRDY_TXKL bit, for example, after completing a DMA buffer by software if UDPHS_DMACONTROLx register END_B_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

**Bit 0 – EPT_ENABL** Endpoint Enable (cleared upon USB reset)

| Value | Description |
|---|---|
| 0 | The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration. |
| 1 | The endpoint is enabled according to the device configuration. |

### 40.7.15 UDPHS Endpoint Set Status Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS_EPTSETSTAx
**Offset:** 0x0114 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints).

**Bit 11 – TXRDY** TX Packet Ready Set

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Set this bit after a packet has been written into the endpoint FIFO for IN data transfers<br>– This flag is used to generate a Data IN transaction (device to host).<br>– Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY is cleared.<br>– Transfer to the FIFO is done by writing in the “Buffer Address” register.<br>– Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY to one.<br>– UDPHS bus transactions can start.<br>– TXCOMP is set once the data payload has been received by the host.<br>– Data should be written into the endpoint FIFO only after this bit has been cleared.<br>– Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet. |

**Bit 9 – RXRDY_TXKL** KILL Bank Set (for IN Endpoint)

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Kill the last written bank. |

**Bit 5 – FRCESTALL** Stall Handshake Request Set
Refer to chapters 8.4.5 (Handshake Packets) and 9.4.5 (Get Status) of the Universal Serial Bus Specification, Rev 2.0 for more information on the STALL handshake.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Set this bit to request a STALL answer to the host for the next handshake |

### 40.7.16 UDPHS Endpoint Set Status Register (Isochronous Endpoint)

**Name:** UDPHS_EPTSETSTAx
**Offset:** 0x0114 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x1 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Status Register (Isochronous Endpoint).

**Bit 15 – NAK_OUT** NAKOUT Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the NAK_OUT flag of UDPHS_EPTSTAx. |

**Bit 14 – NAK_IN** NAKIN Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the NAK_IN flags of UDPHS_EPTSTAx. |

**Bit 13 – STALL_SNT** Stall Sent Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the STALL_SNT flags of UDPHS_EPTSTAx. |

**Bit 12 – RX_SETUP** Received SETUP Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the RX_SETUP flags of UDPHS_EPTSTAx. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the TX_COMPLT flag of UDPHS_EPTSTAx. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx. |

**Bit 6 – TOGGLESQ** Data Toggle Clear
For OUT endpoints, the next received packet should be a DATA0.

For IN endpoints, the next packet will be sent with a DATA0 PID.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the PID data of the current bank |

**Bit 5 – FRCESTALL** Stall Handshake Request Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the STALL request. The next packets from host will not be STALLed. |

### 40.7.18 UDPHS Endpoint Clear Status Register (Isochronous Endpoint)

**Name:** UDPHS_EPTCLRSTAx
**Offset:** 0x0118 + x*0x20 [x=0..15]
**Reset:** –
**Property:** Write-only

This register view is relevant only if EPT_TYPE = 0x1 in UDPHS Endpoint Configuration Register.

For additional information, see UDPHS Endpoint Status Register (Isochronous Endpoint).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 14 – ERR_FLUSH** Bank Flush Error Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the ERR_FLUSH flags of UDPHS_EPTSTAx. |

**Bit 13 – ERR_CRC_NTR** Number of Transaction Error Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the ERR_CRC_NTR flags of UDPHS_EPTSTAx. |

**Bit 12 – ERR_FL_ISO** Error Flow Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the ERR_FL_ISO flags of UDPHS_EPTSTAx. |

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the TX_COMPLT flag of UDPHS_EPTSTAx. |

**Bit 9 – RXRDY_TXKL** Received OUT Data Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx. |

**Bit 6 – TOGGLESQ** Data Toggle Clear
For OUT endpoints, the next received packet should be a DATA0.

For IN endpoints, the next packet will be sent with a DATA0 PID.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the PID data of the current bank |

### 40.7.19 UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints)

**Name:** UDPHS_EPTSTAx
**Offset:** 0x011C + x*0x20 [x=0..15]
**Reset:** 0x00000040
**Property:** Read-only

This register view is relevant only if EPT_TYPE = 0x0, 0x2 or 0x3 in UDPHS Endpoint Configuration Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | TOGGLESQ_STA[1:0] | | FRCESTALL | | | | | |
| Access | R | R | R | | | | | |
| Reset | 0 | 1 | 0 | | | | | |

**Bit 31 – SHRT_PCKT** Short Packet (cleared upon USB reset)
An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS_EPTCFGx register EPT_Size.

This bit is updated at the same time as the BYTE_COUNT field.

It is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bits 30:20 – BYTE_COUNT[10:0]** UDPHS Byte Count (cleared upon USB reset)
Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer). It is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY_TXKL flag clear with the next bank, and at TXRDY flag set with the next bank.

This field is reset by UDPHS_EPTRST.EPT_x.

**Bits 19:18 – BUSY_BANK_STA[1:0]** Busy Bank Number (cleared upon USB reset)
These bits are set by hardware to indicate the number of busy banks.

IN endpoint: Indicates the number of busy banks filled by the user, ready for IN transfer.

OUT endpoint: Indicates the number of busy banks filled by OUT transaction from the Host.

| Value | Name | Description |
|---|---|---|
| 0 | 0BUSYBANK | All banks are free |
| 1 | 1BUSYBANK | 1 busy bank |
| 2 | 2BUSYBANKS | 2 busy banks |
| 3 | 3BUSYBANKS | 3 busy banks |

**Bits 17:16 – CURBK_CTLDIR[1:0]** Current Bank/Control Direction (cleared upon USB reset)
**Control Direction (for Control endpoint only):**
0: A Control Write is requested by the Host.

1: A Control Read is requested by the Host.
**Note:**

1. Corresponds to the the 7th bit of the bmRequestType (Byte 0 of the Setup Data).
2. Updated after receiving new setup data.

**Current Bank (not relevant for Control endpoint):**

- Set by hardware to indicate the number of the current bank.
- Reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).
- The current bank is updated each time the user:
  - Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
  - Clears the received OUT data bit to access the next bank.

| Value | Name | Description |
|---|---|---|
| 0 | BANK0 | Bank 0 (or single bank) |
| 1 | BANK1 | Bank 1 |
| 2 | BANK2 | Bank 2 |

**Bit 15 – NAK_OUT** NAK OUT (cleared upon USB reset)
This bit is set by hardware when a NAK handshake has been sent in response to an OUT or PING request from the Host.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by EPT_CTL_DISx (disable endpoint).

**Bit 14 – NAK_IN** NAK IN (cleared upon USB reset)
This bit is set by hardware when a NAK handshake has been sent in response to an IN request from the Host.

This bit is cleared by software.

**Bit 13 – STALL_SNT** Stall Sent (cleared upon USB reset)
For Control, Bulk and Interrupt endpoints.

This bit is set by hardware after a STALL handshake has been sent as requested by the UDPHS_EPTSTAx register FRCESTALL bit.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 12 – RX_SETUP** Received SETUP (cleared upon USB reset)
For Control endpoint only.

This bit is set by hardware when a valid SETUP packet has been received from the host.

It is cleared by the device firmware after reading the SETUP data from the endpoint FIFO.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 11 – TXRDY** TX Packet Ready (cleared upon USB reset)
This bit is cleared by hardware after the host has acknowledged the packet.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register TXRDY bit.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete (cleared upon USB reset)
This bit is set by hardware after an IN packet has been accepted (ACK'ed) by the host.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 9 – RXRDY_TXKL** Received OUT Data/KILL Bank (cleared upon USB reset)
**Received OUT Data (for OUT endpoint or Control endpoint):**

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register RXRDY_TXKL bit.
- This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**KILL Bank (for IN endpoint):**

- The bank is really cleared or the bank is sent, BUSY_BANK_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.
  **Note:** "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

**Bit 8 – ERR_OVFLW** Overflow Error (cleared upon USB reset)
This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.

This bit is updated at the same time as the BYTE_COUNT field.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bits 7:6 – TOGGLESQ_STA[1:0]** Toggle Sequencing (cleared upon USB reset)
In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

This field is reset to DATA1 by the UDPHS_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS_EPTCTLDISx (disable endpoint).

Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- CONTROL and OUT endpoints: Set by hardware to indicate the PID data of the current bank.

| Value | Name | Description |
|---|---|---|
| 0 | DATA0 | DATA0 |
| 1 | DATA1 | DATA1 |
| 2 | DATA2 | Reserved for High Bandwidth Isochronous Endpoint |
| 3 | MDATA | Reserved for High Bandwidth Isochronous Endpoint |

**Bit 5 – FRCESTALL** Stall Handshake Request (cleared upon USB reset)
This bit is reset by hardware upon received SETUP.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If set a STALL answer will be done to the host for the next handshake. |

### 40.7.20 UDPHS Endpoint Status Register (Isochronous Endpoint)

**Name:** UDPHS_EPTSTAx
**Offset:** 0x011C + x*0x20 [x=0..15]
**Reset:** 0x00000040
**Property:** Read-only

This register view is relevant only if EPT_TYPE = 0x1 in “UDPHS Endpoint Configuration Register”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SHRT_PCKT | BYTE_COUNT[10:4] | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | ERR_FLUSH | ERR_CRC_NT | ERR_FL_ISO | TXRDY_TRER | TX_COMPLT | RXRDY_TXKL | ERR_OVFLW |
| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TOGGLESQ_STA[1:0] | | | | | | | |
| Access | R | R | | | | | | |
| Reset | 0 | 1 | | | | | | |

**Bit 31 – SHRT_PCKT** Short Packet (cleared upon USB reset)
An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS_EPTCFGx register EPT_Size.

This bit is updated at the same time as the BYTE_COUNT field.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bits 30:20 – BYTE_COUNT[10:0]** UDPHS Byte Count (cleared upon USB reset)
Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer).

This field is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY_TXKL flag clear with the next bank.

This field is also updated at TXRDY_TRER flag set with the next bank.

This field is reset by EPT_x of UDPHS_EPTRST register.

**Bits 19:18 – BUSY_BANK_STA[1:0]** Busy Bank Number (cleared upon USB reset)
These bits are set by hardware to indicate the number of busy banks.

IN endpoint: It indicates the number of busy banks filled by the user, ready for IN transfer.

OUT endpoint: It indicates the number of busy banks filled by OUT transaction from the Host.

| Value | Name | Description |
|---|---|---|
| 0 | 0BUSYBANK | All banks are free |
| 1 | 1BUSYBANK | 1 busy bank |
| 2 | 2BUSYBANKS | 2 busy banks |
| 3 | 3BUSYBANKS | 3 busy banks |

**Bits 17:16 – CURBK[1:0]** Current Bank (cleared upon USB reset)
These bits are set by hardware to indicate the number of the current bank.

The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

| Value | Name | Description |
|---|---|---|
| 0 | BANK0 | Bank 0 (or single bank) |
| 1 | BANK1 | Bank 1 |
| 2 | BANK2 | Bank 2 |

**Bit 14 – ERR_FLUSH** Bank Flush Error (cleared upon USB reset)
For High Bandwidth Isochronous IN endpoints.

This bit is set when flushing unsent banks at the end of a microframe.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by EPT_CTL_DISx (disable endpoint).

**Bit 13 – ERR_CRC_NTR** CRC ISO Error/Number of Transaction Error (cleared upon USB reset)
**CRC ISO Error (for Isochronous OUT endpoints) (Read-only):**
This bit is set by hardware if the last received data is corrupted (CRC error on data).

This bit is updated by hardware when new data is received (Received OUT Data bit).

**Number of Transaction Error (for High Bandwidth Isochronous IN endpoints):**
This bit is set at the end of a microframe in which at least one data bank has been transmitted, if less than the number of transactions per micro-frame banks (UDPHS_EPTCFGx register NB_TRANS) have been validated for transmission inside this microframe.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 12 – ERR_FL_ISO** Error Flow (cleared upon USB reset)
This bit is set by hardware when a transaction error occurs.

- Isochronous IN transaction is missed, the micro has no time to fill the endpoint (underflow).
- Isochronous OUT data is dropped because the bank is busy (overflow).

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 11 – TXRDY_TRER** TX Packet Ready/Transaction Error (cleared upon USB reset)
**TX Packet Ready**
This bit is cleared by hardware, as soon as the packet has been sent.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register TXRDY_TRER bit.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

**Transaction Error (for high bandwidth isochronous OUT endpoints) (Read-Only):**
This bit is set by hardware when a transaction error occurs inside one microframe.

If one toggle sequencing problem occurs among the n-transactions (n = 1, 2 or 3) inside a microframe, then this bit is still set as long as the current bank contains one “bad” n-transaction (see CURBK field description). As soon as the current bank is relative to a new “good” n-transactions, then this bit is reset.

**Note:**

1. A transaction error occurs when the toggle sequencing does not comply with the Universal Serial Bus Specification, Rev 2.0 (5.9.2 High Bandwidth Isochronous endpoints) (Bad PID, missing data, etc.)
2. When a transaction error occurs, the user may empty all the “bad” transactions by clearing the Received OUT Data flag (RXRDY_TXKL).

If this bit is reset, then the user should consider that a new n-transaction is coming.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 10 – TX_COMPLT** Transmitted IN Data Complete (cleared upon USB reset)
This bit is set by hardware after an IN packet has been sent.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

**Bit 9 – RXRDY_TXKL** Received OUT Data/KILL Bank (cleared upon USB reset)
**Received OUT Data (for OUT endpoint or Control endpoint):**

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register RXRDY_TXKL bit.
- This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**KILL Bank (for IN endpoint):**

- The bank is really cleared or the bank is sent, BUSY_BANK_STA is decremented.

- The bank is not cleared but sent on the IN transfer, TX_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.
  **Note:** "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

**Bit 8 – ERR_OVFLW** Overflow Error (cleared upon USB reset)
This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.

This bit is updated at the same time as the BYTE_COUNT field.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

**Bits 7:6 – TOGGLESQ_STA[1:0]** Toggle Sequencing (cleared upon USB reset)
In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

For High Bandwidth Isochronous Out endpoint, it is recommended to check the UDPHS_EPTSTAx/ TXRDY_TRER bit to know if the toggle sequencing is correct or not.

This field is reset to DATA1 by the UDPHS_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS_EPTCTLDISx (disable endpoint).

Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- OUT endpoint: Set by hardware to indicate the PID data of the current bank:

| Value | Name | Description |
|---|---|---|
| 0 | DATA0 | DATA0 |
| 1 | DATA1 | DATA1 |
| 2 | DATA2 | Data2 (only for High Bandwidth Isochronous Endpoint) |
| 3 | MDATA | MData (only for High Bandwidth Isochronous Endpoint) |

### 40.7.21 UDPHS DMA Channel Transfer Descriptor

The DMA channel transfer descriptor is loaded from the memory. Be careful with the alignment of this buffer. The structure of the DMA channel transfer descriptor is defined by three parameters as described below:

- Offset 0:
  - The address must be aligned: 0xXXXX0
  - Next Descriptor Address Register: UDPHS_DMANXTDSCx

- Offset 4:
  - The address must be aligned: 0xXXXX4
  - DMA Channelx Address Register: UDPHS_DMAADDRESSx
- Offset 8:
  - The address must be aligned: 0xXXXX8
  - DMA Channelx Control Register: UDPHS_DMACONTROLx

To use the DMA channel transfer descriptor, fill the structures with the correct value (as described in the following pages). Then write directly in UDPHS_DMANXTDSCx the address of the descriptor to be used first. Then write '1' in the LDNXT_DSC bit of UDPHS_DMACONTROLx (load next channel transfer descriptor). The descriptor is automatically loaded upon Endpointx request for packet transfer.

### 40.7.22 UDPHS DMA Next Descriptor Address Register

**Name:** UDPHS_DMANXTDSCx
**Offset:** 0x0300 + x*0x10 [x=0..6]
**Reset:** 0x00000000
**Property:** Read/Write

Channel 0 is not used.

**Bits 31:0 – NXT_DSC_ADD[31:0]** Next Descriptor Address
This field points to the next channel descriptor to be processed. This channel descriptor must be aligned, so bits 0 to 3 of the address must be equal to zero.

### 40.7.23 UDPHS DMA Channel Address Register

**Name:** UDPHS_DMAADDRESSx
**Offset:** 0x0304 + x*0x10 [x=0..6]
**Reset:** 0x00000000
**Property:** Read/Write

Channel 0 is not used.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BUFF_ADD[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|
| | BUFF_ADD[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – BUFF_ADD[31:0]** Buffer Address
This field determines the AHB bus starting address of a DMA channel transfer.

Channel start and end addresses may be aligned on any byte boundary.

The firmware may write this field only when the UDPHS_DMASTATUS register CHANN_ENB bit is clear.

This field is updated at the end of the address phase of the current access to the AHB bus. It is incrementing of the access byte width. The access width is 4 bytes (or less) at packet start or end, if the start or end address is not aligned on a word boundary.

The packet start address is either the channel start address or the next channel address to be accessed in the channel buffer.

The packet end address is either the channel end address or the latest channel address accessed in the channel buffer.

The channel start address is written by software or loaded from the descriptor, whereas the channel end address is either determined by the end of buffer or the UDPHS device, USB end of transfer if the UDPHS_DMACONTROLx register END_TR_EN bit is set.

### 40.7.24 UDPHS DMA Channel Control Register

**Name:** UDPHS_DMACONTROLx
**Offset:** 0x0308 + x*0x10 [x=0..6]
**Reset:** 0x00000000
**Property:** Read/Write

Channel 0 is not used.

Bits [31:2] are only writable when issuing a channel Control Command other than “Stop Now”.

For reliability it is highly recommended to wait for both UDPHS_DMASTATUS.CHAN_ACT and CHAN_ENB flags at 0, thus ensuring the channel has been stopped before issuing a command other than “Stop Now”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BUFF_LENGTH[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | BUFF_LENGTH[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BURST_LCK | DESC_LD_IT | END_BUFFIT | END_TR_IT | END_B_EN | END_TR_EN | LDNXT_DSC | CHANN_ENB |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – BUFF_LENGTH[15:0]** Buffer Byte Length (Write-only)
This field determines the number of bytes to be transferred until end of buffer. The maximum channel transfer size (64 KBytes) is reached when this field is 0 (default value). If the transfer size is unknown, this field should be set to 0, but the transfer end may occur earlier under UDPHS device control.

When this field is written, the UDPHS_DMASTATUS.BUFF_COUNT field is updated with the write value.

**Bit 7 – BURST_LCK** Burst Lock Enable

| Value | Description |
|---|---|
| 0 | The DMA never locks bus access. |
| 1 | USB packets AHB data bursts are locked for maximum optimization of the bus bandwidth usage and maximization of fly-by AHB burst duration. |

**Bit 6 – DESC_LD_IT** Descriptor Loaded Interrupt Enable

| Value | Description |
|---|---|
| 0 | UDPHS_DMASTATUS.DESC_LDST rising will not trigger any interrupt. |
| 1 | An interrupt is generated when a descriptor has been loaded from the bus. |

**Bit 5 – END_BUFFIT** End of Buffer Interrupt Enable

| Value | Description |
|---|---|
| 0 | UDPHS_DMASTATUS.END_BF_ST rising will not trigger any interrupt. |
| 1 | An interrupt is generated when the UDPHS_DMASTATUS.BUFF_COUNT reaches zero. |

**Bit 4 – END_TR_IT** End of Transfer Interrupt Enable

| Value | Description |
|---|---|
| 0 | UDPHS device initiated buffer transfer completion will not trigger any interrupt at UDPHS_STATUS.END_TR_ST rising. |
| 1 | An interrupt is sent after the buffer transfer is complete, if the UDPHS device has ended the buffer transfer.<br>Use when the receive size is unknown. |

**Bit 3 – END_B_EN** End of Buffer Enable (Control)

| Value | Description |
|---|---|
| 0 | DMA Buffer End has no impact on USB packet transfer. |
| 1 | Endpoint can validate the packet (according to the values programmed in the UDPHS_EPTCTL.AUTO_VALID and SHRT_PCKT fields) at DMA Buffer End, i.e., when the UDPHS_DMASTATUS.BUFF_COUNT reaches 0.<br>This is mainly for short packet IN validation initiated by the DMA reaching end of buffer, but could be used for OUT packet truncation (discarding of unwanted packet data) at the end of DMA buffer. |

**Bit 2 – END_TR_EN** End of Transfer Enable (Control)
Used for OUT transfers only.

| Value | Description |
|---|---|
| 0 | USB end of transfer is ignored. |
| 1 | UDPHS device can put an end to the current buffer transfer.<br>When set, a BULK or INTERRUPT short packet or the last packet of an ISOCHRONOUS (micro) frame (DATAX) will close the current buffer and the UDPHS_DMASTATUS.END_TR_ST flag will be raised.<br>This is intended for UDPHS non-prenegotiated end of transfer (BULK or INTERRUPT) or ISOCHRONOUS microframe data buffer closure. |

**Bit 1 – LDNXT_DSC** Load Next Channel Transfer Descriptor Enable (Command)
0: No channel register is loaded after the end of the channel transfer.

1: The channel controller loads the next descriptor after the end of the current transfer, i.e., when the UDPHS_DMASTATUS/CHANN_ENB bit is reset.

If CHANN_ENB is cleared, the next descriptor is immediately loaded upon transfer request.

DMA Channel Control Command Summary

| LDNXT_DSC | CHANN_ENB | Description |
|---|---|---|
| 0 | 0 | Stop now |
| 0 | 1 | Run and stop at end of buffer |
| 1 | 0 | Load next descriptor now |
| 1 | 1 | Run and link at end of buffer |

**Bit 0 – CHANN_ENB** (Channel Enable Command)

| Value | Description |
|---|---|
| 0 | DMA channel is disabled at and no transfer will occur upon request. This bit is also cleared by hardware when the channel source bus is disabled at end of buffer.<br>If the UDPHS_DMACONTROL register LDNXT_DSC bit has been cleared by descriptor loading, the firmware will have to set the corresponding CHANN_ENB bit to start the described transfer, if needed.<br>If the UDPHS_DMACONTROL register LDNXT_DSC bit is cleared, the channel is frozen and the channel registers may then be read and/or written reliably as soon as both UDPHS_DMASTATUS register CHANN_ENB and CHANN_ACT flags read as 0.<br>If a channel request is currently serviced when this bit is cleared, the DMA FIFO buffer is drained until it is empty, then the UDPHS_DMASTATUS register CHANN_ENB bit is cleared.<br>If the LDNXT_DSC bit is set at or after this bit clearing, then the currently loaded descriptor is skipped (no data transfer occurs) and the next descriptor is immediately loaded. |
| 1 | UDPHS_DMASTATUS register CHANN_ENB bit will be set, thus enabling DMA channel data transfer. Then any pending request will start the transfer. This may be used to start or resume any requested transfer. |

### 40.7.25 UDPHS DMA Channel Status Register

**Name:** UDPHS_DMASTATUSx
**Offset:** 0x030C + x*0x10 [x=0..6]
**Reset:** 0x00000000
**Property:** Read/Write

Channel 0 is not used.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BUFF_COUNT[15:8] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | BUFF_COUNT[7:0] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | DESC_LDST | END_BF_ST | END_TR_ST | | | CHANN_ACT | CHANN_ENB |
| Access | | | | | | | | |
| Reset | | 0 | 0 | 0 | | | 0 | 0 |

**Bits 31:16 – BUFF_COUNT[15:0]** Buffer Byte Count
This field determines the current number of bytes still to be transferred for this buffer.

This field is decremented from the AHB source bus access byte width at the end of this bus address phase.

The access byte width is 4 by default, or less, at DMA start or end, if the start or end address is not aligned on a word boundary.

At the end of buffer, the DMA accesses the UDPHS device only for the number of bytes needed to complete it.

This field value is reliable (stable) only if the channel has been stopped or frozen (UDPHS_EPTCTLx register NT_DIS_DMA bit is used to disable the channel request) and the channel is no longer active CHANN_ACT flag is 0.

**Note:** For OUT endpoints, if the receive buffer byte length (BUFF_LENGTH) has been defaulted to zero because the USB transfer length is unknown, the actual buffer byte length received is 0x10000-BUFF_COUNT.

**Bit 6 – DESC_LDST** Descriptor Loaded Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

| Value | Description |
|---|---|
| 0 | Cleared automatically when read by software. |
| 1 | Set by hardware when a descriptor has been loaded from the system bus. |

**Bit 5 – END_BF_ST** End of Channel Buffer Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

| Value | Description |
|---|---|
| 0 | Cleared automatically when read by software. |
| 1 | Set by hardware when the BUFF_COUNT countdown reaches zero. |

**Bit 4 – END_TR_ST** End of Channel Transfer Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

| Value | Description |
|---|---|
| 0 | Cleared automatically when read by software. |
| 1 | Set by hardware when the last packet transfer is complete, if the UDPHS device has ended the transfer. |

**Bit 1 – CHANN_ACT** Channel Active Status
When a packet transfer is ended this bit is automatically reset.

When a packet transfer cannot be completed due to an END_BF_ST, this flag stays set during the next channel descriptor load (if any) and potentially until UDPHS packet transfer completion, if allowed by the new descriptor.

| Value | Description |
|---|---|
| 0 | The DMA channel is no longer trying to source the packet data. |
| 1 | The DMA channel is currently trying to source packet data, i.e., selected as the highest-priority requesting channel. |

**Bit 0 – CHANN_ENB** Channel Enable Status
When any transfer is ended either due to an elapsed byte count or a UDPHS device initiated transfer end, this bit is automatically reset.

This bit is normally set or cleared by writing into the UDPHS_DMACONTROLx register CHANN_ENB bit either by software or descriptor loading.

If a channel request is currently serviced when the UDPHS_DMACONTROLx register CHANN_ENB bit is cleared, the DMA FIFO buffer is drained until it is empty, then this status bit is cleared.

| Value | Description |
|---|---|
| 0 | The DMA channel no longer transfers data, and may load the next descriptor if the UDPHS_DMACONTROLx register LDNXT_DSC bit is set. |
| 1 | The DMA channel is currently enabled and transfers data upon request. |

# 41. USB Host High Speed Port (UHPHS)

## 41.1 Description

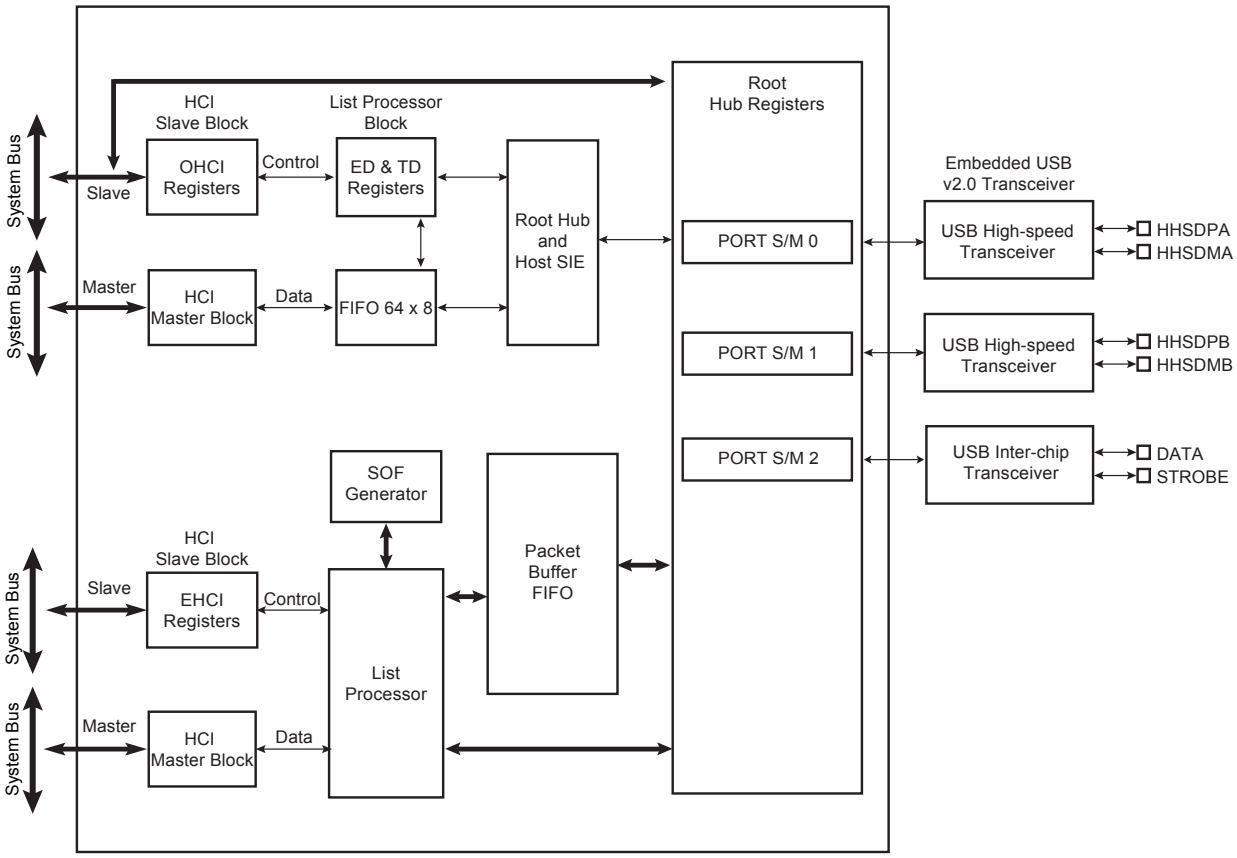
The USB Host High Speed Port (UHPHS) interfaces the USB with the host application. It handles Open HCI protocol (Open Host Controller Interface) as well as Enhanced HCI protocol (Enhanced Host Controller Interface).

## 41.2 Embedded Characteristics

- Compliant with Enhanced HCI Rev 1.0 Specification
  - Compliant with USB V2.0 High-speed
  - Supports High-speed 480 Mbps
- Compliant with Open HCI Rev 1.0 Specification
  - Compliant with USB V2.0 Full-speed and Low-speed Specification
  - Supports both Low-speed 1.5 Mbps and Full-speed 12 Mbps USB devices
- Root Hub Integrated with 3 Downstream USB HS Ports
- Embedded USB Transceivers
- Supports Power Management
- 3 Hosts (A, B and C) High Speed (EHCI), Port A shared with UDPHS
  - 1 Host (C) High Speed Inter-Chip Only (HSIC)

## 41.3 Block Diagram

**Figure 41-1. Block Diagram**



Access to the USB host operational registers is achieved through the system bus slave interface. The Open HCI host controller and Enhanced HCI host controller initialize master DMA transfers through the system bus master interface as follows:

- Fetches endpoint descriptors and transfer descriptors
- Access to endpoint data from system memory
- Access to the HC communication area
- Write status and retire transfer descriptor

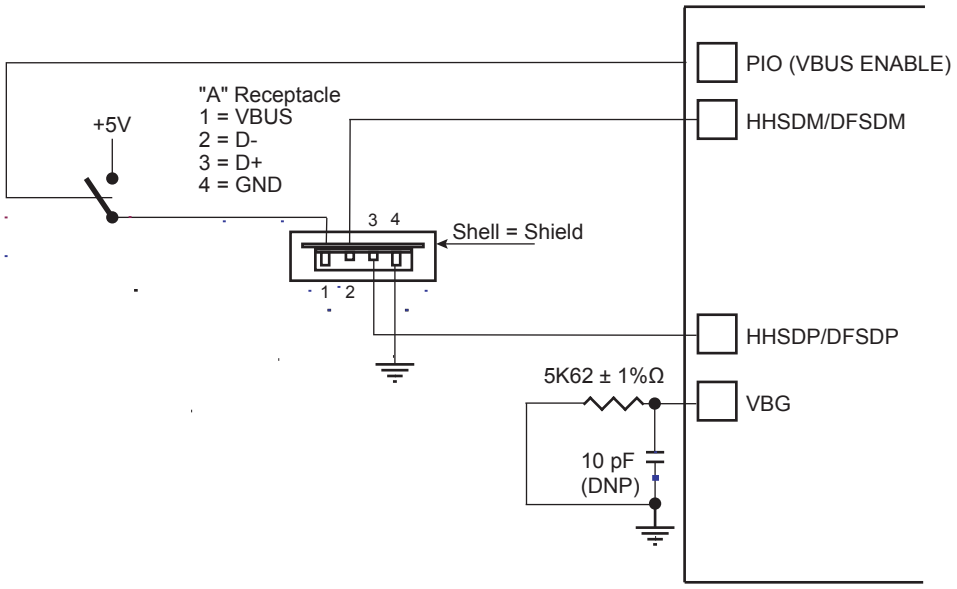
Memory access errors (abort, misalignment) lead to an “Unrecoverable Error” indicated by the corresponding flag in the host controller operational registers.

The USB root hub is integrated in the USB host. Several USB downstream ports are available. The number of downstream ports can be determined by the software driver reading the root hub’s operational registers. Device connection is automatically detected by the USB host port logic.

USB physical transceivers are integrated in the product and driven by the root hub’s ports.

## 41.4 Typical Connection

**Figure 41-2. Board Schematic to Interface UHP High-speed Host Controller**



## 41.5 Product Dependencies

### 41.5.1 I/O Lines

HFSDPs, HFSDMs, HHSDPs and HHSDMs are not controlled by any PIO controllers. The embedded USB High Speed physical transceivers are controlled by the USB host controller.

One transceiver is shared with the USB High Speed Device (port A). The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

In the case the port A is driven by the USB High Speed Device, the output signals are DFSDP, DFSDM, DHSDP and DHSDM. The transceiver is automatically selected for Device operation once the USB High Speed Device is enabled.

In the case the port A is driven by the USB High Speed Host, the output signals are HFSDPA, HFSDMA, HHSDPA and HHSDMA.

### 41.5.2 Power Management

The system embeds 3 transceivers.

The USB Host High Speed requires a 480 MHz clock for the embedded High-speed transceivers. This clock (UPLLCK) is provided by the UTMI PLL.

In case power consumption is saved by stopping the UTMI PLL, high-speed operations are not possible. Nevertheless, OHCI Full-speed operations remain possible by selecting PLLACK as the input clock of OHCI.

The High-speed transceiver returns a 30 MHz clock to the USB Host controller.

The USB Host controller requires 48 MHz and 12 MHz clocks for OHCI full-speed operations. These clocks must be generated by a PLL with a correct accuracy of +/-0.25% using the USBDIV field.

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

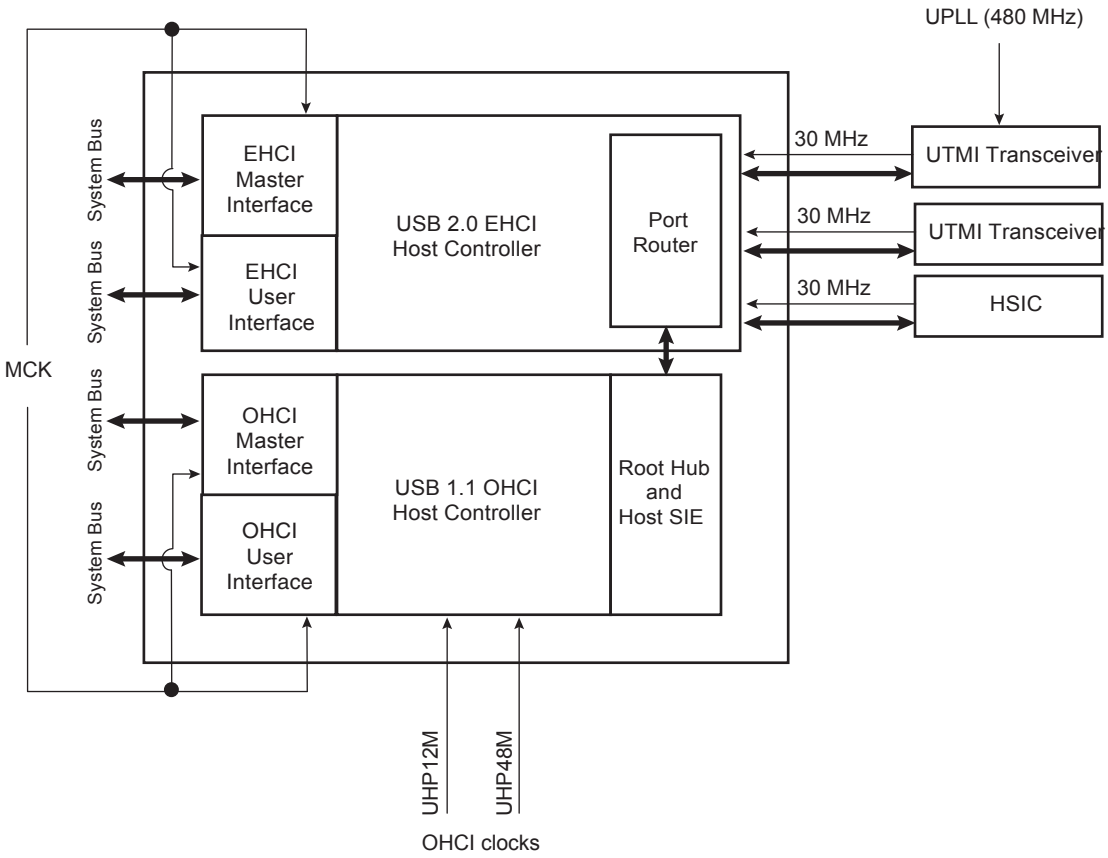
For High-speed operations, the user has to perform the following:

- Enable UHP peripheral clock in PMC_PCER.
- Write PLLCOUNT field in CKGR_UCKR.
- Enable UPLL with UPLLEN bit in CKGR_UCKR.
- Wait until UTMI_PLL is locked (LOCKU bit in PMC_SR).
- Select UPLLCK as Input clock of OHCI part (USBS bit in PMC_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC_USB register. USBDIV must be 9 (division by 10) if UPLLCK is selected.
- Enable OHCI clocks with UHP bit in PMC_SCER.

For OHCI Full-speed operations only, the user has to perform the following:

- Enable UHP peripheral clock in PMC_PCER.
- Select PLLACK as Input clock of OHCI part (USBS bit in PMC_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC_USB register. USBDIV value is to be calculated according to the PLLACK value and USB Full-speed accuracy.
- Enable the OHCI clocks with UHP bit in PMC_SCER.

**Figure 41-3. UHP Clock Trees**



### 41.5.3 Interrupt Sources

The USB host interface has an interrupt line connected to the interrupt controller.

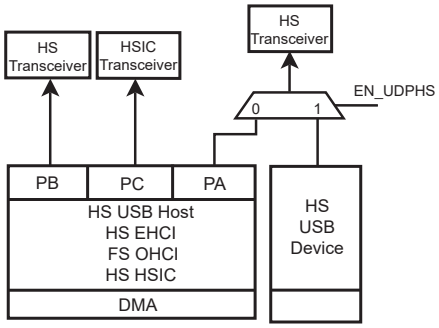
Handling USB host interrupts requires programming the interrupt controller before configuring the UHPHS.

## 41.6 Functional Description

### 41.6.1 UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

**Figure 41-4. USB Selection**



### 41.6.2 EHCI

The USB Host Port controller is fully compliant with the Enhanced HCI specification. The USB Host Port User Interface (registers description) can be found in the Enhanced HCI Rev 1.0 Specification available on www.usb.org

### 41.6.3 OHCI

The USB Host Port integrates a root hub and transceivers on downstream ports. It provides several Full-speed half-duplex serial communication ports at a baud rate of 12 Mbps. Up to 127 USB devices (printer, camera, mouse, keyboard, disk, etc.) and the USB hub can be connected to the USB host in the USB “tiered star” topology.

The USB Host Port controller is fully compliant with the Open HCI specification. The USB Host Port User Interface (registers description) can be found in the Open HCI Rev 1.0 Specification available on www.usb.org.

All standard class devices are automatically detected and available to the user’s application. As an example, integrating an HID (Human Interface Device) class driver provides a plug & play feature for all USB keyboards and mouses.

### 41.6.4 HSIC

The High-Speed Inter-Chip (HSIC) is a standard for USB chip-to-chip interconnect with a 2-signal (strobe, data) source synchronous serial interface using 240 MHz DDR signaling to provide only high-speed 480 Mbps data rate.

External cables, connectors and hot plug & play are not supported.

The HSIC interface operates at high speed, 480 Mbps, and is fully compatible with existing USB software stacks. It meets all data transfer needs through a single unified USB software stack.

## 41.7 Register Summary

The Enhanced USB Host Controller contains two sets of software-accessible hardware registers: memory-mapped Host Controller Registers and optional PCI configuration registers. Note that the PCI configuration registers are only needed for PCI devices that implement the Host Controller.

- Memory-mapped USB Host Controller Registers—This block of registers is memory-mapped into non-cacheable memory. This memory space must begin on a DWord (32-bit) boundary. This register space is divided into two sections: a set of read-only capability registers and a set of read/write operational registers. The table below describes each register space.
  **Note:** Host controllers are not required to support exclusive-access mechanisms (such as PCI LOCK) for accesses to the memory-mapped register space. Therefore, if software attempts exclusive-access mechanisms to the host controller memory-mapped register space, the results are undefined.
- PCI Configuration Registers (for PCI devices)—In addition to the normal PCI header, power management, and device-specific registers, two registers are needed in the PCI configuration space to support USB. The normal PCI header and device-specific registers are beyond the scope of this document (the UHPHS_CLASSC register is shown in this document). Note that HCD does not interact with the PCI configuration space. This space is used only by the PCI enumerator to identify the USB Host Controller, and assign the appropriate system resources.
  The table below summarizes the enhanced interface register sets.

| Offset | Register Set | Explanation |
|---|---|---|
| 0 to N-1 | Capability Registers | The capability registers specify the limits, restrictions, and capabilities of a host controller implementation.<br>These values are used as parameters to the host controller driver. |
| N to N+M-1 | Operational Registers | The operational registers are used by system software to control and monitor the operational state of the host controller. |

**Note:** Software must not modify reserved bits in Read/Write registers.

| Reset | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

**Bits 31:16 – HCIVERSION[15:0]** Host Controller Interface Version Number
This is a two-byte field containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this field represents the major revision and the least significant byte the minor revision.

**Bits 7:0 – CAPLENGTH[7:0]** Capability Registers Length
This field is used as an offset to add to the register base to find the beginning of the Operational Register Space.

### 41.7.2 UHPHS Host Controller Structural Parameters Register

**Name:** UHPHS_HCSPARAMS
**Offset:** 0x04
**Reset:** 0x00001116
**Property:** Read-only

These fields define structural parameters: number of downstream ports, etc.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | N_DP[3:0] | | | | | | | P_INDICATOR |
| Access | R | R | R | R | | | | R |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | N_CC[3:0] | | | | N_PCC[3:0] | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | PPC | N_PORTS[3:0] | | | |
| Access | | | | R | R | R | R | R |
| Reset | | | | 1 | 0 | 1 | 1 | 0 |

**Bits 23:20 – N_DP[3:0]** Debug Port Number
Optional. This register identifies which of the host controller ports is the debug port. The value is the port number (1-based) of the debug port. A non-zero value in this field indicates the presence of a debug port. The value in this register must not be greater than N_PORTS (see above).

**Bit 16 – P_INDICATOR** Port Indicators
This bit indicates whether the ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. See UHPHS Port Status and Control Register for a definition of the port indicator control field.

**Bits 15:12 – N_CC[3:0]** Number of Companion Controllers
This field indicates the number of companion controllers associated with this USB 2.0 host controller.

A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports.

A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.

**Bits 11:8 – N_PCC[3:0]** Number of Ports per Companion Controller
This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.

For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, etc. In the previous example, the N_PCC could have been 4, where the first four are routed to companion controller 1 and the last two are routed to companion controller 2.

The number in this field must be consistent with N_PORTS and N_CC.

**Bit 4 – PPC** Port Power Control
This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the ports do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register (see UHPHS Port Status and Control Register).

**Bits 3:0 – N_PORTS[3:0]** Number of Ports
This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1 to 15.

A zero in this field is undefined.

### 41.7.3 UHPHS Host Controller Capability Parameters Register

**Name:** UHPHS_HCCPARAMS
**Offset:** 0x08
**Reset:** 0x0000A010
**Property:** Read-only

These fields define capability parameters: Multiple Mode control (time-base bit functionality), addressing capability, etc.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | EECP[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IST[3:0] | | | | | ASPC | PFLF | AC |
| Access | R | R | R | R | | R | R | R |
| Reset | 0 | 0 | 0 | 1 | | 0 | 0 | 0 |

**Bits 15:8 – EECP[7:0]** EHCI Extended Capabilities Pointer
Indicates the existence of a capabilities list. A value of 0 indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in the PCI configuration space of the first EHCI extended capability. The pointer value must be 64 or greater if implemented to maintain the consistency of the PCI header defined for this class of device.

**Bits 7:4 – IST[3:0]** Isochronous Scheduling Threshold
Indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is 0, the value of the least significant three bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set to 1, the host software assumes the host controller may cache an isochronous data structure for an entire frame.

**Bit 2 – ASPC** Asynchronous Schedule Park Capability
The park capability can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the UHPHS_USBCMD register.

| Value | Description |
|---|---|
| 0 | Host controller does not supports the park feature for high-speed queue. |

| Value | Description |
|---|---|
| 1 | Host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. |

**Bit 1 – PFLF** Programmable Frame List Flag

| Value | Description |
|---|---|
| 0 | System software must use a frame list length of 1024 elements with this host controller. The UHPHS_USBCMD register Frame List Size field is a read-only register and must be set to 0. |
| 1 | System software can specify and use a smaller frame list and configure the host controller via the UHPHS_USBCMD register Frame List Size field. The frame list must always be aligned on a 4-Kbyte page boundary. This requirement ensures that the frame list is always physically contiguous. |

**Bit 0 – AC** 64-bit Addressing Capability
This field documents the addressing range capability of this implementation. The value of this field determines whether software should use 32-bit or 64-bit data structures.

This information is not tightly coupled with the UHPHS_USBBASE address register mapping control. The 64-bit Addressing Capability bit indicates whether the host controller can generate 64-bit addresses as a master. The UHPHS_USBBASE register indicates the host controller only needs to decode 32-bit addresses as a slave.

| Value | Description |
|---|---|
| 0 | Data structures using 32-bit address memory pointers |
| 1 | Data structures using 64-bit address memory pointers |

### 41.7.4 UHPHS USB Command Register

**Name:** UHPHS_USBCMD
**Offset:** 0x10
**Reset:** 0x00080B00
**Property:** Read/Write

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ITC[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | ASPME | | ASPMC[1:0] | |
| Access | | | | | R-R/W | | R-R/W | R-R/W |
| Reset | | | | | 1 | | 1 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LHCR | IAAD | ASE | PSE | FLS[1:0] | | HCRESET | RS |
| Access | R/W | R/W | R/W | R/W | R-R/W | R-R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:16 – ITC[7:0]** Interrupt Threshold Control
This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined.

| Value | Maximum Interrupt Interval |
|---|---|
| 0 | Reserved |
| 1 | 1 microframe |
| 2 | 2 microframes |
| 4 | 4 microframes |
| 8 | 8 microframes (1 ms) |
| 16 | 16 microframes (2 ms) |
| 32 | 32 microframes (4 ms) |
| 64 | 64 microframes (8 ms) |

Any other value in this register yields undefined results.

Software modifications to this field while HCHLT=0 results in undefined behavior.

**Bit 11 – ASPME** Asynchronous Schedule Park Mode Enable (optional)
If the Asynchronous Park Capability bit in the UHPHS_HCCPARAMS register is set to 1, then this bit is set to 1 and is Read/Write. Otherwise the bit must be 0 and is read-only.

| Value | Description |
|---|---|
| 0 | Park mode is enabled. |
| 1 | Park mode is disabled. |

**Bits 9:8 – ASPMC[1:0]** Asynchronous Schedule Park Mode Count (optional)
If the Asynchronous Park Capability bit in the UHPHS_HCCPARAMS register is set to 1, then this field defaults to 3 and is read/write. Otherwise it defaults to 0 and is read-only. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1 to 3. Software must not write a 0 to this bit when Park Mode Enable is set to 1 as this will result in undefined behavior.

**Bit 7 – LHCR** Light Host Controller Reset (optional)
This control bit is not required. If implemented, it allows the driver to reset the EHCI controller without affecting the state of the ports or the relationship to the companion host controllers. For example, the UHPHS_PORTSC registers should not be reset to their default values and the CF bit setting should not go to 0 (retaining port ownership relationships).

A host software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for host software to re-initialize the host controller. A host software read of this bit as 1 indicates the Light Host Controller Reset has not yet completed.

If not implemented, a read of this field will always return a 0.

**Bit 6 – IAAD** Interrupt on Async Advance Doorbell
This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell.

When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the UHPHS_USBSTS register. If the Interrupt on Async Advance Enable bit in the UHPHS_USBINTR register is set to 1, then the host controller will assert an interrupt at the next interrupt threshold.

The host controller sets this bit to 0 after it has set the Interrupt on Async Advance status bit in the UHPHS_USBSTS register to 1.

Software should not write a 1 to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.

**Bit 5 – ASE** Asynchronous Schedule Enable
This bit controls whether the host controller skips processing the Asynchronous Schedule.

| Value | Description |
|---|---|
| 0 | Do not process the Asynchronous Schedule. |
| 1 | Use the UHPHS_ASYNCLISTADDR register to access the Asynchronous Schedule. |

**Bit 4 – PSE** Periodic Schedule Enable
This bit controls whether the host controller skips processing the Periodic Schedule.

| Value | Description |
|---|---|
| 0 | Do not process the Periodic Schedule. |
| 1 | Use the UHPHS_PERIODICLISTBASE register to access the Periodic Schedule. |

**Bits 3:2 – FLS[1:0]** Frame List Size
This field is read-only with one exception: it is read/write if the Programmable Frame List flag, in the UHPHS_HCCPARAMS register, is set to 1. This field specifies the size of the frame list. The size of the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index.

| Value | Description |
|---|---|
| 0 | 1024 elements (4096 bytes). |
| 1 | 512 elements (2048 bytes). |
| 2 | 256 elements (1024 bytes), for resource-constrained environments. |
| 3 | Reserved. |

**Bit 1 – HCRESET** Host Controller Reset
This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.

When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.

PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines, are set to their initial values. Port ownership reverts to the companion host controller(s) with side effects. Software must reinitialize the host controller in order to return the host controller to an operational state.

This bit is set to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this register.

Software must not set this bit to 1 when HCHLT in the UHPHS_USBSTS register is 0. Attempting to reset an actively running host controller results in undefined behavior.

**Bit 0 – RS** Run/Stop
The Host Controller must halt within 16 microframes after software clears the bit RS. The HCHLT bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write 1 to this field unless the host controller is in the halted state (i.e., HCHLT in the UHPHS_USBSTS register is 1). Doing so yields undefined results.

| Value | Description |
|---|---|
| 0 | Host Controller completes the current and any actively pipelined transactions on the USB and then halts. |
| 1 | Host Controller proceeds with execution of the schedule. |

### 41.7.5 UHPHS USB Status Register

**Name:** UHPHS_USBSTS
**Offset:** 0x14
**Reset:** 0x00001000
**Property:** Read/Write

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to 0 in this register by writing a 1 to it.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ASS | PSS | RCM | HCHLT | | | | |
| Access | R | R | R | R | | | | |
| Reset | 0 | 0 | 0 | 1 | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | IAA | HSE | FLR | PCD | USBERRINT | USBINT |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – ASS** Asynchronous Schedule Status
The bit reports the current real status of the Asynchronous Schedule.

The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the UHPHS_USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled or disabled.

| Value | Description |
|---|---|
| 0 | Asynchronous Schedule is disabled. |
| 1 | Asynchronous Schedule is enabled. |

**Bit 14 – PSS** Periodic Schedule Status
The bit reports the current real status of the Periodic Schedule. If this bit is set to 0, then the status of the Periodic Schedule is disabled. If this bit is set to 1, then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the UHPHS_USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled or disabled.

**Bit 13 – RCM** Reclamation
This is a read-only status bit used to detect any empty asynchronous schedule.

**Bit 12 – HCHLT** HCHalted
This bit is 0 whenever the Run/Stop bit is 1. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error).

**Bit 5 – IAA** Interrupt on Async Advance (Cleared on write)
System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing 1 to the Interrupt on the Async Advance Doorbell bit in the UHPHS_USBCMD register. This status bit indicates the assertion of that interrupt source.

**Bit 4 – HSE** Host System Error (Cleared on write)
The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.

**Bit 3 – FLR** Frame List Rollover (Cleared on write)
The Host Controller sets this bit to 1 when the Frame List Index (see UHPHS USB Frame Index Register) rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the UHPHS_USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to 1 every time FRINDEX[12] toggles.

**Bit 2 – PCD** Port Change Detect (Cleared on write)
The Host Controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 (see UHPHS Port Status and Control Register) has a change bit transition from 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to 1 after system software has relinquished ownership of a connected port by writing 1 to a port's Port Owner bit.

This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force Port Resume, Overcurrent Change, Enable/Disable Change and Connect Status Change).

**Bit 1 – USBERRINT** USB Error Interrupt (Cleared on write)
The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.

**Bit 0 – USBINT** USB Interrupt (Cleared on write)
The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set.

The Host Controller also sets this bit to 1 when a short packet is detected (the actual number of bytes received was less than the expected number of bytes).

### 41.7.6 UHPHS USB Interrupt Enable Register

**Name:** UHPHS_USBINTR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read/Write

This register enables and disables reporting of the corresponding interrupt to the software. When a bit is set and the corresponding interrupt is active, an interrupt is generated to the host. Interrupt sources that are disabled in this register still appear in the UHPHS_USBSTS to allow the software to poll for events.

For all bits, 1=Enabled, 0=Disabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – IAAE** Interrupt on Async Advance Enable
The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit UHPHS_USBSTS.

**Bit 4 – HSEE** Host System Error Enable
The interrupt is acknowledged by software clearing the Host System Error bit in UHPHS_USBSTS.

**Bit 3 – FLRE** Frame List Rollover Enable
The interrupt is acknowledged by software clearing the Frame List Rollover in UHPHS_USBSTS.

**Bit 2 – PCIE** Port Change Interrupt Enable
The interrupt is acknowledged by software clearing the Port Change Detect bit in UHPHS_USBSTS.

**Bit 1 – USBEIE** USB Error Interrupt Enable
The interrupt is acknowledged by software clearing the USBERRINT in UHPHS_USBSTS.

**Bit 0 – USBIE** USB Interrupt Enable
The interrupt is acknowledged by software clearing the USBINT in UHPHS_USBSTS.

© 2018 Microchip Technology Inc.

### 41.7.7 UHPHS USB Frame Index Register

**Name:** UHPHS_FRINDEX
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read/Write

This register is used by the host controller to index into the periodic frame list. The register updates every 125 µs (once each microframe). Bits [N:3] are used to select a particular entry in the Periodic Frame List during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by system software in the Frame List Size field in the UHPHS_USBCMD register).

This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the Host Controller is in the Halted state as indicated by the HCHLT bit (UHPHS_USBSTS register). A write to this register while the Run/Stop bit is set to 1 (UHPHS_USBCMD register) produces undefined results. Writes to this register also affect the SOF value.

**Bits 13:0 – FI[13:0]** Frame Index
The value in this register increments at the end of each time frame (e.g., microframe). Bits [N:3] are used for the Frame List current index. This means that each location of the frame list is accessed eight times (frames or microframes) before moving to the next index. The following illustrates values of N based on the value of FLS (Frame List Size) in the UHPHS_USBCMD register.

| UHPHS_USBCMD.FLS | Number Elements | N |
|---|---|---|
| 0 | 1024 | 12 |
| 1 | 512 | 11 |
| 2 | 256 | 10 |
| 3 | Reserved | – |

The SOF frame number value for the bus SOF token is derived or alternatively managed from this register. The value of FRINDEX must be 125 µs (1 microframe) ahead of the SOF token value. The SOF value may be implemented as an 11-bit shadow register. For this discussion, this shadow register is 11 bits and is named SOFV. SOFV updates every eight microframes (1 millisecond). An example implementation to achieve this behavior is to increment SOFV each time the FRINDEX[2:0] increments from 0 to 1.

Software must use the value of FRINDEX to derive the current microframe number, both for high-speed isochronous scheduling purposes and to provide the “get microframe number” function required for client drivers. Therefore, the value of FRINDEX and the value of SOFV must be kept consistent if chip is reset or software writes to FRINDEX. Writes to FRINDEX must also write-through FRINDEX[13:3] to SOFV[10:0]. In order to keep the update as simple as possible, software should never write a FRINDEX value where the three least significant bits are 7 or 0.

### 41.7.8 UHPHS Periodic Frame List Base Address Register

**Name:** UHPHS_PERIODICLISTBASE
**Offset:** 0x24
**Reset:** 0x00000000
**Property:** Read/Write

This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. If the host controller is in 64-bit mode (as indicated by a 1 in the 64-bit Addressing Capability field in the UHPHS_HCCSPARAMS register), then the most significant 32 bits of every control data structure address comes from the UHPHS_CTRLDSSEGMENT register. System software loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (UHPHS_FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. This register must be written as a DWord. Byte writes produce undefined results.

| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bits 31:12 – BA[19:0]** Base Address (Low)
These bits correspond to memory address signals [31:12], respectively.

### 41.7.9 UHPHS Asynchronous List Address Register

**Name:** UHPHS_ASYNCLISTADDR
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read/Write

This 32-bit register contains the address of the next asynchronous queue head to be executed. If the host controller is in 64-bit mode (as indicated by a 1 in the 64-bit Addressing Capability field in the UHPHS_HCCPARAMS register), then the most significant 32 bits of every control data structure address comes from the UHPHS_CTRLDSSEGMENT register. Bits [4:0] of this register cannot be modified by system software and will always return a zero when read. The memory structure referenced by this physical memory pointer is assumed to be 32-byte (cache line) aligned. This register must be written as a DWord. Byte writes produce undefined results.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 31:5 – LPL[26:0]** Link Pointer Low
These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (QH).

### 41.7.10 UHPHS Configure Flag Register

**Name:** UHPHS_CONFIGFLAG
**Offset:** 0x50
**Reset:** 0x00000000
**Property:** Read/Write

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CF |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – CF** Configure Flag
Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below.

| Value | Description |
|---|---|
| 0 | Port routing control logic default-routes each port to an implementation-dependent classic host controller (default value). |
| 1 | Port routing control logic default-routes all ports to this host controller. |

### 41.7.11 UHPHS Port Status and Control Register

**Name:** UHPHS_PORTSCx
**Offset:** 0x54 + x*0x04 [x=0..2]
**Reset:** 0x00002000
**Property:** Read/Write

The number of port registers is documented in the UHPHS_HCSPARAMS register. Software uses this information as an input parameter to determine how many ports need to be serviced. All ports have the structure defined below.

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset. The initial conditions of a port are:

- No device connected
- Port disabled

If the port has port power control, software cannot change the state of the port until after it applies power to the port by setting port power to a 1. Software must not attempt to change the state of the port until after power is stable on the port. The host is required to have power stable to the port within 20 milliseconds of the 0 to 1 transition.

**Note:**

1. When a device is attached, the port state transitions to the connected state and system software will process this as with any status change notification.
2. If a port is being used as the Debug Port, then the port may report device connected and enabled when the Configured Flag is set to 0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

|---|---|---|---|---|---|---|---|---|
| | SUS | FPR | OCC | OCA | PEDC | PED | CSC | CCS |
| Access | R/W | R/W | R/W | R | R/W | R/W | R/W | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 22 – WKOC_E** Wake on Overcurrent Enable
This field is 0 if Port Power is 0.

| Value | Description |
|---|---|
| 0 | Disables the port to be sensitive to overcurrent conditions as wake-up events. |
| 1 | Enables the port to be sensitive to overcurrent conditions as wake-up events. |

**Bit 21 – WKDSCNNT_E** Wake on Disconnect Enable
This field is 0 if Port Power is 0.

| Value | Description |
|---|---|
| 0 | Disables the port to be sensitive to device disconnects as wake-up events. |
| 1 | Enables the port to be sensitive to device disconnects as wake-up events. |

**Bit 20 – WKCNNT_E** Wake on Connect Enable
This field is 0 if Port Power is 0.

| Value | Description |
|---|---|
| 0 | Disables the port to be sensitive to device connects as wake-up events. |
| 1 | Enables the port to be sensitive to device connects as wake-up events. |

**Bits 19:16 – PTC[3:0]** Port Test Control
When this field is set to 0, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value.

Test mode bits are encoded as follows (6 to 15 are reserved):

| Value | Test Mode |
|---|---|
| 0 | Test mode not enabled |
| 1 | Test J_STATE |
| 2 | Test K_STATE |
| 3 | Test SE0_NAK |
| 4 | Test Packet |
| 5 | Test FORCE_ENABLE |

Refer to the USB Specification Revision 2.0, Chapter 7, for details on each test mode.

**Bits 15:14 – PIC[1:0]** Port Indicator Control
Writing to these bits has no effect if the P_INDICATOR bit in the UHPHS_HCSPARAMS register is set to 0. If the P_INDICATOR bit is set to 1, then the bits are encoded as follows:

| Value | Meaning |
|---|---|
| 0 | Port indicators are off |
| 1 | Amber |
| 2 | Green |
| 3 | Undefined |

Refer to the USB Specification Revision 2.0 for a description of how these bits are to be used.

This field is 0 if Port Power is 0.

**Bit 13 – PO** Port Owner
System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes 1 to this bit when the attached device is not a high-speed device. A 1 in this bit means that a companion host controller owns and controls the port.

| Value | Description |
|---|---|
| 0 | This bit unconditionally goes to a 0 when the bit UHPHS_CONFIGFLAG.CF makes a 0 to 1 transition. |
| 1 | This bit unconditionally goes to 1 whenever the bit UHPHS_CONFIGFLAG.CF=0. |

**Bit 12 – PP** Port Power
The function of this bit depends on the value of the Port Power Control (PPC) field in the UHPHS_HCSPARAMS register. When host controller has port power control switches (PPC=0), PP is in read-only mode:

| Value | Description |
|---|---|
| 1 | Each port is hard-wired to power. |

When host controller has port power control switches (PPC=1), PP is in read/write mode:

| Value | Description |
|---|---|
| 0 | Host port power switch is OFF.<br>When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc. |
| 1 | Host port power switch is ON.<br>When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc. |

When an overcurrent condition is detected on a powered port and PPC is set to 1, the PP bit in each affected port may be transitioned by the host controller from 1 to 0 (removing power from the port).

**Bits 11:10 – LS[1:0]** Line Status
These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is 0 and the current connect status bit is set to 1.

This value of this field is undefined if Port Power is 0.

| Value | Name | Description |
|---|---|---|
| 0 | SE0 | Not a low-speed device, perform EHCI reset |
| 1 | K-STATE | Low-speed device, release ownership of port |
| 2 | J-STATE | Not a low-speed device, perform EHCI reset |
| 3 | Undefined | Not a low-speed device, perform EHCI reset |

**Bit 8 – PR** Port Reset
When software writes a 1 to this bit (from 0), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a 0 to this bit to terminate the bus reset sequence. Software must

keep this bit set to 1 long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.

**Note:** When software writes this bit to 1, it must also write 0 to the Port Enable bit.

When software writes a 0 to this bit, there may be a delay before the bit status changes to 0. The bit status will not read as 0 until after the reset has completed. If the port is in High-Speed mode after reset is complete, the host controller will automatically enable this port (e.g., set the Port Enable bit to 1). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from 1 to 0. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2 ms of software writing this bit to 0.

The HCHLT bit in the UHPHS_USBSTS register should be set to 0 before software attempts to use this bit. The host controller may hold Port Reset asserted to 1 when the HCHLT bit is 1.

This field is 0 if Port Power is 0.

| Value | Description |
|---|---|
| 0 | Port is not in Reset. |
| 1 | Port is in Reset. |

**Bit 7 – SUS** Suspend

| Value | Description |
|---|---|
| 0 | Port not in suspend state. |
| 1 | Port in suspend state. |

**Note:**
Port Enabled Bit and Suspend bit of this register define the port states as follows:

| Bits [Port Enabled, Suspend] | Port State |
|---|---|
| 0X | Disable |
| 10 | Enable |
| 11 | Suspend |

When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.

A write of 0 to this bit is ignored by the host controller. The host controller will unconditionally set this bit to 0 when:

- Software sets the Force Port Resume bit to 0 (from 1).
- Software sets the Port Reset bit to 1 (from 0).

If host software sets this bit to 1 when the port is not enabled (i.e., Port Enabled bit set to 0), the results are undefined.

This field is 0 if Port Power is set to 0.

**Bit 6 – FPR** Force Port Resume
This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are set to 1) and software transitions this bit to 1, then the effects on the bus are undefined.

Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to 1 because a J-to-K transition is detected, the Port Change Detect bit in the UHPHS_USBSTS register is also set to 1. If software sets this bit to 1, the host controller must not set the Port Change Detect bit.

Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains set to 1. Software must appropriately time the Resume and set this bit to 0 when the appropriate amount of time has elapsed. Writing a 0 (from 1) causes the port to return to High-Speed mode (forcing the bus below the port into a high-speed idle). This bit will remain set to 1 until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to 0.

This field is 0 if Port Power is 0.

| Value | Description |
|---|---|
| 0 | No resume (K-state) detected/driven on port. |
| 1 | Resume detected/driven on port. |

**Bit 5 – OCC** Overcurrent Change (Cleared on write)
Software clears this bit by writing 1.

| Value | Description |
|---|---|
| 0 | No change to Overcurrent Active. |
| 1 | Changes to Overcurrent Active. |

**Bit 4 – OCA** Overcurrent Active
This bit will automatically transition from 1 to 0 when the overcurrent condition is removed.

| Value | Description |
|---|---|
| 0 | This port does not have an overcurrent condition. |
| 1 | This port currently has an overcurrent condition. |

**Bit 3 – PEDC** Port Enable/Disable Change (Cleared on write)
For the root hub, this bit gets set to 1 only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it.

This field is 0 if Port Power bit is 0.

| Value | Description |
|---|---|
| 0 | No change in port enabled/disabled status. |
| 1 | Port enabled/disabled status has changed. |

**Bit 2 – PED** Port Enabled/Disabled
Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this field. The host controller will only set this bit to 1 when the reset sequence determines that the attached device is a high-speed device.

Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.

When the port is disabled (0b), downstream propagation of data is blocked on this port, except for reset.

This field is 0 if Port Power bit is 0.

| Value | Description |
|---|---|
| 0 | Disable. |
| 1 | Enable. |

**Bit 1 – CSC** Connect Status Change (Cleared on write)
Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit remains set). Software sets this bit to 0 by writing a 1 to it.

This field is 0 if Port Power bit is 0.

| Value | Description |
|---|---|
| 0 | No change. |
| 1 | Change in Current Connect Status. |

**Bit 0 – CCS** Current Connect Status
This value reflects the current state of the port, and may not correspond directly to the event that caused the CSC bit to be 1.

This bit is 0 if Port Power is 0.

| Value | Description |
|---|---|
| 0 | No device is present. |
| 1 | Device is present on port. |

### 41.7.12 EHCI: REG06 - AHB Error Status

**Name:** UHPHS_INSNREG06
**Offset:** 0xA8
**Reset:** 0x00000000
**Property:** Read/Write

Control and Status Register, used to read the UTMI registers from the signals below.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | AHB_ERR | | | | | | | |
| Access | R/W | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – AHB_ERR** AHB Error
System bus error was encountered and erroneous burst characteristics are captured. To clear this field the application must write a 0.

EHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and an error occurs, 4 is written to INSNREG06[8:4].
- When INCR8 and an error occurs, 8 is written to INSNREG06[8:4].
- When INCR16 and an error occurs, 16 is written to INSNREG06[8:4].
- Other values except 4, 8, and 16 are not written to INSNREG06[8:4].

OHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and error occurs, 4 is written to INSNREG06[8:4].
- Other values except 4 are not written to INSNREG06[8:4].

**Bits 11:9 – HBURST[2:0]** Burst Value
Value of the control phase at which the AHB error occurred.

This field applies to enabled incremental bursts only.

**Bits 8:4 – Nb_Burst[4:0]** Number of Bursts
Number of beats expected in the burst at which the AHB error occurred. Valid values are 0 to 16.

This field applies to enabled incremental bursts only.

**Bits 3:0 – Nb_Success_Burst[3:0]** Number of Successful Bursts
Number of successfully completed beats in the current burst before the AHB error occurred.

This field applies to enabled incremental bursts only.

### 41.7.13 EHCI: REG07 - AHB Master Error Address

**Name:** UHPHS_INSNREG07
**Offset:** 0xAC
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 2 – HSIC_EN** HSIC Enable/Disable
This register has R/W access to the host driver and gives control to the host driver to enable/disable the HSIC interface of Port C.

| Value | Description |
|---|---|
| 0 | Port C is in the HSIC Disable state (see High-Speed Inter-Chip USB Electrical Specification, Version 1.0, Section 3.1.2). HSIC is in the Disabled state after a power-on reset. |
| 1 | Port C is in the HSIC Enable state (see High-Speed Inter-Chip USB Electrical Specification, Version 1.0, Section 3.1.2). |

# 42. Audio Class D Amplifier (CLASSD)

## 42.1 Description

The Audio Class D Amplifier (CLASSD) is a digital input, Pulse Width Modulated (PWM) output stereo Class D amplifier. It features a high quality interpolation filter embedding a digitally controlled gain, an equalizer and a de-emphasis filter.

On its input side, the CLASSD is compatible with most common audio data rates. On the output side, its PWM output can drive either:

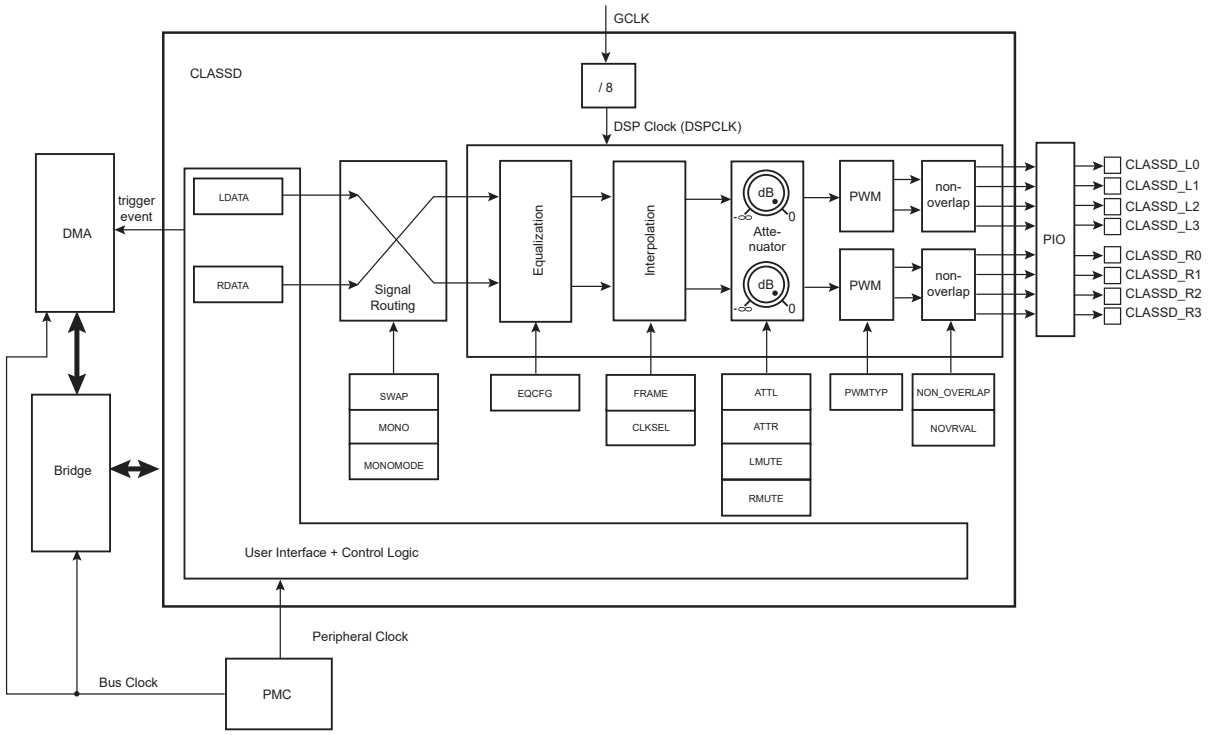
- high-impedance single-ended or differential output loads (Audio DAC application) or,
- external MOSFETs through an integrated non-overlapping circuit (Class D power amplifier application).

## 42.2 Embedded Characteristics

- Stereo PWM Class D Amplifier
- 16-bit Audio Data
- DSP clocks: 12.288 and 11.2896 MHz
- Input Sampling Rates: 8, 16, 32, 48, 96, 22.05, 44.1, 88.2 kHz
- 3-band Equalizer
- De-emphasis Filter
- Digital Volume Control
- Differential or Single-ended Outputs
- Non-overlapping Circuit to Control External MOSFETs
- Supports DMA

## 42.3 Block Diagram

**Figure 42-1. CLASSD Block Diagram**



## 42.4 Pin Name List

**Table 42-1. Output Pins Assignment Versus Application Use Cases**

| Pin | External MOS Driver (NON_OVERLAP = 1) | | Direct Load (NON_OVERLAP = 0) | | Type |
|---|---|---|---|---|---|
| | Full H-Bridge (PWMTYP = 1) | Half H-Bridge (PWMTYP = 0) | Differential Load (PWMTYP = 1) | Single-Ended Load (PWMTYP = 0) | |
| | Use Case 1 | Use Case 2 | Use Case 3A & 3B | Use Case 4A & 4B | |
| CLASSD_L0 | gate_pmos_leftp | gate_pmos_left | leftp | left | Output |
| CLASSD_L1 | gate_nmos_leftp | gate_nmos_left | Not used (fixed to 0) | Not used (fixed to 0) | Output |
| CLASSD_L2 | gate_pmos_leftn | Not used (fixed to 1) | leftn | Not used (fixed to 0) | Output |
| CLASSD_L3 | gate_nmos_leftn | Not used (fixed to 1) | Not used (fixed to 0) | Not used (fixed to 0) | Output |
| CLASSD_R0 | gate_pmos_rightp | gate_pmos_right | rightp | right | Output |

.....continued

| Pin | External MOS Driver (NON_OVERLAP = 1) | | Direct Load (NON_OVERLAP = 0) | | Type |
|---|---|---|---|---|---|
| | Full H-Bridge (PWMTYP = 1) | Half H-Bridge (PWMTYP = 0) | Differential Load (PWMTYP = 1) | Single-Ended Load (PWMTYP = 0) | |
| | Use Case 1 | Use Case 2 | Use Case 3A & 3B | Use Case 4A & 4B | |
| CLASSD_R1 | gate_nmos_rightp | gate_nmos_right | Not used (fixed to 0) | Not used (fixed to 0) | Output |
| CLASSD_R2 | gate_pmos_rightn | Not used (fixed to 1) | rightn | Not used (fixed to 0) | Output |
| CLASSD_R3 | gate_nmos_rightn | Not used (fixed to 1) | Not used (fixed to 0) | Not used (fixed to 0) | Output |

## 42.5 Product Dependencies

### 42.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CLASSD pins to their peripheral functions.

### 42.5.2 Power Management

The CLASSD is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the CLASSD Peripheral Clock and provide a generic clock (GCLK).

The fields NOVRVAL, NON_OVERLAP and PWMTYP in CLASSD_MR, and DSPCLKFREQ and FREQ in CLASSD_INTPMR, must be configured prior to applying the GCLK.

### 42.5.3 Interrupt

The CLASSD has an interrupt line connected to the interrupt controller. Handling the CLASSD interrupt requires programming the interrupt controller before configuring the CLASSD.

## 42.6 Functional Description

### 42.6.1 Interpolator

#### 42.6.1.1 Clock Configuration

The interpolator accepts input sampling frequencies ($f_s$) and the input DSP clock (DSPCLK) that can be configured in the CLASSD Interpolator Mode Register. GCLK must be configured in the PMC according to the desired DSPCLK so that DSPCLK = GCLK / 8.

The following table provides authorized DSPCLK / $f_s$ ratios and associated filter types.

**Table 42-2. Authorized DSPCLK / $f_s$ Ratios & Filter Types**

| $f_s$ | DSPCLK | |
|---|---|---|
| | 12.288 MHz | 11.2896 MHz |
| 8 kHz | 2 | – |
| 16 kHz | 2 | – |
| 32 kHz | 2 | – |
| 48 kHz | 1 | – |
| 96 kHz | 3 | – |
| 22.05 kHz | – | 1 |
| 44.1 kHz | – | 1 |
| 88.2 kHz | – | 3 |

**Note:** Each dash (–) indicates a configuration that is not authorized and that raises the CFGERR flag in the CLASSD Interpolator Status Register.

#### 42.6.1.2 CLASSD Frequency Response

Interpolation is performed with a combination of Infinite Impulse Response (IIR) and Cascaded Integrator-Comb (CIC) filters. Given the input configuration, the coefficients of the filters are redefined to optimize their transfer function to optimize the audio bandwidth. The different types of filters are defined in section Clock Configuration.

**Figure 42-2. Type 1 Frequency Response**

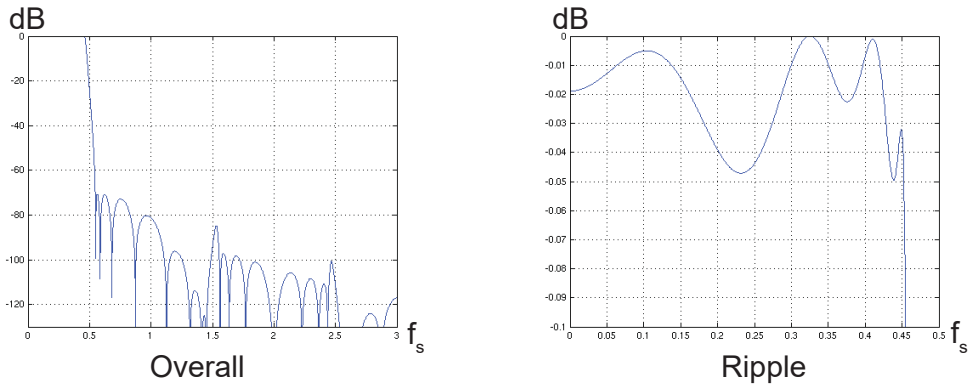


**Figure 42-3. Type 2 Frequency Response**

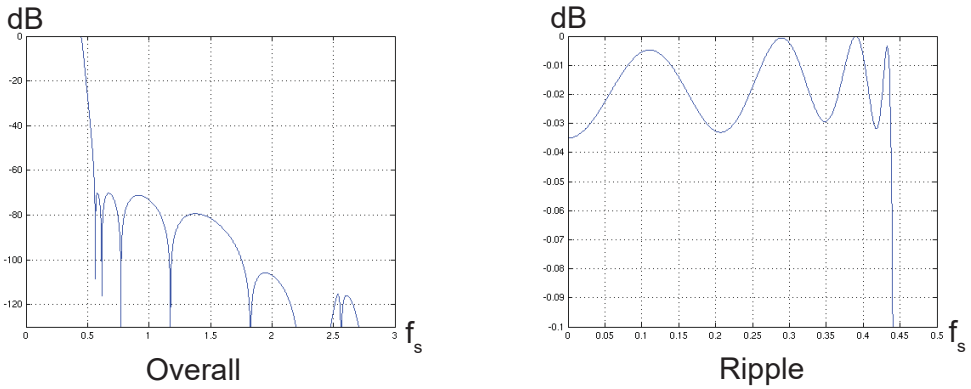

**Figure 42-4. Type 3 Frequency Response**

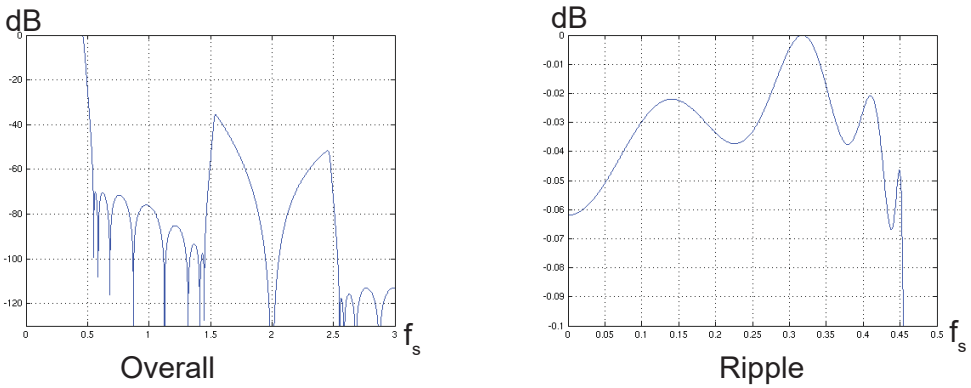

### 42.6.2 Equalizer

The CLASSD offers 12 pre-programmed equalization filters.

A zero-cross detection system is used to modify the equalizer on-the-fly with minimum disturbance on the output signal.

Programming of the equalization filter is detailed in section CLASSD Interpolator Mode Register.

The following figures show the frequency response of the equalizer function implemented in the D/A channels.

**Figure 42-5. Bass Filters Response**

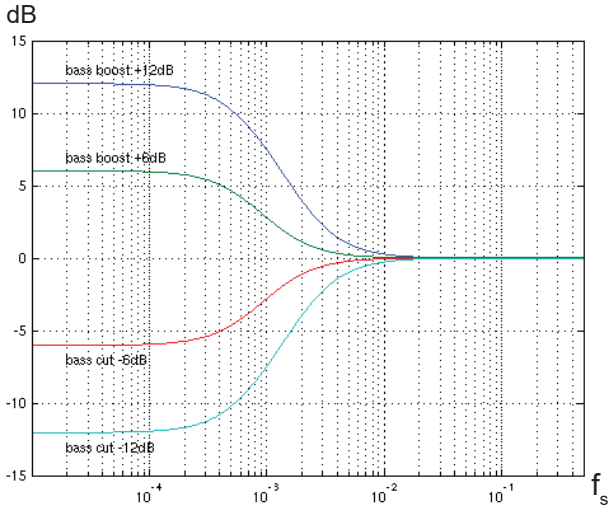

**Figure 42-6. Medium Filters Response**

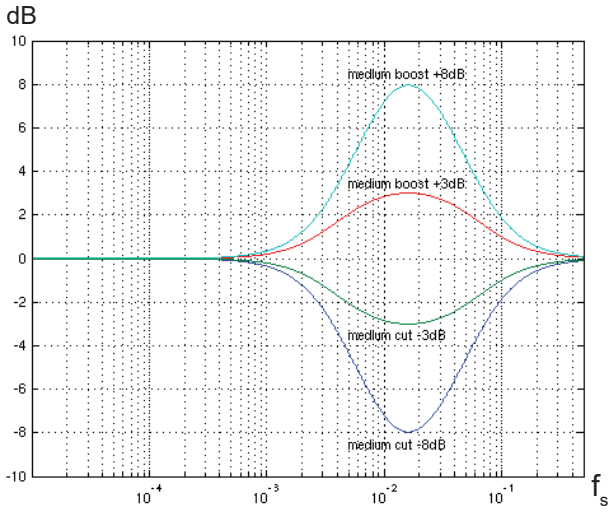

**Figure 42-7. Treble Filters Response**

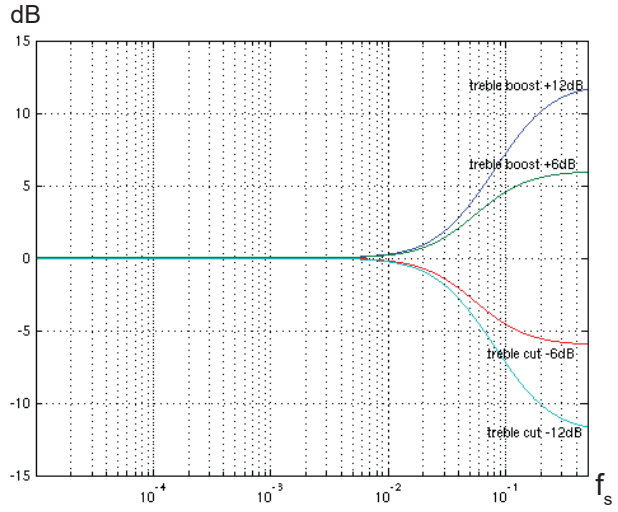

### 42.6.3 De-emphasis Filter Frequency Response

The CLASSD includes a de-emphasis filter which can be enabled for 32, 44.1 or 48 kHz sampling frequencies.

The response and the error generated by the digital approximation of the filter are illustrated in the following figures.

**Figure 42-8. De-emphasis Filter: Frequency Response & Error ($f_s$ = 32 kHz)**

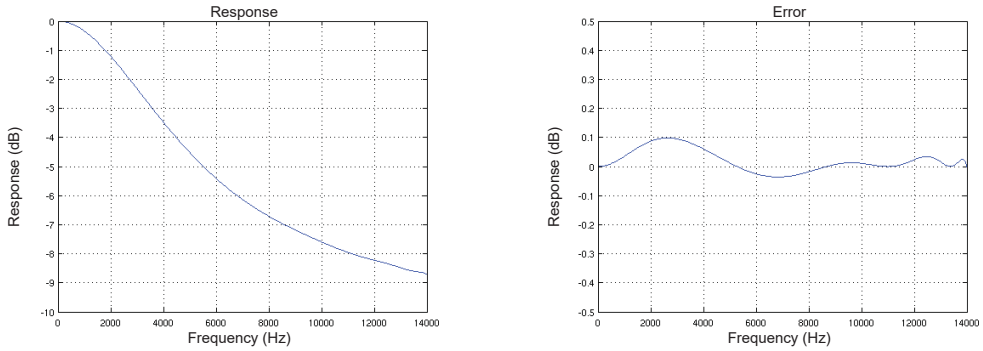

**Figure 42-9. De-emphasis Filter: Frequency Response & Error ($f_s$ = 44.1 kHz)**

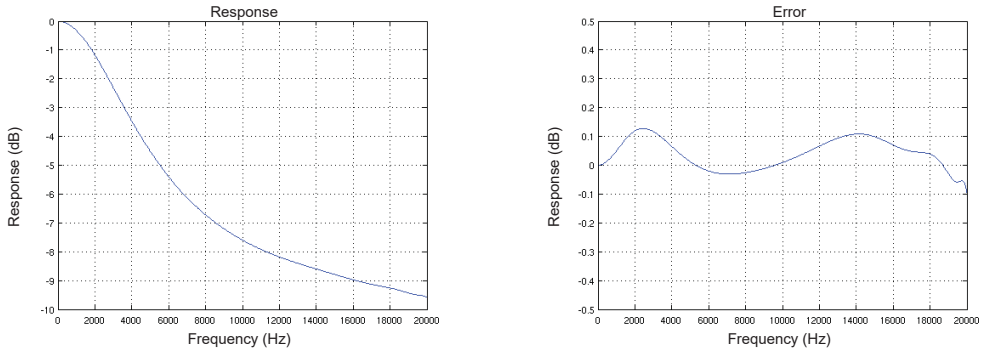

**Figure 42-10. De-emphasis Filter: Frequency Response & Error ($f_s$ = 48 kHz)**

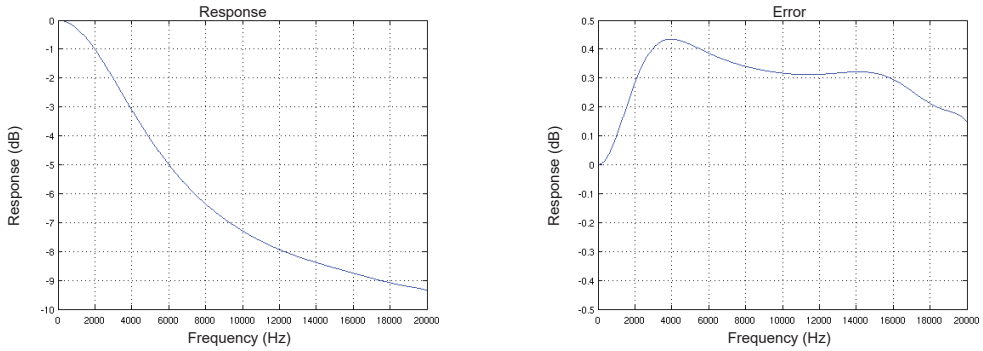

### 42.6.4 Attenuator and Recommended Input Levels

The CLASSD features a digital attenuator with an attenuation range of 0–77 dB and a step size of 1 dB. When attenuation greater than 77 dB is programmed, the attenuator mutes the channel.

To avoid saturations in the PWM stage, it is recommended to avoid input levels greater than 1 dB below the digital full scale (-1 dBFS). This can done by programming a minimum attenuation of 1 dB.

### 42.6.5 Pulse Width Modulator (PWM)

The CLASSD Pulse Width Modulator generates fixed frequency pulse width modulated output signals. For the 44.1 kS/s and 48 kS/s standard audio sample rates, the PWM output frequency is set to 16 × $f_S$: 705.6 kHz and 768 kHz respectively. For 8, 16, 24 and 96 kS/s, the 16× (interpolation) ratio is adapted to keep the output frequency at 768 kHz. In the same way, the output frequency is 705.6 kHz for the 22.05 and 88.2 kS/s cases.

The CLASSD functions either as a DAC loaded by a medium-to-high resistive load (e.g., 1 kΩ to 100 kΩ) or as a Class D power amplifier controller driving an external power stage. Depending on the value of CLASSD_MR.NON_OVERLAP, the CLASSD drives:

- Single-ended or differential resistive loads (NON_OVERLAP = 0)
- Full or Half MOSFET H-bridges (NON_OVERLAP = 1)

When driving an external power stage (NON_OVERLAP = 1), the CLASSD generates the signals to control complementary MOSFET pairs (PMOS and NMOS) with a non-overlapping delay between the NMOS and PMOS controls to avoid short circuit current. The non-overlapping delay can be adjusted in the CLASSD_MR.NOVRVAL field.

The CLASSD can have a single-ended or a differential output. A specific pulse width modulation type is associated to each case. For single-ended output (CLASSD_MR.PWMTYP = 0), the PWM acts only on the falling edge of the PWM waveform (trailing edge PWM). For differential output (CLASSD_MR.PWMTYP = 1), both the rising and the falling edges of the PWM waveform are modulated (symmetric PWM). Modulation principles are illustrated in the following figures for both types of PWM. In particular, when describing a null input, if PWMTYP = 0 (trailing edge PWM), the output waveform is a square wave with 50% duty cycle. With the same input and PWMTYP = 1, the differential output waveform is zero. This difference removes the classical L-C low pass filter when PWMTYP = 1.

**Figure 42-11. Output Waveform Modulation Principle for PWMTYP = 0**

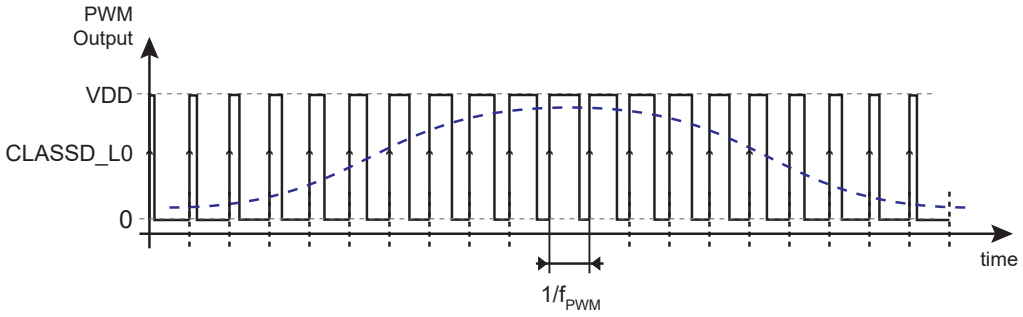

**Figure 42-12. Output Waveform Modulation Principle for PWMTYP = 1 (Only Left Channel Pins Shown)**

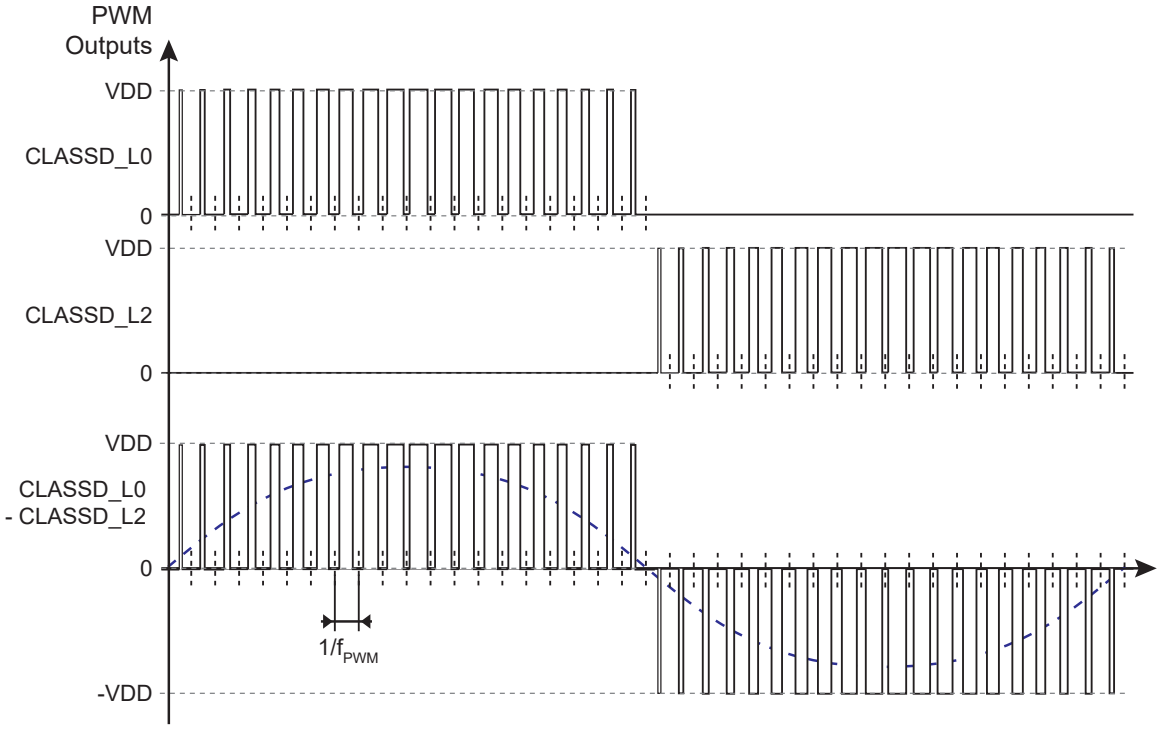
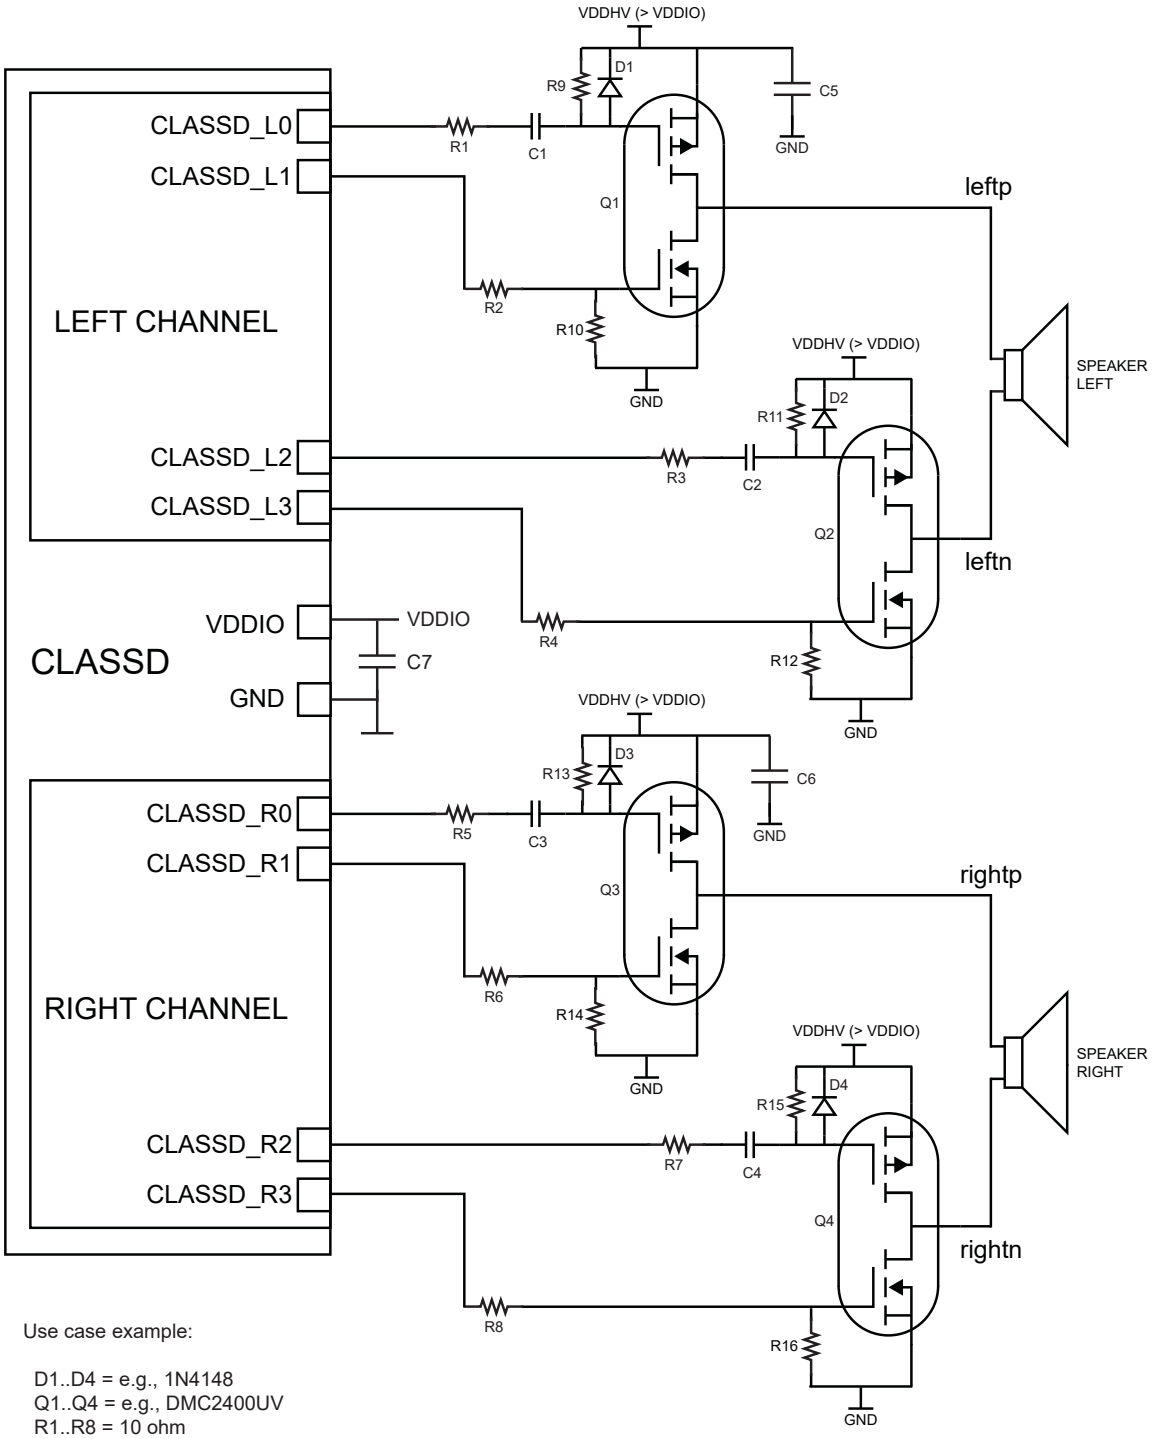


### 42.6.6 Application Schematics For Use Case Examples

**Figure 42-13. Use Case 1: Stereo Class D Amplifier With External Differential Power Stage**

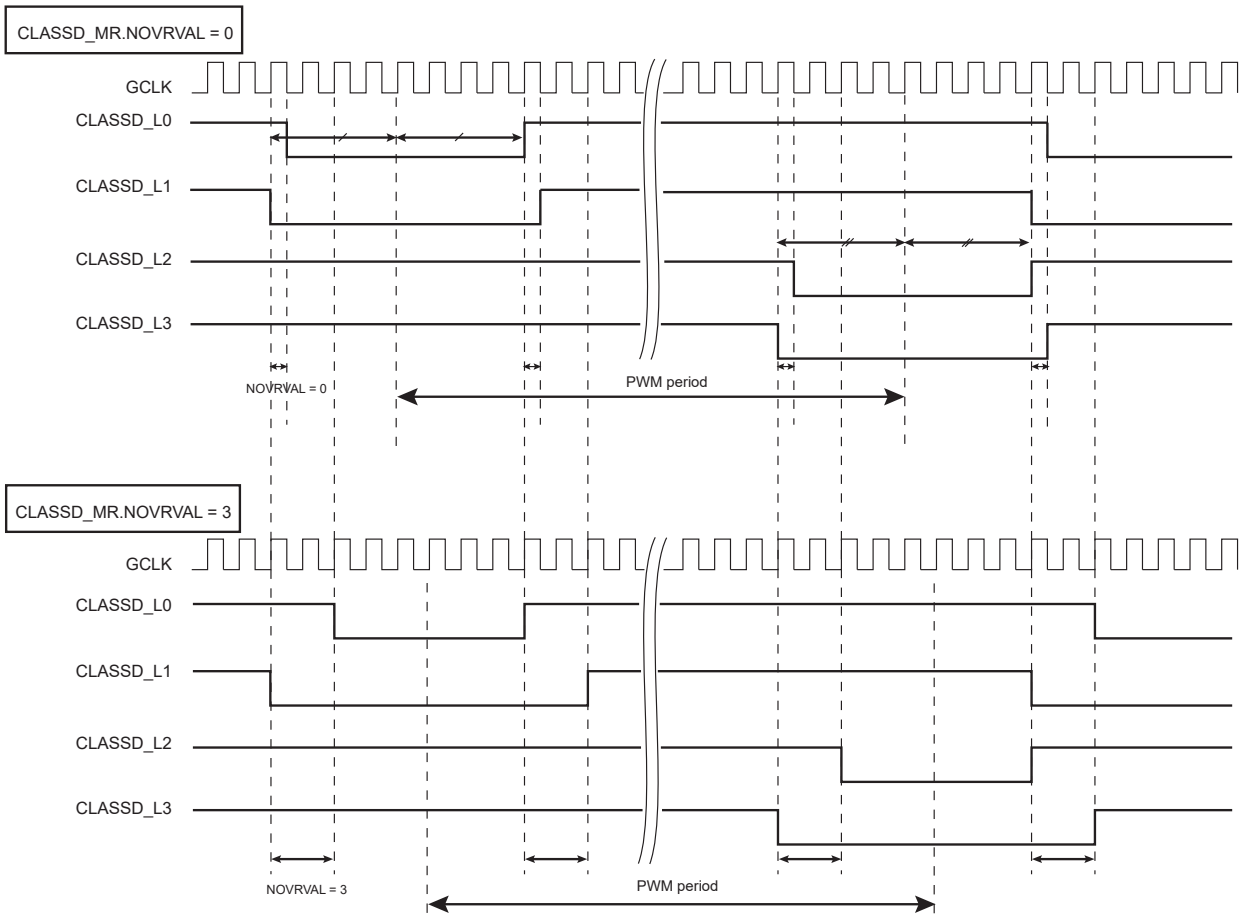


Use case example:

D1..D4 = e.g., 1N4148
Q1..Q4 = e.g., DMC2400UV
R1..R8 = 10 ohm
R9..R16 = 10 kohm
C1..C4 = 10 nF
C5..C6 = 10 µF
C7 = 1 µF

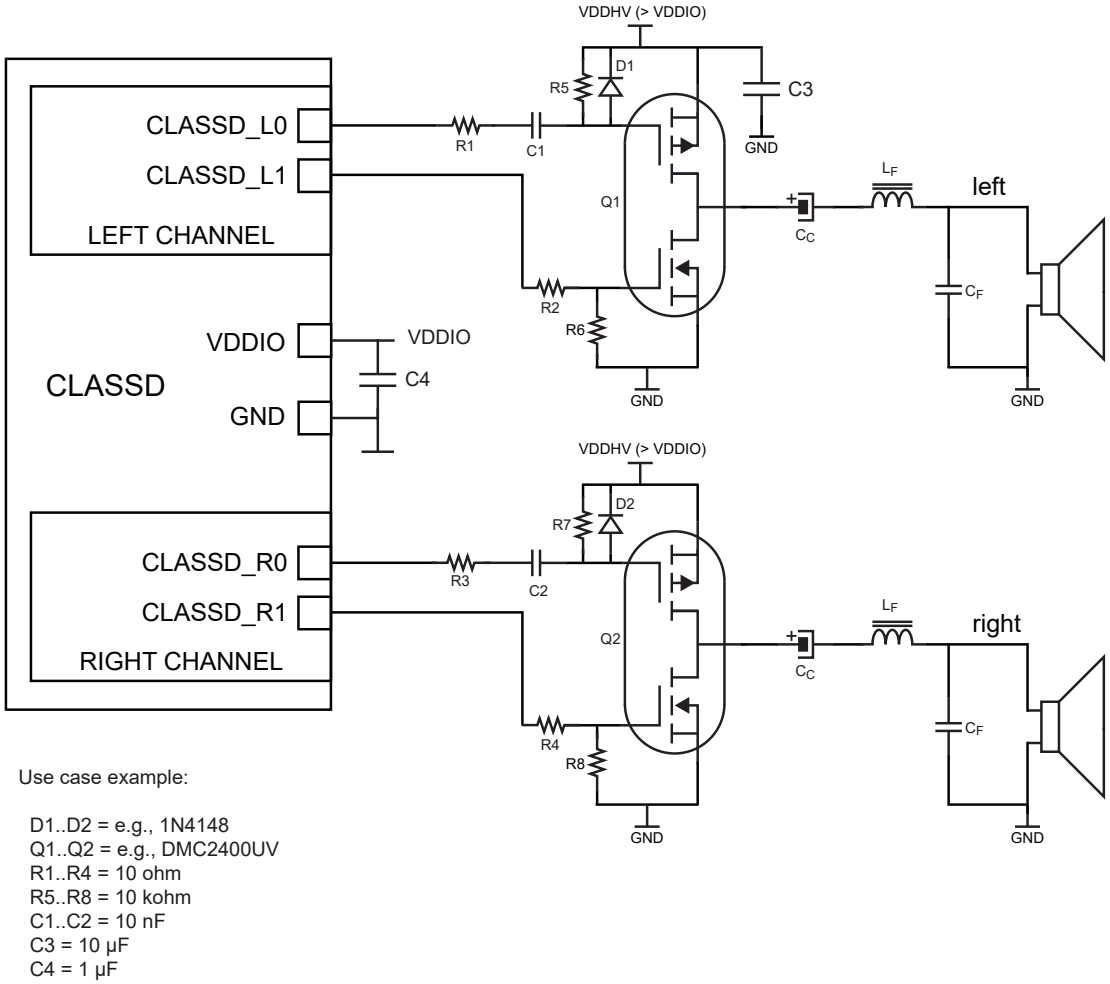
**Figure 42-14. Use Case 1: Waveforms**

CLASSD_MR.PWMTYP = 1, CLASSD_MR.NON_OVERLAP = 1



In Use Case 1, the external power stages are made of complementary low-cost MOSFETs. In addition to the $R_{DSON}$ and drain breakdown voltage characteristics, the choice of these components is driven by a low gate threshold voltage, a low input capacitance, a low total gate charge and a fast turn-on time characteristics. Series resistance (10 Ω) added to the gates of the MOSFETs are optional and may be adjusted to optimize the gate drive. They help to limit the output current peaks driven by the I/Os into the MOSFET gates in some cases. The 10k resistors ensure an OFF condition when not driven and the capacitor / diode network (C1..C2 / D1..D2) shifts the PMOS drive from the typical $V_{DDIO}$ level (3.3V) to a higher supply voltage (e.g., a 5V power domain).

**Figure 42-15. Use Case 2: Stereo Class D Amplifier With External Single-ended Power Stage**



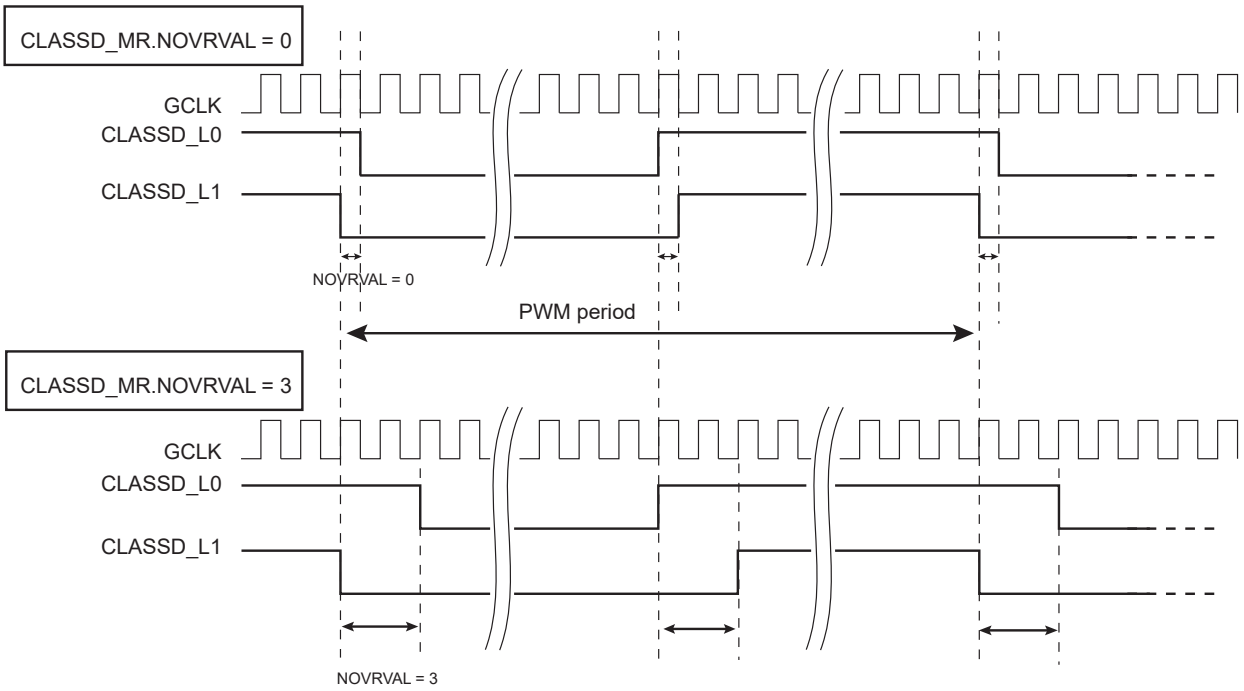
Use case example:

D1..D2 = e.g., 1N4148
Q1..Q2 = e.g., DMC2400UV
R1..R4 = 10 ohm
R5..R8 = 10 kohm
C1..C2 = 10 nF
C3 = 10 µF
C4 = 1 µF

In the Use Case 2 application schematic, the drive network of the MOSFETs gates follows the principles described in Use Case 1.

**Figure 42-16. Use Case 2: Waveforms**

CLASSD_MR.PWMTYP = 0, CLASSD_MR.NON_OVERLAP = 1



A coupling capacitor ($C_C$) and an L-C low pass filter ($L_F$, $C_F$) are added to the output of the power stage to remove both the DC and the high frequency components of the PWM signal. $C_C$ with the resistive part of the speaker ($R_{SPK}$) forms a C-R high pass filter with a corner frequency of $f_{HP} = 1 / (2 \times PI \times C_C \times R_{SPK})$.

$L_F$, $C_F$ and $R_{SPK}$ form a second-order low pass filter of corner frequency $f_C = 1 / (2 \times PI \times sqrt (L_F \times C_F))$ and of quality factor $Q = R_{SPK} \times sqrt (C_F / L_F)$. As a numerical example, consider the case $f_{HP}$ = 200 Hz, $f_C$ = 30 kHz, Q = 0.707 (maximum flat response) with $R_{SPK}$ = 8 Ω. This leads to $C_C$ = 100 µF, $L_F$ = 60 µH, $C_F$ = 470 nF.

**Figure 42-17. Use Case 3A: Stereo Audio DAC With Active differential to single low pass filter**

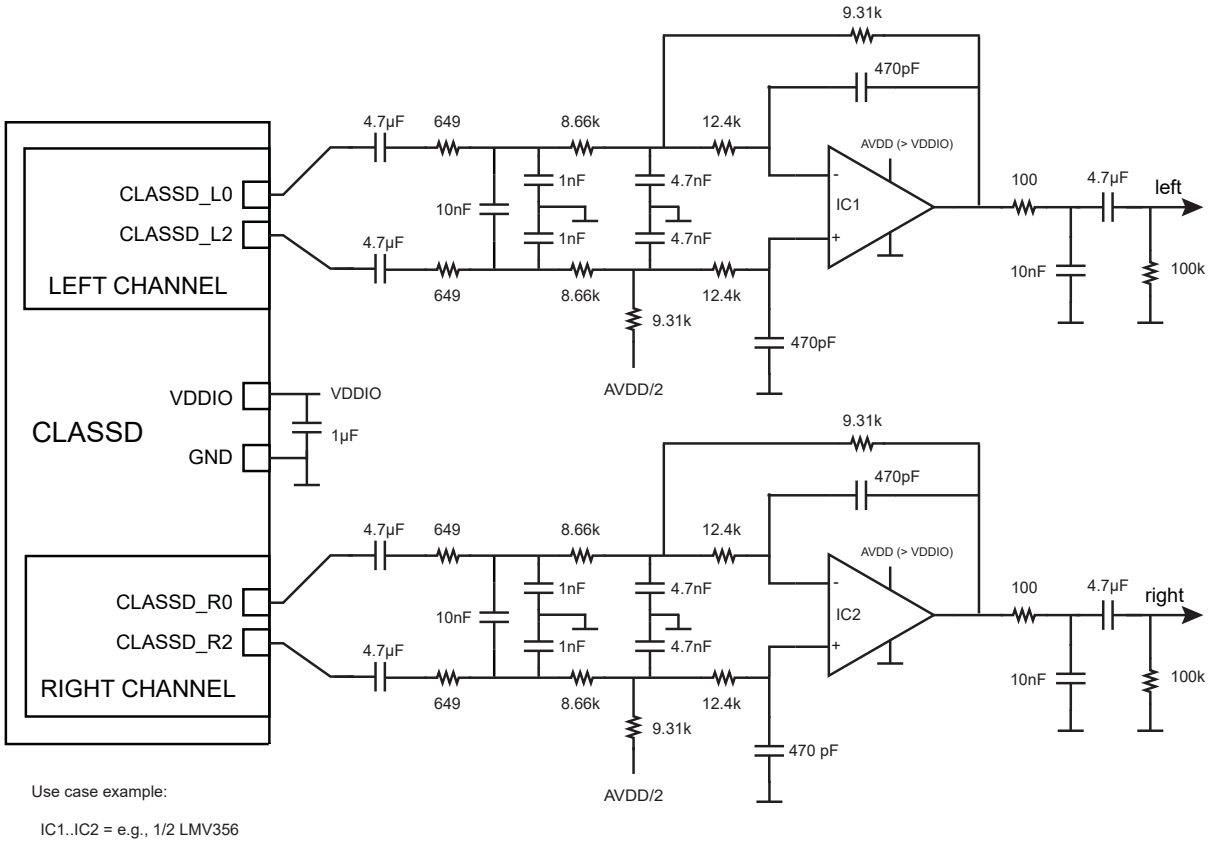


**Figure 42-18. Use Case 3B: Stereo Audio DAC With Simple Passive Low Pass Filter and Differential Outputs**

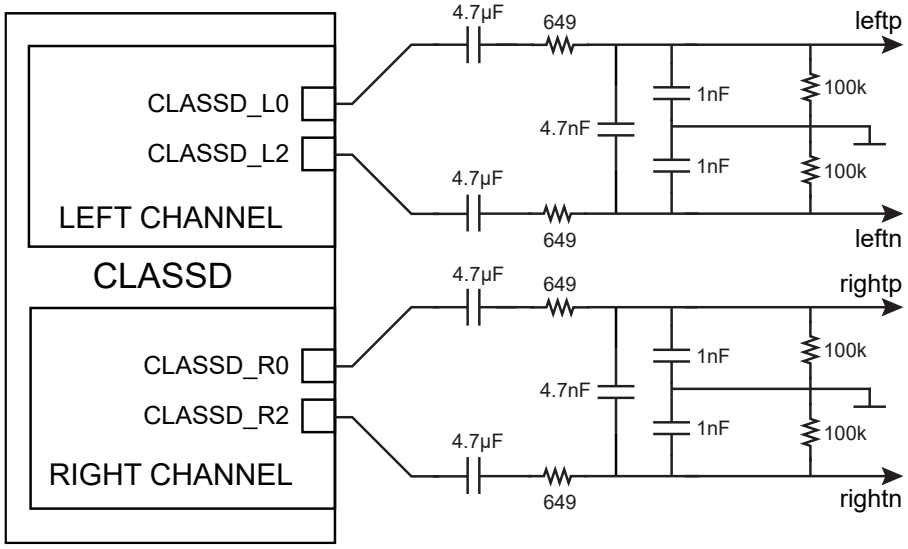

**Figure 42-19. Use Cases 3A and 3B: Waveforms**

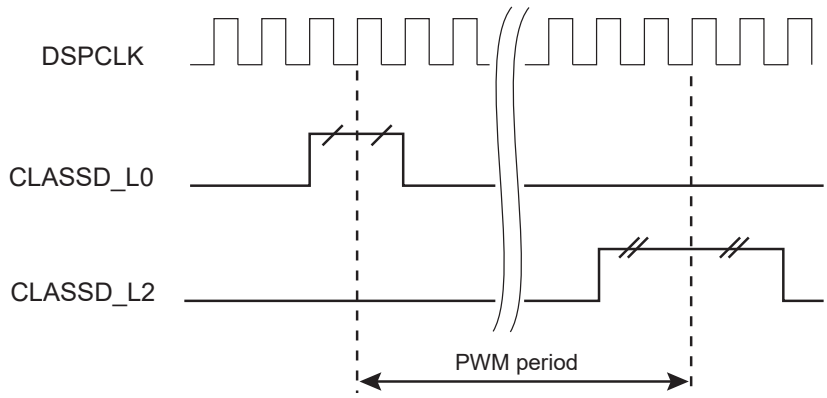
CLASSD_MR.PWMTYP = 1, CLASSD_MR.NON_OVERLAP = 0



In Use Case 3A, the CLASSD is used as an audio DAC. In this case, the differential outputs of the CLASSD are used. The application schematic suggested in figure "Use Case 3A: Stereo Audio DAC With Active differential to single low pass filter" above implements a third order 10 kHz low pass Butterworth filter and makes the differential to single-ended conversion. Note that in this schematic, the AVDD/2 point needs to be fed at low impedance (e.g., a buffered voltage). A simpler schematic (Use Case 3B) may also be possible, as shown in figure "Use Case 3B: Stereo Audio DAC With Simple Passive Low Pass Filter and Differential Outputs" above, at the cost of higher out-of-band noise and differential outputs which may be acceptable in some applications.

**Figure 42-20. Use Case 4A: Stereo Audio DAC With Active Low Pass Filter and Single-ended Outputs**

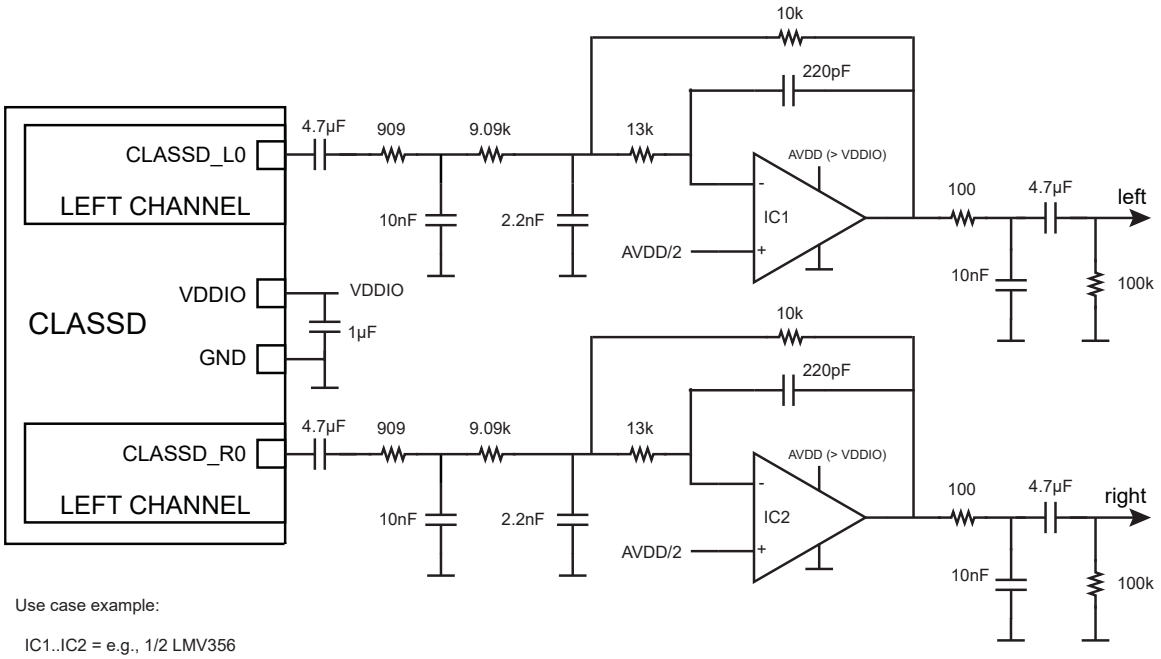


**Figure 42-21. Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs**

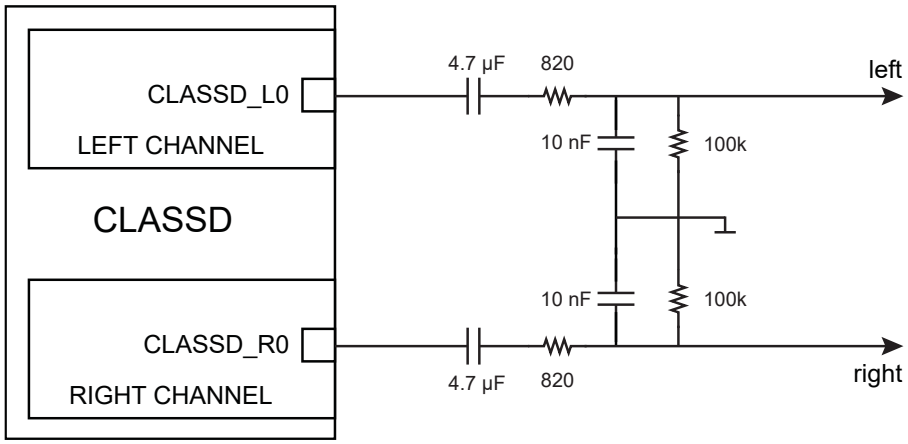

**Figure 42-22. Use Cases 4A and 4B: Waveforms**

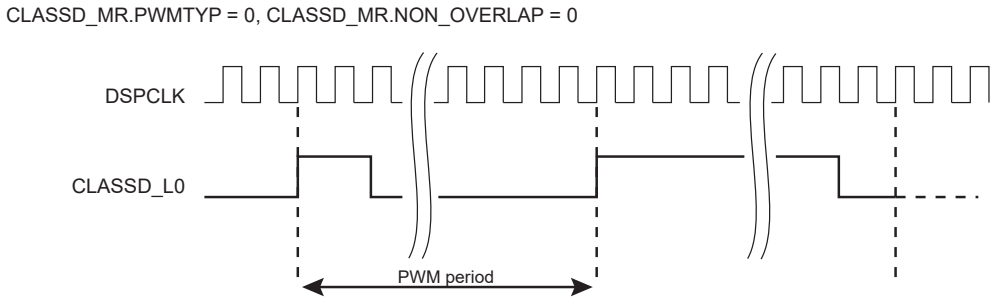

In Use Case 4A, the CLASSD is used as an audio DAC with active low pass filter. In this case, the single-ended outputs of the CLASSD are selected (PWMTYP = 0, trailing edge PWM) which leaves more I/Os to the application. A third order 30 kHz low pass Butterworth filter is shown in figure "Use Case 4A: Stereo Audio DAC With Active Low Pass Filter and Single-ended Outputs". The AVDD/2 point can be fed at relatively high impedance as no current is drawn from this point (a simple resistive divider properly decoupled is acceptable). A reduced complexity schematic is presented in figure "Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs" above for less constrained applications.

### 42.6.7 Register Write Protection

To prevent any single software error from corrupting CLASSD behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the CLASSD Write Protection Mode Register (CLASSD_WPMR).

The following registers can be write-protected:

- CLASSD Mode Register
- CLASSD Interpolator Mode Register

## 42.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|

| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets CLASSD, simulating a hardware reset. |

### 42.7.2 CLASSD Mode Register

**Name:** CLASSD_MR
**Offset:** 0x04
**Reset:** 0x00010022
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | NOVRVAL[1:0] | | | | | NON_OVERLAP |
| Access | | | R/W | R/W | | | | R/W |
| Reset | | | 0 | 0 | | | | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | PWMTYP |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RMUTE | REN | | | LMUTE | LEN |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 1 | 0 | | | 1 | 0 |

**Bits 21:20 – NOVRVAL[1:0]** Non-Overlapping Value
This field has no effect when NON_OVERLAP = 0.

| Value | Name | Description |
|---|---|---|
| 0 | 5NS | Non-overlapping time is 5 ns |
| 1 | 10NS | Non-overlapping time is 10 ns |
| 2 | 15NS | Non-overlapping time is 15 ns |
| 3 | 20NS | Non-overlapping time is 20 ns |

**Bit 16 – NON_OVERLAP** Non-Overlapping Enable

| Value | Description |
|---|---|
| 0 | Non-overlapping circuit is disabled. |
| 1 | Non-overlapping circuit is enabled. |

**Bit 8 – PWMTYP** PWM Modulation Type
0 (TRAILING_EDGE): The signal is single-ended.

If NON_OVERLAP is cleared, the signal is sent to CLASSD_L0 and CLASSD_R0 (see figure Use Case 4A or figure Use Case 4B).

If NON_OVERLAP is set, the signal is sent to CLASSD_L0/L1 and CLASSD_R0/R1 (see figure Use Case 2).

1 (UNIFORM): The signal is differential.

If NON_OVERLAP is cleared, the signal is sent to CLASSD_L0/L2 and CLASSD_R0/R2 (see figure Use Case 3A or figure Use Case 3B).

If NON_OVERLAP is set, the signal is sent to CLASSD_L0/L1/L2/L3 and CLASSD_R0/R1/R2/R3 (see figure Use Case 1).

**Bit 5 – RMUTE** Right Channel Mute

| Value | Description |
|---|---|
| 0 | Right channel is unmuted. |
| 1 | Right channel is muted. |

**Bit 4 – REN** Right Channel Enable

| Value | Description |
|---|---|
| 0 | Right channel is disabled. |
| 1 | Right channel is enabled. |

**Bit 1 – LMUTE** Left Channel Mute

| Value | Description |
|---|---|
| 0 | Left channel is unmuted. |
| 1 | Left channel is muted. |

**Bit 0 – LEN** Left Channel Enable

| Value | Description |
|---|---|
| 0 | Left channel is disabled. |
| 1 | Left channel is enabled. |

### 42.7.3 CLASSD Interpolator Mode Register

**Name:** CLASSD_INTPMR
**Offset:** 0x08
**Reset:** 0x00304E4E
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | MONOMODE[1:0] | | MONO | EQCFG[3:0] | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | FRAME[2:0] | | | SWAP | DEEMP | | DSPCLKFREQ |
| Access | | R/W | R/W | R/W | R/W | R/W | | R/W |
| Reset | | 0 | 1 | 1 | 0 | 0 | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | ATTR[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 1 | 0 | 0 | 1 | 1 | 1 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | ATTL[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 1 | 0 | 0 | 1 | 1 | 1 | 0 |

**Bits 30:29 – MONOMODE[1:0]** Mono Mode Selection
This field defines which signal is sent to both channels when the MONO bit is set.

| Value | Name | Description |
|---|---|---|
| 0 | MONOMIX | (left + right) / 2 is sent to both channels |
| 1 | MONOSAT | (left + right) is sent to both channels. If the sum is too high, the result is saturated. |
| 2 | MONOLEFT | THR[15:0] is sent to both the left and the right channels |
| 3 | MONORIGHT | THR[31:16] is sent to both the left and the right channels |

**Bit 28 – MONO** Mono Signal
0 (DISABLED): The signal is sent stereo to the left and right channels.

1 (ENABLED): The same signal is sent to both the left and the right channels. The sent signal is defined by the MONOMODE field value.

**Bits 27:24 – EQCFG[3:0]** Equalization Selection
EQCFG field values 13–15 = flat response

| Value | Name | Description |
|---|---|---|
| 0 | FLAT | Flat response |
| 1 | BBOOST12 | Bass boost +12 dB |
| 2 | BBOOST6 | Bass boost +6 dB |
| 3 | BCUT12 | Bass cut -12 dB |
| 4 | BCUT6 | Bass cut -6 dB |
| 5 | MBOOST3 | Medium boost +3 dB |
| 6 | MBOOST8 | Medium boost +8 dB |
| 7 | MCUT3 | Medium cut -3 dB |
| 8 | MCUT8 | Medium cut -8 dB |
| 9 | TBOOST12 | Treble boost +12 dB |
| 10 | TBOOST6 | Treble boost +6 dB |
| 11 | TCUT12 | Treble cut -12 dB |
| 12 | TCUT6 | Treble cut -6 dB |

**Bits 22:20 – FRAME[2:0]** CLASSD Incoming Data Sampling Frequency

| Value | Name | Description |
|---|---|---|
| 0 | FRAME_8K | 8 kHz |
| 1 | FRAME_16K | 16 kHz |
| 2 | FRAME_32K | 32 kHz |
| 3 | FRAME_48K | 48 kHz |
| 4 | FRAME_96K | 96 kHz |
| 5 | FRAME_22K | 22.05 kHz |
| 6 | FRAME_44K | 44.1 kHz |
| 7 | FRAME_88K | 88.2 kHz |

**Bit 19 – SWAP** Swap Left and Right Channels
0 (LEFT_ON_LSB): Left channel is on CLASSD_THR[15:0], right channel is on CLASSD_THR[31:16].

1 (RIGHT_ON_LSB): Right channel is on CLASSD_THR[15:0], left channel is on CLASSD_THR[31:16].

**Bit 18 – DEEMP** Enable De-emphasis Filter
0 (DISABLED): De-emphasis filter is disabled.

1 (ENABLED): De-emphasis filter is enabled.

**Bit 16 – DSPCLKFREQ** DSP Clock Frequency
0 (12M288): DSP Clock (DSPCLK) is 12.288 MHz.

1 (11M2896): DSP Clock (DSPCLK) is 11.2896 MHz.

**Bits 14:8 – ATTR[6:0]** Right Channel Attenuation
Right channel attenuation is defined as follows:

– if ATTR ≤ 77 the attenuation is -ATTR dB

– else the right signal is muted

**Bits 6:0 – ATTL[6:0]** Left Channel Attenuation
Left channel attenuation is defined as follows:

– if ATTL ≤ 77 the attenuation is -ATTL dB

– else the left signal is muted

### 42.7.4 CLASSD Interpolator Status Register

**Bit 0 – WPEN** Write Protection Enable
See Register Write Protection for the list of registers that can be write-protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x434C44 (“CLD” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x434C44 (“CLD” in ASCII). |

# 43. Inter-IC Sound Controller (I2SC)

## 43.1 Description

The Inter-IC Sound Controller (I2SC) provides a 5-wire, bidirectional, synchronous, digital audio link to external audio devices: I2SC_DI, I2SC_DO, I2SC_WS, I2SC_CK, and I2SC_MCK pins.

The I2SC is compliant with the Inter-IC Sound ($I^2S$) bus specification.

The I2SC consists of a receiver, a transmitter and a common clock generator that can be enabled separately to provide Master, Slave or Controller modes with receiver and/or transmitter active.

DMA Controller channels, separate for the receiver and for the transmitter, allow a continuous high bit rate data transfer without processor intervention to the following:

- Audio CODECs in Master, Slave, or Controller mode
- Stereo DAC or ADC through a dedicated $I^2S$ serial interface

The I2SC uses a single DMA Controller channel for both audio channels.

The 8- and 16-bit compact stereo format reduces the required DMA Controller bandwidth by transferring the left and right samples within the same data word.

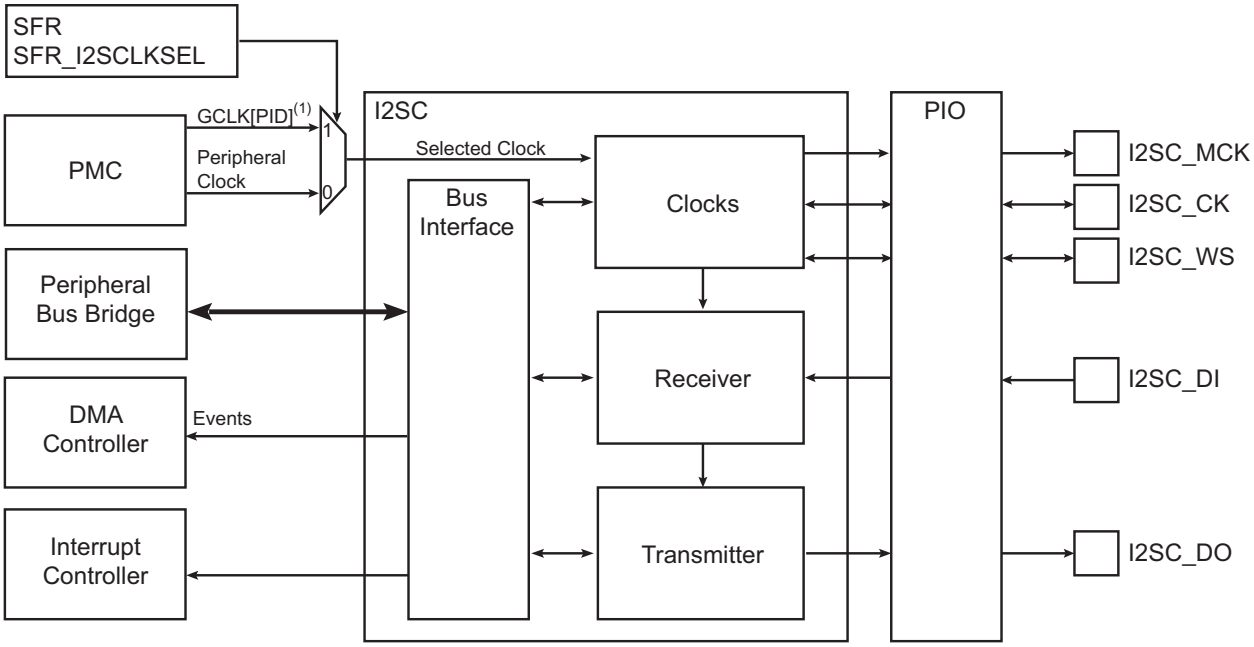
In Master mode, the I2SC can produce a 32 $f_s$ to 1024 $f_s$ master clock that provides an over-sampling clock to an external audio codec or digital signal processor (DSP).

## 43.2 Embedded Characteristics

- Compliant with Inter-IC Sound ($I^2S$) Bus Specification
- Master, Slave, and Controller Modes
  - Slave: Data Received/Transmitted
  - Master: Data Received/Transmitted And Clocks Generated
  - Controller: Clocks Generated
- Individual Enable and Disable of Receiver, Transmitter and Clocks
- Configurable Clock Generator Common to Receiver and Transmitter
  - Suitable for a Wide Range of Sample Frequencies ($f_s$), Including 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, and 192 kHz
  - 32 $f_s$ to 1024 $f_s$ Master Clock Generated for External Oversampling Data Converters
- Support for Multiple Data Formats
  - 32-, 24-, 20-, 18-, 16-, and 8-bit Mono or Stereo Format
  - 16- and 8-bit Compact Stereo Format, with Left and Right Samples Packed in the Same Word to Reduce Data Transfers
- DMA Controller Interfaces the Receiver and Transmitter to Reduce Processor Overhead
  - One DMA Controller Channel for Both Audio Channels
- Smart Holding Registers Management to Avoid Audio Channels Mix After Overrun or Underrun

## 43.3 Block Diagram

**Figure 43-1. I2SC Block Diagram**



(1) For the value of 'PID', refer to I2SCx in the table "Peripheral Identifiers".

## 43.4 I/O Lines Description

**Table 43-1. I/O Lines Description**

| Pin Name | Pin Description | Type |
|---|---|---|
| I2SC_MCK | Master Clock | Output |
| I2SC_CK | Serial Clock | Input/Output |
| I2SC_WS | $I^2S$ Word Select | Input/Output |
| I2SC_DI | Serial Data Input | Input |
| I2SC_DO | Serial Data Output | Output |

## 43.5 Product Dependencies

To use the I2SC, other parts of the system must be configured correctly, as described below.

### 43.5.1 I/O Lines

The I2SC pins may be multiplexed with I/O Controller lines. The user must first program the PIO Controller to assign the required I2SC pins to their peripheral function. If the I2SC I/O lines are not used by the application, they can be used for other purposes by the PIO Controller. The user must enable the I2SC inputs and outputs that are used.

### 43.5.2 Power Management

If the CPU enters a Sleep mode that disables clocks used by the I2SC, the I2SC stops functioning and resumes operation after the system wakes up from Sleep mode.

### 43.5.3 Clocks

The clock for the I2SC bus interface is generated by the Power Management Controller (PMC). I2SC must be disabled before disabling the clock to avoid freezing the I2SC in an undefined state.

### 43.5.4 DMA Controller

The I2SC interfaces to the DMA Controller. Using the I2SC DMA functionality requires the DMA Controller to be programmed first.

### 43.5.5 Interrupt Sources

The I2SC interrupt line is connected to the Interrupt Controller. Using the I2SC interrupt requires the Interrupt Controller to be programmed first.

## 43.6 Functional Description

### 43.6.1 Initialization

The I2SC features a receiver, a transmitter and a clock generator for Master and Controller modes. Receiver and transmitter share the same serial clock and word select.

Before enabling the I2SC, the selected configuration must be written to the I2SC Mode Register (I2SC_MR) and to the I2S Clock Source Selection register (SFR_I2SCLKSEL) described in the section “Special Function Registers (SFR)”.

If the I2SC_MR.IMCKMODE bit is set, the I2SC_MR.IMCKFS field must be configured as described in section “Serial Clock and Word Select Generation”.

Once the I2SC_MR has been written, the I2SC clock generator, receiver, and transmitter can be enabled by writing a ’1’ to the CKEN, RXEN, and TXEN bits in the Control Register (I2SC_CR). The clock generator can be enabled alone in Controller mode to output clocks to the I2SC_MCK, I2SC_CK, and I2SC_WS pins. The clock generator must also be enabled if the receiver or the transmitter is enabled.

The clock generator, receiver, and transmitter can be disabled independently by writing a ’1’ to I2SC_CR.CXDIS, I2SC_CR.RXDIS and/or I2SC_CR.TXDIS, respectively. Once requested to stop, they stop only when the transmission of the pending frame transmission is completed.

### 43.6.2 Basic Operation

The receiver can be operated by reading the Receiver Holding Register (I2SC_RHR), whenever the Receive Ready (RXRDY) bit in the Status Register (I2SC_SR) is set. Successive values read from RHR correspond to the samples from the left and right audio channels for the successive frames.

The transmitter can be operated by writing to the Transmitter Holding Register (I2SC_THR), whenever the Transmit Ready (TXRDY) bit in the I2SC_SR is set. Successive values written to THR correspond to the samples from the left and right audio channels for the successive frames.

The RXRDY and TXRDY bits can be polled by reading the I2SC_SR.

The I2SC processor load can be reduced by enabling interrupt-driven operation. The RXRDY and/or TXRDY interrupt requests can be enabled by writing a ’1’ to the corresponding bit in the Interrupt Enable Register (I2SC_IER). The interrupt service routine associated to the I2SC interrupt request is executed whenever the Receive Ready or the Transmit Ready status bit is set.

### 43.6.3 Master, Controller and Slave Modes

In Master and Controller modes, the I2SC provides the master clock, the serial clock and the word select. I2SC_MCK, I2SC_CK, and I2SC_WS pins are outputs.

In Controller mode, the I2SC receiver and transmitter are disabled. Only the clocks are enabled and used by an external receiver and/or transmitter.

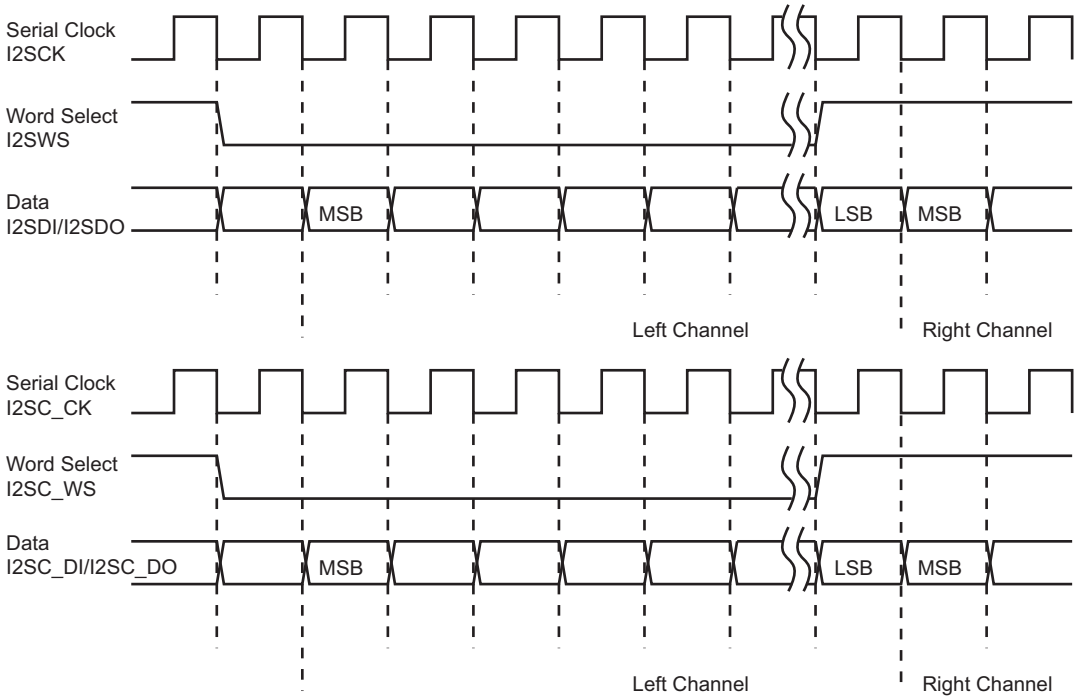
In Slave mode, the I2SC receives the serial clock and the word select from an external master. I2SC_CK and I2SC_WS pins are inputs.

The mode is selected by writing the MODE field in the I2SC_MR. Since the MODE field changes the direction of the I2SC_WS and I2SC_SCK pins, the I2SC_MR must be written when the I2SC is stopped.

### 43.6.4 I²S Reception and Transmission Sequence

As specified in the I²S protocol, data bits are left-justified in the word select time slot, with the MSB transmitted first, starting one clock period after the transition on the word select line.

**Figure 43-2. I²S Reception and Transmission Sequence**



Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The word select line indicates the channel in transmission, a low level for the left channel and a high level for the right channel.

The length of transmitted words can be chosen among 8, 16, 18, 20, 24, and 32 bits by writing the I2SC_MR.DATALENGTH field.

If the time slot allows for more data bits than written in the I2SC_MR.DATALENGTH field, zeroes are appended to the transmitted data word or extra received bits are discarded.

### 43.6.5 Serial Clock and Word Select Generation

The generation of clocks in the I2SC is described in figure ”I2SC Clock Generation”.

In Slave mode, the serial clock and word select clock are driven by an external master. I2SC_CK and I2SC_WS pins are inputs.

In Master mode, the user can configure the master clock, serial clock, and word select clock through the I2SC_MR. I2SC_MCK, I2SC_CK, and I2SC_WS pins are outputs and MCK is used to derive the I2SC clocks.

In Master mode, if the peripheral clock frequency is higher than 96 MHz, GCLK[PID] from the PMC must be selected as the I2SC input clock by writing a ’1’ in the CLKSELx bit of the SFR_I2SCLKSEL register located in SFR.

Audio codecs connected to the I2SC pins may require a master clock (I2SC_MCK) signal with a frequency multiple of the audio sample frequency ($f_s$), such as $256f_s$. When the I2SC is in Master mode, writing a ’1’ to I2SC_MR.IMCKMODE outputs MCK as master clock to the I2SC_MCK pin, and divides MCK to create the internal bit clock, output on the I2SC_CK pin. The clock division factor is defined by writing to I2SC_MR.IMCKFS and I2SC_MR.DATALENGTH, as described in the I2SC_MR.IMCKFS field description.

The master clock (I2SC_MCK) frequency is (2×16 × (IMCKFS + 1)) / (IMCKDIV + 1) times the sample frequency ($f_s$), i.e., I2SC_WS frequency.

Example: If the sampling rate is 44.1 kHz with an I2S master clock (I2SC_MCK) ratio of 256, the core frequency must be an integer multiple of 11.2896 MHz. Assuming an integer multiple of 4, the IMCKDIV field must be configured to 4; the field IMCKFS must then be set to 31.

The serial clock (I2SC_CK) frequency is 2 × Slot Length times the sample frequency ($f_s$), where Slot Length is defined in table Slot Length.

**Table 43-2. Slot Length**

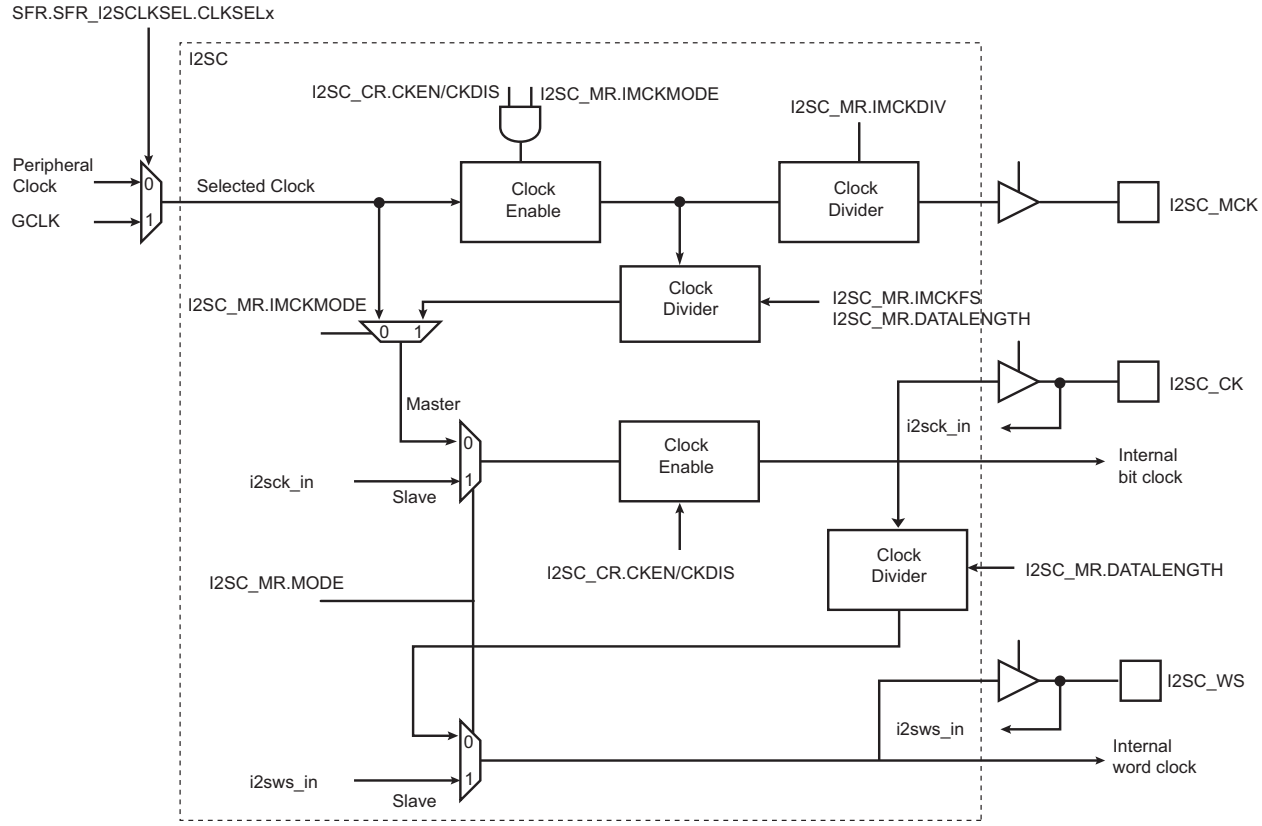
| I2SC_MR.DATALENGTH | Word Length | Slot Length |
|---|---|---|
| 0 | 32 bits | 32 |
| 1 | 24 bits | 32 if I2SC_MR.IWS = 0<br>24 if I2SC_MR.IWS = 1 |
| 2 | 20 bits | |
| 3 | 18 bits | |
| 4 | 16 bits | 16 |
| 5 | 16 bits compact stereo | |
| 6 | 8 bits | 8 |
| 7 | 8 bits compact stereo | |

**⚠WARNING** I2SC_MR.IMCKMODE must be written to ’1’ if the master clock frequency is strictly higher than the serial clock.

If a master clock output is not required, the MCK clock is used as I2SC_CK by clearing I2SC_MR.IMCKMODE. Alternatively, if the frequency of the MCK clock used is a multiple of the required I2SC_CK frequency, the I2SC_MCK to I2SC_CK divider can be used with the ratio defined by writing the I2SC_MR.IMCKFS field.

The I2SC_WS pin is used as word select as described in section “I2S Reception and Transmission Sequence”.

**Figure 43-3. I2SC Clock Generation**



### 43.6.6 Mono

When the Transmit Mono bit (TXMONO) in I2SC_MR is set, data written to the left channel is duplicated to the right output channel.

When the Receive Mono bit (RXMONO) in I2SC_MR is set, data received from the left channel is duplicated to the right channel.

### 43.6.7 Holding Registers

The I2SC user interface includes a Receive Holding Register (I2SC_RHR) and a Transmit Holding Register (I2SC_THR). These registers are used to access audio samples for both audio channels.

When a new data word is available in I2SC_RHR, the Receive Ready bit (RXRDY) in I2SC_SR is set. Reading I2SC_RHR clears this bit.

A receive overrun condition occurs if a new data word becomes available before the previous data word has been read from I2SC_RHR. In this case, the Receive Overrun bit in I2SC_SR and bit i of the RXORCH field in I2SC_SR are set, where i is the current receive channel number.

When I2SC_THR is empty, the Transmit Ready bit (TXRDY) in I2SC_SR is set. Writing to I2SC_THR clears this bit.

A transmit underrun condition occurs if a new data word needs to be transmitted before it has been written to I2SC_THR. In this case, the Transmit Underrun (TXUR) bit and bit i of the TXORCH field in I2SC_SR are set, where i is the current transmit channel number. If the TXSAME bit in I2SC_MR is ’0’, then a zero data word is transmitted in case of underrun. If I2SC_MR.TXSAME is ’1’, then the previous data word for the current transmit channel number is transmitted.

Data words are right-justified in I2SC_RHR and I2SC_THR. For the 16-bit compact stereo data format, the left sample uses bits 15:0 and the right sample uses bits 31:16 of the same data word. For the 8-bit compact stereo data format, the left sample uses bits 7:0 and the right sample uses bits 15:8 of the same data word.

### 43.6.8 DMA Controller Operation

All receiver audio channels are assigned to a single DMA Controller.

The DMA Controller reads from the I2SC_RHR and writes to the I2SC_THR for both audio channels successively.

The DMA Controller transfers may use 32-bit word, 16-bit halfword, or 8-bit byte depending on the value of the I2SC_MR.DATALENGTH field.

### 43.6.9 Loopback Mode

For debug purposes, the I2SC can be configured to loop back the transmitter to the Receiver. Writing a ’1’ to the I2SC_MR.LOOP bit internally connects I2SC_DO to I2SC_DI, so that the transmitted data is also received. Writing a ’0’ to I2SC_MR.LOOP restores the normal behavior with independent Receiver and Transmitter. As for other changes to the Receiver or Transmitter configuration, the I2SC Receiver and Transmitter must be disabled before writing to I2SC_MR to update I2SC_MR.LOOP.

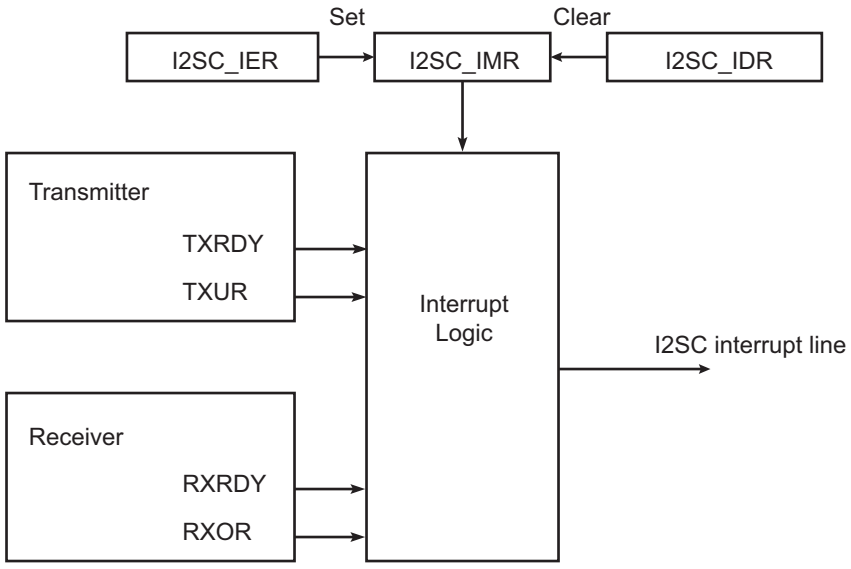
### 43.6.10 Interrupts

An I2SC interrupt request can be triggered whenever one or several of the following bits are set in I2SC_SR: Receive Ready (RXRDY), Receive Overrun (RXOR), Transmit Ready (TXRDY) or Transmit Underrun (TXUR).

The interrupt request is generated if the corresponding bit in the Interrupt Mask Register (I2SC_IMR) is set. Bits in I2SC_IMR are set by writing a ’1’ to the corresponding bit in I2SC_IER and cleared by writing a ’1’ to the corresponding bit in the Interrupt Disable Register (I2SC_IDR). The interrupt request remains active until the corresponding bit in I2SC_SR is cleared by writing a ’1’ to the corresponding bit in the Status Clear Register (I2SC_SCR).

For debug purposes, interrupt requests can be simulated by writing a ’1’ to the corresponding bit in the Status Set Register (I2SC_SSR).

**Figure 43-4. Interrupt Block Diagram**



## 43.7 I2SC Application Examples

The I2SC supports several serial communication modes used in audio or high-speed serial links. Examples of standard applications are shown in the following figures. All serial link applications supported by the I2SC are not listed here.

**Figure 43-5. Slave Transmitter I2SC Application Example**

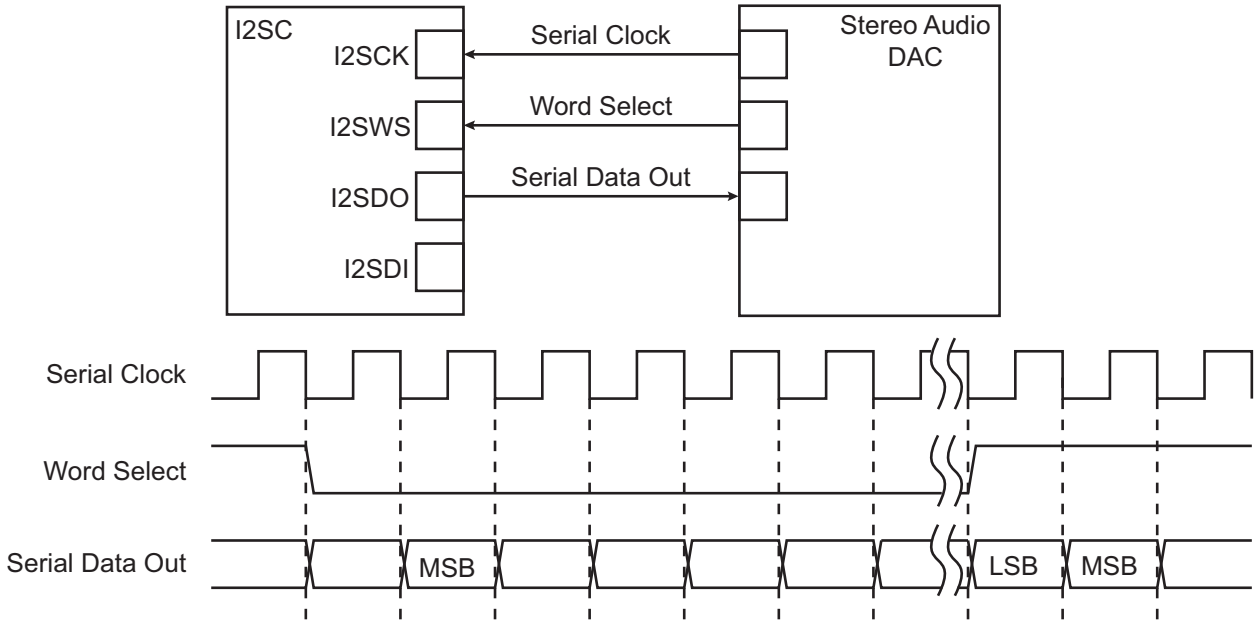


**Figure 43-6. Dual Microphone Application Block Diagram**

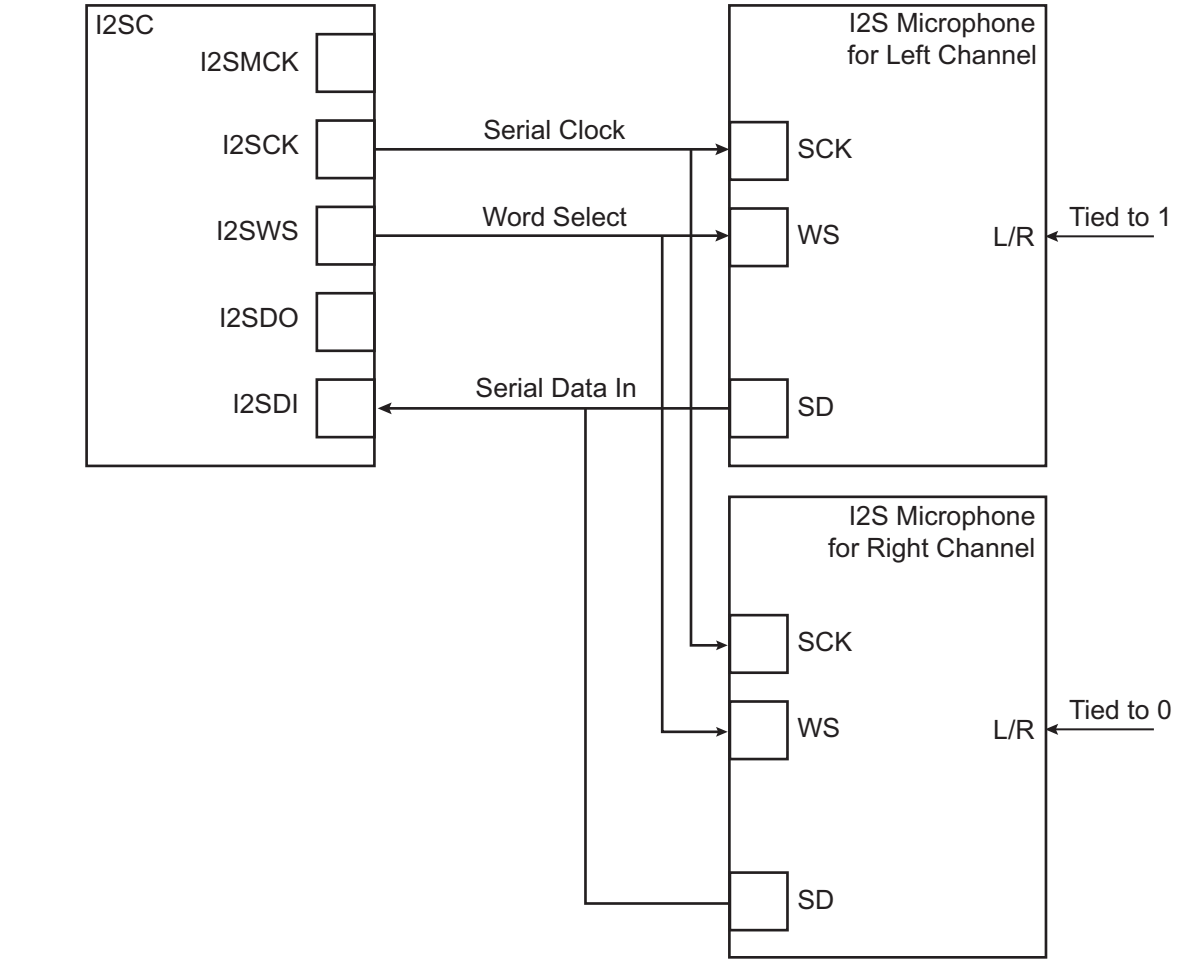

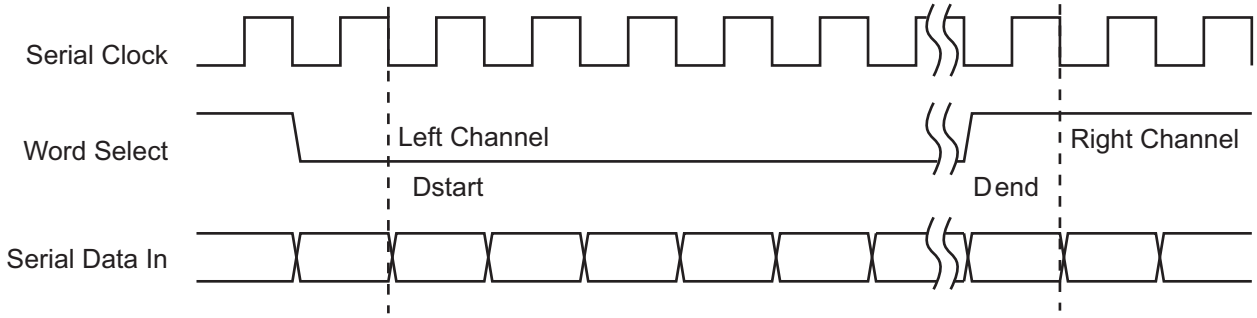

**Figure 43-7. Codec Application Block Diagram**

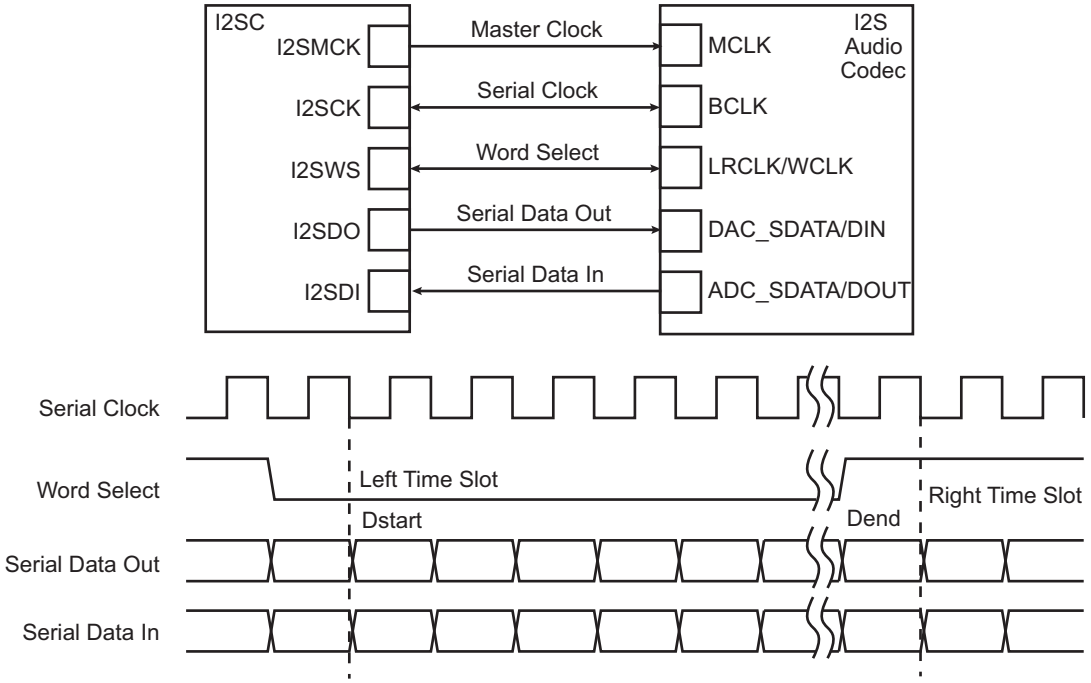

## 43.8 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |

### 43.8.1 I2SC Control Register

**Name:** I2SC_CR
**Offset:** 0x00
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SWRST | | TXDIS | TXEN | CKDIS | CKEN | RXDIS | RXEN |
| Access | W | | W | W | W | W | W | W |
| Reset | – | | – | – | – | – | – | – |

**Bit 7 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit resets all the registers in the I2SC. The I2SC is disabled after the reset. |

**Bit 5 – TXDIS** Transmitter Disable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit disables the I2SC transmitter. Bit I2SC_SR.TXEN is cleared when the Transmitter is stopped. |

**Bit 4 – TXEN** Transmitter Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit enables the I2SC transmitter, if TXDIS is not one. Bit I2SC_SR.TXEN is set when the Transmitter is started. |

**Bit 3 – CKDIS** Clocks Disable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a zone to this bit disables the I2SC clock generation. |

**Bit 2 – CKEN** Clocks Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit enables the I2SC clocks generation, if CKDIS is not one. |

**Bit 1 – RXDIS** Receiver Disable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit disables the I2SC receiver. Bit I2SC_SR.RXEN is cleared when the receiver is stopped. |

**Bit 0 – RXEN** Receiver Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit enables the I2SC receiver, if RXDIS is not one. Bit I2SC_SR.RXEN is set when the receiver is activated. |

### 43.8.2 I2SC Mode Register

**Name:** I2SC_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

The I2SC_MR must be written when the I2SC is stopped. The proper sequence is to write to I2SC_MR, then write to I2SC_CR to enable the I2SC or to disable the I2SC before writing a new value to I2SC_MR.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IWS | IMCKMODE | IMCKFS[5:0] | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | TXSAME | | TXMONO | | RXLOOP | | RXMONO |
| Access | | R/W | | R/W | | R/W | | R/W |
| Reset | | 0 | | 0 | | 0 | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FORMAT[1:0] | | | DATALENGTH[2:0] | | | | MODE |
| Access | R/W | R/W | | R/W | R/W | R/W | | R/W |
| Reset | 0 | 0 | | 0 | 0 | 0 | | 0 |

**Bit 31 – IWS** I2SC_WS Slot Width
Refer to table Slot Length (I2S format).

| Value | Description |
|---|---|
| 0 | I2SC_WS slot is 32 bits wide for DATALENGTH = 18/20/24 bits. |
| 1 | I2SC_WS slot is 24 bits wide for DATALENGTH = 18/20/24 bits. |

**Bit 30 – IMCKMODE** Master Clock Mode

**WARNING** If I2SC_MCK frequency is the same as I2SC_CK, IMCKMODE must be cleared. Refer to section Serial Clock and Word Select Generation and table Slot Length.

| Value | Description |
|---|---|
| 0 | No master clock generated (Selected Clock drives I2SC_CK output). |
| 1 | Master clock generated (internally generated clock is used as I2SC_MCK output). |

**Bits 29:24 – IMCKFS[5:0]** Master Clock to $f_s$ Ratio
Master clock frequency is [2 x 16 × (IMCKFS + 1)] / (IMCKDIV + 1) times the sample rate, i.e., I2SC_WS frequency.

| Value | Name | Description |
|---|---|---|
| 0 | M2SF32 | Sample frequency ratio set to 32 |
| 1 | M2SF64 | Sample frequency ratio set to 64 |
| 2 | M2SF96 | Sample frequency ratio set to 96 |
| 3 | M2SF128 | Sample frequency ratio set to 128 |
| 5 | M2SF192 | Sample frequency ratio set to 192 |
| 7 | M2SF256 | Sample frequency ratio set to 256 |
| 11 | M2SF384 | Sample frequency ratio set to 384 |
| 15 | M2SF512 | Sample frequency ratio set to 512 |
| 23 | M2SF768 | Sample frequency ratio set to 768 |
| 31 | M2SF1024 | Sample frequency ratio set to 1024 |
| 47 | M2SF1536 | Sample frequency ratio set to 1536 |
| 63 | M2SF2048 | Sample frequency ratio set to 2048 |

**Bits 21:16 – IMCKDIV[5:0]** Selected Clock to I2SC Master Clock Ratio
I2SC_MCK Master clock output frequency is Selected Clock divided by (IMCKDIV + 1). Refer to the IMCKFS field description.

**Note:**

1. This field is write-only. Always read as ‘0’.
2. Do not write a ‘0’ to this field.

**Bit 14 – TXSAME** Transmit Data when Underrun

| Value | Description |
|---|---|
| 0 | Zero sample transmitted when underrun. |
| 1 | Previous sample transmitted when underrun |

**Bit 12 – TXMONO** Transmit Mono

| Value | Description |
|---|---|
| 0 | Stereo |
| 1 | Mono, with left audio samples duplicated to right audio channel by the I2SC. |

**Bit 10 – RXLOOP** Loopback Test Mode

| Value | Description |
|---|---|
| 0 | Normal mode |
| 1 | I2SC_DO output of I2SC is internally connected to I2SC_DI input. |

**Bit 8 – RXMONO** Receive Mono

| Value | Description |
|---|---|
| 0 | Stereo |
| 1 | Mono, with left audio samples duplicated to right audio channel by the I2SC. |

**Bits 7:6 – FORMAT[1:0]** Data Format

| Value | Name | Description |
|---|---|---|
| 0 | I2S | $I^2S$ format, stereo with I2SC_WS low for left channel, and MSB of sample starting one I2SC_CK period after I2SC_WS edge |
| 1 | LJ | Left-justified format, stereo with I2SC_WS high for left channel, and MSB of sample starting on I2SC_WS edge |
| 2 | – | Reserved |
| 3 | – | Reserved |

**Bits 4:2 – DATALENGTH[2:0]** Data Word Length

| Value | Name | Description |
|---|---|---|
| 0 | 32_BITS | Data length is set to 32 bits. |
| 1 | 24_BITS | Data length is set to 24 bits. |
| 2 | 20_BITS | Data length is set to 20 bits. |
| 3 | 18_BITS | Data length is set to 18 bits. |
| 4 | 16_BITS | Data length is set to 16 bits. |
| 5 | 16_BITS_COMPACT | Data length is set to 16-bit compact stereo. Left sample in bits 15:0 and right sample in bits 31:16 of same word. |
| 6 | 8_BITS | Data length is set to 8 bits. |
| 7 | 8_BITS_COMPACT | Data length is set to 8-bit compact stereo. Left sample in bits 7:0 and right sample in bits 15:8 of the same word. |

**Bit 0 – MODE** Inter-IC Sound Controller Mode

| Value | Name | Description |
|---|---|---|
| 0 | SLAVE | I2SC_CK and I2SC_WS pin inputs used as bit clock and word select/frame synchronization. |
| 1 | MASTER | Bit clock and word select/frame synchronization generated by I2SC from MCK and output to I2SC_CK and I2SC_WS pins. Peripheral clock or GCLK is output as master clock on I2SC_MCK if I2SC_MR.IMCKMODE is set. |

### 43.8.3 I2SC Status Register

**Name:** I2SC_SR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Access | | R | R | R | | R | R | R |
| Reset | | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 21:20 – TXURCH[1:0]** Transmit Underrun Channel

| Value | Description |
|---|---|
| 0 | This field is cleared when I2SC_SCR.TXUR is written to ’1’. |
| 1 | Bit i of this field is set when a transmit underrun error occurred in channel i (i = 0 for first channel of the frame). |

**Bits 9:8 – RXORCH[1:0]** Receive Overrun Channel
This field is cleared when I2SC_SCR.RXOR is written to ’1’.

Bit i of this field is set when a receive overrun error occurred in channel i (i = 0 for first channel of the frame).

**Bit 6 – TXUR** Transmit Underrun

| Value | Description |
|---|---|
| 0 | This bit is cleared when the corresponding bit in I2SC_SCR is written to ’1’. |
| 1 | This bit is set when an underrun error occurs on I2SC_THR or when the corresponding bit in I2SC_SSR is written to ’1’. |

**Bit 5 – TXRDY** Transmit Ready

| Value | Description |
|---|---|
| 0 | This bit is cleared when data is written to I2SC_THR. |
| 1 | This bit is set when I2SC_THR is empty and can be written with new data to be transmitted. |

**Bit 4 – TXEN** Transmitter Enabled

| Value | Description |
|---|---|
| 0 | This bit is cleared when the transmitter is disabled, following a I2SC_CR.TXDIS or I2SC_CR.SWRST request. |
| 1 | This bit is set when the transmitter is enabled, following a I2SC_CR.TXEN request. |

**Bit 2 – RXOR** Receive Overrun

| Value | Description |
|---|---|
| 0 | This bit is cleared when the corresponding bit in I2SC_SCR is written to ’1’. |
| 1 | This bit is set when an overrun error occurs on I2SC_RHR or when the corresponding bit in I2SC_SSR is written to ’1’. |

**Bit 1 – RXRDY** Receive Ready

| Value | Description |
|---|---|
| 0 | This bit is cleared when I2SC_RHR is read. |
| 1 | This bit is set when received data is present in I2SC_RHR. |

**Bit 0 – RXEN** Receiver Enabled

| Value | Description |
|---|---|
| 0 | This bit is cleared when the receiver is disabled, following a RXDIS or SWRST request in I2SC_CR. |
| 1 | This bit is set when the receiver is enabled, following a RXEN request in I2SC_CR. |

### 43.8.4 I2SC Status Clear Register

**Name:** I2SC_SCR
**Offset:** 0x0C
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | TXUR | | | | RXOR | | |
| Access | | W | | | | W | | |
| Reset | | – | | | | – | | |

**Bits 21:20 – TXURCH[1:0]** Transmit Underrun Per Channel Status Clear
Writing a ’0’ has no effect.

Writing a ’1’ to any bit in this field clears the corresponding bit in the I2SC_SR and the corresponding interrupt request.

**Bits 9:8 – RXORCH[1:0]** Receive Overrun Per Channel Status Clear
Writing a ’0’ has no effect.

Writing a ’1’ to any bit in this field clears the corresponding bit in the I2SC_SR and the corresponding interrupt request.

**Bit 6 – TXUR** Transmit Underrun Status Clear
Writing a ’0’ to this bit has no effect.

Writing a ’1’ to this bit clears the status bit.

**Bit 2 – RXOR** Receive Overrun Status Clear
Writing a ’0’ to this bit has no effect.

Writing a ’1’ to this bit clears the status bit.

### 43.8.5 I2SC Status Set Register

**Name:** I2SC_SSR
**Offset:** 0x10
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | TXURCH[1:0] | | | | | |
| Access | | | W | W | | | | |
| Reset | | | – | – | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | RXORCH[1:0] | |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

|---|---|---|---|---|---|---|---|---|
| | | TXUR | | | | RXOR | | |
| Access | | W | | | | W | | |
| Reset | | – | | | | – | | |

**Bits 21:20 – TXURCH[1:0]** Transmit Underrun Per Channel Status Set
Writing a ’0’ has no effect.

Writing a ’1’ to any bit in this field sets the corresponding bit in I2SC_SR and the corresponding interrupt request.

**Bits 9:8 – RXORCH[1:0]** Receive Overrun Per Channel Status Set
Writing a ’0’ has no effect.

Writing a ’1’ to any bit in this field sets the corresponding bit in I2SC_SR and the corresponding interrupt request.

**Bit 6 – TXUR** Transmit Underrun Status Set
Writing a ’0’ to this bit has no effect.

Writing a ’1’ to this bit sets the status bit.

**Bit 2 – RXOR** Receive Overrun Status Set
Writing a ’0’ to this bit has no effect.

Writing a ’1’ to this bit sets the status bit.

### 43.8.6 I2SC Interrupt Enable Register

**Name:** I2SC_IER
**Offset:** 0x14
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | – | – | | | – | – | |

**Bit 6 – TXUR** Transmit Underflow Interrupt Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit sets the corresponding bit in I2SC_IMR. |

**Bit 5 – TXRDY** Transmit Ready Interrupt Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit as no effect. |
| 1 | Writing a ’1’ to this bit sets the corresponding bit in I2SC_IMR. |

**Bit 2 – RXOR** Receiver Overrun Interrupt Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit sets the corresponding bit in I2SC_IMR. |

**Bit 1 – RXRDY** Receiver Ready Interrupt Enable

| Value | Description |
|---|---|
| 0 | Writing a ’0’ to this bit has no effect. |
| 1 | Writing a ’1’ to this bit sets the corresponding bit in I2SC_IMR. |

### 43.8.7 I2SC Interrupt Disable Register

**Name:** I2SC_IDR
**Offset:** 0x18
**Property:** Write-only

**Bit 6 – TXUR** Transmit Underflow Interrupt Disable

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to ’1’. |
| 1 | The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to ’1’. |

**Bit 5 – TXRDY** Transmit Ready Interrupt Disable

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to ’1’. |
| 1 | The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to ’1’. |

**Bit 2 – RXOR** Receiver Overrun Interrupt Disable

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to ’1’. |

| Value | Description |
|---|---|
| 1 | The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to ’1’. |

**Bit 1 – RXRDY** Receiver Ready Interrupt Disable

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is disabled. This bit is cleared when the corresponding bit in I2SC_IDR is written to ’1’. |
| 1 | The corresponding interrupt is enabled. This bit is set when the corresponding bit in I2SC_IER is written to ’1’. |

### 43.8.9 I2SC Receiver Holding Register

**Name:** I2SC_RHR
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RHR[31:24] | | | | | | | |

| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – THR[31:0]** Transmitter Holding Register
Next data word to be transmitted after the current word if TXRDY is not set. If I2SC_MR.DATALENGTH specifies fewer than 32 bits, data is right-justified in the THR field.

# 44. Synchronous Serial Controller (SSC)

## 44.1 Description

The Synchronous Serial Controller (SSC) provides a synchronous communication link with external devices. It supports many serial synchronous communication protocols generally used in audio and telecom applications such as I2S, Short Frame Sync, Long Frame Sync, etc.

The SSC contains an independent receiver and transmitter and a common clock divider. The receiver and the transmitter each interface with three signals: the TD/RD signal for data, the TK/RK signal for the clock and the TF/RF signal for the Frame Sync. The transfers can be programmed to start automatically or on different events detected on the Frame Sync signal.

The SSC high-level of programmability and its use of DMA enable a continuous high bit rate data transfer without processor intervention.

Featuring connection to the DMA, the SSC enables interfacing with low processor overhead to:

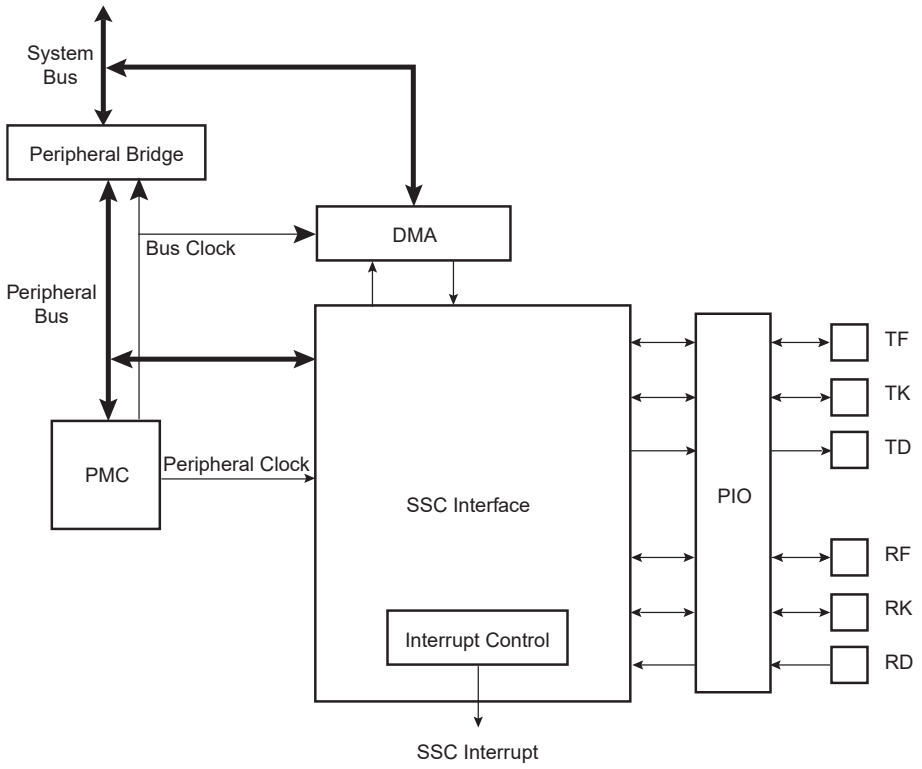
- Codecs in Master or Slave mode
- DAC through dedicated serial interface, particularly I2S
- Magnetic card reader

## 44.2 Embedded Characteristics

- Provides Serial Synchronous Communication Links Used in Audio and Telecom Applications
- Contains an Independent Receiver and Transmitter and a Common Clock Divider
- Interfaced with the DMA Controller (DMAC) to Reduce Processor Overhead
- Offers a Configurable Frame Sync and Data Length
- Receiver and Transmitter Can be Programmed to Start Automatically or on Detection of Different Events on the Frame Sync Signal
- Receiver and Transmitter Include a Data Signal, a Clock Signal and a Frame Sync Signal

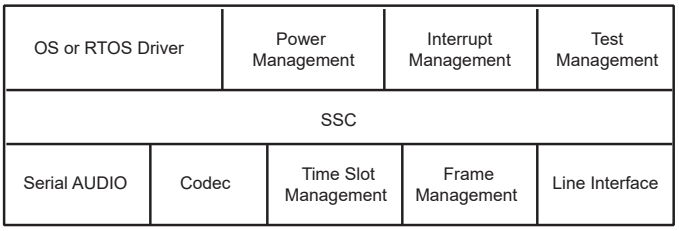
## 44.3 Block Diagram

**Figure 44-1. Block Diagram**



## 44.4 Application Block Diagram

**Figure 44-2. Application Block Diagram**



## 44.5 SSC Application Examples

The SSC can support several serial communication modes used in audio or high speed serial links. Some standard applications are shown in the following figures. All serial link applications supported by the SSC are not listed here.

**Figure 44-3. Audio Application Block Diagram**

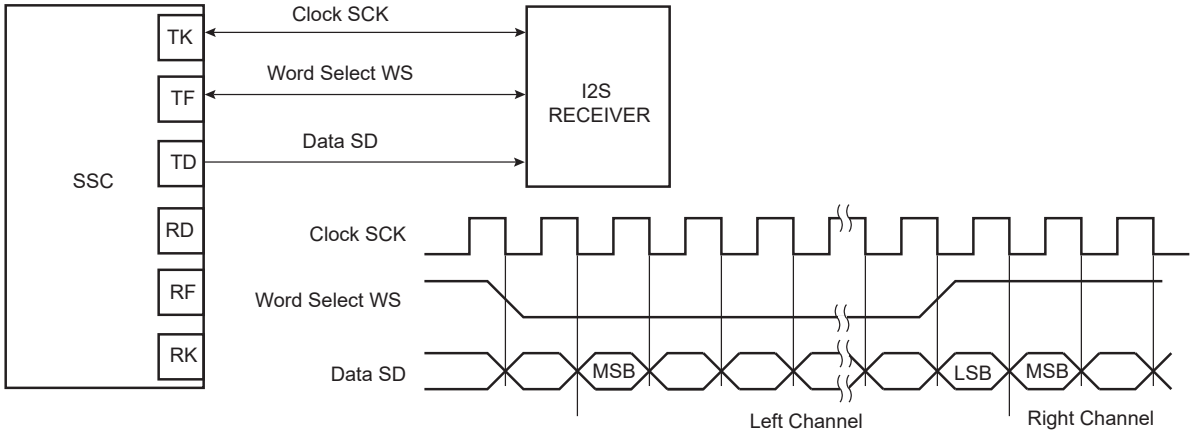


**Figure 44-4. Codec Application Block Diagram**

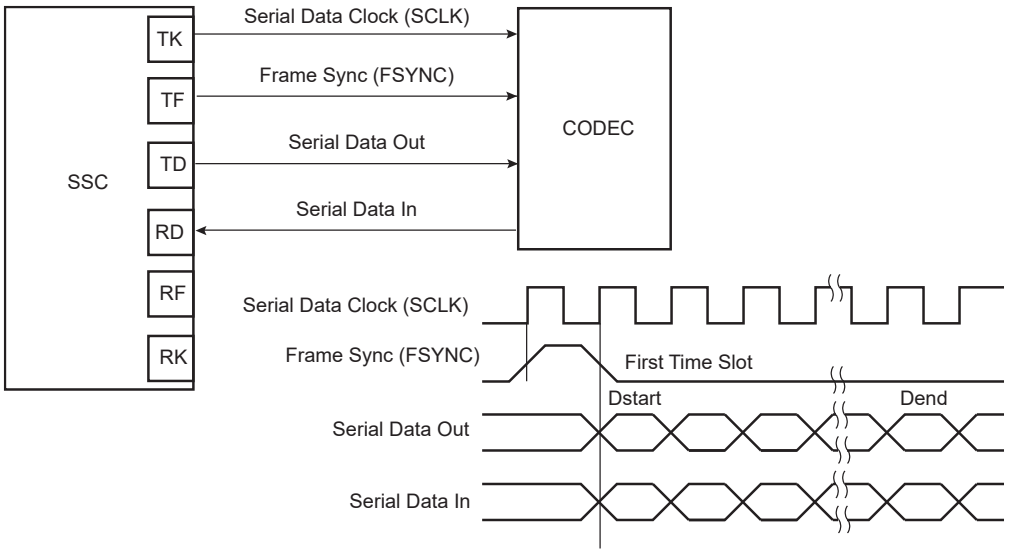

**Figure 44-5. Time Slot Application Block Diagram**

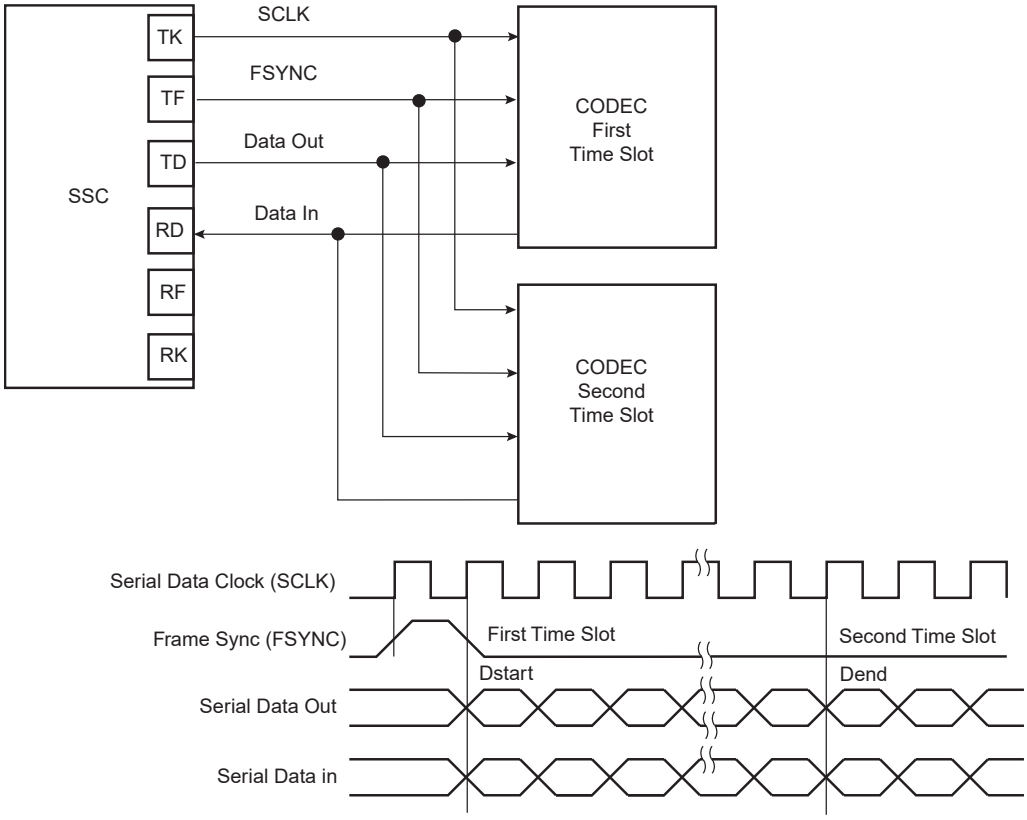


## 44.6 Pin Name List

**Table 44-1. I/O Lines Description**

| Pin Name | Pin Description | Type |
|---|---|---|
| RF | Receive Frame Synchronization | Input/Output |
| RK | Receive Clock | Input/Output |
| RD | Receive Data | Input |
| TF | Transmit Frame Synchronization | Input/Output |
| TK | Transmit Clock | Input/Output |
| TD | Transmit Data | Output |

## 44.7 Product Dependencies

### 44.7.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines.

Before using the SSC receiver, the PIO controller must be configured to dedicate the SSC receiver I/O lines to the SSC Peripheral mode.

Before using the SSC transmitter, the PIO controller must be configured to dedicate the SSC transmitter I/O lines to the SSC Peripheral mode.

### 44.7.2 Power Management

The SSC is not continuously clocked. The SSC interface may be clocked through the Power Management Controller (PMC), therefore the programmer must first configure the PMC to enable the SSC clock.

### 44.7.3 Interrupt

The SSC interface has an interrupt line connected to the interrupt controller. Handling interrupts requires programming the interrupt controller before configuring the SSC.

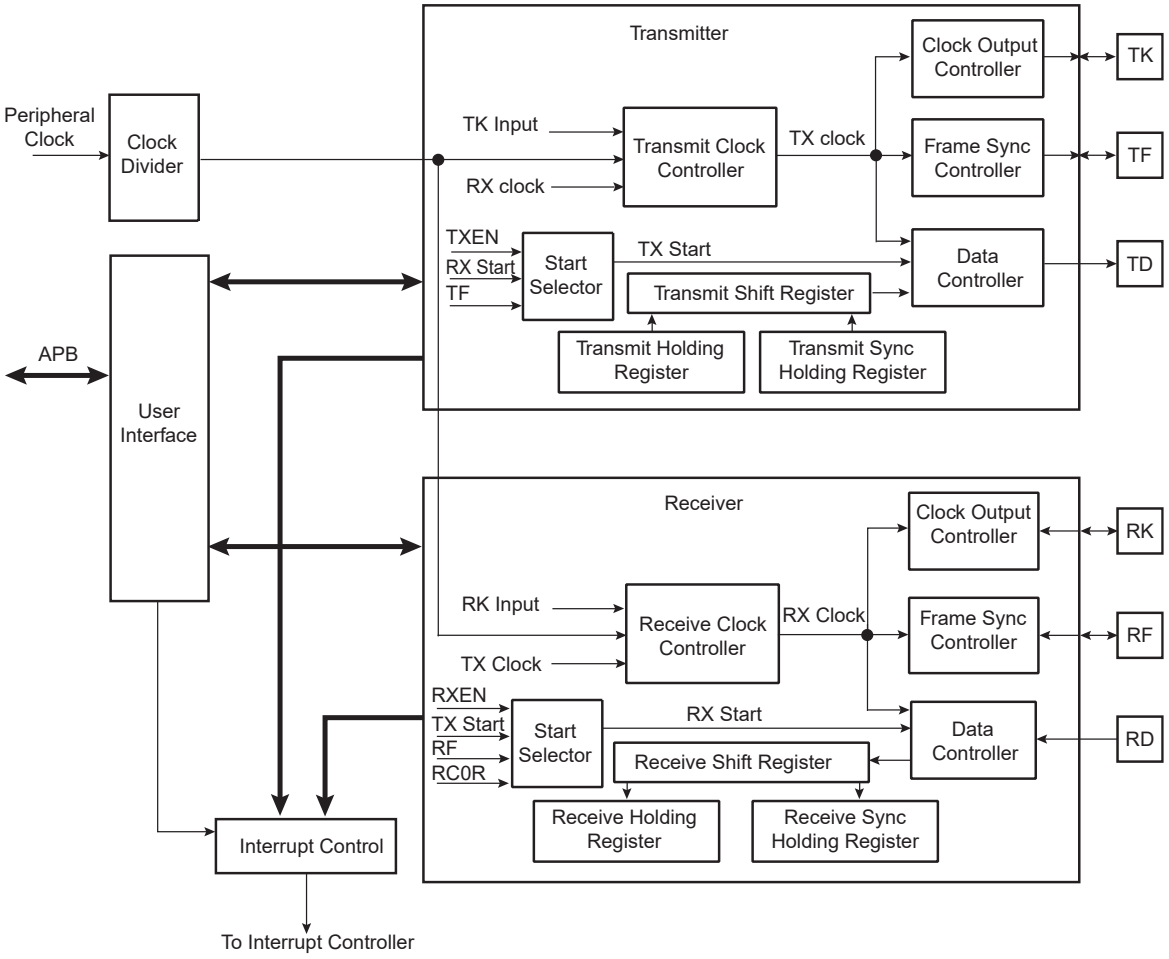
All SSC interrupts can be enabled/disabled configuring the SSC Interrupt Mask Register. Each pending and unmasked SSC interrupt asserts the SSC interrupt line. The SSC interrupt service routine can get the interrupt origin by reading the SSC Interrupt Status Register.

## 44.8 Functional Description

This section contains the functional description of the following: SSC Functional Block, Clock Management, Data Format, Start, Transmit, Receive and Frame Synchronization.

The receiver and transmitter operate separately. However, they can work synchronously by programming the receiver to use the transmit clock and/or to start a data transfer when transmission starts. Alternatively, this can be done by programming the transmitter to use the receive clock and/or to start a data transfer when reception starts. The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Slave mode data transfers. The maximum clock speed allowed on the TK and RK pins is the peripheral clock divided by 2.

**Figure 44-6. SSC Functional Block Diagram**



### 44.8.1 Clock Management

The transmit clock can be generated by:

- an external clock received on the TK I/O pad
- the receive clock
- the internal clock divider

The receive clock can be generated by:

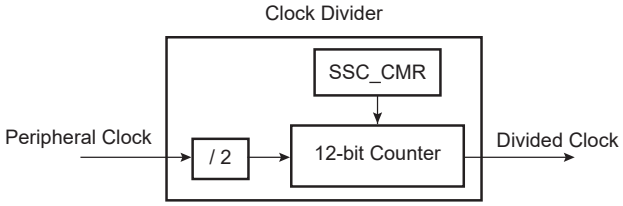
- an external clock received on the RK I/O pad
- the transmit clock
- the internal clock divider

Furthermore, the transmitter block can generate an external clock on the TK I/O pad, and the receive block can generate an external clock on the RK I/O pad.

This allows the SSC to support many Master and Slave mode data transfers.

#### 44.8.1.1 Clock Divider

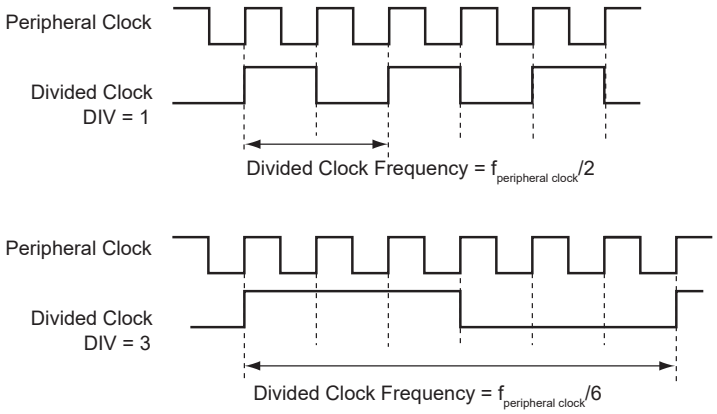
**Figure 44-7. Divided Clock Block Diagram**



The peripheral clock divider is determined by the 12-bit field DIV counter and comparator (so its maximal value is 4095) in the Clock Mode Register (SSC_CMR), allowing a peripheral clock division by up to 8190. The Divided Clock is provided to both the receiver and the transmitter. When this field is programmed to 0, the Clock Divider is not used and remains inactive.

When DIV is set to a value equal to or greater than 1, the Divided Clock has a frequency of peripheral clock divided by 2 times DIV. Each level of the Divided Clock has a duration of the peripheral clock multiplied by DIV. This ensures a 50% duty cycle for the Divided Clock regardless of whether the DIV value is even or odd.

**Figure 44-8. Divided Clock Generation**

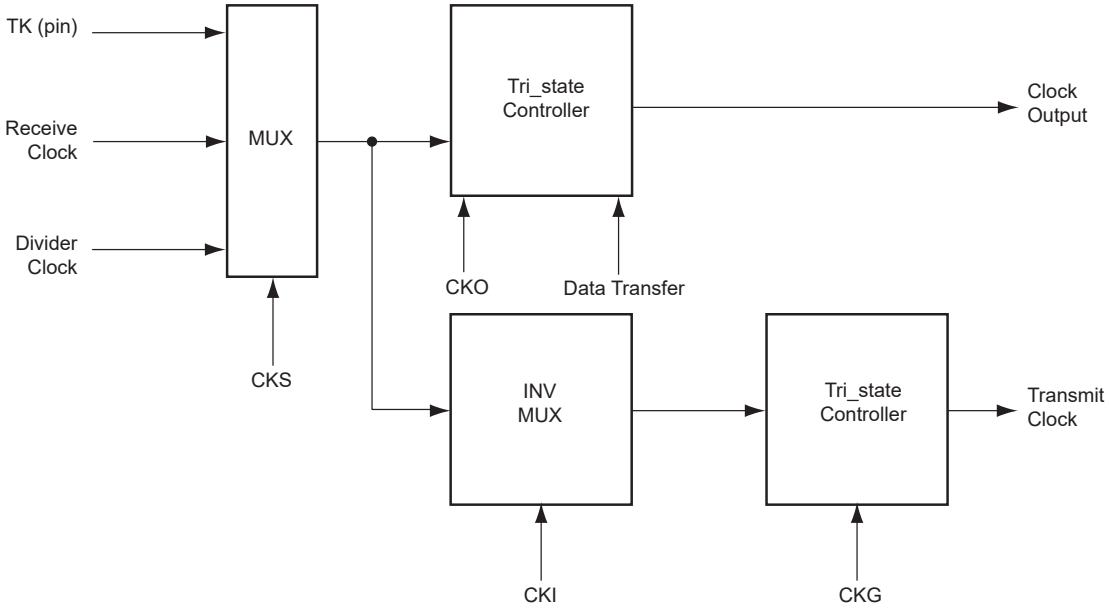


#### 44.8.1.2 Transmit Clock Management

The transmit clock is generated from the receive clock or the divider clock or an external clock scanned on the TK I/O pad. The transmit clock is selected by the CKS field in the Transmit Clock Mode Register (SSC_TCMR). Transmit Clock can be inverted independently by the CKI bits in the SSC_TCMR.

The transmitter can also drive the TK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC_TCMR. The Transmit Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC_TCMR to select TK pin (CKS field) and at the same time Continuous Transmit Clock (CKO field) can lead to unpredictable results.

**Figure 44-9. Transmit Clock Management**

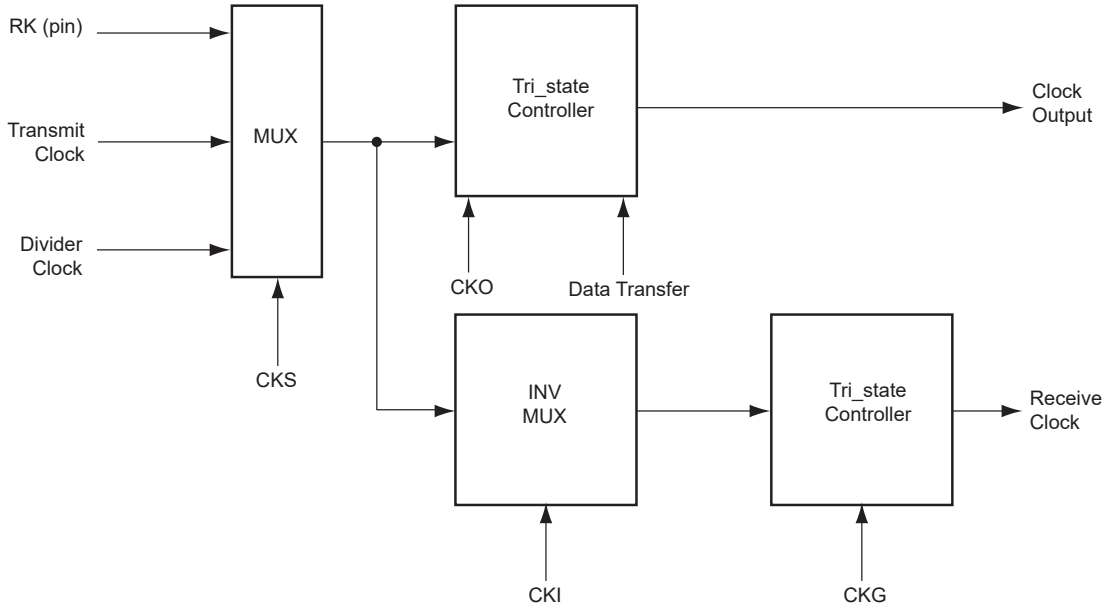


### 44.8.1.3 Receive Clock Management

The receive clock is generated from the transmit clock or the divider clock or an external clock scanned on the RK I/O pad. The Receive Clock is selected by the CKS field in SSC_RCMR (Receive Clock Mode Register). Receive Clocks can be inverted independently by the CKI bits in SSC_RCMR.

The receiver can also drive the RK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC_RCMR. The Receive Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC_RCMR to select RK pin (CKS field) and at the same time Continuous Receive Clock (CKO field) can lead to unpredictable results.

**Figure 44-10. Receive Clock Management**



#### 44.8.1.4 Serial Clock Ratio Considerations

The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Slave mode data transfers. In this case, the maximum clock speed allowed on the RK pin is:

- Peripheral clock divided by 2 if Receive Frame Synchronization is input
- Peripheral clock divided by 3 if Receive Frame Synchronization is output

In addition, the maximum clock speed allowed on the TK pin is:

- Peripheral clock divided by 6 if Transmit Frame Synchronization is input
- Peripheral clock divided by 2 if Transmit Frame Synchronization is output

These are only theoretical speed limits for first order calculations. Exact speed limits on TK and RK are provided in the "Electrical Characteristics" chapter.

### 44.8.2 Transmit Operations

A transmit frame is triggered by a start event and can be followed by synchronization data before data transmission.

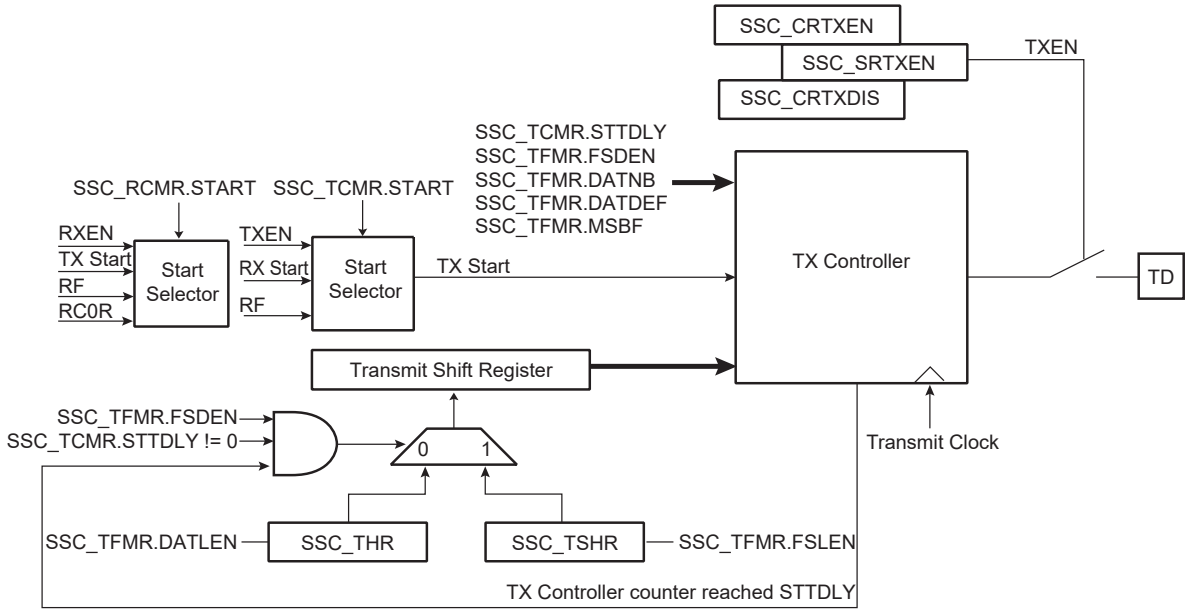
The start event is configured by setting the SSC_TCMR. See Start.

The frame synchronization is configured setting the Transmit Frame Mode Register (SSC_TFMR). See Frame Synchronization.

To transmit data, the transmitter uses a shift register clocked by the transmit clock signal and the start mode selected in the SSC_TCMR. Data is written by the application to the Transmit Holding register (SSC_THR) then transferred to the transmit shift register according to the data format selected.

When both the SSC_THR and the transmit shift register are empty, the status flag TXEMPTY is set in the Status register (SSC_SR). When the Transmit Holding register is transferred in the transmit shift register, the status flag TXRDY is set in the SSC_SR and additional data can be loaded in the Transmit Holding register.

**Figure 44-11. Transmit Block Diagram**



### 44.8.3 Receive Operations

A receive frame is triggered by a start event and can be followed by synchronization data before data transmission.

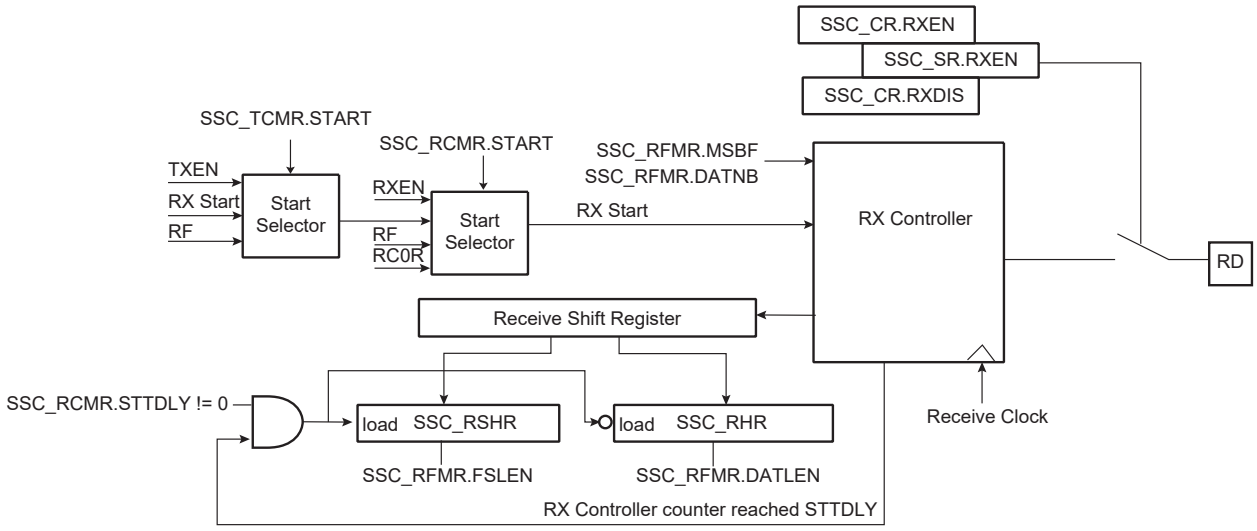
The start event is configured by setting the Receive Clock Mode Register (SSC_RCMR). See Start.

The frame synchronization is configured by setting the Receive Frame Mode Register (SSC_RFMR). See Frame Synchronization.

The receiver uses a shift register clocked by the receive clock signal and the start mode selected in the SSC_RCMR. The data is transferred from the shift register depending on the data format selected.

When the receive shift register is full, the SSC transfers the data into the Receive Holding register (SSC_RHR), the status flag RXRDY is set in the SSC_SR and the data can be read in the Receive Holding register. If another transfer occurs before read of the Receive Holding register, the status flag OVRUN is set in the SSC_SR and the receive shift register is transferred in the SSC_RHR. The old unread data is then lost.

**Figure 44-12. Receive Block Diagram**



### 44.8.4 Start

The transmitter and receiver can both be programmed to start their operations when an event occurs, respectively in the Transmit Start Selection (START) field of SSC_TCMR and in the Receive Start Selection (START) field of SSC_RCMR.

Under the following conditions the start event is independently programmable:

- Continuous. In this case, the transmission starts as soon as a word is written in SSC_THR and the reception starts as soon as the receiver is enabled.
- Synchronously with the transmitter/receiver
- On detection of a falling/rising edge on TF/RF
- On detection of a low level/high level on TF/RF
- On detection of a level change or an edge on TF/RF

A start can be programmed in the same manner on either side of the Transmit/Receive Clock Register (SSC_RCMR/SSC_TCMR). Thus, the start could be on TF (Transmit) or RF (Receive).

Moreover, the receiver can start when data is detected in the bit stream with the Compare Functions.

Detection on TF/RF input/output is done by the field FSOS of the Transmit/Receive Frame Mode Register (SSC_TFMR/SSC_RFMR).

**Figure 44-13. Transmit Start Mode**

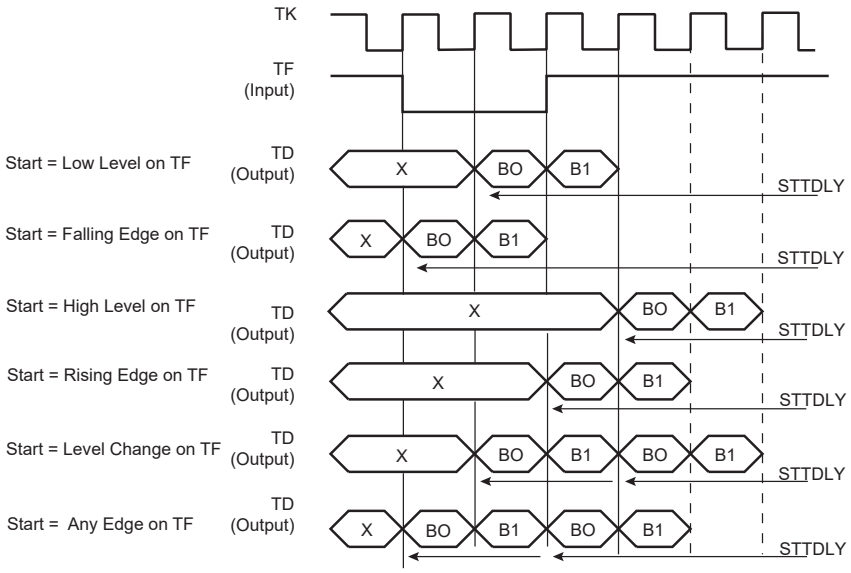


**Figure 44-14. Receive Pulse/Edge Start Modes**

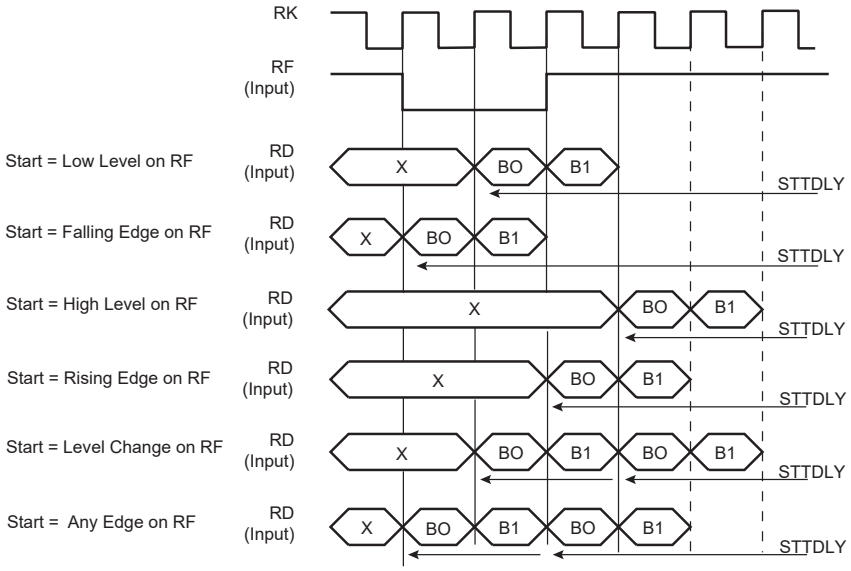


### 44.8.5 Frame Synchronization

The Transmit and Receive Frame Sync pins, TF and RF, can be programmed to generate different kinds of Frame Sync signals. The Frame Sync Output Selection (FSOS) field in the Receive Frame Mode Register (SSC_RFMR) and in the Transmit Frame Mode Register (SSC_TFMR) are used to select the required waveform.

- Programmable low or high levels during data transfer are supported.
- Programmable high levels before the start of data transfers or toggling are also supported.

If a pulse waveform is selected, the Frame Sync Length (FSLEN) field in SSC_RFMR and SSC_TFMR programs the length of the pulse, from 1 bit time up to 256 bit times.

The periodicity of the Receive and Transmit Frame Sync pulse output can be programmed through the Period Divider Selection (PERIOD) field in SSC_RCMR and SSC_TCMR.

#### 44.8.5.1 Frame Sync Data

Frame Sync Data transmits or receives a specific tag during the Frame Sync signal.

During the Frame Sync signal, the receiver can sample the RD line and store the data in the Receive Sync Holding Register and the transmitter can transfer Transmit Sync Holding Register in the shift register. The data length to be sampled/shifted out during the Frame Sync signal is programmed by the FSLEN field in SSC_RFMR/SSC_TFMR and has a maximum value of 256.

Concerning the Receive Frame Sync Data operation, if the Frame Sync Length is equal to or lower than the delay between the start event and the current data reception, the data sampling operation is performed in the Receive Sync Holding Register through the receive shift register.

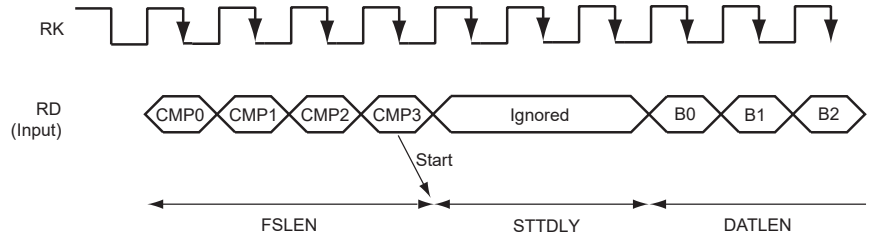
The Transmit Frame Sync Operation is performed by the transmitter only if the bit Frame Sync Data Enable (FSDEN) in SSC_TFMR is set. If the Frame Sync length is equal to or lower than the delay between the start event and the current data transmission, the normal transmission has priority and the data contained in the Transmit Sync Holding Register is transferred in the Transmit Register, then shifted out.

#### 44.8.5.2 Frame Sync Edge Detection

The Frame Sync Edge detection is programmed by the FSEDGE field in SSC_RFMR/SSC_TFMR. This sets the corresponding flags RXSYN/TXSYN in the SSC Status Register (SSC_SR) on Frame Sync Edge detection (signals RF/TF).

### 44.8.6 Receive Compare Modes

**Figure 44-15. Receive Compare Modes**



#### 44.8.6.1 Compare Functions

The length of the comparison patterns (Compare 0, Compare 1) and thus the number of bits they are compared to is defined by FSLEN, but with a maximum value of 256 bits. Comparison is always done by comparing the last bits received with the comparison pattern. Compare 0 can be one start event of the receiver. In this case, the receiver compares at each new sample the last bits received at the Compare 0 pattern contained in the Compare 0 Register (SSC_RC0R). When this start event is selected, the user can program the receiver to start a new data transfer either by writing a new Compare 0, or by receiving continuously until Compare 1 occurs. This selection is done with the STOP bit in the SSC_RCMR.

### 44.8.7 Data Format

The data framing format of both the transmitter and the receiver are programmable through the Transmitter Frame Mode Register (SSC_TFMR) and the Receive Frame Mode Register (SSC_RFMR). In either case, the user can independently select the following parameters:

- Event that starts the data transfer (START)
- Delay in number of bit periods between the start event and the first data bit (STTDLY)

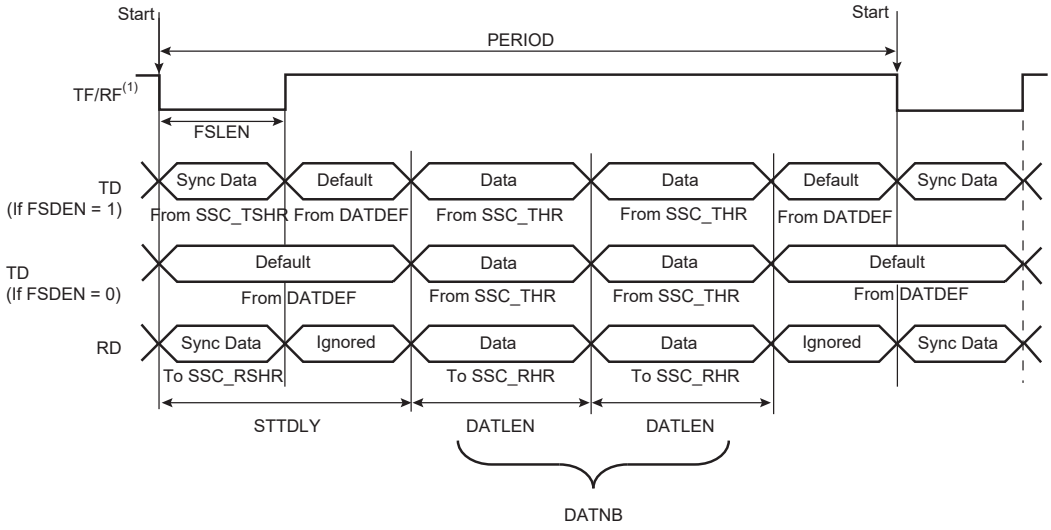
- Length of the data (DATLEN)
- Number of data to be transferred for each start event (DATNB)
- Length of synchronization transferred for each start event (FSLEN)
- Bit sense: most or least significant bit first (MSBF)

Additionally, the transmitter can be used to transfer synchronization and select the level driven on the TD pin while not in data transfer operation. This is done respectively by the Frame Sync Data Enable (FSDEN) and by the Data Default Value (DATDEF) bits in SSC_TFMR.

**Table 44-2. Data Frame Registers**

| Transmitter | Receiver | Field | Length | Comment |
|---|---|---|---|---|
| SSC_TFMR | SSC_RFMR | DATLEN | Up to 32 | Size of word |
| SSC_TFMR | SSC_RFMR | DATNB | Up to 16 | Number of words transmitted in frame |
| SSC_TFMR | SSC_RFMR | MSBF | – | Most significant bit first |
| SSC_TFMR | SSC_RFMR | FSLEN | Up to 256 | Size of Synchro data register |
| SSC_TFMR | – | DATDEF | 0 or 1 | Data default value ended |
| SSC_TFMR | – | FSDEN | – | Enable send SSC_TSHR |
| SSC_TCMR | SSC_RCMR | PERIOD | Up to 512 | Frame size |
| SSC_TCMR | SSC_RCMR | STTDLY | Up to 255 | Size of transmit start delay |

**Figure 44-16. Transmit and Receive Frame Format in Edge/Pulse Start Modes**



Note: 1. Example of input on falling edge of TF/RF.

In the example illustrated above, the SSC_THR is loaded twice. The FSDEN value has no effect on the transmission. SyncData cannot be output in Continuous mode.

**Figure 44-17. Transmit Frame Format in Continuous Mode (STTDLY = 0)**

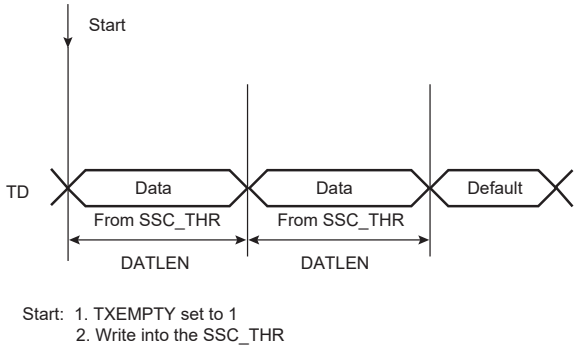


**Figure 44-18. Receive Frame Format in Continuous Mode (STTDLY = 0)**

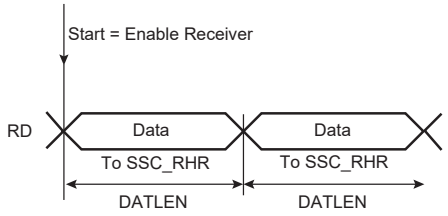


### 44.8.8 Loop Mode

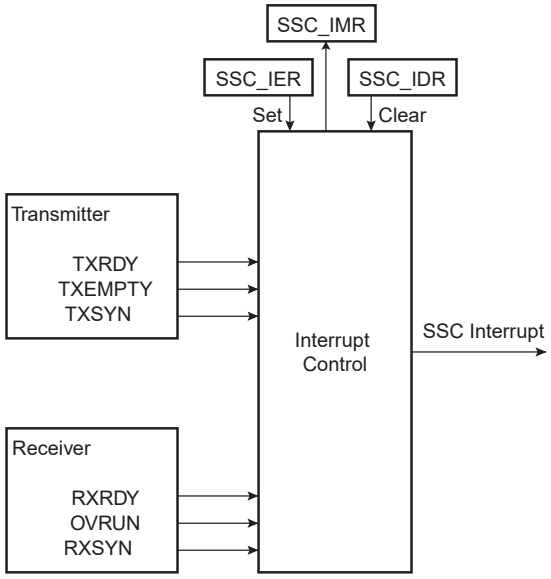
The receiver can be programmed to receive transmissions from the transmitter. This is done by setting the Loop Mode (LOOP) bit in the SSC_RFMR. In this case, RD is connected to TD, RF is connected to TF and RK is connected to TK.

### 44.8.9 Interrupt

Most bits in the SSC_SR have a corresponding bit in interrupt management registers.

The SSC can be programmed to generate an interrupt when it detects an event. The interrupt is controlled by writing the Interrupt Enable Register (SSC_IER) and Interrupt Disable Register (SSC_IDR). These registers enable and disable, respectively, the corresponding interrupt by setting and clearing the corresponding bit in the Interrupt Mask Register (SSC_IMR), which controls the generation of interrupts by asserting the SSC interrupt line connected to the interrupt controller.

**Figure 44-19. Interrupt Block Diagram**



### 44.8.10 Register Write Protection

To prevent any single software error from corrupting SSC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the SSC Write Protection Mode Register (SSC_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the SSC Write Protection Status Register (SSC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SSC_WPSR.

The following registers can be write-protected:

- SSC Clock Mode Register
- SSC Receive Clock Mode Register
- SSC Receive Frame Mode Register
- SSC Transmit Clock Mode Register
- SSC Transmit Frame Mode Register
- SSC Receive Compare 0 Register
- SSC Receive Compare 1 Register

## 44.9 Register Summary

**Note:** Offsets 0x100–0x128 are reserved for PDC registers.

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SSC_CR | 7:0 | | | | | | | RXDIS | RXEN |

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Performs a software reset. Has priority on any other bit in SSC_CR. |

**Bit 9 – TXDIS** Transmit Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables Transmit. If a character is currently being transmitted, disables at end of current character transmission. |

**Bit 8 – TXEN** Transmit Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables Transmit if TXDIS is not set. |

**Bit 1 – RXDIS** Receive Disable

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Disables Receive. If a character is currently being received, disables at end of current character reception. |

**Bit 0 – RXEN** Receive Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables Receive if RXDIS is not set. |

### 44.9.2 SSC Clock Mode Register

**Name:** SSC_CMR
**Offset:** 0x4
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | DIV[11:8] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DIV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 11:0 – DIV[11:0]** Clock Divider

| Value | Description |
|---|---|
| 0 | The Clock Divider is not active. |
| Any other value | The divided clock equals the peripheral clock divided by 2 times DIV.<br>The maximum bit rate is $f_{peripheral\ clock}/2$. The minimum bit rate is $f_{peripheral\ clock}/2 \times 4095 = f_{peripheral\ clock}/8190$. |

### 44.9.3 SSC Receive Clock Mode Register

**Name:** SSC_RCMR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PERIOD[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | STTDLY[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | STOP | START[3:0] | | | |
| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CKG[1:0] | | CKI | CKO[2:0] | | | CKS[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – PERIOD[7:0]** Receive Period Divider Selection
This field selects the divider to apply to the selected Receive Clock in order to generate a new Frame Sync signal. If 0, no PERIOD signal is generated. If not 0, a PERIOD signal is generated each 2 x (PERIOD + 1) Receive Clock.

**Bits 23:16 – STTDLY[7:0]** Receive Start Delay
If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of reception. When the receiver is programmed to start synchronously with the transmitter, the delay is also applied.

**Note:**
STTDLY must be configured in relation to the receive synchronization data to be stored in SSC_RSHR.

**Bit 12 – STOP** Receive Stop Selection

| Value | Description |
|---|---|
| 0 | After completion of a data transfer when starting with a Compare 0, the receiver stops the data transfer and waits for a new compare 0. |
| 1 | After starting a receive with a Compare 0, the receiver operates in a continuous mode until a Compare 1 is detected. |

**Bits 11:8 – START[3:0]** Receive Start Selection

| Value | Name | Description |
|---|---|---|
| 0 | CONTINUOUS | Continuous, as soon as the receiver is enabled, and immediately after the end of transfer of the previous data. |
| 1 | TRANSMIT | Transmit start |
| 2 | RF_LOW | Detection of a low level on RF signal |
| 3 | RF_HIGH | Detection of a high level on RF signal |
| 4 | RF_FALLING | Detection of a falling edge on RF signal |
| 5 | RF_RISING | Detection of a rising edge on RF signal |
| 6 | RF_LEVEL | Detection of any level change on RF signal |
| 7 | RF_EDGE | Detection of any edge on RF signal |
| 8 | CMP_0 | Compare 0 |

**Bits 7:6 – CKG[1:0]** Receive Clock Gating Selection

| Value | Name | Description |
|---|---|---|
| 0 | CONTINUOUS | None |
| 1 | EN_RF_LOW | Receive Clock enabled only if RF Low |
| 2 | EN_RF_HIGH | Receive Clock enabled only if RF High |

**Bit 5 – CKI** Receive Clock Inversion
CKI affects only the Receive Clock and not the output clock signal.

| Value | Description |
|---|---|
| 0 | The data inputs (Data and Frame Sync signals) are sampled on Receive Clock falling edge. The Frame Sync signal output is shifted out on Receive Clock rising edge. |
| 1 | The data inputs (Data and Frame Sync signals) are sampled on Receive Clock rising edge. The Frame Sync signal output is shifted out on Receive Clock falling edge. |

**Bits 4:2 – CKO[2:0]** Receive Clock Output Mode Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None, RK pin is an input |
| 1 | CONTINUOUS | Continuous Receive Clock, RK pin is an output |
| 2 | TRANSFER | Receive Clock only during data transfers, RK pin is an output |

**Bits 1:0 – CKS[1:0]** Receive Clock Selection

| Value | Name | Description |
|---|---|---|
| 0 | MCK | Divided Clock |
| 1 | TK | TK Clock signal |
| 2 | RK | RK pin |

### 44.9.4 SSC Receive Frame Mode Register

**Name:** SSC_RFMR
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FSLEN_EXT[3:0] | | | | | | | FSEDGE |
| Access | R/W | R/W | R/W | R/W | | | | R/W |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | FSOS[2:0] | | | FSLEN[3:0] | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | DATNB[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | MSBF | | LOOP | DATLEN[4:0] | | | | |
| Access | R/W | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:28 – FSLEN_EXT[3:0]** FSLEN Field Extension
Extends FSLEN field. For details, see FSLEN: Receive Frame Sync Length.

**Bit 24 – FSEDGE** Frame Sync Edge Detection
Determines which edge on Frame Sync will generate the interrupt RXSYN in the SSC Status Register.

| Value | Name | Description |
|---|---|---|
| 0 | POSITIVE | Positive Edge Detection |
| 1 | NEGATIVE | Negative Edge Detection |

**Bits 22:20 – FSOS[2:0]** Receive Frame Sync Output Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None, RF pin is an input |
| 1 | NEGATIVE | Negative Pulse, RF pin is an output |
| 2 | POSITIVE | Positive Pulse, RF pin is an output |
| 3 | LOW | Driven Low during data transfer, RF pin is an output |
| 4 | HIGH | Driven High during data transfer, RF pin is an output |
| 5 | TOGGLING | Toggling at each start of data transfer, RF pin is an output |

**Bits 19:16 – FSLEN[3:0]** Receive Frame Sync Length
This field defines the number of bits sampled and stored in the Receive Sync Data Register. When this mode is selected by the START field in the Receive Clock Mode Register, it also determines the length of the sampled data to be compared to the Compare 0 or Compare 1 register.

This field is used with FSLEN_EXT to determine the pulse length of the Receive Frame Sync signal.

Pulse length is equal to FSLEN + (FSLEN_EXT × 16) + 1 Receive Clock periods.

**Bits 11:8 – DATNB[3:0]** Data Number per Frame
This field defines the number of data words to be received after each transfer start, which is equal to (DATNB + 1).

**Bit 7 – MSBF** Most Significant Bit First

| Value | Description |
|---|---|
| 0 | The lowest significant bit of the data register is sampled first in the bit stream. |
| 1 | The most significant bit of the data register is sampled first in the bit stream. |

**Bit 5 – LOOP** Loop Mode

| Value | Description |
|---|---|
| 0 | Normal operating mode. |
| 1 | RD is driven by TD, RF is driven by TF and TK drives RK. |

**Bits 4:0 – DATLEN[4:0]** Data Length

| Value | Description |
|---|---|
| 0 | Forbidden value (1-bit data length not supported). |
| Any other value | The bit stream contains DATLEN + 1 data bits. |

### 44.9.5 SSC Transmit Clock Mode Register

**Name:** SSC_TCMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PERIOD[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | STTDLY[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | START[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CKG[1:0] | | CKI | CKO[2:0] | | | CKS[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – PERIOD[7:0]** Transmit Period Divider Selection
This field selects the divider to apply to the selected Transmit Clock to generate a new Frame Sync signal. If 0, no period signal is generated. If not 0, a period signal is generated at each 2 × (PERIOD + 1) Transmit Clock.

**Bits 23:16 – STTDLY[7:0]** Transmit Start Delay
If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of transmission of data. When the transmitter is programmed to start synchronously with the receiver, the delay is also applied.

**Note:**
If STTDLY is too short with respect to transmit synchronization data (SSC_TSHR), SSC_THR.TDAT is transmitted instead of the end of SSC_TSHR.

**Bits 11:8 – START[3:0]** Transmit Start Selection

| Value | Name | Description |
|---|---|---|
| 0 | CONTINUOUS | Continuous, as soon as a word is written in the SSC_THR (if Transmit is enabled), and immediately after the end of transfer of the previous data |
| 1 | RECEIVE | Receive start |
| 2 | TF_LOW | Detection of a low level on TF signal |

| Value | Name | Description |
|---|---|---|
| 3 | TF_HIGH | Detection of a high level on TF signal |
| 4 | TF_FALLING | Detection of a falling edge on TF signal |
| 5 | TF_RISING | Detection of a rising edge on TF signal |
| 6 | TF_LEVEL | Detection of any level change on TF signal |
| 7 | TF_EDGE | Detection of any edge on TF signal |

**Bits 7:6 – CKG[1:0]** Transmit Clock Gating Selection

| Value | Name | Description |
|---|---|---|
| 0 | CONTINUOUS | None |
| 1 | EN_TF_LOW | Transmit Clock enabled only if TF Low |
| 2 | EN_TF_HIGH | Transmit Clock enabled only if TF High |

**Bit 5 – CKI** Transmit Clock Inversion
CKI affects only the Transmit Clock and not the Output Clock signal.

| Value | Description |
|---|---|
| 0 | The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock falling edge. The Frame Sync signal input is sampled on Transmit Clock rising edge. |
| 1 | The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock rising edge. The Frame Sync signal input is sampled on Transmit Clock falling edge. |

**Bits 4:2 – CKO[2:0]** Transmit Clock Output Mode Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None, TK pin is an input |
| 1 | CONTINUOUS | Continuous Transmit Clock, TK pin is an output |
| 2 | TRANSFER | Transmit Clock only during data transfers, TK pin is an output |

**Bits 1:0 – CKS[1:0]** Transmit Clock Selection

| Value | Name | Description |
|---|---|---|
| 0 | MCK | Divided Clock |
| 1 | RK | RK Clock signal |
| 2 | TK | TK pin |

### 44.9.6 SSC Transmit Frame Mode Register

**Name:** SSC_TFMR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FSLEN_EXT[3:0] | | | | | | | FSEDGE |
| Access | R/W | R/W | R/W | R/W | | | | R/W |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | FSDEN | FSOS[2:0] | | | FSLEN[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | DATNB[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | MSBF | | DATDEF | DATLEN[4:0] | | | | |
| Access | R/W | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:28 – FSLEN_EXT[3:0]** FSLEN Field Extension
Extends FSLEN field. For details, seee FSLEN bit description below.

**Bit 24 – FSEDGE** Frame Sync Edge Detection
Determines which edge on frame synchronization will generate the interrupt TXSYN (Status Register).

| Value | Name | Description |
|---|---|---|
| 0 | POSITIVE | Positive Edge Detection |
| 1 | NEGATIVE | Negative Edge Detection |

**Bit 23 – FSDEN** Frame Sync Data Enable

| Value | Description |
|---|---|
| 0 | The TD line is driven with the default value during the Transmit Frame Sync signal. |
| 1 | SSC_TSHR value is shifted out during the transmission of the Transmit Frame Sync signal. |

**Bits 22:20 – FSOS[2:0]** Transmit Frame Sync Output Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None, TF pin is an input |
| 1 | NEGATIVE | Negative Pulse, TF pin is an output |

| Value | Name | Description |
|---|---|---|
| 2 | POSITIVE | Positive Pulse, TF pin is an output |
| 3 | LOW | Driven Low during data transfer |
| 4 | HIGH | Driven High during data transfer |
| 5 | TOGGLING | Toggling at each start of data transfer |

**Bits 19:16 – FSLEN[3:0]** Transmit Frame Sync Length
This field defines the length of the Transmit Frame Sync signal and the number of bits shifted out from SSC_TSHR if FSDEN is 1.

This field is used with FSLEN_EXT to determine the pulse length of the Transmit Frame Sync signal.

Pulse length is equal to FSLEN + (FSLEN_EXT × 16) + 1 Transmit Clock period.

**Bits 11:8 – DATNB[3:0]** Data Number per Frame
This field defines the number of data words to be transferred after each transfer start, which is equal to (DATNB + 1).

**Bit 7 – MSBF** Most Significant Bit First

| Value | Description |
|---|---|
| 0 | The lowest significant bit of the data register is shifted out first in the bit stream. |
| 1 | The most significant bit of the data register is shifted out first in the bit stream. |

**Bit 5 – DATDEF** Data Default Value
This bit defines the level driven on the TD pin while out of transmission. Note that if the pin is defined as multi-drive by the PIO Controller, the pin is enabled only if the SCC TD output is 1.

**Bits 4:0 – DATLEN[4:0]** Data Length

| Value | Description |
|---|---|
| 0 | Forbidden value (1-bit data length not supported). |
| Any other value | The bit stream contains DATLEN + 1 data bits. |

### 44.9.7 SSC Receive Holding Register

**Name:** SSC_RHR
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RDAT[31:24] | | | | | | | |

**Bit 17 – RXEN** Receive Enable

| Value | Description |
|---|---|
| 0 | Receive is disabled. |
| 1 | Receive is enabled. |

**Bit 16 – TXEN** Transmit Enable

| Value | Description |
|---|---|
| 0 | Transmit is disabled. |
| 1 | Transmit is enabled. |

**Bit 11 – RXSYN** Receive Sync

| Value | Description |
|---|---|
| 0 | An Rx Sync has not occurred since the last read of the Status Register. |
| 1 | An Rx Sync has occurred since the last read of the Status Register. |

**Bit 10 – TXSYN** Transmit Sync

| Value | Description |
|---|---|
| 0 | A Tx Sync has not occurred since the last read of the Status Register. |
| 1 | A Tx Sync has occurred since the last read of the Status Register. |

**Bit 9 – CP1** Compare 1

| Value | Description |
|---|---|
| 0 | A compare 1 has not occurred since the last read of the Status Register. |
| 1 | A compare 1 has occurred since the last read of the Status Register. |

**Bit 8 – CP0** Compare 0

| Value | Description |
|---|---|
| 0 | A compare 0 has not occurred since the last read of the Status Register. |
| 1 | A compare 0 has occurred since the last read of the Status Register. |

**Bit 5 – OVRUN** Receive Overrun

| Value | Description |
|---|---|
| 0 | No data has been loaded in SSC_RHR while previous data has not been read since the last read of the Status Register. |
| 1 | Data has been loaded in SSC_RHR while previous data has not yet been read since the last read of the Status Register. |

**Bit 4 – RXRDY** Receive Ready

| Value | Description |
|---|---|
| 0 | SSC_RHR is empty. |
| 1 | Data has been received and loaded in SSC_RHR. |

**Bit 1 – TXEMPTY** Transmit Empty

| Value | Description |
|---|---|
| 0 | Data remains in SSC_THR or is currently transmitted from TSR. |
| 1 | Last data written in SSC_THR has been loaded in TSR and last data loaded in TSR has been transmitted. |

**Bit 0 – TXRDY** Transmit Ready

| Value | Description |
|---|---|
| 0 | Data has been loaded in SSC_THR and is waiting to be loaded in the transmit shift register (TSR). |
| 1 | SSC_THR is empty. |

**Bit 11 – RXSYN** Rx Sync Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Rx Sync Interrupt is disabled. |
| 1 | The Rx Sync Interrupt is enabled. |

**Bit 10 – TXSYN** Tx Sync Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Tx Sync Interrupt is disabled. |
| 1 | The Tx Sync Interrupt is enabled. |

**Bit 9 – CP1** Compare 1 Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Compare 1 Interrupt is disabled. |
| 1 | The Compare 1 Interrupt is enabled. |

**Bit 8 – CP0** Compare 0 Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Compare 0 Interrupt is disabled. |
| 1 | The Compare 0 Interrupt is enabled. |

**Bit 5 – OVRUN** Receive Overrun Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Receive Overrun Interrupt is disabled. |
| 1 | The Receive Overrun Interrupt is enabled. |

**Bit 4 – RXRDY** Receive Ready Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Receive Ready Interrupt is disabled. |
| 1 | The Receive Ready Interrupt is enabled. |

**Bit 1 – TXEMPTY** Transmit Empty Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Transmit Empty Interrupt is disabled. |
| 1 | The Transmit Empty Interrupt is enabled. |

**Bit 0 – TXRDY** Transmit Ready Interrupt Mask

| Value | Description |
|---|---|
| 0 | The Transmit Ready Interrupt is disabled. |
| 1 | The Transmit Ready Interrupt is enabled. |

### 44.9.17 SSC Write Protection Mode Register

| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x535343 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See Register Write Protection for the list of registers that can be protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x535343 (“SSC” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x535343 (“SSC” in ASCII). |

### 44.9.18 SSC Write Protection Status Register

**Name:** SSC_WPSR
**Offset:** 0xE8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protect Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of the SSC_WPSR. |
| 1 | A write protection violation has occurred since the last read of the SSC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 45. Two-wire Interface (TWIHS)

## 45.1 Description

The Two-wire Interface (TWIHS) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 kbit/s in Fast mode and up to 3.4 Mbit/s in High-speed slave mode only, based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and I²C-compatible devices, such as a Real-Time Clock (RTC), Dot Matrix/Graphic LCD Controller and temperature sensor. The TWIHS is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The table below lists the compatibility level of the Two-wire Interface in Master mode and a full $I^2C$ compatible device.

**Table 45-1. TWI Compatibility with $I^2C$ Standard**

| $I^2C$ Standard | TWI |
|---|---|
| Standard Mode Speed (100 kHz) | Supported |
| Fast Mode Speed (400 kHz) | Supported |
| High-speed Mode (Slave only, 3.4 MHz) | Supported |
| 7- or 10-bit(1) Slave Addressing | Supported |
| START Byte(2) | Not Supported |
| Repeated Start (Sr) Condition | Supported |
| ACK and NACK Management | Supported |
| Input Filtering | Supported |
| Slope Control | Not Supported |
| Clock Stretching | Supported |
| Multi Master Capability | Supported |

**Note:**

1. 10-bit support in Master mode only.
2. START + 00000001 + Ack + Sr

## 45.2 Embedded Characteristics

- 2 TWIHSs
- 16-byte Transmit and Receive FIFOs
- Compatible with Two-wire Interface Serial Memory and I²C Compatible Devices(1)
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations

- Master and Multimaster Operation (Standard and Fast Modes Only)
- Slave Mode Operation (Standard, Fast and High-Speed Modes)
- Bit Rate: Up to 400 Kbit/s in Fast Mode and 3.4 Mbit/s in High-Speed Mode (Slave Mode Only)
- General Call Supported in Slave Mode
- SleepWalking (Asynchronous and Partial Wakeup)
- SMBus Support
- Connection to DMA Controller (DMA) Channel Capabilities Optimizes Data Transfers
- Register Write Protection

**Note:**
See TWI Compatibility with I2C Standard for details on compatibility with I²C Standard.

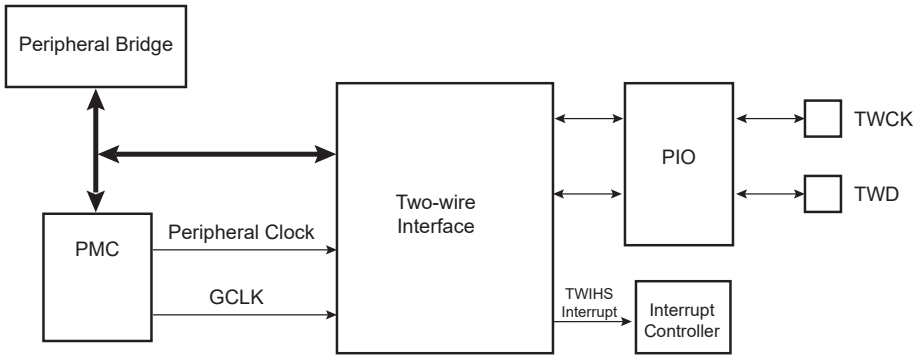
## 45.3 List of Abbreviations

**Table 45-2. Abbreviations**

| Abbreviation | Description |
|---|---|
| TWI | Two-wire Interface |
| A | Acknowledge |
| NA | Non Acknowledge |
| P | Stop |
| S | Start |
| Sr | Repeated Start |
| SADR | Slave Address |
| ADR | Any address except SADR |
| R | Read |
| W | Write |

## 45.4 Block Diagram

**Figure 45-1. Block Diagram**



### 45.4.1 I/O Lines Description

**Table 45-3. I/O Lines Description**

| Pin Name | Pin Description | Type |
|---|---|---|
| TWD | Two-wire Serial Data | Input/Output |
| TWCK | Two-wire Serial Clock | Input/Output |

## 45.5 Product Dependencies

### 45.5.1 I/O Lines

Both TWD and TWCK are bidirectional lines, connected to a positive supply voltage via a current source or pullup resistor. When the bus is free, both lines are high. The output stages of devices connected to the bus must have an open-drain or open-collector to perform the wired-AND function.

TWD and TWCK pins may be multiplexed with PIO lines. To enable the TWIHS, the user must program the PIO Controller to dedicate TWD and TWCK as peripheral lines. When High-speed Slave mode is enabled, the analog pad filter must be enabled.

The user must not program TWD and TWCK as open-drain. This is already done by the hardware.

### 45.5.2 Power Management

Enable the peripheral clock.

The TWIHS may be clocked through the Power Management Controller (PMC), thus the user must first configure the PMC to enable the TWIHS clock.

### 45.5.3 Interrupt Sources

The TWIHS has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TWIHS.

## 45.6 Functional Description

### 45.6.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data is transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited, shown in Transfer Format.

Each transfer begins with a START condition and terminates with a STOP condition, as shown in START and STOP Conditions.

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines the STOP condition.

**Figure 45-2. START and STOP Conditions**

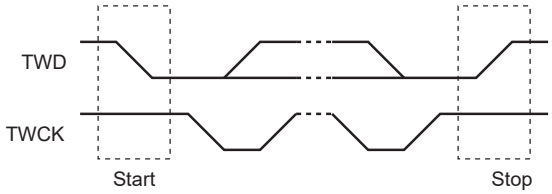


**Figure 45-3. Transfer Format**

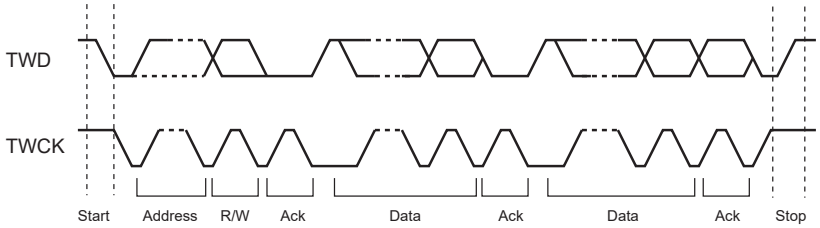

### 45.6.2 Modes of Operation

The TWIHS has different modes of operation:

- Master Transmitter mode (Standard and Fast modes only)
- Master Receiver mode (Standard and Fast modes only)
- Multimaster Transmitter mode (Standard and Fast modes only)
- Multimaster Receiver mode (Standard and Fast modes only)
- Slave Transmitter mode (Standard, Fast and High-speed modes)
- Slave Receiver mode (Standard, Fast and High-speed modes)

These modes are described in the following sections.

### 45.6.3 Master Mode

#### 45.6.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it. This operating mode is not available if High-speed mode is selected.

#### 45.6.3.2 Programming Master Mode

The following registers must be programmed before entering Master mode:

1. TWIHS_MMR.DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
2. TWIHS_CWGR.CKDIV + CHDIV + CLDIV: Clock Waveform register
3. TWIHS_CR.SVDIS: Disables the Slave mode
4. TWIHS_CR.MSEN: Enables the Master mode

**Note:** If the TWIHS is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

#### 45.6.3.3 Transfer Rate Clock Source

The TWIHS speed is defined in the TWIHS_CWGR. The TWIHS baud rate can be based either on the peripheral clock if the CKSRC bit value is ‘0’ or on a GCLK clock if the CKSRC bit value is ‘1’.

If CKSRC = 1, the baud rate is independent of the system/core clock (MCK) and thus the MCK frequency can be changed without affecting the TWIHS transfer rate.

The GCLK frequency must always be three times lower than the peripheral clock frequency.

#### 45.6.3.4 Master Transmitter Mode

This operating mode is not available if High-speed mode is selected.

After the master initiates a START condition when writing into the Transmit Holding register (TWIHS_THR), it sends a 7-bit slave address, configured in the Master Mode register (DADR in TWIHS_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction, 0 in this case (MREAD = 0 in TWIHS_MMR).

The TWIHS transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWIHS Status Register (TWIHS_SR) of the master and a STOP condition is sent. The NACK flag must be cleared by reading TWIHS_SR before the next write into TWIHS_THR. As with the other status bits, an interrupt can be generated if enabled in the Interrupt Enable register (TWIHS_IER). If the slave acknowledges the byte, the data written in the TWIHS_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in the TWIHS_THR.

TXRDY is used as Transmit Ready for the DMA transmit channel.

While no new data is written in the TWIHS_THR, the serial clock line is tied low. When new data is written in the TWIHS_THR, the SCL is released and the data is sent. Setting the STOP bit in TWIHS_CR generates a STOP condition.

After a master write transfer, the serial clock line is stretched (tied low) as long as no new data is written in the TWIHS_THR or until a STOP command is performed.

To clear the TXRDY flag, first set the bit TWIHS_CR.MSDIS, then set the bit TWIHS_CR.MSEN.

See the figures below.

**Figure 45-4. Master Write with One Data Byte**

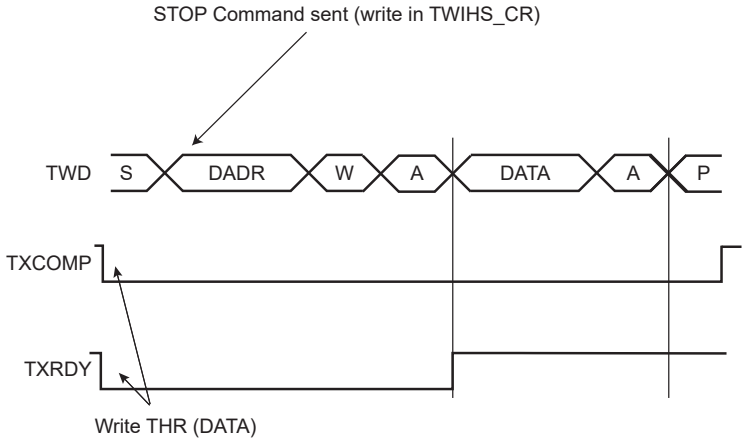

**Figure 45-5. Master Write with Multiple Data Bytes**

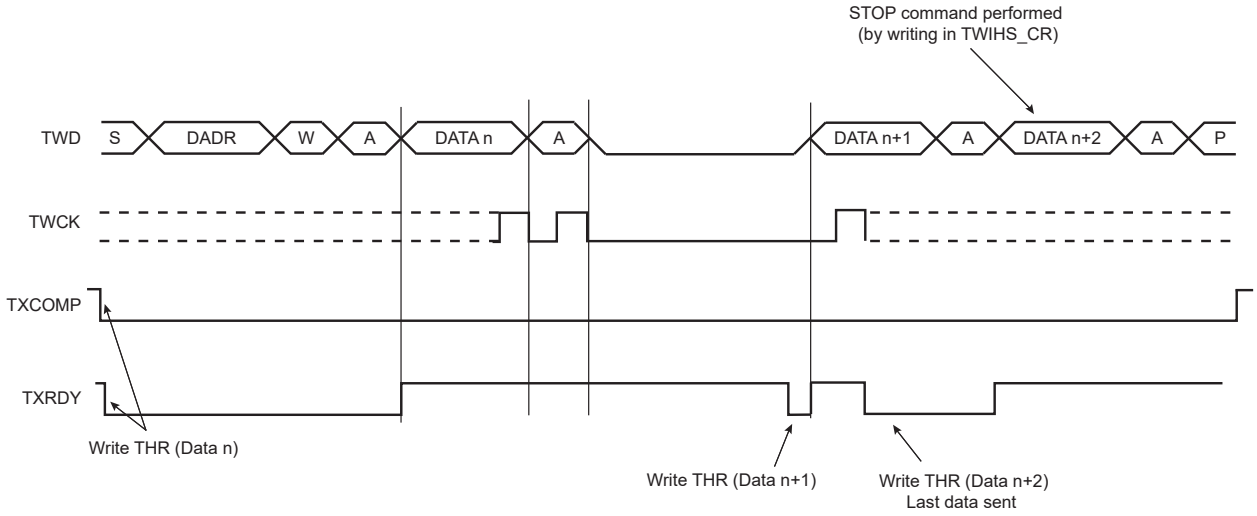

**Figure 45-6. Master Write with One-Byte Internal Address and Multiple Data Bytes**

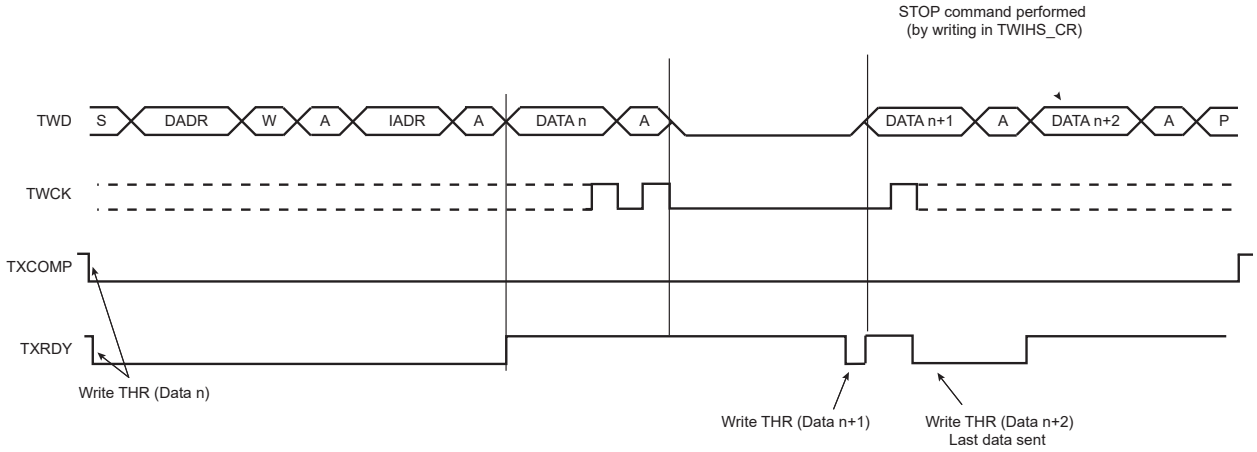

### 45.6.3.5 Master Receiver Mode

Master Receiver mode is not available if High-speed mode is selected.

The read sequence begins by setting the START bit. After the START condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction, 1 in this case (MREAD = 1 in TWIHS_MMR). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets TWIHS_SR.NACK if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data (see Master Read with One Data Byte). When TWIHS_SR.RXRDY is set, a character has been received in the Receive Holding register (TWIHS_RHR). The RXRDY bit is reset when reading the TWIHS_RHR.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See Master Read with One Data Byte. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-

to-last data received (same condition applies for START bit to generate a REPEATED START). See Master Read with Multiple Data Bytes. For internal address usage, see Internal Address.

If TWIHS_RHR is full (RXRDY high) and the master is receiving data, the serial clock line is tied low before receiving the last bit of the data and until the TWIHS_RHR is read. Once the TWIHS_RHR is read, the master stops stretching the serial clock line and ends the data reception. See Master Read Clock Stretching with Multiple Data Bytes.

**WARNING** When receiving multiple bytes in Master Read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access is not completed until TWIHS_RHR is read. The last access stops on the next-to-last bit (clock stretching). When the TWIHS_RHR is read, there is only half a bit period to send the STOP (or START) command, else another read access might occur (spurious access).

A possible workaround is to set the STOP (or START) bit before reading the TWIHS_RHR on the next-to-last access (within IT handler).

**Figure 45-7. Master Read with One Data Byte**

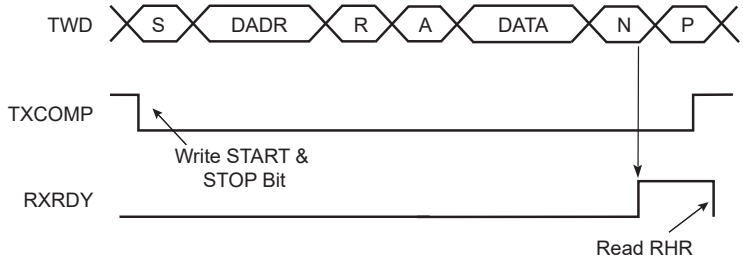

**Figure 45-8. Master Read with Multiple Data Bytes**

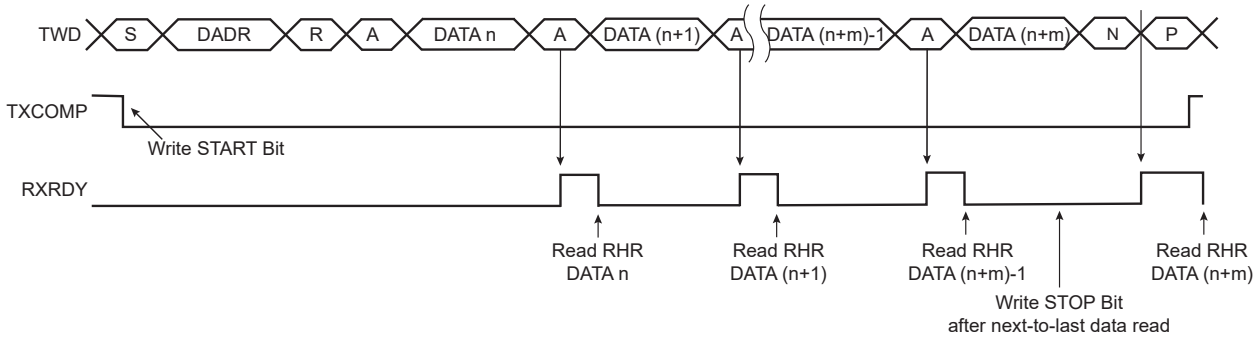

**Figure 45-9. Master Read Clock Stretching with Multiple Data Bytes**

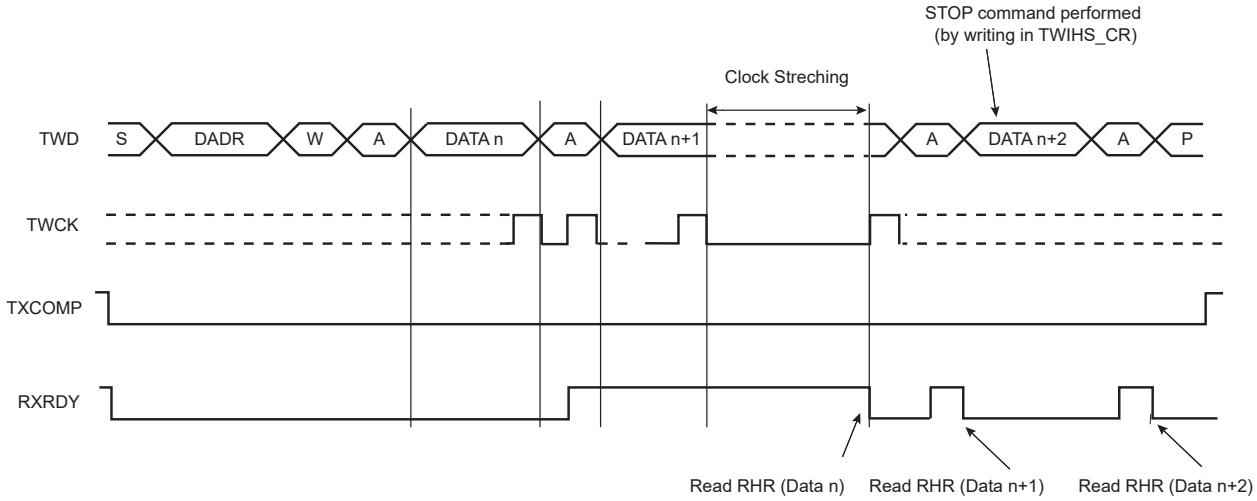

RXRDY is used as receive ready for the DMA receive channel.

### 45.6.3.6 Internal Address

The TWIHS can perform transfers with 7-bit slave address devices and with 10-bit slave address devices.

#### 45.6.3.6.1 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g. within a memory page location in a serial memory. When performing read operations with an internal address, the TWIHS performs a write operation to set the internal address into the slave device, and then switch to Master Receiver mode. Note that the second START condition (after sending the IADR) is sometimes called “repeated start” (Sr) in $I^2C$ fully-compatible devices. See Master Read with One-, Two- or Three-Byte Internal Address and One Data Byte.

See Master Write with One-, Two- or Three-Byte Internal Address and One Data Byte and Internal Address Usage for the master write operation with internal address.

The three internal address bytes are configurable through TWIHS_MMR.

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be set to 0.

The table below shows the abbreviations used in the figures below.

**Table 45-4. Abbreviations**

| Abbreviation | Definition |
|---|---|
| S | Start |
| Sr | Repeated Start |
| P | Stop |
| W | Write |
| R | Read |
| A | Acknowledge |
| NA | Not Acknowledge |
| DADR | Device Address |

| .....continued | |
|---|---|
| **Abbreviation** | **Definition** |
| IADR | Internal Address |

**Figure 45-10. Master Write with One-, Two- or Three-Byte Internal Address and One Data Byte**

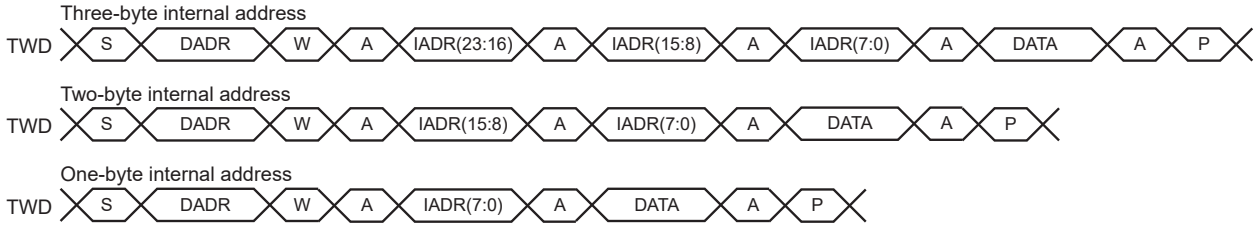

**Figure 45-11. Master Read with One-, Two- or Three-Byte Internal Address and One Data Byte**

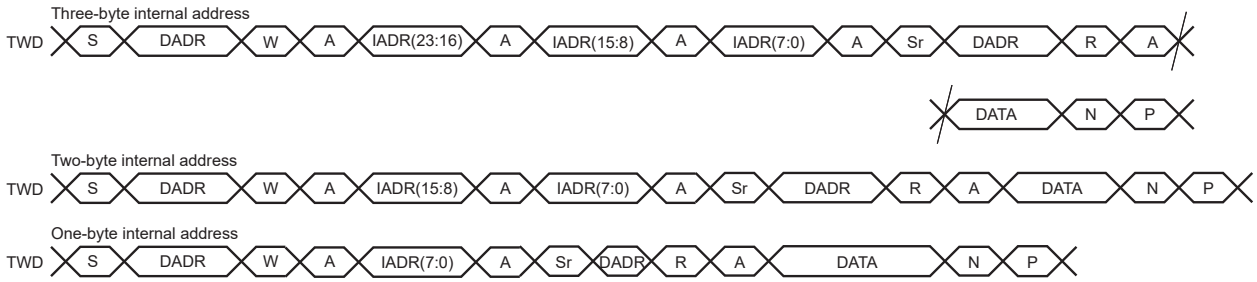


#### 45.6.3.6.2 10-bit Slave Addressing

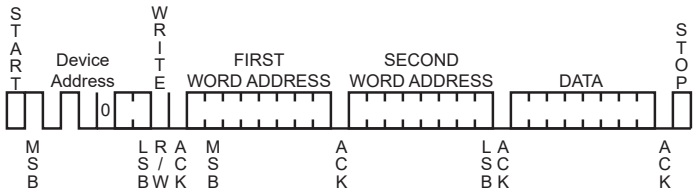
For a slave address higher than seven bits, configure the address size (IADRSZ) and set the other slave address bits in the Internal Address register (TWIHS_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit slave addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1,
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
3. Program TWIHS_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

The figure below shows a byte write to a memory device. This demonstrates the use of internal addresses to access the device.

**Figure 45-12. Internal Address Usage**



### 45.6.3.7 Repeated Start

In addition to Internal Address mode, REPEATED START (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case, the parameters of the next transfer (direction, SADR, etc.) need to be set before writing the START bit at the end of the previous transfer.

See Read/Write Flowcharts for detailed flowcharts.

Note that generating a REPEATED START after a single data read is not supported.

#### 45.6.3.8 Bus Clear Command

The TWIHS can perform a Bus Clear command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Start the transfer by setting TWIHS_CR.CLEAR.

**Note:** If alternative command is used (ACMEN bit set to '1'), DATAL field must be set to 0.

#### 45.6.3.9 Using the DMA Controller (DMAC) in Master Mode

The use of the DMA significantly reduces the CPU load.

To ensure correct implementation, follow the programming sequences below:

##### 45.6.3.9.1 Data Transmit with the DMA in Master Mode

If Alternative Command mode is disabled (ACMEN bit set to '0'):

The DMA transfer size must be defined with the buffer size minus 1. The remaining character must be managed without DMA to ensure that the exact number of bytes are transmitted regardless of system bus latency conditions during the end of the buffer transfer period.

1. Initialize the DMA (channels, memory pointers, size - 1, etc.);
2. Configure the Master mode (DADR, CKDIV, MREAD = 0, etc.) or Slave mode.
3. Enable the DMA.
4. Wait for the DMA status flag indicating that the buffer transfer is complete.
5. Disable the DMA.
6. Wait for the TXRDY flag in TWIHS_SR.
7. Set TWIHS_CR.STOP.
8. Write the last character in TWIHS_THR.
9. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS_SR.

If Alternative Command mode is enabled (ACMEN bit set to '1'):

1. Initialize the transmit DMA (memory pointers, transfer size).
2. Configure the Master mode (DADR, CKDIV, etc.) and TWIHS_ACR.
3. Start the transfer by setting the DMA TXTEN bit.
4. Wait for the DMA ENDTX flag either by using the polling method or ENDTX interrupt.
5. Disable the DMA by setting the DMA TXTDIS bit.
6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS_SR.

##### 45.6.3.9.2 Data Receive with the DMA in Master Mode

If Alternative Command mode is disabled (ACMEN bit set to '0'):

The DMA transfer size must be defined with the buffer size minus 2. The two remaining characters must be managed without DMA to ensure that the exact number of bytes are received regardless of system bus latency conditions encountered during the end of buffer transfer period.

1. Initialize the DMA (channels, memory pointers, size - 2, etc.);
2. Configure the Master mode (DADR, CKDIV, MREAD = 1, etc.) or Slave mode.
3. Enable the DMA.
4. (Master Only) Write TWIHS_CR.START to start the transfer.
5. Wait for the DMA status flag indicating that the buffer transfer is complete.
6. Disable the DMA.
7. Wait for the RXRDY flag in the TWIHS_SR.

8. Set TWIHS_CR.STOP.
9. Read the penultimate character in TWIHS_RHR.
10. Wait for the RXRDY flag in the TWIHS_SR.
11. Read the last character in TWIHS_RHR.
12. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS_SR.

If Alternative Command mode is enabled (ACMEN bit set to '1'):

1. Initialize the transmit DMA (memory pointers, transfer size).
2. Configure the Master mode (DADR, CKDIV, etc.) and TWIHS_ACR.
3. Set the DMA RXTEN bit.
4. (Master Only) Write TWIHS_CR.START to start the transfer.
5. Wait for the DMA ENDTX Flag either by using the polling method or ENDTX interrupt.
6. Disable the DMA by setting the DMA TXTDIS bit.
7. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS_SR.

#### 45.6.3.10 SMBus Mode

SMBus mode is enabled when a one is written to TWIHS_CR.SMBEN. SMBus mode operation is similar to I²C operation with the following exceptions:

- Only 7-bit addressing can be used.
- The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into TWIHS_SMBTR.
- Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
- A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring TWIHS_CR.

##### 45.6.3.10.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing a one to TWIHS_CR.PECEN enables automatic PEC handling in the current transfer. Transfers with and without PEC can be intermixed in the same system, since some slaves may not support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers is correct.

In Master Transmitter mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave compares it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave returns an ACK to the master. If the PEC values differ, data was corrupted, and the slave returns a NACK value. Some slaves may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the slave should always return an ACK after the PEC byte, and another method must be used to verify that the transmission was received correctly.

In Master Receiver mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master compares it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and TWIHS_SR.PECERR is set. In Master Receiver mode, the PEC byte is always followed by a NACK transmitted by the master, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers.

If the Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND_BYTE, ACK, SR, ADR+R, DATA_BYTE, ACK, PEC_BYTE, NACK, P

See Read/Write Flowcharts for detailed flowcharts.

#### 45.6.3.10.2 Timeouts

The TLOWS and TLOWM fields in TWIHS_SMBTR configure the SMBus timeout values. If a timeout occurs, the master transmits a STOP condition and leaves the bus. The TOUT bit is also set in TWIHS_SR.

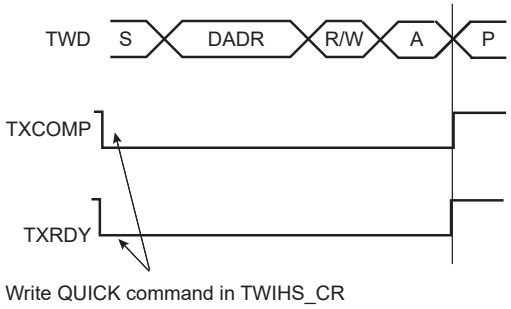
### 45.6.3.11 SMBus Quick Command (Master Mode Only)

The TWIHS can perform a quick command by following these steps:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Write TWIHS_MMR.MREAD at the value of the one-bit command to be sent.
3. Start the transfer by setting TWIHS_CR.QUICK.

If alternative command is used (ACMEN bit set to ‘1’), DATAL field must be set to 0.

**Figure 45-13. SMBus Quick Command**



### 45.6.3.12 Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWIHS Control Register.

In this mode, the transfer is configured through the TWIHS Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWIHS Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWIHS Control Register in case of a read transfer, or write the TWIHS Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If Alternative Command mode is used, TWIHS_MMR.IADRSZ must be set to 0.

See Read/Write Flowcharts for detailed flowcharts.

### 45.6.3.13 Handling Errors in Alternative Command

If a NACK is generated by a slave device or SMBus timeout error, the TWIHS stops the frame immediately, although the DMA transfer may still be active. To prevent a new frame from being restarted

with the remaining DMA data (transmit), the TWIHS prevents any start of frame until the LOCK flag is cleared in the TWIHS_SR.

TWIHS_SR.LOCK indicates the state of the TWIHS (locked or not locked).

When the TWIHS is locked, no transfer begins until the LOCK is cleared by TWIHS_CR.LOCKCLR and error flags are cleared by reading the TWIHS_SR.

In case of error, the TWIHS_THR may have been loaded with a new data. TWIHS_CR.THRCLR can be used to flush the TWIHS_THR. If THRCLR is set, the TXRDY and TXCOMP flags are set.

#### 45.6.3.14 Read/Write Flowcharts

The flowcharts give examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that TWIHS_IER be configured first.

**Figure 45-14. TWIHS Write Operation with Single Data Byte without Internal Address**

### 45.6.4 Multimaster Mode

#### 45.6.4.1 Definition

In Multimaster mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as arbitration is lost by a master, it stops sending data and listens to the bus in order to detect a stop. When the stop is detected, the master that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in Arbitration Cases.

#### 45.6.4.2 Different Multimaster Modes

Two Multimaster modes may be distinguished:

1. The TWIHS is considered as a master only and is never addressed.
2. The TWIHS may be either a master or a slave and may be addressed.

**Note:** Arbitration in supported in both Multimaster modes.

##### 45.6.4.2.1 TWIHS as Master Only

In this mode, the TWIHS is considered as a master only (MSEN is always at one) and must be driven like a master with the ARBLST (Arbitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If starting a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWIHS automatically waits for a STOP condition on the bus to initiate the transfer (see User Sends Data While the Bus is Busy).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

##### 45.6.4.2.2 TWIHS as Master or Slave

The automatic reversal from master to slave is not supported in case of a lost arbitration.

Then, in the case where TWIHS may be either a master or a slave, the user must manage the pseudo Multimaster mode described in the steps below:

1. Program the TWIHS in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWIHS is addressed).
2. If the TWIHS has to be set in Master mode, wait until TXCOMP flag is at 1.
3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as the Master mode is enabled, the TWIHS scans the bus in order to detect if it is busy or free. When the bus is considered free, the TWIHS initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is set to 1), the user must program the TWIHS in Slave mode in case the master that won the arbitration needs to access the TWIHS.
7. If the TWIHS has to be set in Slave mode, wait until the TXCOMP flag is at 1 and then program the Slave mode.

**Note:** If the arbitration is lost and the TWIHS is addressed, the TWIHS does not acknowledge, even if it is programmed in Slave mode as soon as ARBLST is set to 1. Then the master must repeat SADR.

**Figure 45-28. User Sends Data While the Bus is Busy**

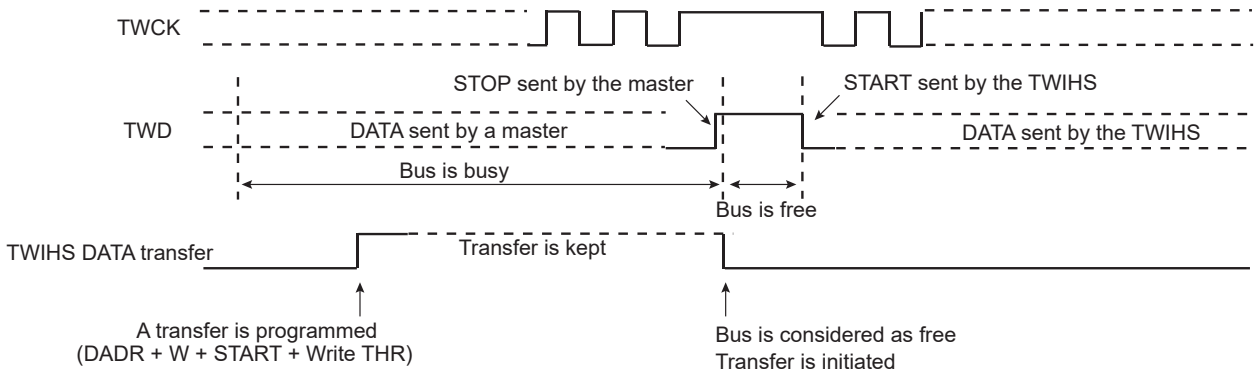

**Figure 45-29. Arbitration Cases**

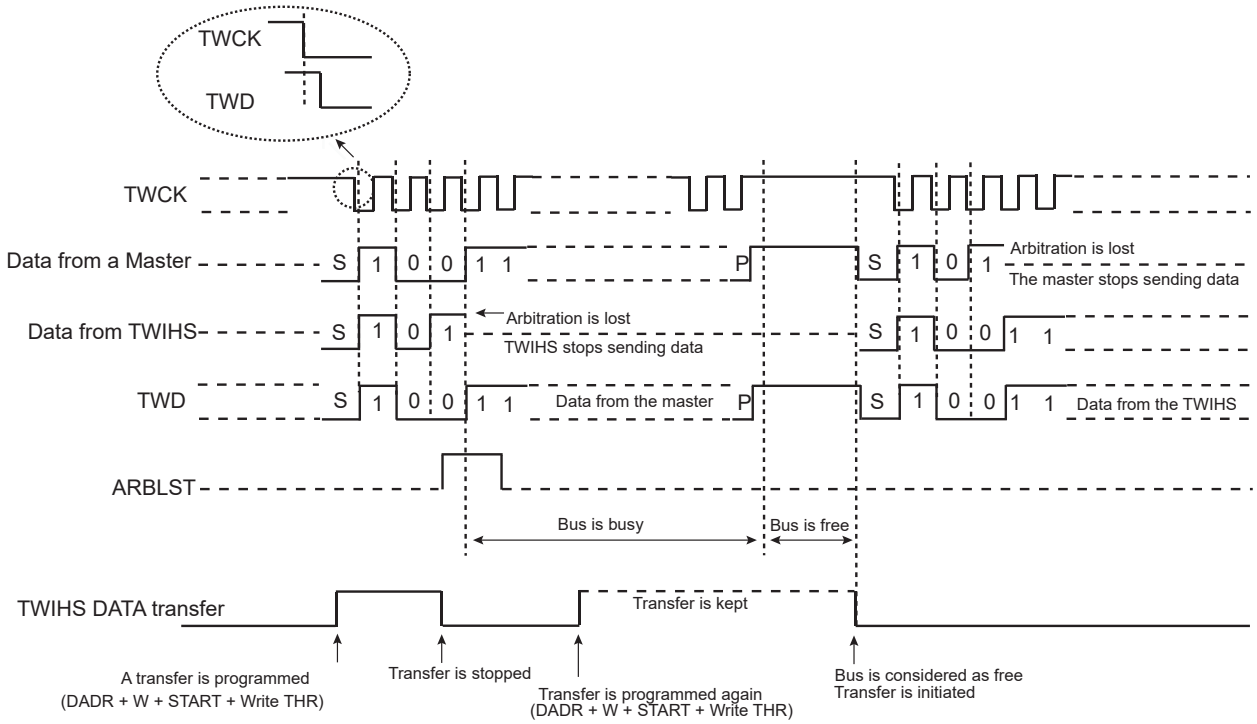
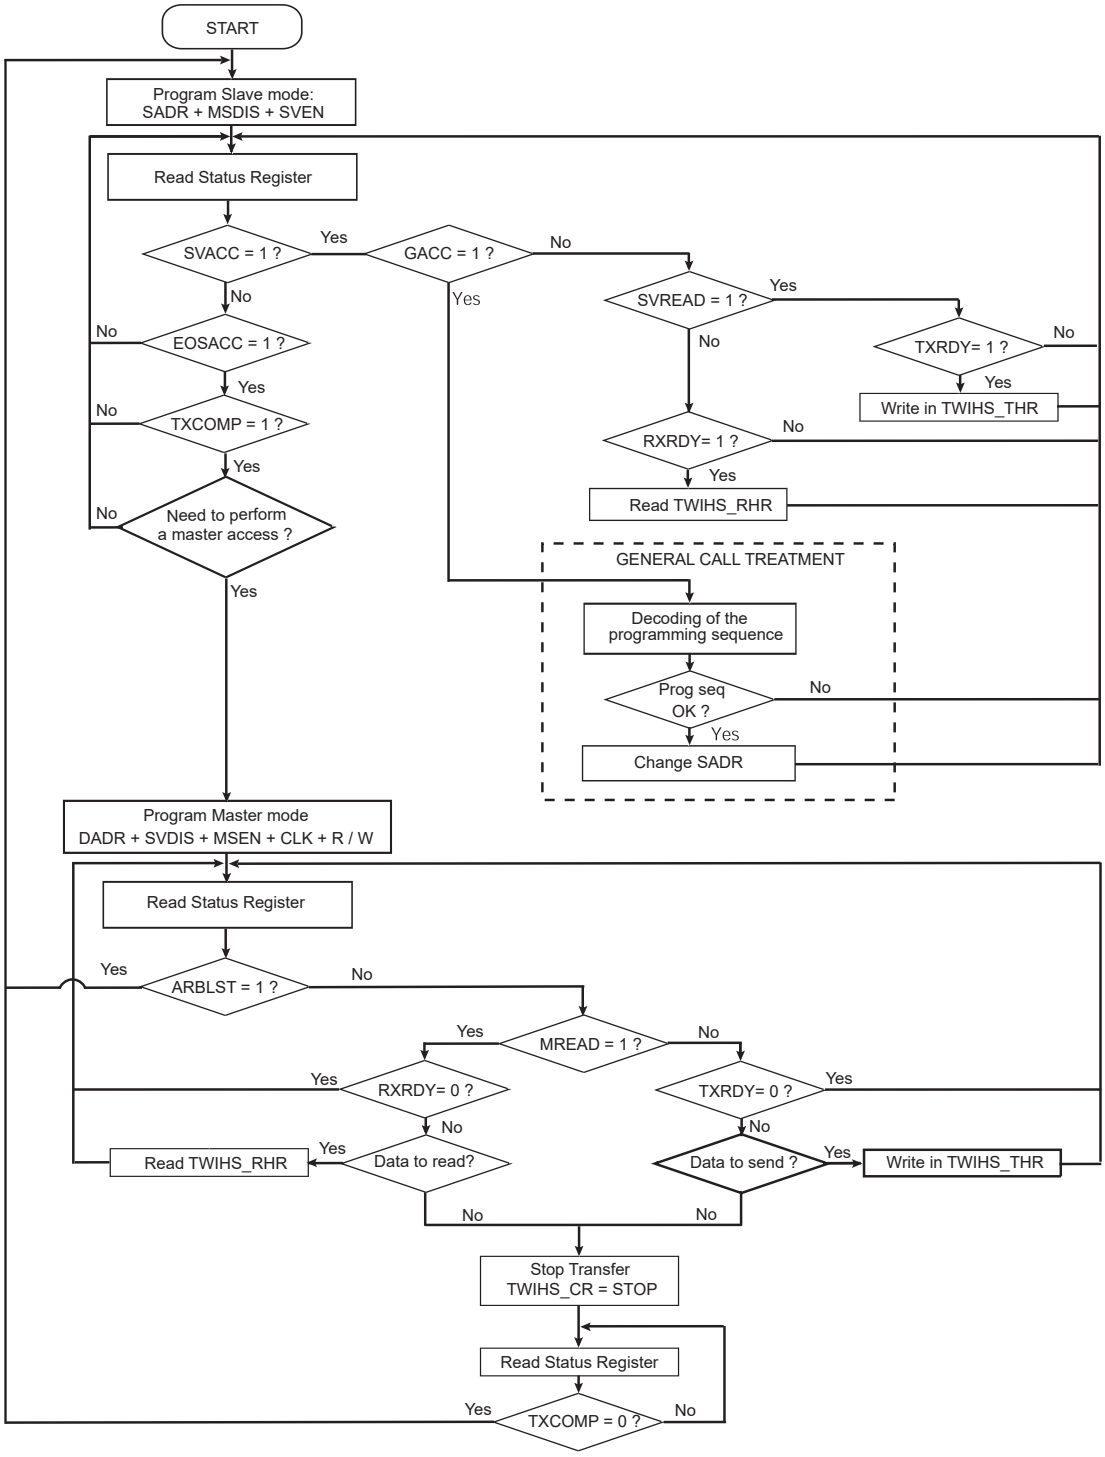


The flowchart below gives an example of read and write operations in Multimaster mode.

**Figure 45-30. Multimaster Flowchart**



## 45.6.5 Slave Mode

### 45.6.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED_START and STOP conditions are always provided by the master).

#### 45.6.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

1. TWIHS_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
2. (Optional) TWIHS_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. TWIHS_CR.MSDIS: Disables the Master mode.
4. TWIHS_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in TWIHS_CWGR are ignored.

#### 45.6.5.3 Receiving Data

After a START or REPEATED START condition is detected, and if the address sent by the master matches the slave address programmed in the SADR (Slave Address) field, the SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a REPEATED START is detected. When such a condition is detected, the EOSACC (End Of Slave Access) flag is set.

##### 45.6.5.3.1 Read Sequence

In the case of a read sequence (SVREAD is high), the TWIHS transfers data written in the TWIHS_THR until a STOP condition or a REPEATED_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC reset.

As soon as data is written in the TWIHS_THR, TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a REPEATED START always follows a NACK.

To clear the TXRDY flag, first set TWIHS_CR.SVDIS, then set TWIHS_CR.SVEN.

See Read Access Ordered by a Master.

##### 45.6.5.3.2 Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in TWIHS_RHR. RXRDY is reset when reading TWIHS_RHR.

The TWIHS continues receiving data until a STOP condition or a REPEATED_START + an address different from SADR is detected. Note that at the end of the write sequence, the TXCOMP flag is set and SVACC is reset.

See Write Access Ordered by a Master.

##### 45.6.5.3.3 Clock Stretching Sequence

If TWIHS_THR or TWIHS_RHR is not written/read in time, the TWIHS performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See Clock Stretching in Read Mode and Clock Stretching in Write Mode.

**Note:** Clock stretching can be disabled by configuring the SCLWSDIS bit in TWIHS_SMR. In that case, the UNRE and OVRE flags indicate an underrun (when TWIHS_THR is not filled on time) or an overrun (when TWIHS_RHR is not read on time).

#### 45.6.5.3.4 General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, the user must interpret the meaning of the GENERAL CALL and decode the new address programming sequence.

See Master Performs a General Call.

### 45.6.5.4 Data Transfer

#### 45.6.5.4.1 Read Operation

The Read mode is defined as a data requirement from the master.

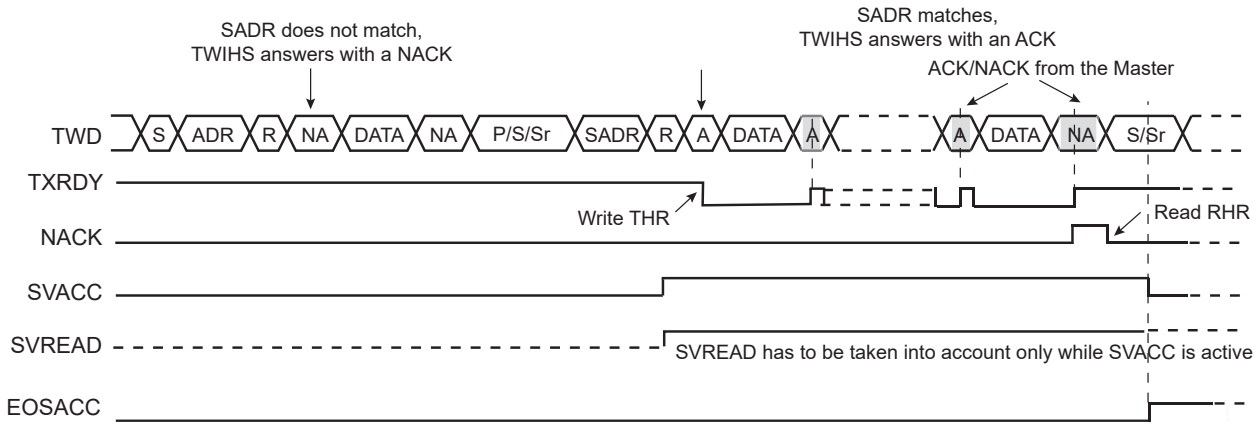
After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, the TWIHS continues sending data loaded in TWIHS_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The figure below describes the read operation.

**Figure 45-31. Read Access Ordered by a Master**



**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from TWIHS_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

#### 45.6.5.4.2 Write Operation

The Write mode is defined as a data transmission from the master.

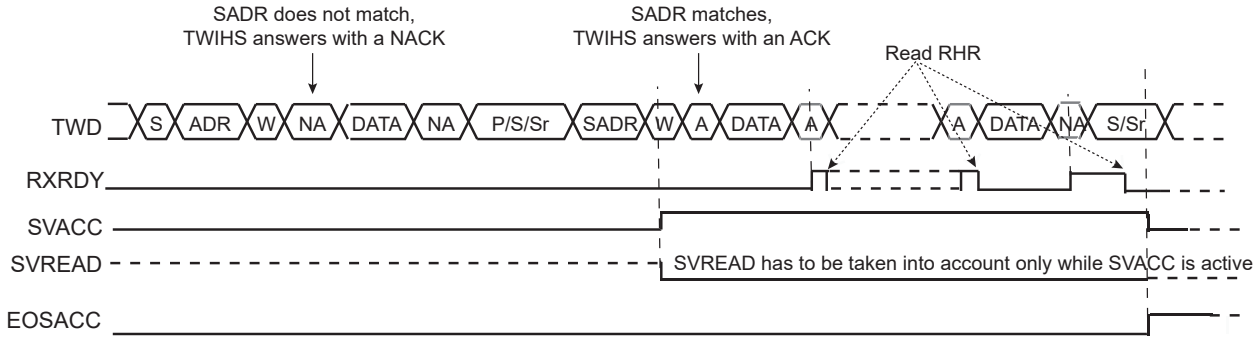
After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, the TWIHS stores the received data in TWIHS_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The figure below describes the write operation.

**Figure 45-32. Write Access Ordered by a Master**



**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to TWIHS_RHR and reset when this data is read.

#### 45.6.5.4.3 General Call

The general call is performed in order to change the address of the slave.

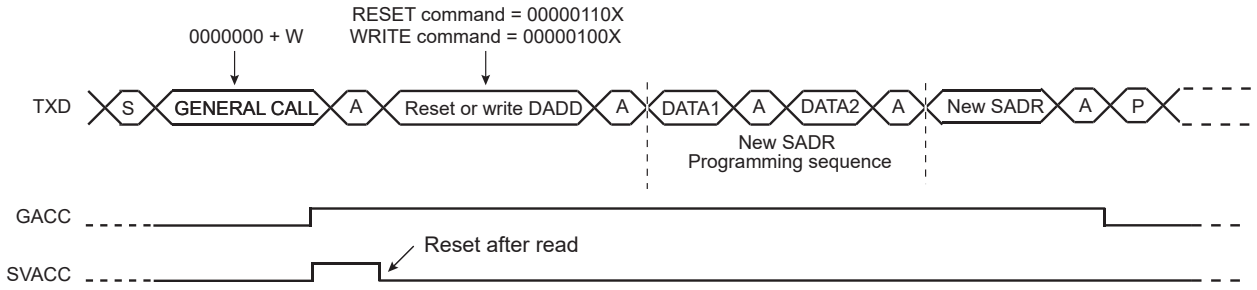
If a GENERAL CALL is detected, GACC is set.

After the detection of general call, decode the commands that follow.

In case of a WRITE command, decode the programming sequence and program a new SADR if the programming sequence matches.

The figure below describes the general call access.

**Figure 45-33. Master Performs a General Call**



**Note:** This method enables the user to create a personal programming sequence by choosing the programming bytes and their number. The programming sequence has to be provided to the master.

#### 45.6.5.4.4 Clock Stretching

In both Read and Write modes, it may occur that TWIHS_THR/TWIHS_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

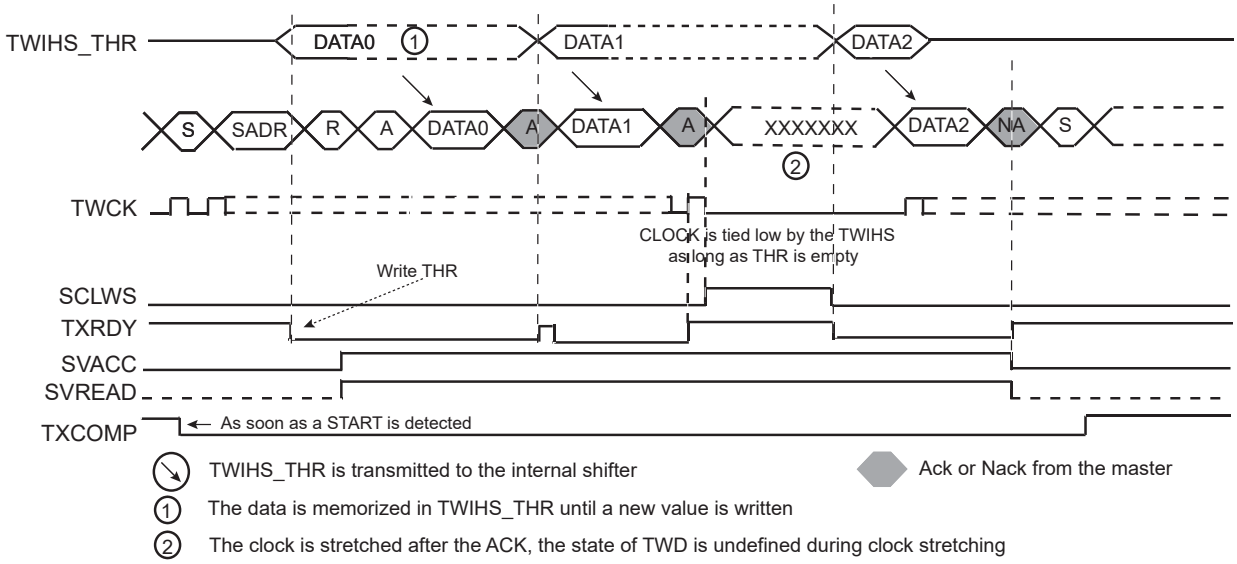
**Note:** Clock stretching can be disabled by setting TWIHS_SMR.SCLWSDIS. In that case the UNRE and OVRE flags indicate an underrun (when TWIHS_THR is not filled on time) or an overrun (when TWIHS_RHR is not read on time).

***Clock Stretching in Read Mode***

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

The figure below describes the clock stretching in Read mode.

**Figure 45-34. Clock Stretching in Read Mode**



**Note:**

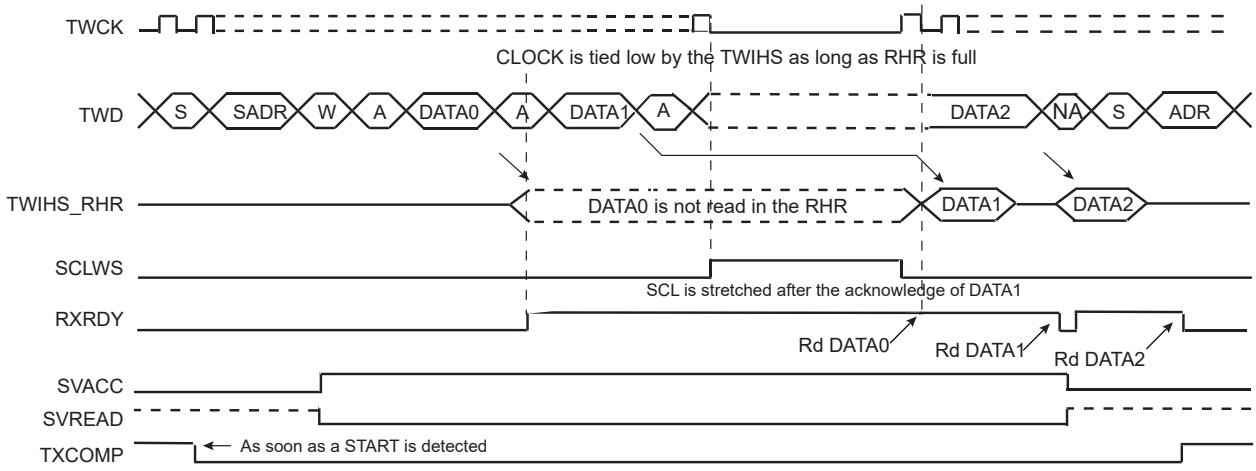
1. TXRDY is reset when data has been written in TWIHS_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

***Clock Stretching in Write Mode***

The clock is tied low if the internal shifter and TWIHS_RHR is full. If a STOP or REPEATED_START condition was not detected, it is tied low until TWIHS_RHR is read.

The figure below describes the clock stretching in Write mode.

**Figure 45-35. Clock Stretching in Write Mode**



**Note:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED_START + an address different from SADR.
2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

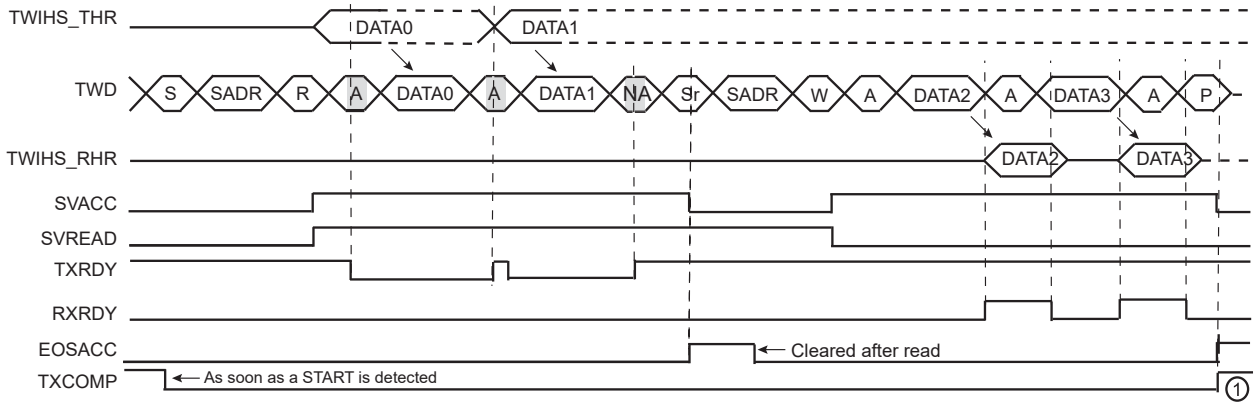
#### 45.6.5.4.5 Reversal after a Repeated Start

***Reversal of Read to Write***

The master initiates the communication by a read command and finishes it by a write command.

The figure below describes the REPEATED START and the reversal from Read mode to Write mode.

**Figure 45-36. Repeated Start and Reversal from Read Mode to Write Mode**

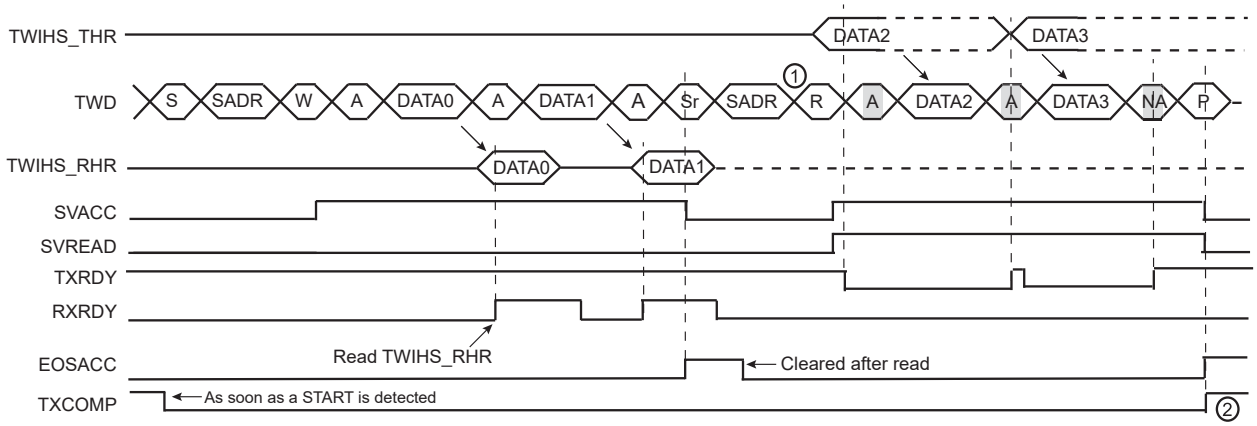


**Note:** TXCOMP is only set at the end of the transmission. This is because after the REPEATED START, SADR is detected again.

***Reversal of Write to Read***

The master initiates the communication by a write command and finishes it by a read command. The figure below describes the REPEATED START and the reversal from Write mode to Read mode.

**Figure 45-37. Repeated Start and Reversal from Write Mode to Read Mode**



**Note:**

1. In this case, if TWIHS_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.
2. TXCOMP is only set at the end of the transmission. This is because after the REPEATED START, SADR is detected again.

### 45.6.5.5 Using the DMA Controller (DMAC) in Slave Mode

The use of the DMAC significantly reduces the CPU load.

#### 45.6.5.5.1 Data Transmit with the DMA in Slave Mode

The following procedure shows an example to transmit data with DMA.

1. Initialize the transmit DMA (memory pointers, transfer size, etc).

2. Configure the Slave mode.
3. Enable the DMA.
4. Wait for the DMA status flag indicating that the buffer transfer is complete.
5. Disable the DMA.
6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS_SR.

#### 45.6.5.5.2 Data Receive with the DMA in Slave Mode

The following procedure shows an example to transmit data with DMA where the number of characters to receive is known.

1. Initialize the DMA (channels, memory pointers, size, etc.).
2. Configure the Slave mode.
3. Enable the DMA.
4. Wait for the DMA status flag indicating that the buffer transfer is complete.
5. Disable the DMA.
6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWIHS_SR.

### 45.6.5.6 SMBus Mode

SMBus mode is enabled when a one is written to TWIHS_CR.SMBEN. SMBus mode operation is similar to I²C operation with the following exceptions:

- Only 7-bit addressing can be used.
- The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into the TWIHS_SMBTR.
- Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
- A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring the TWIHS_CR.

#### 45.6.5.6.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing a one to TWIHS_CR.PECEN will send/check the PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on the following linked transfers is correct.

In Slave Receiver mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave compares it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave returns an ACK to the master. If the PEC values differ, data was corrupted, and the slave returns a NACK value. TWIHS_SR.PECERR is set automatically if a PEC error occurred.

In Slave Transmitter mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master compares it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the master must take appropriate action.

See Slave Read Write Flowcharts for detailed flowcharts.

#### 45.6.5.6.2 Timeouts

The TWIHS SMBus Timing Register (TWIHS_SMBTR) configures the SMBus timeout values. If a timeout occurs, the slave leaves the bus. The TOUT bit is also set in TWIHS_SR.

#### 45.6.5.7 High-Speed Slave Mode

High-speed mode is enabled when a one is written to TWIHS_CR.HSEN. Furthermore, the analog pad filter must be enabled, a one must be written to TWIHS_FILTR.PADFEN and the FILT bit must be cleared. TWIHS High-speed mode operation is similar to TWIHS operation with the following exceptions:

1. A master code is received first at normal speed before entering High-speed mode period.
2. When TWIHS High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or REPEATED START (Sr) (as consequence OVF may happen).

TWIHS High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWIHS slave in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if slave clock stretching is enabled (SCLWSDIS bit at ‘0’). If slave clock stretching is disabled (SCLWSDIS bit at ‘1’), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

**Note:** When slave clock stretching is disabled, the TWIHS_RHR must always be read before receiving the next data (MASTER write frame). It is strongly recommended to use either the polling method on the RXRDY flag in TWIHS_SR, or the DMA. If the receive is managed by an interrupt, the TWIHS interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.

**Note:** When slave clock stretching is disabled, the TWIHS_THR must be filled with the first data to send before the beginning of the frame (MASTER read frame). It is strongly recommended to use either the polling method on the TXRDY flag in TWIHS_SR, or the DMA. If the transmit is managed by an interrupt, the TWIHS interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

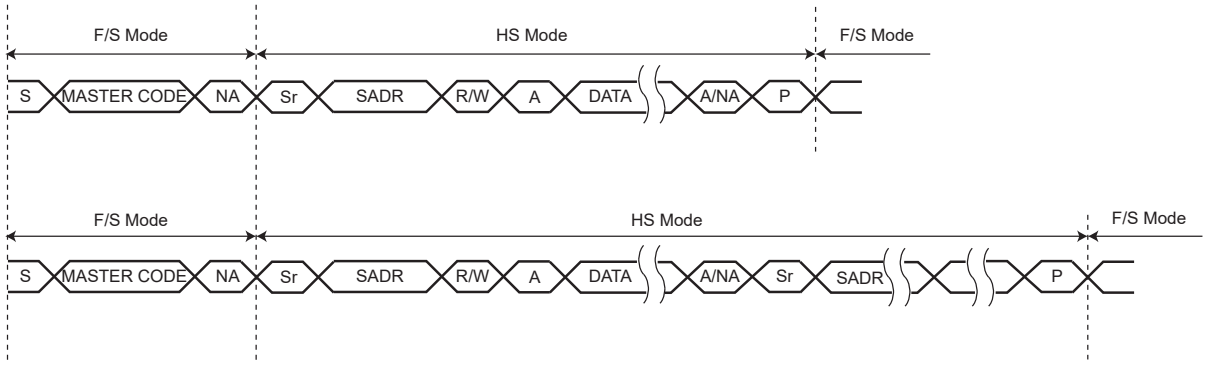
##### 45.6.5.7.1 Read/Write Operation

A TWIHS high-speed frame always begins with the following sequence:

1. START condition (S)
2. Master Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWIHS is programmed in Slave mode and TWIHS High-speed mode is activated, master code matching is activated and internal timings are set to match the TWIHS High-speed mode requirements.

**Figure 45-38. High-Speed Mode Read/Write**



##### 45.6.5.7.2 Usage

TWIHS High-speed mode usage is the same as the standard TWIHS (See Read/Write Flowcharts).

#### 45.6.5.8 Alternative Command

In Slave mode, Alternative Command mode is useful when SMBus mode is enabled to send or check the PEC byte.

Alternative Command mode is enabled by setting the ACMEN bit of the TWIHS Control Register and the transfer is configured in TWIHS_ACR.

For a combined transfer with PEC, only TWIHS_ACR.NPEC must be set as the PEC byte is sent once at the end of the frame.

See Slave Read Write Flowcharts for detailed flowcharts.

#### 45.6.5.9 Asynchronous Partial Wakeup (SleepWalking)

The TWIHS includes an asynchronous start condition detector. It is capable of waking the device up from a Sleep mode upon an address match (and optionally an additional data match), including Sleep modes where the TWIHS peripheral clock is stopped.

After detecting the START condition on the bus, the TWIHS stretches TWCK until the TWIHS peripheral clock has started. The time required for starting the TWIHS depends on which Sleep mode the device is in. After the TWIHS peripheral clock has started, the TWIHS releases its TWCK stretching and receives one byte of data (slave address) on the bus. At this time, only a limited part of the device, including the TWIHS module, receives a clock, thus saving power. If the address phase causes a TWIHS address match (and, optionally, if the first data byte causes data match as well), the entire device is woken up and normal TWIHS address matching actions are performed. Normal TWIHS transfer then follows. If the TWIHS is not addressed (or if the optional data match fails), the TWIHS peripheral clock is automatically stopped and the device returns to its original Sleep mode.

The TWIHS has the capability to match on more than one address. The SADR1EN, SADR2EN and SADR3EN bits in TWIHS_SMR enable address matching on additional addresses which can be configured through SADR1, SADR2 and SADR3 fields in the TWIHS_SWMR. The SleepWalking matching process can be extended to the first received data byte if TWIHS_SMR.DATAMEN is set and, in this case, a complete matching includes address matching and first received data matching. TWIHS_SWMR.DATAM configures the data to match on the first received byte.

When the system is in Active mode and the TWIHS enters Asynchronous Partial Wakeup mode, the flag SVACC must be programmed as the unique source of the TWIHS interrupt and the data match comparison must be disabled.

When the system exits Wait mode as the result of a matching condition, the SVACC flag is used to determine if the TWIHS is the source of exit.

#### 45.6.5.10 Slave Read Write Flowcharts

The flowchart below illustrates an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that TWIHS_IER be configured first.

**Figure 45-43. Read Write Flowchart in Slave Mode**

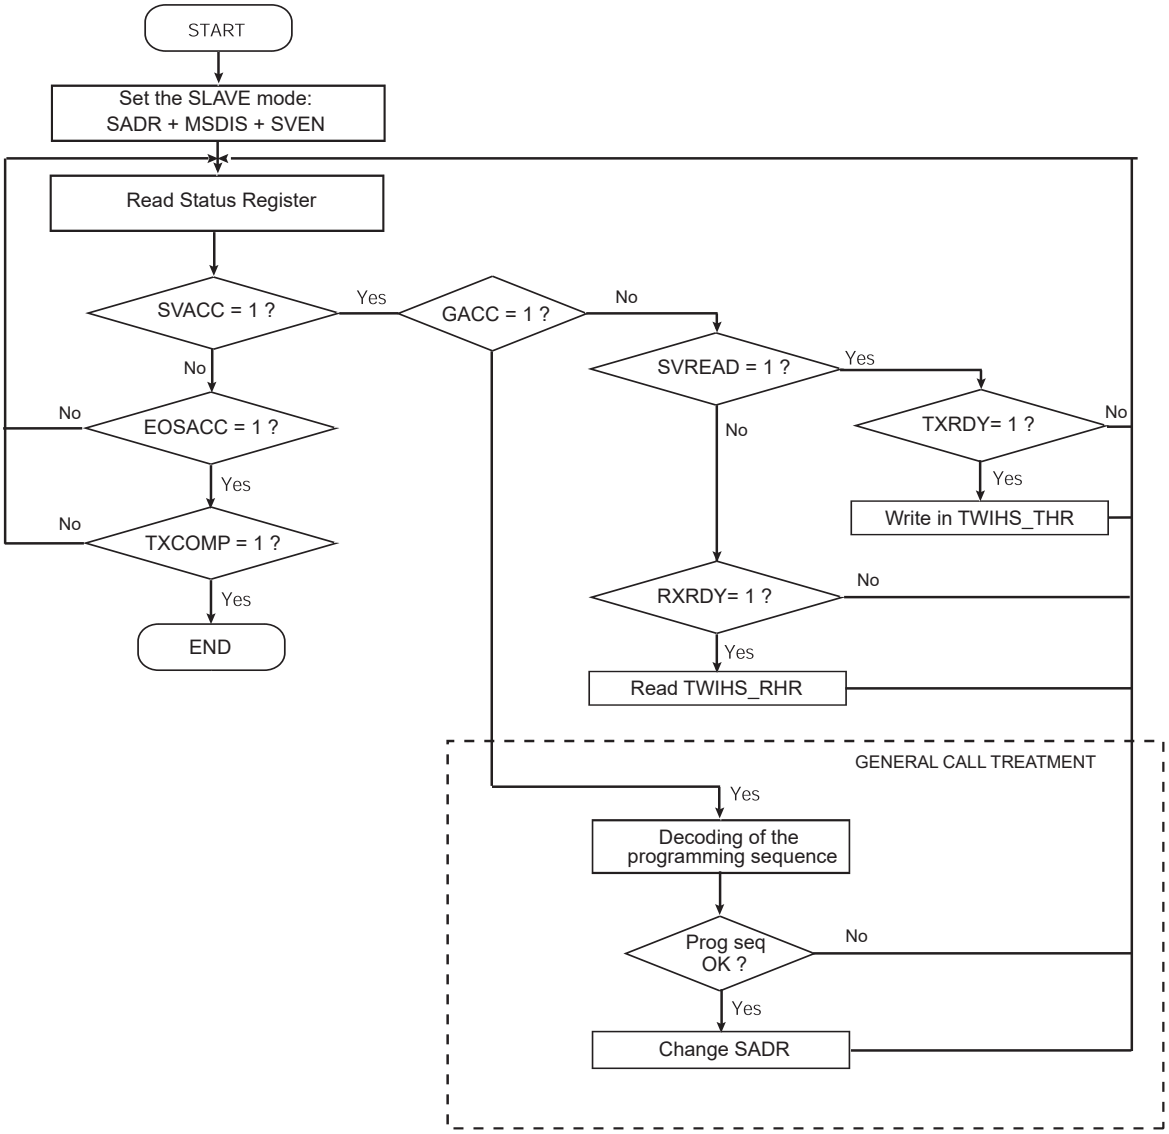

**Figure 45-44. Read Write Flowchart in Slave Mode with SMBus PEC**

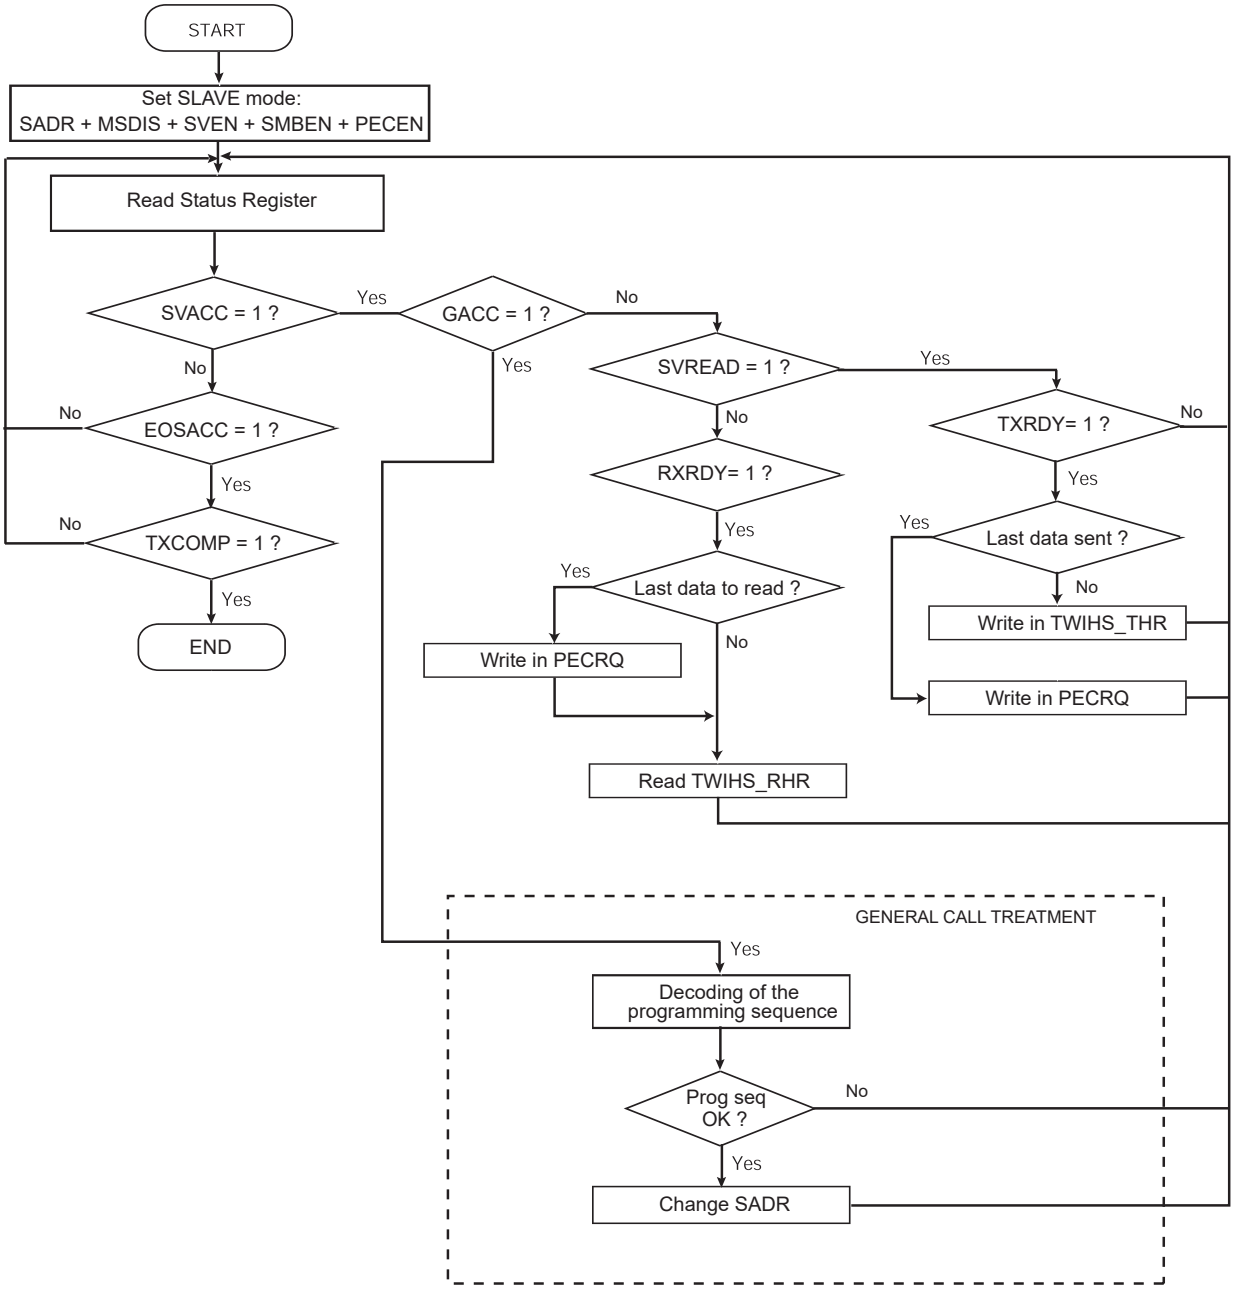

**Figure 45-45. Read Write Flowchart in Slave Mode with SMBus PEC and Alternative Command Mode**

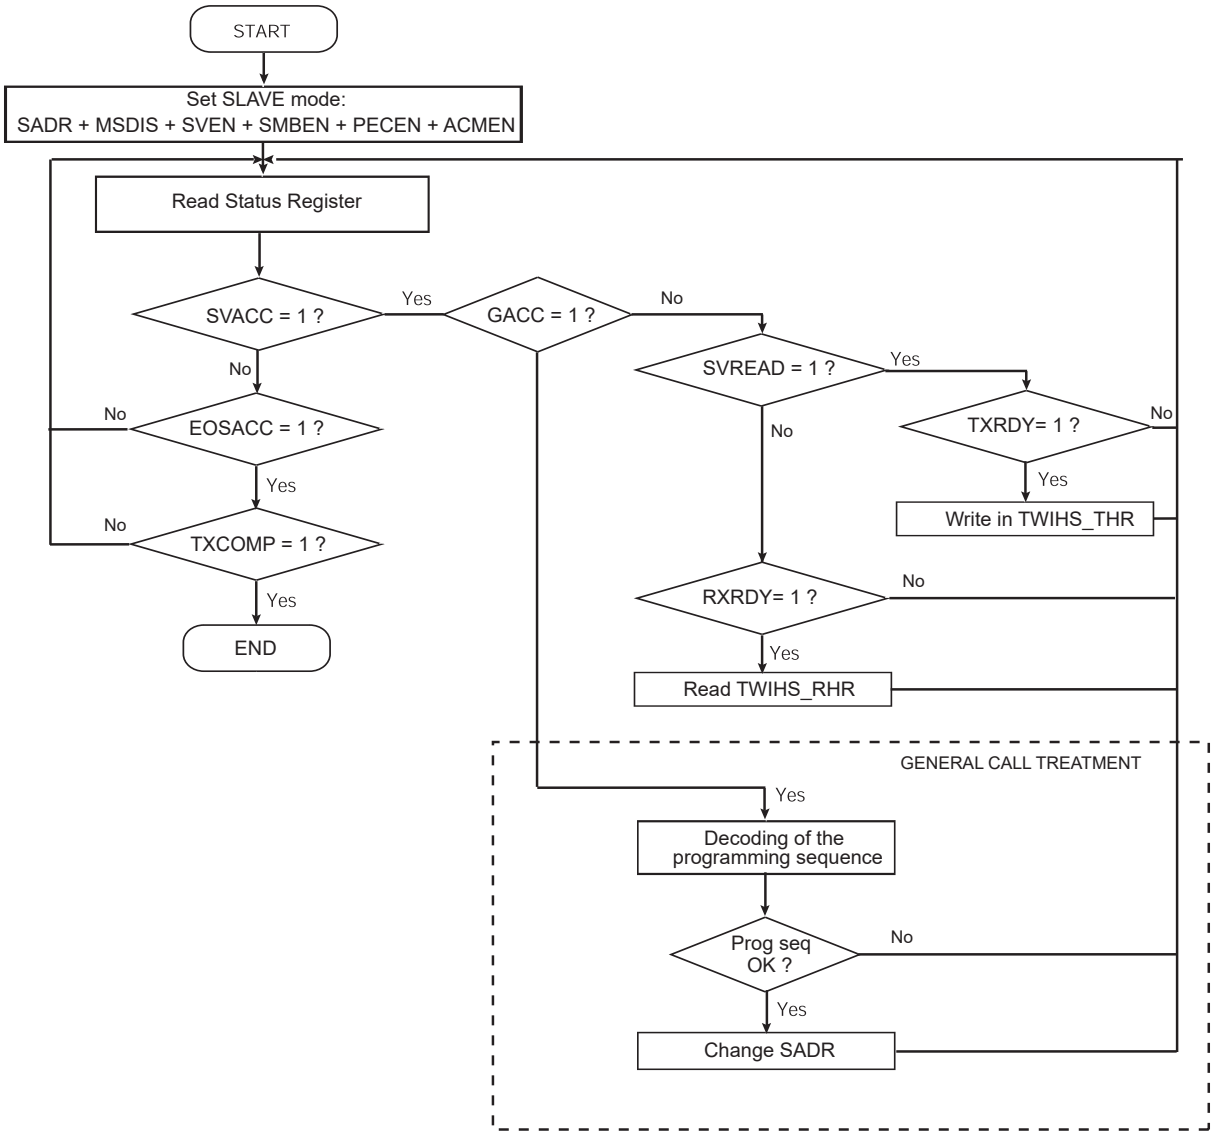


### 45.6.6 FIFOs

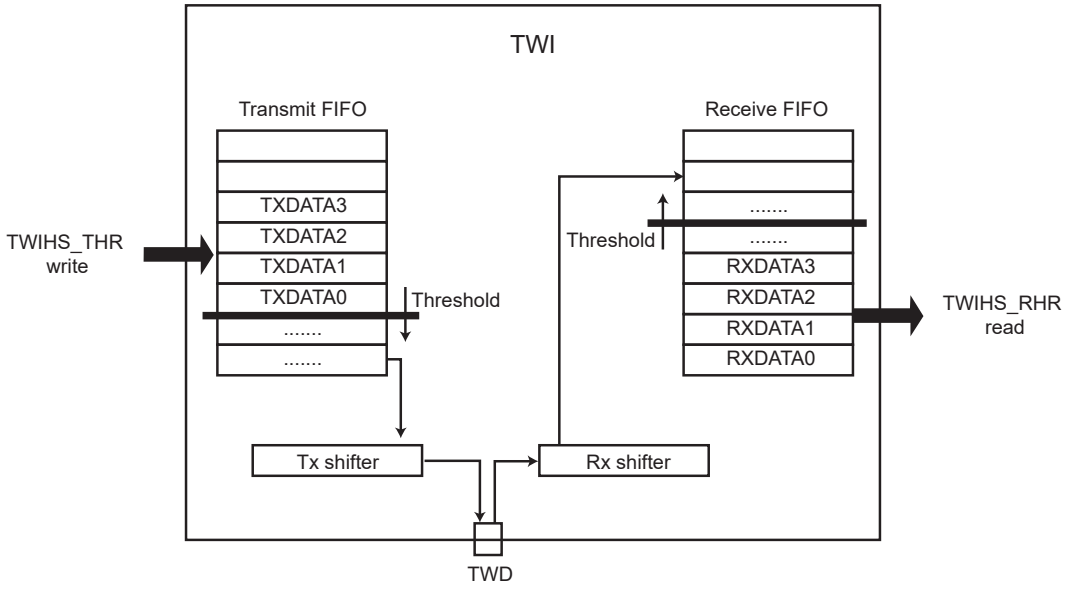
#### 45.6.6.1 Overview

The TWI includes two FIFOs which can be enabled/disabled using TWIHS_CR.FIFOEN/FIFODIS. Both Master and Slave modes must be disabled before enabling or disabling the FIFOs (TWIHS_CR.MSDIS/SVDIS).

Writing TWIHS_CR.FIFOEN to ‘1’ enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to TWIHS_THR/RHR, depending onTWIHS_FMR.TXRDYM/RXRDYM settings.

**Figure 45-46. FIFOs Block Diagram**



### 45.6.6.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to TWIHS_THR loads the Transmit FIFO.

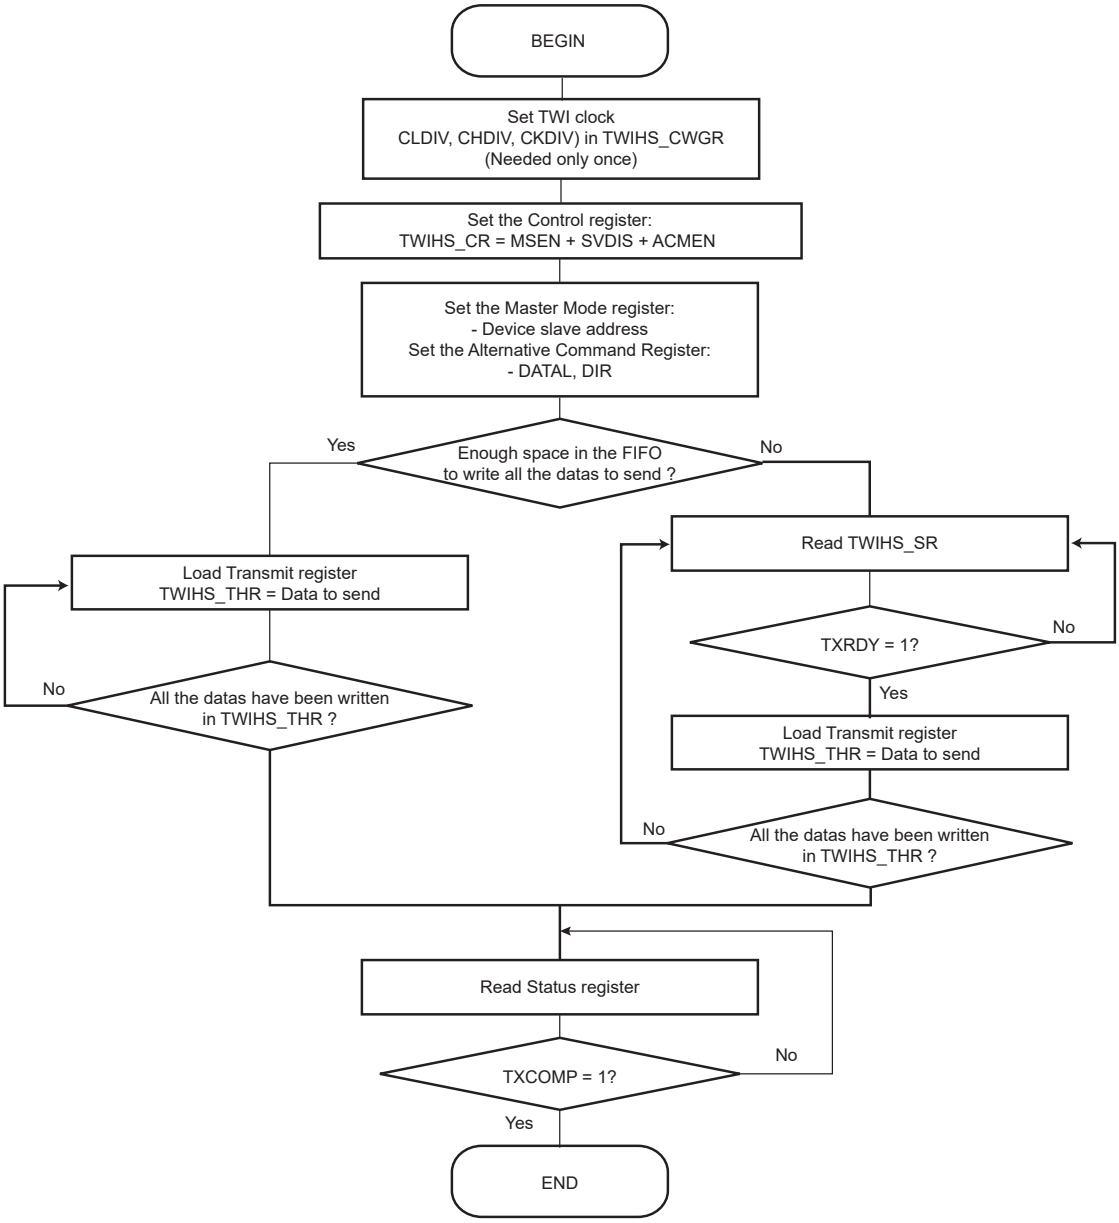
The Transmit FIFO level is provided in TWIHS_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor TWIHS_SR.TXRDY and the data can be successively written in TWIHS_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in TWIHS_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See the figure below and the figure Sending/Receiving Data with FIFO Enabled in Slave Mode.

**Figure 45-47. Sending Data with FIFO Enabled in Master Mode**



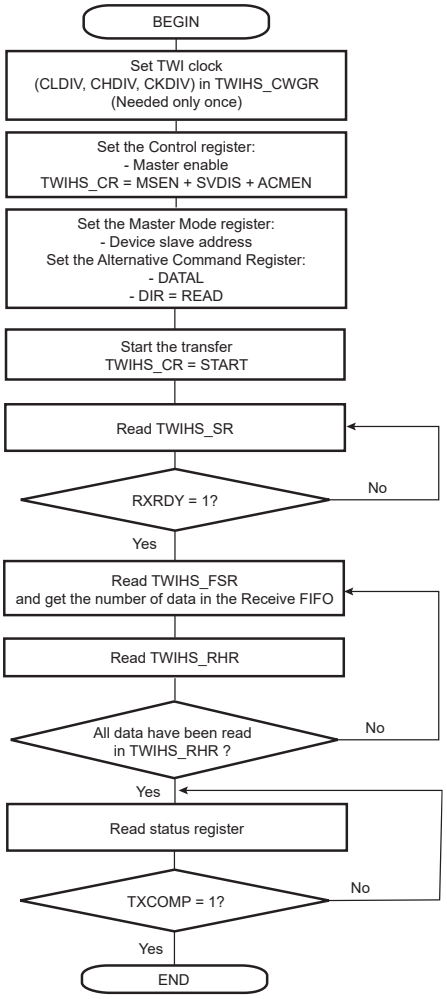
### 45.6.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, TWIHS_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to ‘1’), the exact number of data can be checked with TWIHS_FLR.RXFL. All the data can be read successively in TWIHS_RHR without checking the TWIHS_SR.RXRDY flag between each access.

See the figure below and the figure Sending/Receiving Data with FIFO Enabled in Slave Mode.

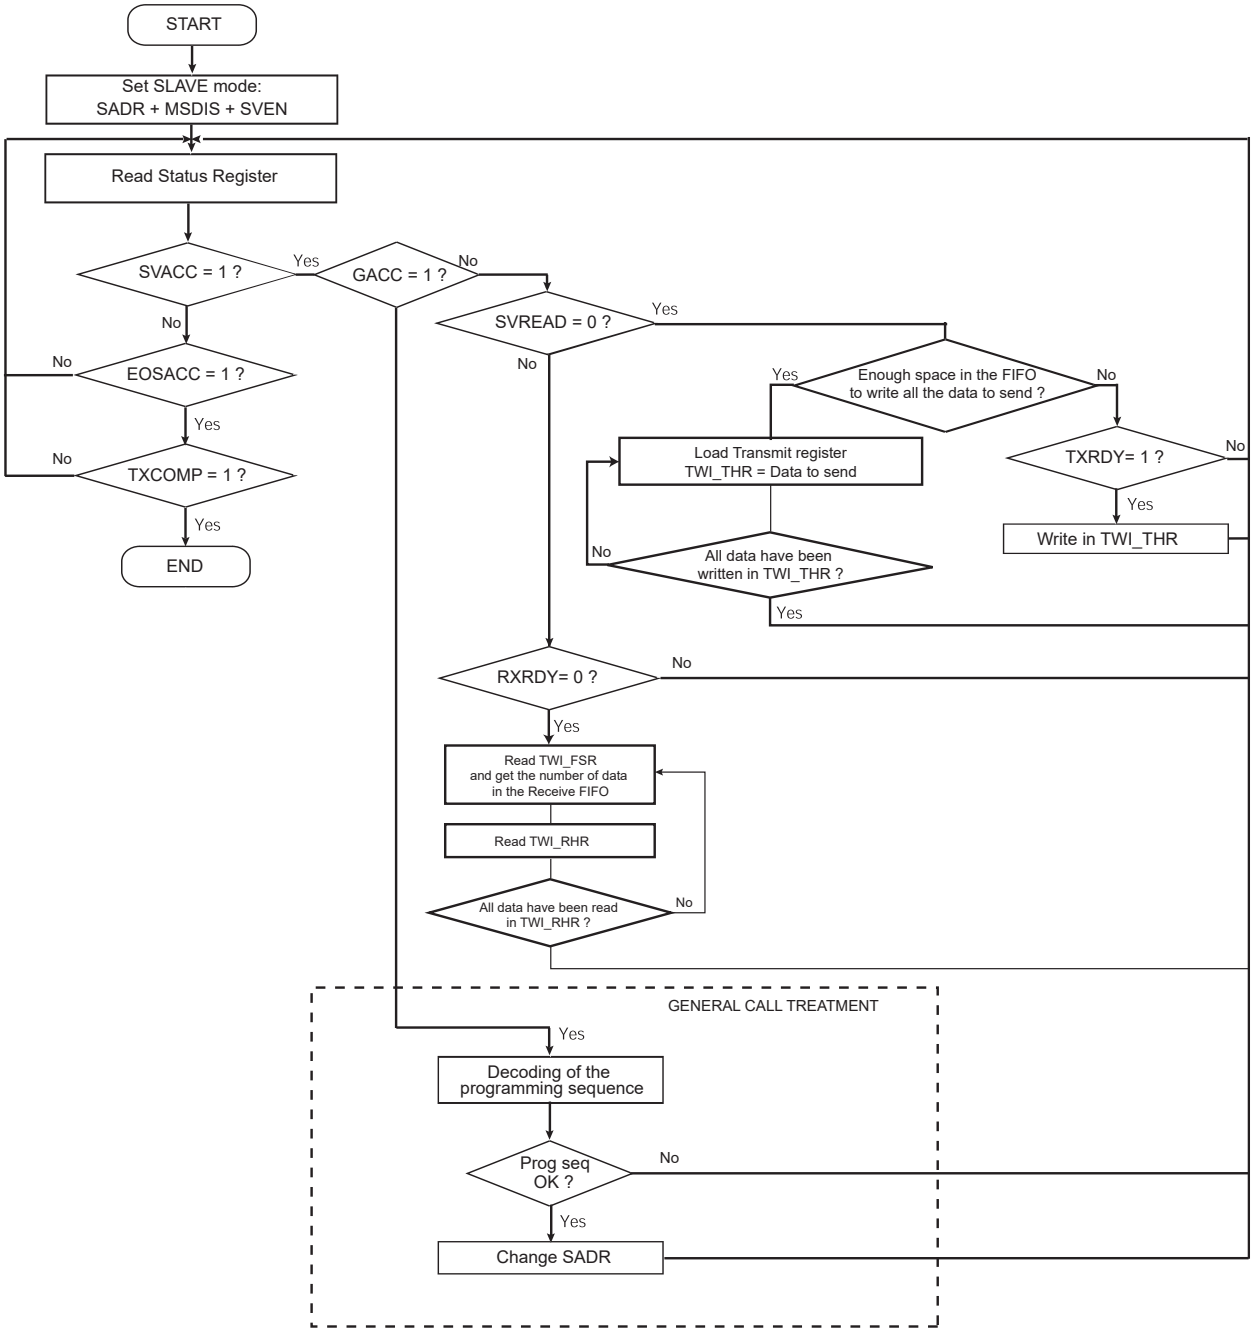
**Figure 45-48. Receiving Data with FIFO Enabled in Master Mode**



### 45.6.6.4 Sending/Receiving with FIFO Enabled in Slave Mode

See sections 45.6.6.2 Sending Data with FIFO Enabled and 45.6.6.3 Receiving Data with FIFO Enabled for details.

**Figure 45-49. Sending/Receiving Data with FIFO Enabled in Slave Mode**



### 45.6.6.5 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using TWIHS_CR.TXFCLR/RXFCLR.

### 45.6.6.6 TXRDY and RXRDY Behavior

TWIHS_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure Figure 45-50.

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. Refer to figure Figure 45-51.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode Register (TWIHS_FMR) to reduce the number of accesses to TWIHS_THR/RHR.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See TWI FIFO Mode Register for the FIFO configuration.

**Figure 45-50. TXRDY Behavior when TXRDYM = 0 in Master Mode**

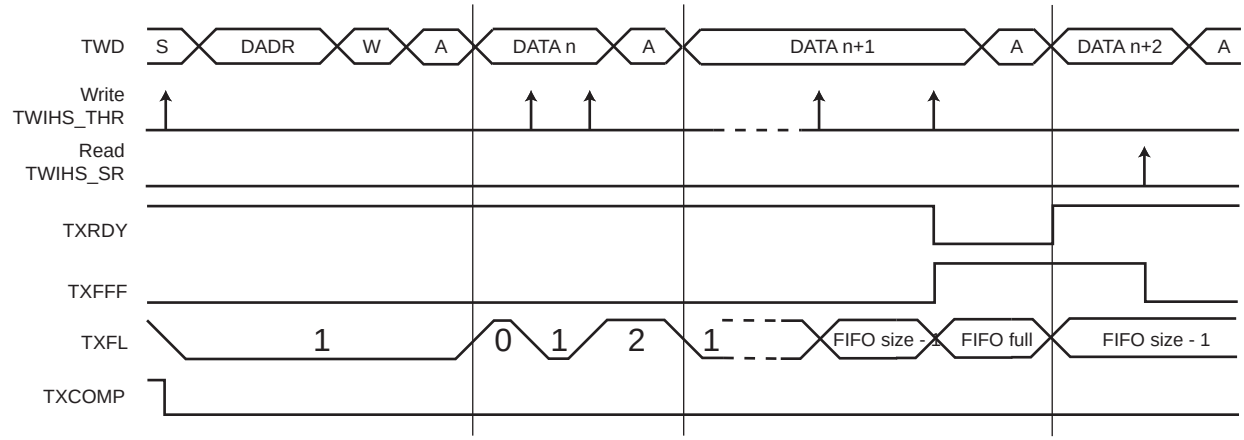


**Figure 45-51. RXRDY Behavior when RXRDYM = 0 in Master and Slave Modes**

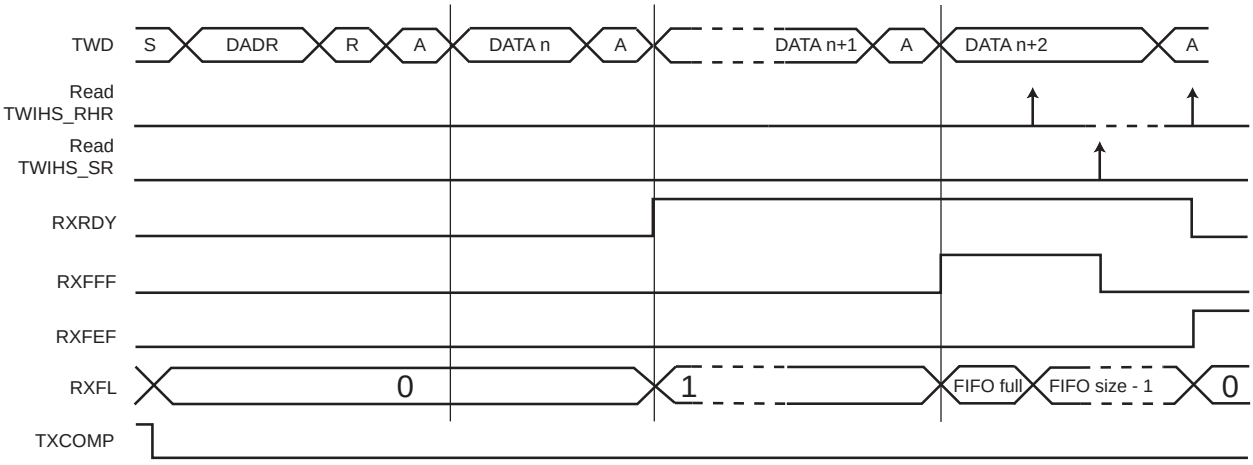

**Figure 45-52. TXRDY Behavior when TXRDYM = 0 in Slave Mode**

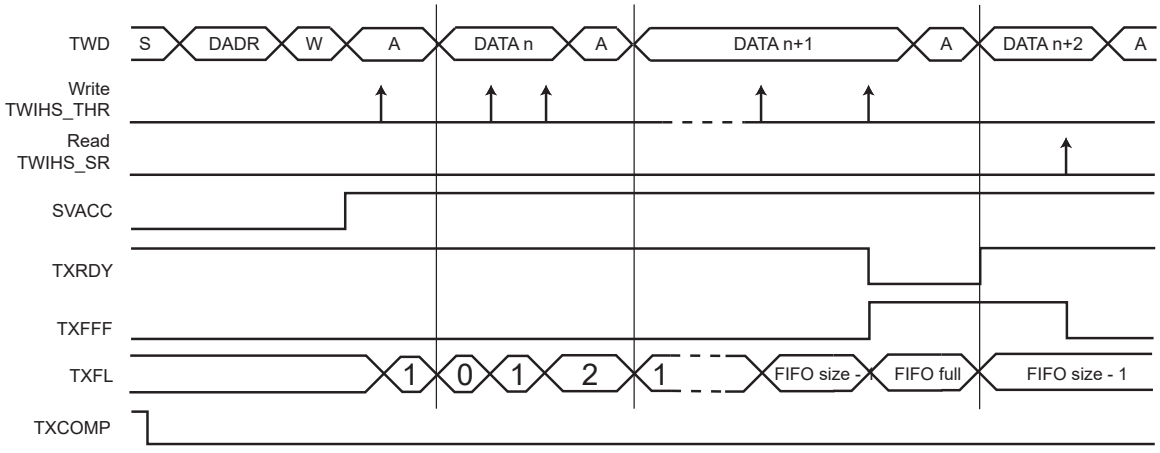

#### 45.6.6.7 Single Data Mode

In Single Data mode, only one data is written every time TWIHS_THR is accessed, and only one data is read every time TWIHS_RHR is accessed.

When TWIHS_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When TWIHS_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

See sections 45.7.18 TWIHS_THR and 45.7.15 TWIHS_RHR.

#### 45.6.6.8 Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When TWIHS_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When TWIHS_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

In Multiple Data mode, it is possible to write/read up to four data in one TWIHS_THR/TWIHS_RHR register access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a wordsize register access, then up to four data are read and up to two data are written.

Written/Read data are always right-aligned, as described in sections 45.7.16 TWIHS_RHR (FIFO_ENABLED) and 45.7.19 TWIHS_THR (FIFO_ENABLED).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six TWIHS_THR-byte write accesses
- three TWIHS_THR-halfword write accesses
- one TWIHS_THR-word write access and one TWIHS_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six TWIHS_RHR-byte read accesses
- three TWIHS_RHR-halfword read accesses
- one TWIHS_RHR-word read access and one TWIHS_RHR-halfword read access

##### 45.6.6.8.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same TWIHS_THR/TWIHS_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of TWIHS_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in TWIHS_THR, it is useful to configure the TXRDYM field to the value ‘1’ so that the TXRDY flag is at ‘1’ only when at least two data can be written in the Transmit FIFO.

In the same way, if four data are read each time in TWIHS_RHR, it is useful to configure the RXRDYM field to the value ‘2’ so that the RXRDY flag is at ‘1’ only when at least four unread data are in the Receive FIFO.

##### 45.6.6.8.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the TWIHS_FMR.TXRDYM/RXRDYM settings.

#### 45.6.6.9 Transmit FIFO Lock

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or master code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

TWIHS_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting TWIHS_CR.TXFLCLR to ‘1’.

#### 45.6.6.10 FIFO Pointer Error

A FIFO overflow is reported in TWIHS_FSR.

If the Transmit FIFO is full and a write access is performed on TWIHS_THR, it generates a Transmit FIFO pointer error and sets TWIHS_FSR.TXFPTEF.

In Multiple Data mode, if the number of data written in TWIHS_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and TWIHS_FSR.TXFPTEF is set.

A FIFO underflow is reported in TWIHS_FSR.

In Multiple Data mode, if the number of data read in TWIHS_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and TWIHS_FSR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in TWIHS_THR/TWIHS_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit or Receive pointer error occurs, a software reset must be performed using TWIHS_CR.SWRST. Note that issuing a software while transmitting might leave a slave in an unknown state holding the TWD line. In such case, a Bus Clear Command will allow to make the slave release the TWD line (the first frame sent after might not be received properly by the slave).

#### 45.6.6.11 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field TWIHS_FMR.TXFTHRES. Each time the Transmit FIFO level goes from ‘above threshold’ to ‘equal to or below threshold’, the flag TWIHS_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field TWIHS_FMR.RXFTHRES. Each time the Receive FIFO level goes from ‘below threshold’ to ‘equal to or above threshold’, the flag TWIHS_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using TWIHS_FIER and TWIHS_FIDR.

#### 45.6.6.12 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through TWIHS_FIER and TWIHS_FIDR.

FIFO flags state can be read in TWIHS_FSR. They are cleared when TWIHS_FSR is read.

### 45.6.7 TWIHS Comparison Function on Received Character

The comparison function differs if asynchronous partial wakeup (SleepWalking) is enabled or not.

If asynchronous partial wakeup is disabled (see the section “Power Management Controller (PMC)”), the TWIHS can extend the address matching on up to three slave addresses. The SADR1EN, SADR2EN and SADR3EN bits in TWIHS_SMR enable address matching on additional addresses which can be configured through SADR1, SADR2 and SADR3 fields in the TWIHS_SWMR. The DATAMEN bit in the TWIHS_SMR has no effect.

The SVACC bit is set when there is a comparison match with the received slave address.

### 45.6.8 Register Write Protection

To prevent any single software error from corrupting TWIHS behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the TWIHS Write Protection Mode Register (TWIHS_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the TWIHS Write Protection Status Register (TWIHS_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading TWIHS_WPSR.

The following registers can be write-protected:

- TWIHS Slave Mode Register
- TWIHS Clock Waveform Generator Register
- TWIHS SMBus Timing Register
- TWIHS SleepWalking Matching Register

## 45.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | TWIHS_CR | 7:0 | SWRST | QUICK | SVDIS | SVEN | MSDIS | MSEN | STOP | START |

### 45.7.1 TWIHS Control Register

**Name:** TWIHS_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | FIFODIS | FIFOEN | | LOCKCLR | | THRCLR |
| Access | | | W | W | | W | | W |
| Reset | | | – | – | | – | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ACMDIS | ACMEN |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CLEAR | PECRQ | PECDIS | PECEN | SMBDIS | SMBEN | HSDIS | HSEN |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SWRST | QUICK | SVDIS | SVEN | MSDIS | MSEN | STOP | START |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 29 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the Transmit and Receive FIFOs. |

**Bit 28 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Transmit and Receive FIFOs. |

**Bit 26 – LOCKCLR** Lock Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clears the TWIHS FSM lock. |

**Bit 24 – THRCLR** Transmit Holding Register Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clears the Transmit Holding Register and sets TXRDY, TXCOMP flags. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, sends a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWIHS High-Speed Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode disabled. |

**Bit 8 – HSEN** TWIHS High-Speed Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, a SMBus Quick Command is sent. |

**Bit 5 – SVDIS** TWIHS Slave Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in case of read operation. In write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN** TWIHS Slave Mode Enabled
Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS** TWIHS Master Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN** TWIHS Master Mode Enabled
Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Master mode (MSDIS must be written to 0). |

**Bit 1 – STOP** Send a STOP Condition

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | STOP condition is sent just after completing the current byte transmission in Master Read mode.<br>• In single data byte master read, both START and STOP must be set.<br>• In multiple data bytes master read, the STOP must be set after the last data received but one.<br>• In Master Read mode, if a NACK bit is received, the STOP is automatically performed.<br>• In master data write operation, a STOP condition will be sent after the transmission of the current data is finished. |

**Bit 0 – START** Send a START Condition
This action is necessary when the TWIHS peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (TWIHS_THR).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A frame beginning with a START bit is transmitted according to the features defined in the TWIHS Master Mode Register (TWIHS_MMR). |

### 45.7.2 TWIHS Control Register (FIFO_ENABLED)

**Name:** TWIHS_CR (FIFO_ENABLED)
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

This configuration is relevant only if TWIHS.CR.FIFOEN = ‘1’.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | FIFODIS | FIFOEN | | TXFLCLR | RXFCLR | TXFCLR |
| Access | | | W | W | | W | W | W |

| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SWRST | QUICK | SVDIS | SVEN | MSDIS | MSEN | STOP | START |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 29 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the Transmit and Receive FIFOs. |

**Bit 28 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Transmit and Receive FIFOs. |

**Bit 26 – TXFLCLR** Transmit FIFO Lock CLEAR

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clears the Transmit FIFO Lock. |

**Bit 25 – RXFCLR** Receive FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Clears the Receive FIFO, Receive FIFO will become empty. |

**Bit 24 – TXFCLR** Transmit FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clears the Transmit FIFO, Transmit FIFO will become empty. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, sends a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWIHS High-Speed Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode disabled. |

**Bit 8 – HSEN** TWIHS High-Speed Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, a SMBus Quick Command is sent. |

**Bit 5 – SVDIS** TWIHS Slave Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in case of read operation. In write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN** TWIHS Slave Mode Enabled
Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS** TWIHS Master Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN** TWIHS Master Mode Enabled
Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Master mode (MSDIS must be written to 0). |

**Bit 1 – STOP** Send a STOP Condition

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | STOP condition is sent just after completing the current byte transmission in Master Read mode.<br>• In single data byte master read, both START and STOP must be set.<br>• In multiple data bytes master read, the STOP must be set after the last data received but one.<br>• In Master Read mode, if a NACK bit is received, the STOP is automatically performed.<br>• In master data write operation, a STOP condition will be sent after the transmission of the current data is finished. |

**Bit 0 – START** Send a START Condition
This action is necessary when the TWIHS peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (TWIHS_THR).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A frame beginning with a START bit is transmitted according to the features defined in the TWIHS Master Mode Register (TWIHS_MMR). |

### 45.7.3 TWIHS Master Mode Register

**Name:** TWIHS_MMR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bits 22:16 – DADR[6:0]** Device Address
The device address is used to access slave devices in Read or Write mode. These bits are only used in Master mode.

**Bit 12 – MREAD** Master Read Direction

| Value | Description |
|---|---|
| 0 | Master write direction. |
| 1 | Master read direction. |

**Bits 9:8 – IADRSZ[1:0]** Internal Device Address Size

| Value | Name | Description |
|---|---|---|
| 0 | NONE | No internal device address |
| 1 | 1_BYTE | One-byte internal device address |
| 2 | 2_BYTE | Two-byte internal device address |
| 3 | 3_BYTE | Three-byte internal device address |

### 45.7.4 TWIHS Slave Mode Register

**Name:** TWIHS_SMR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TWIHS Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DATAMEN | SADR3EN | SADR2EN | SADR1EN | | | | |
| Access | R/W | R/W | R/W | R/W | | | | |
| Reset | 0 | 0 | 0 | 0 | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | SADR[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | MASK[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | SCLWSDIS | | | SMHH | SMDA | | NACKEN |
| Access | | R/W | | | R/W | R/W | | R/W |
| Reset | | 0 | | | 0 | 0 | | 0 |

**Bit 31 – DATAMEN** Data Matching Enable

| Value | Description |
|---|---|
| 0 | Data matching on first received data is disabled. |
| 1 | Data matching on first received data is enabled. |

**Bit 30 – SADR3EN** Slave Address 3 Enable

| Value | Description |
|---|---|
| 0 | Slave address 3 matching is disabled. |
| 1 | Slave address 3 matching is enabled. |

**Bit 29 – SADR2EN** Slave Address 2 Enable

| Value | Description |
|---|---|
| 0 | Slave address 2 matching is disabled. |
| 1 | Slave address 2 matching is enabled. |

**Bit 28 – SADR1EN** Slave Address 1 Enable

| Value | Description |
|---|---|
| 0 | Slave address 1 matching is disabled. |

| Value | Description |
|---|---|
| 1 | Slave address 1 matching is enabled. |

**Bits 22:16 – SADR[6:0]** Slave Address
The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

**Bits 14:8 – MASK[6:0]** Slave Address Mask
A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to 1, the corresponding SADR bit is masked.

If the MASK field value is 0, no mask is applied to the SADR field.

**Bit 6 – SCLWSDIS** Clock Wait State Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clock stretching disabled in Slave mode, OVRE and UNRE indicate an overrun/underrun. |

**Bit 3 – SMHH** SMBus Host Header

| Value | Description |
|---|---|
| 0 | Acknowledge of the SMBus host header disabled. |
| 1 | Acknowledge of the SMBus host header enabled. |

**Bit 2 – SMDA** SMBus Default Address

| Value | Description |
|---|---|
| 0 | Acknowledge of the SMBus default address disabled. |
| 1 | Acknowledge of the SMBus default address enabled. |

**Bit 0 – NACKEN** Slave Receiver Data Phase NACK enable

| Value | Description |
|---|---|
| 0 | Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |
| 1 | NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |

### 45.7.5 TWIHS Internal Address Register

**Name:** TWIHS_IADR
**Offset:** 0x0C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | IADR[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IADR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:0 – IADR[23:0]** Internal Address
0, 1, 2 or 3 bytes depending on IADRSZ.

### 45.7.6 TWIHS Clock Waveform Generator Register

**Name:** TWIHS_CWGR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TWIHS Write Protection Mode Register.

TWIHS_CWGR is used in Master mode only.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | HOLD[4:0] | | | | |
| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |
| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | | | | CKSRC | | CKDIV[2:0] | | |
| Access | | | | R/W | | R/W | R/W | R/W |
| Reset | | | | 0 | | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| | CHDIV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CLDIV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 28:24 – HOLD[4:0]** TWD Hold Time Versus TWCK Falling
If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I2C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of (HOLD + 3) × $t_{peripheral\ clock}$.

**Bit 20 – CKSRC** Transfer Rate Clock Source

| Value | Name | Description |
|---|---|---|
| 0 | PERIPH_CK | Peripheral clock is used to generate the TWIHS baud rate. |
| 1 | GCLK | GCLK is used to generate the TWIHS baud rate. |

**Bits 18:16 – CKDIV[2:0]** Clock Divider
The CKDIV is used to increase both SCL high and low periods.

**Bits 15:8 – CHDIV[7:0]** Clock High Divider
The SCL high period is defined as follows:

If CKSRC = 0

$t_{high} = ((CHDIV \times 2^{CKDIV}) + 3) \times t_{peripheral\ clock}$

If CKSRC = 1

$t_{high} = (CHDIV \times 2^{CKDIV}) \times t_{external\ clock}$

**Bits 7:0 – CLDIV[7:0]** Clock Low Divider
The SCL low period is defined as follows:

If CKSRC = 0

$t_{low} = ((CLDIV \times 2^{CKDIV}) + 3) \times t_{peripheral\ clock}$

If CKSRC = 1

$t_{low} = (CLDIV \times 2^{CKDIV}) \times t_{external\ clock}$

### 45.7.7 TWIHS Status Register

**Name:** TWIHS_SR
**Offset:** 0x20
**Reset:** 0x03000009
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | SDA | SCL |
| Access | | | | | | | R | R |
| Reset | | | | | | | 1 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | | | | EOSACC | SCLWS | ARBLST | NACK |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNRE | OVRE | GACC | SVACC | SVREAD | TXRDY | RXRDY | TXCOMP |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |

**Bit 25 – SDA** SDA Line Value

| Value | Description |
|---|---|
| 0 | SDA line sampled value is ‘0’. |
| 1 | SDA line sampled value is ‘1’. |

**Bit 24 – SCL** SCL Line Value

| Value | Description |
|---|---|
| 0 | SCL line sampled value is ‘0’. |
| 1 | SCL line sampled value is ‘1.’ |

**Bit 23 – LOCK** TWIHS Lock due to Frame Errors (cleared by writing a one to bit LOCKCLR in TWIHS_CR)

| Value | Description |
|---|---|
| 0 | The TWIHS is not locked or LOCKCLR command issued in TWIHS_CR. |
| 1 | The TWIHS is locked due to frame errors (see Handling Errors in Alternative Command). |

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Host Header Address received since the last read of TWIHS_SR. |

| Value | Description |
|---|---|
| 1 | An SMBus Host Header Address was received since the last read of TWIHS_SR. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Default Address received since the last read of TWIHS_SR. |
| 1 | An SMBus Default Address was received since the last read of TWIHS_SR. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus PEC error occurred since the last read of TWIHS_SR. |
| 1 | An SMBus PEC error occurred since the last read of TWIHS_SR. |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus timeout occurred since the last read of TWIHS_SR. |
| 1 | An SMBus timeout occurred since the last read of TWIHS_SR. |

**Bit 16 – MCACK** Master Code Acknowledge (cleared on read)
MACK used in Slave mode:

| Value | Description |
|---|---|
| 0 | No Master Code has been received since the last read of TWIHS_SR. |
| 1 | A Master Code has been received since the last read of TWIHS_SR. |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)
This bit is used in Slave mode only.

EOSACC behavior can be seen in Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | A slave access is being performing. |
| 1 | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State
This bit is used in Slave mode only.

SCLWS behavior can be seen in the figures, Clock Stretching in Read Mode and Clock Stretching in Write Mode.

| Value | Description |
|---|---|
| 0 | The clock is not stretched. |
| 1 | The clock is stretched. TWIHS_THR / TWIHS_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)
This bit is used in Master mode only.

| Value | Description |
|---|---|
| 0 | Arbitration won. |
| 1 | Arbitration lost. Another master of the TWIHS bus has won the multimaster arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)

- NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWIHS slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

- NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill TWIHS_THR even if TXRDY is set, because it means that the master stops the data transfer or re-initiate it.

**Note:** In Slave Write mode, all data are acknowledged by the TWIHS.

**Bit 7 – UNRE** Underrun Error (cleared on read)
This bit is used only if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | TWIHS_THR has been filled on time. |
| 1 | TWIHS_THR has not been filled on time. |

**Bit 6 – OVRE** Overrun Error (cleared on read)
This bit is used only if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | TWIHS_RHR has not been loaded while RXRDY was set. |
| 1 | TWIHS_RHR has been loaded while RXRDY was set. Reset by read in TWIHS_SR when TXCOMP is set. |

**Bit 5 – GACC** General Call Access (cleared on read)
This bit is used in Slave mode only.

GACC behavior can be seen in Master Performs a General Call.

| Value | Description |
|---|---|
| 0 | No general call has been detected. |
| 1 | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

**Bit 4 – SVACC** Slave Access
This bit is used in Slave mode only.

SVACC behavior can be seen in Read Access Ordered by a Master, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | TWIHS is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected. |
| 1 | Indicates that the address decoding sequence has matched (A master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

**Bit 3 – SVREAD** Slave Read
This bit is used in Slave mode only. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in Read Access Ordered by a Master, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | Indicates that a write access is performed by a master. |
| 1 | Indicates that a read access is performed by a master. |

**Bit 2 – TXRDY** Transmit Holding Register Ready (cleared by writing TWIHS_THR)

- TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into TWIHS_THR.

1: As soon as a data byte is transferred from TWIHS_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWIHS).

TXRDY behavior in Master mode can be seen in Master Write with One Data Byte, Master Write with Multiple Data Bytes and Master Write with One-Byte Internal Address and Multiple Data Bytes.

- TXRDY used in Slave mode:

0: As soon as data is written in the TWIHS_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that the TWIHS_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission is stopped. Thus when TRDY = NACK = 1, the user must not fill TWIHS_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in Read Access Ordered by a Master, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared by reading TWIHS_RHR)
RXRDY behavior in Master mode can be seen in Master Read with One Data Byte, Master Read with Multiple Data Bytes and Master Read Clock Stretching with Multiple Data Bytes.

RXRDY behavior in Slave mode can be seen in Write Access Ordered by a Master, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | No character has been received since the last TWIHS_RHR read operation. |

| Value | Description |
|---|---|
| 1 | A byte has been received in the TWIHS_RHR since the last read. |

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing TWIHS_THR)

- TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in Master Write with One-Byte Internal Address and Multiple Data Bytes and in Master Read with Multiple Data Bytes.

- TXCOMP used in Slave mode:

0: As soon as a START is detected.

1: After a STOP or a REPEATED START + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

### 45.7.8 TWIHS Status Register (FIFO_ENABLED)

**Name:** TWIHS_SR (FIFO_ENABLED)
**Offset:** 0x20
**Reset:** 0x03000009
**Property:** Read-only

This configuration is relevant only if TWIHS_CR.FIFOEN = ‘1’.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | SDA | SCL |
| Access | | | | | | | R | R |
| Reset | | | | | | | 1 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | TXFLOCK | | SMBHHM | SMBDAM | PECERR | TOUT | | MCACK |
| Access | R | | R | R | R | R | | R |
| Reset | 0 | | 0 | 0 | 0 | 0 | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | EOSACC | SCLWS | ARBLST | NACK |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNRE | OVRE | GACC | SVACC | SVREAD | TXRDY | RXRDY | TXCOMP |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |

**Bit 25 – SDA** SDA Line Value

| Value | Description |
|---|---|
| 0 | SDA line sampled value is ‘0’. |
| 1 | SDA line sampled value is ‘1’. |

**Bit 24 – SCL** SCL Line Value

| Value | Description |
|---|---|
| 0 | SCL line sampled value is ‘0’. |
| 1 | SCL line sampled value is ‘1.’ |

**Bit 23 – TXFLOCK** Transmit FIFO Lock

| Value | Description |
|---|---|
| 0 | The Transmit FIFO is not locked. |
| 1 | The Transmit FIFO is locked. |

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Host Header Address received since the last read of TWIHS_SR. |

| Value | Description |
|---|---|
| 1 | An SMBus Host Header Address was received since the last read of TWIHS_SR. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Default Address received since the last read of TWIHS_SR. |
| 1 | An SMBus Default Address was received since the last read of TWIHS_SR. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus PEC error occurred since the last read of TWIHS_SR. |
| 1 | An SMBus PEC error occurred since the last read of TWIHS_SR. |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus timeout occurred since the last read of TWIHS_SR. |
| 1 | An SMBus timeout occurred since the last read of TWIHS_SR. |

**Bit 16 – MCACK** Master Code Acknowledge (cleared on read)

- MACK used in Slave mode:

| Value | Description |
|---|---|
| 0 | No Master Code has been received since the last read of TWIHS_SR. |
| 1 | A Master Code has been received since the last read of TWIHS_SR. |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)
This bit is used in Slave mode only.

EOSACC behavior can be seen in Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | A slave access is being performing. |
| 1 | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State
This bit is used in Slave mode only.

SCLWS behavior can be seen in Clock Stretching in Read Mode and Clock Stretching in Write Mode.

| Value | Description |
|---|---|
| 0 | The clock is not stretched. |
| 1 | The clock is stretched. TWIHS_THR / TWIHS_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)
This bit is used in Master mode only.

| Value | Description |
|---|---|
| 0 | Arbitration won. |
| 1 | Arbitration lost. Another master of the TWIHS bus has won the multimaster arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)
**Note:** In Slave Write mode, all data are acknowledged by the TWIHS.

- NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWIHS slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

- NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill TWIHS_THR even if TXRDY is set, because it means that the master stops the data transfer or re-initiate it.

**Bit 7 – UNRE** Underrun Error (cleared on read)
This bit is used only if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | TWIHS_THR has been filled on time. |
| 1 | TWIHS_THR has not been filled on time. |

**Bit 6 – OVRE** Overrun Error (cleared on read)
This bit is used only if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | TWIHS_RHR has not been loaded while RXRDY was set. |
| 1 | TWIHS_RHR has been loaded while RXRDY was set. Reset by read in TWIHS_SR when TXCOMP is set. |

**Bit 5 – GACC** General Call Access (cleared on read)
This bit is used in Slave mode only.

GACC behavior can be seen in Master Performs a General Call.

| Value | Description |
|---|---|
| 0 | No general call has been detected. |
| 1 | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

**Bit 4 – SVACC** Slave Access
This bit is used in Slave mode only.

SVACC behavior can be seen in Read Access Ordered by a Master, Write Access Ordered by a Master, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | TWIHS is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected. |
| 1 | Indicates that the address decoding sequence has matched (A master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

**Bit 3 – SVREAD** Slave Read
This bit is used in Slave mode only. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in Read Access Ordered by a Master, Write Access Ordered by a Master, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | Indicates that a write access is performed by a master. |
| 1 | Indicates that a read access is performed by a master. |

**Bit 2 – TXRDY** Transmit Holding Register Ready (cleared by writing TWIHS_THR)

- TXRDY used in Master mode:

TXRDY behavior in Master mode can be seen in Master Write with One Data Byte, Master Write with Multiple Data Bytes and Master Write with One-Byte Internal Address and Multiple Data Bytes.

- TXRDY used in Slave mode:

If TXRDY is high and if a NACK has been detected, the transmission is stopped. Thus when TRDY = NACK = 1, the user must not fill TWIHS_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in Read Access Ordered by a Master, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into TWIHS_THR. |
| 1 | As soon as a data byte is transferred from TWIHS_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWIHS). |
| 0 | As soon as data is written in the TWIHS_THR, until this data has been transmitted and acknowledged (ACK or NACK). |
| 1 | Indicates that the TWIHS_THR is empty and that data has been transmitted and acknowledged. |

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared by reading TWIHS_RHR)
RXRDY behavior in Master mode can be seen in Master Read with One Data Byte, Master Read with Multiple Data Bytes and Master Read Clock Stretching with Multiple Data Bytes.

RXRDY behavior in Slave mode can be seen in Write Access Ordered by a Master, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | No character has been received since the last TWIHS_RHR read operation. |

| Value | Description |
|---|---|
| 1 | A byte has been received in the TWIHS_RHR since the last read. |

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing TWIHS_THR)

- TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in Master Write with One-Byte Internal Address and Multiple Data Bytes and in Master Read with Multiple Data Bytes.

- TXCOMP used in Slave mode:

0: As soon as a START is detected.

1: After a STOP or a REPEATED START + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

### 45.7.9 TWIHS SMBus Timing Register

**Name:** TWIHS_SMBTR
**Offset:** 0x38
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TWIHS Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | THMAX[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | TLOWM[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TLOWS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PRESC[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 31:24 – THMAX[7:0]** Clock High Maximum Cycles
Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

**Bits 23:16 – TLOWM[7:0]** Master Clock Stretch Maximum Cycles

| Value | Description |
|---|---|
| 0 | TLOW:MEXT timeout check disabled. |
| 1-255 | Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT. |

**Bits 15:8 – TLOWS[7:0]** Slave Clock Stretch Maximum Cycles

| Value | Description |
|---|---|
| 0 | TLOW:SEXT timeout check disabled. |
| 1-255 | Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT. |

**Bits 3:0 – PRESC[3:0]** SMBus Clock Prescaler
Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:

$$f_{\text{Prescaled}} = \frac{f_{\text{peripheral clock}}}{2^{(\text{PRESC} + 1)}}$$

### 45.7.10 TWIHS Alternative Command Register

**Name:** TWIHS_ACR
**Offset:** 0x40
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | NPEC | NDIR |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | PEC | DIR |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DATAL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 25 – NPEC** Next PEC Request (SMBus Mode only)

| Value | Description |
|---|---|
| 0 | The next transfer does not use a PEC byte. |
| 1 | The next transfer uses a PEC byte. |

**Bit 24 – NDIR** Next Transfer Direction

| Value | Description |
|---|---|
| 0 | Write direction. |
| 1 | Read direction. |

**Bits 23:16 – NDATAL[7:0]** Next Data Length

| Value | Description |
|---|---|
| 0 | No data to send (see Alternative Command. |
| 1-255 | Number of bytes to send for the next transfer. |

**Bit 9 – PEC** PEC Request (SMBus Mode only)

| Value | Description |
|---|---|
| 0 | The transfer does not use a PEC byte. |
| 1 | The transfer uses a PEC byte. |

**Bit 8 – DIR** Transfer Direction

| Value | Description |
|---|---|
| 0 | Write direction. |
| 1 | Read direction. |

**Bits 7:0 – DATAL[7:0]** Data Length

| Value | Description |
|---|---|
| 0 | No data to send (see Alternative Command). |
| 1-255 | Number of bytes to send during the transfer. |

### 45.7.11 TWIHS Filter Register

**Name:** TWIHS_FILTR
**Offset:** 0x44
**Reset:** 0x00000000
**Property:** Read/Write

TWIHS digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | THRES[2:0] | | |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | PADFCFG | PADFEN | FILT |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 10:8 – THRES[2:0]** Digital Filter Threshold

| Value | Description |
|---|---|
| 0 | No filtering applied on TWIHS inputs. |
| 1-7 | Maximum pulse width of spikes to be suppressed by the input filter, defined in peripheral clock cycles. |

**Bit 2 – PADFCFG** PAD Filter Config
See the electrical characteristics section for filter configuration details.

**Bit 1 – PADFEN** PAD Filter Enable

| Value | Description |
|---|---|
| 0 | PAD analog filter is disabled. |
| 1 | PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.) |

**Bit 0 – FILT** RX Digital Filter

| Value | Description |
|---|---|
| 0 | No filtering applied on TWIHS inputs. |
| 1 | TWIHS input filtering is active (only in Standard and Fast modes) |

### 45.7.12 TWIHS Interrupt Enable Register

**Name:** TWIHS_IER
**Offset:** 0x24
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | SMBHHM | SMBDAM | PECERR | TOUT | | MCACK |
| Access | | | W | W | W | W | | W |
| Reset | | | – | – | – | – | | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | EOSACC | SCL_WS | ARBLST | NACK |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNRE | OVRE | GACC | SVACC | | TXRDY | RXRDY | TXCOMP |
| Access | W | W | W | W | | W | W | W |
| Reset | – | – | – | – | | – | – | – |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Enable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Enable

**Bit 19 – PECERR** PEC Error Interrupt Enable

**Bit 18 – TOUT** Timeout Error Interrupt Enable

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Enable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Enable

**Bit 10 – SCL_WS** Clock Wait State Interrupt Enable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Enable

**Bit 8 – NACK** Not Acknowledge Interrupt Enable

**Bit 7 – UNRE** Underrun Error Interrupt Enable

**Bit 6 – OVRE** Overrun Error Interrupt Enable

**Bit 5 – GACC** General Call Access Interrupt Enable

**Bit 4 – SVACC** Slave Access Interrupt Enable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Enable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Enable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Enable

### 45.7.13 TWIHS Interrupt Disable Register

**Name:** TWIHS_IDR
**Offset:** 0x28
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Disable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Disable

**Bit 19 – PECERR** PEC Error Interrupt Disable

**Bit 18 – TOUT** Timeout Error Interrupt Disable

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Disable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Disable

**Bit 10 – SCL_WS** Clock Wait State Interrupt Disable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Disable

**Bit 8 – NACK** Not Acknowledge Interrupt Disable

**Bit 7 – UNRE** Underrun Error Interrupt Disable

**Bit 6 – OVRE** Overrun Error Interrupt Disable

**Bit 5 – GACC** General Call Access Interrupt Disable

**Bit 4 – SVACC** Slave Access Interrupt Disable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Disable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Disable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Disable

### 45.7.14 TWIHS Interrupt Mask Register

**Name:** TWIHS_IMR
**Offset:** 0x2C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

**Bits 7:0 – RXDATA[7:0]** Master or Slave Receive Holding Data

### 45.7.16 TWIHS Receive Holding Register (FIFO Enabled)

**Name:** TWIHS_RHR (FIFO_ENABLED)
**Offset:** 0x30
**Reset:** 0x00000000
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in TWIHS_CR), refer to 45.6.6.8 Multiple Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RXDATA3[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RXDATA2[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RXDATA1[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RXDATA0[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – RXDATA3[7:0]** Master or Slave Receive Holding Data 3

**Bits 23:16 – RXDATA2[7:0]** Master or Slave Receive Holding Data 2

**Bits 15:8 – RXDATA1[7:0]** Master or Slave Receive Holding Data 1

**Bits 7:0 – RXDATA0[7:0]** Master or Slave Receive Holding Data 0

### 45.7.17 TWIHS SleepWalking Matching Register

**Name:** TWIHS_SWMR
**Offset:** 0x4C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TWIHS Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DATAM[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | SADR3[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | SADR2[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | SADR1[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DATAM[7:0]** Data Match
The TWIHS module extends the SleepWalking matching process to the first received data, comparing it with DATAM if DATAMEN bit is enabled.

**Bits 22:16 – SADR3[6:0]** Slave Address 3
Slave address 3. The TWIHS module matches on this additional address if SADR3EN bit is enabled.

**Bits 14:8 – SADR2[6:0]** Slave Address 2
Slave address 2. The TWIHS module matches on this additional address if SADR2EN bit is enabled.

**Bits 6:0 – SADR1[6:0]** Slave Address 1
Slave address 1. The TWIHS module matches on this additional address if SADR1EN bit is enabled.

### 45.7.18 TWIHS Transmit Holding Register

**Name:** TWIHS_THR
**Offset:** 0x34
**Reset:** 0x00000000
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| | TXDATA0[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – TXDATA3[7:0]** Master or Slave Transmit Holding Data 3

**Bits 23:16 – TXDATA2[7:0]** Master or Slave Transmit Holding Data 2

**Bits 15:8 – TXDATA1[7:0]** Master or Slave Transmit Holding Data 1

**Bits 7:0 – TXDATA0[7:0]** Master or Slave Transmit Holding Data 02

### 45.7.20 TWIHS FIFO Mode Register

**Name:** TWIHS_FMR
**Offset:** 0x50
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RXRDYM[1:0] | | | | TXRDYM[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

**Bits 29:24 – RXFTHRES[5:0]** Receive FIFO Threshold

| Value | Description |
|---|---|
| 0–16 | Defines the Receive FIFO threshold value (number of data). RXFTH flag in TWIHS_FSR will be set when Receive FIFO goes from “below” threshold state to “equal or above” threshold state. |

**Bits 21:16 – TXFTHRES[5:0]** Transmit FIFO Threshold

| Value | Description |
|---|---|
| 0–16 | Defines the Transmit FIFO threshold value (number of data). TXFTH flag in TWIHS_FSR will be set when Transmit FIFO goes from “above” threshold state to “equal or below” threshold state. |

**Bits 5:4 – RXRDYM[1:0]** Receiver Ready Mode
If FIFOs are enabled, the RXRDY flag (in TWIHS_SR) behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO |
| 1 | TWO_DATA | RXRDY will be at level ‘1’ when at least two unread data are in the Receive FIFO |

| Value | Name | Description |
|---|---|---|
| 2 | FOUR_DATA | RXRDY will be at level ‘1’ when at least four unread data are in the Receive FIFO |

**Bits 1:0 – TXRDYM[1:0]** Transmitter Ready Mode
If FIFOs are enabled, the TXRDY flag (in TWIHS_SR) behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | TXRDY will be at level ‘1’ when at least one data can be written in the Transmit FIFO |
| 1 | TWO_DATA | TXRDY will be at level ‘1’ when at least two data can be written in the Transmit FIFO |
| 2 | FOUR_DATA | TXRDY will be at level ‘1’ when at least four data can be written in the Transmit FIFO |

### 45.7.21 TWIHS FIFO Level Register

**Name:** TWIHS_FLR
**Offset:** 0x54
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFL[5:0] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFL[5:0] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 21:16 – RXFL[5:0]** Receive FIFO Level

| Value | Description |
|---|---|
| 0 | There is no unread data in the Receive FIFO |
| 1-16 | Indicates the number of unread DATA in the Receive FIFO |

**Bits 5:0 – TXFL[5:0]** Transmit FIFO Level

| Value | Description |
|---|---|
| 0 | There is no data in the Transmit FIFO |
| 1-16 | Indicates the number of DATA in the Transmit FIFO |

### 45.7.22 TWIHS FIFO Status Register

**Name:** TWIHS_FSR
**Offset:** 0x60
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag
See 45.6.6.10 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Receive FIFO pointer occurred |
| 1 | Receive FIFO pointer error occurred. Receiver must be reset |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag
See 45.6.6.10 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Transmit FIFO pointer occurred |
| 1 | Transmit FIFO pointer error occurred. Transceiver must be reset |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description |
|---|---|
| 0 | Number of unread DATA in Receive FIFO is below RXFTHRES threshold. |
| 1 | Number of unread DATA in Receive FIFO has reached RXFTHRES threshold since the last read of TWIHS_FSR. |

**Bit 4 – RXFFF** Receive FIFO Full Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty. |
| 1 | Receive FIFO has been filled since the last read of TWIHS_FSR. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty. |
| 1 | Receive FIFO has been emptied since the last read of TWIHS_FSR. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Number of DATA in Transmit FIFO is above TXFTHRES threshold. |
| 1 | Number of DATA in Transmit FIFO has reached TXFTHRES threshold since the last read of TWIHS_FSR. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not full. |
| 1 | Transmit FIFO has been filled since the last read of TWIHS_FSR. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not empty. |
| 1 | Transmit FIFO has been emptied since the last read of TWIHS_FSR. |

### 45.7.23 TWIHS FIFO Interrupt Enable Register

**Name:** TWIHS_FIER
**Offset:** 0x64
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 7 – RXFPTEF** RXFPTEF Interrupt Enable

**Bit 6 – TXFPTEF** TXFPTEF Interrupt Enable

**Bit 5 – RXFTHF** RXFTHF Interrupt Enable

**Bit 4 – RXFFF** RXFFF Interrupt Enable

**Bit 3 – RXFEF** RXFEF Interrupt Enable

**Bit 2 – TXFTHF** TXFTHF Interrupt Enable

**Bit 1 – TXFFF** TXFFF Interrupt Enable

**Bit 0 – TXFEF** TXFEF Interrupt Enable

### 45.7.24 TWIHS FIFO Interrupt Disable Register

**Name:** TWIHS_FIDR
**Offset:** 0x68
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 7 – RXFPTEF** RXFPTEF Interrupt Disable

**Bit 6 – TXFPTEF** TXFPTEF Interrupt Disable

**Bit 5 – RXFTHF** RXFTHF Interrupt Disable

**Bit 4 – RXFFF** RXFFF Interrupt Disable

**Bit 3 – RXFEF** RXFEF Interrupt Disable

**Bit 2 – TXFTHF** TXFTHF Interrupt Disable

**Bit 1 – TXFFF** TXFFF Interrupt Disable

**Bit 0 – TXFEF** TXFEF Interrupt Disable

### 45.7.25 TWIHS FIFO Interrupt Mask Register

**Name:** TWIHS_FIMR
**Offset:** 0x6C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Bits 31:8 – WPVSRC[23:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of the TWIHS_WPSR. |
| 1 | A write protection violation has occurred since the last read of the TWIHS_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 46. Flexible Serial Communication Controller (FLEXCOM)

## 46.1 Description

The Flexible Serial Communication Controller (FLEXCOM) offers several serial communication protocols that are managed by the three submodules USART, SPI, and TWI.

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full-duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver timeout enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote Loopback, Local Loopback and Automatic Echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, and SPI, with ISO7816 T = 0 or T = 1 smart card slots, and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

The Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 kbits per second in Fast mode and up to 3.4 Mbits per second in High-speed Slave mode only, based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and $I^2C$-compatible devices, such as a Real-Time Clock (RTC),

Dot Matrix/Graphic LCD Controller and temperature sensor. The TWI is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

Arbitration of the bus is performed internally and puts the TWI in Slave mode automatically if the bus arbitration is lost.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The following table lists the compatibility level of any Two-wire Interface in Master mode and a full $I^2C$ compatible device.

**Table 46-1. TWI Compatibility with $I^2C$ Standard**

| $I^2C$ Standard | TWI |
|---|---|
| Standard Mode Speed (100 kHz) | Supported |
| Fast Mode Speed (400 kHz) | Supported |
| High-speed Mode (Slave only, 3.4 MHz) | Supported |
| 7- or 10-bit(1) Slave Addressing | Supported |
| Repeated Start (Sr) Condition | Supported |
| ACK and NACK Management | Supported |
| Input Filtering | Supported |
| Slope Control | Not Supported |
| Clock Stretching | Supported |
| Multi Master Capability | Supported |

Notes: 1. 10-bit support in Master mode only

## 46.2 Embedded Characteristics

### 46.2.1 USART/UART Characteristics

- 32-byte Transmit and Receive FIFOs
- Programmable Baud Rate Generator
- Baud Rate can be Independent of the Processor/Peripheral Clock
- Comparison Function on Received Character
- 5-bit to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5 or 2 Stop Bits in Asynchronous Mode or 1 or 2 Stop Bits in Synchronous Mode
  - Parity Generation and Error Detection
  - Framing Error Detection, Overrun Error Detection
  - Digital Filter on Receive Line
  - MSB- or LSB-first
  - Optional Break Generation and Detection
  - By 8 or by 16 Oversampling Receiver Frequency
  - Optional Hardware Handshaking RTS-CTS

  - Receiver Timeout and Transmitter Timeguard
  - Optional Multidrop Mode with Address Generation and Detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK Handling, Error Counter with Repetition and Iteration Limit
- IrDA Modulation and Demodulation
  - Communication at up to 115.2 kbit/s
- SPI Mode
  - MASTER or Slave
  - Serial Clock Programmable Phase and Polarity
  - SPI Serial Clock (SCK) Frequency up to $f_{peripheral\ clock}/6$
- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 specifications
  - Master or Slave
  - Processing of Frames with Up to 256 Data Bytes
  - Response Data Length can be Configurable or Defined Automatically by the Identifier
  - Self-synchronization in Slave Node Configuration
  - Automatic Processing and Verification of the “Synch Break” and the “Synch Field”
  - “Synch Break” Detection Even When Partially Superimposed with a Data Byte
  - Automatic Identifier Parity Calculation/Sending and Verification
  - Parity Sending and Verification Can be Disabled
  - Automatic Checksum Calculation/sending and Verification
  - Checksum Sending and Verification Can be Disabled
  - Support Both “Classic” and “Enhanced” Checksum Types
  - Full LIN Error Checking and Reporting
  - Frame Slot Mode: Master Allocates Slots to the Scheduled Frames Automatically
  - Generation of the Wakeup Signal
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller (DMAC) Channels
  - Offers Buffer Transfer without Processor Intervention
- Register Write Protection

### 46.2.2 SPI Characteristics

- 32-byte Transmit and Receive FIFOs
- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
- Selectable Mode Fault Detection

- Master Mode Can Drive SPCK up to Peripheral Clock
- Master Mode Bit Rate Can Be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Two Chip Selects with External Decoder Support Allow Communication with up to 3 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

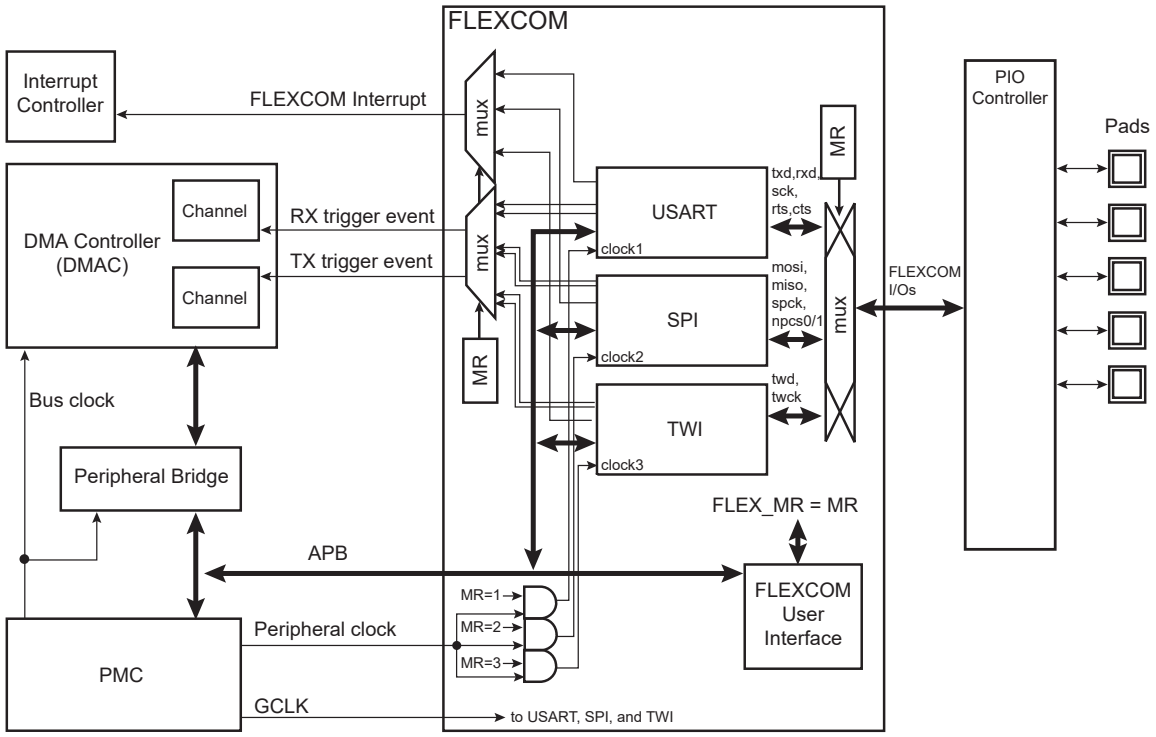
### 46.2.3 TWI/SMBus Characteristics

- 16-byte Transmit and Receive FIFOs
- Bit Rate: Up to 400 kbit/s in Fast Mode and 3.4 Mbit/s in High-Speed Mode (Slave Only)
- Bit Rate can be Independent of the Processor/Peripheral Clock
- SMBus Support
- Compatible with Two-wire Interface Serial Memory and $I^2C$ Compatible Devices(1)
- Master and Multi-Master Operation (Standard and Fast Mode Only)
- Slave Mode Operation (Standard, Fast and High-Speed Mode)
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations
- General Call Supported in Slave Mode
- Connection to DMA Controller Channels Optimizes Data Transfers
  - One Channel for the Receiver
  - One Channel for the Transmitter
- Register Write Protection

Note: 1. See table TWI Compatibility with $I^2C$ Standard for further details.

## 46.3 Block Diagram

**Figure 46-1. FLEXCOM Block Diagram**



## 46.4 I/O Lines Description

**Table 46-2. I/O Lines Description**

| Name | Description | | | Type |
|---|---|---|---|---|
| | USART/UART | SPI | TWI | |
| FLEXCOM_IO0 | TXD | MOSI | TWD | I/O |
| FLEXCOM_IO1 | RXD | MISO | TWCK | I/O |
| FLEXCOM_IO2 | SCK | SPCK | – | I/O |
| FLEXCOM_IO3 | CTS | NPCS0/NSS | – | I/O |
| FLEXCOM_IO4 | RTS | NPCS1 | – | O |

## 46.5 Product Dependencies

### 46.5.1 I/O Lines

The pins used for interfacing the FLEXCOM are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired FLEXCOM pins to their peripheral function. If I/O lines of the FLEXCOM are not used by the application, they can be used for other purposes by the PIO Controller.

### 46.5.2 Power Management

The peripheral clock is not continuously provided to the FLEXCOM. The programmer must first enable the FLEXCOM Clock in the Power Management Controller (PMC) before using the USART or SPI or TWI.

In SleepWalking mode (asynchronous partial wakeup), the PMC must be configured to enable SleepWalking for the FLEXCOM in the Sleepwalking Enable Register (PMC_SLPWK_ER). The peripheral clock can be automatically provided to the FLEXCOM, depending on the instructions (requests) provided by the FLEXCOM to the PMC.

### 46.5.3 Interrupt Sources

The FLEXCOM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the FLEXCOM interrupt requires the Interrupt Controller to be programmed first.

## 46.6 Register Accesses

Register accesses support 8-bit, 16-bit and 32-bit accesses, which means that only an 8-bit part of a 32-bit register can be written in one access, for instance. For this the access must be done with the right size at the right address.

8-bit, 16-bit and 32-bit accesses are supported for register accesses. However, a field in a register cannot be partially written (e.g., if a field is bigger than 8 bits, the whole field must be written).

This feature helps avoiding a read-modify-write process if only a small part of the register is to be modified.

## 46.7 USART Functional Description

### 46.7.1 Baud Rate Generator

The baud rate generator provides the bit period clock named “baud rate clock” to both the receiver and the transmitter.

Configuring the USCLKS field in FLEX_US_MR selects the baud rate generator clock from one of the following sources:

- the peripheral clock
- a division of the peripheral clock, the divider being product dependent, but generally set to 8
- a fully programmable generic clock (GCLK) provided by PMC and independent of processor/peripheral clock
- the external clock, available on the SCK pin

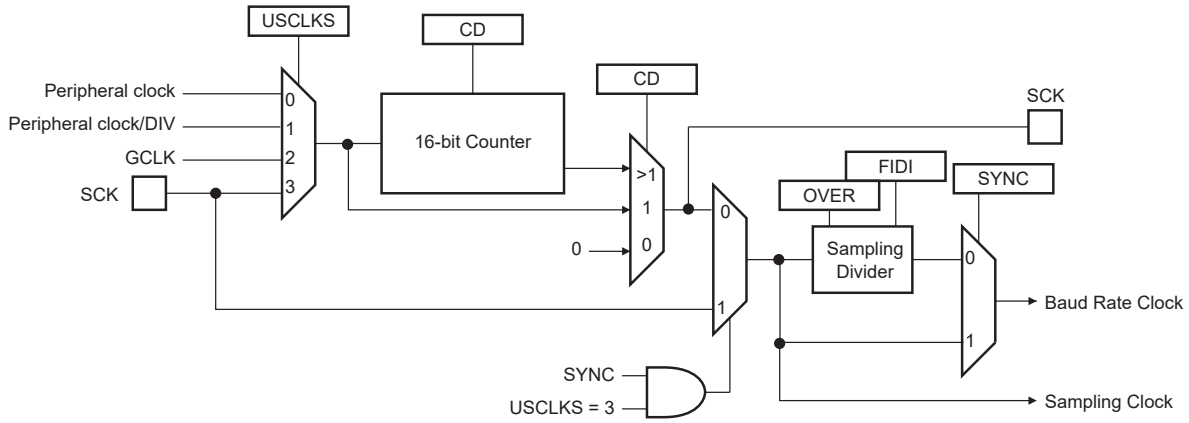
The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator Register (FLEX_US_BRGR). If a zero is written to CD, the baud rate generator does not generate any clock. If a one is written to CD, the divider is bypassed and becomes inactive.

If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must be at least three times lower than peripheral clock in USART mode (field USART_MODE differs from 0xE or 0xF) or six times lower in SPI mode (field USART_MODE equals 0xE or 0xF).

If GCLK is selected, the baud rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the USART transfer. The GCLK frequency must be at least three times lower than peripheral clock frequency.

If GCLK is selected (USCLKS = 2) and the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.

**Figure 46-2. Baud Rate Generator**



### 46.7.1.1 Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field-programmed in FLEX_US_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on the programming of FLEX_US_MR.OVER.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{(8(2 - \text{OVER})\text{CD})}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that peripheral clock is the highest possible clock and that the OVER bit is set.

#### 46.7.1.1.1 Baud Rate Calculation Example

The following table shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. It also shows the actual resulting baud rate and the error.

**Table 46-3. Baud Rate Example (OVER = 0)**

| Source Clock (MHz) | Expected Baud Rate (bit/s) | Calculation Result | CD | Actual Baud Rate (bit/s) | Error |
|---|---|---|---|---|---|
| 3,686,400 | 38,400 | 6.00 | 6 | 38,400.00 | 0.00% |
| 4,915,200 | 38,400 | 8.00 | 8 | 38,400.00 | 0.00% |
| 5,000,000 | 38,400 | 8.14 | 8 | 39,062.50 | 1.70% |
| 7,372,800 | 38,400 | 12.00 | 12 | 38,400.00 | 0.00% |
| 8,000,000 | 38,400 | 13.02 | 13 | 38,461.54 | 0.16% |
| 12,000,000 | 38,400 | 19.53 | 20 | 37,500.00 | 2.40% |
| 12,288,000 | 38,400 | 20.00 | 20 | 38,400.00 | 0.00% |
| 14,318,180 | 38,400 | 23.30 | 23 | 38,908.10 | 1.31% |

.....continued

| Source Clock (MHz) | Expected Baud Rate (bit/s) | Calculation Result | CD | Actual Baud Rate (bit/s) | Error |
|---|---|---|---|---|---|
| 14,745,600 | 38,400 | 24.00 | 24 | 38,400.00 | 0.00% |
| 18,432,000 | 38,400 | 30.00 | 30 | 38,400.00 | 0.00% |
| 24,000,000 | 38,400 | 39.06 | 39 | 38,461.54 | 0.16% |
| 24,576,000 | 38,400 | 40.00 | 40 | 38,400.00 | 0.00% |
| 25,000,000 | 38,400 | 40.69 | 40 | 38,109.76 | 0.76% |
| 32,000,000 | 38,400 | 52.08 | 52 | 38,461.54 | 0.16% |
| 32,768,000 | 38,400 | 53.33 | 53 | 38,641.51 | 0.63% |
| 33,000,000 | 38,400 | 53.71 | 54 | 38,194.44 | 0.54% |
| 40,000,000 | 38,400 | 65.10 | 65 | 38,461.54 | 0.16% |
| 50,000,000 | 38,400 | 81.38 | 81 | 38,580.25 | 0.47% |

The baud rate is calculated with the following formula:

Baud rate = MCK / CD × 16

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$\text{Error} = 1 - \left(\frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}}\right)$$

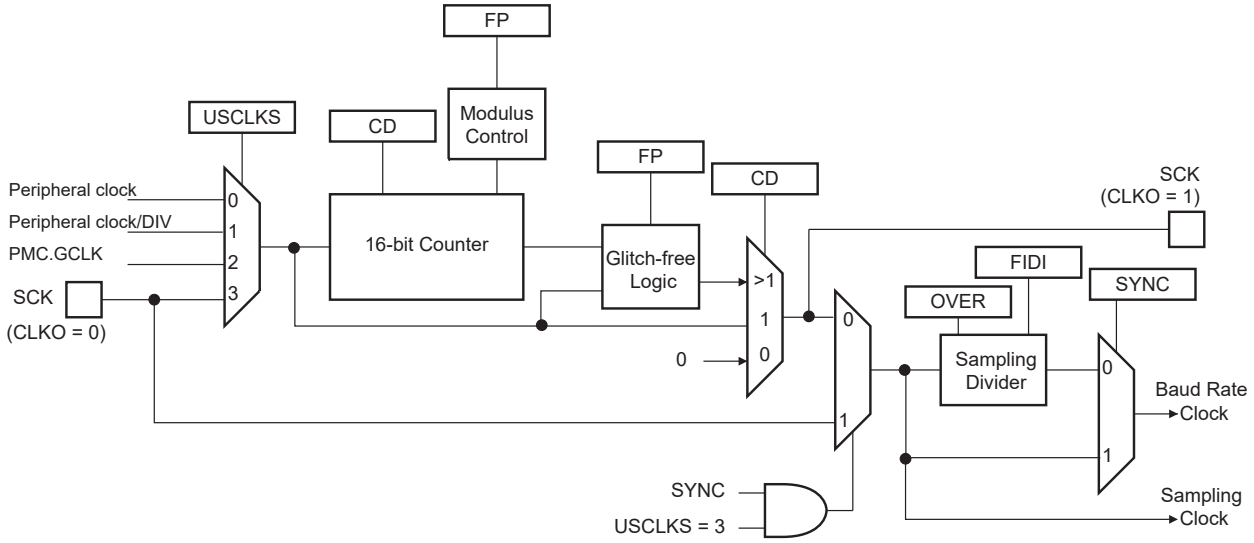
#### 46.7.1.2 Fractional Baud Rate in Asynchronous Mode

The baud rate generator previously defined is subject to the following limitation: the output frequency changes by only integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in FLEX_US_BRGR. If FP is not 0, the fractional part is activated. The resolution is one eighth of the clock divider. The fractional baud rate is calculated using the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\left(8(2 - \text{OVER})\left(\text{CD} + \frac{\text{FP}}{8}\right)\right)}$$

The modified architecture is presented in the following figure.

**Figure 46-3. Fractional Baud Rate Generator**



**WARNING** When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

#### 46.7.1.3 Baud Rate in Synchronous Mode or SPI Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the CD field in FLEX_US_BRGR:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\text{CD}}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3) and CLKO = 0 (Slave mode), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in FLEX_US_BRGR has no effect. The external clock frequency must be at least three times lower than the system clock. In Synchronous mode master (USCLKS = 0 or 1, CLKO = 1), the receive part limits the SCK maximum frequency to $f_{\text{peripheral clock}}/3$ in USART mode, or $f_{\text{peripheral clock}}/6$ in SPI mode.

When either the external clock SCK or the internal clock divided (peripheral clock/DIV or GCLK) is selected, the value programmed in CD must be even if the user has to ensure a 50:50 mark/space ratio on the SCK pin. If the peripheral clock is selected, the baud rate generator ensures a 50:50 duty cycle on the SCK pin, even if the value programmed in CD is odd.

#### 46.7.1.4 Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{\text{Di}}{\text{Fi}} \times f$$

where:

- B is the bit rate
- Di is the bit rate adjustment factor
- Fi is the clock frequency division factor

- f is the ISO7816 clock frequency (Hz)

Di is a binary value encoded on a 4-bit field, named DI, as represented in the following table.

**Table 46-4. Binary and Decimal Values for Di**

| DI field | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1000 | 1001 |
|---|---|---|---|---|---|---|---|---|
| Di (decimal) | 1 | 2 | 4 | 8 | 16 | 32 | 12 | 20 |

Fi is a binary value encoded on a 4-bit field, named FI, as represented in the following table.

**Table 46-5. Binary and Decimal Values for Fi**

| FI field | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1001 | 1010 | 1011 | 1100 | 1101 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Fi (decimal) | 372 | 372 | 558 | 744 | 1116 | 1488 | 1860 | 512 | 768 | 1024 | 1536 | 2048 |

The following table shows the resulting Fi/Di Ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

**Table 46-6. Possible Values for the Fi/Di Ratio**

| Fi/Di | 372 | 558 | 744 | 1116 | 1488 | 1806 | 512 | 768 | 1024 | 1536 | 2048 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | 372 | 558 | 744 | 1116 | 1488 | 1860 | 512 | 768 | 1024 | 1536 | 2048 |
| 2 | 186 | 279 | 372 | 558 | 744 | 930 | 256 | 384 | 512 | 768 | 1024 |
| 4 | 93 | 139.5 | 186 | 279 | 372 | 465 | 128 | 192 | 256 | 384 | 512 |
| 8 | 46.5 | 69.75 | 93 | 139.5 | 186 | 232.5 | 64 | 96 | 128 | 192 | 256 |
| 16 | 23.25 | 34.87 | 46.5 | 69.75 | 93 | 116.2 | 32 | 48 | 64 | 96 | 128 |
| 32 | 11.62 | 17.43 | 23.25 | 34.87 | 46.5 | 58.13 | 16 | 24 | 32 | 48 | 64 |
| 12 | 31 | 46.5 | 62 | 93 | 124 | 155 | 42.66 | 64 | 85.33 | 128 | 170.6 |
| 20 | 18.6 | 27.9 | 37.2 | 55.8 | 74.4 | 93 | 25.6 | 38.4 | 51.2 | 76.8 | 102.4 |

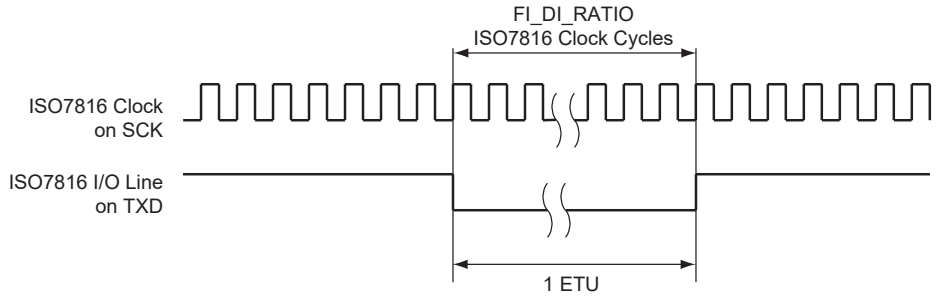
If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in FLEX_US_MR is first divided by the value programmed in field CD field in FLEX_US_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that FLEX_US_MR.CLKO can be set.

This clock is then divided by the value programmed in the FI_DI_RATIO field in the FI DI Ratio Register (FLEX_US_FIDI). This is performed by the Sampling Divider, which performs a division by up to 65535 in ISO7816 mode. The noninteger values of the Fi/Di Ratio are not supported and the user must program the FI_DI_RATIO field to a value as close as possible to the expected value.

The FI_DI_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate (Fi = 372, Di = 1).

The following figure shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO 7816 clock.

**Figure 46-4. Elementary Time Unit (ETU)**



### 46.7.2 Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the USART Control Register (FLEX_US_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in FLEX_US_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in FLEX_US_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in FLEX_US_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the USART Transmit Holding Register (FLEX_US_THR). If a timeguard is programmed, it is handled normally.

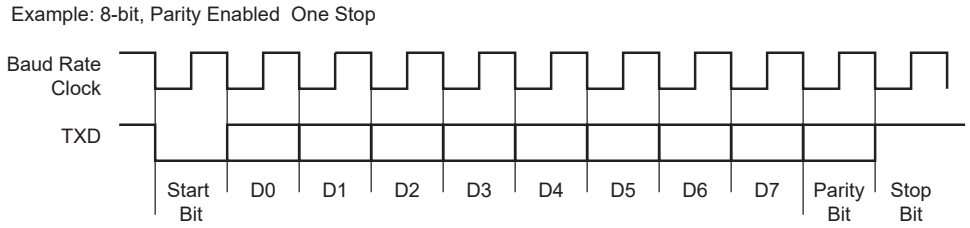
### 46.7.3 Synchronous and Asynchronous Modes

#### 46.7.3.1 Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, 1 optional parity bit and up to 2 stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX_US_MR. Nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in FLEX_US_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF bit in FLEX_US_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in FLEX_US_MR. The 1.5 stop bit is supported in Asynchronous mode only.

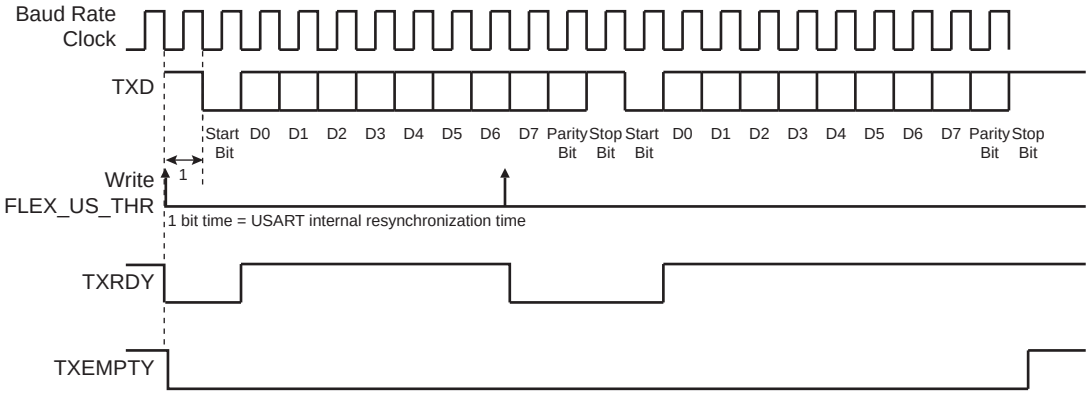
**Figure 46-5. Character Transmit**



The characters are sent by writing in FLEX_US_THR. The transmitter reports two status bits in the USART Channel Status Register (FLEX_US_CSR): TXRDY (Transmitter Ready), which indicates that FLEX_US_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX_US_THR have been processed. When the current character processing is completed, the last character written in FLEX_US_THR is transferred into the shift register of the transmitter and FLEX_US_THR is emptied, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX_US_THR while TXRDY is low has no effect and the written character is lost.

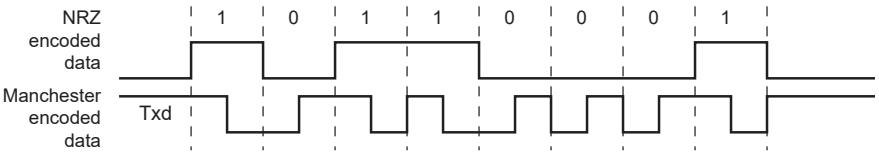
**Figure 46-6. Transmitter Status**



### 46.7.3.2 Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the FLEX_US_MR.MAN bit to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 01 10, assuming the default polarity of the encoder. The following figure illustrates this coding scheme.

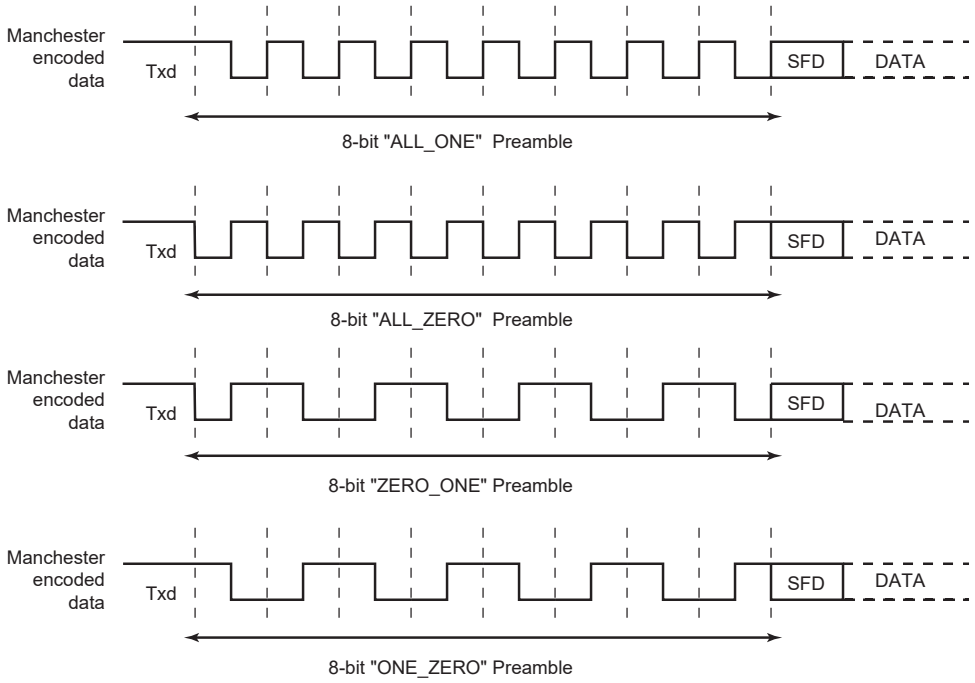
**Figure 46-7. NRZ to Manchester Encoding**



The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is

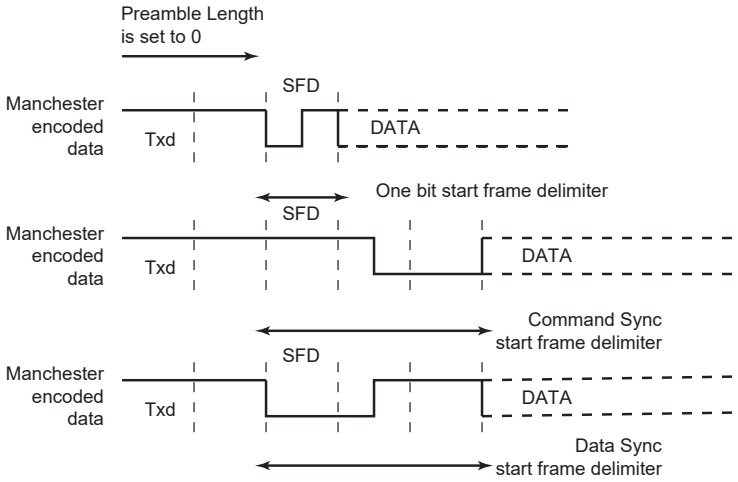
chosen among the following sequences: ALL_ONE, ALL_ZERO, ONE_ZERO or ZERO_ONE, writing the FLEX_US_MAN.TX_PP field. The TX_PL field is used to configure the preamble length. The following figure illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the FLEX_US_MAN.TX_MPOL bit. If the TX_MPOL bit is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition. If the TX_MPOL bit is set to one, a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

**Figure 46-8. Preamble Patterns, Default Polarity Assumed**



A start frame delimiter is to be configured using the FLEX_US_MR.ONEBIT bit. It consists of a user-defined pattern that indicates the beginning of a valid data. The following figure illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT = 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for the second one and a half bit times. If the FLEX_US_MR.MODSYNC bit is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC bit can be immediately updated with a modified character located in memory. To enable this mode, the FLEX_US_MR.VAR_SYNC bit must be set. In this case, the FLEX_US_MR.MODSYNC bit is bypassed and the sync configuration is held in the FLEX_US_THR.TXSYNH bit. The USART character format is modified and includes sync information.

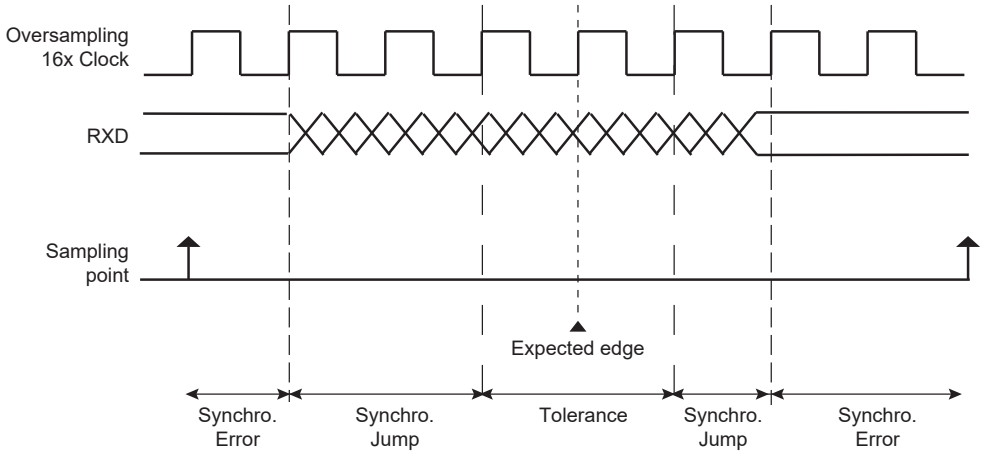
**Figure 46-9. Start Frame Delimiter**



#### 46.7.3.2.1 Drift Compensation

Drift compensation is available only in 16X Oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the FLEX_US_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

**Figure 46-10. Bit Resynchronization**



### 46.7.3.3 Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the FLEX_US_MR.OVER bit.

The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start bit is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism only, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the NBSTOP field, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

The following figures illustrate start detection and character reception when USART operates in Asynchronous mode.

**Figure 46-11. Asynchronous Start Detection**

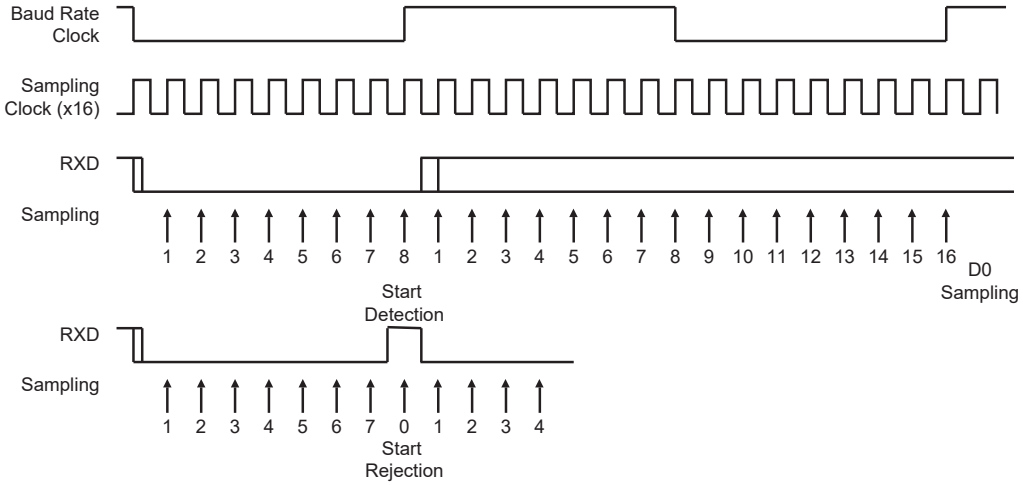


**Figure 46-12. Asynchronous Character Reception**

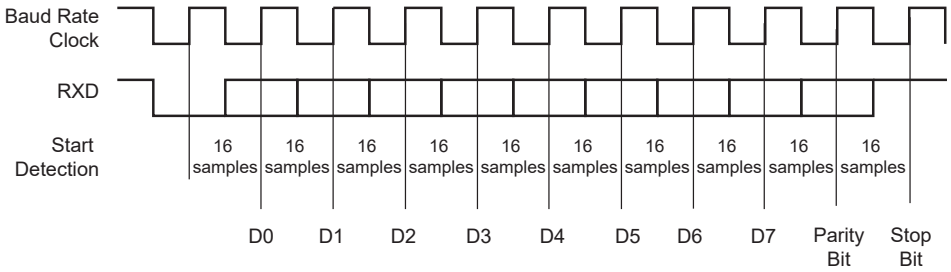
Example: 8-bit, Parity Enabled



### 46.7.3.4 Manchester Decoder

When the FLEX_US_MR.MAN bit is set, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

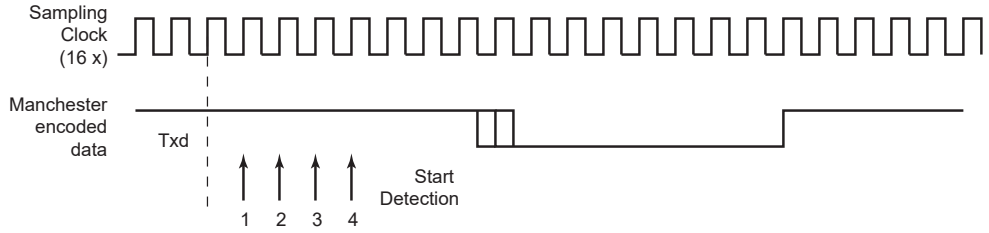
An optional preamble sequence can be defined. Its length is user-defined and totally independent of the transmitter side. Use the FLEX_US_MAN.RX_PL field to configure the length of the preamble sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with the FLEX_US_MAN.RX_MPOL bit. Depending on the desired application, the preamble pattern matching is to be defined via the FLEX_US_MAN.RX_PP field. See figure Preamble Patterns, Default Polarity Assumed for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT bit = 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT = 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by

detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See the following figure. The sample pulse rejection mechanism applies.

The FLEX_US_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive). The user must define RXIDLEV to ensure reliable synchronization. By default, RXIDLEV is set to one (receiver line is at level 1 when there is no activity).

**Figure 46-13. Asynchronous Start Bit Detection**



The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge.The minimum time threshold to estimate the bit value is three quarters of a bit time.

If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. The following figure illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, the MANE flag in FLEX_US_CSR is raised. It is cleared by writing a one to FLEX_US_CR.RSTSTA. See figure "Manchester Error Flag" below for an example of Manchester error detection during the data phase.

**Figure 46-14. Preamble Pattern Mismatch**

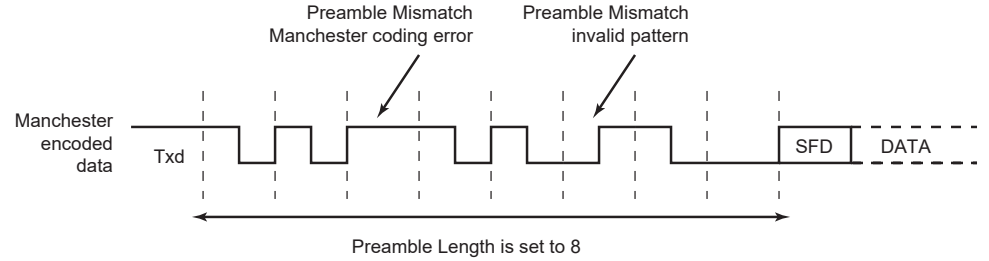


**Figure 46-15. Manchester Error Flag**

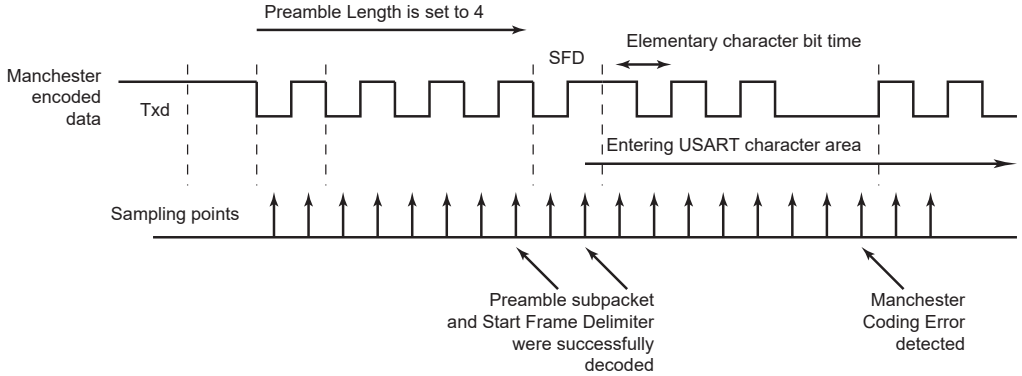


When the start frame delimiter is a sync pattern (ONEBIT = 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the Receive Holding Register (FLEX_US_RHR) and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.

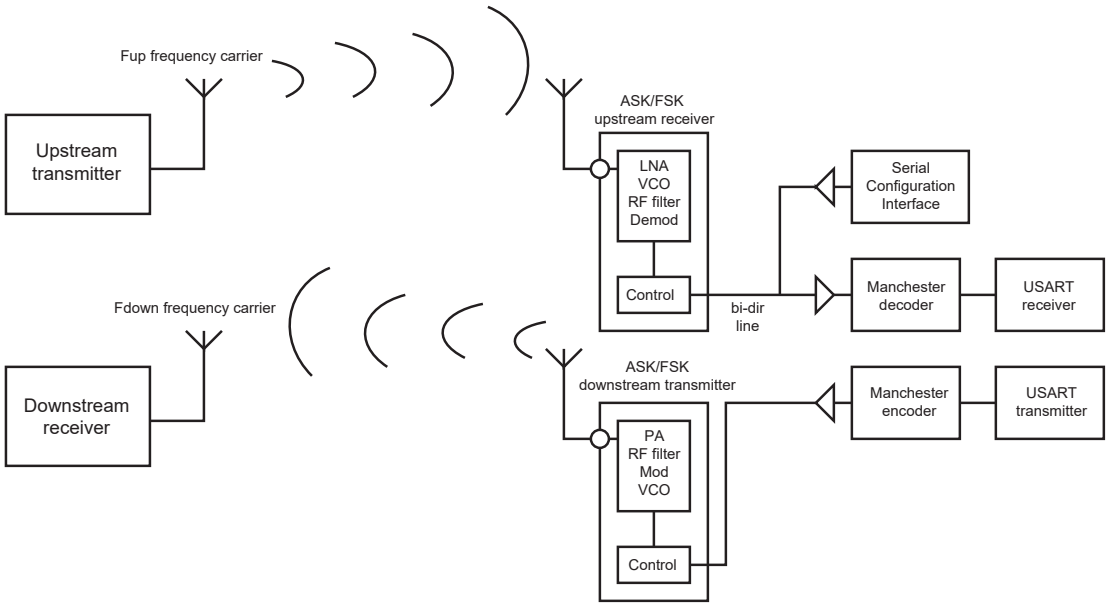
As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

#### 46.7.3.5 Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full-duplex radio transmission of characters using two different frequency carriers. See configuration in the following figure.

**Figure 46-16. Manchester Encoded Characters RF Transmission**



The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF transmitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See the following figure for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency F0 and switches to F1 if the data sent is a 0. See figure "FSK Modulator Output" below.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

**Figure 46-17. ASK Modulator Output**

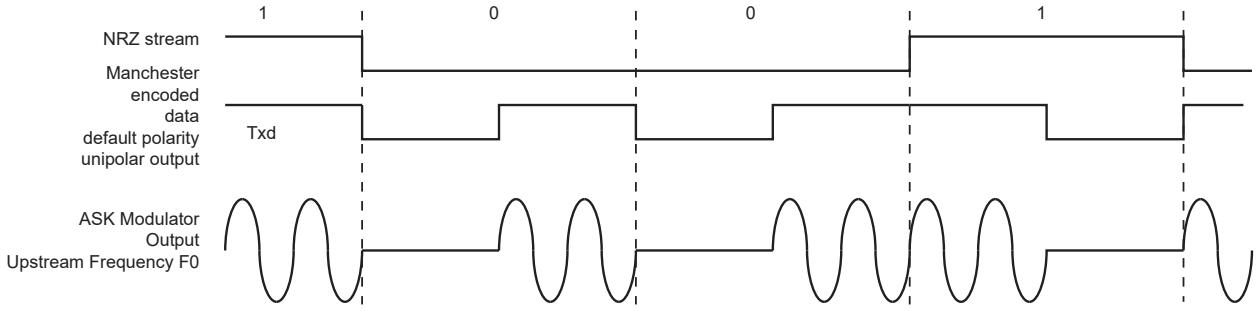


**Figure 46-18. FSK Modulator Output**

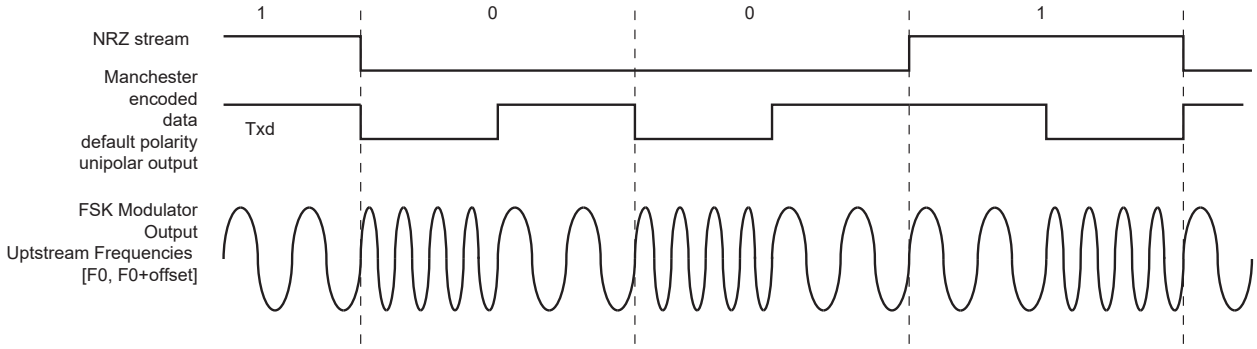


### 46.7.3.6 Synchronous Receiver

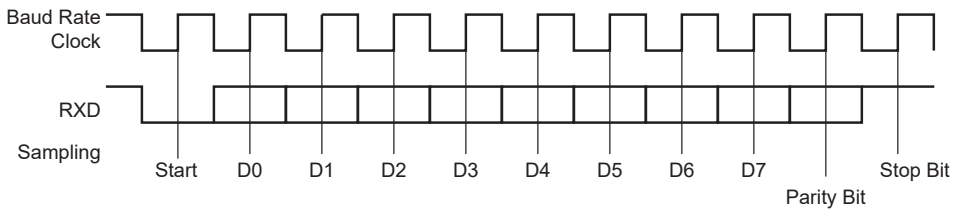
In Synchronous mode (SYNC = 1), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

The following figure illustrates a character reception in Synchronous mode.

**Figure 46-19. Synchronous Mode Character Reception**

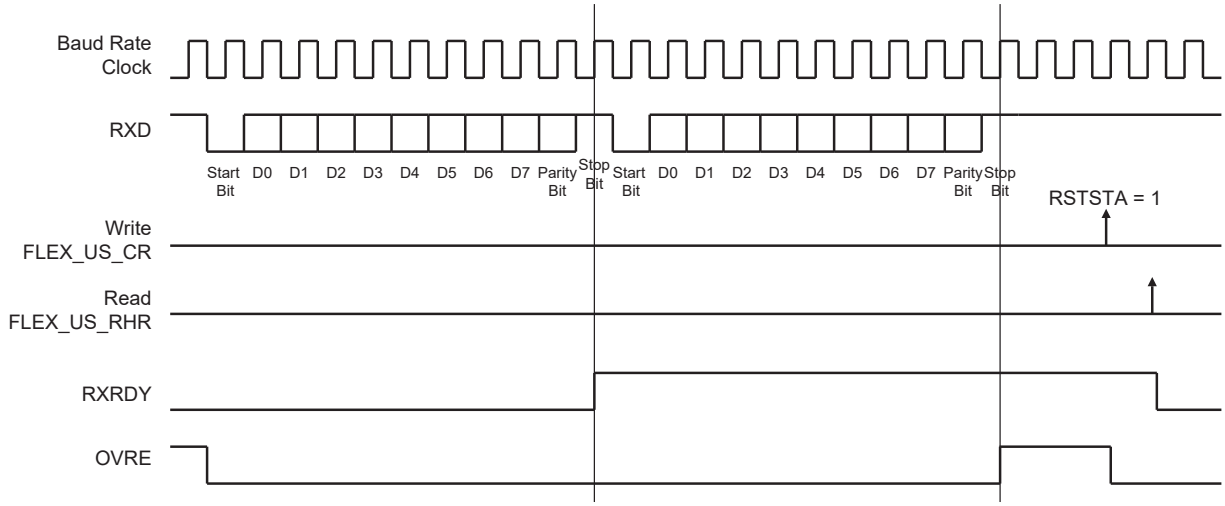
Example: 8-bit, Parity Enabled 1 Stop



### 46.7.3.7 Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding Register (FLEX_US_RHR) and the FLEX_US_CSR.RXRDY bit is raised. If a character is completed while the RXRDY is set, the Overrun Error (OVRE) bit is set. The last character is transferred into FLEX_US_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to Reset Status bit FLEX_US_CR.RSTSTA.

**Figure 46-20. Receiver Status**



### 46.7.3.8 Parity

The USART supports five parity modes that are selected by writing to the FLEX_US_MR.PAR field. The PAR field also enables the Multidrop mode (see section Multidrop Mode). Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

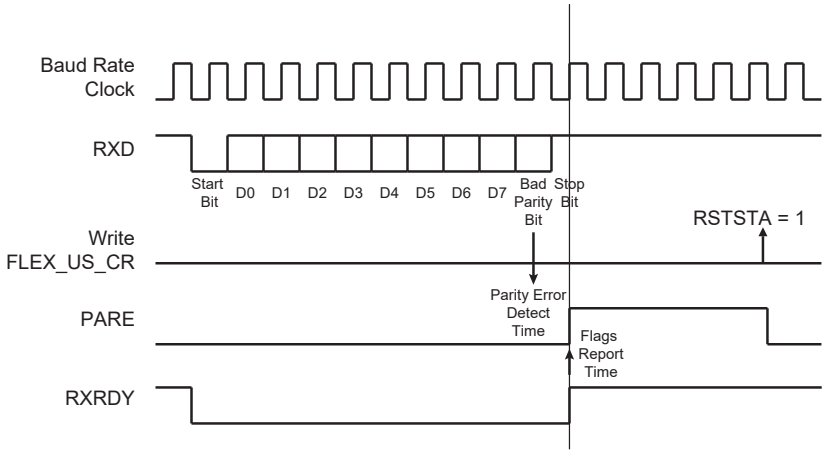
The following table shows an example of the parity bit for the character 0x41 (character ASCII “A”) depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

**Table 46-7. Parity Bit Examples**

| Character | Hexadecimal | Binary | Parity Bit | Parity Mode |
|---|---|---|---|---|
| A | 0x41 | 0100 0001 | 1 | Odd |
| A | 0x41 | 0100 0001 | 0 | Even |
| A | 0x41 | 0100 0001 | 1 | Mark |
| A | 0x41 | 0100 0001 | 0 | Space |
| A | 0x41 | 0100 0001 | None | None |

When the receiver detects a parity error, it sets the Parity Error bit FLEX_US_CSR.PARE. The PARE bit can be cleared by writing a one to the FLEX_US_CR.RSTSTA bit. The following figure illustrates the parity bit status setting and clearing.

**Figure 46-21. Parity Error**



#### 46.7.3.9 Multidrop Mode

If the value 0x6 or 0x07 is written to the FLEX_US_MR.PAR field, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data are transmitted with the parity bit to 0 and addresses are transmitted with the parity bit to 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a one is written to the FLEX_US_CR.SENDA bit.

To handle parity error, the PARE bit is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

The transmitter sends an address byte (parity bit set) when the FLEX_US_CR.SENDA bit is written to 1. In this case, the next byte written to FLEX_US_THR is transmitted as an address. Any character written in FLEX_US_THR when the SENDA command is not written is transmitted normally with parity to 0.

#### 46.7.3.10 Transmitter Timeguard

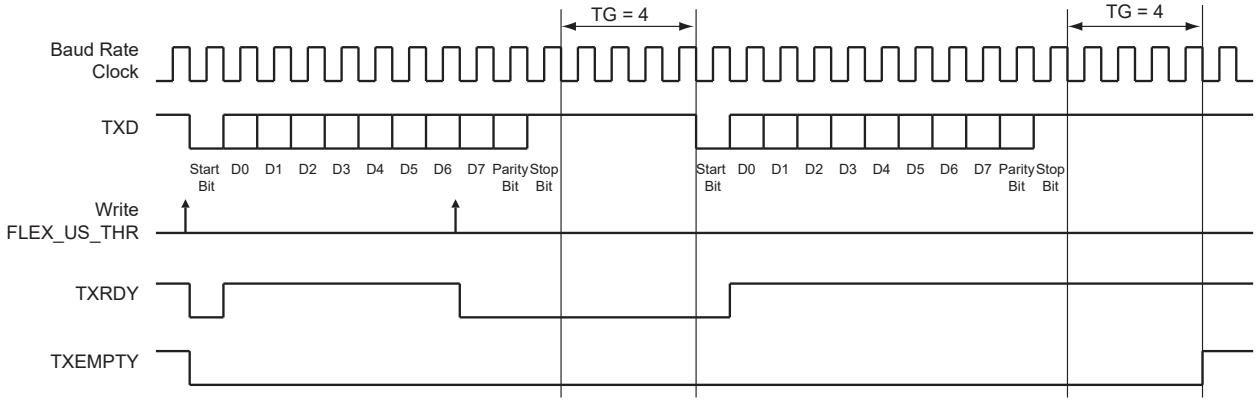
The timeguard feature enables the USART interface with slow remote devices.

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.

The duration of the idle state is programmed in the TG field of the Transmitter Timeguard Register (FLEX_US_TTGR). When this field is written to zero, no timeguard is generated. Otherwise, the transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in the following figure, the behavior of the TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in FLEX_US_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

**Figure 46-22. Timeguard Operations**



The following table indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

**Table 46-8. Maximum Timeguard Length Depending on Baud Rate**

| Baud Rate (bit/s) | Bit Time (µs) | Timeguard (ms) |
|---|---|---|
| 1,200 | 833 | 212.50 |
| 9,600 | 104 | 26.56 |
| 14,400 | 69.4 | 17.71 |
| 19,200 | 52.1 | 13.28 |
| 28,800 | 34.7 | 8.85 |
| 38,400 | 26 | 6.63 |
| 56,000 | 17.9 | 4.55 |
| 57,600 | 17.4 | 4.43 |
| 115,200 | 8.7 | 2.21 |

#### 46.7.3.11 Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a timeout is detected, the FLEX_US_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver an end of frame.

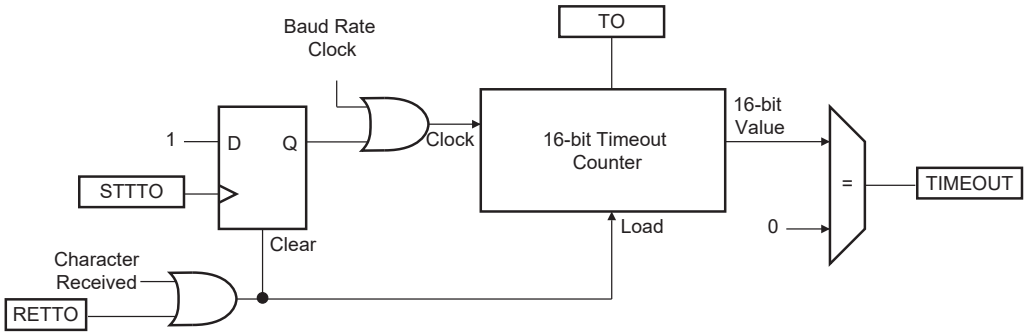
The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout Register (FLEX_US_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The FLEX_US_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX_US_CSR.TIMEOUT bit rises. Then, the user can either:

- Stop the counter clock until a new character is received. This is performed by writing a ‘1’ to FLEX_US_CR.STTTO. In this case, the idle state on RXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and enables waiting for the next idle state on RXD after a frame is received.
- Obtain an interrupt while no character is received. This is performed by writing a ‘1’ to FLEX_US_CR.RETTO. In this case, the counter starts counting down immediately from the value

TO. This generates a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

The following figure shows the block diagram of the Receiver Timeout feature.

**Figure 46-23. Receiver Timeout Block Diagram**



The following table gives the maximum timeout period for some standard baud rates.

**Table 46-9. Maximum Timeout Period**

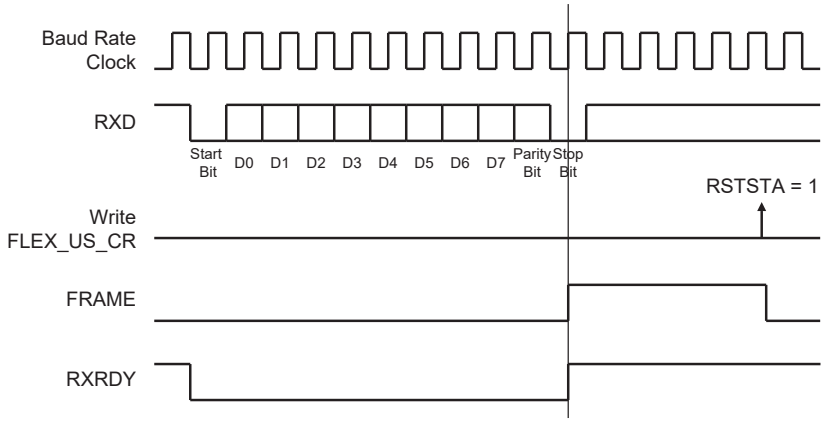
| Baud Rate (bit/s) | Bit Time (µs) | Timeout (ms) |
|---|---|---|
| 600 | 1,667 | 109,225 |
| 1,200 | 833 | 54,613 |
| 2,400 | 417 | 27,306 |
| 4,800 | 208 | 13,653 |
| 9,600 | 104 | 6,827 |
| 14,400 | 69 | 4,551 |
| 19,200 | 52 | 3,413 |
| 28,800 | 35 | 2,276 |
| 38,400 | 26 | 1,704 |
| 56,000 | 18 | 1,170 |
| 57,600 | 17 | 1,138 |
| 200,000 | 5 | 328 |

#### 46.7.3.12 Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FLEX_US_CSR.FRAME bit. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

**Figure 46-24. Framing Error Status**



#### 46.7.3.13 Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits to 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

A break is transmitted by setting the FLEX_US_CR.STTBRK bit. This can be done at any time, either while the transmitter is empty (no character in either the shift register or in FLEX_US_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once the Start Break command is requested, further Start Break commands are ignored until the end of the break is completed.

The break condition is removed by setting the FLEX_US_CR.STPBRK bit. If the Stop Break command is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the Start Break and Stop Break commands are processed only if the FLEX_US_CSR.TXRDY bit = 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character was processed.

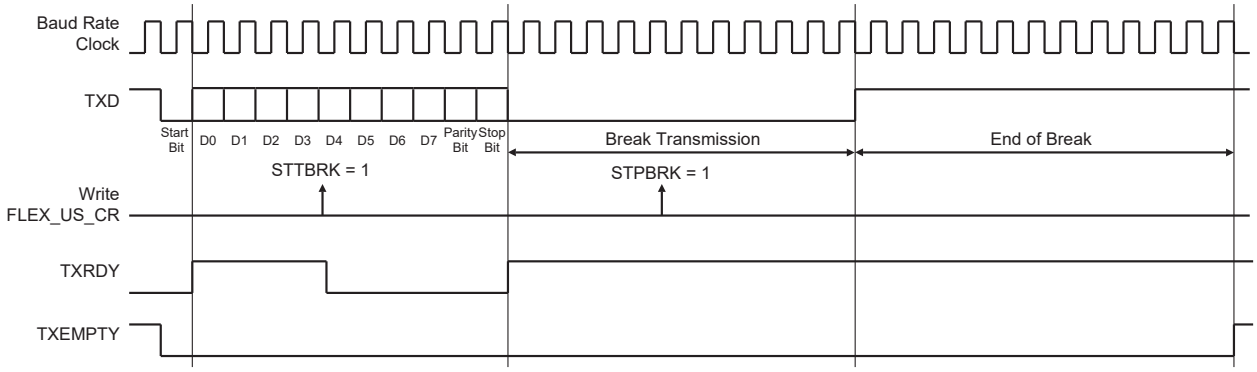
Setting both the FLEX_US_CR.STTBRK and FLEX_US_CR.STPBRK bits can lead to an unpredictable result. All Stop Break commands requested without a previous Start Break command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.

After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

The following figure illustrates the effect of both the Start Break (STTBRK) and Stop Break (STPBRK) commands on the TXD line.

**Figure 46-25. Break Transmission**



#### 46.7.3.14 Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.

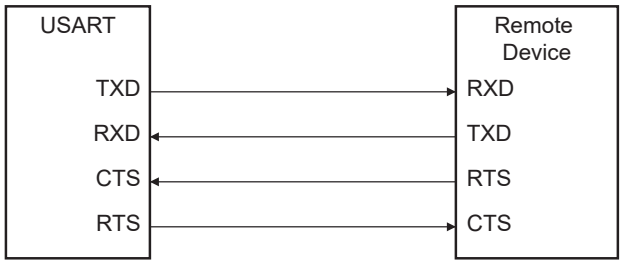
When the low stop bit is detected, the receiver asserts the FLEX_US_CSR.RXBRK bit. FLEX_US_CSR.RXBRK may be cleared by setting the FLEX_US_CR.RSTSTA bit.

An end of receive break is detected by a high level for at least 2/16ths of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

#### 46.7.3.15 Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in the following figure.

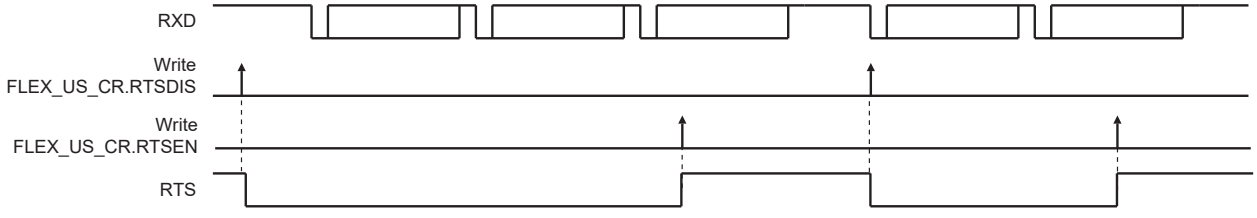
**Figure 46-26. Connection with a Remote Device for Hardware Handshaking**



Setting the USART to operate with hardware handshaking is performed by writing the FLEX_US_MR.USART_MODE field to the value 0x2.

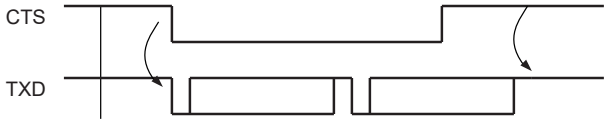
The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMAC channel for reception. The transmitter can handle hardware handshaking in any case.

**Figure 46-27. RTS Line Software Control when FLEX_US_MR.USART_MODE = 2**



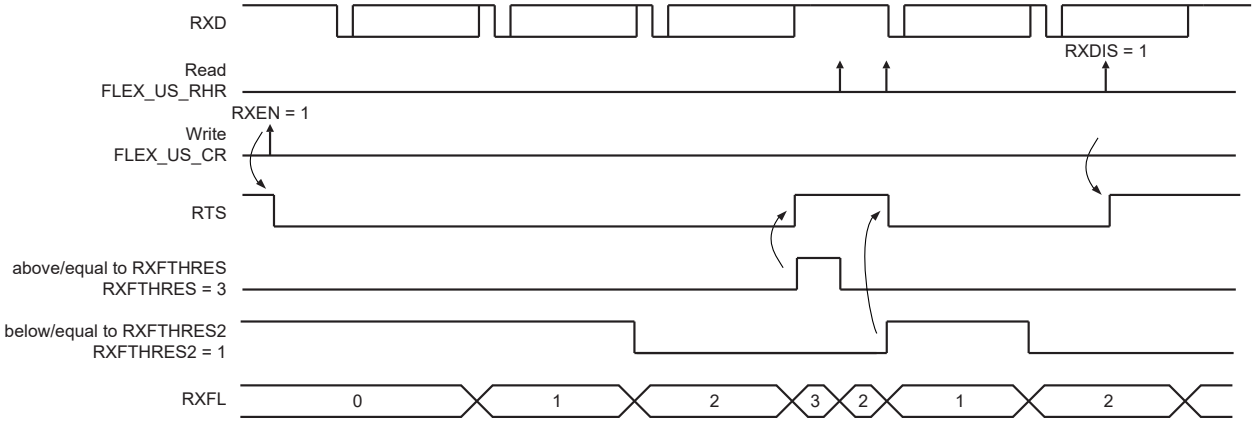
The following figure shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

**Figure 46-28. Transmitter Behavior when Operating with Hardware Handshaking**



If USART FIFOs are enabled (bit FLEX_US_CR.FIFOEN), the RTS pin can be controlled by the USART Receive FIFO thresholds. The RTS pin control through Receive FIFO thresholds can be activated with the FLEX_US_FMR.FRTSC bit. Once activated, the RTS pin will be controlled by Receive FIFO thresholds, set to level 1 each time RXFTHRES is reached and set to level '0' each time RXFTHRES2 is reached (and RXFTHRES is not reached).

**Figure 46-29. Receiver Behavior When FIFO Enabled and FRTSC Set to '1'**



**Note:** In this mode, RXFTHRES must be > RXFTHRES2.

### 46.7.4 ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

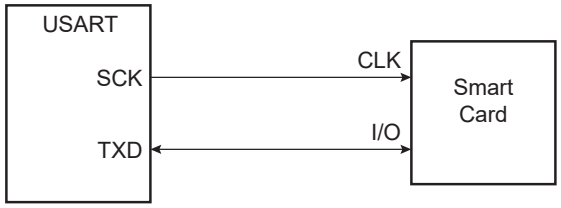
Setting the USART in ISO7816 mode is performed by writing the FLEX_US_MR.USART_MODE field to the value 0x4 for protocol T = 0 and to the value 0x6 for protocol T = 1.

#### 46.7.4.1 ISO7816 Mode Overview

The ISO7816 is a half-duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see figure in section Baud Rate Generator).

The USART connects to a smart card as shown in the following figure. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the master of the communication as it generates the clock.

**Figure 46-30. Connection of a Smart Card to the USART**



When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is partially predefined. The configuration is forced to 8 data bits, and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9 and CHMODE fields. MSBF can be used to transmit LSB or MSB first. The bit INVDATA can be used to transmit in Normal or Inverse mode.

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

#### 46.7.4.2 Protocol T = 0

In T = 0 protocol, a character is made up of 1 start bit, 8 data bits, 1 parity bit and 1 guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in the following figure.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in figure "T = 0 Protocol with Parity Error" below. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding Register (FLEX_US_RHR). It appropriately sets the PARE bit in the Status Register (FLEX_US_CSR) so that the software can handle the error.

**Figure 46-31. T = 0 Protocol without Parity Error**

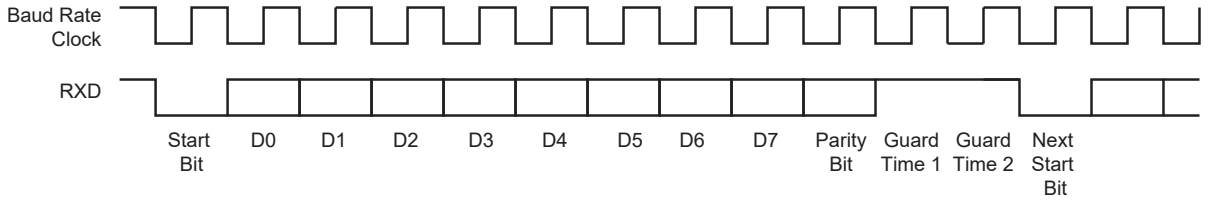


**Figure 46-32. T = 0 Protocol with Parity Error**

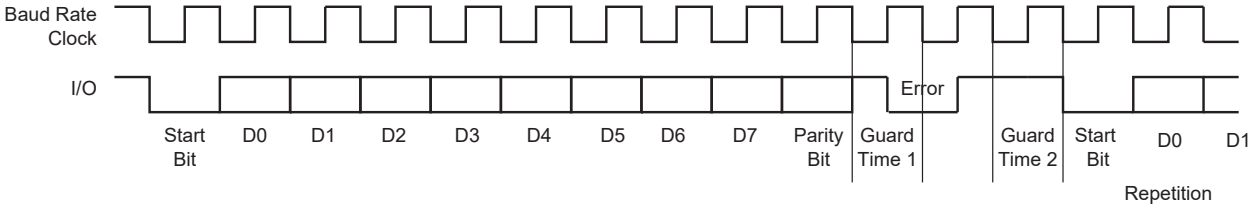


#### 46.7.4.2.1 Receive Error Counter

The USART receiver also records the total number of errors. This can be read in the Number of Error (FLEX_US_NER) register. The NB_ERRORS field can record up to 255 errors. Reading FLEX_US_NER automatically clears the NB_ERRORS field.

#### 46.7.4.2.2 Receive NACK Inhibit

The USART can be configured to inhibit an error. This is done by writing a ‘1’ to FLEX_US_MR.INACK. In this case, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK = 1, the erroneous received character is stored in the Receive Holding register as if no error occurred, and the RXRDY bit rises.

#### 46.7.4.2.3 Transmit Character Repetition

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the FLEX_US_MR.MAX_ITERATION field at a value higher than 0. Each character can be transmitted up to eight times: the first transmission plus seven repetitions.

If MAX_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX_ITERATION.

When the USART repetition number reaches MAX_ITERATION, and the last repeated character is not acknowledged, the FLEX_US_CSR.ITER bit is set. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

The FLEX_US_CSR.ITER bit can be cleared by writing the FLEX_US_CR.RSTIT bit to 1.

#### 46.7.4.2.4 Disable Successive Receive NACK

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the FLEX_US_MR.DSNACK bit. The maximum number of NACKs transmitted is programmed in the MAX_ITERATION field. As soon as MAX_ITERATION is reached, no error signal is driven on the I/O line and the FLEX_US_CSR.ITER bit is set.

### 46.7.4.3 Protocol T = 1

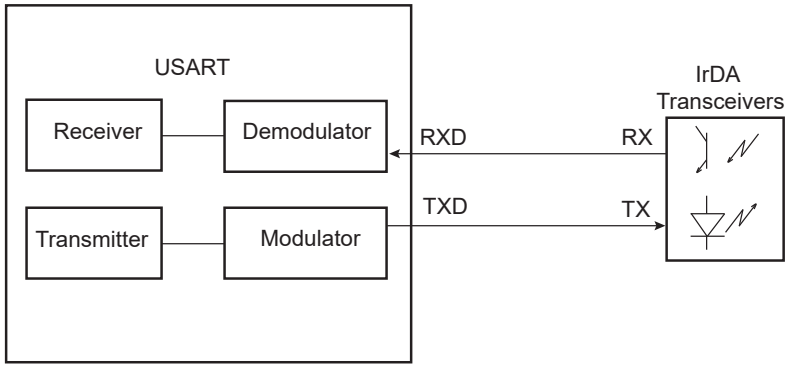
When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the FLEX_US_CSR.PARE bit.

## 46.7.5 IrDA Mode

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in the following figure. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The USART IrDA mode is enabled by setting the FLEX_US_MR.USART_MODE field to the value 0x8. The IrDA Filter Register (FLEX_US_IF) allows configuring the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

**Figure 46-33. Connection to IrDA Transceivers**



The receiver and the transmitter must be enabled or disabled according to the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED transmission). Disable the internal pullup (better for power consumption).
- Receive data

#### 46.7.5.1 IrDA Modulation

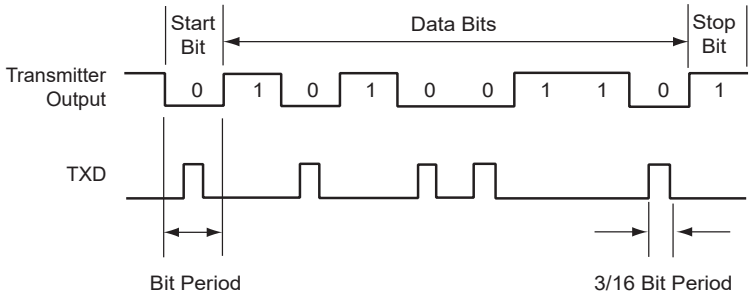
For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. “0” is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in the following table.

**Table 46-10. IrDA Pulse Duration**

| Baud Rate | Pulse Duration (3/16) |
|---|---|
| 2.4 kbit/s | 78.13 µs |
| 9.6 kbit/s | 19.53 µs |
| 19.2 kbit/s | 9.77 µs |
| 38.4 kbit/s | 4.88 µs |
| 57.6 kbit/s | 3.26 µs |
| 115.2 kbit/s | 1.63 µs |

The following figure shows an example of character transmission.

**Figure 46-34. IrDA Modulation**



#### 46.7.5.2 IrDA Baud Rate

The following table gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of ±1.87% must be met.

**Table 46-11. IrDA Baud Rate Error**

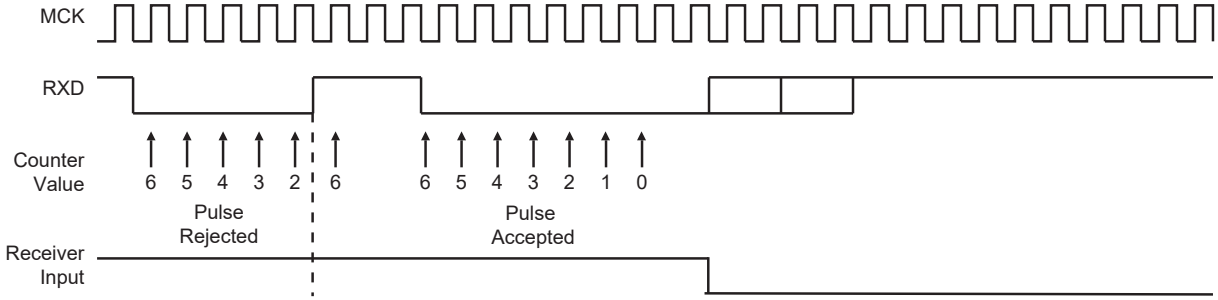
| Peripheral Clock | Baud Rate (bit/s) | CD | Baud Rate Error | Pulse Time (µs) |
|---|---|---|---|---|
| 3,686,400 | 115,200 | 2 | 0.00% | 1.63 |
| 20,000,000 | 115,200 | 11 | 1.38% | 1.63 |
| 32,768,000 | 115,200 | 18 | 1.25% | 1.63 |
| 40,000,000 | 115,200 | 22 | 1.38% | 1.63 |
| 3,686,400 | 57,600 | 4 | 0.00% | 3.26 |
| 20,000,000 | 57,600 | 22 | 1.38% | 3.26 |
| 32,768,000 | 57,600 | 36 | 1.25% | 3.26 |
| 40,000,000 | 57,600 | 43 | 0.93% | 3.26 |
| 3,686,400 | 38,400 | 6 | 0.00% | 4.88 |
| 20,000,000 | 38,400 | 33 | 1.38% | 4.88 |
| 32,768,000 | 38,400 | 53 | 0.63% | 4.88 |
| 40,000,000 | 38,400 | 65 | 0.16% | 4.88 |
| 3,686,400 | 19,200 | 12 | 0.00% | 9.77 |
| 20,000,000 | 19,200 | 65 | 0.16% | 9.77 |
| 32,768,000 | 19,200 | 107 | 0.31% | 9.77 |
| 40,000,000 | 19,200 | 130 | 0.16% | 9.77 |
| 3,686,400 | 9,600 | 24 | 0.00% | 19.53 |
| 20,000,000 | 9,600 | 130 | 0.16% | 19.53 |
| 32,768,000 | 9,600 | 213 | 0.16% | 19.53 |
| 40,000,000 | 9,600 | 260 | 0.16% | 19.53 |
| 3,686,400 | 2,400 | 96 | 0.00% | 78.13 |
| 20,000,000 | 2,400 | 521 | 0.03% | 78.13 |
| 32,768,000 | 2,400 | 853 | 0.04% | 78.13 |

#### 46.7.5.3 IrDA Demodulator

The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in FLEX_US_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with FLEX_US_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

The following figure illustrates the operations of the IrDA demodulator.

**Figure 46-35. IrDA Demodulator Operations**



The programmed value in the FLEX_US_IF register must always meet the following criteria:

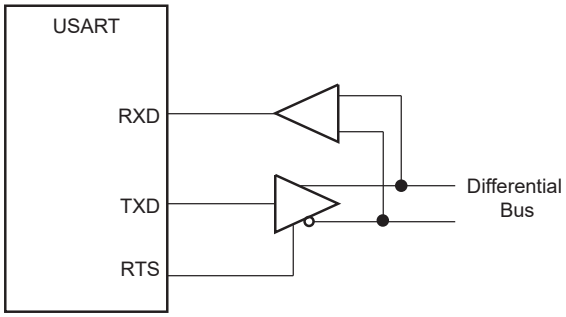
$t_{peripheral\ clock} \times (IRDA_FILTER + 3) < 1.41\ \mu s$

As the IrDA mode uses the same logic as the ISO7816, note that the FLEX_US_FIDI.FI_DI_RATIO field must be set to a value higher than 0 to make sure IrDA communications operate correctly.

### 46.7.6 RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in the following figure.

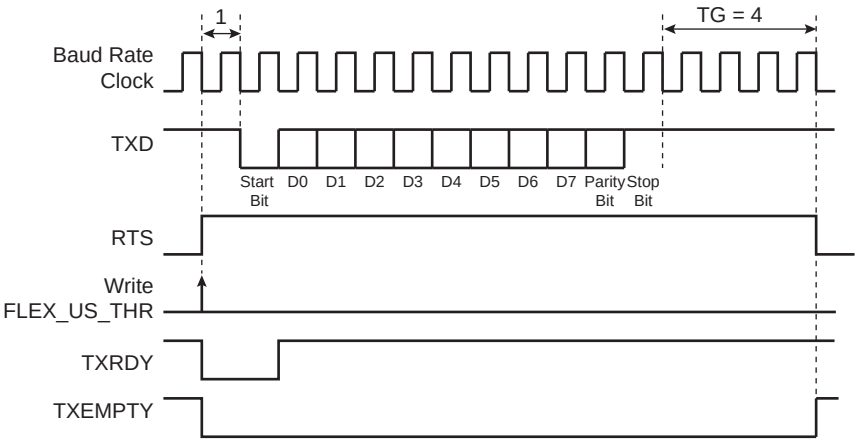
**Figure 46-36. Typical Connection to an RS485 Bus**



The USART is set in RS485 mode by writing the value 0x1 to the FLEX_US_MR.USART_MODE field.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed, so that the line can remain driven after the last character completion. The following figure gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

**Figure 46-37. Example of RTS Drive with Timeguard**



### 46.7.7 USART Comparison Function on Received Character

The CMP flag in FLEX_US_CSR is set when the received character matches the conditions programmed in FLEX_US_CMPR. The CMP flag is set as soon as FLEX_US_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to FLEX_US_CR.RSTSTA.

FLEX_US_CMPR can be programmed to provide different comparison methods:

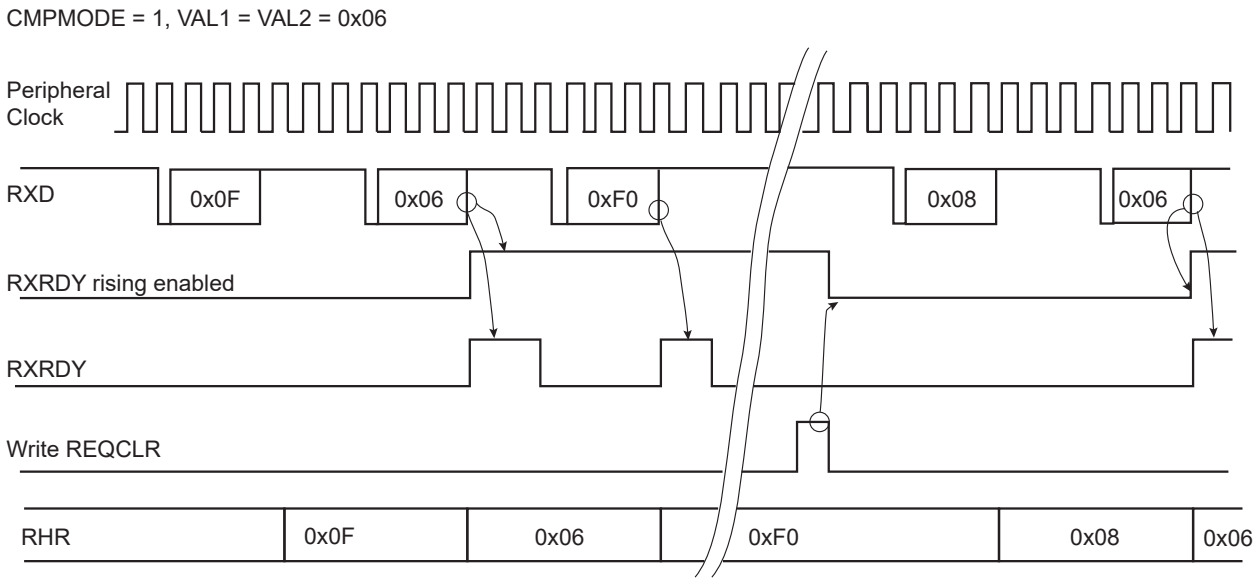
- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When the FLEX_US_CMPR.CMPMODE bit is set to FLAG_ONLY (value 0), all received data are loaded in FLEX_US_RHR and the CMP flag provides the status of the comparison result.

By programming the START_CONDITION.CMPMODE bit (value 1), the comparison function result triggers the start of the loading of FLEX_US_RHR (see the following figure). The trigger condition exists as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in FLEX_US_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX_US_CR.REQCLR bit.

The value programmed in the VAL1 and VAL2 fields must not exceed the maximum value of the received character (see CHRL field in register 46.10.6 FLEX_US_MR).

**Figure 46-38. Receive Holding Register Management**



### 46.7.8 SPI Mode

The Serial Peripheral Interface (SPI) mode is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves" which have data shifted into and out by the master. Different CPUs can take turns being masters and one master may simultaneously shift data into multiple slaves. (Multiple master protocol is the opposite of single master protocol, where one CPU is always the master while all of the others are always slaves.) However, only one slave may drive its output to write data back to the master at any given time.

A slave device is selected when its NSS signal is asserted by the master. The USART in SPI Master mode can address only one SPI slave because it can generate only one NSS signal.

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI): This data line supplies the output data from the master shifted into the input of the slave.
- Master In Slave Out (MISO): This data line supplies the output data from a slave to the input of the master.
- Serial Clock (SCK): This control line is driven by the master and regulates the flow of the data bits. The master may transmit data at a variety of bit rates. The SCK line cycles once for each bit that is transmitted.
- Slave Select (NSS): This control line allows the master to select or deselect the slave.

#### 46.7.8.1 Modes of Operation

The USART can operate in SPI Master mode or in SPI Slave mode.

Operation in SPI Master mode is programmed by writing 0xE to the FLEX_US_MR.USART_MODE field. In this case, the SPI lines must be connected as described below:

- The MOSI line is driven by the output pin TXD

- The MISO line drives the input pin RXD
- The SCK line is driven by the output pin SCK
- The NSS line is driven by the output pin RTS

Operation in SPI Slave mode is programmed by writing to 0xF the FLEX_US_MR.USART_MODE field. In this case, the SPI lines must be connected as described below:

- The MOSI line drives the input pin RXD
- The MISO line is driven by the output pin TXD
- The SCK line drives the input pin SCK
- The NSS line drives the input pin CTS

In order to avoid an unpredictable behavior, any change of the SPI mode must be followed by a software reset of the transmitter and of the receiver (except the initial configuration after a hardware reset). (See section Receiver and Transmitter Control.)

#### 46.7.8.2 Bit Rate

In SPI mode, the bit rate generator operates in the same way as in USART Synchronous mode. See section 46.7.1.3 Baud Rate in Synchronous Mode or SPI Mode. However, some restrictions apply:

In SPI Master mode:

- The external clock SCK must not be selected (USCLKS ≠ 0x3), and the FLEX_US_MR.CLKO bit must be set in order to generate correctly the serial clock on the SCK pin.
- To ensure a correct behavior of the receiver and the transmitter, the value programmed in CD must be ≥ 6.
- If the divided peripheral clock is selected, the value programmed in CD must be even to ensure a 50:50 mark/space ratio on the SCK pin; this value can be odd if the peripheral clock is selected.

In SPI Slave mode:

- The external clock (SCK) selection is forced regardless of the value of the FLEX_US_MR.USCLKS field. Likewise, the value written in FLEX_US_BRGR has no effect, because the clock is provided directly by the signal on the USART SCK pin.
- To ensure a correct behavior of the receiver and the transmitter, the external clock (SCK) frequency must be at least six times lower than the system clock.

#### 46.7.8.3 Data Transfer

Up to nine data bits are successively shifted out on the TXD pin at each rising or falling edge (depending of CPOL and CPHA) of the programmed serial clock. There is no Start bit, no Parity bit and no Stop bit.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX_US_MR. The nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The MSB data bit is always sent first in SPI mode (Master or Slave).

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the FLEX_US_MR.CPOL bit. The clock phase is programmed with the CPHA bit. These two parameters determine the edges of the clock signal upon which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are used and fixed in different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

**Table 46-12. SPI Bus Protocol Mode**

| SPI Bus Protocol Mode | CPOL | CPHA |
|---|---|---|
| 0 | 0 | 1 |
| 1 | 0 | 0 |
| 2 | 1 | 1 |
| 3 | 1 | 0 |

**Figure 46-39. SPI Transfer Format (CPHA = 1, 8 bits per transfer)**

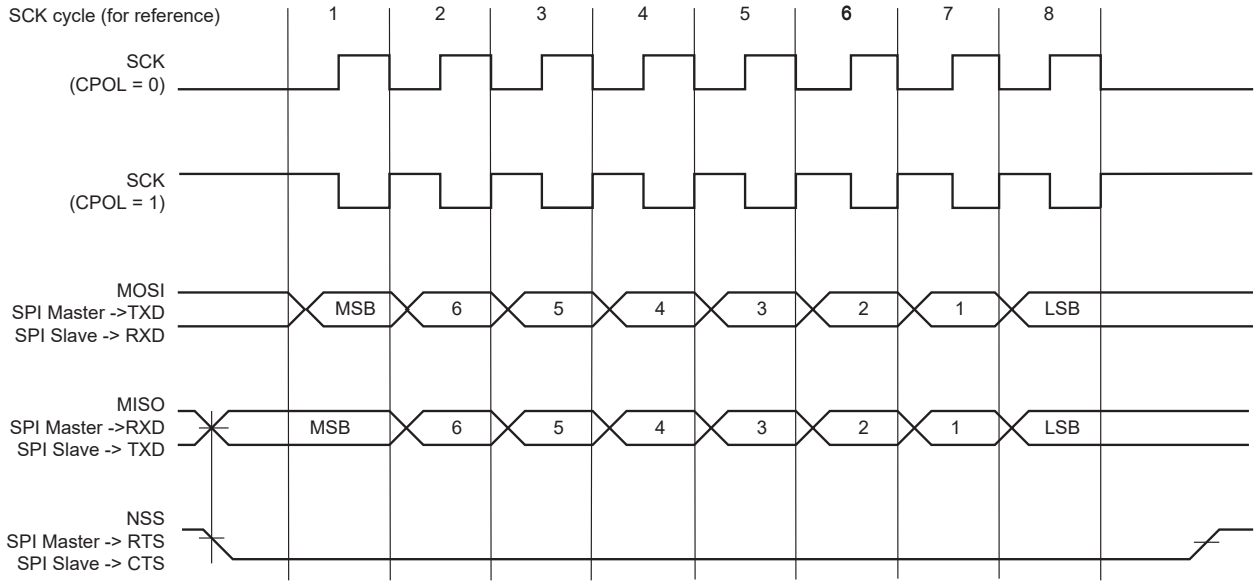


**Figure 46-40. SPI Transfer Format (CPHA = 0, 8 bits per transfer)**

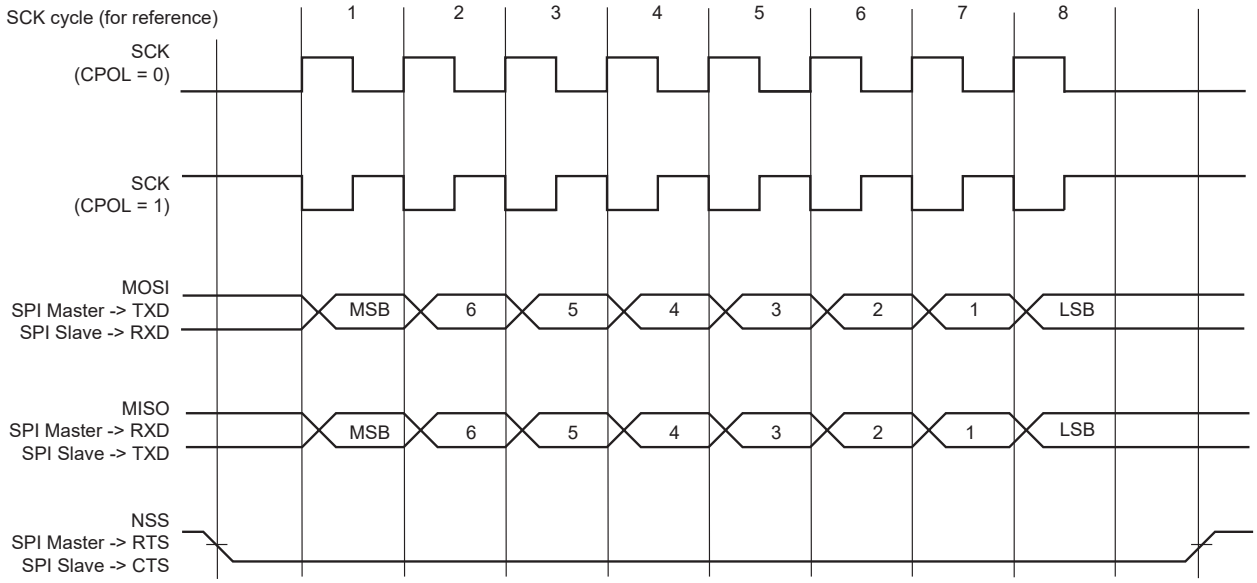


#### 46.7.8.4 Receiver and Transmitter Control

See section Receiver and Transmitter Control.

#### 46.7.8.5 Character Transmission

The characters are sent by writing in the Transmit Holding Register (FLEX_US_THR). An additional condition for transmitting a character can be added when the USART is configured in SPI Master mode. In the “USART Mode Register (SPI_MODE)” (FLEX_US_MR), the value configured on the WRDBT bit can prevent any character transmission (even if FLEX_US_THR has been written) while the receiver side is not ready (character not read). When WRDBT = 0, the character is transmitted whatever the receiver status. If WRDBT = 1, the transmitter waits for the Receive Holding Register (FLEX_US_RHR) to be read before transmitting the character (RXRDY flag cleared), thus preventing any overflow (character loss) on the receiver side.

The chip select line is deasserted for a period equivalent to 3 bits between the transmission of two data.

The transmitter reports two status bits in FLEX_US_CSR: TXRDY (Transmitter Ready), which indicates that FLEX_US_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX_US_THR have been processed. When the current character processing is completed, the last character written in FLEX_US_THR is transferred into the shift register of the transmitter and FLEX_US_THR is emptied, and thus TXRDY rises.

Both the TXRDY and the TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX_US_THR while TXRDY is low has no effect and the written character is lost.

If the USART is in SPI Slave mode and if a character must be sent while FLEX_US_THR is empty, the UNRE (Underrun Error) bit is set. The TXD transmission line stays at high level during all this time. The UNRE bit is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

In SPI Master mode, the slave select line (NSS) is asserted at low level one $t_{bit}$ ($t_{bit}$ being the nominal time required to transmit a bit) before the transmission of the MSB bit and released at high level one $t_{bit}$ after the transmission of the LSB bit. So, the slave select line (NSS) is always released between each character transmission and a minimum delay of three $t_{bit}$ always inserted. However, in order to address slave devices supporting the CSAAT mode (Chip Select Active After Transfer), the slave select line (NSS) can be forced at low level by writing a one to the FLEX_US_CR.RTSEN bit. The slave select line (NSS) can be released at high level only by writing a one to the FLEX_US_CR.RTSDIS bit (for example, when all data have been transferred to the slave device).

In SPI Slave mode, the transmitter does not require a falling edge of the slave select line (NSS) to initiate a character transmission but only a low level. However, this low level must be present on the slave select line (NSS) at least one $t_{bit}$ before the first serial clock cycle corresponding to the MSB bit.

#### 46.7.8.6 Character Reception

When a character reception is completed, it is transferred to the Receive Holding Register (FLEX_US_RHR) and the RXRDY bit in the Status Register (FLEX_US_CSR) rises. If a character is completed while RXRDY is set, the OVRE (Overrun Error) bit is set. The last character is transferred into FLEX_US_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

To ensure correct behavior of the receiver in SPI Slave mode, the master device sending the frame must ensure a minimum delay of one $t_{bit}$ between each character transmission. The receiver does not require a falling edge of the slave select line (NSS) to initiate a character reception but only a low level. However, this low level must be present on the slave select line (NSS) at least one $t_{bit}$ before the first serial clock cycle corresponding to the MSB bit.

#### 46.7.8.7 Receiver Timeout

Because the receiver bit rate clock is active only during data transfers in SPI mode, a receiver timeout is impossible in this mode, whatever the timeout value is in field FLEX_US_RTOR.TO.

### 46.7.9 LIN Mode

The LIN mode provides master node and slave node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single master/multiple slaves concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the slave nodes
- Deterministic signal transmission
- Low cost single-wire implementation
- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

#### 46.7.9.1 Modes of Operation

The USART can act either as a LIN master node or as a LIN slave node.

The node configuration is chosen by setting the USART_MODE field in the USART Mode Register (FLEX_US_MR):

- LIN master node (USART_MODE = 0xA)
- LIN slave node (USART_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). (See section 46.7.2 Receiver and Transmitter Control.)

#### 46.7.9.2 Baud Rate Configuration

See section Baud Rate in Asynchronous Mode.

- LIN master node: The baud rate is configured in FLEX_US_BRGR.
- LIN slave node: The initial baud rate is configured in FLEX_US_BRGR. This configuration is automatically copied in the LIN Baud Rate Register (FLEX_US_LINBRR) when writing FLEX_US_BRGR. After the synchronization procedure, the baud rate is updated in FLEX_US_LINBRR.

#### 46.7.9.3 Receiver and Transmitter Control

See section 46.7.2 Receiver and Transmitter Control.

#### 46.7.9.4 Character Transmission

See section Transmitter Operations.

#### 46.7.9.5 Character Reception

See section Receiver Operations.

#### 46.7.9.6 Header Transmission (Master Node Configuration)

All the LIN Frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

So in master node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier Register (FLEX_US_LINIR). At this moment the flag TXRDY falls.

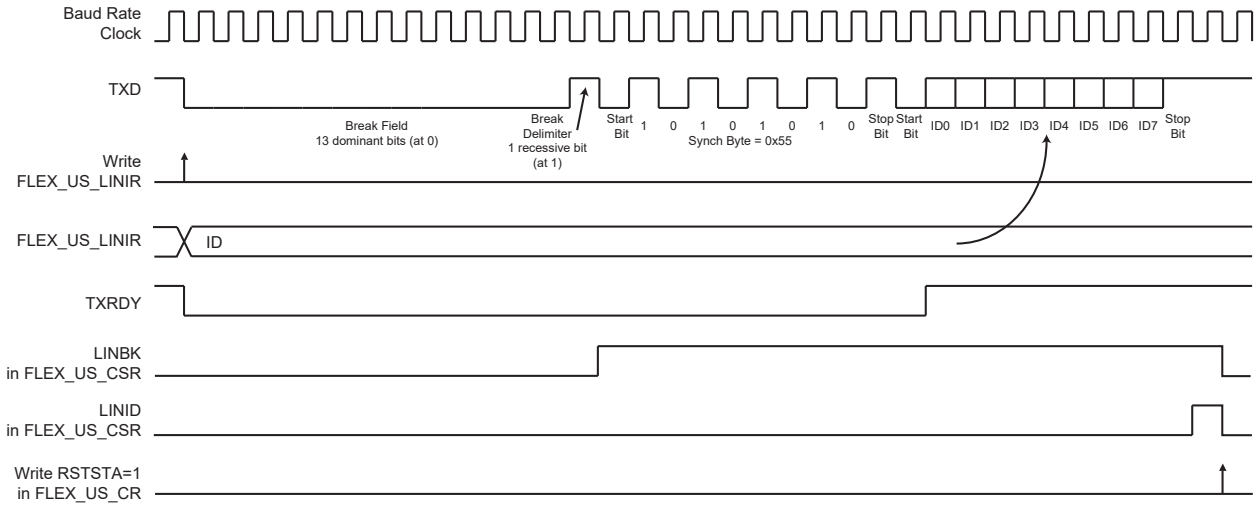
The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.

The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier Register (FLEX_US_LINIR). The Identifier parity bits can be automatically computed and sent (see section Identifier Parity).

The flag TXRDY rises when the identifier character is transferred into the shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the FLEX_US_CSR.LINBK flag bit is set. Likewise, as soon as the Identifier Field is sent, the FLEX_US_CSR.LINID flag bit is set. These flags are reset by writing a one to the FLEX_US_CR.RSTSTA bit.

**Figure 46-41. Header Transmission**



### 46.7.9.7 Header Reception (Slave Node Configuration)

All the LIN frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

In slave node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the FLEX_US_CSR.LINBK flag is set and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to remain synchronized (see section Slave Node Synchronization). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see section LIN Errors).

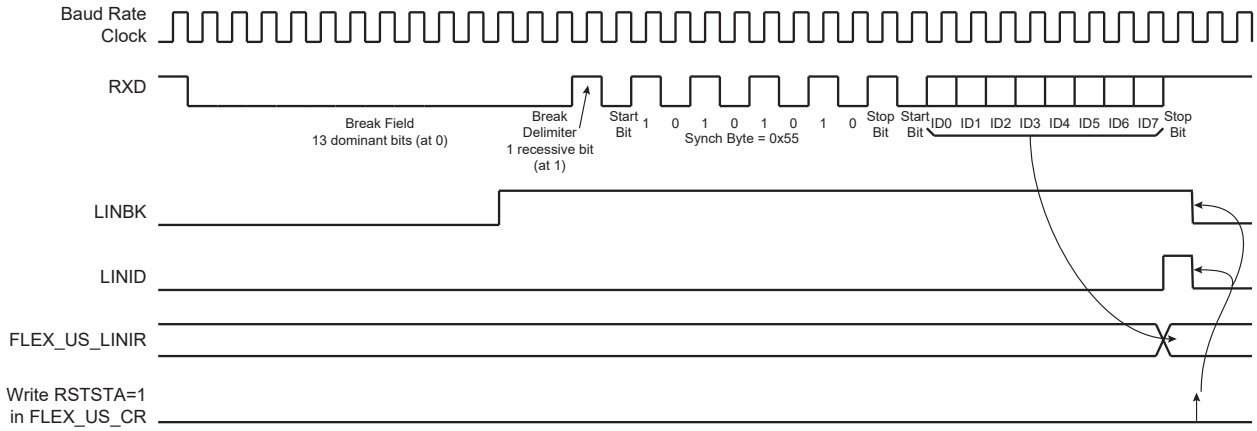
After receiving the Synch Field, the USART expects to receive the Identifier Field.

When the Identifier Field has been received, the FLEX_US_CSR.LINID flag bit is set. At this moment, the IDCHR field in the LIN Identifier Register (FLEX_US_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see section Identifier Parity).

If the header is not entirely received within the time given by the maximum length of the header $t_{Header_Maximum}$, the FLEX_US_CSR.LINHTE error flag bit is set.

The flag bits LINID, LINBK and LINHTE are reset by writing a one to the FLEX_US_CR.RSTSTA bit.

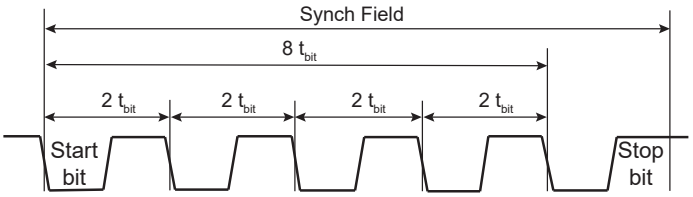
**Figure 46-42. Header Reception**



### 46.7.9.8 Slave Node Synchronization

The synchronization is done only in slave node configuration. The procedure is based on time measurement between the falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

**Figure 46-43. Synch Field**



The time measurement is made by a 19-bit counter driven by the sampling clock (see section Baud Rate Generator).

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight $t_{bit}$ of the Synch Field, the counter is incremented. At the end of these eight $t_{bit}$, the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the 3 least significant bits of this value (the remainder) give the new fractional part (LINFP).

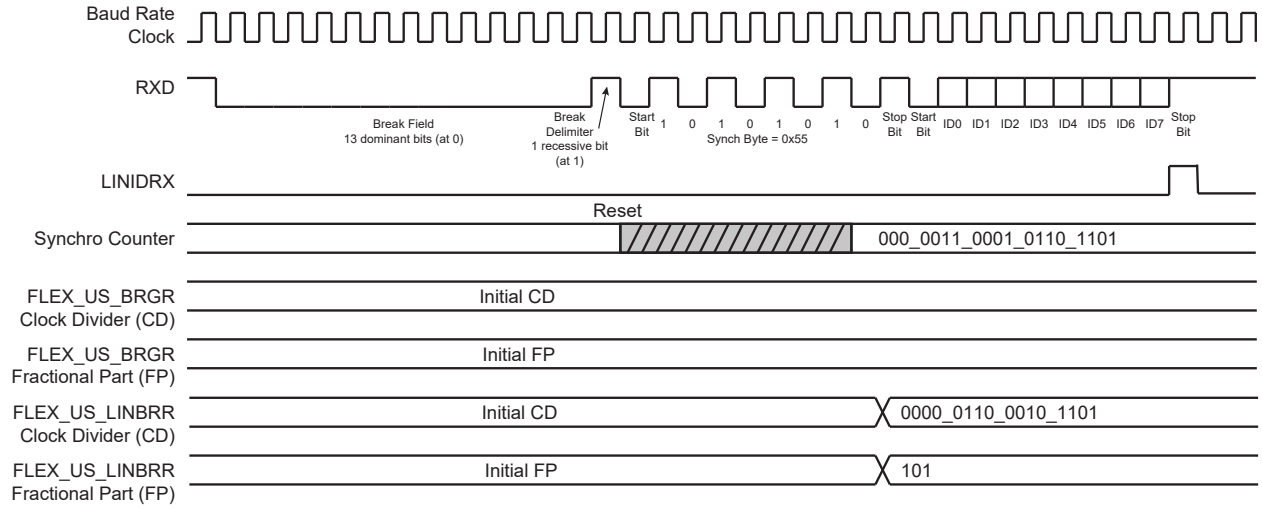
Once the Synch Field has been entirely received, the clock divider (LINCD) and the fractional part (LINFP) are updated in the LIN Baud Rate Register (FLEX_US_LINBRR) with the computed values, if the Synchronization is not disabled by the SYNCDIS bit in the LIN Mode Register (FLEX_US_LINMR).

After reception of the Synch Field:

- If it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol_Unsynch (±15%), then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX_US_CSR.LINSTE error flag bit is set.
- If it appears that the sampled Synch character is not equal to 0x55, then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX_US_CSR.LINISFE error flag bit is set.

Flags LINSTE and LINISFE are reset by writing a one to the FLEX_US_CR.RSTSTA bit.

**Figure 46-44. Slave Node Synchronization**



The synchronization accuracy depends on several parameters:

- The nominal clock frequency ($f_{Nom}$) (the theoretical slave node clock frequency)
- The baud rate
- The oversampling (OVER = 0 => 16X or OVER = 1 => 8X)

The following formula is used to compute the deviation of the slave bit rate relative to the master bit rate after synchronization ($f_{SLAVE}$ is the real slave node clock frequency).

$$\text{Baud rate deviation} = \left(100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times f_{SLAVE}}\right)\%$$

$$\text{Baud rate deviation} = \left(100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times \left(\frac{f_{TOL_UNSYNCH}}{100}\right) \times f_{Nom}}\right)\%$$

$-0.5 \leq \alpha \leq +0.5 \quad -1 < \beta < +1$

$f_{TOL_UNSYNCH}$ is the deviation of the real slave node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed ±15%. The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than ±2%. This means that the baud rate deviation must not exceed ±1%.

Therefore, a minimum value for the nominal clock frequency can be computed as follows:

$$f_{Nom}(\text{min}) = \left(100 \times \frac{[0.5 \times 8 \times (2 - \text{Over}) + 1] \times \text{Baud rate}}{8 \times \left(\frac{-15}{100} + 1\right) \times 1\%}\right)\text{Hz}$$

Examples:

- Baud rate = 20 kbit/s, OVER = 0 (Oversampling 16X) => $f_{Nom}$(min) = 2.64 MHz
- Baud rate = 20 kbit/s, OVER = 1 (Oversampling 8X) => $f_{Nom}$(min) = 1.47 MHz
- Baud rate = 1 kbit/s, OVER = 0 (Oversampling 16X) => $f_{Nom}$(min) = 132 kHz
- Baud rate = 1 kbit/s, OVER = 1 (Oversampling 8X) => $f_{Nom}$(min) = 74 kHz

#### 46.7.9.9 Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier, and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes via the FLEX_US_LINMR.PARDIS bit:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier Register (FLEX_US_LINIR). Bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see section Parity). Only the six least significant bits of the IDCHR field are updated with the received Identifier. Bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier Register (FLEX_US_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

#### 46.7.9.10 Node Action

Depending on the identifier, the node is affected—or not—by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the LIN Node Action (NACT) field in USART LIN Mode Register (FLEX_US_LINMR).

Example: a LIN cluster that contains a master and two slaves:

- Data transfer from the master to slave 1 and to slave 2:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = SUBSCRIBE

- Data transfer from the master to slave 1 only:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to the master:

NACT(master) = SUBSCRIBE

NACT(slave 1) = PUBLISH

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to slave 2:

NACT(master) = IGNORE

NACT(slave 1) = PUBLISH

NACT(slave 2) = SUBSCRIBE

- Data transfer from slave 2 to the master and to slave 1:

NACT(master) = SUBSCRIBE

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = PUBLISH

#### 46.7.9.11 Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.

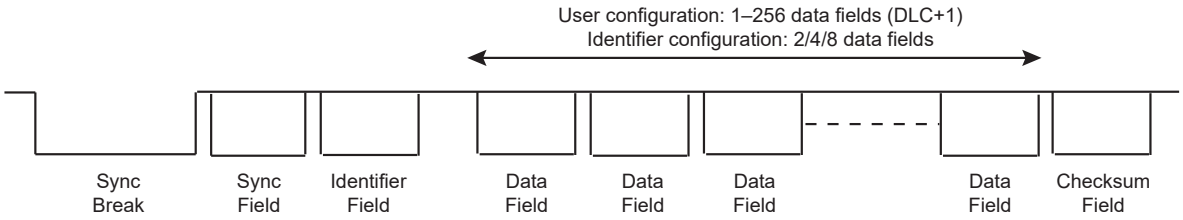
The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the FLEX_US_LINMR.DLM bit:

- DLM = 0: The response data length is configured by the user via the FLEX_US_LINMR.DLC field. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in FLEX_US_LINIR) according to the table below. The FLEX_US_LINMR.DLC field is discarded. The response can contain 2 or 4 or 8 data bytes.

**Table 46-13. Response Data Length if DLM = 1**

| IDCHR[5] | IDCHR[4] | Response Data Length (bytes) |
|---|---|---|
| 0 | 0 | 2 |
| 0 | 1 | 2 |
| 1 | 0 | 4 |
| 1 | 1 | 8 |

**Figure 46-45. Response Data Length**



#### 46.7.9.12 Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8- bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 slaves. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 slaves.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) bits of FLEX_US_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see section Response Data Length).

#### 46.7.9.13 Frame Slot Mode

This mode is useful only for master nodes. It respects the following rule: each frame slot shall be longer than or equal to $t_{Frame_Maximum}$.

If the Frame Slot mode is enabled (FSDIS = 0) and a frame transfer has been completed, the TXRDY flag is set again only after $t_{Frame_Maximum}$ delay, from the start of frame. So the master node cannot send a new header if the frame slot duration of the previous frame is inferior to $t_{Frame_Maximum}$.

If the Frame Slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The $t_{Frame_Maximum}$ is calculated as follows:

If the Checksum is sent (CHKDIS = 0):

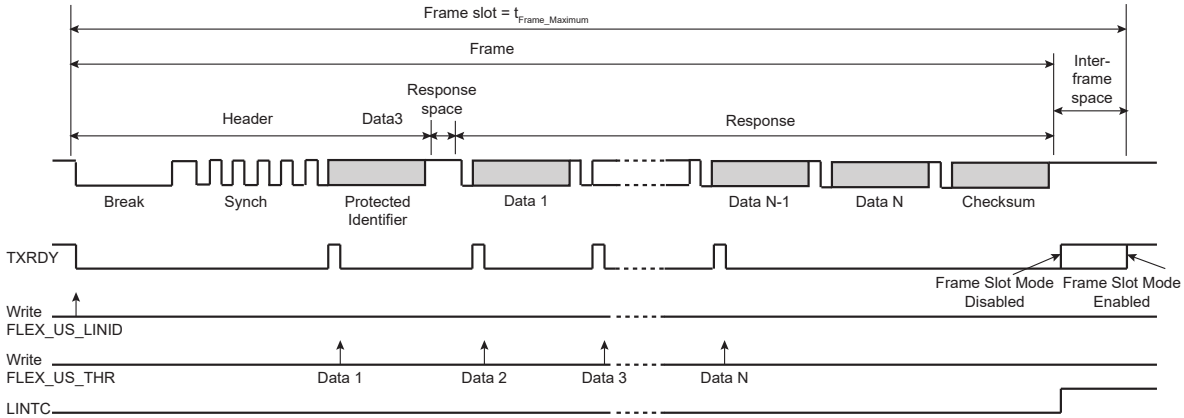
- $t_{Header_Nominal} = 34 \times t_{bit}$
- $t_{Response_Nominal} = 10 \times (NData + 1) \times t_{bit}$
- $t_{Frame_Maximum} = 1.4 \times (t_{Header_Nominal} + t_{Response_Nominal} + 1)$(1)
- $t_{Frame_Maximum} = 1.4 \times (34 + 10 \times (DLC + 1 + 1) + 1) \times t_{bit}$
- $t_{Frame_Maximum} = (77 + 14 \times DLC) \times t_{bit}$

If the Checksum is not sent (CHKDIS = 1):

- $t_{Header_Nominal} = 34 \times t_{bit}$
- $t_{Response_Nominal} = 10 \times NData \times t_{bit}$
- $t_{Frame_Maximum} = 1.4 \times (t_{Header_Nominal} + t_{Response_Nominal} + 1)$(1)
- $t_{Frame_Maximum} = 1.4 \times (34 + 10 \times (DLC + 1) + 1) \times t_{bit}$
- $t_{Frame_Maximum} = (63 + 14 \times DLC) \times t_{bit}$

Note: 1. The term “+1” leads to an integer result for $t_{Frame_Maximum}$ (LIN Specification 1.3).

**Figure 46-46. Frame Slot Mode**



### 46.7.9.14 LIN Errors

#### 46.7.9.14.1 Bit Error

This error is generated in master of slave node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by the FLEX_US_CSR.LINBE flag.

#### 46.7.9.14.2 Inconsistent Synch Field Error

This error is generated in slave node configuration, if the Synch Field character received is other than 0x55.

This error is reported by the FLEX_US_CSR.LINISFE flag.

#### 46.7.9.14.3 Identifier Parity Error

This error is generated in slave node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by the FLEX_US_CSR.LINIPE flag.

#### 46.7.9.14.4 Checksum Error

This error is generated in master of slave node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by the FLEX_US_CSR.LINCE flag.

#### 46.7.9.14.5 Slave Not Responding Error

This error is generated in master of slave node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame, $t_{Frame_Maximum}$ (see section Frame Slot Mode). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by the FLEX_US_CSR.LINSNRE.

#### 46.7.9.14.6 Synch Tolerance Error

This error is generated in slave node configuration if, after the clock synchronization procedure, it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol_Unsynch (±15%).

This error is reported by the FLEX_US_CSR.LINSTE flag.

#### 46.7.9.14.7 Header Timeout Error

This error is generated in slave node configuration, if the Header is not entirely received within the time given by the maximum length of the Header, $t_{Header_Maximum}$.

This error is reported by the FLEX_US_CSR.LINHTE flag.

### 46.7.9.15 LIN Frame Handling

#### 46.7.9.15.1 Master Node Configuration

- Write FLEX_US_CR.TXEN and FLEX_US_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX_US_MR.USART_MODE to select the LIN mode and the master node configuration.
- Write FLEX_US_BRGR.CD and FLEX_US_BRGR.FP to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in FLEX_US_LINMR to configure the frame transfer.
- Check that FLEX_US_CSR. TXRDY is set to 1.
- Write FLEX_US_LINIR.IDCHR to send the header.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the USART sends the response.
  - Wait until FLEX_US_CSR. TXRDY rises.
  - Write FLEX_US_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX_US_CSR.RXRDY rises.
  - Read FLEX_US_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 46-47. Master Node Configuration, NACT = PUBLISH**

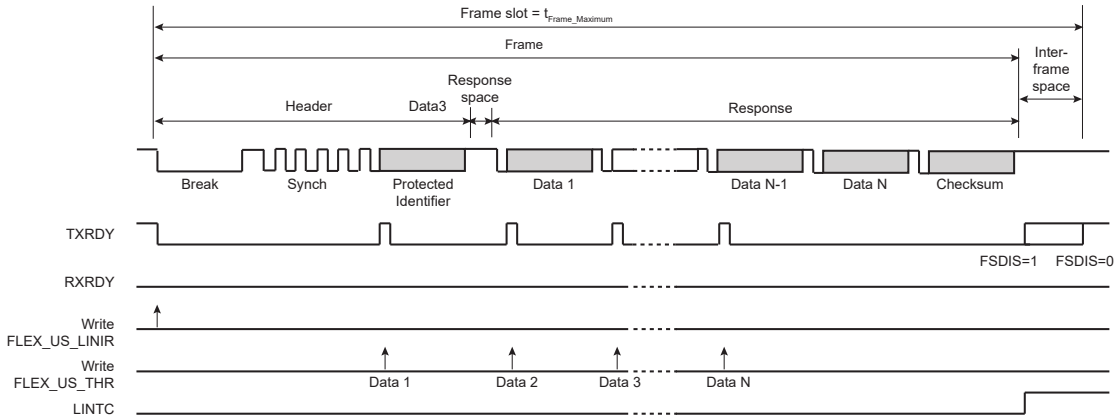


**Figure 46-48. Master Node Configuration, NACT = SUBSCRIBE**

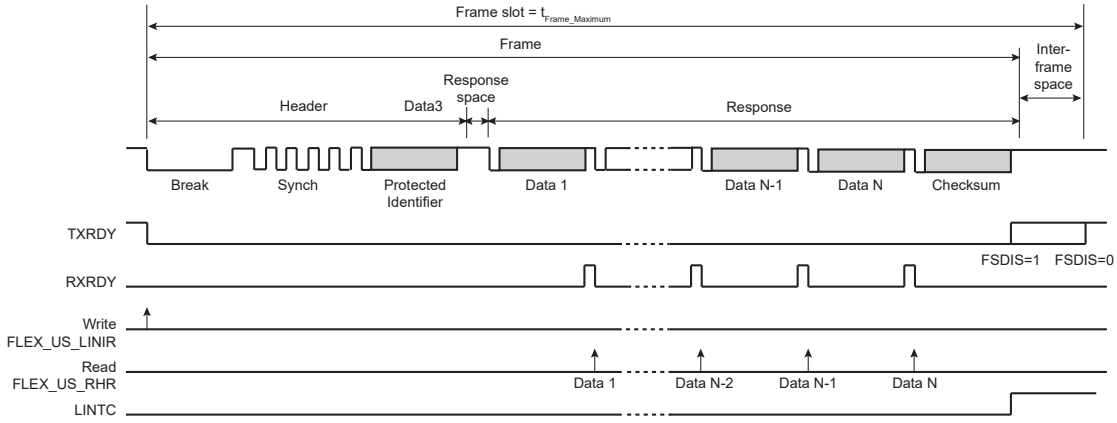

**Figure 46-49. Master Node Configuration, NACT = IGNORE**

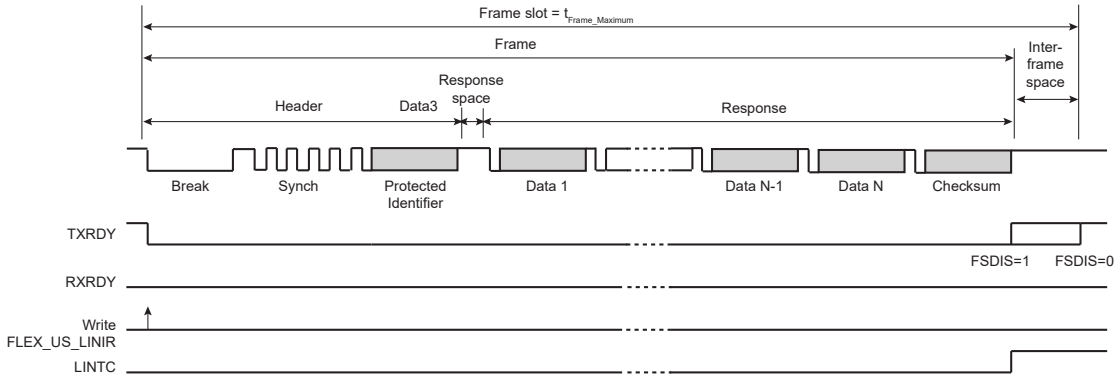

#### 46.7.9.15.2 Slave Node Configuration

- Write FLEX_US_CR.TXEN and FLEX_US_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX_US_MR.USART_MODE to select the LIN mode and the slave node configuration.
- Write FLEX_US_BRGR.CD and FLEX_US_BRGR.FP to configure the baud rate.
- Wait until FLEX_US_CSR.LINID rises.
- Check LINISFE and LINPE errors.
- Read FLEX_US_RHR.IDCHR.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in FLEX_US_LINMR to configure the frame transfer.

IMPORTANT: If the NACT configuration for this frame is PUBLISH, FLEX_US_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response.
  - Wait until FLEX_US_CSR.TXRDY rises.
  - Write FLEX_US_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX_US_CSR. LINTC rises.
  - Check the LIN errors.

- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX_US_CSR.RXRDY rises.
  - Read FLEX_US_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX_US_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 46-50. Slave Node Configuration, NACT = PUBLISH**

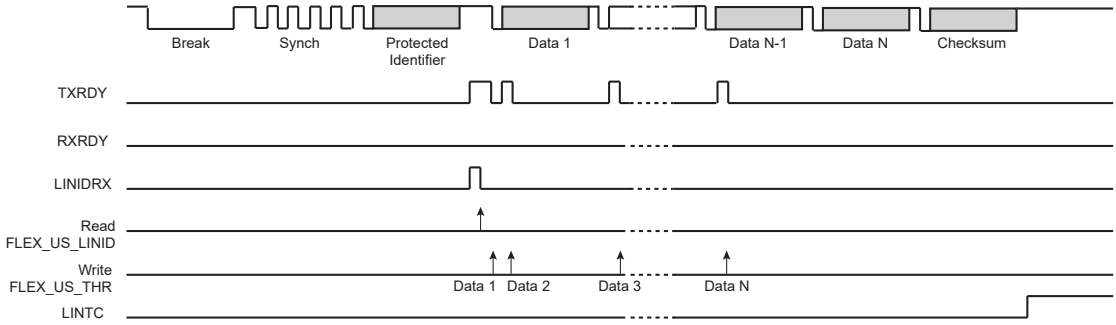

**Figure 46-51. Slave Node Configuration, NACT = SUBSCRIBE**

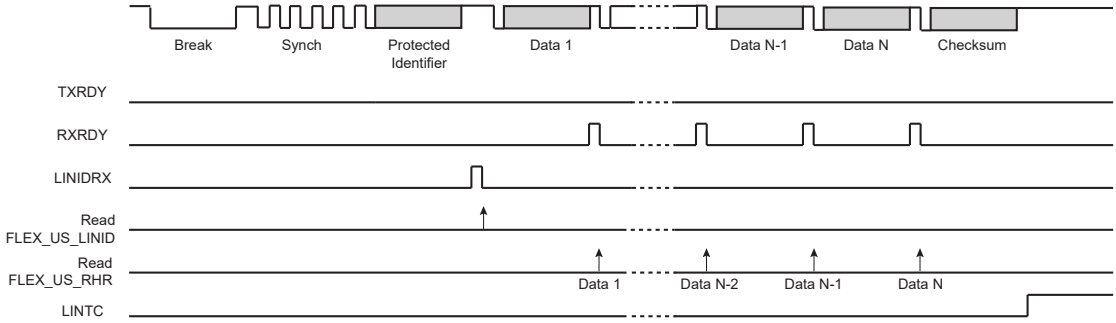

**Figure 46-52. Slave Node Configuration, NACT = IGNORE**

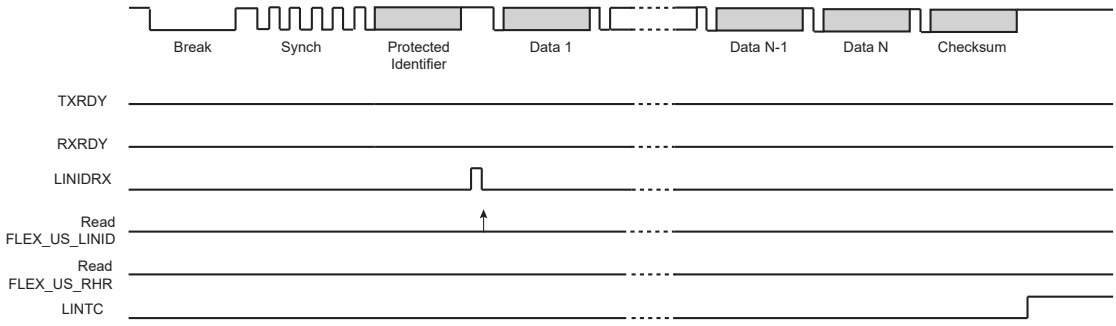

#### 46.7.9.16 LIN Frame Handling with the DMAC

The USART can be used in association with the DMAC in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMAC uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMAC always writes in the Transmit Holding Register (FLEX_US_THR) and it always reads in the Receive

Holding Register (FLEX_US_RHR). The size of the data written or read by the DMAC in the USART is always a byte.

#### 46.7.9.16.1 Master Node Configuration

The user can choose between two DMAC modes by configuring the FLEX_US_LINMR.PDCM bit:

- PDCM = 1: The LIN configuration is stored in the WRITE buffer and it is written by the DMAC in the Transmit Holding register FLEX_US_THR (instead of the LIN Mode register FLEX_US_LINMR). Because the DMAC transfer size is limited to a byte, the transfer is split into two accesses. During the first access, the NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS bits are written. During the second access, the 8-bit DLC field is written.
- PDCM = 0: The LIN configuration is not stored in the WRITE buffer and it must be written by the user in FLEX_US_LINMR.

The WRITE buffer also contains the Identifier and the data, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 46-53. Master Node with DMAC (PDCM = 1)**

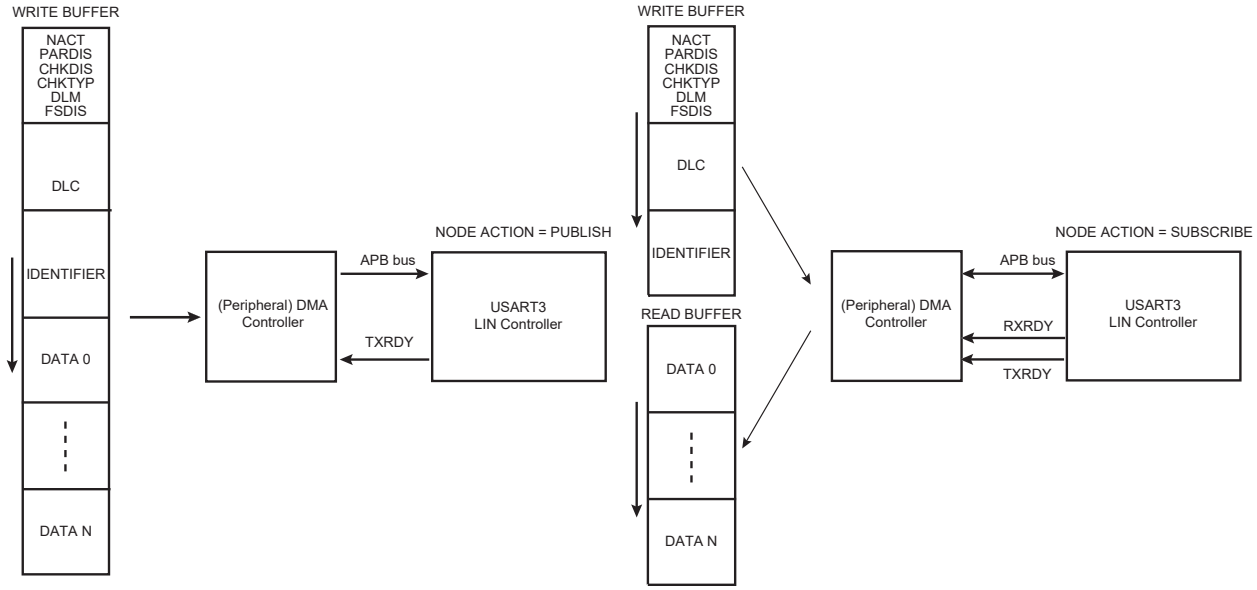

**Figure 46-54. Master Node with DMAC (PDCM = 0)**

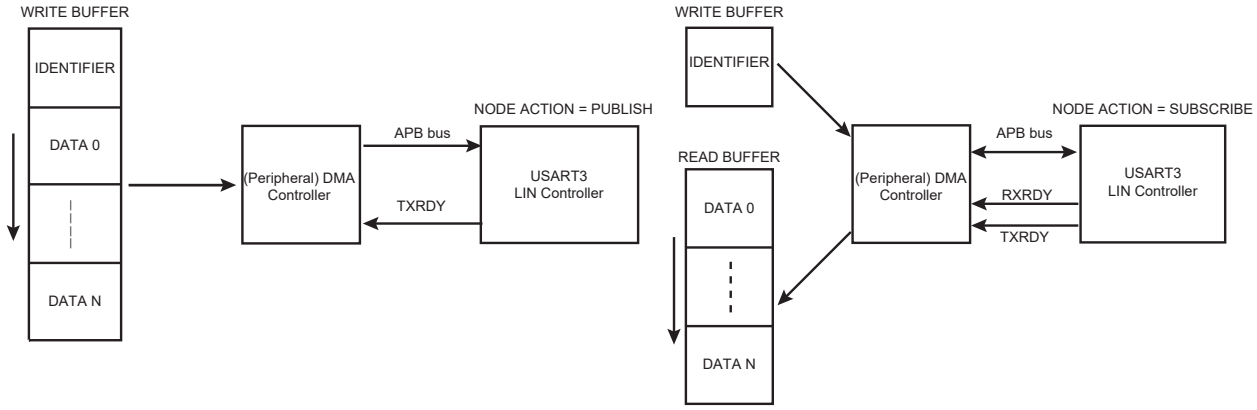


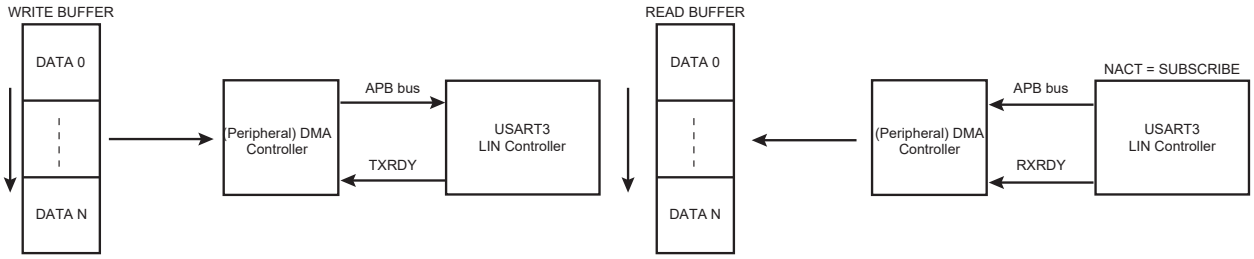
#### 46.7.9.16.2 Slave Node Configuration

In this configuration, the DMAC transfers only the data. The identifier must be read by the user in the LIN Identifier Register (FLEX_US_LINIR). The LIN mode must be written by the user in FLEX_US_LINMR.

The WRITE buffer contains the data if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 46-55. Slave Node with DMAC**



#### 46.7.9.17 Wakeup Request

Any node in a sleeping LIN cluster may request a wakeup.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250 µs to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character respects the specified timings.

- Baud rate min = 1 kbit/s -> $t_{bit}$ = 1 ms -> 5 $t_{bit}$ = 5 ms
- Baud rate max = 20 kbit/s -> $t_{bit}$ = 50 µs -> 5 $t_{bit}$ = 250 µs

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

Using the FLEX_US_LINMR.WKUPTYP bit, the user can choose to send either a LIN 2.0 wakeup request (WKUPTYP = 0) or a LIN 1.3 wakeup request (WKUPTYP = 1).

A wakeup request is transmitted by writing the FLEX_US_CR.LINWKUP bit to 1. Once the transfer is completed, the LINTC flag is asserted in the Status Register (FLEX_US_CSR). It is cleared by writing a one to the FLEX_US_CR.RSTSTA bit.

#### 46.7.9.18 Bus Idle Timeout

If the LIN bus is inactive for a certain duration, the slave nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this timeout is defined as 4 seconds. In the LIN 1.3 specification, it is defined as 25,000 $t_{bit}$.

In slave Node configuration, the receiver timeout detects an idle condition on the RXD line. When a timeout is detected, the FLEX_US_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The timeout delay period (during which the receiver waits for a new character) is programmed in the FLEX_US_RTOR.TO field. If a zero is written to the TO field, the Receiver Timeout is disabled and no timeout is detected. The FLEX_US_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX_US_CSR.TIMEOUT bit rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

**Table 46-14. Receiver Timeout Programming**

| LIN Specification | Baud Rate | Timeout period | TO |
|---|---|---|---|
| 2.0 | 1,000 bit/s | 4s | 4,000 |
| | 2,400 bit/s | | 9,600 |
| | 9,600 bit/s | | 38,400 |
| | 19,200 bit/s | | 76,800 |
| | 20,000 bit/s | | 80,000 |
| 1.3 | – | 25,000 $t_{bit}$ | 25,000 |

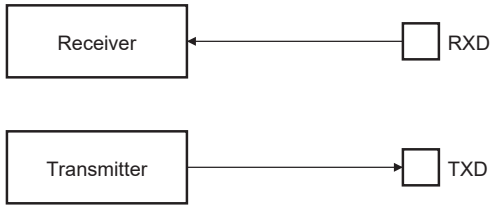
### 46.7.10 Test Modes

The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

#### 46.7.10.1 Normal Mode

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

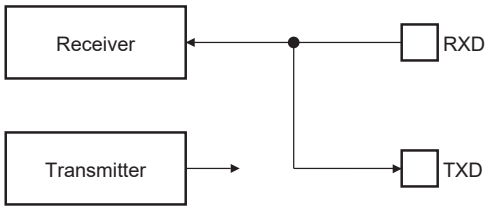
**Figure 46-56. Normal Mode Configuration**



#### 46.7.10.2 Automatic Echo Mode

Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in the following figure. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

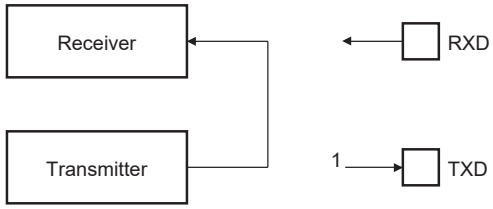
**Figure 46-57. Automatic Echo Mode Configuration**



#### 46.7.10.3 Local Loopback Mode

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the following figure. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

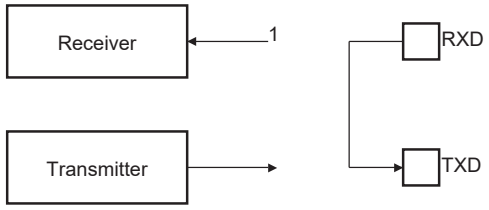
**Figure 46-58. Local Loopback Mode Configuration**



#### 46.7.10.4 Remote Loopback Mode

Remote Loopback mode directly connects the RXD pin to the TXD pin, as shown in the following figure. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

**Figure 46-59. Remote Loopback Mode Configuration**



### 46.7.11 USART FIFOs

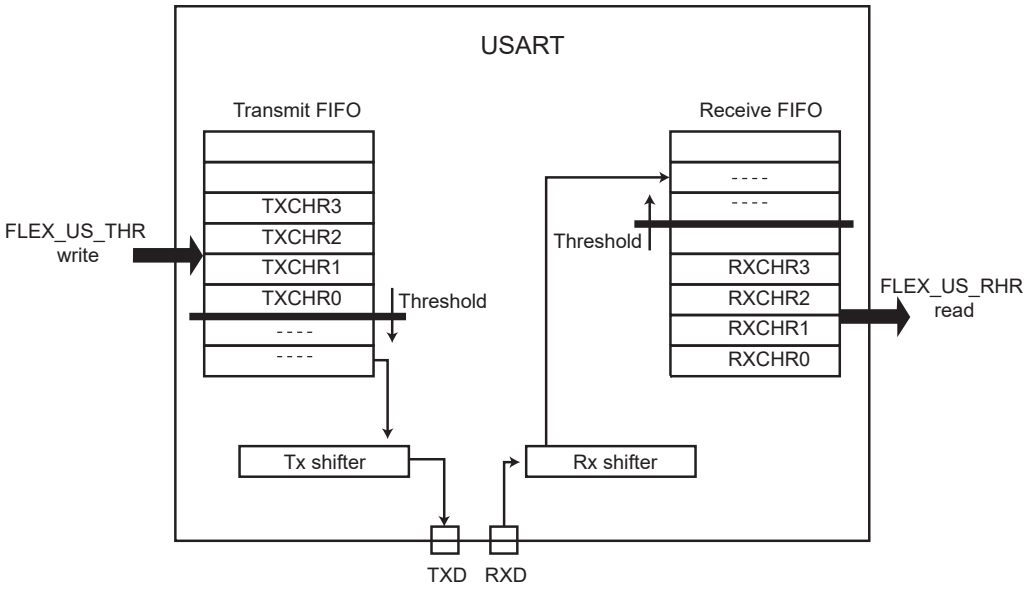
#### 46.7.11.1 Overview

The USART includes two FIFOs which can be enabled/disabled using FLEX_US_CR.FIFOEN/FIFODIS. Both the transmitter and the receiver must be disabled before enabling or disabling the FIFOs, using the FLEX_US_CR.TXDIS/RXDIS bits.

Writing FLEX_US_CR.FIFOEN to ‘1’ enables a 32-data Transmit FIFO and a 32-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX_US_THR/RHR. See sections USART Single Data Mode and USART Multiple Data Mode.

**Figure 46-60. FIFOs Block Diagram**



### 46.7.11.2 Sending Data with FIFO Enabled

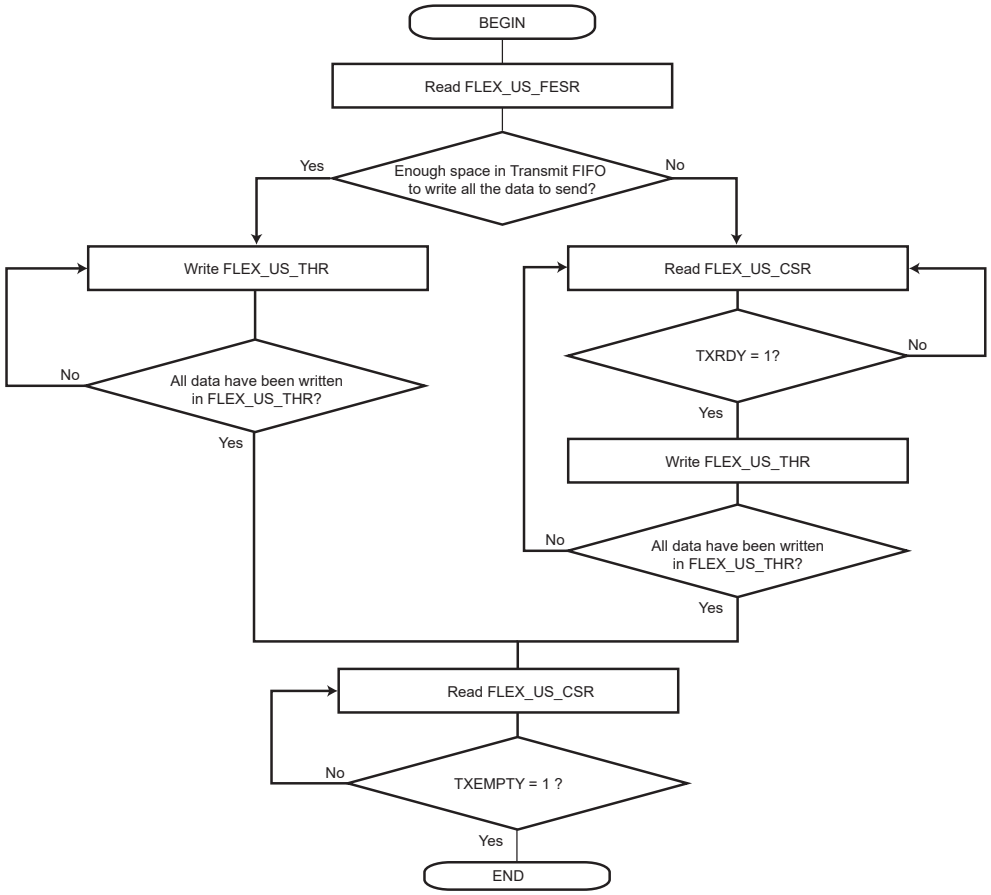
When the Transmit FIFO is enabled, write access to FLEX_US_THR loads the Transmit FIFO.

The FIFO level is provided in FLEX_US_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX_US_CSR.TXRDY and the data can be successively written in FLEX_US_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX_US_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

**Figure 46-61. Sending Data with FIFO Enabled**

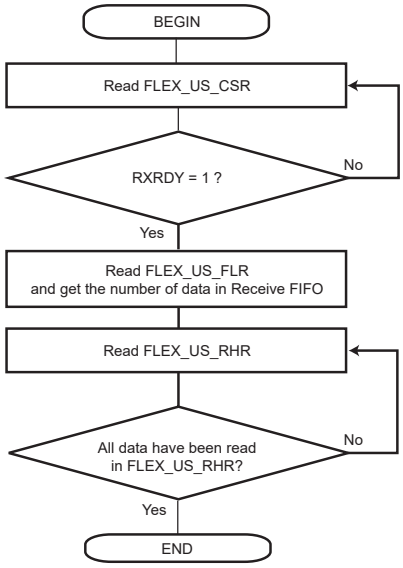


### 46.7.11.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX_US_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to ‘1’), the exact number of data can be checked with FLEX_US_FLR.RXFL. All the data can be read successively in FLEX_US_RHR without checking the RXRDY flag between each access.

**Figure 46-62. Receiving Data with FIFO Enabled**



#### 46.7.11.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX_US_CR.TXFCLR/RXFCLR.

#### 46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior

FLEX_US_CSR.TXEMPTY, FLEX_US_CSR.TXRDY and FLEX_US_CSR.RXRDY flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure TXRDY in Single Data Mode and TXRDYM = 0.

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. See figure RXRDY in Single Data Mode and RXRDYM = 0 below.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the USART FIFO Mode Register (FLEX_US_FMR) to reduce the number of accesses to FLEX_US_RHR/THR. However, for some configurations, the following constraints apply:

- If FLEX_US_MR.MODE9 is set, FLEX_US_FMR.TXRDYM/RXRDYM must be cleared.
- If FLEX_US_MR.USART_MODE is set to either LIN_MASTER or LIN_SLAVE, FLEX_US_FMR.TXRDYM/RXRDYM must be cleared.

See USART FIFO Mode Register for the FIFO configuration.

**Figure 46-63. TXRDY in Single Data Mode and TXRDYM = 0**

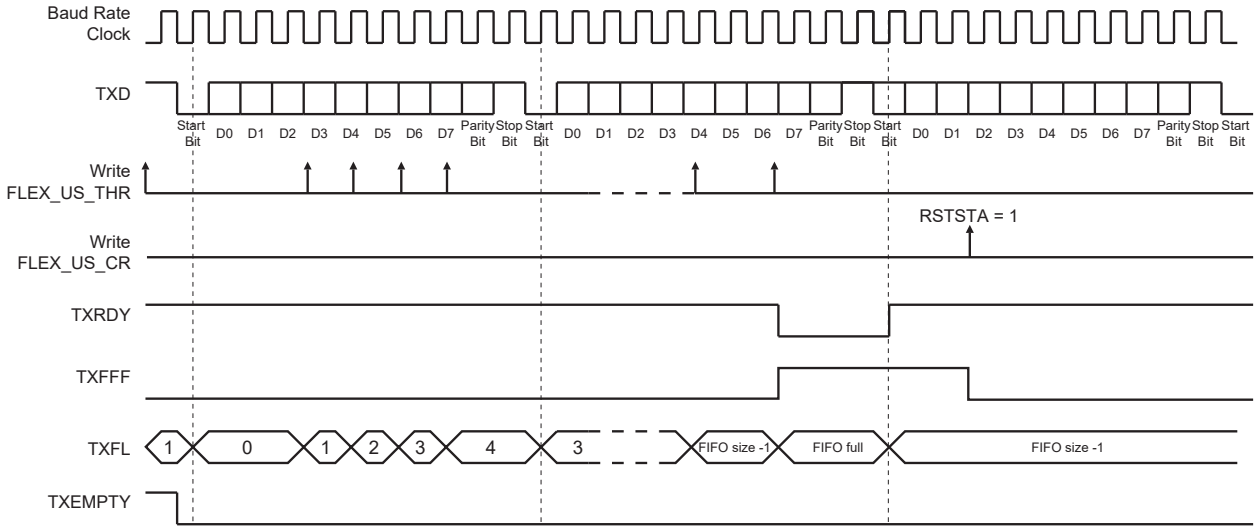


**Figure 46-64. RXRDY in Single Data Mode and RXRDYM = 0**

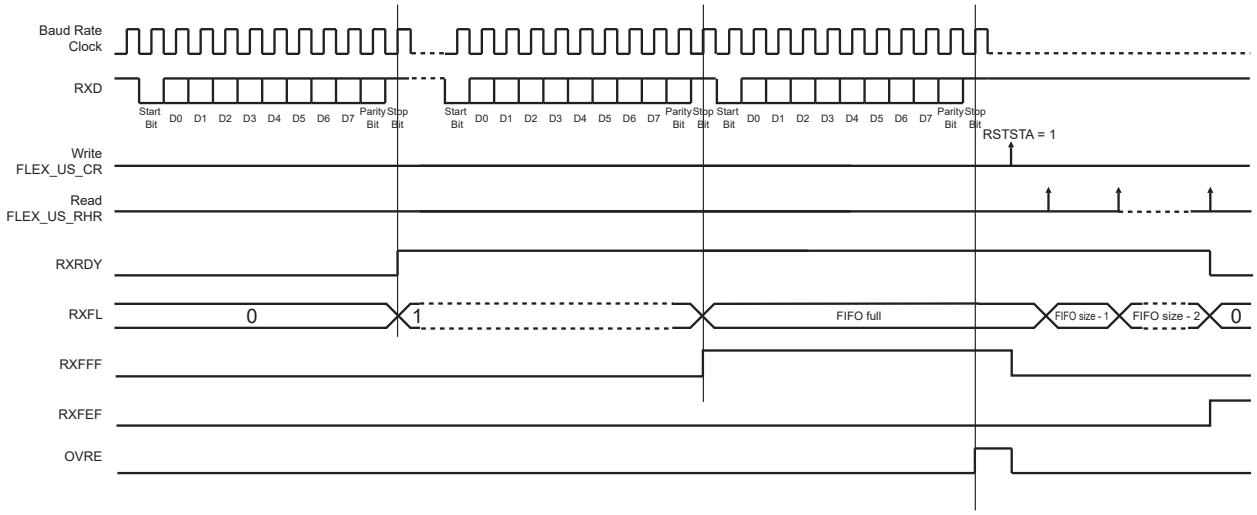


### 46.7.11.6 USART Single Data Mode

In Single Data mode, only one data is written every time FLEX_US_THR is accessed, and only one data is read every time FLEX_US_RHR is accessed.

When FLEX_US_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX_US_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If FLEX_US_MR.MODE9 is set, or if FLEX_US_MR.USART_MODE is set to either LIN_MASTER or LIN_SLAVE, the FIFOs must operate in Single Data mode.

See USART Receive Holding Register (FLEX_US_RHR) and USART Transmit Holding Register (FLEX_US_THR).

#### 46.7.11.6.1 DMAC

The DMAC transfer type must be configured in bytes or halfwords when FIFOs operate in Single Data mode (the same applies when FIFOs are disabled).

#### 46.7.11.7 USART Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX_US_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX_US_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

However, Multiple Data mode cannot be used for the following configurations:

- If FLEX_US_MR.MODE9 is set
- If FLEX_US_MR.USART_MODE is set to either LIN_MASTER or LIN_SLAVE

In Multiple Data mode, it is possible to write/read up to four data in one FLEX_US_THR/FLEX_US_RHR access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read, if the access is a halfword size register access, then two data are written/read and, finally, if the access is a word-size register access, four data are written/read.

Written/read data are always right-aligned, as described in sections USART Receive Holding Register (FIFO Multi Data) and USART Transmit Holding Register (FIFO Multi Data).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX_US_THR-byte write accesses
- three FLEX_US_THR-halfword write accesses
- one FLEX_US_THR word write access and one FLEX_US_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX_US_RHR-byte read accesses
- three FLEX_US_RHR-halfword read accesses
- one FLEX_US_RHR-word read access and one FLEX_US_RHR-halfword read access

##### 46.7.11.7.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX_US_THR/FLEX_US_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX_US_FMR.TXRDYM/RXRDYM.

As an example, if four data are written each time in FLEX_US_THR, it is useful to configure the TXRDYM field to the value ‘2’ so that the TXRDY flag is at ‘1’ only when at least four data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX_US_RHR, it is useful to configure the RXRDYM field to the value ‘2’ so that the RXRDY flag is at ‘1’ only when at least four unread data are in the Receive FIFO.

##### 46.7.11.7.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX_US_FMR.TXRDYM/RXRDYM settings.

#### 46.7.11.8 Transmit FIFO Lock

- LIN Mode:

If a frame is aborted using the Abort LIN Transmission bit (FLEX_US_CR.LINABT), a lock is set on the Transmit FIFO, preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

The TXFLOCK bit in the USART FIFO Event Status Register (FLEX_US_FESR) is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX_US_CR.TXFLCLR to ‘1’.

#### 46.7.11.9 FIFO Pointer Error

A FIFO overflow is reported in FLEX_US_FESR.

If the Transmit FIFO is full and a write access is performed on FLEX_US_THR, it generates a Transmit FIFO pointer error and sets FLEX_US_FESR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX_US_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX_US_FESR.TXFPTEF is set.

A FIFO underflow is reported in FLEX_US_FESR.

In Multiple Data mode, if the number of data read in FLEX_US_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX_US_FESR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX_US_THR/ FLEX_US_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit pointer error occurs, a transmitter reset must be performed using FLEX_US_CR.RSTTX. If a Receive pointer error occurs, a receiver reset must be performed using FLEX_US_CR.RSTRX.

#### 46.7.11.10 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX_US_FMR.TXFTHRES. Each time the Transmit FIFO level goes from ‘above threshold’ to ‘equal to or below threshold’, the flag FLEX_US_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX_US_FMR.RXFTHRES. Each time the Receive FIFO level goes from ‘below threshold’ to ‘equal to or above threshold’, the flag FLEX_US_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The Receive FIFO threshold 2 can be set using the field FLEX_US_FMR.RXFTHRES2. Each time the Receive FIFO level goes from ‘above threshold 2’ to ‘equal to or below threshold 2’, the flag FLEX_US_FESR.RXFTHF2 is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF, RXFTHF and RXTHF2 flags can be configured to generate an interrupt using FLEX_US_FIER and FLEX_US_FIDR.

#### 46.7.11.11 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX_US_FIER and FLEX_US_FIDR.

FIFO flags state can be read in FLEX_US_FESR. They are cleared by writing FLEX_US_CR.RSTSTA to ‘1’.

### 46.7.12 USART Register Write Protection

The FLEXCOM operating mode (FLEX_MR.OPMODE) must be set to FLEX_MR_OPMODE_USART to enable access to the write protection registers.

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable) bit in the USART Write Protection Mode Register (FLEX_US_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the USART Write Protection Status Register (FLEX_US_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX_US_WPSR.

The following registers can be write-protected when WPEN is set:

- USART Mode Register
- USART Baud Rate Generator Register
- USART Receiver Timeout Register
- USART Transmitter Timeguard Register
- USART FI DI RATIO Register
- USART IrDA FILTER Register
- USART Manchester Configuration Register
- USART Comparison Register

## 46.8 SPI Functional Description

### 46.8.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by writing a 1 to the MSTR bit in the SPI Mode Register (FLEX_SPI_MR):
  - The pins NPCS0 to NPCS1 are all configured as outputs.
  - The SPCK pin is driven.
  - The MISO line is wired on the receiver input.
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in FLEX_SPI_MR is written to 0:
  - The MISO line is driven by the transmitter output.
  - The MOSI line is wired on the receiver input.
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPCS0 pin becomes an input, and is used as a slave select signal (NSS).
  - Pin NPCS1 is not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The bit rate generator is activated only in Master mode.

### 46.8.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select Register (FLEX_SPI_CSR). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

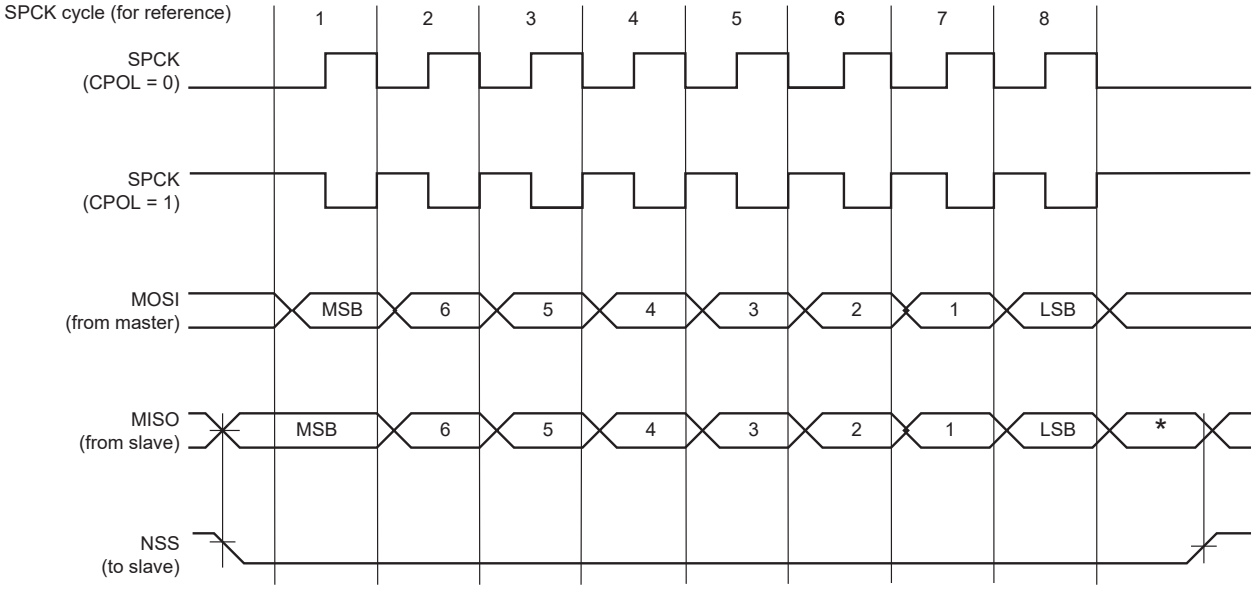
The following table shows the four modes and corresponding parameter settings.

**Table 46-15. SPI Bus Protocol Mode**

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|---|---|---|---|---|---|
| 0 | 0 | 1 | Falling | Rising | Low |
| 1 | 0 | 0 | Rising | Falling | Low |
| 2 | 1 | 1 | Rising | Falling | High |
| 3 | 1 | 0 | Falling | Rising | High |

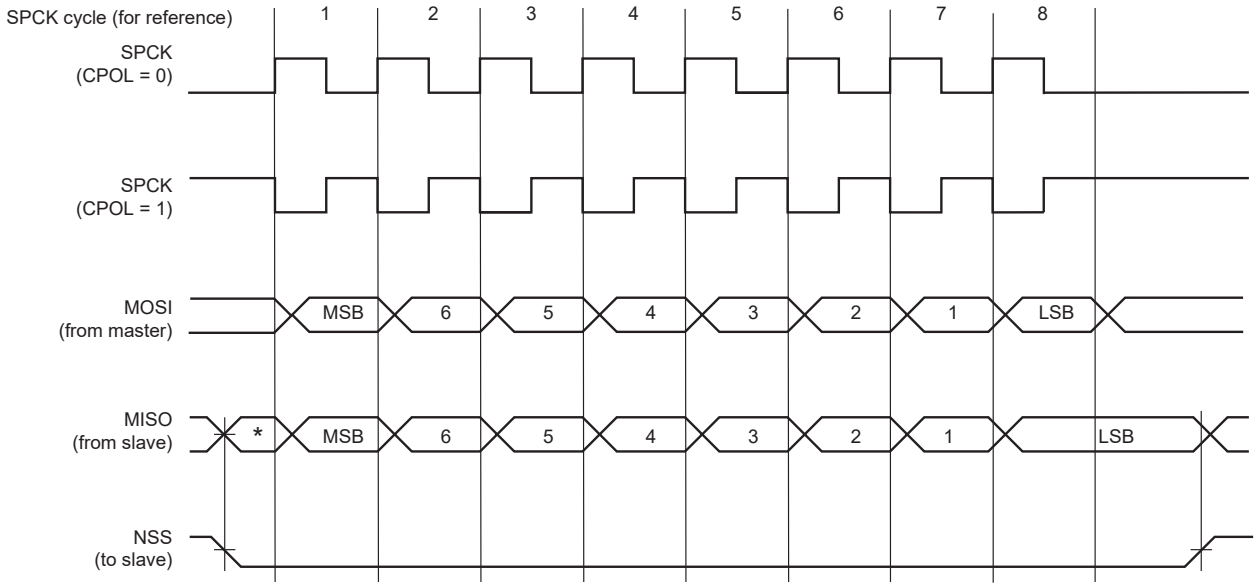
The following figures show examples of data transfers.

**Figure 46-65. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**



* Not defined.

**Figure 46-66. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**



* Not defined.

### 46.8.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable bit rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (FLEX_SPI_TDR) and the Receive Data Register (FLEX_SPI_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to FLEX_SPI_TDR. The written data are immediately transferred in the shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the shift register. Data cannot be loaded in FLEX_SPI_RDR without transmitting data. If there is no data to transmit, a dummy data can be used (FLEX_SPI_TDR filled with ones). When the WDRBT bit is set, a new data cannot be transmitted if FLEX_SPI_RDR has not been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status Register (FLEX_SPI_SR) can be discarded.

Before writing the TDR, the FLEX_SPI_MR.PCS field must be set in order to select a slave.

If new data are written in FLEX_SPI_TDR during the transfer, it is kept in FLEX_SPI_TDR until the current transfer is completed. Then, the received data are transferred from the shift register to FLEX_SPI_RDR, the data in FLEX_SPI_TDR is loaded in the shift register and a new transfer starts.

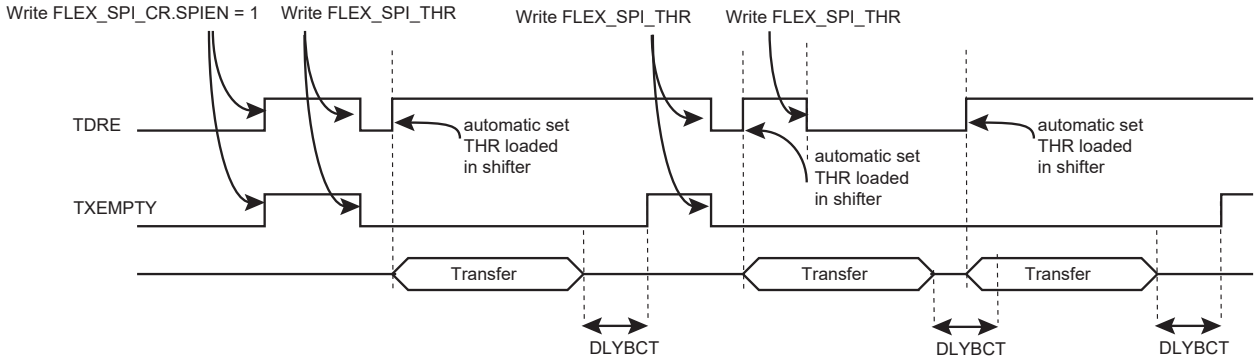
As soon as the FLEX_SPI_TDR is written, the Transmit Data Register Empty (TDRE) flag in FLEX_SPI_SR is cleared. When the data written in FLEX_SPI_TDR is loaded into the shift register, the FLEX_SPI_SR.TDRE flag is set. The TDRE bit is used to trigger the Transmit DMA channel (see figure below).

The end of transfer is indicated by FLEX_SPI_SR.TXEMPTY. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:**

1. When the SPI is enabled, the TDRE and TXEMPTY flags are set.
2. The TXEMPTY flag alone cannot be used to detect the end of the buffer DMA transfer.

**Figure 46-67. TDRE and TXEMPTY Flag Behavior**



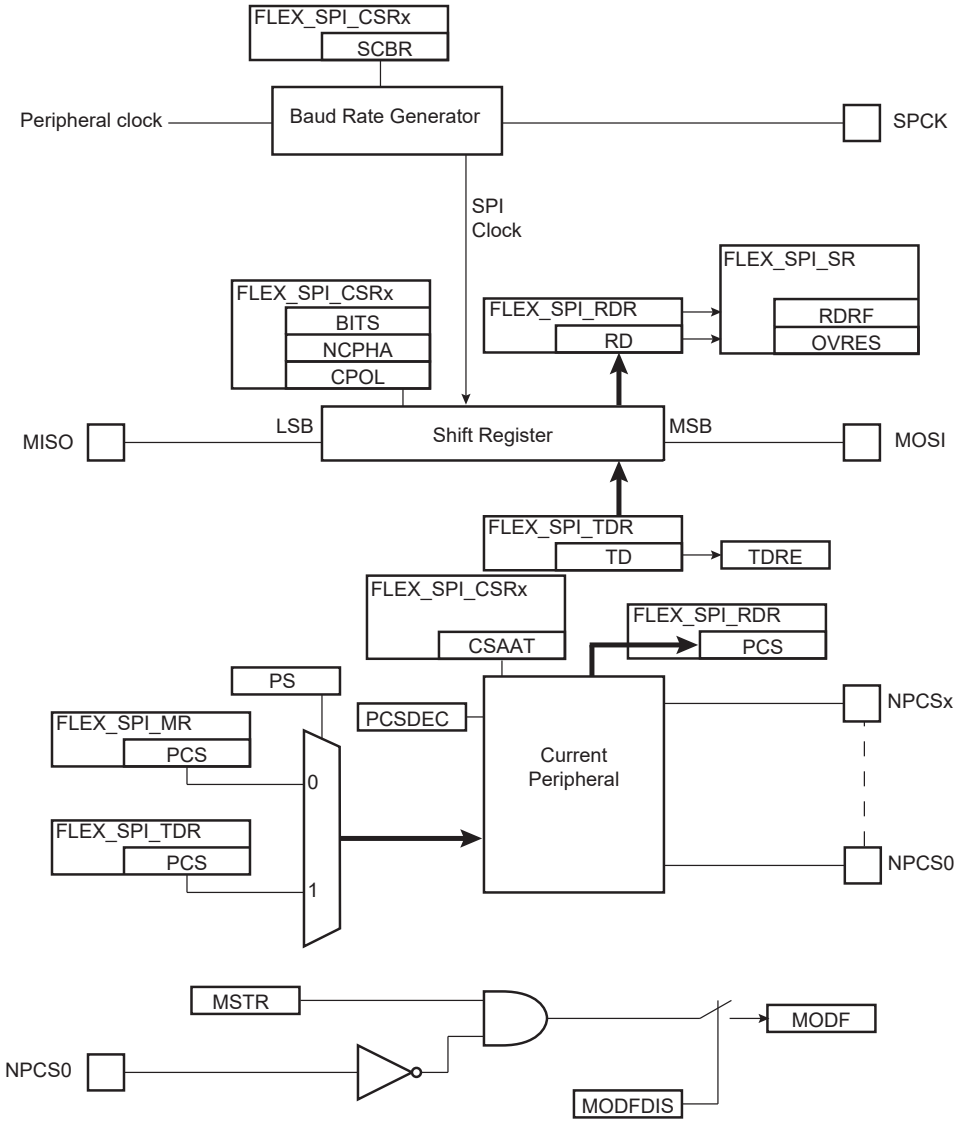
The transfer of received data from the shift register to FLEX_SPI_RDR is indicated by the Receive Data Register Full (RDRF) bit in FLEX_SPI_SR. When the received data are read, the RDRF bit is cleared.

If FLEX_SPI_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX_SPI_SR is set. As long as this flag is set, data are loaded in FLEX_SPI_RDR. The user has to read the status register to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

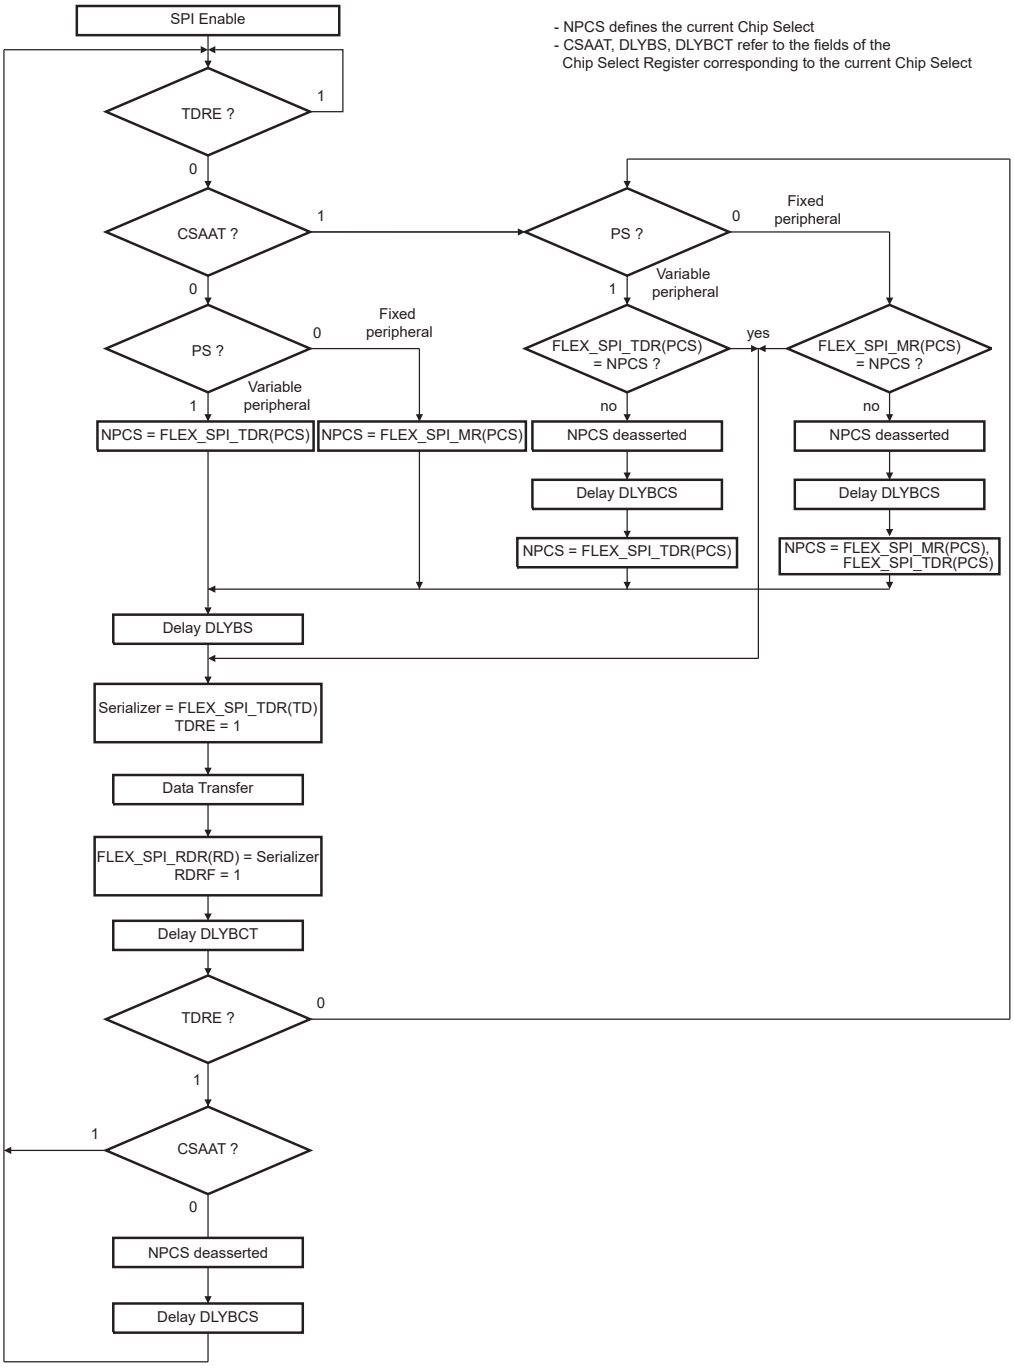
#### 46.8.3.1 Master Mode Block Diagram

**Figure 46-68. Master Mode Block Diagram**



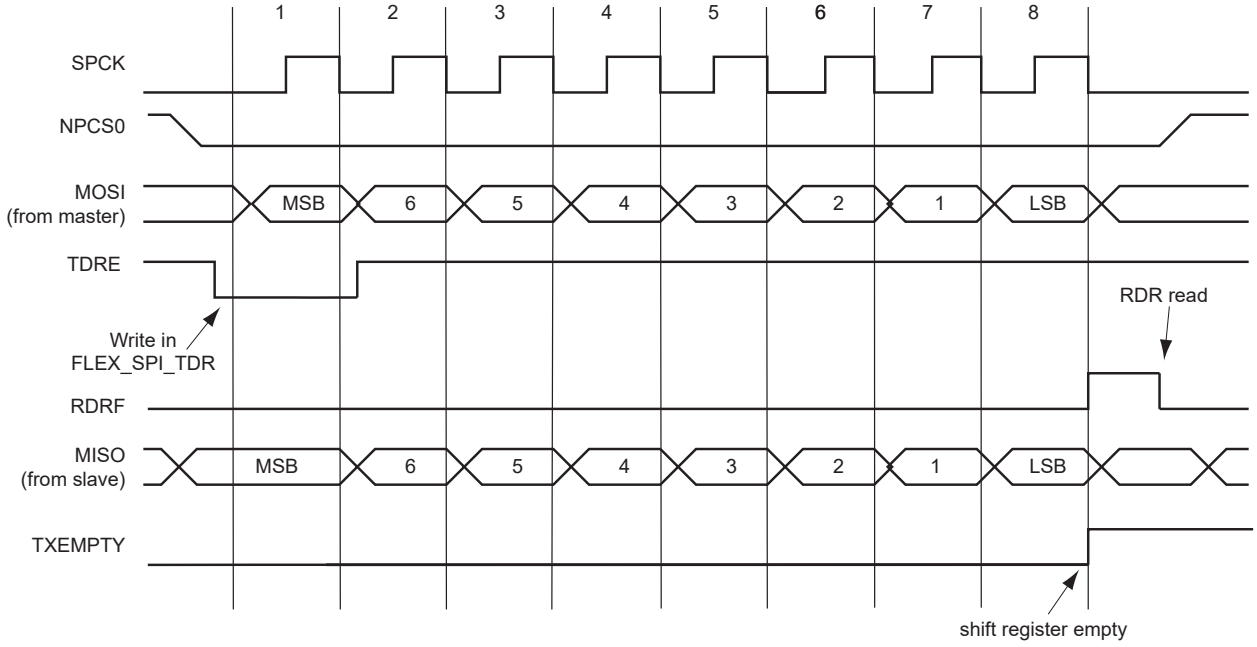
### 46.8.3.2 Master Mode Flowchart

**Figure 46-69. Master Mode**



The following figure shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within FLEX_SPI_SR during an 8-bit data transfer in Fixed mode without the DMAC involved.

**Figure 46-70. Status Register Flags Behavior**



#### 46.8.3.3 Clock Generation

The SPI bit rate clock is generated by dividing a source clock which can be the peripheral clock or a programmable clock from the GCLK. The divider can be a value between 1 and 255.

If the SCBR field is programmed to 1 and the clock source is GCLK, the operating bit rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in the FLEX_SPI_CSR.SCBR field. This allows the SPI to automatically adapt the bit rate for each interfaced peripheral without reprogramming.

If GCLK is selected as source clock (FLEX_SPI_MR.BRSRCCLK = 1), the bit rate is independent of the processor/bus clock. Thus, the processor clock can be changed while SPI is enabled. The processor clock frequency changes must be performed only by programming the PMC_MCKR.PRES field (refer to the section “Power Management Controller” (PMC)). Any other method to modify the processor/bus clock frequency (PLL multiplier, etc.) is forbidden when SPI is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

#### 46.8.3.4 Transfer Delays

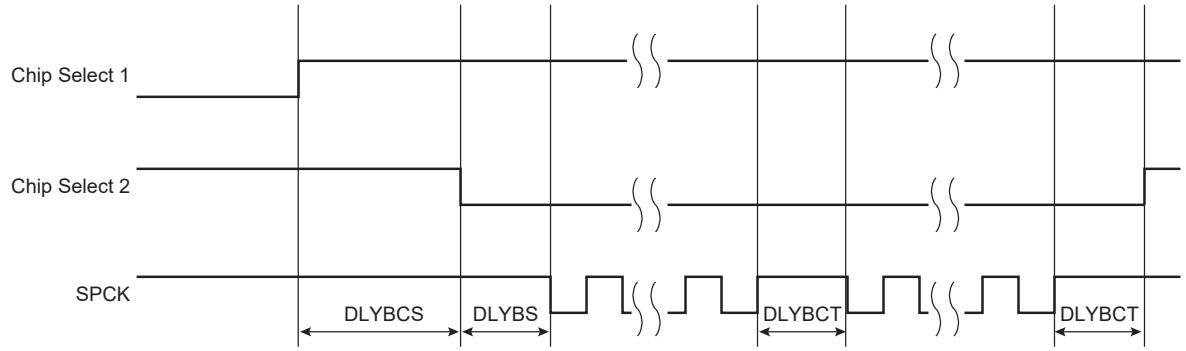
The figure below shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- The delay between the chip selects. It is programmable only once for all chip selects by writing the FLEX_SPI_MR.DLYBCS field. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, the DLYBCS field does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to the SPI slave device electrical characteristics.

- The delay before SPCK, independently programmable for each chip select by writing the DLYBS field. The SPI slave device activation delay is managed through DLYBS. Refer to the SPI slave device electrical characteristics to define DLYBS.
- The delay between consecutive transfers, independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 46-71. Programmable Delays**



#### 46.8.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS1 signals. By default, all NPCS signals are high before and after each transfer.

- Fixed Peripheral Select Mode: SPI exchanges data with only one peripheral.
  Fixed Peripheral Select mode is enabled by writing the FLEX_SPI_MR.PS bit to zero. In this case, the current peripheral is defined by the FLEX_SPI_MR.PCS field, and the FLEX_SPI_TDR. PCS field has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram FLEX_SPI_MR.PCS.
  Variable Peripheral Select Mode is enabled by setting the FLEX_SPI_MR.PS bit to one. The FLEX_SPI_TDR.PCS field is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to FLEX_SPI_TDR in the following format:

  [xxxxxxx(7-bit) + LASTXFER(1-bit)(1)+ xxxx(4-bit) + PCS (4-bit) + TD (8 to 16-bit data)]
  with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section SPI Transmit Data Register (FLEX_SPI_TDR).
  Note: 1. Optional

  The CSAAT, LASTXFER and CSNAAT bits are discussed in section Peripheral Deselection with DMA.

  If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (FLEX_SPI_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the FLEX_SPI_CR.SPIEN bit has previously been written.

#### 46.8.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, FLEX_SPI_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming FLEX_SPI_MR. Data written in FLEX_SPI_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

#### 46.8.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 3 slave peripherals by decoding the two chip select lines, NPCS0 to NPCS1 with an external decoder/demultiplexer (see the following figure). This can be enabled by setting the FLEX_SPI_MR.PCSDEC bit.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

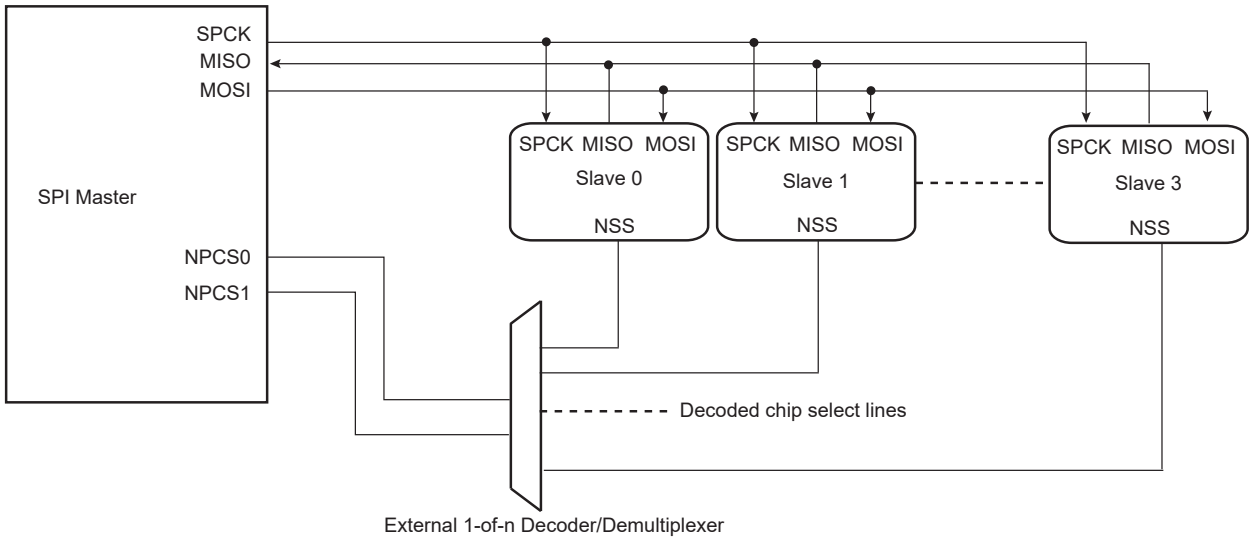
When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either FLEX_SPI_MR or FLEX_SPI_TDR (depending on PS).

As the SPI sets a default value of 0x3 on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 3 peripherals can be decoded.

The SPI has only two Chip Select registers. As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to two peripherals. As an example, FLEX_SPI_CRS0 defines the characteristics of the externally decoded peripherals 0 to 1, corresponding to the PCS values 0x0 to 0x1. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 1 and 2. The following figure shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the mode fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since mode fault detection is only on NPCS0.

**Figure 46-72. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**



#### 46.8.3.8 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, FLEX_SPI_TDR is loaded by the processor, the TDRE flag rises as soon as the content of FLEX_SPI_TDR is transferred into the internal shift register. When this flag is detected high, FLEX_SPI_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload FLEX_SPI_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in FLEX_SPI_CSR, gives even less time for the processor to reload FLEX_SPI_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the Chip Select registers [CSR0...CSR1] can be programmed with the Chip Select Active After Transfer (CSAAT) bit to 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if FLEX_SPI_TDR is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in FLEX_SPI_CR must be set after writing the last data to transmit into FLEX_SPI_TDR.

#### 46.8.3.9 Peripheral Deselection with DMA

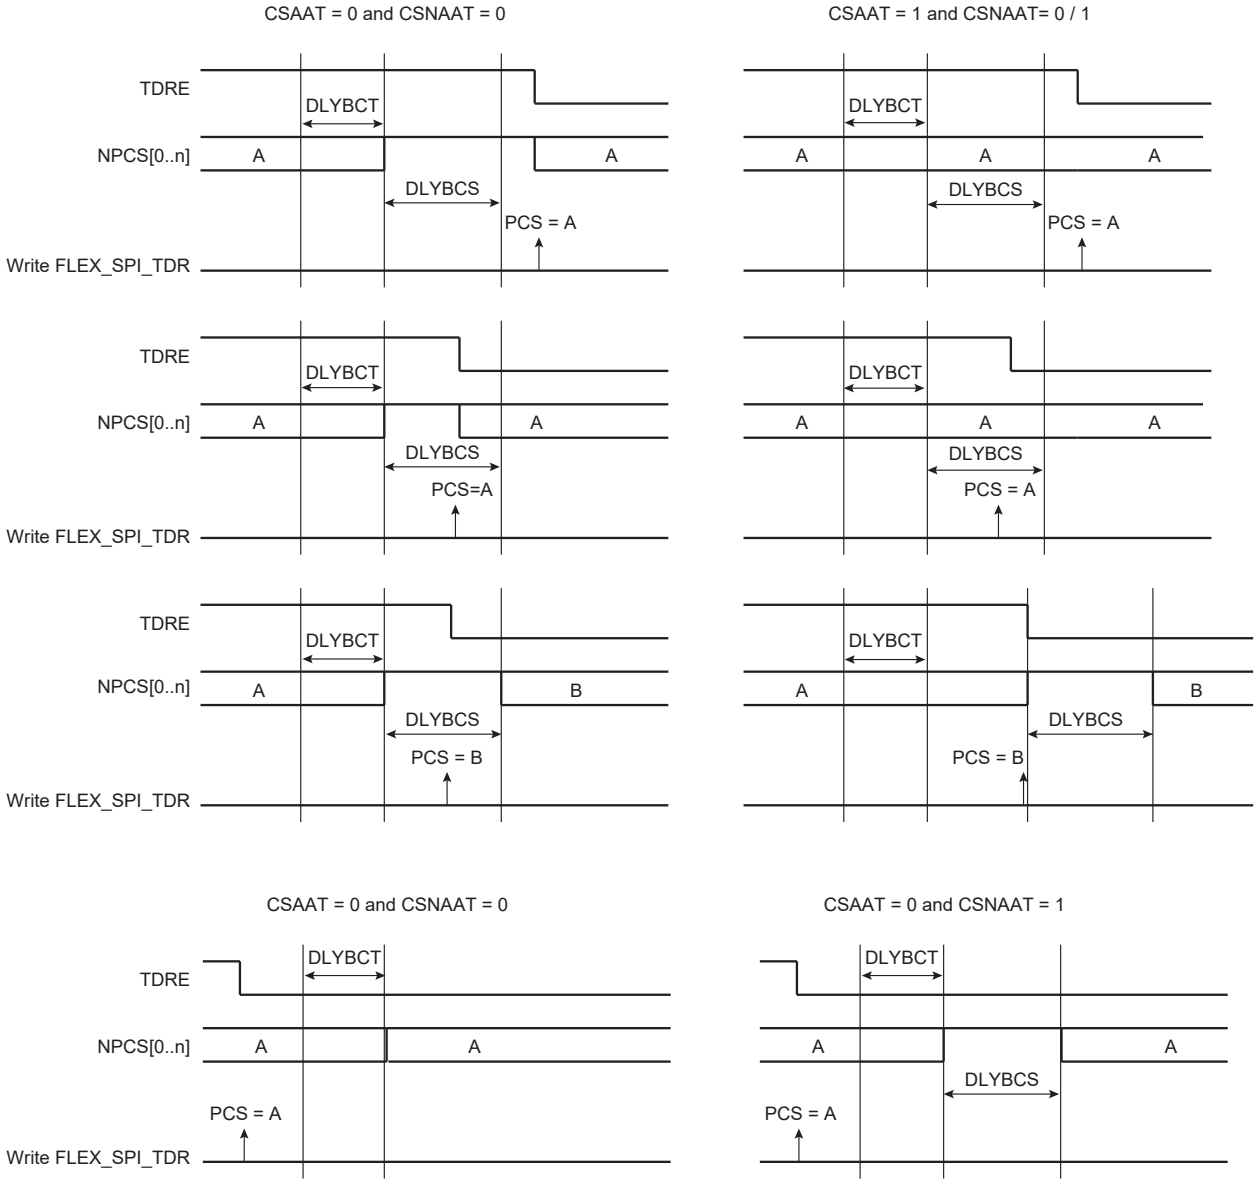
DMA provides faster reloads of FLEX_SPI_TDR compared to software. However, depending on the system activity, it is not guaranteed that FLEX_SPI_TDR is written with the next data before the end of the current transfer. Consequently, a data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is cleared, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the TDRE flag rises as soon as the content of FLEX_SPI_TDR is transferred into the internal shift register. When this flag is detected, FLEX_SPI_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select

to be deasserted after each transfer. To facilitate interfacing with such devices, FLEX_SPI_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit to 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is cleared for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 46-73. Peripheral Deselection**



### 46.8.3.10 Mode Fault Detection

The SPI has the capability to operate in multi-master environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit a data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multi-master environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, the FLEX_SPI_SR.MODF bit is set until FLEX_SPI_SR is

read and the SPI is automatically disabled until it is re-enabled by writing the FLEX_SPI_CR.SPIEN bit to 1.

By default, the mode fault detection is enabled. The user can disable it by setting the FLEX_SPI_MR.MODFDIS bit.

### 46.8.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data are loaded in FLEX_SPI_RDR according to the configuration value of the FLEX_SPI_CSR0.BITS field. These bits are processed following a phase and a polarity defined respectively by the FLEX_SPI_CSR0.NCPHA and FLEX_SPI_CSR0.CPOL bits. Note that the BITS field, CPOL bit and NCPHA bit of the other Chip Select registers have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on the BITS field, see also the note below the FLEX_SPI_CSRx register bitmap in section SPI Chip Select Register

When all bits are processed, the received data are transferred in FLEX_SPI_RDR and the RDRF bit rises. If FLEX_SPI_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX_SPI_SR is set. As long as this flag is set, data are loaded in FLEX_SPI_RDR. The user must read FLEX_SPI_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the shift register. If no data has been written in FLEX_SPI_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the shift register resets to 0.

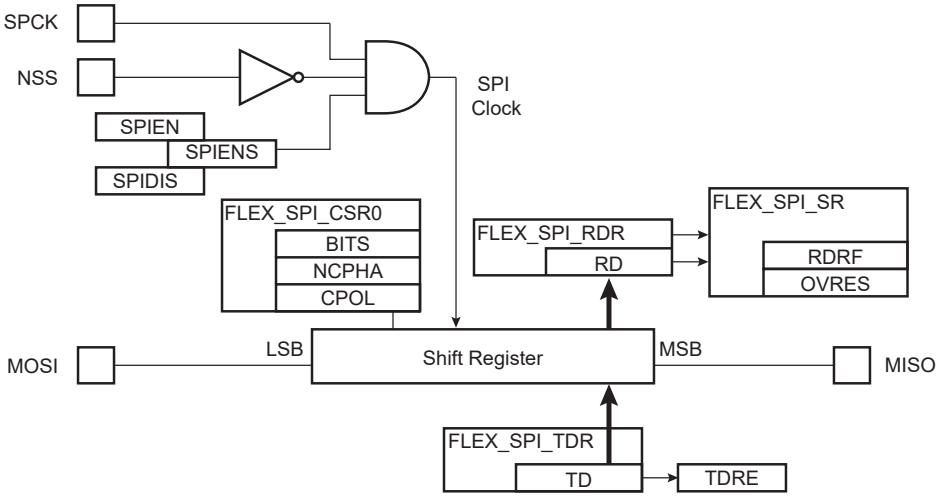
When a first data is written in FLEX_SPI_TDR, it is transferred immediately in the shift register and the TDRE flag rises. If new data is written, it remains in FLEX_SPI_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in FLEX_SPI_TDR is transferred in the shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, a new data is loaded in the shift register from FLEX_SPI_TDR. If no character is ready to be transmitted, i.e., no character has been written in FLEX_SPI_TDR since the last load from FLEX_SPI_TDR to the shift register, FLEX_SPI_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in FLEX_SPI_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 46-74. Slave Mode Functional Block Diagram**



### 46.8.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (MSTR = 0 in FLEX_US_MR).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section 46.8.6 SPI Asynchronous and Partial Wake-up (SleepWalking)).

In Active mode, the CMP flag in FLEX_SPI_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (FLEX_SPI_CMPR). The CMP flag is set as soon as FLEX_SPI_RDR is loaded with the new received character. The CMP flag is cleared by reading FLEX_SPI_SR.

The SPI Comparison Register can be programmed to provide different comparison methods. These are listed below:

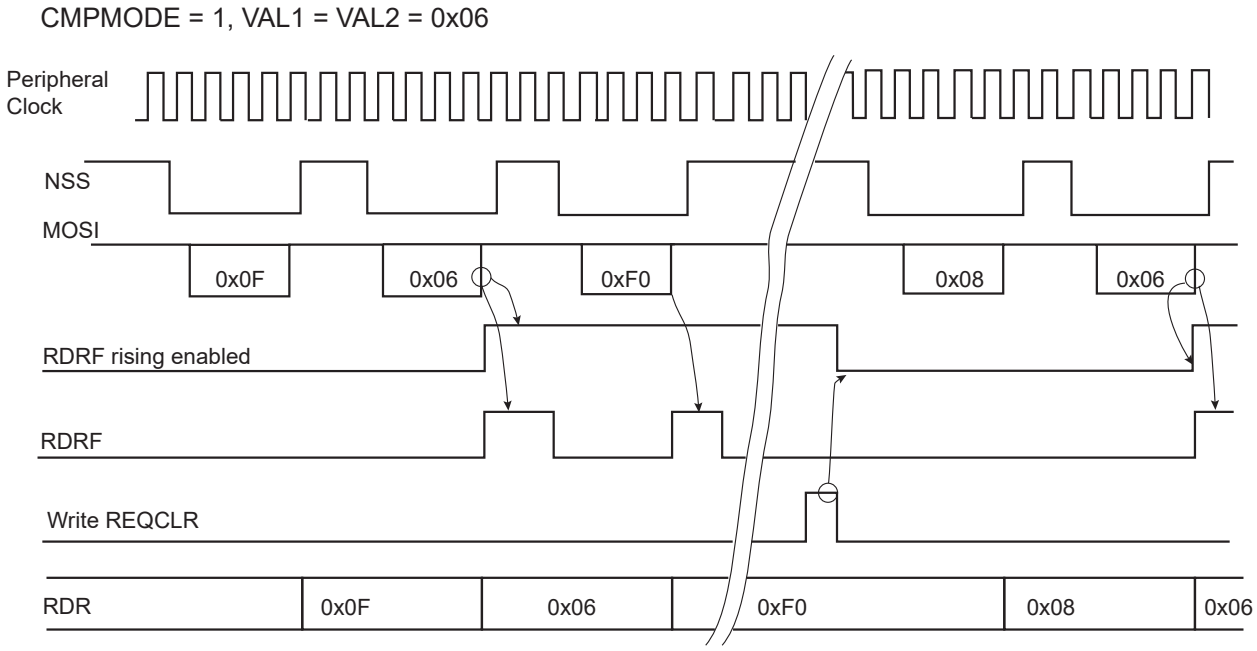
- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When FLEX_SPI_MR.CMPMODE is cleared, all received data is loaded in FLEX_SPI_RDR and the CMP flag provides the status of the comparison result.

By setting the CMPMODE bit, the comparison result triggers the start of FLEX_SPI_RDR loading (see the figure below). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in FLEX_SPI_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX_SPI_CR.REQCLR bit.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see BITS field in SPI Chip Select Register (FLEX_SPI_CSR)).

**Figure 46-75. Receive Data Register Management**



### 46.8.6 SPI Asynchronous and Partial Wake-up (SleepWalking)

This operating mode is a means of data pre-processing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wake-up is mainly used when the system is in Wait mode (refer to the section “Power Management Controller” (PMC) for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wake-up can be used only when SPI is configured in Slave mode (FLEX_SPI_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 15 µs.

The FLEX_SPI_RDR register must be read before enabling the asynchronous and partial wake-up.

When asynchronous and partial wake-up is enabled for the SPI (refer to the section “Power Management Controller” (PMC)), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with VAL1 and VAL2 in FLEX_SPI_CMPR (section FLEX_SPI_CMPR).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in FLEX_SPI_CMPR (see Figure 46-76 ).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see Figure 46-77).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wake-up is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wake-up is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wake-up mode by enabling the PMC_SLPWK_ER (refer to the section “Power Management Controller” (PMC)). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the SPI (refer to PMC_SLPWK_ER in the section “Power Management Controller” (PMC)).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wake-up mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

**Figure 46-76. Asynchronous Wake-up Use Case Example**

Case with VAL1 = VAL2 = 0x55

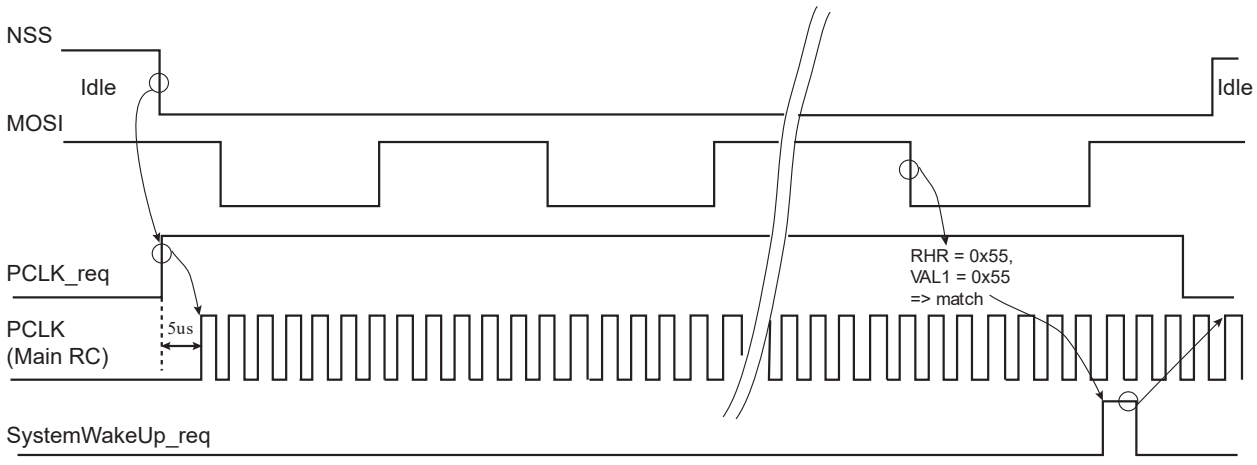


**Figure 46-77. Asynchronous Event Generating Only Partial Wake-up**

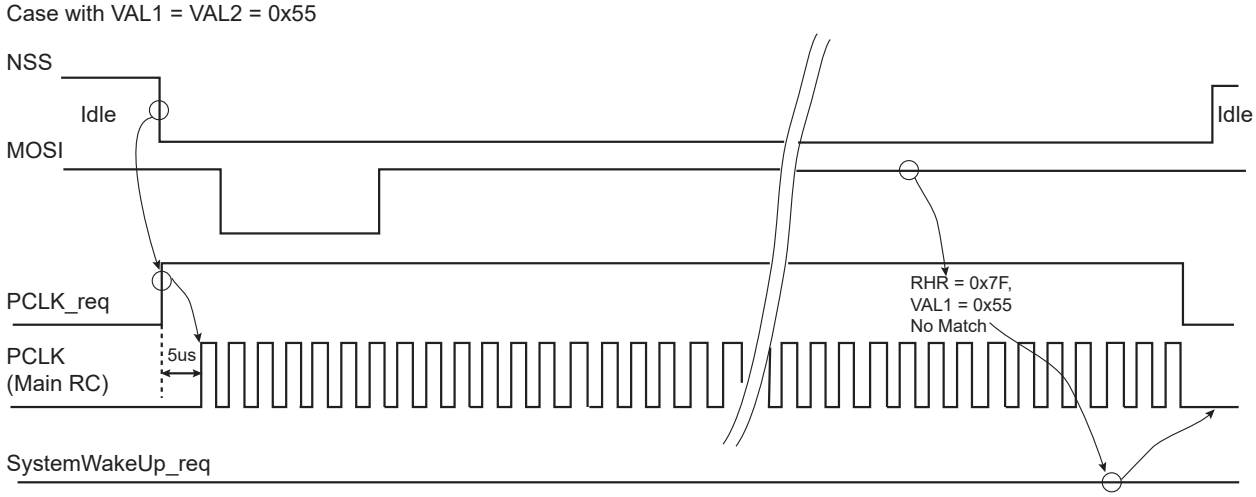


### 46.8.7 SPI FIFOs

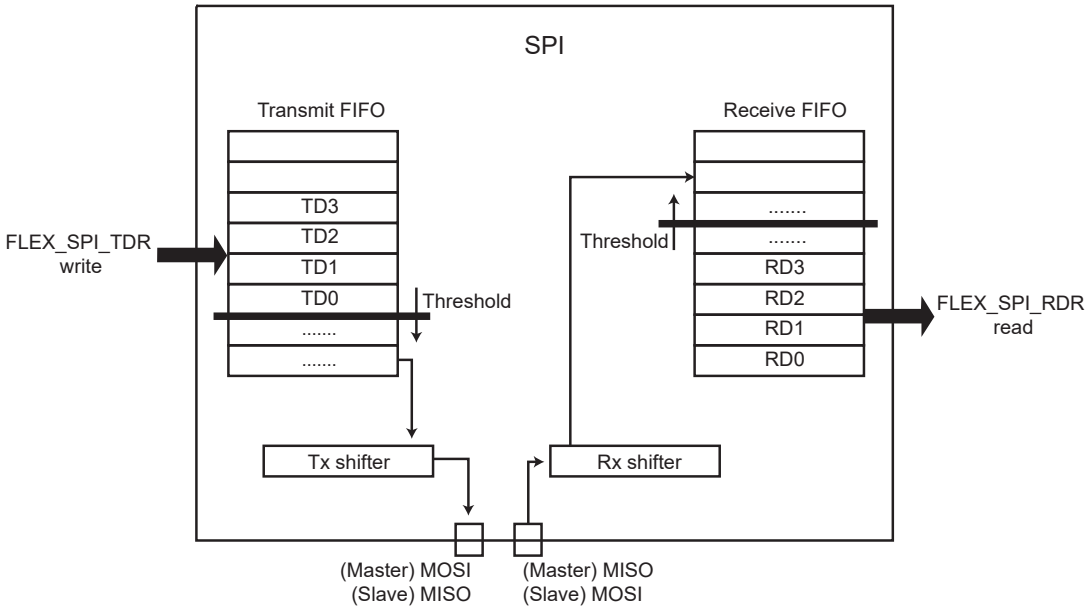
#### 46.8.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using the FLEX_SPI_CR.FIFOEN/FIFODIS. The SPI module must be disabled before enabling or disabling the SPI FIFOs (FLEX_SPI_CR.SPIDIS).

Writing FLEX_SPI_CR.FIFOEN to '1' enables a FIFO_DEPTH-data Transmit FIFO and a FIFO_DEPTH-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX_SPI_TDR/RDR. See sections SPI Single Data Mode and SPI Multiple Data Mode.

**Figure 46-78. FIFOs Block Diagram**



#### 46.8.7.2 Sending Data with FIFO Enabled

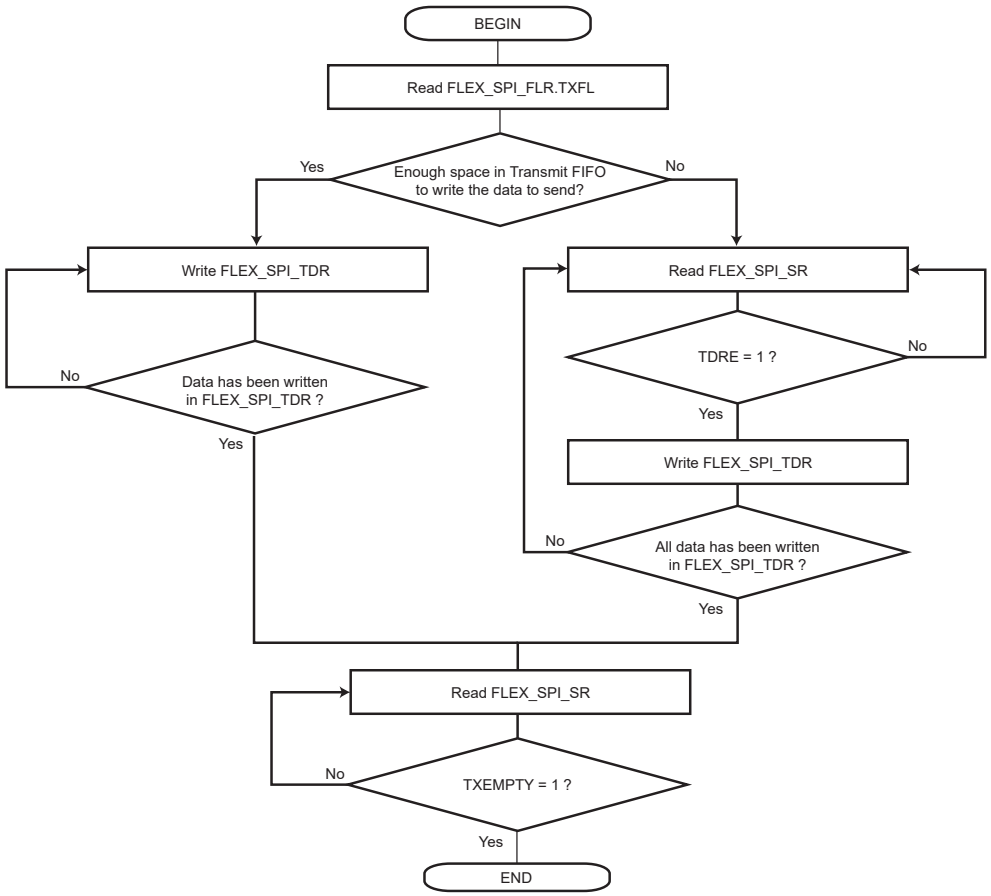
When the Transmit FIFO is enabled, write access to FLEX_SPI_TDR loads the Transmit FIFO.

The FIFO level is provided in FLEX_SPI_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX_SPI_SR.TDRE and the data can be successively written in FLEX_SPI_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in FLEX_SPI_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 46-79. Sending Data with FIFO Enabled**

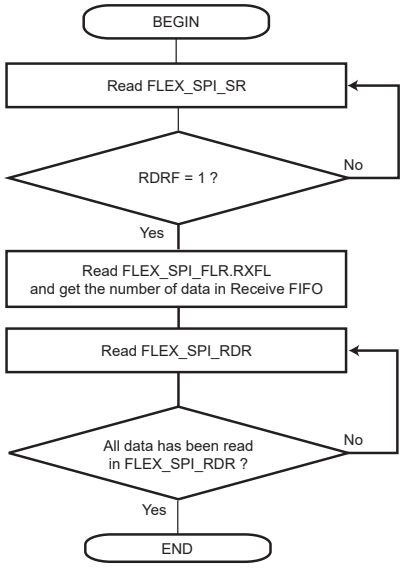


### 46.8.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX_SPI_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to ‘1’), the exact number of data can be checked with FLEX_SPI_FLR.RXFL. All the data can be read successively in FLEX_SPI_RDR without checking the RDRF flag between each access.

**Figure 46-80. Receiving Data with FIFO Enabled**



#### 46.8.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX_SPI_CR.TXFCLR/RXFCLR.

#### 46.8.7.5 TXEMPTY, TDRE and RDRF Behavior

FLEX_SPI_SR.TXEMPTY, FLEX_SPI_SR.TDRE and FLEX_SPI_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. See figure TDRE in Single Data Mode and TXRDYM = 0.

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. See figure RDRF in Single Data Mode and RXRDYM = 0.

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (FLEX_SPI_FMR) to reduce the number of accesses to FLEX_SPI_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (FLEX_SPI_MR.PS=1), TXRDYM/RXRDYM must be cleared.
- In Master mode (FLEX_SPI_MR.MSTR=1), RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See SPI FIFO Mode Register (FLEX_SPI_FMR) for the FIFO configuration.

**Figure 46-81. TDRE in Single Data Mode and TXRDYM = 0**

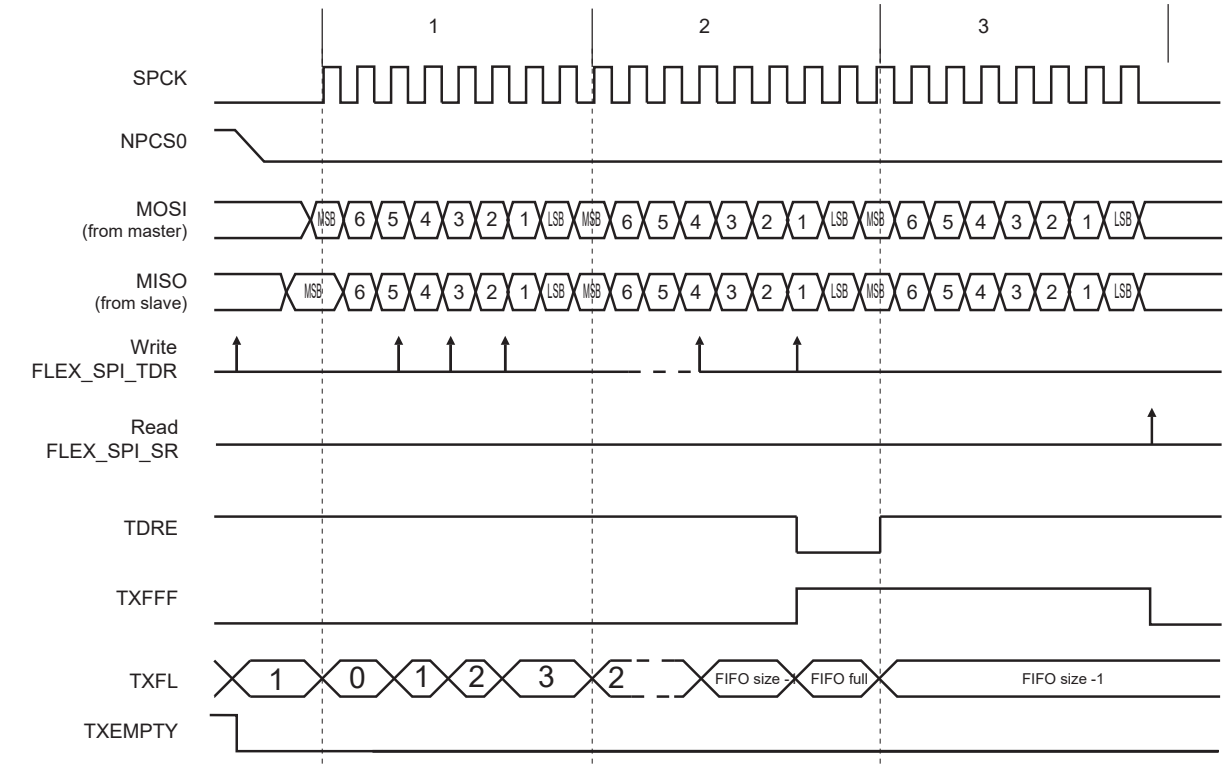


**Figure 46-82. RDRF in Single Data Mode and RXRDYM = 0**

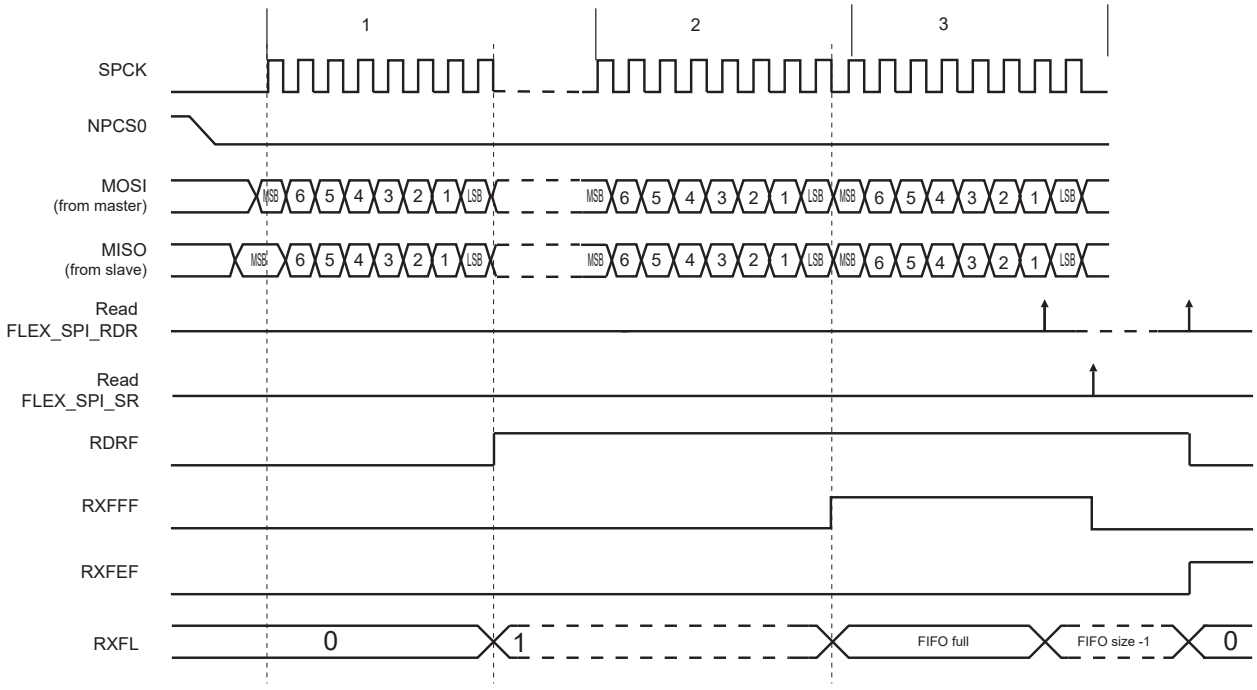


### 46.8.7.6 SPI Single Data Mode

In Single Data mode, only one data is written every time FLEX_SPI_TDR is accessed, and only one data is read every time FLEX_SPI_RDR is accessed.

When FLEX_SPI_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX_SPI_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (FLEX_SPI_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (FLEX_SPI_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections SPI Transmit Data Register and SPI Receive Data Register.

#### 46.8.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on FLEX_SPI_MR.PS bit value and FLEX_SPI_CSRx.BITS field value.

The same applies when FIFOs are disabled.

### 46.8.7.7 SPI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX_SPI_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX_SPI_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (FLEX_SPI_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when FLEX_SPI_MR.PS=0.

In Multiple Data mode, up to two data can be written in one FLEX_SPI_TDR write access. It is also possible to read up to four data in one FLEX_SPI_RDR access if FLEX_SPI_CSRx.BITS is configured to ‘0’ (8-bit data size) and up to two data if FLEX_SPI_CSRx.BITS is configured to a value other than ‘0’ (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections SPI Receive Data Register (FIFO Multiple Data, 8-bit), SPI Receive Data Register (FIFO Multiple Data, 16-bit) and SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX_SPI_TDR-byte write accesses
- three FLEX_SPI_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX_SPI_RDR-byte read accesses
- three FLEX_SPI_RDR-halfword read accesses
- one FLEX_SPI_RDR-word read access and one FLEX_SPI_RDR-halfword read access

#### 46.8.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX_SPI_TDR/RDR access. The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX_SPI_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX_SPI_TDR, it is useful to configure the TXRDYM field to the value ‘1’ so that the TDRE flag is at ‘1’ only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in FLEX_SPI_RDR, it is useful to configure the RXRDYM field to the value ‘2’ so that the RDRF flag is at ‘1’ only when at least four unread data are in the Receive FIFO.

#### 46.8.7.7.2 DMAC

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX_SPI_FMR.TXRDYM/RXRDYM configuration. See section SPI Multiple Data Mode for constraints.

### 46.8.7.8 FIFO Pointer Error

A FIFO overflow is reported in FLEX_SPI_SR.

If the Transmit FIFO is full and a write access is performed on FLEX_SPI_TDR, it generates a Transmit FIFO pointer error and sets FLEX_SPI_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX_SPI_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX_SPI_SR.TXFPTEF is set.

A FIFO underflow is reported in FLEX_SPI_SR.

In Multiple Data mode, if the number of data read in FLEX_SPI_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX_SPI_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX_SPI_TDR/SPI_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using FLEX_SPI_CR.SWRST (configuration will be lost).

### 46.8.7.9 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX_SPI_FMR.TXFTHRES. Each time the Transmit FIFO level goes from ‘above threshold’ to ‘equal to or below threshold’, the flag FLEX_SPI_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX_SPI_FMR.RXFTHRES. Each time the Receive FIFO level goes from ‘below threshold’ to ‘equal to or above threshold’, the flag FLEX_SPI_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX_SPI_IER and FLEX_SPI_IDR.

### 46.8.7.10 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX_SPI_IER and FLEX_SPI_IDR.

FIFO flags state can be read in FLEX_SPI_SR. They are cleared when FLEX_SPI_SR is read.

### 46.8.8 SPI Register Write Protection

The FLEXCOM operating mode (FLEX_MR.OPMODE) must be set to FLEX_MR_OPMODE_SPI to enable access to the write protection registers.

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SPI Write Protection Mode Register (FLEX_SPI_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SPI Write Protection Status Register (FLEX_SPI_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX_SPI_WPSR.

The following registers can be write-protected when WPEN is set:

- SPI Mode Register
- SPI Chip Select Register
- SPI Comparison Register

The following registers can be write-protected when WPITEN is set:

- SPI Interrupt Enable Register
- SPI Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

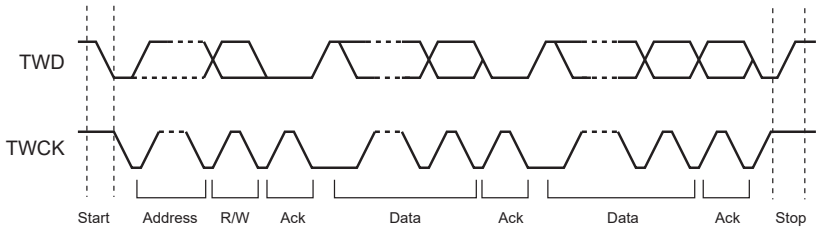
- SPI Control Register

## 46.9 TWI Functional Description

### 46.9.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data are transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see figure below).

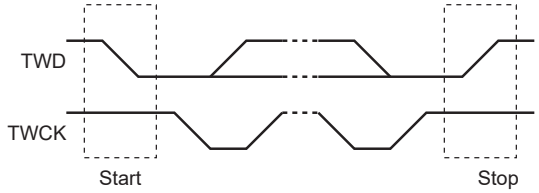
**Figure 46-83. Transfer Format**



Each transfer begins with a START condition and terminates with a STOP condition (see figure below).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines a STOP condition.

**Figure 46-84. START and STOP Conditions**



### 46.9.2 Modes of Operation

The TWI has different modes of operation:

- Master Transmitter mode (Standard and Fast modes only)
- Master Receiver mode (Standard and Fast modes only)
- Multi-master Transmitter mode (Standard and Fast modes only)
- Multi-master Receiver mode (Standard and Fast modes only)
- Slave Transmitter mode (Standard, Fast and High-speed modes)
- Slave Receiver mode (Standard, Fast and High-speed modes)

These modes are described in the following sections.

### 46.9.3 Master Mode

#### 46.9.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it. This operating mode is not available if High-speed mode is selected.

#### 46.9.3.2 Programming Master Mode

The following fields must be programmed before entering Master mode:

1. DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
2. CWGR + CKDIV + CHDIV + CLDIV: Clock waveform.
3. SVDIS: Disables Slave mode.
4. MSEN: Enables Master mode.
   **Note:** If the TWI is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

#### 46.9.3.3 Transfer Speed/Bit Rate

The TWI speed is defined in FLEX_TWI_CWGR. The TWI bit rate can be based either on the peripheral clock if the BRSRCCLK bit value is 0 or on a programmable clock source provided by the GCLK if the BRSRCCLK bit value is 1.

If BRSRCCLK = 1, the bit rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the TWI transfer rate.

The GCLK frequency must be at least three times lower than the peripheral clock frequency.

#### 46.9.3.4 Master Transmitter Mode

This operating mode is not available if High-speed mode is selected.

After the master initiates a START condition when writing into the Transmit Holding register FLEX_TWI_THR, it sends a 7-bit slave address, configured in the Master Mode Register (DADR in FLEX_TWI_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction, 0 in this case (FLEX_TWI_MMR.MREAD = 0).

The TWI transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (ninth pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status Register (FLEX_TWI_SR) of the master and a STOP condition is sent. Alternatively, if the FLEX_TWI_MMR.NOAP bit is set, no stop condition will be sent and a START or STOP condition must be triggered manually through the FLEX_TWI_CR.START or FLEX_TWI_CR.STOP bit once the software is ready for the transmission of the condition. The NACK flag must be cleared by reading the TWI Status Register (FLEX_TWI_SR) before the next write into the TWI Transmit Holding Register (FLEX_TWI_THR). As with the other status bits, an interrupt can be generated if enabled in the interrupt enable Register (FLEX_TWI_IER). If the slave acknowledges the byte, the data written in FLEX_TWI_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in FLEX_TWI_THR.

TXRDY is used as transmit ready for the DMA transmit channel.

**Note:** To clear the TXRDY flag in Master mode, write the FLEX_TWI_CR.MSDIS bit to 1, then write the FLEX_TWI_CR.MSEN bit to 1.

While no new data is written in FLEX_TWI_THR, the serial clock line is tied low. When new data is written in FLEX_TWI_THR, the SCL is released and the data is sent. To generate a STOP event, the STOP command must be performed by writing in the STOP field of the TWI Control Register (FLEX_TWI_CR).

After a master write transfer, the Serial Clock line is stretched (tied low) while no new data is written in FLEX_TWI_THR or until a STOP command is performed.

See the following figures.

**Figure 46-85. Master Write with One Data Byte**

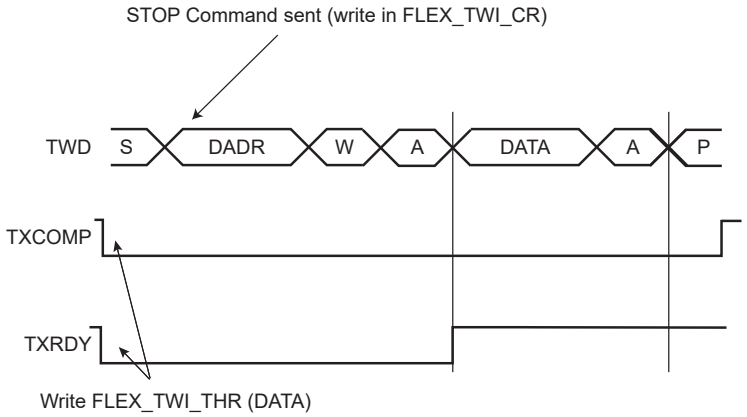


**Figure 46-86. Master Write with Multiple Data Bytes**

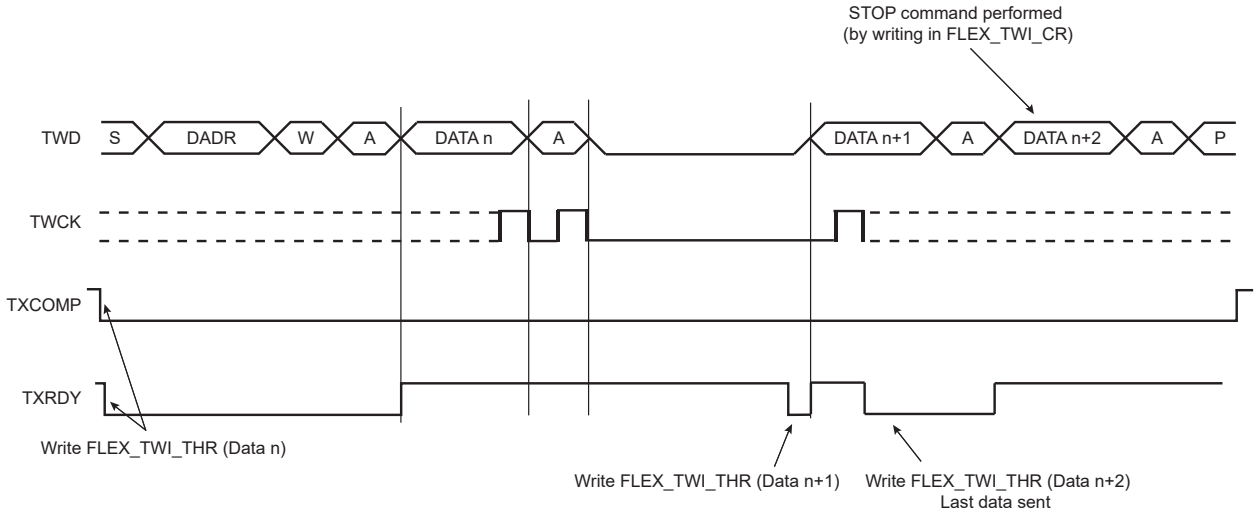

**Figure 46-87. Master Write with One Byte Internal Address and Multiple Data Bytes**

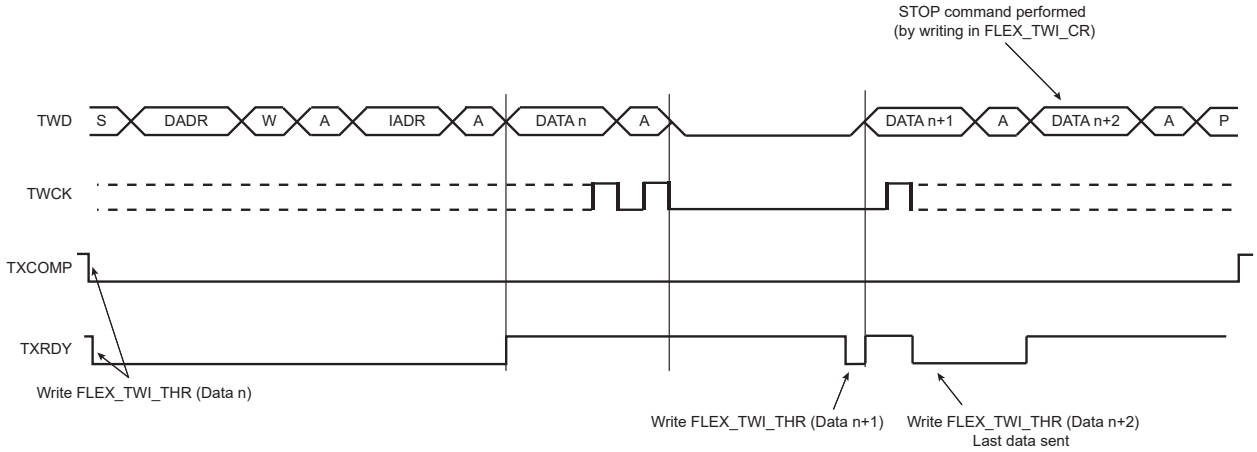

#### 46.9.3.5 Master Receiver Mode

Master Receiver mode is not available if High-speed mode is selected.

The read sequence begins by setting the START bit. After the start condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction, 1 in this case (FLEX_TWI_MMR.MREAD = 1). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets the FLEX_TWI_SR.NACK bit if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data (see figure "Master Read with One Data Byte" below). When the FLEX_TWI_SR.RXRDY bit is set, a character has been received in the Receive Holding Register (FLEX_TWI_RHR). The RXRDY bit is reset when reading FLEX_TWI_RHR.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See figure "Master Read with One Data Byte" below. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received (same condition applies for START bit to generate a repeated start).

See figure "Master Read with Multiple Data Bytes" below. For internal address usage, see section Internal Address.

If FLEX_TWI_RHR is full (RXRDY high) and the master is receiving data, the serial clock line will be tied low before receiving the last bit of the data and until FLEX_TWI_RHR is read. Once FLEX_TWI_RHR is read, the master will stop stretching the serial clock line and end the data reception. See figure "Master Read Clock Stretching with Multiple Data Bytes" below.

**WARNING** When receiving multiple bytes in Master Read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access will not be completed until FLEX_TWI_RHR is read. The last access stops on the next-to-last bit (clock stretching). When FLEX_TWI_RHR is read there is only half a bit period to send the STOP bit (or START bit) command, else another read access might occur (spurious access).

A possible workaround is to set the STOP bit (or START bit) before reading FLEX_TWI_RHR on the next-to-last access (within IT handler).

**Figure 46-88. Master Read with One Data Byte**

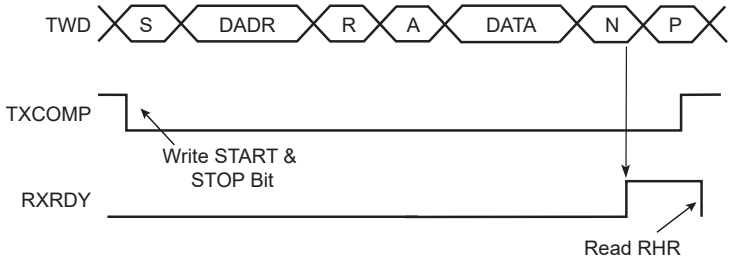

**Figure 46-89. Master Read with Multiple Data Bytes**

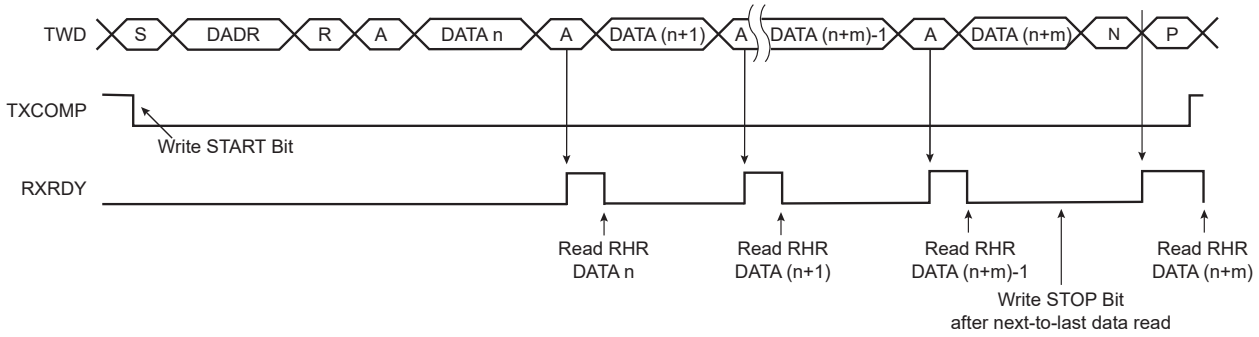

**Figure 46-90. Master Read Clock Stretching with Multiple Data Bytes**

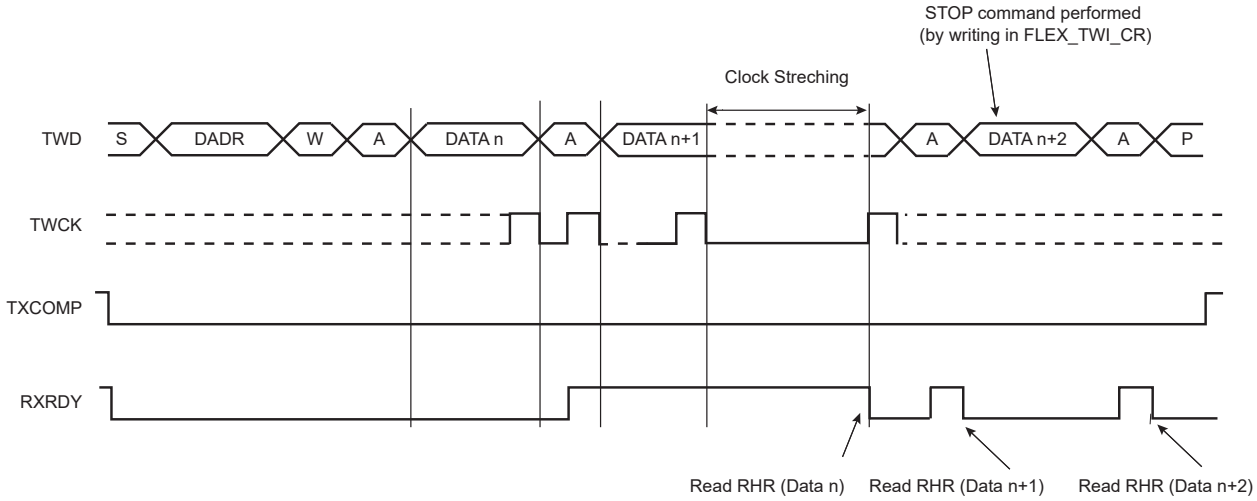

RXRDY is used as receive ready trigger event for the DMA receive channel.

#### 46.9.3.6 Internal Address

The TWI interface can perform transfers with 7-bit slave address devices and with 10-bit slave address devices.

##### 46.9.3.6.1 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g., within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the slave device, and then switch to Master Receiver mode. Note that the second start condition (after sending the IADR) is sometimes called “repeated start” (Sr) in $I^2C$ fully-compatible devices. See figure Master Read with One, Two or Three Bytes Internal Address and One Data Byte.

See figures Master Write with One, Two or Three Bytes Internal Address and One Data Byte and Internal Address Usage for the master write operation with internal address.

The three internal address bytes are configurable through the Master Mode Register (FLEX_TWI_MMR).

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be configured to 0.

The abbreviations listed below are used in the following figures:

| | |
|---|---|
| S | Start |
| Sr | Repeated Start |
| P | Stop |
| W | Write |
| R | Read |
| A | Acknowledge |
| N | Not Acknowledge |
| DADR | Device Address |

| | |
|---|---|
| IADR | Internal Address |

**Figure 46-91. Master Write with One, Two or Three Bytes Internal Address and One Data Byte**

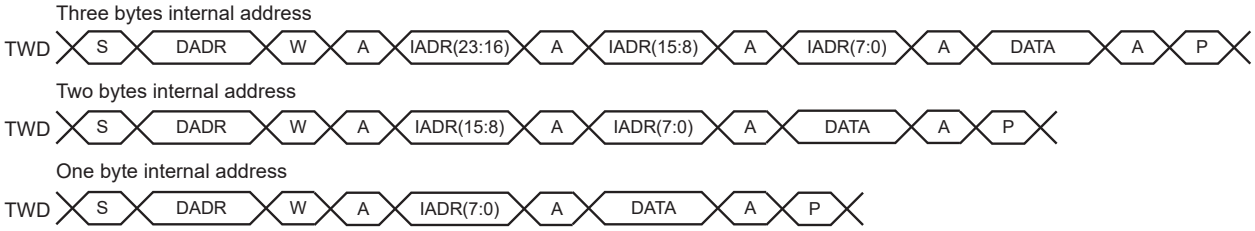

**Figure 46-92. Master Read with One, Two or Three Bytes Internal Address and One Data Byte**

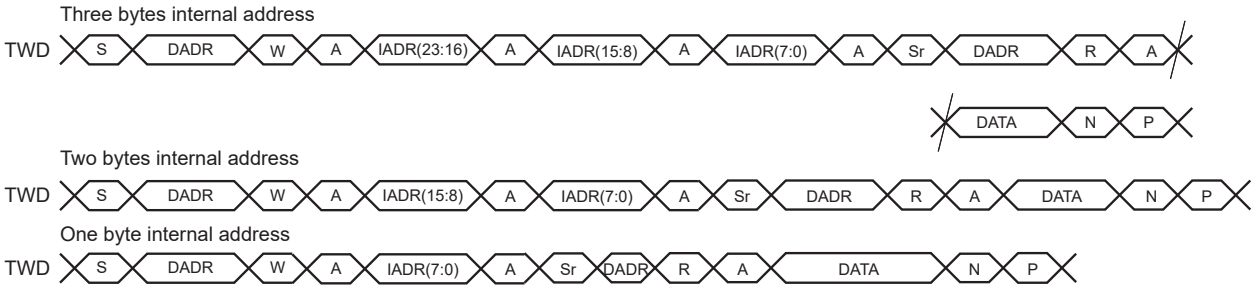


#### 46.9.3.6.2 10-bit Slave Addressing

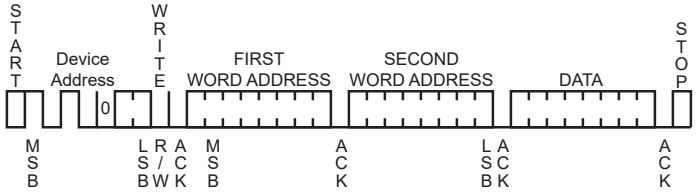
For a slave address higher than seven bits, the user must configure the address size (IADRSZ) and set the other slave address bits in the Internal Address Register (FLEX_TWI_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit slave addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
3. Program FLEX_TWI_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

The following figure shows a byte write to a TWI EEPROM. This demonstrates the use of internal addresses to access the device.

**Figure 46-93. Internal Address Usage**



### 46.9.3.7 Repeated Start

In addition to Internal Address mode, repeated start (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case the parameters of the next transfer (direction, SADR, etc.) will need to be set before writing the START bit at the end of the previous transfer.

See section Read/Write Flowcharts.

### 46.9.3.8 Bus Clear Command

The TWI interface can perform a Bus Clear Command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Start the transfer by setting the FLEX_TWI_CR.CLEAR bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

#### 46.9.3.9 SMBus Mode

SMBus mode is enabled when the FLEX_TWI_CR.SMBEN bit is written to one. SMBus mode operation is similar to I²C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX_TWI_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX_TWI_CR appropriately.

##### 46.9.3.9.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX_TWI_CR.PECEN bit to one enables automatic PEC handling in the current transfer. Transfers with and without PEC can freely be intermixed in the same system, since some slaves may not support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers will be correct.

In Master Transmitter mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. Some slaves may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the slave should always return an ACK after the PEC byte, and some other mechanism must be implemented to verify that the transmission was received correctly.

In Master Receiver mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the FLEX_TWI_SR.PECERR bit is set. In Master Receiver mode, the PEC byte is always followed by a NACK transmitted by the master, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers. If Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND_BYTE, ACK, SR, ADR+R, DATA_BYTE, ACK, PEC_BYTE, NACK, P

See section Read/Write Flowcharts for detailed flowcharts.

##### 46.9.3.9.2 Timeouts

The FLEX_TWI_SMBTR.TLOWS/TLOWM fields configure the SMBus timeout values. If a timeout occurs, the master transmits a STOP condition and leaves the bus. Furthermore, the FLEX_TWI_SR.TOUT bit is set.

#### 46.9.3.10 SMBus Quick Command (Master Mode Only)

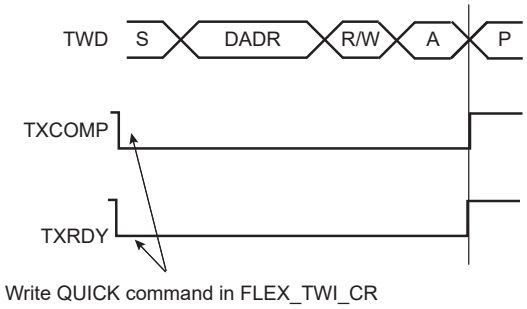
The TWI interface can perform a quick command:

1. Configure the Master mode (DADR, CKDIV, etc).

2. Write the FLEX_TWI_MMR.MREAD bit at the value of the one-bit command to be sent.
3. Start the transfer by setting the FLEX_TWI_CR.QUICK bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

**Figure 46-94. SMBus Quick Command**



#### 46.9.3.11 Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWI Control Register.

In this mode, the transfer is configured through the TWI Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWI Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWI Control Register in case of a read transfer, or write the TWI Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If the Alternative Command mode is used, the TWIHS_MMR.IADRSZ field must be set to 0.

See Read/Write Flowcharts for detailed flowcharts.

#### 46.9.3.12 Handling Errors in Alternative Command

In case of NACK generated by a slave device or SMBus timeout error, the TWI stops immediately the frame, but the DMA transfer may still be active. To prevent a new frame to be restarted with the remaining DMA data (transmit), the TWI prevents any start of frame until the FLEX_TWI_SR.LOCK flag is cleared.

The FLEX_TWI_SR.LOCK bit indicates the state of the TWI (locked or not locked).

When the TWI is locked, no transfer can begin until the LOCK is cleared using the FLEX_TWI_CR.LOCKCLR bit and until the error flags are cleared reading FLEX_TWI_SR.

In case of error, FLEX_TWI_THR may have been loaded with a new data. The FLEX_TWI_CR.THRCLR bit can be used to flush FLEX_TWI_THR. If the THRCLR bit is set, the TXRDY and TXCOMP flags are set.

#### 46.9.3.13 Read/Write Flowcharts

The flowcharts shown in this section provide examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX_TWI_IER) be configured first.

### 46.9.4 Multi-Master Mode

#### 46.9.4.1 Definition

In Multi-Master mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as arbitration is lost by a master, it stops sending data and listens to the bus in order to detect a STOP. When the STOP is detected, the master that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in figure "Arbitration Cases" below.

#### 46.9.4.2 Different Multi-Master Modes

Two Multi-Master modes may be distinguished:

- TWI as Master Only—TWI is considered as a master only and will never be addressed.
- TWI as Master or Slave—TWI may be either a master or a slave and may be addressed.

**Note:** Arbitration in supported in both Multi-Master modes.

##### 46.9.4.2.1 TWI as Master Only

In this mode, the TWI is considered as a master only (MSEN is always at one) and must be driven like a master with the ARBLST (ARBitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see figure "User Sends Data While the Bus is Busy" below).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

##### 46.9.4.2.2 TWI as Master or Slave

The automatic reversal from master to slave is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a master or a slave, the user must manage the pseudo Multi-Master mode described in the steps below:

1. Program the TWI in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWI is addressed).
2. If the TWI has to be set in Master mode, wait until TXCOMP flag is at 1.
3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as the Master mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered as free, the TWI initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is = 1), the user must program the TWI in Slave mode in case the master that won the arbitration needs to access the TWI.
7. If the TWI has to be set in Slave mode, wait until TXCOMP flag is at 1 and then program the Slave mode.
   **Note:** In case the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Slave mode as soon as ARBLST = 1. Then the master must repeat SADR.

**Figure 46-109. User Sends Data While the Bus is Busy**

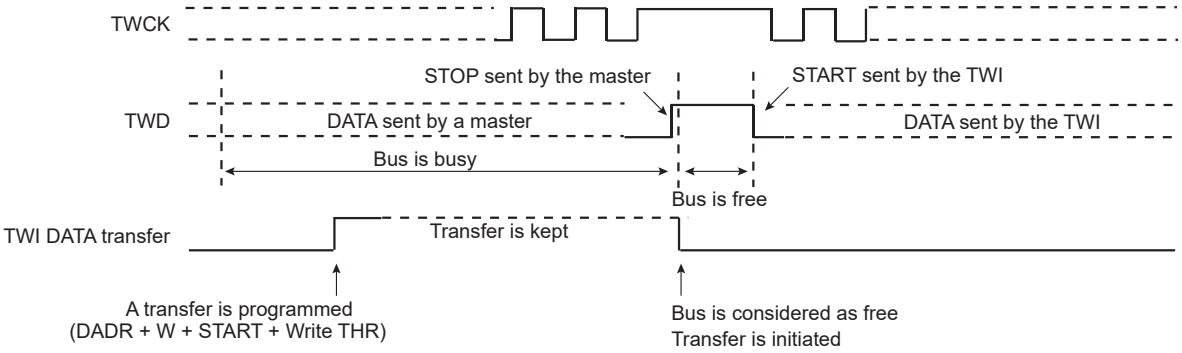

**Figure 46-110. Arbitration Cases**

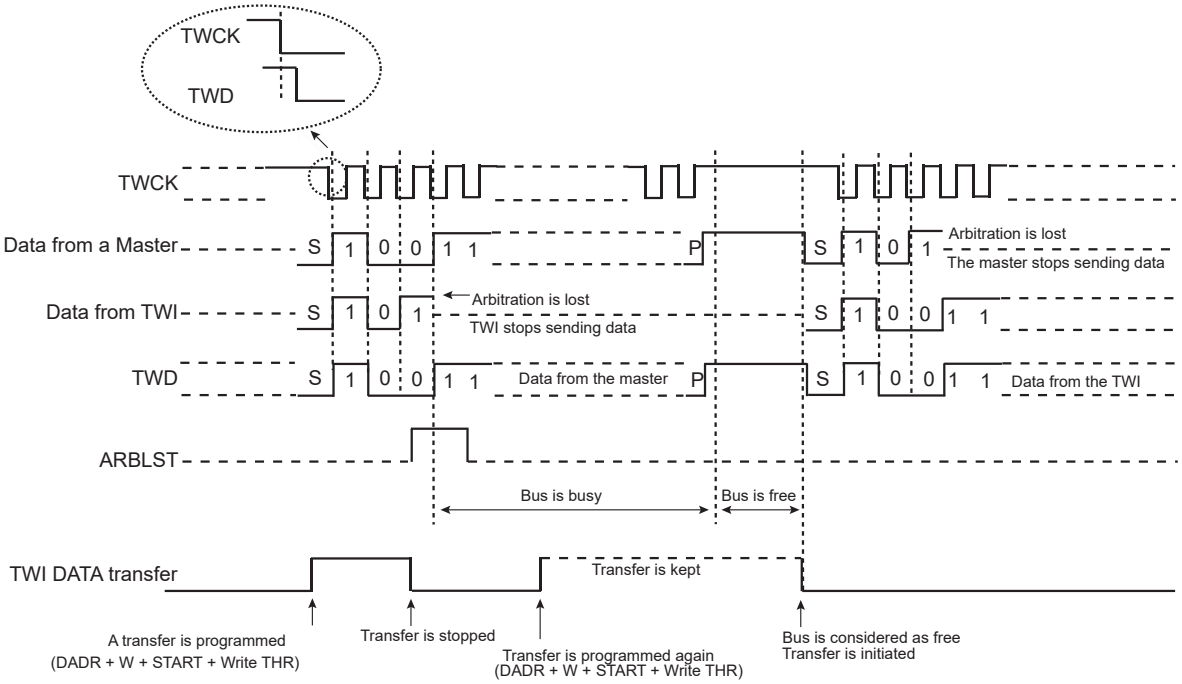
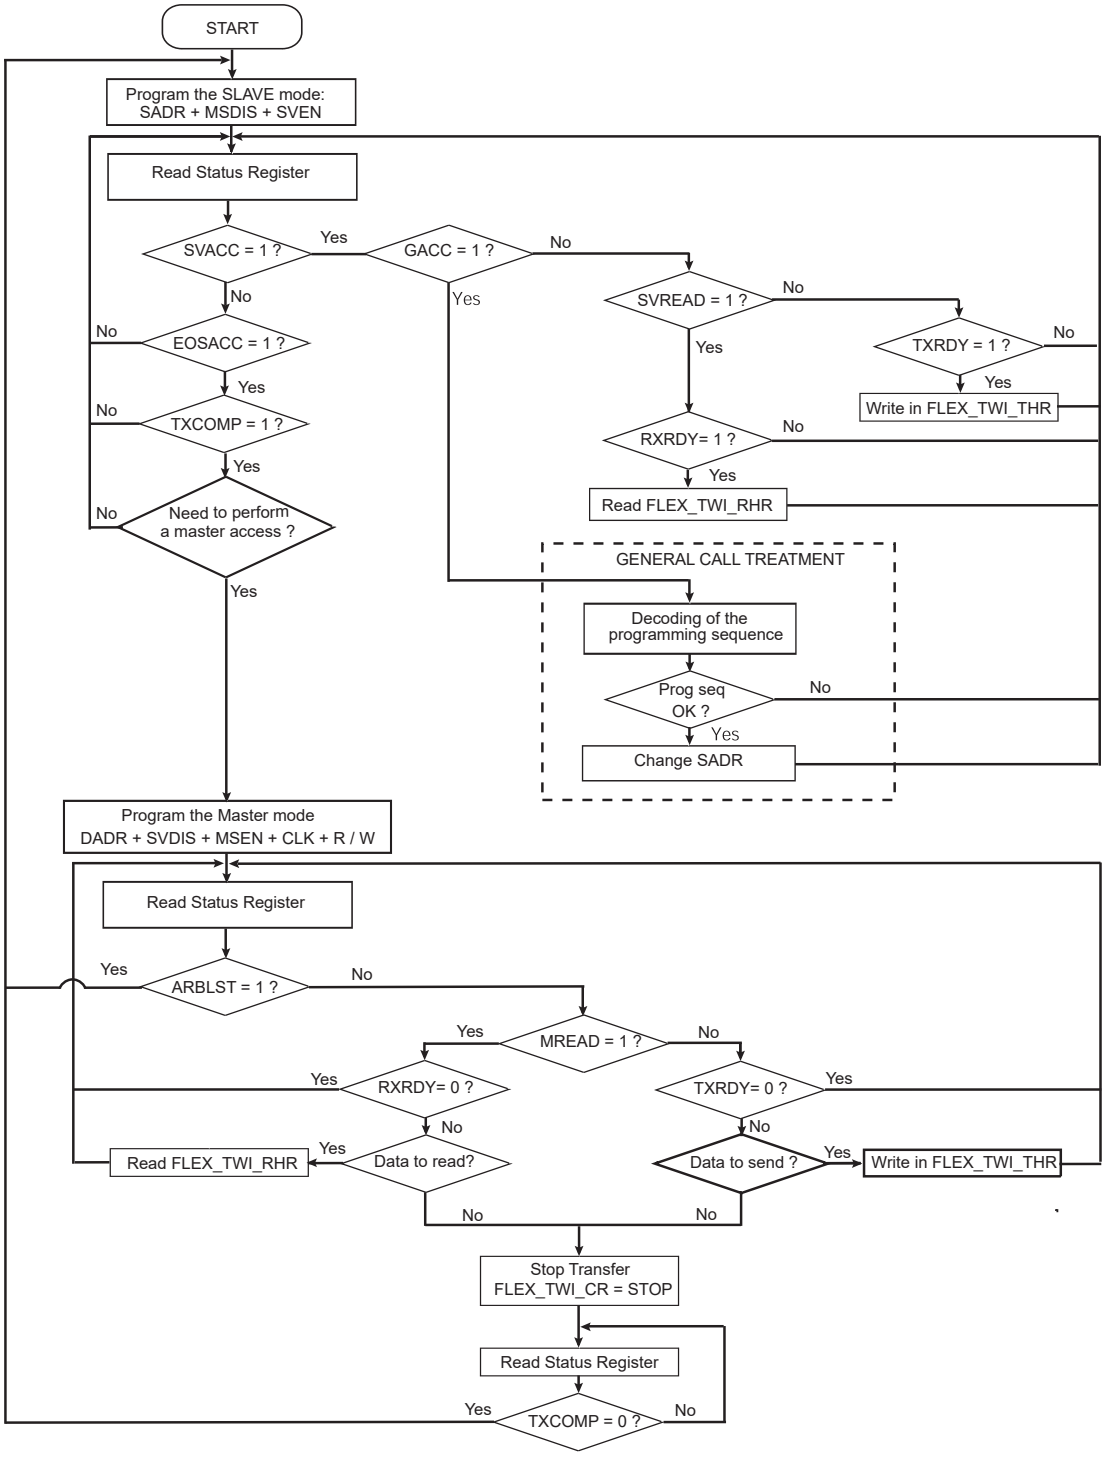


The flowchart shown in the following figure gives an example of read and write operations in Multi-Master mode.

**Figure 46-111. Multi-Master Mode**



## 46.9.5 Slave Mode

### 46.9.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED_START and STOP conditions are always provided by the master).

#### 46.9.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

1. FLEX_TWI_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
2. (Optional) FLEX_TWI_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. FLEX_TWI_CR.MSDIS: Disables the Master mode.
4. FLEX_TWI_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in FLEX_TWI_CWGR are not processed.

#### 46.9.5.3 Receiving Data

After a START or repeated START condition is detected, and if the address sent by the master matches the slave address programmed in the SADR (Slave Address) field, the SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, EOSACC (End Of Slave Access) flag is set.

##### 46.9.5.3.1 Read Sequence

In the case of a read sequence (SVREAD is high), the TWI transfers data written in FLEX_TWI_THR (TWI Transmit Holding Register) until a STOP condition or a REPEATED_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC is reset.

As soon as data is written in FLEX_TWI_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a repeated START always follows a NACK.

See figure "Read Access Ordered by a Master" below.

**Note:** To clear the TXRDY flag in Slave mode, write the FLEX_TWI_CR.SVDIS bit to 1, then write the FLEX_TWI_CR.SVEN bit to 1.

##### 46.9.5.3.2 Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in FLEX_TWI_RHR (TWI Receive Holding Register). RXRDY is reset when reading FLEX_TWI_RHR.

TWI continues receiving data until a STOP condition or a REPEATED_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See figure "Write Access Ordered by a Master" below.

##### 46.9.5.3.3 Clock Stretching Sequence

If FLEX_TWI_THR or FLEX_TWI_RHR is not written/read in time, the TWI performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See figures "Clock Stretching in Read Mode" and "Clock Stretching in Write Mode" below.

**Note:** Clock stretching can be disabled by configuring the FLEX_TWI_SMR.SCLWSDIS bit. In that case, UNRE and OVRE flags will indicate underrun (when FLEX_TWI_THR is not filled on time) or overrun (when FLEX_TWI_RHR is not read on time).

#### 46.9.5.3.4 General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, it is up to the user to interpret the meaning of the GENERAL CALL and to decode the new address programming sequence.

See figure "Master Performs a General Call" below.

### 46.9.5.4 Data Transfer

#### 46.9.5.4.1 Read Operation

The Read mode is defined as a data requirement from the master.

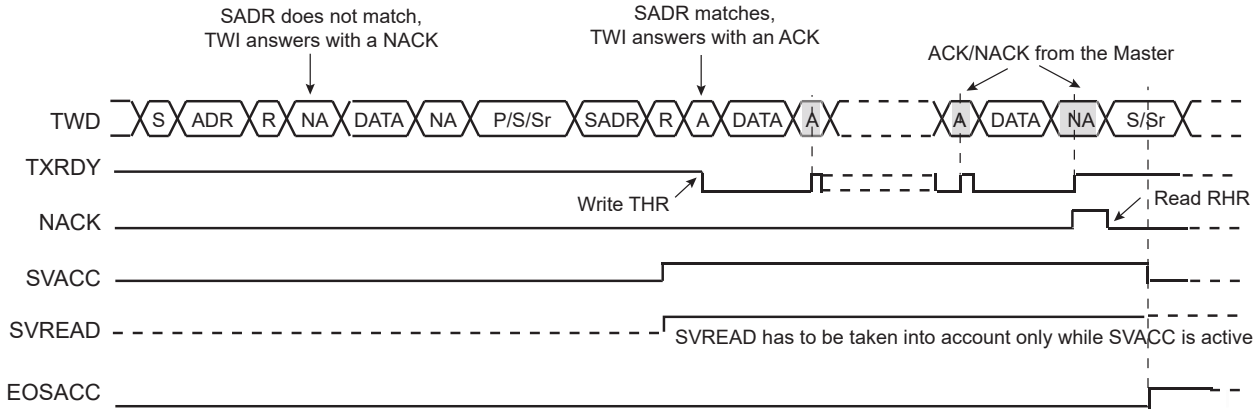
After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in FLEX_TWI_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the read operation.

**Figure 46-112. Read Access Ordered by a Master**



**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from FLEX_TWI_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

#### 46.9.5.4.2 Write Operation

The Write mode is defined as a data transmission from the master.

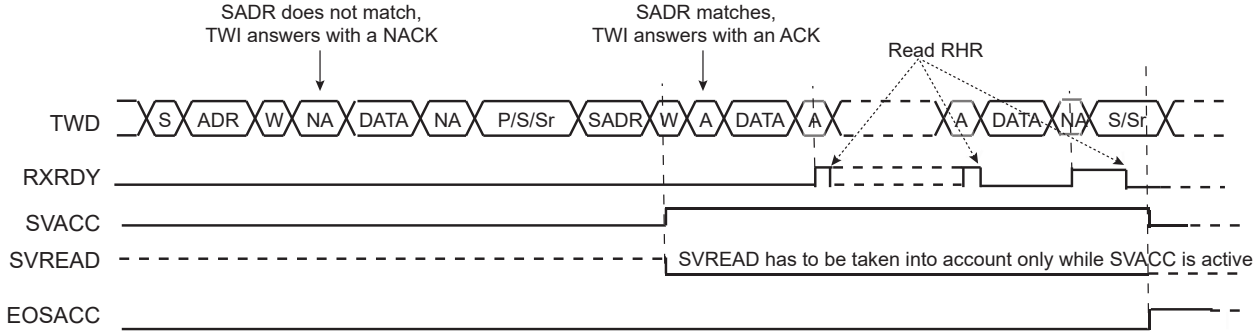
After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, TWI stores the received data in FLEX_TWI_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the write operation.

**Figure 46-113. Write Access Ordered by a Master**



**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to FLEX_TWI_RHR, and reset when this data is read.

#### 46.9.5.4.3 General Call

The general call is performed in order to change the address of the slave.

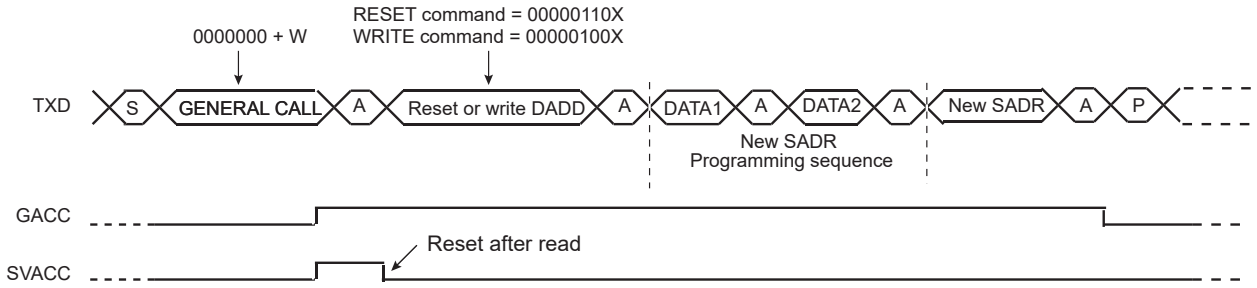
If a GENERAL CALL is detected, GACC is set.

After the detection of general call, it is up to the user to decode the commands which follow.

In case of a WRITE command, the user has to decode the programming sequence and program a new SADR if the programming sequence matches.

The following figure describes the general call access.

**Figure 46-114. Master Performs a General Call**



**Note:** This method enables to create a user-specific programming sequence by choosing the number of programming bytes. The programming sequence has to be provided to the master.

#### 46.9.5.4.4 Clock Stretching

In both Read and Write modes, it may happen that the FLEX_TWI_THR/FLEX_TWI_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

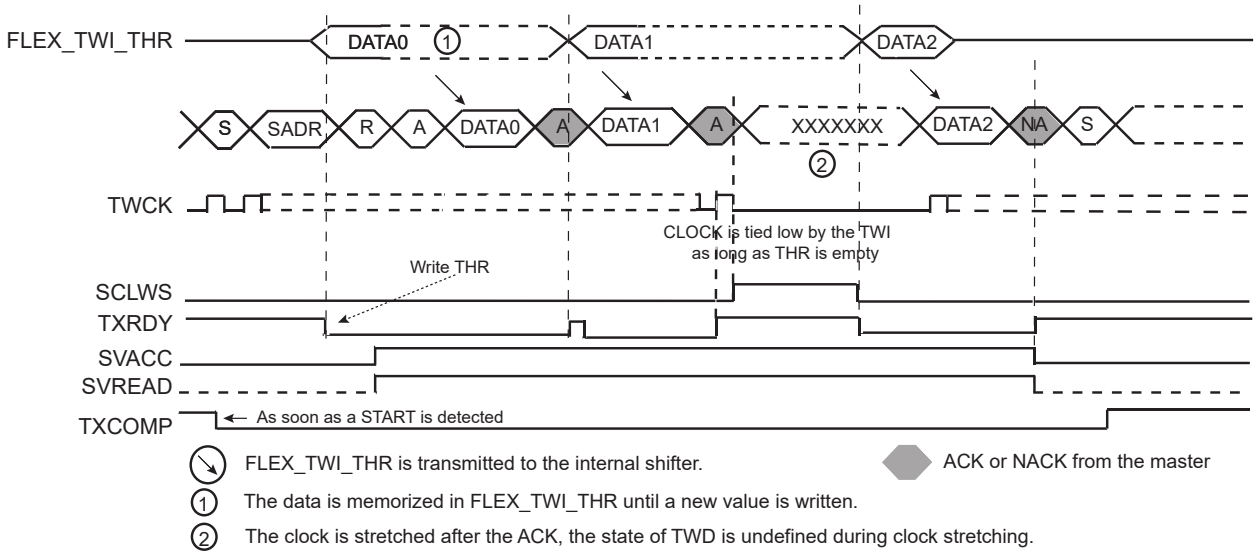
**Note:** Clock stretching can be disabled by setting the FLEX_TWI_SMR.SCLWSDIS bit. In that case, the UNRE and OVRE flags indicate an underrun (when FLEX_TWI_THR is not filled on time) or an overrun (when FLEX_TWI_RHR is not read on time).

***— Clock Stretching in Read Mode***

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

The following figure describes clock stretching in Read mode.

**Figure 46-115. Clock Stretching in Read Mode**



**Note:**

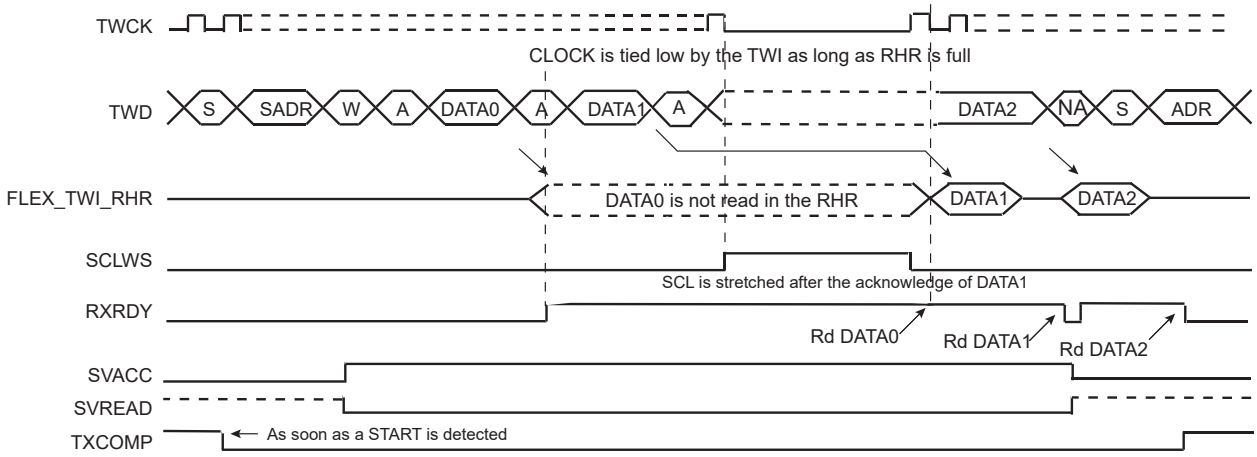
1. TXRDY is reset when data has been written in FLEX_TWI_THR to the internal shifter, and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

***— Clock Stretching in Write Mode***

The clock is tied low if the internal shifter and FLEX_TWI_RHR are full. If a STOP or REPEATED_START condition was not detected, it is tied low until FLEX_TWI_RHR is read.

The following figure describes the clock stretching in Write mode.

**Figure 46-116. Clock Stretching in Write Mode**



**Note:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED_START + an address different from SADR.

2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

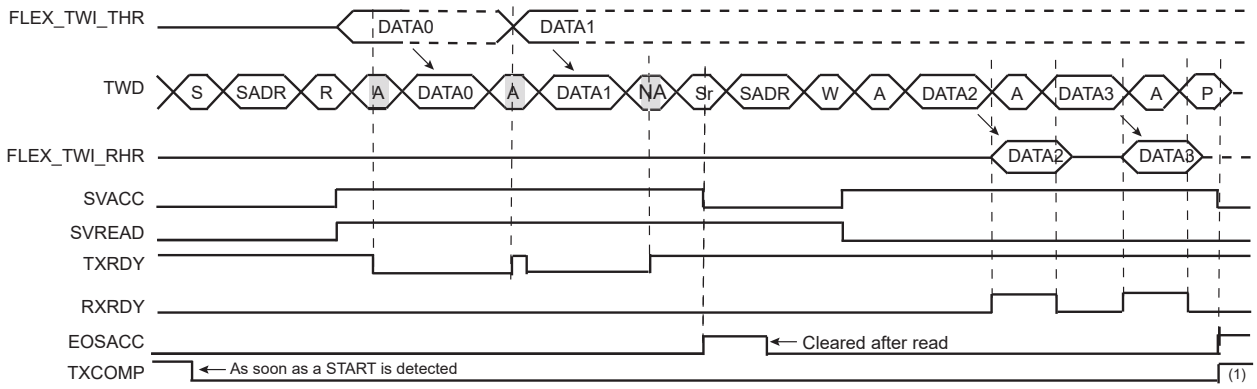
#### 46.9.5.4.5 Reversal after a Repeated Start

***— Reversal of Read to Write***

The master initiates the communication by a read command and finishes it by a write command.

The following figure describes the repeated start and the reversal from Read mode to Write mode.

**Figure 46-117. Repeated Start and Reversal from Read Mode to Write Mode**



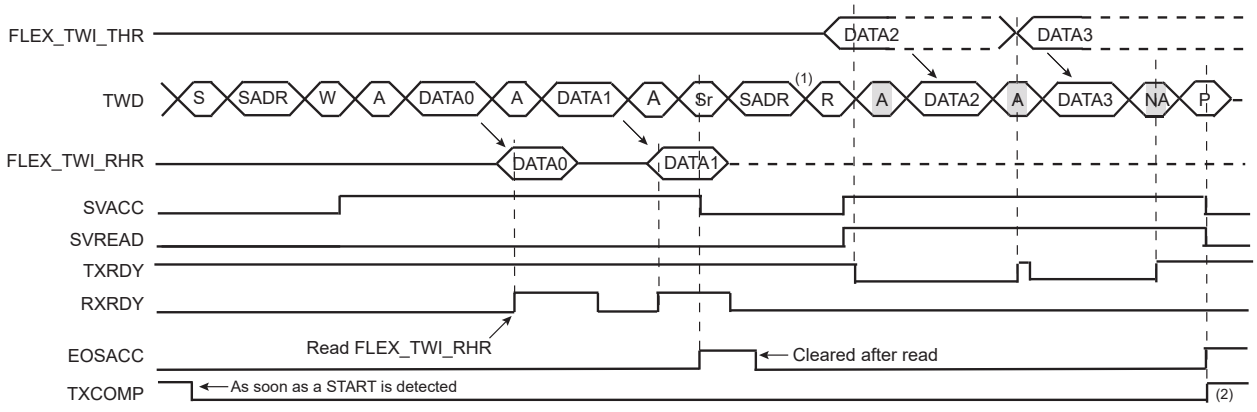
Note:
1. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

***— Reversal of Write to Read***

The master initiates the communication by a write command and finishes it by a read command.

The following figure describes the repeated start and the reversal from Write mode to Read mode.

**Figure 46-118. Repeated Start and Reversal from Write Mode to Read Mode**



Notes:
1. In this case, if FLEX_TWI_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.
2. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

#### 46.9.5.4.6 SMBus Mode

SMBus mode is enabled when the FLEX_TWI_CR.SMEN bit is written to one. SMBus mode operation is similar to I²C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX_TWI_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).

4. A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX_TWI_CR appropriately.

***— Packet Error Checking***

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX_TWI_CR.PECEN bit to one will send/check the FLEX_TWI_ACR.PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on following linked transfers will be correct.

In Slave Receiver mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. The FLEX_TWI_SR.PECERR bit is set automatically if a PEC error occurred.

In Slave Transmitter mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the master must take appropriate action.

See section Slave Read/Write Flowcharts for detailed flowcharts.

***— Timeouts***

The TWI SMBus Timing Register (FLEX_TWI_SMBTR) configures the SMBus timeout values. If a timeout occurs, the slave will leave the bus. Furthermore, the FLEX_TWI_SR.TOUT bit is set.

#### 46.9.5.5 High-Speed Slave Mode

High-speed mode is enabled when the FLEX_TWI_CR.HSEN bit is written to one. Furthermore, the analog pad filter must be enabled, the FLEX_TWI_FILTR.PADFEN bit must be written to one and the FLEX_TWI_FILTR.FILT bit must be cleared. TWI High-speed mode operation is similar to TWI operation with the following exceptions:

1. A master code is received first at normal speed before entering High-speed mode period.
2. When TWI High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (asa consequence, OVF may happen).

TWI High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWI slave in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if slave clock stretching is enabled (SCLWSDIS bit at ‘0’). If slave clock stretching is disabled (SCLWSDIS bit at ‘1’), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

**Note:**

1. When slave clock stretching is disabled, FLEX_TWI_RHR must always be read before receiving the next data (MASTER write frame). It is strongly recommended to use either the polling method on the FLEX_TWI_SR.RXRDY flag, or the DMA. If the receive is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.
2. When slave clock stretching is disabled, FLEX_TWI_THR must be filled with the first data to send before the beginning of the frame (MASTER read frame). It is strongly recommended to use either the polling method on the FLEX_TWI_SR.TXRDY flag, or the DMA. If the transmit is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

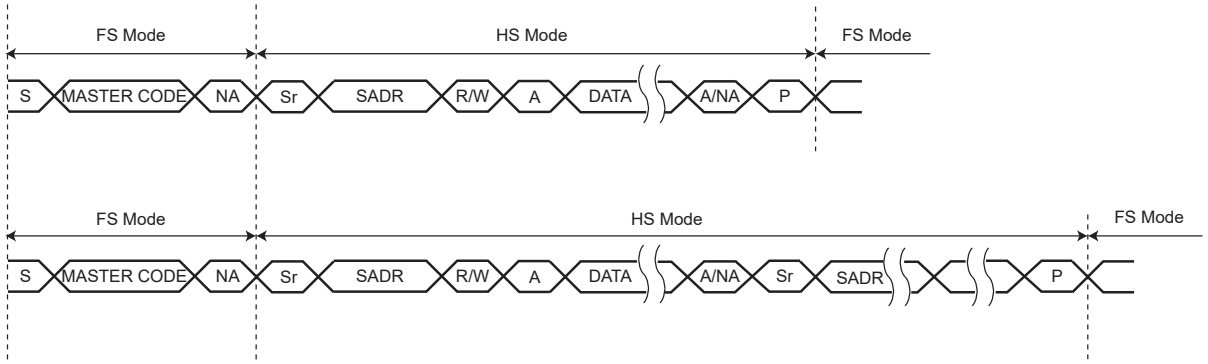
#### 46.9.5.5.1 Read/Write Operation

A TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Master Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWI is programmed in Slave mode and TWI High-speed mode is activated, master code matching is activated and internal timings are set to match the TWI High-speed mode requirements.

**Figure 46-119. High-Speed Mode Read/Write**



#### 46.9.5.5.2 Usage

TWI High-speed mode usage is the same as the standard TWI (see section Read/Write Flowcharts).

### 46.9.5.6 Alternative Command

In Slave mode, the Alternative Command mode is used when the SMBus mode is enabled to send or check the PEC byte.

The Alternative Command mode is enabled by setting the ACMEN bit of the TWIHS Control Register, and the transfer is configured in TWIHS_ACR.

For a combined transfer with PEC, only the NPEC bit in TWIHS_ACR must be set as the PEC byte is sent once at the end of the frame.

See section Slave Read/Write Flowcharts for detailed flowcharts.

### 46.9.5.7 TWI Asynchronous and Partial Wakeup (SleepWalking)

The TWI module includes an asynchronous start condition detector, it is capable of waking the device up from a Sleep mode upon an address match (and optionally an additional data match), including Sleep modes where the TWI peripheral clock is stopped.

The FLEX_TWI_RHR register must be read prior to enable the asynchronous and partial wakeup.

After detecting the START condition on the bus, the TWI will stretch TWCK until the TWI peripheral clock has started. The time required for starting the TWI peripheral depends on which Sleep mode the device is in. After the TWI peripheral clock has started, the TWI releases its TWCK stretching and receives one byte of data (slave address) on the bus. At this time, only a limited part of the device, including the TWI module, receives a clock, thus saving power. If the address phase causes a TWIS address match (and optionally if the first data byte causes data match as well), the entire device is wakened and normal TWI address matching actions are performed. Normal TWI transfer then follows. If the TWI module is not addressed (or if the optional data match fails), the TWI peripheral clock is automatically stopped and the device returns to its original Sleep mode.

The TWI module has the capability to match on more than one address. The FLEX_TWI_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX_TWI_SWMR.SADR1/SADR2/SADR3 fields. The SleepWalking matching process can be extended to the first received data byte if the FLEX_TWI_SMR.DATAMEN bit is set. In that case, a complete matching includes address matching and first received data matching. The FLEX_TWI_SWMR.DATAM field can be used to configure the data to match on the first received byte.

When the system is in Active mode and the TWI enters asynchronous partial Wakeup mode, the flag SVACC must be programmed as the unique source of the TWI interrupt and the data match comparison must be disabled.

When the system exits Wait mode as the result of a matching condition, the SVACC flag is used to determine if the TWI is the source of the exit from Wait mode.

**Figure 46-120. Address Match and Data Matching Disabled**

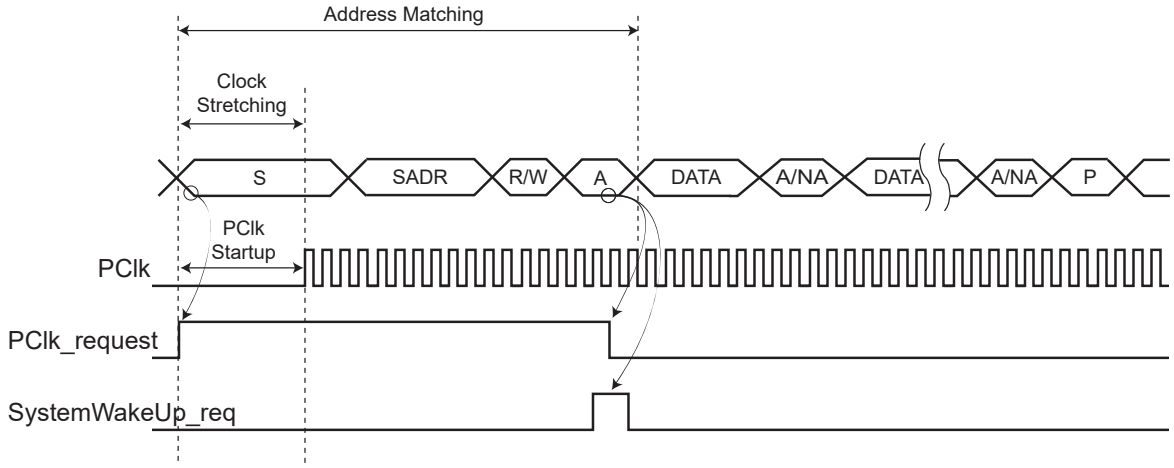


**Figure 46-121. Address Does Not Match and Data Matching Disabled**

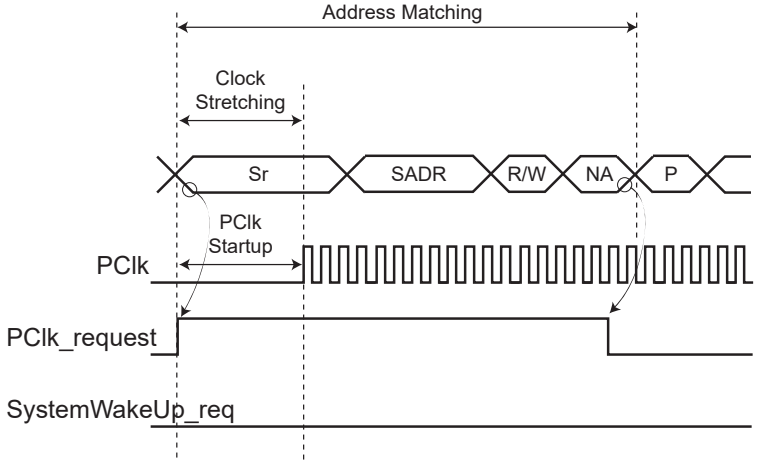

**Figure 46-122. Address and Data Match (Data Matching Enabled)**

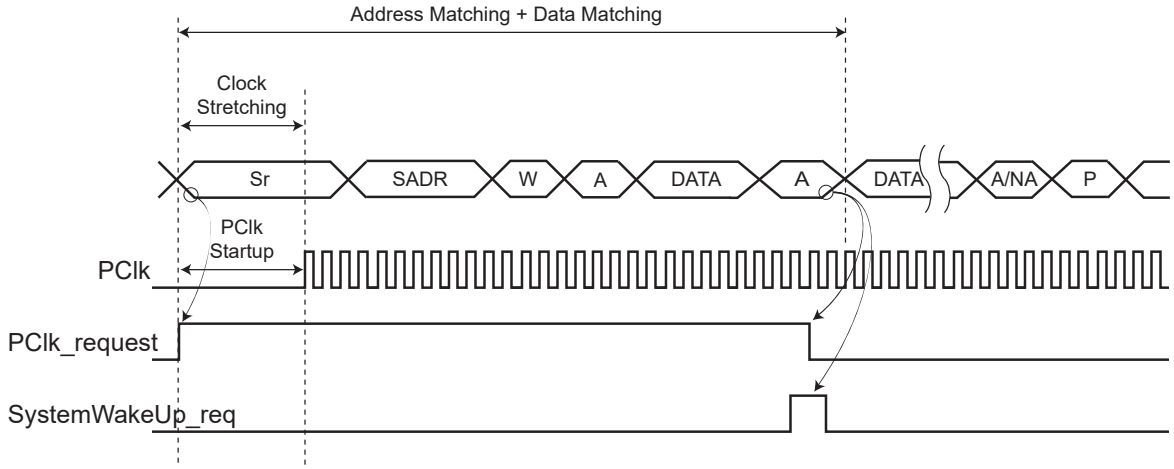

**Figure 46-123. Address Matches and Data Do Not Match (Data Matching Enabled)**

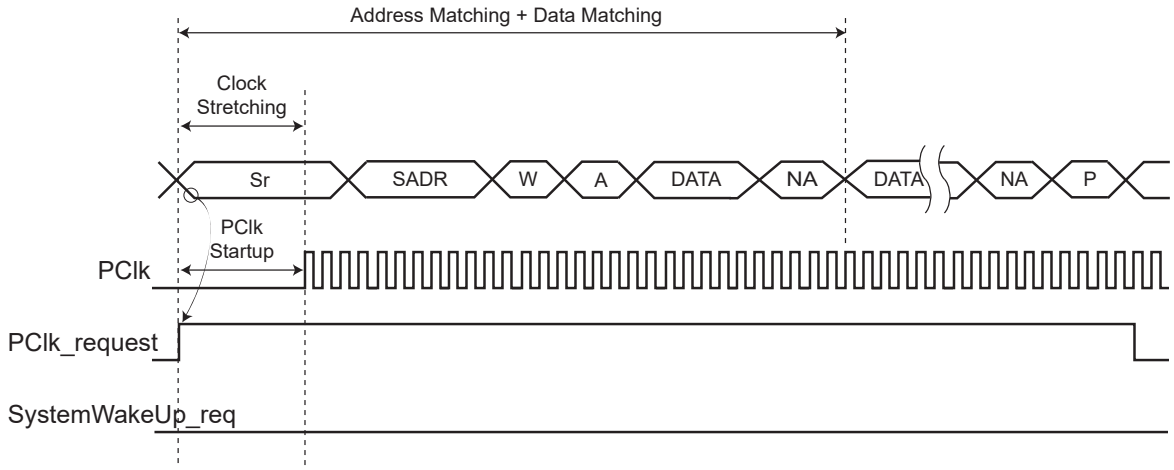

#### 46.9.5.8 Slave Read/Write Flowcharts

The flowchart shown in the following figure gives an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX_TWI_IER) be configured first.

**Figure 46-124. Read/Write in Slave Mode**

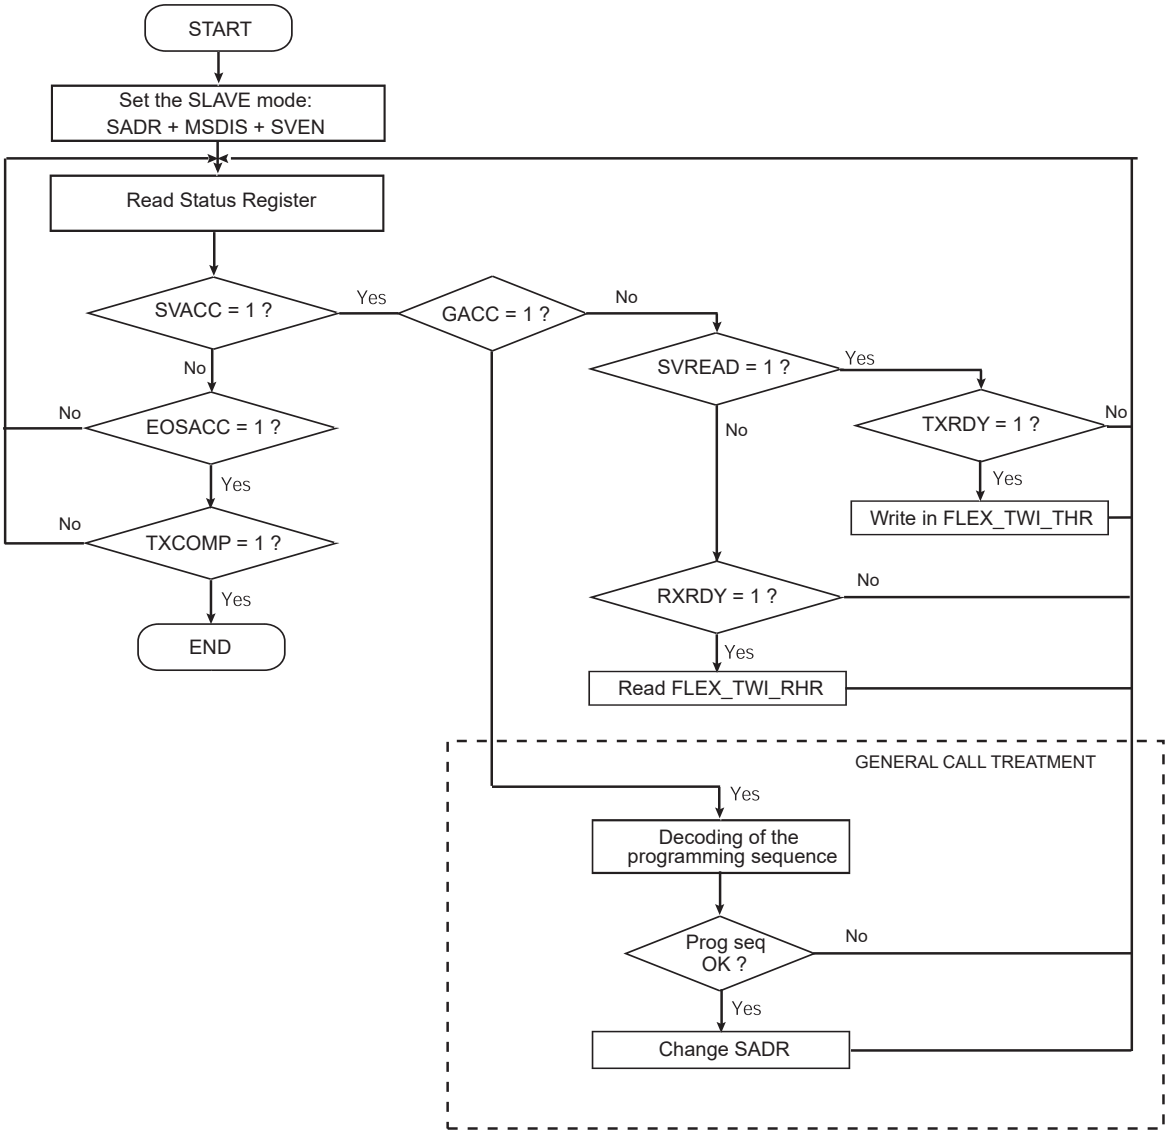

**Figure 46-125. Read/Write in Slave Mode with SMBus PEC**

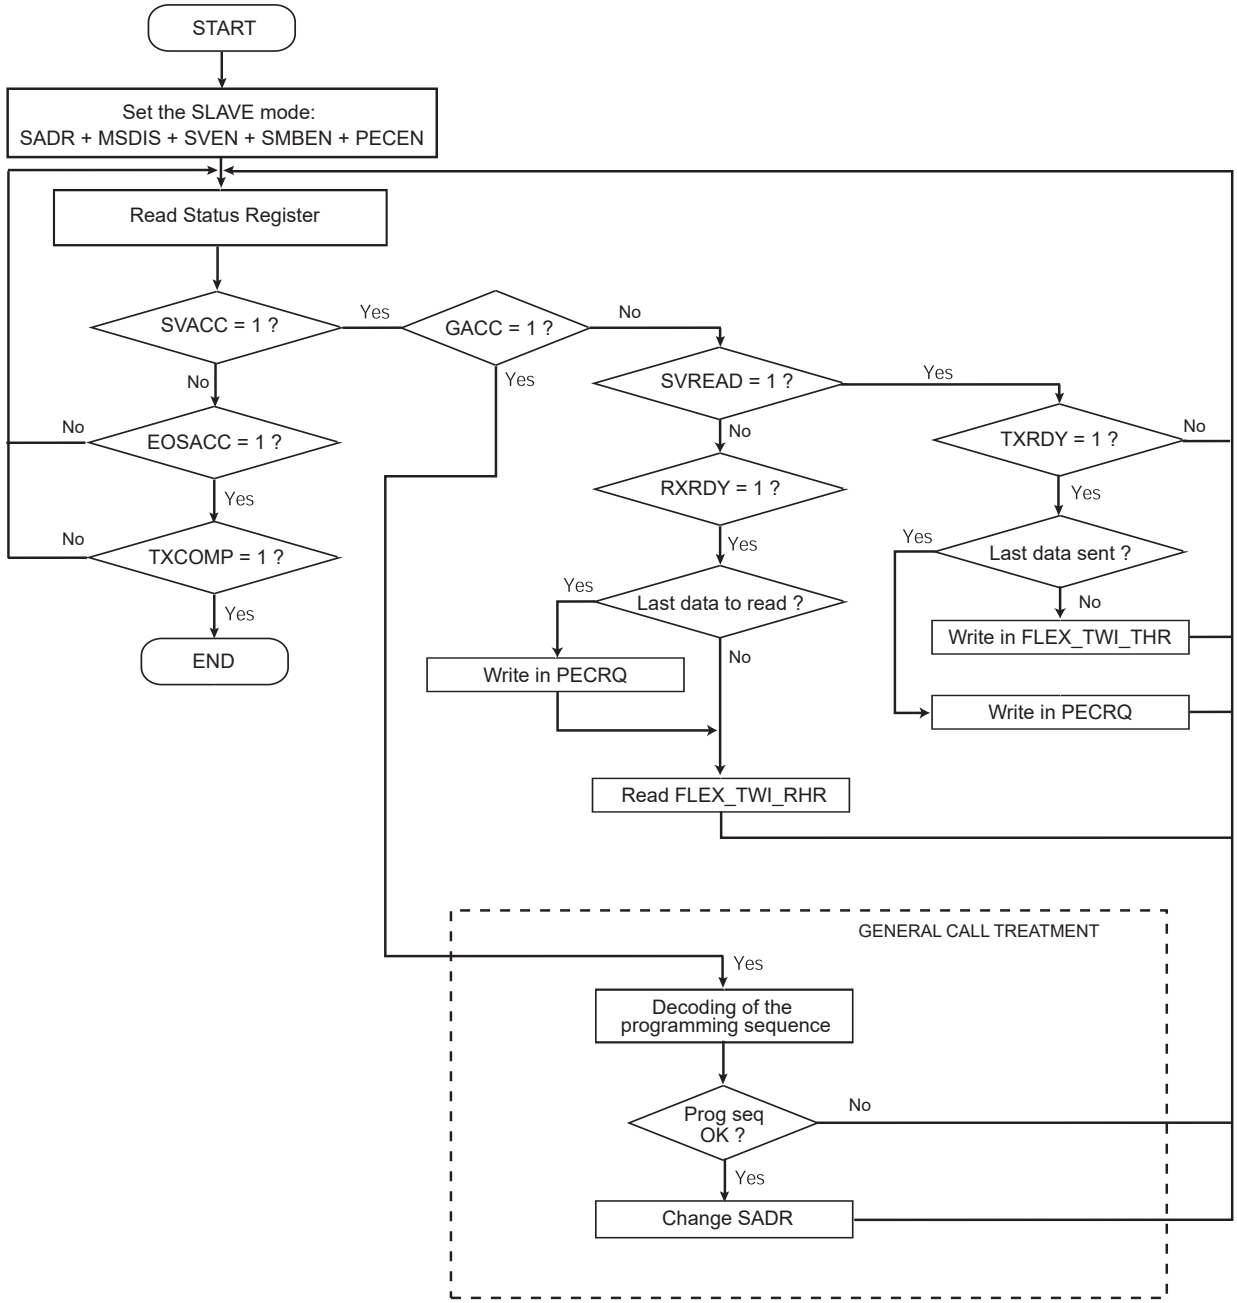

**Figure 46-126. Read/Write in Slave Mode with SMBus PEC and Alternative Command Mode**

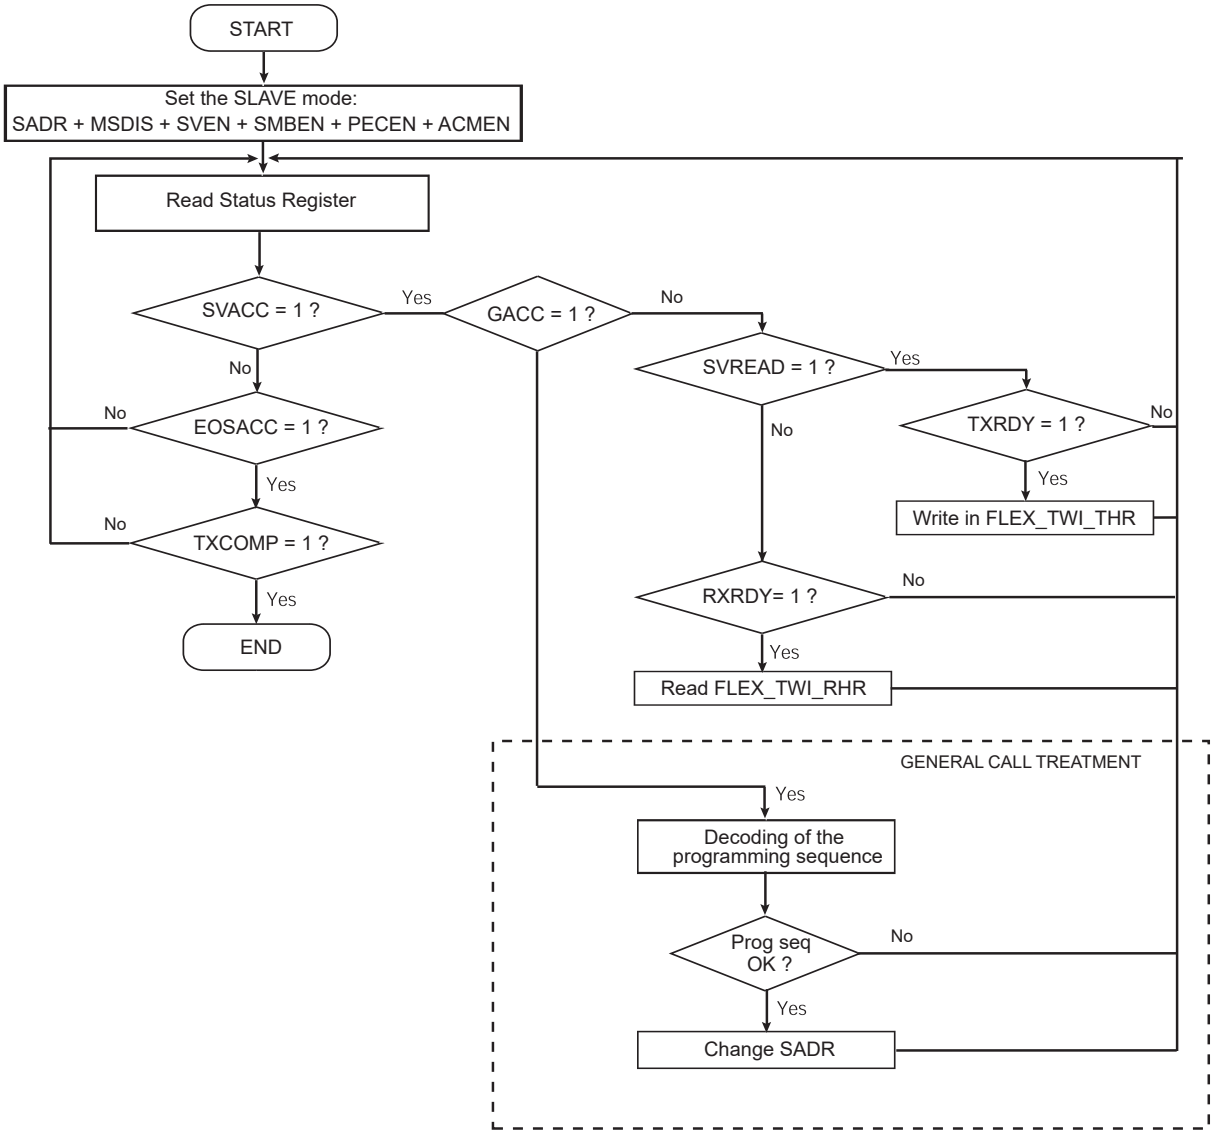


### 46.9.6 TWI FIFOs

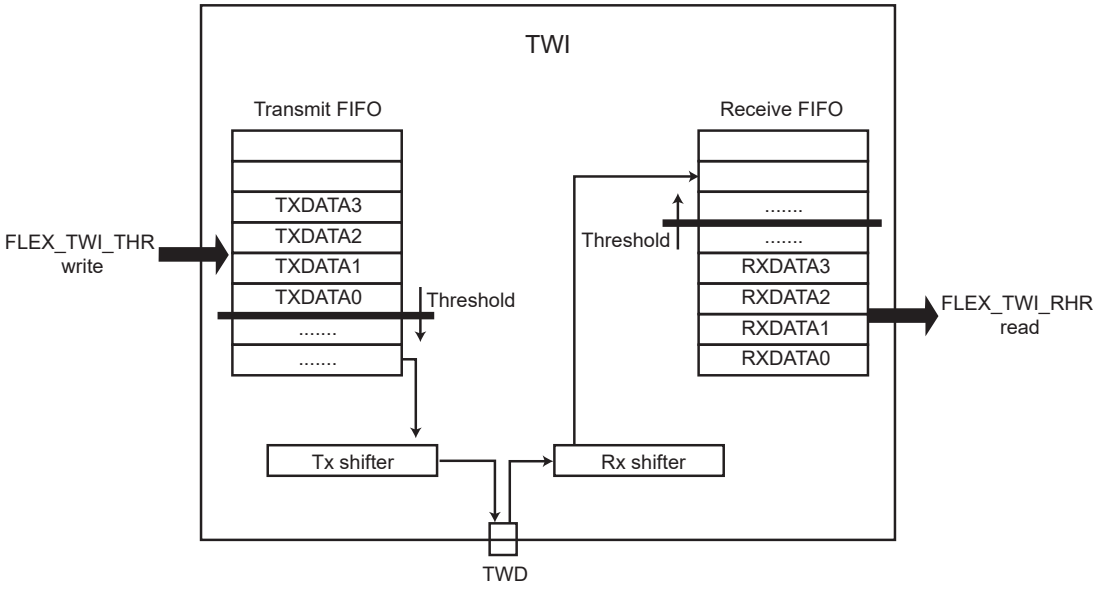
#### 46.9.6.1 Overview

The TWI includes two FIFOs which can be enabled/disabled using FLEX_TWI_CR.FIFOEN/FIFODIS. Both Master and Slave modes must be disabled before enabling or disabling the FIFOs (FLEX_TWI_CR.MSDIS/SVDIS).

Writing FLEX_TWI_CR.FIFOEN to ‘1’ enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX_TWI_THR/RHR, depending on FLEX_TWI_FMR.TXRDYM/RXRDYM settings.

**Figure 46-127. FIFOs Block Diagram**



### 46.9.6.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX_TWI_THR loads the Transmit FIFO.

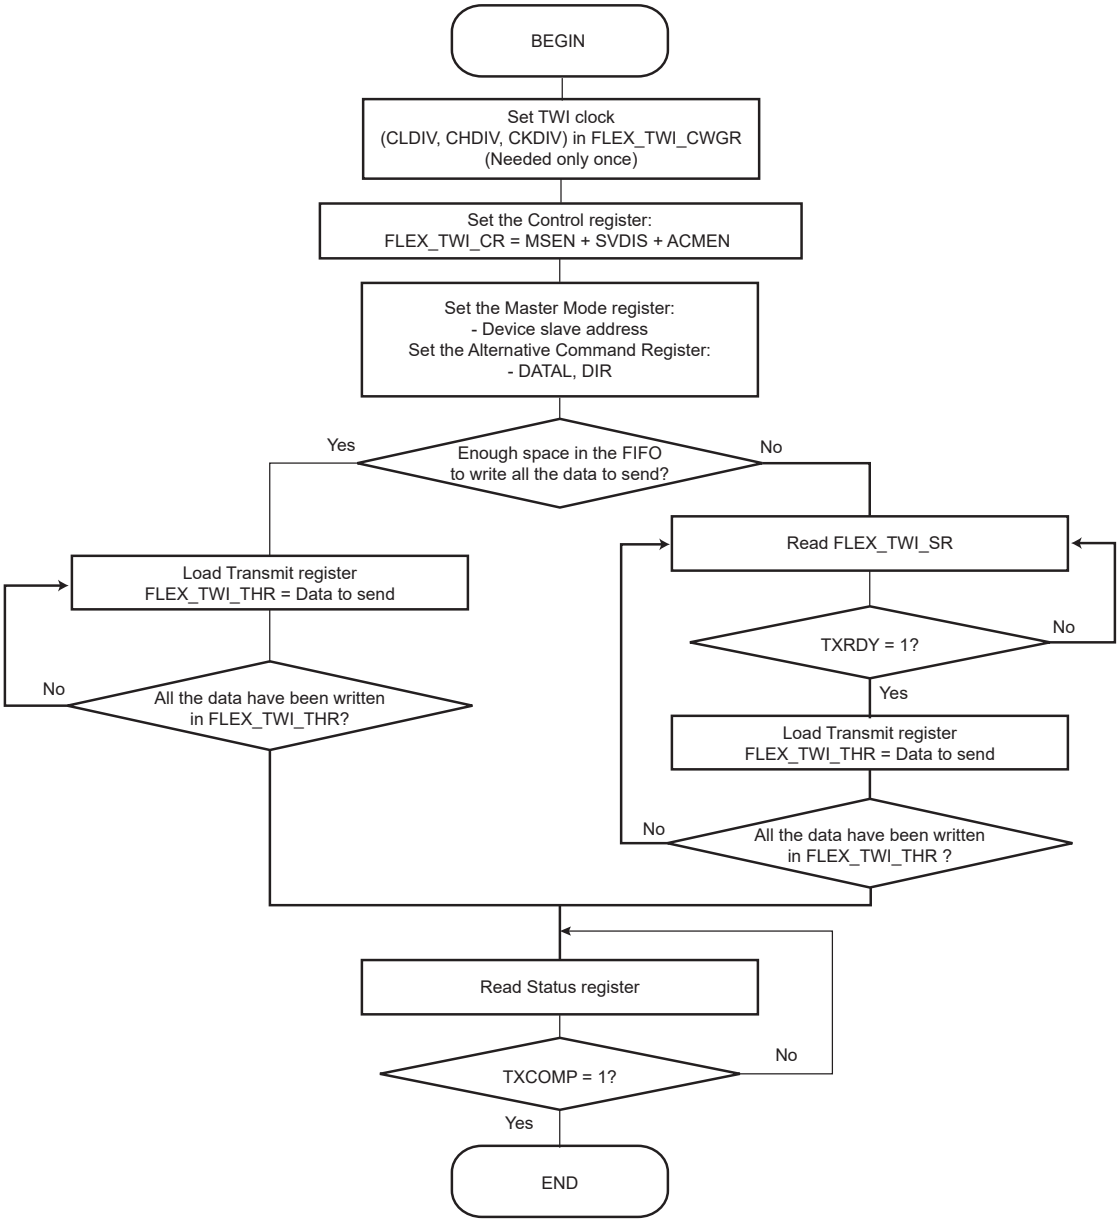
The Transmit FIFO level is provided in FLEX_TWI_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX_TWI_SR.TXRDY and the data can be successively written in FLEX_TWI_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX_TWI_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See figures Sending Data with FIFO Enabled in Master Mode and Sending/Receiving Data with FIFO Enabled in Slave Mode.

**Figure 46-128. Sending Data with FIFO Enabled in Master Mode**



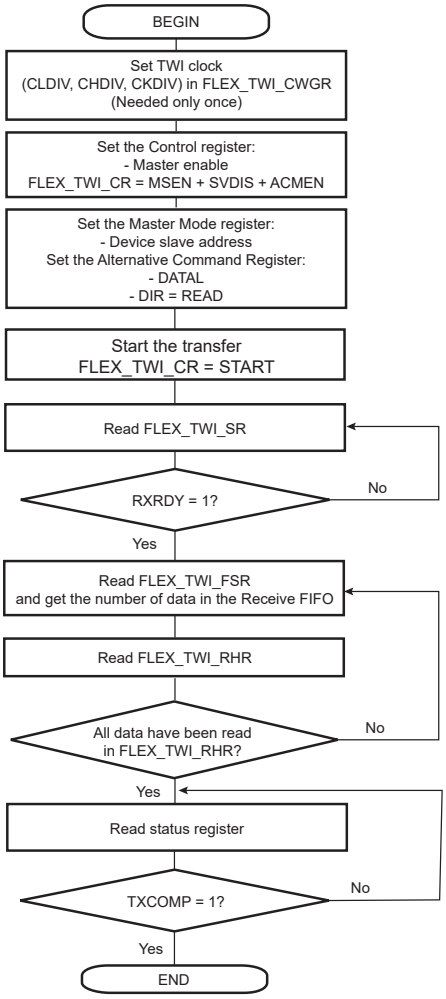
### 46.9.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX_TWI_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to ‘1’), the exact number of data can be checked with FLEX_TWI_FLR.RXFL. All the data can be read successively in FLEX_TWI_RHR without checking the FLEX_TWI_SR.RXRDY flag between each access.

See figures Receiving Data with FIFO Enabled in Master Mode and Sending/Receiving Data with FIFO Enabled in Slave Mode.

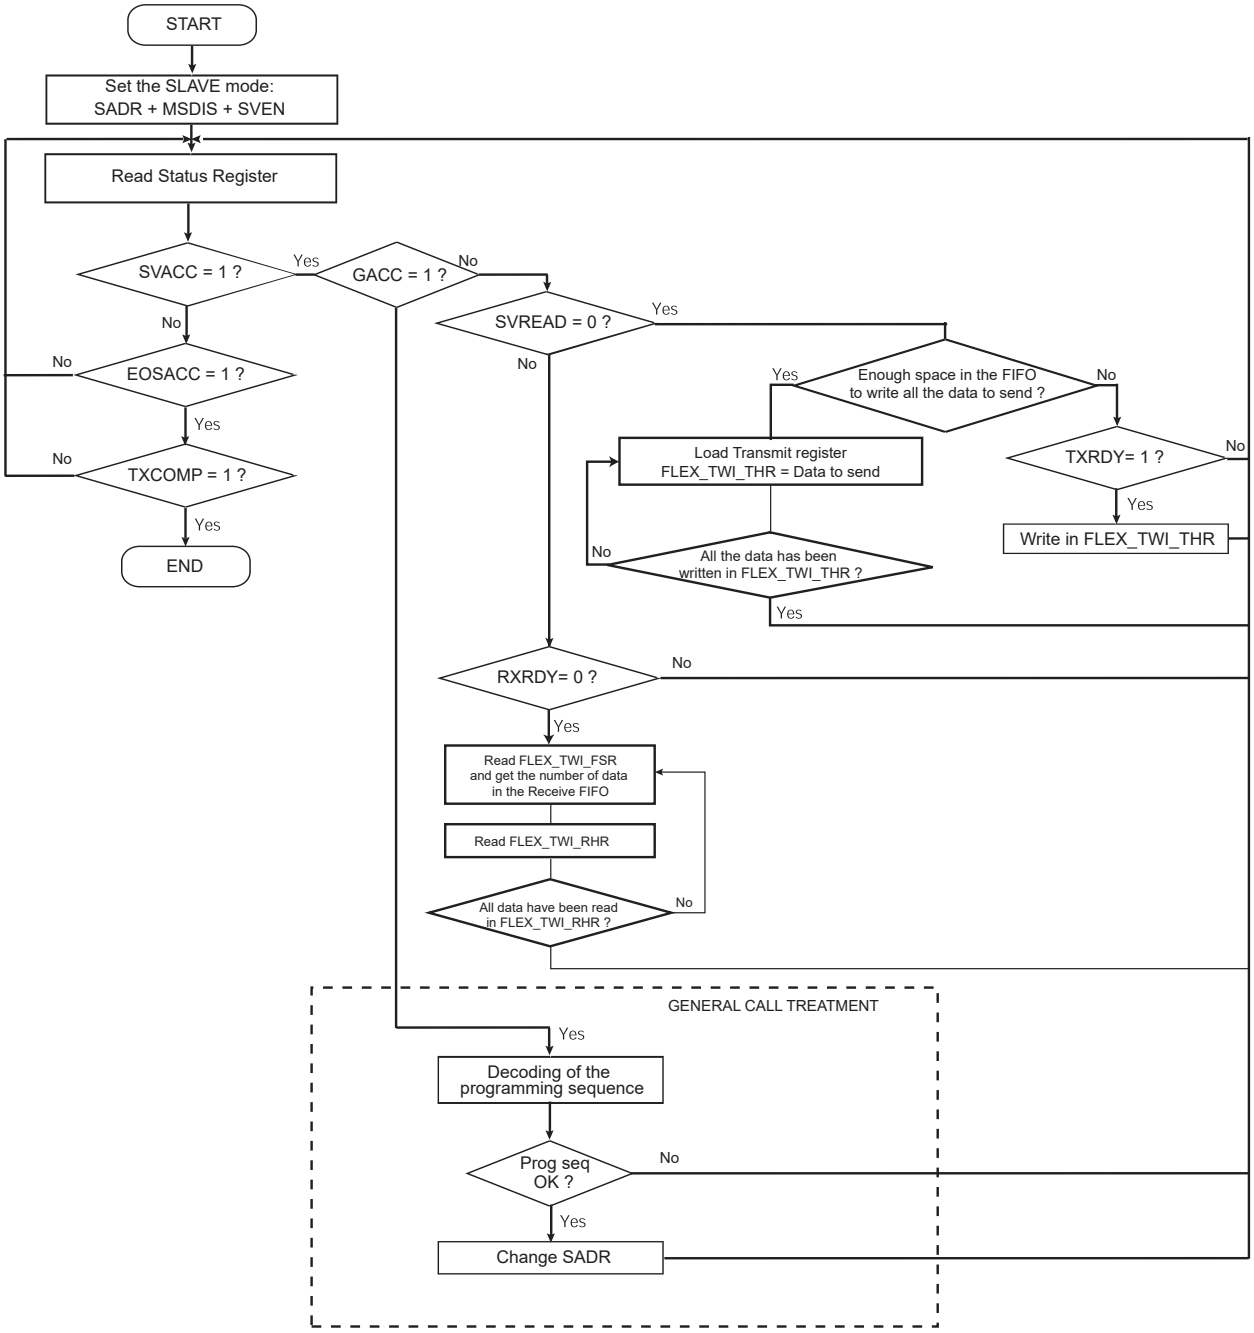
**Figure 46-129. Receiving Data with FIFO Enabled in Master Mode**



### 46.9.6.4 Sending/Receiving with FIFO Enabled in Slave Mode

See sections Sending Data with FIFO Enabled and Receiving Data with FIFO Enabled for details.

**Figure 46-130. Sending/Receiving Data with FIFO Enabled in Slave Mode**



### 46.9.6.5 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX_TWI_CR.TXFCLR/RXFCLR.

### 46.9.6.6 TXRDY and RXRDY Behavior

FLEX_TWI_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure TXRDY Behavior when TXRDYM = 0 in Master mode.

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. Refer to figure RXRDY Behavior when RXRDYM = 0 in Master and Slave modes.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode Register (FLEX_TWI_FMR) to reduce the number of accesses to FLEX_TWI_THR/RHR.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See TWI FIFO Mode Register for the FIFO configuration.

**Figure 46-131. TXRDY Behavior when TXRDYM = 0 in Master Mode**

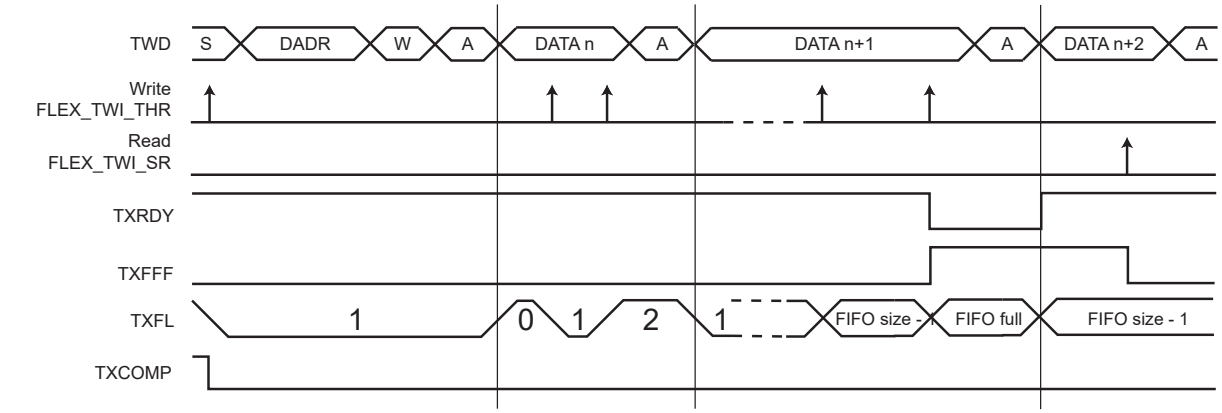


**Figure 46-132. RXRDY Behavior when RXRDYM = 0 in Master and Slave Modes**

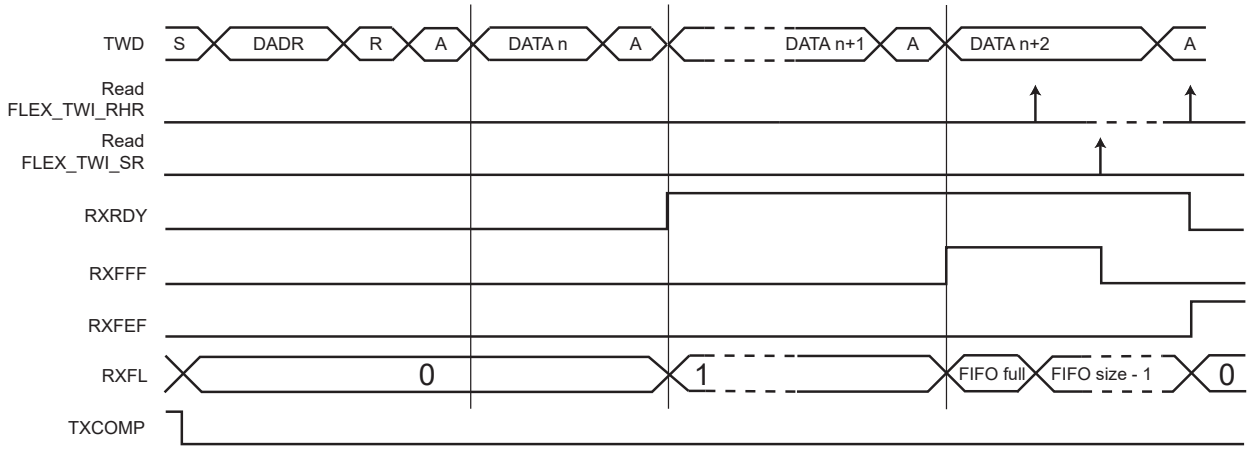

**Figure 46-133. TXRDY Behavior when TXRDYM = 0 in Slave Mode**

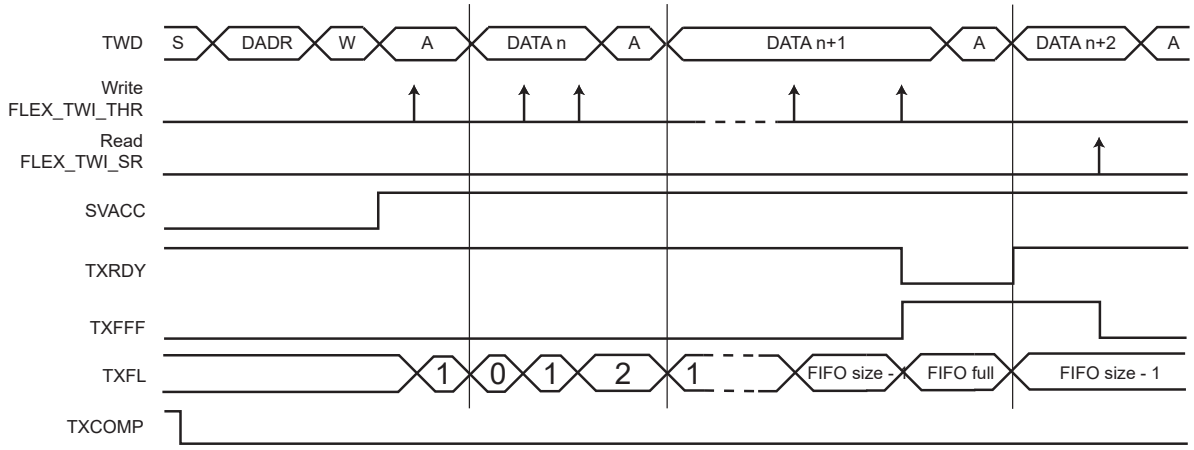

### 46.9.6.7 TWI Single Data Mode

In Single Data mode, only one data is written every time FLEX_TWI_THR is accessed, and only one data is read every time FLEX_TWI_RHR is accessed.

When FLEX_TWI_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX_TWI_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

See sections TWI Transmit Holding Register and TWI Receive Holding Register.

### 46.9.6.8 TWI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX_TWI_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX_TWI_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

In Multiple Data mode, it is possible to write/read up to four data in one FLEX_TWI_THR/ FLEX_TWI_RHR register access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a wordsize register access, then up to four data are read and up to two data are written.

Written/Read data are always right-aligned, as described in sections TWI Receive Holding Register (FIFO Enabled) and TWI Transmit Holding Register (FIFO Enabled).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX_TWI_THR-byte write accesses
- three FLEX_TWI_THR-halfword write accesses
- one FLEX_TWI_THR-word write access and one FLEX_TWI_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX_TWI_RHR-byte read accesses
- three FLEX_TWI_RHR-halfword read accesses
- one FLEX_TWI_RHR-word read access and one FLEX_TWI_RHR-halfword read access

#### 46.9.6.8.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX_TWI_THR/FLEX_TWI_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX_TWI_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX_TWI_THR, it is useful to configure the TXRDYM field to the value ‘1’ so that the TXRDY flag is at ‘1’ only when at least two data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX_TWI_RHR, it is useful to configure the RXRDYM field to the value ‘2’ so that the RXRDY flag is at ‘1’ only when at least four unread data are in the Receive FIFO.

#### 46.9.6.8.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX_TWI_FMR.TXRDYM/RXRDYM settings.

### 46.9.6.9 Transmit FIFO Lock

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or master code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

FLEX_TWI_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX_TWI_CR.TXFLCLR to ‘1’.

### 46.9.6.10 FIFO Pointer Error

A FIFO overflow is reported in FLEX_TWI_FSR.

If the Transmit FIFO is full and a write access is performed on FLEX_TWI_THR, it generates a Transmit FIFO pointer error and sets FLEX_TWI_FSR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX_TWI_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX_TWI_FSR.TXFPTEF is set.

A FIFO underflow is reported in FLEX_TWI_FSR.

In Multiple Data mode, if the number of data read in FLEX_TWI_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX_TWI_FSR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX_TWI_THR/FLEX_TWI_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit or Receive pointer error occurs, a software reset must be performed using FLEX_TWI_CR.SWRST. Note that issuing a software while transmitting might leave a slave in an unknown state holding the TWD line. In such case, a Bus Clear Command will allow to make the slave release the TWD line (the first frame sent afterwards might not be received properly by the slave).

### 46.9.6.11 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX_TWI_FMR.TXFTHRES. Each time the Transmit FIFO level goes from ‘above threshold’ to ‘equal to or below threshold’, the flag FLEX_TWI_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX_TWI_FMR.RXFTHRES. Each time the Receive FIFO level goes from ‘below threshold’ to ‘equal to or above threshold’, the flag FLEX_TWI_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX_TWI_FIER and FLEX_TWI_FIDR.

#### 46.9.6.12 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX_TWI_FIER and FLEX_TWI_FIDR.

FIFO flags state can be read in FLEX_TWI_FSR. They are cleared when FLEX_TWI_FSR is read.

### 46.9.7 TWI Comparison Function on Received Character

The comparison function differs if the asynchronous partial wakeup (Sleepwalking) is enabled or not.

If asynchronous partial wakeup is disabled (refer to the section “Power Management Controller” (PMC)), the TWI has the capability to extend the address matching on up to three slave addresses. The FLEX_TWI_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX_TWI_SWMR.SADR1/SADR2/SADR3 fields. The DATAMEN bit has no effect.

The SVACC bit is set when there is a comparison match with the received slave address.

### 46.9.8 TWI Register Write Protection

The FLEXCOM operating mode (FLEX_MR.OPMODE) must be set to FLEX_MR_OPMODE_TWI to enable access to the write protection registers.

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TWI Write Protection Mode Register (FLEX_TWI_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the TWI Write Protection Status Register (FLEX_TWI_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX_TWI_WPSR.

The following register(s) can be write-protected when WPEN is set:

- TWI Slave Mode Register
- TWI Clock Waveform Generator Register
- TWI SMBus Timing Register
- TWI SleepWalking Matching Register
- TWI FIFO Mode Register

The following register(s) can be write-protected when WPITEN is set:

- TWI Interrupt Enable Register

- TWI Interrupt Disable Register

The following register(s) can be write-protected when WPCREN is set:

- TWI Control Register

## 46.10 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | FLEX_MR | 7:0 | | | | | | | OPMODE[1:0] | |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:0 – TXDATA[15:0]** Transmit Data
This register is a mirror of:

- USART Transmit Holding Register (FLEX_US_THR) if FLEX_MR.OPMODE field equals 1
- SPI Transmit Data Register (FLEX_SPI_TDR) if FLEX_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX_TWI_THR) if FLEX_MR.OPMODE field equals 3

### 46.10.4 USART Control Register

**Name:** FLEX_US_CR
**Offset:** 0x200
**Reset:** –
**Property:** Write-only

For SPI control, see USART Control Register (SPI_MODE).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FIFODIS | FIFOEN | | REQCLR | | TXFLCLR | RXFCLR | TXFCLR |

| | RETTO | RSTNACK | RSTIT | SENDA | STTTO | STPBRK | STTBRK | RSTSTA |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | | |
| Access | W | W | W | W | W | W | | |
| Reset | – | – | – | – | – | – | | |

**Bit 31 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the Transmit and Receive FIFOs. |

**Bit 30 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Transmit and Receive FIFOs. |

**Bit 28 – REQCLR** Request to Clear the Comparison Trigger

**Bit 26 – TXFLCLR** Transmit FIFO Lock CLEAR

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clears the Transmit FIFO Lock. |

**Bit 25 – RXFCLR** Receive FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Receive FIFO. |

**Bit 24 – TXFCLR** Transmit FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Transmit FIFO. |

**Bit 21 – LINWKUP** Send LIN Wakeup Signal

| Value | Description |
|---|---|
| 0 | No effect: |
| 1 | Sends a wakeup signal on the LIN bus. |

**Bit 20 – LINABT** Abort LIN Transmission

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Aborts the current LIN transmission. |

**Bit 19 – RTSDIS** Request to Send Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 0. |

**Bit 18 – RTSEN** Request to Send Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 0. |

**Bit 15 – RETTO** Start Timeout Immediately

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Immediately restarts timeout period. |

**Bit 14 – RSTNACK** Reset Non Acknowledge

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Resets FLEX_US_CSR.NACK. |

**Bit 13 – RSTIT** Reset Iterations

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Resets FLEX_US_CSR.ITER. No effect if the ISO7816 is not enabled. |

**Bit 12 – SENDA** Send Address

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | In Multidrop mode only, the next character written to FLEX_US_THR is sent with the address bit set. |

**Bit 11 – STTTO** Clear TIMEOUT Flag and Start Timeout After Next Character Received

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Starts waiting for a character before clocking the timeout counter. Immediately disables a timeout period in progress. Resets the FLEX_US_CSR.TIMEOUT status bit. |

**Bit 10 – STPBRK** Stop Break

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted. |

**Bit 9 – STTBRK** Start Break

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Starts transmission of a break after the characters present in FLEX_US_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted. |

**Bit 8 – RSTSTA** Reset Status Bits

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the PARE, FRAME, OVRE, MANE, LINBE, LINISFE, LINIPE, LINCE, LINSNRE, LINSTE, LINHTE, LINID, LINTC, LINBK, CMP and RXBRK in FLEX_US_CSR status bits, as well as the TXFEF, TXFFF, TXFTHF, RXFEF, RXFFF, RXFTHF, TXFPTEF, RXFPTEF in FLEX_US_FESR status bits. |

**Bit 7 – TXDIS** Transmitter Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the transmitter. |

**Bit 6 – TXEN** Transmitter Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the transmitter if TXDIS is 0. |

**Bit 5 – RXDIS** Receiver Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the receiver. |

**Bit 4 – RXEN** Receiver Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the receiver, if RXDIS is 0. |

**Bit 3 – RSTTX** Reset Transmitter

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the transmitter. |

**Bit 2 – RSTRX** Reset Receiver

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the receiver. |

### 46.10.5 USART Control Register (SPI_MODE)

**Name:** FLEX_US_CR (SPI_MODE)
**Offset:** 0x200
**Reset:** –
**Property:** Write-only

This configuration is relevant only if USART_MODE = 0xE or 0xF in the USART Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | RCS | FCS | | |
| Access | | | | | W | W | | |
| Reset | | | | | – | – | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RSTSTA |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | | |
| Access | W | W | W | W | W | W | | |
| Reset | – | – | – | – | – | – | | |

**Bit 19 – RCS** Release SPI Chip Select
Applicable if USART operates in SPI Master mode (USART_MODE = 0xE):

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Releases the Slave Select Line NSS (RTS pin). |

**Bit 18 – FCS** Force SPI Chip Select
Applicable if USART operates in SPI Master mode (USART_MODE = 0xE):

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Forces the Slave Select Line NSS (RTS pin) to 0, even if USART is not transmitting, in order to address SPI slave devices supporting the CSAAT mode (Chip Select Active After Transfer). |

**Bit 8 – RSTSTA** Reset Status Bits

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the FLEX_US_CSR.OVRE/UNRE status bits. |

**Bit 7 – TXDIS** Transmitter Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the transmitter. |

**Bit 6 – TXEN** Transmitter Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the transmitter if TXDIS is 0. |

**Bit 5 – RXDIS** Receiver Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the receiver. |

**Bit 4 – RXEN** Receiver Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the receiver, if RXDIS is 0. |

**Bit 3 – RSTTX** Reset Transmitter

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the transmitter. |

**Bit 2 – RSTRX** Reset Receiver

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the receiver. |

### 46.10.6 USART Mode Register

**Name:** FLEX_US_MR
**Offset:** 0x204
**Reset:** –
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

For SPI configuration, see section USART Mode Register (SPI_MODE).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ONEBIT | MODSYNC | MAN | FILTER | | MAX_ITERATION[2:0] | | |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | – | – | – | – | | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | INVDATA | VAR_SYNC | DSNACK | INACK | OVER | CLKO | MODE9 | MSBF |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CHMODE[1:0] | | NBSTOP[1:0] | | PAR[2:0] | | | SYNC |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CHRL[1:0] | | USCLKS[1:0] | | USART_MODE[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 31 – ONEBIT** Start Frame Delimiter Selector

| Value | Description |
|---|---|
| 0 | Start frame delimiter is COMMAND or DATA SYNC. |
| 1 | Start frame delimiter is one bit. |

**Bit 30 – MODSYNC** Manchester Synchronization Mode

| Value | Description |
|---|---|
| 0 | The Manchester start bit is a 0 to 1 transition |
| 1 | The Manchester start bit is a 1 to 0 transition. |

**Bit 29 – MAN** Manchester Encoder/Decoder Enable

| Value | Description |
|---|---|
| 0 | Manchester encoder/decoder are disabled. |
| 1 | Manchester encoder/decoder are enabled. |

**Bit 28 – FILTER** Receive Line Filter

| Value | Description |
|---|---|
| 0 | The USART does not filter the receive line. |
| 1 | The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority). |

**Bits 26:24 – MAX_ITERATION[2:0]** Maximum Number of Automatic Iterations

| Value | Description |
|---|---|
| 0-7 | Defines the maximum number of iterations in mode ISO7816, protocol T = 0. |

**Bit 23 – INVDATA** Inverted Data

| Value | Description |
|---|---|
| 0 | The data field transmitted on TXD line is the same as the one written in FLEX_US_THR or the content read in FLEX_US_RHR is the same as RXD line. Normal mode of operation. |
| 1 | The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written in FLEX_US_THR or the content read in FLEX_US_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF. |

**Bit 22 – VAR_SYNC** Variable Synchronization of Command/Data Sync Start Frame Delimiter

| Value | Description |
|---|---|
| 0 | User defined configuration of command or data sync field depending on MODSYNC value. |
| 1 | The sync field is updated when a character is written into FLEX_US_THR. |

**Bit 21 – DSNACK** Disable Successive NACK
The MAX_ITERATION field must be cleared if DSNACK is cleared.

| Value | Description |
|---|---|
| 0 | NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set). |
| 1 | Successive parity errors are counted up to the value specified in the MAX_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted. |

**Bit 20 – INACK** Inhibit Non Acknowledge

| Value | Description |
|---|---|
| 0 | The NACK is generated. |
| 1 | The NACK is not generated. |

**Bit 19 – OVER** Oversampling Mode

| Value | Description |
|---|---|
| 0 | 16x Oversampling. |
| 1 | 8x Oversampling. |

**Bit 18 – CLKO** Clock Output Select

| Value | Description |
|---|---|
| 0 | The USART does not drive the SCK pin (Synchronous Slave mode or Asynchronous mode with external baud rate clock source). |
| 1 | The USART drives the SCK pin if USCLKS does not select the external clock SCK (USART Synchronous Master mode). |

**Bit 17 – MODE9** 9-bit Character Length

| Value | Description |
|---|---|
| 0 | CHRL defines character length. |
| 1 | 9-bit character length. |

**Bit 16 – MSBF** Bit Order

| Value | Description |
|---|---|
| 0 | Least significant bit is sent/received first. |
| 1 | Most significant bit is sent/received first. |

**Bits 15:14 – CHMODE[1:0]** Channel Mode

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Normal mode |
| 1 | AUTOMATIC | Automatic Echo. Receiver input is connected to the TXD pin. |
| 2 | LOCAL_LOOPBACK | Local Loopback. Transmitter output is connected to the Receiver Input. |
| 3 | REMOTE_LOOPBACK | Remote Loopback. RXD pin is internally connected to the TXD pin. |

**Bits 13:12 – NBSTOP[1:0]** Number of Stop Bits

| Value | Name | Description |
|---|---|---|
| 0 | 1_BIT | 1 stop bit |
| 1 | 1_5_BIT | 1.5 stop bit (SYNC = 0) or reserved (SYNC = 1) |
| 2 | 2_BIT | 2 stop bits |

**Bits 11:9 – PAR[2:0]** Parity Type

| Value | Name | Description |
|---|---|---|
| 0 | EVEN | Even parity |
| 1 | ODD | Odd parity |
| 2 | SPACE | Parity forced to 0 (Space) |
| 3 | MARK | Parity forced to 1 (Mark) |
| 4 | NO | No parity |
| 6 | MULTIDROP | Multidrop mode |

**Bit 8 – SYNC** Synchronous Mode Select

| Value | Description |
|---|---|
| 0 | USART operates in Asynchronous mode (UART). |
| 1 | USART operates in Synchronous mode. |

**Bits 7:6 – CHRL[1:0]** Character Length

| Value | Name | Description |
|---|---|---|
| 0 | 5_BIT | Character length is 5 bits |
| 1 | 6_BIT | Character length is 6 bits |
| 2 | 7_BIT | Character length is 7 bits |
| 3 | 8_BIT | Character length is 8 bits |

**Bits 5:4 – USCLKS[1:0]** Clock Selection

| Value | Name | Description |
|---|---|---|
| 0 | MCK | Peripheral clock is selected |
| 1 | DIV | Peripheral clock divided (DIV = 8) is selected |
| 2 | GCLK | PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1. |
| 3 | SCK | External pin SCK is selected |

**Bits 3:0 – USART_MODE[3:0]** USART Mode of Operation

| Value | Name | Description |
|---|---|---|
| 0x0 | NORMAL | Normal mode |
| 0x1 | RS485 | RS485 |
| 0x2 | HW_HANDSHAKING | Hardware handshaking |
| 0x3 | MODEM | Modem |
| 0x4 | IS07816_T_0 | IS07816 Protocol: T = 0 |
| 0x6 | IS07816_T_1 | IS07816 Protocol: T = 1 |
| 0x8 | IRDA | IrDA |
| 0x9 | LON | LON |
| 0xA | LIN_MASTER | LIN Master mode |
| 0xB | LIN_SLAVE | LIN Slave mode |
| 0xC | DATA16BIT_MASTER | 16-bit data master |
| 0xD | DATA16BIT_SLAVE | 16-bit data slave |
| 0xE | SPI_MASTER | SPI Master mode (CLKO must be written to 1 and USCLKS = 0, 1 or 2) |
| 0xF | SPI_SLAVE | SPI Slave mode |

### 46.10.7 USART Mode Register (SPI_MODE)

**Name:** FLEX_US_MR (SPI_MODE)
**Offset:** 0x204
**Reset:** –
**Property:** Read/Write

This configuration is relevant only if USART_MODE = 0xE or 0xF in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | WRDBT | | | | CPOL |
| Access | | | | R/W | | | | R/W |
| Reset | | | | – | | | | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CHMODE[1:0] | | | | | | | CPHA |
| Access | R/W | R/W | | | | | | R/W |
| Reset | 0 | – | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CHRL[1:0] | | USCLKS[1:0] | | USART_MODE[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | – | 0 | – | 0 | 0 | 0 | – |

**Bit 20 – WRDBT** Wait Read Data Before Transfer

| Value | Description |
|---|---|
| 0 | The character transmission starts as soon as a character is written into FLEX_US_THR (assuming TXRDY was set). |
| 1 | The character transmission starts when a character is written and only if RXRDY flag is cleared (Receive Holding Register has been read). |

**Bit 16 – CPOL** SPI Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

Applicable if USART operates in SPI mode (slave or master, USART_MODE = 0xE or 0xF):

| Value | Description |
|---|---|
| 0 | The inactive state value of SPCK is logic level zero. |
| 1 | The inactive state value of SPCK is logic level one. |

**Bits 15:14 – CHMODE[1:0]** Channel Mode

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Normal mode |

**Bit 8 – CPHA** SPI Clock Phase
CPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

Applicable if USART operates in SPI mode (USART_MODE = 0xE or 0xF):

| Value | Description |
|---|---|
| 0 | Data are changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1 | Data are captured on the leading edge of SPCK and changed on the following edge of SPCK. |

**Bits 7:6 – CHRL[1:0]** Character Length

| Value | Name | Description |
|---|---|---|
| 3 | 8_BIT | Character length is 8 bits |

**Bits 5:4 – USCLKS[1:0]** Clock Selection

| Value | Name | Description |
|---|---|---|
| 0 | MCK | Peripheral clock is selected |
| 1 | DIV | Peripheral clock Divided (DIV= 8) is selected |
| 2 | GCLK | A PMC generic clock is selected |
| 3 | SCK | External pin SCK is selected |

**Bits 3:0 – USART_MODE[3:0]** USART Mode of Operation

| Value | Name | Description |
|---|---|---|
| 0xE | SPI_MASTER | SPI master |
| 0xF | SPI_SLAVE | SPI slave |

### 46.10.8 USART Interrupt Enable Register

**Name:** FLEX_US_IER
**Offset:** 0x208
**Reset:** –
**Property:** Write-only

For SPI-specific configurations, see USART Interrupt Enable Register (SPI_MODE).

For LIN-specific configurations, see USART Interrupt Enable Register (LIN_MODE).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | MANE |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | CMP | | | CTSIC | | | |
| Access | | W | | | W | | | |
| Reset | | – | | | – | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | NACK | | | ITER | TXEMPTY | TIMEOUT |
| Access | | | W | | | W | W | W |
| Reset | | | – | | | – | – | – |

| Access | W | W | W | | | W | W | W |
| Reset | – | – | – | | | – | – | – |

**Bit 24 – MANE** Manchester Error Interrupt Enable

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – CTSIC** Clear to Send Input Change Interrupt Enable

**Bit 13 – NACK** Non Acknowledge Interrupt Enable

**Bit 10 – ITER** Max number of Repetitions Reached Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 8 – TIMEOUT** Timeout Interrupt Enable

**Bit 7 – PARE** Parity Error Interrupt Enable

**Bit 6 – FRAME** Framing Error Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 2 – RXBRK** Receiver Break Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

### 46.10.9 USART Interrupt Enable Register (SPI_MODE)

**Name:** FLEX_US_IER (SPI_MODE)
**Offset:** 0x208
**Reset:** –
**Property:** Write-only

This configuration is relevant only if USART_MODE = 0xE or 0xF in the USART Mode Register.

This register can only be written if the WPITEN bit is cleared in the USART Write Protection Mode Register .

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| | | | OVRE | | | | TXRDY | RXRDY |
| Access | | | W | | | | W | W |
| Reset | | | – | | | | – | – |

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – NSSE** NSS Line (Driving CTS Pin) Rising or Falling Edge Event

**Bit 10 – UNRE** SPI Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

### 46.10.10 USART Interrupt Enable Register (LIN_MODE)

**Name:** FLEX_US_IER (LIN_MODE)
**Offset:** 0x208
**Reset:** –
**Property:** Write-only

This configuration is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

This register can only be written if the WPITEN bit is cleared in the USART Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 31 – LINHTE** LIN Header Timeout Error Interrupt Mask

**Bit 30 – LINSTE** LIN Synch Tolerance Error Interrupt Mask

**Bit 29 – LINSNRE** LIN Slave Not Responding Error Interrupt Mask

**Bit 28 – LINCE** LIN Checksum Error Interrupt Mask

**Bit 27 – LINIPE** LIN Identifier Parity Interrupt Mask

**Bit 26 – LINISFE** LIN Inconsistent Synch Field Error Interrupt Mask

**Bit 25 – LINBE** LIN Bus Error Interrupt Mask

**Bit 15 – LINTC** LIN Transfer Completed Interrupt Mask

**Bit 14 – LINID** LIN Identifier Sent or LIN Identifier Received Interrupt Mask

**Bit 13 – LINBK** LIN Break Sent or LIN Break Received Interrupt Mask

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Mask

**Bit 8 – TIMEOUT** Timeout Interrupt Mask

**Bit 7 – PARE** Parity Error Interrupt Mask

**Bit 6 – FRAME** Framing Error Interrupt Mask

**Bit 5 – OVRE** Overrun Error Interrupt Mask

**Bit 1 – TXRDY** TXRDY Interrupt Mask

**Bit 0 – RXRDY** RXRDY Interrupt Mask

### 46.10.17 USART Channel Status Register

**Name:** FLEX_US_CSR
**Offset:** 0x214
**Reset:** 0x00000000
**Property:** Read-only

For SPI-specific configurations, see USART Channel Status Register (SPI_MODE).

For LIN-specific configurations, see USART Channel Status Register (LIN_MODE).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 24 – MANE** Manchester Error

| Value | Description |
|---|---|
| 0 | No Manchester error has been detected since the last RSTSTA command was issued. |
| 1 | At least one Manchester error has been detected since the last RSTSTA command was issued. |

**Bit 23 – CTS** Image of CTS Input

| Value | Description |
|---|---|
| 0 | CTS input is driven low. |
| 1 | CTS input is driven high. |

**Bit 22 – CMP** Comparison Status

| Value | Description |
|---|---|
| 0 | No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued. |
| 1 | A received character matched the comparison criteria since the last RSTSTA command was issued. |

**Bit 19 – CTSIC** Clear to Send Input Change Flag

| Value | Description |
|---|---|
| 0 | No input change has been detected on the CTS pin since the last read of FLEX_US_CSR. |
| 1 | At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR. |

**Bit 13 – NACK** Non Acknowledge Interrupt

| Value | Description |
|---|---|
| 0 | Non acknowledge has not been detected since the last RSTNACK. |
| 1 | At least one non acknowledge has been detected since the last RSTNACK. |

**Bit 10 – ITER** Max Number of Repetitions Reached

| Value | Description |
|---|---|
| 0 | Maximum number of repetitions has not been reached since the last RSTIT command was issued. |
| 1 | Maximum number of repetitions has been reached since the last RSTIT command was issued. |

**Bit 9 – TXEMPTY** Transmitter Empty (cleared by writing FLEX_US_THR)

| Value | Description |
|---|---|
| 0 | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1 | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register. |

**Bit 8 – TIMEOUT** Receiver Timeout

| Value | Description |
|---|---|
| 0 | There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0. |
| 1 | There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO). |

**Bit 7 – PARE** Parity Error

| Value | Description |
|---|---|
| 0 | No parity error has been detected since the last RSTSTA command was issued. |
| 1 | At least one parity error has been detected since the last RSTSTA command was issued. |

**Bit 6 – FRAME** Framing Error

| Value | Description |
|---|---|
| 0 | No stop bit has been detected low since the last RSTSTA command was issued. |
| 1 | At least one stop bit has been detected low since the last RSTSTA command was issued. |

**Bit 5 – OVRE** Overrun Error

| Value | Description |
|---|---|
| 0 | No overrun error has occurred since the last RSTSTA command was issued. |
| 1 | At least one overrun error has occurred since the last RSTSTA command was issued. |

**Bit 2 – RXBRK** Break Received/End of Break

| Value | Description |
|---|---|
| 0 | No break received or end of break detected since the last RSTSTA command was issued. |
| 1 | Break received or end of break detected since the last RSTSTA command was issued. |

**Bit 1 – TXRDY** Transmitter Ready (cleared by writing FLEX_US_THR)
When FIFOs are disabled:

0: A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in FLEX_US_THR.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFO enabled is illustrated in 46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior.

**Bit 0 – RXRDY** Receiver Ready (cleared by reading FLEX_US_RHR)
When FIFOs are disabled:

0: No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and FLEX_US_RHR has not yet been read.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read

1: At least one unread data is in the Receive FIFO

RXRDY behavior with FIFO enabled is illustrated in 46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior.

### 46.10.18 USART Channel Status Register (SPI_MODE)

**Name:** FLEX_US_CSR (SPI_MODE)
**Offset:** 0x214
**Reset:** –
**Property:** Read-only

This configuration is relevant only if USART_MODE = 0xE or 0xF in the USART Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Access | | | R | | | | R | R |
| Reset | | | – | | | | – | – |

**Bit 23 – NSS** Image of NSS Line

| Value | Description |
|---|---|
| 0 | NSS line is driven low (if NSSE = 1, falling edge occurred on NSS line). |
| 1 | NSS line is driven high (if NSSE = 1, rising edge occurred on NSS line). |

**Bit 22 – CMP** Comparison Match

| Value | Description |
|---|---|
| 0 | No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in FLEX_US_CMPR since the last RSTSTA command was issued. |
| 1 | A received character matched the comparison criteria since the last RSTSTA command was issued. |

**Bit 19 – NSSE** NSS Line (Driving CTS Pin) Rising or Falling Edge Event (cleared on read)

| Value | Description |
|---|---|
| 0 | No NSS line event has been detected since the last read of FLEX_US_CSR. |
| 1 | A rising or falling edge has been detected on the NSS line since the last read of FLEX_US_CSR. |

**Bit 10 – UNRE** Underrun Error

| Value | Description |
|---|---|
| 0 | No SPI underrun error has occurred since the last RSTSTA command was issued. |
| 1 | At least one SPI underrun error has occurred since the last RSTSTA command was issued. |

**Bit 9 – TXEMPTY** Transmitter Empty (cleared by writing FLEX_US_THR)

| Value | Description |
|---|---|
| 0 | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1 | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register. |

**Bit 5 – OVRE** Overrun Error

| Value | Description |
|---|---|
| 0 | No overrun error has occurred since the last RSTSTA command was issued. |
| 1 | At least one overrun error has occurred since the last RSTSTA command was issued. |

**Bit 1 – TXRDY** Transmitter Ready (cleared by writing FLEX_US_THR)

| Value | Description |
|---|---|
| 0 | A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1. |
| 1 | There is no character in FLEX_US_THR. |

**Bit 0 – RXRDY** Receiver Ready (cleared by reading FLEX_US_RHR)

| Value | Description |
|---|---|
| 0 | No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled. |
| 1 | At least one complete character has been received and FLEX_US_RHR has not yet been read. |

### 46.10.19 USART Channel Status Register (LIN_MODE)

**Name:** FLEX_US_CSR (LIN_MODE)
**Offset:** 0x214
**Reset:** –
**Property:** Read-only

This configuration is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | R | R | R | | | | R | R |
| Reset | – | – | – | | | | – | – |

**Bit 31 – LINHTE** LIN Header Timeout Error

| Value | Description |
|---|---|
| 0 | No LIN header timeout error has been detected since the last RSTSTA command was issued. |
| 1 | A LIN header timeout error has been detected since the last RSTSTA command was issued. |

**Bit 30 – LINSTE** LIN Synch Tolerance Error

| Value | Description |
|---|---|
| 0 | No LIN synch tolerance error has been detected since the last RSTSTA command was issued. |
| 1 | A LIN synch tolerance error has been detected since the last RSTSTA command was issued. |

**Bit 29 – LINSNRE** LIN Slave Not Responding Error

| Value | Description |
|---|---|
| 0 | No LIN slave not responding error has been detected since the last RSTSTA command was issued. |

| Value | Description |
|---|---|
| 1 | A LIN slave not responding error has been detected since the last RSTSTA command was issued. |

**Bit 28 – LINCE** LIN Checksum Error

| Value | Description |
|---|---|
| 0 | No LIN checksum error has been detected since the last RSTSTA command was issued. |
| 1 | A LIN checksum error has been detected since the last RSTSTA command was issued. |

**Bit 27 – LINIPE** LIN Identifier Parity Error

| Value | Description |
|---|---|
| 0 | No LIN identifier parity error has been detected since the last RSTSTA command was issued. |
| 1 | A LIN identifier parity error has been detected since the last RSTSTA command was issued. |

**Bit 26 – LINISFE** LIN Inconsistent Synch Field Error

| Value | Description |
|---|---|
| 0 | No LIN inconsistent synch field error has been detected since the last RSTSTA |
| 1 | The USART is configured as a slave node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued. |

**Bit 25 – LINBE** LIN Bit Error

| Value | Description |
|---|---|
| 0 | No bit error has been detected since the last RSTSTA command was issued. |
| 1 | A bit error has been detected since the last RSTSTA command was issued. |

**Bit 23 – LINBLS** LIN Bus Line Status

| Value | Description |
|---|---|
| 0 | LIN bus line is set to 0. |
| 1 | LIN bus line is set to 1. |

**Bit 15 – LINTC** LIN Transfer Completed

| Value | Description |
|---|---|
| 0 | The USART is idle or a LIN transfer is ongoing. |
| 1 | A LIN transfer has been completed since the last RSTSTA command was issued. |

**Bit 14 – LINID** LIN Identifier Sent or LIN Identifier Received
If USART operates in LIN Master mode (USART_MODE = 0xA):

0: No LIN identifier has been sent since the last RSTSTA command was issued.

1: At least one LIN identifier has been sent since the last RSTSTA command was issued.

If USART operates in LIN Slave mode (USART_MODE = 0xB):

0: No LIN identifier has been received since the last RSTSTA command was issued.

1: At least one LIN identifier has been received since the last RSTSTA.

**Bit 13 – LINBK** LIN Break Sent or LIN Break Received
Applicable if USART operates in LIN Master mode (USART_MODE = 0xA):

0: No LIN break has been sent since the last RSTSTA command was issued.

1: At least one LIN break has been sent since the last RSTSTA.

If USART operates in LIN Slave mode (USART_MODE = 0xB):

0: No LIN break has received sent since the last RSTSTA command was issued.

1: At least one LIN break has been received since the last RSTSTA command was issued.

**Bit 9 – TXEMPTY** Transmitter Empty (cleared by writing FLEX_US_THR)

| Value | Description |
|---|---|
| 0 | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1 | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register. |

**Bit 8 – TIMEOUT** Receiver Timeout

| Value | Description |
|---|---|
| 0 | There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0. |
| 1 | There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO). |

**Bit 7 – PARE** Parity Error

| Value | Description |
|---|---|
| 0 | No parity error has been detected since the last RSTSTA command was issued. |
| 1 | At least one parity error has been detected since the last RSTSTA command was issued. |

**Bit 6 – FRAME** Framing Error

| Value | Description |
|---|---|
| 0 | No stop bit has been detected low since the last RSTSTA command was issued. |
| 1 | At least one stop bit has been detected low since the last RSTSTA command was issued. |

**Bit 5 – OVRE** Overrun Error

| Value | Description |
|---|---|
| 0 | No overrun error has occurred since the last RSTSTA command was issued. |
| 1 | At least one overrun error has occurred since the last RSTSTA command was issued. |

**Bit 1 – TXRDY** Transmitter Ready (cleared by writing FLEX_US_THR)

| Value | Description |
|---|---|
| 0 | A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1. |
| 1 | There is no character in FLEX_US_THR. |

**Bit 0 – RXRDY** Receiver Ready (cleared by reading FLEX_US_RHR)

| Value | Description |
|---|---|
| 0 | No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled. |
| 1 | At least one complete character has been received and FLEX_US_RHR has not yet been read. |

### 46.10.20 USART Receive Holding Register

**Name:** FLEX_US_RHR
**Offset:** 0x218
**Reset:** 0x00000000
**Property:** Read-only

If FIFO is enabled (FLEX_US_CR.FIFOEN bit) and FLEX_US_FMR.RXRDYM = 0, see 46.7.11.6 USART Single Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – RXSYNH** Received Sync

| Value | Description |
|---|---|
| 0 | Last character received is a data. |
| 1 | Last character received is a command. |

**Bits 8:0 – RXCHR[8:0]** Received Character
Last character received if RXRDY is set.

### 46.10.21 USART Receive Holding Register (FIFO Multi Data)

**Name:** FLEX_US_RHR (FIFO_MULTI_DATA)
**Offset:** 0x218
**Reset:** 0x00000000
**Property:** Read-only

If FIFO is enabled (FLEX_US_CR.FIFOEN bit) and FLEX_US_FMR.RXRDYM > 0, see 46.7.11.7 USART Multiple Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RXCHR3[7:0] | | | | | | | |

| | TXCHR[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 15 – TXSYNH** Sync Field to be Transmitted

| Value | Description |
|---|---|
| 0 | The next character sent is encoded as a data. Start frame delimiter is DATA SYNC. |
| 1 | The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC. |

**Bits 8:0 – TXCHR[8:0]** Character to be Transmitted
The next character to be transmitted after the current character if TXRDY is not set.

### 46.10.23 USART Transmit Holding Register (FIFO Multi Data)

**Name:** FLEX_US_THR (FIFO_MULTI_DATA)
**Offset:** 0x21C
**Reset:** –
**Property:** Write-only

If FIFO is enabled (FLEX_US_CR.FIFOEN bit) and FLEX_US_FMR.TXRDY > 0, see 46.7.11.7 USART Multiple Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | TXCHR3[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | TXCHR2[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

|---|---|---|---|---|---|---|---|---|
| | TXCHR0[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 0:7, 8:15, 16:23, 24:31 – TXCHRx** Character to be Transmitted
Next character to be transmitted.

### 46.10.24 USART Baud Rate Generator Register

**Name:** FLEX_US_BRGR
**Offset:** 0x220
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |
| | | | | | | FP[2:0] | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | CD[15:8] | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | CD[7:0] | | | | | | | |

**Bits 18:16 – FP[2:0]** Fractional Part

**WARNING** When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

| Value | Description |
|---|---|
| 0 | Fractional divider is disabled. |
| 1–7 | Baud rate resolution, defined by FP × 1/8. |

**Bits 15:0 – CD[15:0]** Clock Divider

| CD | USART_MODE ≠ ISO7816 | | | USART_MODE = ISO7816 |
|---|---|---|---|---|
| | SYNC = 0 | | SYNC = 1 or USART_MODE = SPI (master or Slave) | |
| | OVER = 0 | OVER = 1 | | |

| 0 | Baud Rate Clock Disabled | | | |
|---|---|---|---|---|
| 1 to 65535 | CD = Selected Clock / (16 × Baud Rate) | CD = Selected Clock / (8 × Baud Rate) | CD = Selected Clock / Baud Rate | CD = Selected Clock / (FI_DI_RATIO × Baud Rate) |

### 46.10.25 USART Receiver Timeout Register

**Name:** FLEX_US_RTOR
**Offset:** 0x224
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | TO[16:16] |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TO[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TO[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 16:0 – TO[16:0]** Timeout Value

| Value | Description |
|---|---|
| 0 | The receiver timeout is disabled. |
| 1–131071 | The receiver timeout is enabled and the timeout delay is TO × bit period. |

### 46.10.26 USART Transmitter Timeguard Register

**Name:** FLEX_US_TTGR
**Offset:** 0x228
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TG[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 7:0 – TG[7:0]** Timeguard Value

| Value | Description |
|---|---|
| 0 | The transmitter timeguard is disabled. |
| 1–255 | The transmitter timeguard is enabled and TG is timeguard delay / bit period. |

### 46.10.27 USART FI DI RATIO Register

**Name:** FLEX_US_FIDI
**Offset:** 0x240
**Reset:** 0x174
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | FI_DI_RATIO[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FI_DI_RATIO[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 |

**Bits 15:0 – FI_DI_RATIO[15:0]** FI Over DI Ratio Value

| Value | Description |
|---|---|
| 0 | If ISO7816 mode is selected, the baud rate generator generates no signal. |
| 1–2 | Do not use. |
| 3–65535 | If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI_DI_RATIO. |

### 46.10.28 USART Number of Errors Register

**Name:** FLEX_US_NER
**Offset:** 0x244
**Reset:** –
**Property:** Read-only

This register is relevant only if USART_MODE = 0x4 or 0x6 in the USART Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NB_ERRORS[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | – | – | – | – | – | – | – | – |

**Bits 7:0 – NB_ERRORS[7:0]** Number of Errors
Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

### 46.10.29 USART IrDA FILTER Register

**Name:** FLEX_US_IF
**Offset:** 0x24C
**Reset:** 0x00000000
**Property:** Read/Write

This register is relevant only if USART_MODE = 0x8 in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IRDA_FILTER[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 7:0 – IRDA_FILTER[7:0]** IrDA Filter
The IRDA_FILTER value must be defined to meet the following criteria:

$t_{peripheral\ clock} \times (IRDA_FILTER + 3) < 1.41\ \mu s$

### 46.10.30 USART Manchester Configuration Register

**Name:** FLEX_US_MAN
**Offset:** 0x250
**Reset:** 0xB0011004
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RXIDLEV | DRIFT | ONE | RX_MPOL | | | RX_PP[1:0] | |
| Access | R/W | R/W | R/W | R/W | | | R/W | R/W |
| Reset | 1 | 0 | 1 | 1 | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | RX_PL[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | TX_MPOL | | | TX_PP[1:0] | |
| Access | | | | R/W | | | R/W | R/W |
| Reset | | | | 1 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | TX_PL[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 1 | 0 | 0 |

**Bit 31 – RXIDLEV** Receiver Idle Value

| Value | Description |
|---|---|
| 0 | Receiver line idle value is 0. |
| 1 | Receiver line idle value is 1. |

**Bit 30 – DRIFT** Drift Compensation

| Value | Description |
|---|---|
| 0 | The USART cannot recover from an important clock drift. |
| 1 | The USART can recover from clock drift. The 16X Clock mode must be enabled. |

**Bit 29 – ONE** Must Be Set to 1
Bit 29 must always be set to 1 when programming the FLEX_US_MAN register.

**Bit 28 – RX_MPOL** Receiver Manchester Polarity

| Value | Description |
|---|---|
| 0 | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |

| Value | Description |
|---|---|
| 1 | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

**Bits 25:24 – RX_PP[1:0]** Receiver Preamble Pattern detected
The following values assume that RX_MPOL field is not set:

| Value | Name | Description |
|---|---|---|
| 0 | ALL_ONE | The preamble is composed of ‘1’s. |
| 1 | ALL_ZERO | The preamble is composed of ‘0’s. |
| 2 | ZERO_ONE | The preamble is composed of ‘01’s. |
| 3 | ONE_ZERO | The preamble is composed of ‘10’s. |

**Bits 19:16 – RX_PL[3:0]** Receiver Preamble Length

| Value | Description |
|---|---|
| 0 | The receiver preamble pattern detection is disabled. |
| 1–15 | The detected preamble length is RX_PL × Bit Period. |

**Bit 12 – TX_MPOL** Transmitter Manchester Polarity

| Value | Description |
|---|---|
| 0 | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |
| 1 | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

**Bits 9:8 – TX_PP[1:0]** Transmitter Preamble Pattern
The following values assume that TX_MPOL field is not set:

| Value | Name | Description |
|---|---|---|
| 0 | ALL_ONE | The preamble is composed of ‘1’s. |
| 1 | ALL_ZERO | The preamble is composed of ‘0’s. |
| 2 | ZERO_ONE | The preamble is composed of ‘01’s. |
| 3 | ONE_ZERO | The preamble is composed of ‘10’s. |

**Bits 3:0 – TX_PL[3:0]** Transmitter Preamble Length

| Value | Description |
|---|---|
| 0 | The transmitter preamble pattern generation is disabled. |
| 1–15 | The preamble length is TX_PL × Bit Period. |

### 46.10.31 USART LIN Mode Register

**Name:** FLEX_US_LINMR
**Offset:** 0x254
**Reset:** 0x00000000
**Property:** Read/Write

This register is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | SYNCDIS | PDCM |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | DLC[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WKUPTYP | FSDIS | DLM | CHKTYP | CHKDIS | PARDIS | NACT[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 17 – SYNCDIS** Synchronization Disable

| Value | Description |
|---|---|
| 0 | The synchronization procedure is performed in LIN slave node configuration. |
| 1 | The synchronization procedure is not performed in LIN slave node configuration. |

**Bit 16 – PDCM** DMAC Mode

| Value | Description |
|---|---|
| 0 | The LIN mode register FLEX_US_LINMR is not written by the DMAC. |
| 1 | The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMAC. |

**Bits 15:8 – DLC[7:0]** Data Length Control

| Value | Description |
|---|---|
| 0-255 | Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes. |

**Bit 7 – WKUPTYP** Wake-up Signal Type

| Value | Description |
|---|---|
| 0 | Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal. |

| Value | Description |
|---|---|
| 1 | Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal. |

**Bit 6 – FSDIS** Frame Slot Mode Disable

| Value | Description |
|---|---|
| 0 | The Frame Slot mode is enabled. |
| 1 | The Frame Slot mode is disabled. |

**Bit 5 – DLM** Data Length Mode

| Value | Description |
|---|---|
| 0 | The response data length is defined by the DLC field of this register. |
| 1 | The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR). |

**Bit 4 – CHKTYP** Checksum Type

| Value | Description |
|---|---|
| 0 | LIN 2.0 “enhanced” checksum |
| 1 | LIN 1.3 “classic” checksum |

**Bit 3 – CHKDIS** Checksum Disable

| Value | Description |
|---|---|
| 0 | In master node configuration, the checksum is computed and sent automatically. In slave node configuration, the checksum is checked automatically. |
| 1 | Whatever the node configuration is, the checksum is not computed/sent and it is not checked. |

**Bit 2 – PARDIS** Parity Disable

| Value | Description |
|---|---|
| 0 | In master node configuration, the identifier parity is computed and sent automatically. In master node and slave node configuration, the parity is checked automatically. |
| 1 | Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked. |

**Bits 1:0 – NACT[1:0]** LIN Node Action
Values which are not listed in the table must be considered as “reserved”.

| Value | Name | Description |
|---|---|---|
| 0 | PUBLISH | The USART transmits the response. |
| 1 | SUBSCRIBE | The USART receives the response. |
| 2 | IGNORE | The USART does not transmit and does not receive the response. |

### 46.10.32 USART LIN Identifier Register

**Name:** FLEX_US_LINIR
**Offset:** 0x258
**Reset:** 0x00000000
**Property:** Read/Write

Write is possible only in LIN master node configuration.

This register is relevant only if USART_MODE = 0xA or 0xB in USART Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDCHR[7:0] | | | | | | | |
| Access | R/W-R | R/W-R | R/W-R | R/W-R | R/W-R | R/W-R | R/W-R | R/W-R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 7:0 – IDCHR[7:0]** Identifier Character
If USART_MODE = 0xA (master node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART_MODE = 0xB (slave node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

### 46.10.33 USART LIN Baud Rate Register

**Name:** FLEX_US_LINBRR
**Offset:** 0x25C
**Reset:** 0x00000000
**Property:** Read-only

This register is relevant only if USART_MODE = 0xA or 0xB in USART Mode Register.

Returns the baud rate value after the synchronization process completion.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | LINFP[2:0] | | |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | LINCD[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LINCD[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 18:16 – LINFP[2:0]** Fractional Part after Synchronization

**Bits 15:0 – LINCD[15:0]** Clock Divider after Synchronization

### 46.10.34 USART Comparison Register

**Name:** FLEX_US_CMPR
**Offset:** 0x290
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | VAL2[8:8] |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VAL2[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | CMPPAR | | CMPMODE | | | | VAL1[8:8] |
| Access | | R/W | | R/W | | | | R/W |
| Reset | | 0 | | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VAL1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 24:16 – VAL2[8:0]** Second Comparison Value for Received Character

| Value | Description |
|---|---|
| 0-511 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag. |

**Bit 14 – CMPPAR** Compare Parity

| Value | Description |
|---|---|
| 0 | The parity is not checked and a bad parity cannot prevent from waking up the system. |
| 1 | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed. |

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name | Description |
|---|---|---|
| 0 | FLAG_ONLY | Any character is received and comparison function drives CMP flag. |
| 1 | START_CONDITION | Comparison condition must be met to start reception. |
| 2 | FILTER | Comparison must be met to receive the current data only |

**Bits 8:0 – VAL1[8:0]** First Comparison Value for Received Character

| Value | Description |
|---|---|
| 0–511 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag. |

### 46.10.35 USART FIFO Mode Register

**Name:** FLEX_US_FMR
**Offset:** 0x2A0
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFTHRES2[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FRTSC | | RXRDYM[1:0] | | | | TXRDYM[1:0] | |
| Access | R/W | | R/W | R/W | | | R/W | R/W |
| Reset | 0 | | 0 | 0 | | | 0 | 0 |

**Bits 29:24 – RXFTHRES2[5:0]** Receive FIFO Threshold 2

| Value | Description |
|---|---|
| 0–32 | Defines the Receive FIFO threshold 2 value (number of data). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from “above” threshold state to “equal to or below” threshold state. |

**Bits 21:16 – RXFTHRES[5:0]** Receive FIFO Threshold

| Value | Description |
|---|---|
| 0–32 | Defines the Receive FIFO threshold value (number of data). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

**Bits 13:8 – TXFTHRES[5:0]** Transmit FIFO Threshold

| Value | Description |
|---|---|
| 0–32 | Defines the Transmit FIFO threshold value (number of data). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

**Bit 7 – FRTSC** FIFO RTS Pin Control enable (Hardware Handshaking mode only)
See Hardware Handshaking for details.

| Value | Description |
|---|---|
| 0 | RTS pin is not controlled by Receive FIFO thresholds. |
| 1 | RTS pin is controlled by Receive FIFO thresholds. |

**Bits 5:4 – RXRDYM[1:0]** Receiver Ready Mode
If FIFOs are enabled, the FLEX_US_CSR.RXRDY flag behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | RXRDY will be at level '1' when at least one unread data is in the Receive FIFO. |
| 1 | TWO_DATA | RXRDY will be at level '1' when at least two unread data are in the Receive FIFO. |
| 2 | FOUR_DATA | RXRDY will be at level '1' when at least four unread data are in the Receive FIFO. |

**Bits 1:0 – TXRDYM[1:0]** Transmitter Ready Mode
If FIFOs are enabled, the FLEX_US_CSR.TXRDY flag behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO |
| 1 | TWO_DATA | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO |
| 2 | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

### 46.10.36 USART FIFO Level Register

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 9 – RXFTHF2** Receive FIFO Threshold Flag 2 (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Number of unread data in Receive FIFO is above RXFTHRES threshold. |
| 1 | Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued. |

**Bit 8 – TXFLOCK** Transmit FIFO Lock

| Value | Description |
|---|---|
| 0 | The Transmit FIFO is not locked. |
| 1 | The Transmit FIFO is locked. |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag
See 46.7.11.9 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Receive FIFO pointer occurred. |
| 1 | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag
See 46.7.11.9 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Transmit FIFO pointer occurred. |
| 1 | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Number of unread data in Receive FIFO is below RXFTHRES threshold. |
| 1 | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 4 – RXFFF** Receive FIFO Full Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty. |
| 1 | Receive FIFO has been filled since the last RSTSTA command was issued. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty. |
| 1 | Receive FIFO has been emptied since the last RSTSTA command was issued. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Number of data in Transmit FIFO is above TXFTHRES threshold. |
| 1 | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not full. |
| 1 | Transmit FIFO has been filled since the last RSTSTA command was issued. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not empty. |
| 1 | Transmit FIFO has been emptied since the last RSTSTA command was issued. |

### 46.10.41 USART Write Protection Mode Register

**Name:** FLEX_US_WPMR
**Offset:** 0x2E4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x555341 | PASSWD | Writing any other value in this field aborts the write operation of bit WPEN. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See USART Register Write Protection for the list of registers that can be write-protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII). |
| 1 | Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII). |

### 46.10.42 USART Write Protection Status Register

**Name:** FLEX_US_WPSR
**Offset:** 0x2E8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of FLEX_US_WPSR. |
| 1 | A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

### 46.10.43 SPI Control Register

**Name:** FLEX_SPI_CR
**Offset:** 0x400
**Reset:** –
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the SPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FIFODIS | FIFOEN | | | | | | LASTXFER |
| Access | W | W | | | | | | W |
| Reset | – | – | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | RXFCLR | TXFCLR |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | REQCLR | | | | |
| Access | | | | W | | | | |
| Reset | | | | – | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SWRST | | | | | | SPIDIS | SPIEN |
| Access | W | | | | | | W | W |
| Reset | – | | | | | | – | – |

**Bit 31 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the Transmit and Receive FIFOs |

**Bit 30 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Transmit and Receive FIFOs |

**Bit 24 – LASTXFER** Last Transfer
See Peripheral Selection for more details.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

**Bit 17 – RXFCLR** Receive FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Receive FIFO. |

**Bit 16 – TXFCLR** Transmit FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Transmit FIFO. |

**Bit 12 – REQCLR** Request to Clear the Comparison Trigger
SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable FLEX_SPI_RDR loading.

**Bit 7 – SWRST** SPI Software Reset
The SPI is in Slave mode after software reset.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the SPI. A software-triggered hardware reset of the SPI interface is performed. |

**Bit 1 – SPIDIS** SPI Disable
If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX_US_THR is loaded.

All pins are set in Input mode after completion of the transmission in progress, if any.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the SPI. |

**Bit 0 – SPIEN** SPI Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the SPI to transfer and receive data. |

### 46.10.44 SPI Mode Register

**Name:** FLEX_SPI_MR
**Offset:** 0x404
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DLYBCS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | PCS[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | CMPMODE | | | | |
| Access | | | | R/W | | | | |
| Reset | | | | 0 | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LLB | | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS | MSTR |
| Access | R/W | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DLYBCS[7:0]** Delay Between Chip Selects
This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is ≤ 6, six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If FLEX_SPI_MR.BRSRCCLK = 0: DLYBCS = Delay Between Chip Selects × $f_{peripheral\ clock}$

If FLEX_SPI_MR.BRSRCCLK = 1: DLYBCS = Delay Between Chip Selects × $f_{GCLK}$

**Bits 17:16 – PCS[1:0]** Peripheral Chip Select
This field is only used if fixed peripheral select is active (PS = 0).

If PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don’t care)

If PCSDEC = 1:

NPCS[1:0] output signals = PCS

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name | Description |
|---|---|---|
| 0 | FLAG_ONLY | Any character is received and comparison function drives CMP flag. |
| 1 | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

**Bit 7 – LLB** Local Loopback Enable
LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description |
|---|---|
| 0 | Local loopback path disabled. |
| 1 | Local loopback path enabled. |

**Bit 5 – WDRBT** Wait Data Read Before Transfer

| Value | Description |
|---|---|
| 0 | No Effect. In Master mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state. |
| 1 | In Master mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

**Bit 4 – MODFDIS** Mode Fault Detection

| Value | Description |
|---|---|
| 0 | Mode fault detection is enabled. |
| 1 | Mode fault detection is disabled. |

**Bit 3 – BRSRCCLK** Bit Rate Source Clock
If the bit BRSRCCLK = 1, the FLEX_US_CSRx.SCBR field must be programmed with a value greater than 1.

| Value | Name | Description |
|---|---|---|
| 0 | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation. |
| 1 | GCLK | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

**Bit 2 – PCSDEC** Chip Select Decode
When PCSDEC equals one, up to 3 Chip Select signals can be generated with the two NPCS lines using an external 2- to 4-bit decoder. The Chip Select registers define the characteristics of the 3 chip selects, with the following rules:

FLEX_SPI_CSR0 defines peripheral chip select signals 0 to 1.

FLEX_SPI_CSR1 defines peripheral chip select signal 2.

| Value | Description |
|---|---|
| 0 | The chip selects are directly connected to a peripheral device. |

| Value | Description |
|---|---|
| 1 | The two NPCS chip select lines are connected to a 2- to 4-bit decoder. |

**Bit 1 – PS** Peripheral Select

| Value | Description |
|---|---|
| 0 | Fixed Peripheral Select |
| 1 | Variable Peripheral Select |

**Bit 0 – MSTR** Master/Slave Mode

| Value | Description |
|---|---|
| 0 | SPI is in Slave mode. |
| 1 | SPI is in Master mode. |

### 46.10.45 SPI Receive Data Register

**Name:** FLEX_SPI_RDR
**Offset:** 0x408
**Reset:** 0x00000000
**Property:** Read-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN) and FLEX_SPI_FMR.RXRDYM = 0, see SPI Single Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select
In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

**Note:** When using Variable Peripheral Select mode (FLEX_SPI_MR.PS = 1), it is mandatory to set the FLEX_SPI_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX_SPI_RDR.

**Bits 15:0 – RD[15:0]** Receive Data
Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 46.10.46 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** FLEX_SPI_RDR (FIFO_MULTI_DATA_8)
**Offset:** 0x408
**Reset:** 0x00000000
**Property:** Read-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN) and FLEX_SPI_FMR.RXRDYM > 0, see SPI Multiple Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 0:15, 16:31 – RDx** Receive Data
First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 46.10.48 SPI Transmit Data Register

**Name:** FLEX_SPI_TDR
**Offset:** 0x40C
**Reset:** –
**Property:** Write-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN) and FLEX_SPI_FMR.TXRDYM = 0, see 46.8.7.6 SPI Single Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | LASTXFER |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

|---|---|---|---|---|---|---|---|---|
| | TD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 24 – LASTXFER** Last Transfer
This field is only used if variable peripheral select is active (FLEX_SPI_MR.PS = 1).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select
This field is only used if variable peripheral select is active (FLEX_SPI_MR.PS = 1).

If FLEX_SPI_MR.PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don’t care)

If FLEX_SPI_MR.PCSDEC = 1:

NPCS[1:0] output signals = PCS

**Bits 15:0 – TD[15:0]** Transmit Data
Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

### 46.10.49 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** FLEX_SPI_TDR (FIFO_MULTI_DATA)
**Offset:** 0x40C
**Reset:** –
**Property:** Write-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN) and FLEX_SPI_FMR.TXRDYM > 0, see Section 1.8.7.7 “SPI Multiple Data Mode” for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| | | | | | OVRES | MODF | TDRE | RDRF |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 31 – RXFPTEF** Receive FIFO Pointer Error Flag
See 46.8.7.8 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Receive FIFO pointer occurred |
| 1 | Receive FIFO pointer error occurred. Receiver must be reset |

**Bit 30 – TXFPTEF** Transmit FIFO Pointer Error Flag
See 46.8.7.8 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Transmit FIFO pointer occurred |
| 1 | Transmit FIFO pointer error occurred. Transceiver must be reset |

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description |
|---|---|
| 0 | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared. |
| 1 | Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from “below threshold” to “equal to or above threshold”). |

**Bit 28 – RXFFF** Receive FIFO Full Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty or RXFE flag has been cleared. |
| 1 | Receive FIFO has been filled (changing states from “not full” to “full”). |

**Bit 27 – RXFEF** Receive FIFO Empty Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty or RXFE flag has been cleared. |
| 1 | Receive FIFO has been emptied (changing states from “not empty” to “empty”). |

**Bit 26 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Number of data in Transmit FIFO is above TXFTHRES threshold. |
| 1 | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR. |

**Bit 25 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not full or TXFF flag has been cleared. |
| 1 | Transmit FIFO has been filled since the last read of FLEX_SPI_SR. |

**Bit 24 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not empty. |
| 1 | Transmit FIFO has been emptied since the last read of FLEX_SPI_SR. |

**Bit 16 – SPIENS** SPI Enable Status

| Value | Description |
|---|---|
| 0 | SPI is disabled. |
| 1 | SPI is enabled. |

**Bit 11 – CMP** Comparison Status (cleared on read)

| Value | Description |
|---|---|
| 0 | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR. |
| 1 | A received character matched the comparison criteria since the last read of FLEX_SPI_SR. |

**Bit 10 – UNDES** Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description |
|---|---|
| 0 | No underrun has been detected since the last read of FLEX_SPI_SR. |
| 1 | A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read. |

**Bit 9 – TXEMPTY** Transmission Registers Empty (cleared by writing FLEX_SPI_TDR)

| Value | Description |
|---|---|
| 0 | As soon as data is written in FLEX_SPI_TDR. |
| 1 | FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description |
|---|---|
| 0 | No rising edge detected on NSS pin since the last read of FLEX_SPI_SR. |
| 1 | A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR. |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)
An overrun occurs when FLEX_SPI_RDR is loaded at least twice from the shift register since the last read of FLEX_SPI_RDR.

| Value | Description |
|---|---|
| 0 | No overrun has been detected since the last read of FLEX_SPI_SR. |
| 1 | An overrun has occurred since the last read of FLEX_SPI_SR. |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No mode fault has been detected since the last read of FLEX_SPI_SR. |
| 1 | A mode fault occurred since the last read of FLEX_SPI_SR. |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing FLEX_SPI_TDR)
When FIFOs are disabled:

0: Data has been written to FLEX_SPI_TDR and not yet transferred to the internal shift register.

1: The last data written to FLEX_SPI_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO cannot accept more data.

1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in 46.8.7.5 TXEMPTY, TDRE and RDRF Behavior.

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading FLEX_SPI_RDR)
When FIFOs are disabled:

0: No data has been received since the last read of FLEX_SPI_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to FLEX_SPI_RDR since the last read of FLEX_SPI_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in 46.8.7.5 TXEMPTY, TDRE and RDRF Behavior.

### 46.10.51 SPI Interrupt Enable Register

**Name:** FLEX_SPI_IER
**Offset:** 0x414
**Reset:** –
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the SPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |

| Reset | | | | | – | – | – | – |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Enable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Enable

**Bit 29 – RXFTHF** RXFTHF Interrupt Enable

**Bit 28 – RXFFF** RXFFF Interrupt Enable

**Bit 27 – RXFEF** RXFEF Interrupt Enable

**Bit 26 – TXFTHF** TXFTHF Interrupt Enable

**Bit 25 – TXFFF** TXFFF Interrupt Enable

**Bit 24 – TXFEF** TXFEF Interrupt Enable

**Bit 11 – CMP** Comparison Interrupt Enable

**Bit 10 – UNDES** Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** Transmission Registers Empty Enable

**Bit 8 – NSSR** NSS Rising Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – MODF** Mode Fault Error Interrupt Enable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

© 2018 Microchip Technology Inc.

### 46.10.52 SPI Interrupt Disable Register

**Name:** FLEX_SPI_IDR
**Offset:** 0x418
**Reset:** –
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the SPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W | W | W | W | W | W | W | W |

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Disable

**Bit 29 – RXFTHF** RXFTHF Interrupt Disable

**Bit 28 – RXFFF** RXFFF Interrupt Disable

**Bit 27 – RXFEF** RXFEF Interrupt Disable

**Bit 26 – TXFTHF** TXFTHF Interrupt Disable

**Bit 25 – TXFFF** TXFFF Interrupt Disable

**Bit 24 – TXFEF** TXFEF Interrupt Disable

**Bit 11 – CMP** Comparison Interrupt Disable

**Bit 10 – UNDES** Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** Transmission Registers Empty Disable

**Bit 8 – NSSR** NSS Rising Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – MODF** Mode Fault Error Interrupt Disable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 46.10.53 SPI Interrupt Mask Register

**Name:** FLEX_SPI_IMR
**Offset:** 0x41C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Mask

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Mask

**Bit 29 – RXFTHF** RXFTHF Interrupt Mask

**Bit 28 – RXFFF** RXFFF Interrupt Mask

**Bit 27 – RXFEF** RXFEF Interrupt Mask

**Bit 26 – TXFTHF** TXFTHF Interrupt Mask

**Bit 25 – TXFFF** TXFFF Interrupt Mask

**Bit 24 – TXFEF** TXFEF Interrupt Mask

**Bit 11 – CMP** Comparison Interrupt Mask

**Bit 10 – UNDES** Underrun Error Interrupt Mask

**Bit 9 – TXEMPTY** Transmission Registers Empty Mask

**Bit 8 – NSSR** NSS Rising Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – MODF** Mode Fault Error Interrupt Mask

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 46.10.54 SPI Chip Select Register

**Name:** FLEX_SPI_CSRx
**Offset:** 0x0430 + x*0x04 [x=0..1]
**Reset:** 0x00000000
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

FLEX_SPI_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DLYBCT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DLYBCT[7:0]** Delay Between Consecutive Transfers
This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If FLEX_SPI_MR.BRSRCCLK = 0: DLYBCT = Delay Between Consecutive Transfers × $f_{peripheral\ clock}$ / 32

If FLEX_SPI_MR.BRSRCCLK = 1: DLYBCT = Delay Between Consecutive Transfers × $f_{GCLK}$ / 32

**Bits 23:16 – DLYBS[7:0]** Delay Before SPCK
This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If FLEX_SPI_MR.BRSRCCLK = 0: DLYBS = Delay Before SPCK × $f_{peripheral\ clock}$

If FLEX_SPI_MR.BRSRCCLK = 1: DLYBS = Delay Before SPCK × $f_{GCLK}$

**Bits 15:8 – SCBR[7:0]** Serial Clock Bit Rate
In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BRSRCCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If FLEX_SPI_MR.BRSRCCLK = 0: SCBR = $f_{peripheral\ clock}$ / SPCK Bit Rate

If FLEX_SPI_MR.BRSRCCLK = 1: SCBR = $f_{GCLK}$ / SPCK Bit Rate

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in FLEX_SPI_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the FLEX_SPI_CSRx.SCBR fields is set to 1, the other FLEX_SPI_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

**Bits 7:4 – BITS[3:0]** Bits Per Transfer
See Note.

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name | Description |
|---|---|---|
| 0 | 8_BIT | 8 bits for transfer |
| 1 | 9_BIT | 9 bits for transfer |
| 2 | 10_BIT | 10 bits for transfer |
| 3 | 11_BIT | 11 bits for transfer |
| 4 | 12_BIT | 12 bits for transfer |
| 5 | 13_BIT | 13 bits for transfer |
| 6 | 14_BIT | 14 bits for transfer |
| 7 | 15_BIT | 15 bits for transfer |
| 8 | 16_BIT | 16 bits for transfer |
| 9–15 | Reserved | |

**Bit 3 – CSAAT** Chip Select Active After Transfer

| Value | Description |
|---|---|
| 0 | The Peripheral Chip Select Line rises as soon as the last transfer is achieved. |
| 1 | The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

**Bit 2 – CSNAAT** Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

If FLEX_SPI_MR.BRSRCCLK = 0: $\frac{DLYBCS}{f_{peripheral\ clock}}$ (if DLYBCS ≠ 0)

If FLEX_SPI_MR.BRSRCCLK = 1: $\frac{DLYBCS}{f_{GCLK}}$

If DLYBCS < 6, a minimum of six periods is introduced.

| Value | Description |
|---|---|
| 0 | The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select. |
| 1 | The Peripheral Chip Select rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of: |

**Bit 1 – NCPHA** Clock Phase
NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description |
|---|---|
| 0 | Data are changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1 | Data are captured on the leading edge of SPCK and changed on the following edge of SPCK. |

**Bit 0 – CPOL** Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description |
|---|---|
| 0 | The inactive state value of SPCK is logic level zero. |
| 1 | The inactive state value of SPCK is logic level one. |

### 46.10.55 SPI FIFO Mode Register

**Name:** FLEX_SPI_FMR
**Offset:** 0x440
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RXRDYM[1:0] | | | | TXRDYM[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

**Bits 29:24 – RXFTHRES[5:0]** Receive FIFO Threshold

| Value | Description |
|---|---|
| 0-32 | Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

**Bits 21:16 – TXFTHRES[5:0]** Transmit FIFO Threshold

| Value | Description |
|---|---|
| 0-32 | Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

**Bits 5:4 – RXRDYM[1:0]** Receive Data Register Full Mode
If FIFOs are enabled, the FLEX_SPI_SR.RDRF flag behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO. |

| Value | Name | Description |
|---|---|---|
| 1 | TWO_DATA | RDRF will be at level ‘1’ when at least two unread data are in the Receive FIFO.<br>Cannot be used when FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1. |
| 2 | FOUR_DATA | RDRF will be at level ‘1’ when at least four unread data are in the Receive FIFO.<br>Cannot be used when FLEX_SPI_CSRx.BITS is greater than 0, or if FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1. |

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode
If FIFOs are enabled, the FLEX_SPI_SR.TDRE flag behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | TDRE will be at level ‘1’ when at least one data can be written in the Transmit FIFO. |
| 1 | TWO_DATA | TDRE will be at level ‘1’ when at least two data can be written in the Transmit FIFO.<br>Cannot be used if FLEX_SPI_MR.PS =1. |

### 46.10.56 SPI FIFO Level Register

**Name:** FLEX_SPI_FLR
**Offset:** 0x444
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFL[5:0] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFL[5:0] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 21:16 – RXFL[5:0]** Receive FIFO Level

| Value | Description |
|---|---|
| 0 | There is no unread data in the Receive FIFO. |
| 1-32 | Indicates the number of unread data in the Receive FIFO. |

**Bits 5:0 – TXFL[5:0]** Transmit FIFO Level

| Value | Description |
|---|---|
| 0 | There is no data in the Transmit FIFO. |
| 1-32 | Indicates the number of data in the Transmit FIFO. |

### 46.10.57 SPI Comparison Register

**Name:** FLEX_SPI_CMPR
**Offset:** 0x448
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VAL2[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VAL2[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | VAL1[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VAL1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – VAL2[15:0]** Second Comparison Value for Received Character

| Value | Description |
|---|---|
| 0-65535 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met. |

**Bits 15:0 – VAL1[15:0]** First Comparison Value for Received Character

| Value | Description |
|---|---|
| 0-65535 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met. |

### 46.10.58 SPI Write Protection Mode Register

**Name:** FLEX_SPI_WPMR
**Offset:** 0x4E4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |

|---|---|---|---|---|---|---|---|---|
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | WPCREN | WPITEN | WPEN |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.<br>Always reads as 0. |

**Bit 2 – WPCREN** Write Protection Control Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1 | Enables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |

**Bit 1 – WPITEN** Write Protection Interrupt Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1 | Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |

**Bit 0 – WPEN** Write Protection Enable
See 46.8.8 SPI Register Write Protection for the list of registers that can be write-protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |

### 46.10.59 SPI Write Protection Status Register

**Name:** FLEX_SPI_WPSR
**Offset:** 0x4E8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 15:8 – WPVSRC[7:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protect violation has occurred since the last read of FLEX_SPI_WPSR. |
| 1 | A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

### 46.10.60 TWI Control Register

**Name:** FLEX_TWI_CR
**Offset:** 0x600
**Reset:** –
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the TWI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| | SWRST | QUICK | SVDIS | SVEN | MSDIS | MSEN | STOP | START |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 29 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable the Transmit and Receive FIFOs |

**Bit 28 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable the Transmit and Receive FIFOs |

**Bit 26 – LOCKCLR** Lock Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clear the TWI FSM lock. |

**Bit 24 – THRCLR** Transmit Holding Register Clear

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Clear the Transmit Holding Register and set TXRDY, TXCOMP flags. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, send a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode disabled. |

**Bit 8 – HSEN** TWI High-Speed Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, an SMBus Quick Command is sent. |

**Bit 5 – SVDIS** TWI Slave Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN** TWI Slave Mode Enabled
Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS** TWI Master Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN** TWI Master Mode Enabled
Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Master mode (MSDIS must be written to 0). |

**Bit 1 – STOP** Send a STOP Condition

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | STOP condition is sent just after completing the current byte transmission in Master Read mode.<br>– In single data byte master read, both START and STOP must be set.<br>– In multiple data bytes master read, the STOP must be set after the last data received but one.<br>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.<br>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished. |

**Bit 0 – START** Send a START Condition
This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX_TWI_THR).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

### 46.10.61 TWI Control Register (FIFO_ENABLED)

**Name:** FLEX_TWI_CR (FIFO_ENABLED)
**Offset:** 0x600
**Reset:** –
**Property:** Write-only

If FIFO is enabled (FLEX_US_CR.FIFOEN bit), see 46.9.6.8 TWI Multiple Data Mode for details.

This register can only be written if the WPCREN bit is cleared in the TWI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | FIFODIS | FIFOEN | | TXFLCLR | RXFCLR | TXFCLR |
| Access | | | W | W | | W | W | W |
| Reset | | | – | – | | – | – | – |
| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | | | | | | | ACMDIS | ACMEN |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| | CLEAR | PECRQ | PECDIS | PECEN | SMBDIS | SMBEN | HSDIS | HSEN |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SWRST | QUICK | SVDIS | SVEN | MSDIS | MSEN | STOP | START |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 29 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable the Transmit and Receive FIFOs. |

**Bit 28 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable the Transmit and Receive FIFOs. |

**Bit 26 – TXFLCLR** Transmit FIFO Lock CLEAR

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clears the Transmit FIFO Lock. |

**Bit 25 – RXFCLR** Receive FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Receive FIFO. |

**Bit 24 – TXFCLR** Transmit FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Transmit FIFO. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, send a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode disabled. |

**Bit 8 – HSEN** TWI High-Speed Mode Enabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | If Master mode is enabled, a SMBus Quick Command is sent. |

**Bit 5 – SVDIS** TWI Slave Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN** TWI Slave Mode Enabled
Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS** TWI Master Mode Disabled

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN** TWI Master Mode Enabled
Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Master mode (MSDIS must be written to 0). |

**Bit 1 – STOP** Send a STOP Condition

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | STOP condition is sent just after completing the current byte transmission in Master Read mode.<br>– In single data byte master read, both START and STOP must be set.<br>– In multiple data bytes master read, the STOP must be set after the last data received but one.<br>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.<br>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished. |

**Bit 0 – START** Send a START Condition
This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX_TWI_THR).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

### 46.10.62 TWI Master Mode Register

**Bit 24 – NOAP** No Auto-Stop On NACK Error

| Value | Description |
|---|---|
| 0 | A stop condition is sent automatically upon Not-Acknowledge error detection. |
| 1 | No automatic action is performed upon Not-Acknowledge error detection. |

**Bits 22:16 – DADR[6:0]** Device Address
The device address is used to access slave devices in Read or Write mode. Those bits are only used in Master mode.

**Bit 12 – MREAD** Master Read Direction

| Value | Description |
|---|---|
| 0 | Master write direction. |
| 1 | Master read direction. |

**Bits 9:8 – IADRSZ[1:0]** Internal Device Address Size

| Value | Name | Description |
|---|---|---|
| 0 | NONE | No internal device address |
| 1 | 1_BYTE | One-byte internal device address |
| 2 | 2_BYTE | Two-byte internal device address |

| Value | Name | Description |
|---|---|---|
| 3 | 3_BYTE | Three-byte internal device address |

### 46.10.63 TWI Slave Mode Register

**Name:** FLEX_TWI_SMR
**Offset:** 0x608
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | | R/W | | R/W | R/W | R/W | | R/W |
| Reset | | 0 | | 0 | 0 | 0 | | 0 |

**Bit 31 – DATAMEN** Data Matching Enable

| Value | Description |
|---|---|
| 0 | Data matching on first received data is disabled. |
| 1 | Data matching on first received data is enabled. |

**Bit 30 – SADR3EN** Slave Address 3 Enable

| Value | Description |
|---|---|
| 0 | Slave address 3 matching is disabled. |
| 1 | Slave address 3 matching is enabled. |

**Bit 29 – SADR2EN** Slave Address 2 Enable

| Value | Description |
|---|---|
| 0 | Slave address 2 matching is disabled. |
| 1 | Slave address 2 matching is enabled. |

**Bit 28 – SADR1EN** Slave Address 1 Enable

| Value | Description |
|---|---|
| 0 | Slave address 1 matching is disabled. |

| Value | Description |
|---|---|
| 1 | Slave address 1 matching is enabled. |

**Bits 22:16 – SADR[6:0]** Slave Address
The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

**Bits 14:8 – MASK[6:0]** Slave Address Mask
A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.

If the MASK field is set to 0, no mask is applied to the SADR field.

**Bit 6 – SCLWSDIS** Clock Wait State Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Clock stretching disabled in Slave mode, OVRE and UNRE will indicate overrun and underrun. |

**Bit 4 – SADAT** Slave Address Treated as Data

| Value | Description |
|---|---|
| 0 | Slave address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception). |
| 1 | Slave address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon slave address reception. |

**Bit 3 – SMHH** SMBus Host Header

| Value | Description |
|---|---|
| 0 | Acknowledge of the SMBus Host Header disabled. |
| 1 | Acknowledge of the SMBus Host Header enabled. |

**Bit 2 – SMDA** SMBus Default Address

| Value | Description |
|---|---|
| 0 | Acknowledge of the SMBus Default Address disabled. |
| 1 | Acknowledge of the SMBus Default Address enabled. |

**Bit 0 – NACKEN** Slave Receiver Data Phase NACK Enable

| Value | Description |
|---|---|
| 0 | Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |
| 1 | NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |

### 46.10.64 TWI Internal Address Register

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CLDIV[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 29:24 – HOLD[5:0]** TWD Hold Time Versus TWCK Falling
If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the $I^2C$ specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of (HOLD + 3) × $t_{peripheral\ clock}$.

**Bit 20 – BRSRCCLK** Bit Rate Source Clock

| Value | Name | Description |
|---|---|---|
| 0 | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation. |
| 1 | GCLK | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

**Bits 18:16 – CKDIV[2:0]** Clock Divider
The CKDIV is used to increase both SCL high and low periods.

**Bits 15:8 – CHDIV[7:0]** Clock High Divider
The SCL high period is defined as follows:

If BRSRCCLK = 0: CHDIV = $((t_{high} / t_{peripheral\ clock}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1: CHDIV = $(t_{high} / t_{ext_ck}) / 2^{CKDIV}$

**Bits 7:0 – CLDIV[7:0]** Clock Low Divider
The SCL low period is defined as follows:

If BRSRCCLK = 0: CLDIV = $((t_{low} / t_{peripheral\ clock}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1: CLDIV = $(t_{low} / t_{ext_ck}) / 2^{CKDIV}$

### 46.10.66 TWI Status Register

**Name:** FLEX_TWI_SR
**Offset:** 0x620
**Reset:** 0x0300F009
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |

**Bit 26 – SR** Start Repeated

| Value | Description |
|---|---|
| 0 | No repeated start has been detected since last FLEX_TWI_SR read. |
| 1 | At least one repeated start has been detected since last FLEX_TWI_SR read. |

**Bit 25 – SDA** SDA Line Value

| Value | Description |
|---|---|
| 0 | SDA line sampled value is ‘0’. |
| 1 | SDA line sampled value is ‘1’. |

**Bit 24 – SCL** SCL Line Value

| Value | Description |
|---|---|
| 0 | SCL line sampled value is ‘0’. |
| 1 | SCL line sampled value is ‘1.’ |

**Bit 23 – LOCK** TWI Lock Due to Frame Errors

| Value | Description |
|---|---|
| 0 | The TWI is not locked. |

| Value | Description |
|---|---|
| 1 | The TWI is locked due to frame errors (see 46.9.3.12 Handling Errors in Alternative Command and 46.9.6 TWI FIFOs). |

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Host Header Address received. |
| 1 | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Default Address received. |
| 1 | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus PEC error occurred. |
| 1 | A SMBus PEC error occurred. |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus timeout occurred. |
| 1 | SMBus timeout occurred. |

**Bit 16 – MCACK** Master Code Acknowledge (cleared on read)
MACK used in Slave mode:

| Value | Description |
|---|---|
| 0 | No master code has been received. |
| 1 | A master code has been received. |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)
This bit is only used in Slave mode.

EOSACC behavior can be seen in figures Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | A slave access is being performing. |
| 1 | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State
This bit is only used in Slave mode.

SCLWS behavior can be seen in figures Clock Stretching in Read Mode and Clock Stretching in Write Mode.

| Value | Description |
|---|---|
| 0 | The clock is not stretched. |
| 1 | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)
This bit is only used in Master mode.

| Value | Description |
|---|---|
| 0 | Arbitration won. |
| 1 | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)
NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill FLEX_TWI_THR even if TXRDY is set, because it means that the master will stop the data transfer or reinitiate it..

Note that in Slave Write mode, all data are acknowledged by the TWI.

**Bit 7 – UNRE** Underrun Error (cleared on read)
This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | FLEX_TWI_THR has been filled on time. |
| 1 | FLEX_TWI_THR has not been filled on time. |

**Bit 6 – OVRE** Overrun Error (cleared on read)
This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | FLEX_TWI_RHR has not been loaded while RXRDY was set. |
| 1 | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

**Bit 5 – GACC** General Call Access (cleared on read)
This bit is only used in Slave mode.

GACC behavior can be seen in figure Master Performs a General Call.

| Value | Description |
|---|---|
| 0 | No general call has been detected. |

| Value | Description |
|---|---|
| 1 | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

**Bit 4 – SVACC** Slave Access
This bit is only used in Slave mode.

SVACC behavior can be seen in figures Read Access Ordered by a Master, Write Access Ordered by a Master, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected. |
| 1 | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

**Bit 3 – SVREAD** Slave Read
This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures Read Access Ordered by a Master, Write Access Ordered by a Master, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | Indicates that a write access is performed by a master. |
| 1 | Indicates that a read access is performed by a master. |

**Bit 2 – TXRDY** Transmit Holding Register Ready (cleared by writing FLEX_TWI_THR)
TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX_TWI_THR.

1: As soon as a data byte is transferred from FLEX_TWI_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures Master Write with One Data Byte,Master Write with Multiple Data Bytes and Master Write with One Byte Internal Address and Multiple Data Bytes.

TXRDY used in Slave mode:

0: As soon as data is written in FLEX_TWI_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX_TWI_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX_TWI_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures Read Access Ordered by a Master, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in TXRDY and RXRDY Behavior.

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX_TWI_RHR)
When FIFOs are disabled:

0: No character has been received since the last FLEX_TWI_RHR read operation.

1: A byte has been received in FLEX_TWI_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure Master Read with Multiple Data Bytes.

RXRDY behavior in Slave mode can be seen in figures Write Access Ordered by a Master, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in TXRDY and RXRDY Behavior.

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX_TWI_THR)
TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both the holding register and the internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures Master Write with One Byte Internal Address and Multiple Data Bytes and Master Read with Multiple Data Bytes.

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

### 46.10.67 TWI Status Register (FIFO ENABLED)

**Name:** FLEX_TWI_SR (FIFO_ENABLED)
**Offset:** 0x620
**Reset:** 0x0300F009
**Property:** Read-only

If FIFO is enabled (FLEX_US_CR.FIFOEN bit), see TWI Multiple Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 26 – SR** Start Repeated

| Value | Description |
|---|---|
| 0 | No repeated start has been detected since last FLEX_TWI_SR read. |
| 1 | At least one repeated start has been detected since last FLEX_TWI_SR read. |

**Bit 25 – SDA** SDA Line Value

| Value | Description |
|---|---|
| 0 | SDA line sampled value is ‘0’. |
| 1 | SDA line sampled value is ‘1’. |

**Bit 24 – SCL** SCL Line Value

| Value | Description |
|---|---|
| 0 | SCL line sampled value is ‘0’. |
| 1 | SCL line sampled value is ‘1.’ |

**Bit 23 – TXFLOCK** Transmit FIFO Lock

| Value | Description |
|---|---|
| 0 | The Transmit FIFO is not locked. |

| Value | Description |
|---|---|
| 1 | The Transmit FIFO is locked. |

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Host Header Address received. |
| 1 | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus Default Address received. |
| 1 | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus PEC error occurred. |
| 1 | A SMBus PEC error occurred. |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No SMBus timeout occurred. |
| 1 | SMBus timeout occurred. |

**Bit 16 – MCACK** Master Code Acknowledge (cleared on read)
MACK used in Slave mode:

| Value | Description |
|---|---|
| 0 | No master code has been received. |
| 1 | A master code has been received. |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)
This bit is only used in Slave mode.

EOSACC behavior can be seen in figures Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | A Slave Access is being performed. |
| 1 | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State
This bit is only used in Slave mode.

SCLWS behavior can be seen in figures Clock Stretching in Read Mode and Clock Stretching in Write Mode.

| Value | Description |
|---|---|
| 0 | The clock is not stretched. |

| Value | Description |
|---|---|
| 1 | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)
This bit is only used in Master mode.

| Value | Description |
|---|---|
| 0 | Arbitration won. |
| 1 | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)
NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set the user must not fill FLEX_TWI_THR even if TXRDY is set, because it means that the master will stop the data transfer or re initiate it.

Note that in Slave Write mode all data are acknowledged by the TWI.

**Bit 7 – UNRE** Underrun Error (cleared on read)
This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | FLEX_TWI_THR has been filled on time. |
| 1 | FLEX_TWI_THR has not been filled on time. |

**Bit 6 – OVRE** Overrun Error (cleared on read)
This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description |
|---|---|
| 0 | FLEX_TWI_RHR has not been loaded while RXRDY was set. |
| 1 | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

**Bit 5 – GACC** General Call Access (cleared on read)
This bit is only used in Slave mode.

GACC behavior can be seen in figure Master Performs a General Call.

| Value | Description |
|---|---|
| 0 | No general call has been detected. |
| 1 | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

**Bit 4 – SVACC** Slave Access
This bit is only used in Slave mode.

SVACC behavior can be seen in figures Read Access Ordered by a Master, Write Access Ordered by a Master, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected. |
| 1 | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

**Bit 3 – SVREAD** Slave Read
This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures Read Access Ordered by a Master, Write Access Ordered by a Master, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

| Value | Description |
|---|---|
| 0 | Indicates that a write access is performed by a master. |
| 1 | Indicates that a read access is performed by a master. |

**Bit 2 – TXRDY** Transmit Holding Register Ready (cleared by writing FLEX_TWI_THR)
TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX_TWI_THR.

1: As soon as a data byte is transferred from FLEX_TWI_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures Master Write with One Data Byte,Master Write with Multiple Data Bytes and Master Write with One Byte Internal Address and Multiple Data Bytes.

TXRDY used in Slave mode:

0: As soon as data is written in FLEX_TWI_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX_TWI_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX_TWI_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures Read Access Ordered by a Master, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in TXRDY and RXRDY Behavior.

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX_TWI_RHR)
When FIFOs are disabled:

0: No character has been received since the last FLEX_TWI_RHR read operation.

1: A byte has been received in FLEX_TWI_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure Master Read with Multiple Data Bytes.

RXRDY behavior in Slave mode can be seen in figures Write Access Ordered by a Master, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in TXRDY and RXRDY Behavior.

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX_TWI_THR)
TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures Master Write with One Byte Internal Address and Multiple Data Bytes and Master Read with Multiple Data Bytes.

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

### 46.10.68 TWI Interrupt Enable Register

**Name:** FLEX_TWI_IER
**Offset:** 0x624
**Reset:** –
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the TWI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | SMBHHM | SMBDAM | PECERR | TOUT | | MCACK |
| Access | | | W | W | W | W | | W |
| Reset | | | – | – | – | – | | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TXBUFE | RXBUFF | ENDTX | ENDRX | EOSACC | SCL_WS | ARBLST | NACK |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNRE | OVRE | GACC | SVACC | | TXRDY | RXRDY | TXCOMP |
| Access | W | W | W | W | | W | W | W |
| Reset | – | – | – | – | | – | – | – |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Enable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Enable

**Bit 19 – PECERR** PEC Error Interrupt Enable

**Bit 18 – TOUT** Timeout Error Interrupt Enable

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Enable

**Bit 15 – TXBUFE** Transmit Buffer Empty Interrupt Enable

**Bit 14 – RXBUFF** Receive Buffer Full Interrupt Enable

**Bit 13 – ENDTX** End of Transmit Buffer Interrupt Enable

**Bit 12 – ENDRX** End of Receive Buffer Interrupt Enable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Enable

**Bit 10 – SCL_WS** Clock Wait State Interrupt Enable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Enable

**Bit 8 – NACK** Not Acknowledge Interrupt Enable

**Bit 7 – UNRE** Underrun Error Interrupt Enable

**Bit 6 – OVRE** Overrun Error Interrupt Enable

**Bit 5 – GACC** General Call Access Interrupt Enable

**Bit 4 – SVACC** Slave Access Interrupt Enable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Enable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Enable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Enable

### 46.10.69 TWI Interrupt Disable Register

**Name:** FLEX_TWI_IDR
**Offset:** 0x628
**Reset:** –
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the TWI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | SMBHHM | SMBDAM | PECERR | TOUT | | MCACK |
| Access | | | W | W | W | W | | W |
| Reset | | | – | – | – | – | | – |

|---|---|---|---|---|---|---|---|---|
| | TXBUFE | RXBUFF | ENDTX | ENDRX | EOSACC | SCL_WS | ARBLST | NACK |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNRE | OVRE | GACC | SVACC | | TXRDY | RXRDY | TXCOMP |
| Access | W | W | W | W | | W | W | W |
| Reset | – | – | – | – | | – | – | – |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Disable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Disable

**Bit 19 – PECERR** PEC Error Interrupt Disable

**Bit 18 – TOUT** Timeout Error Interrupt Disable

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Disable

**Bit 15 – TXBUFE** Transmit Buffer Empty Interrupt Disable

**Bit 14 – RXBUFF** Receive Buffer Full Interrupt Disable

**Bit 13 – ENDTX** End of Transmit Buffer Interrupt Disable

**Bit 12 – ENDRX** End of Receive Buffer Interrupt Disable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Disable

**Bit 10 – SCL_WS** Clock Wait State Interrupt Disable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Disable

**Bit 8 – NACK** Not Acknowledge Interrupt Disable

**Bit 7 – UNRE** Underrun Error Interrupt Disable

**Bit 6 – OVRE** Overrun Error Interrupt Disable

**Bit 5 – GACC** General Call Access Interrupt Disable

**Bit 4 – SVACC** Slave Access Interrupt Disable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Disable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Disable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Disable

### 46.10.70 TWI Interrupt Mask Register

**Name:** FLEX_TWI_IMR
**Offset:** 0x62C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | SMBHHM | SMBDAM | PECERR | TOUT | | MCACK |
| Access | | | R | R | R | R | | R |
| Reset | | | 0 | 0 | 0 | 0 | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TXBUFE | RXBUFF | ENDTX | ENDRX | EOSACC | SCL_WS | ARBLST | NACK |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UNRE | OVRE | GACC | SVACC | | TXRDY | RXRDY | TXCOMP |
| Access | R | R | R | R | | R | R | R |
| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Mask

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Mask

**Bit 19 – PECERR** PEC Error Interrupt Mask

**Bit 18 – TOUT** Timeout Error Interrupt Mask

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Mask

**Bit 15 – TXBUFE** Transmit Buffer Empty Interrupt Mask

**Bit 14 – RXBUFF** Receive Buffer Full Interrupt Mask

**Bit 13 – ENDTX** End of Transmit Buffer Interrupt Mask

**Bit 12 – ENDRX** End of Receive Buffer Interrupt Mask

**Bit 11 – EOSACC** End Of Slave Access Interrupt Mask

**Bit 10 – SCL_WS** Clock Wait State Interrupt Mask

**Bit 9 – ARBLST** Arbitration Lost Interrupt Mask

**Bit 8 – NACK** Not Acknowledge Interrupt Mask

**Bit 7 – UNRE** Underrun Error Interrupt Mask

**Bit 6 – OVRE** Overrun Error Interrupt Mask

**Bit 5 – GACC** General Call Access Interrupt Mask

**Bit 4 – SVACC** Slave Access Interrupt Mask

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Mask

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Mask

**Bit 0 – TXCOMP** Transmission Completed Interrupt Mask

### 46.10.71 TWI Receive Holding Register

**Name:** FLEX_TWI_RHR
**Offset:** 0x630
**Reset:** 0x00000000
**Property:** Read-only

If FIFO is enabled (FLEX_TWI_CR.FIFOEN bit) and FLEX_TWI_FMR.RXRDYM = 0, see TWI Single Data Mode for details.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TLOWS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PRESC[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 31:24 – THMAX[7:0]** Clock High Maximum Cycles
Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

**Bits 23:16 – TLOWM[7:0]** Master Clock Stretch Maximum Cycles

| Value | Description |
|---|---|
| 0 | TLOW:MEXT timeout check disabled. |
| 1-255 | Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT. |

**Bits 15:8 – TLOWS[7:0]** Slave Clock Stretch Maximum Cycles

| Value | Description |
|---|---|
| 0 | TLOW:SEXT timeout check disabled. |
| 1-255 | Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT. |

**Bits 3:0 – PRESC[3:0]** SMBus Clock Prescaler
Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula: PRESC = Log(fMCK / $f_{Prescaled}$) / Log(2) - 1

### 46.10.76 TWI Alternative Command Register

**Name:** FLEX_TWI_ACR
**Offset:** 0x640
**Reset:** 0x00000000
**Property:** Read/Write

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 25 – NPEC** Next PEC Request (SMBus Mode only)

| Value | Description |
|---|---|
| 0 | The next transfer does not use a PEC byte. |
| 1 | The next transfer uses a PEC byte. |

**Bit 24 – NDIR** Next Transfer Direction

| Value | Description |
|---|---|
| 0 | Write direction. |
| 1 | Read direction. |

**Bits 23:16 – NDATAL[7:0]** Next Data Length

| Value | Description |
|---|---|
| 0 | No data to send (see 46.9.3.11 Alternative Command). |
| 1-255 | Number of bytes to send for the next transfer. |

**Bit 9 – PEC** PEC Request (SMBus Mode only)

| Value | Description |
|---|---|
| 0 | The transfer does not use a PEC byte. |
| 1 | The transfer uses a PEC byte. |

**Bit 8 – DIR** Transfer Direction

| Value | Description |
|---|---|
| 0 | Write direction. |
| 1 | Read direction. |

**Bits 7:0 – DATAL[7:0]** Data Length

| Value | Description |
|---|---|
| 0 | No data to send (see 46.9.3.11 Alternative Command). |
| 1-255 | Number of bytes to send during the transfer. |

### 46.10.77 TWI Filter Register

**Name:** FLEX_TWI_FILTR
**Offset:** 0x644
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | | | PADFCFG | PADFEN | FILT |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 10:8 – THRES[2:0]** Digital Filter Threshold

| Value | Description |
|---|---|
| 0 | No filtering applied on TWI inputs. |
| 1-7 | Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles. |

**Bit 2 – PADFCFG** PAD Filter Config
Refer to the section “Electrical Characteristics” for filter configuration details.

**Bit 1 – PADFEN** PAD Filter Enable

| Value | Description |
|---|---|
| 0 | PAD analog filter is disabled. |
| 1 | PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.) |

**Bit 0 – FILT** RX Digital Filter
TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

| Value | Description |
|---|---|
| 0 | No filtering applied on TWI inputs. |
| 1 | TWI input filtering is active. (Only in Standard and Fast modes) |

### 46.10.78 TWI SleepWalking Matching Register

**Name:** FLEX_TWI_SWMR
**Offset:** 0x64C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DATAM[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | SADR3[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | SADR2[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | SADR1[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DATAM[7:0]** Data Match
The TWI module will extend the SleepWalking matching process to the first received data comparing it with DATAM if DATAMEN bit is enabled.

**Bits 22:16 – SADR3[6:0]** Slave Address 3
Slave address 3. The TWI module will match on this additional address if SADR3EN bit is enabled.

**Bits 14:8 – SADR2[6:0]** Slave Address 2
Slave address 2. The TWI module will match on this additional address if SADR2EN bit is enabled.

**Bits 6:0 – SADR1[6:0]** Slave Address 1
Slave address 1. The TWI module will match on this additional address if SADR1EN bit is enabled.

### 46.10.79 TWI FIFO Mode Register

**Name:** FLEX_TWI_FMR
**Offset:** 0x650
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RXRDYM[1:0] | | | | TXRDYM[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

**Bits 29:24 – RXFTHRES[5:0]** Receive FIFO Threshold

| Value | Description |
|---|---|
| 0-16 | Defines the Receive FIFO threshold value (number of data). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

**Bits 21:16 – TXFTHRES[5:0]** Transmit FIFO Threshold

| Value | Description |
|---|---|
| 0-16 | Defines the Transmit FIFO threshold value (number of data). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

**Bits 5:4 – RXRDYM[1:0]** Receiver Ready Mode
If FIFOs are enabled, the FLEX_TWI_SR.RXRDY flag behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO |

| Value | Name | Description |
|---|---|---|
| 1 | TWO_DATA | RXRDY will be at level ‘1’ when at least two unread data are in the Receive FIFO |
| 2 | FOUR_DATA | RXRDY will be at level ‘1’ when at least four unread data are in the Receive FIFO |

**Bits 1:0 – TXRDYM[1:0]** Transmitter Ready Mode
If FIFOs are enabled, the FLEX_TWI_SR.TXRDY flag behaves as follows.

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | TXRDY will be at level ‘1’ when at least one data can be written in the Transmit FIFO |
| 1 | TWO_DATA | TXRDY will be at level ‘1’ when at least two data can be written in the Transmit FIFO |
| 2 | FOUR_DATA | TXRDY will be at level ‘1’ when at least four data can be written in the Transmit FIFO |

### 46.10.80 TWI FIFO Level Register

**Name:** FLEX_TWI_FLR
**Offset:** 0x654
**Reset:** 0x00000000
**Property:** Read-only

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag
See 46.9.6.10 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Receive FIFO pointer occurred. |
| 1 | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag
See 46.9.6.10 FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Transmit FIFO pointer occurred. |
| 1 | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description |
|---|---|
| 0 | Number of unread data in Receive FIFO is below RXFTHRES threshold. |
| 1 | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 4 – RXFFF** Receive FIFO Full Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty. |
| 1 | Receive FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty. |
| 1 | Receive FIFO has been emptied since the last read of FLEX_TWI_FSR. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Number of data in Transmit FIFO is above TXFTHRES threshold. |
| 1 | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not full. |
| 1 | Transmit FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not empty. |
| 1 | Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR. |

### 46.10.82 TWI FIFO Interrupt Enable Register

**Name:** FLEX_TWI_FIER
**Offset:** 0x664
**Reset:** –
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the TWI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | | | | | 0 | 0 | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x545749 | PASSWD | Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.<br>Always reads as 0. |

**Bit 2 – WPCREN** Write Protection Control Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII). |
| 1 | Enables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII). |

**Bit 1 – WPITEN** Write Protection Interrupt Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII). |
| 1 | Enables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII). |

**Bit 0 – WPEN** Write Protection Enable
See TWI Register Write Protection for the list of registers that can be write-protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII). |

### 46.10.86 TWI Write Protection Status Register

**Name:** FLEX_TWI_WPSR
**Offset:** 0x6E8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[23:16] | | | | | | | |

| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPVSRC[23:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protect Violation Status

| Value | Description |
|---|---|
| 0 | No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. |
| 1 | A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 47. Universal Asynchronous Receiver Transmitter (UART)

## 47.1 Description

The Universal Asynchronous Receiver Transmitter (UART) features a two-pin UART that can be used for communication and trace purposes and offers an ideal medium for in-situ programming solutions.

Moreover, the association with a DMA controller permits packet handling for these tasks with processor time reduced to a minimum.

## 47.2 Embedded Characteristics

- Two-pin UART
  - Independent Receiver and Transmitter with a Common Programmable Baud Rate Generator
  - Baud Rate can be Driven by Processor-Independent Generic Source Clock
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Digital Filter on Receive Line
  - Interrupt Generation
  - Support for Two DMA Channels with Connection to Receiver and Transmitter
  - Supports Asynchronous Partial Wake-up on Receive Line Activity (SleepWalking)
  - Comparison Function on Received Character
  - Receiver Time-out
  - Register Write Protection

## 47.3 Block Diagram

**Figure 47-1. UART Block Diagram**

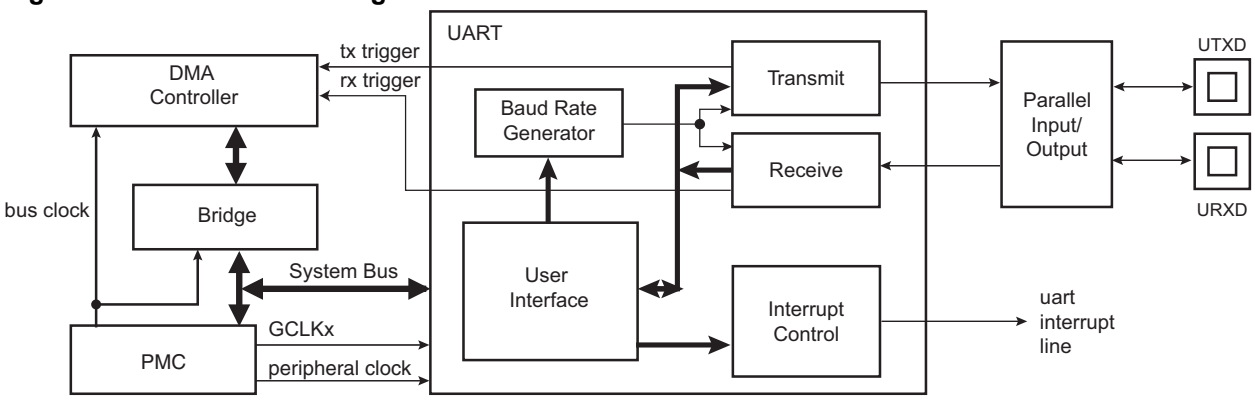

**Table 47-1. UART Pin Description**

| Pin Name | Description | Type |
|---|---|---|
| URXD | UART Receive Data | Input |
| UTXD | UART Trasnmit Data | Output |

## 47.4 Product Dependencies

### 47.4.1 I/O Lines

The UART pins are multiplexed with PIO lines. The user must first configure the corresponding PIO Controller to enable I/O line operations of the UART.

### 47.4.2 Power Management

The UART clock can be controlled through the Power Management Controller (PMC). In this case, the user must first configure the PMC to enable the UART clock. Usually, the peripheral identifier used for this purpose is 1.

In SleepWalking mode (asynchronous partial wake-up), the PMC must be configured to enable SleepWalking for the UART in the Sleepwalking Enable Register (PMC_SLPWK_ER). Depending on the instructions (requests) provided by the UART to the PMC, the system clock may or may not be automatically provided to the UART.

### 47.4.3 Interrupt Sources

The UART interrupt line is connected to one of the interrupt sources of the Interrupt Controller. Interrupt handling requires programming of the Interrupt Controller before configuring the UART.

## 47.5 Functional Description

The UART operates in Asynchronous mode only and supports only 8-bit character handling (with parity). It has no clock pin.

The UART is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

### 47.5.1 Baud Rate Generator

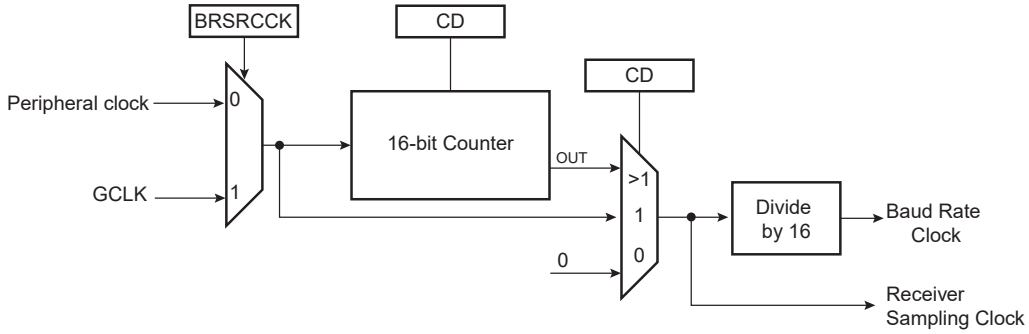
The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the clock divisor (CD) value written in the Baud Rate Generator register (UART_BRGR). If UART_BRGR is set to 0, the baud rate clock is disabled and the UART remains inactive. The maximum allowable baud rate is peripheral clock or GCLK divided by 16. The minimum allowable baud rate is peripheral clock divided by (16 x 65536). The clock source driving the baud rate generator (peripheral clock or GCLK) can be selected by writing the bit BRSRCCK in UART_MR.

If GCLK is selected, the baud rate is independent of the processor/bus clock. Thus the processor clock can be changed while UART is enabled. The processor clock frequency changes must be performed only by programming the field PRES in PMC_MCKR (refer to "Power Management Controller (PMC)"). Other methods to modify the processor/bus clock frequency (PLL multiplier, etc.) are forbidden when UART is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

**Figure 47-2. Baud Rate Generator**



### 47.5.2 Receiver

#### 47.5.2.1 Receiver Reset, Enable and Disable

After device reset, the UART receiver is disabled and must be enabled before being used. The receiver can be enabled by writing the Control Register (UART_CR) with the bit RXEN at 1. At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing UART_CR with the bit RXDIS at 1. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by writing UART_CR with the bit RSTRX at 1. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

#### 47.5.2.2 Start Detection and Data Sampling

The UART only supports asynchronous operations, and this affects only its receiver. The UART receiver detects the start of a received character by sampling the URXD signal until it detects a valid start bit. A low level (space) on URXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the URXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

**Figure 47-3. Start Bit Detection**

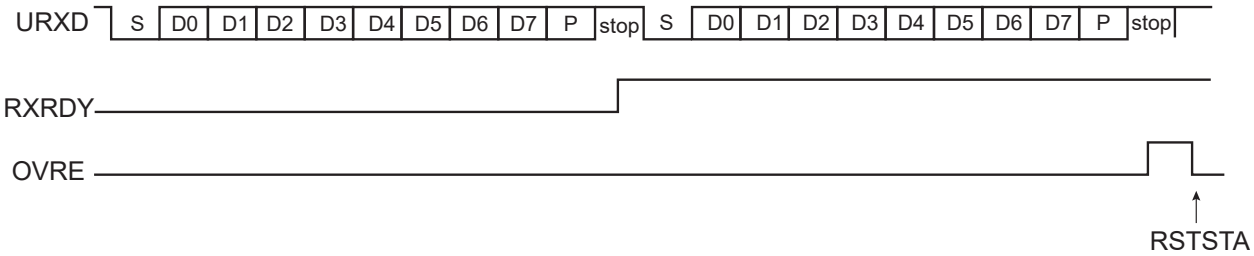


**Figure 47-4. Character Reception**

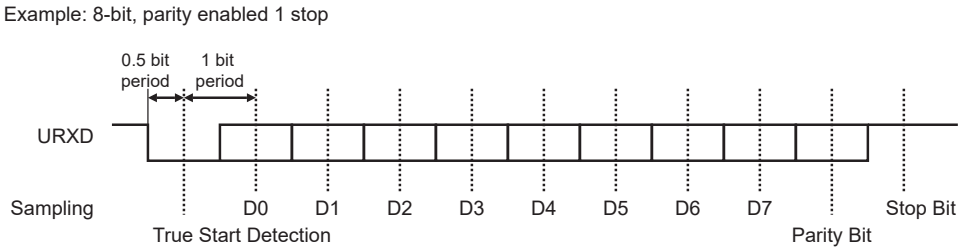
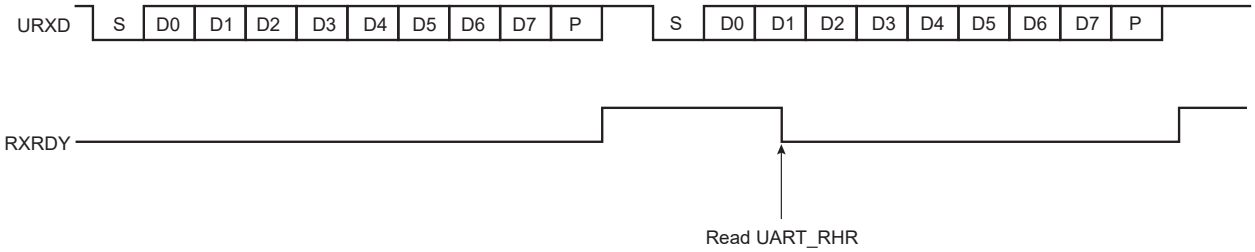


#### 47.5.2.3 Receiver Ready

When a complete character is received, it is transferred to the Receive Holding Register (UART_RHR) and the RXRDY status bit in the Status Register (UART_SR) is set. The bit RXRDY is automatically cleared when UART_RHR is read.

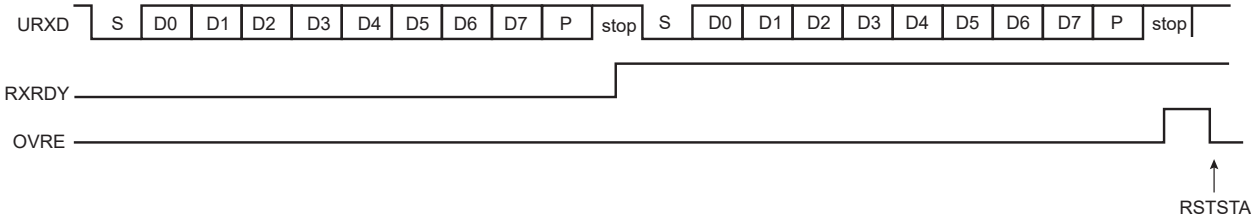
**Figure 47-5. Receiver Ready**



#### 47.5.2.4 Receiver Overrun

The OVRE status bit in UART_SR is set if UART_RHR has not been read by the software (or the DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received. OVRE is cleared when the software writes a 1 to the bit RSTSTA (Reset Status) in UART_CR.

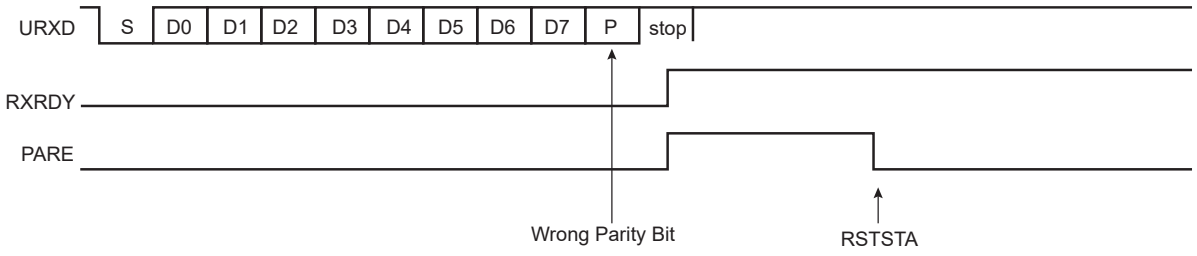
**Figure 47-6. Receiver Overrun**



#### 47.5.2.5 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode Register (UART_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in UART_SR is set at the same time RXRDY is set. The parity bit is cleared when UART_CR is written with the bit RSTSTA (Reset Status) at 1. If a new character is received before the reset status command is written, the PARE bit remains at 1.

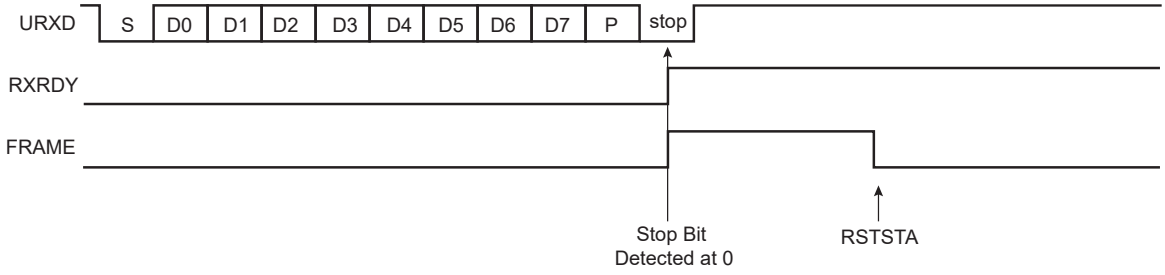
**Figure 47-7. Parity Error**



#### 47.5.2.6 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in UART_SR is set at the same time the RXRDY bit is set. The FRAME bit remains high until the Control Register (UART_CR) is written with the bit RSTSTA at 1.

**Figure 47-8. Receiver Framing Error**



#### 47.5.2.7 Receiver Digital Filter

The UART embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in the FILTER bit of UART_MR. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

#### 47.5.2.8 Receiver Time-out

The Receiver Time-out provides support in handling variable-length frames. This feature detects an idle condition on the URXD line. When a time-out is detected, the bit TIMEOUT in the UART_SR rises and can generate an interrupt, thus indicating to the driver an end of frame.

The time-out delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Time-out register (UART_RTOR). If the TO field is written to 0, the Receiver Time-out is disabled and no time-out is detected. The TIMEOUT bit in the UART_SR remains at 0. Otherwise, the receiver loads an 8-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit UART_SR rises. Then, the user can either:

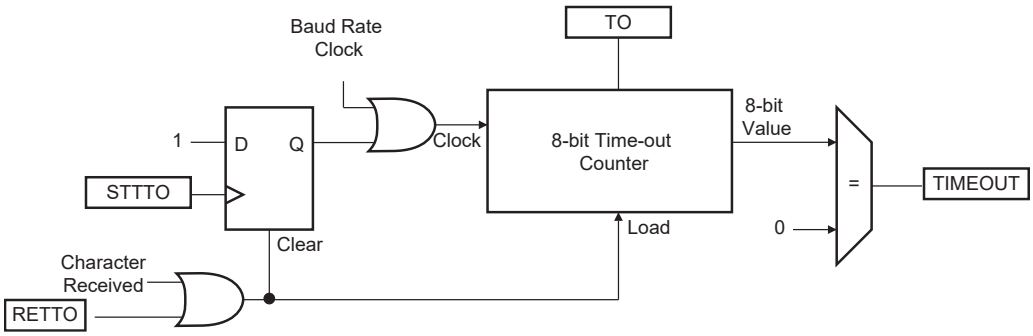
- stop the counter clock until a new character is received. This is performed by writing a one to the STTTO (start Time-out) bit in the UART_CR. In this case, the idle state on URXD before a new character is received does not provide a time-out. This prevents having to handle an interrupt before a character is received and allows waiting for the next idle state on URXD after a frame is received, or
- obtain an interrupt while no character is received. This is performed by writing a one to the RETTO (Reload and Start Time-out) bit in the UART_CR. If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

If STTTO is performed, the counter clock is stopped until a first character is received. The idle state on URXD before the start of the frame does not provide a time-out. This prevents having to obtain a periodic interrupt and enables a wait of the end of frame when the idle state on URXD is detected.

If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

The figure below shows the block diagram of the Receiver Time-out feature.

**Figure 47-9. Receiver Time-out Block Diagram**



The table below gives the maximum time-out period for some standard baud rates.

**Table 47-2. Maximum Time-out Period**

| Baud Rate (bit/s) | Bit Time (µs) | Time-out (µs) |
|---|---|---|
| 600 | 1,667 | 425,085 |
| 1,200 | 833 | 212,415 |
| 2,400 | 417 | 106,335 |
| 4,800 | 208 | 53,040 |
| 9,600 | 104 | 26,520 |
| 14,400 | 69 | 17,595 |
| 19,200 | 52 | 13,260 |
| 28,800 | 35 | 8,925 |
| 38,400 | 26 | 6,630 |
| 56,000 | 18 | 4,590 |
| 57,600 | 17 | 4,335 |
| 200,000 | 5 | 1,275 |

### 47.5.3 Transmitter

#### 47.5.3.1 Transmitter Reset, Enable and Disable

After device reset, the UART transmitter is disabled and must be enabled before being used. The transmitter is enabled by writing UART_CR with the bit TXEN at 1. From this command, the transmitter waits for a character to be written in the Transmit Holding Register (UART_THR) before actually starting the transmission.

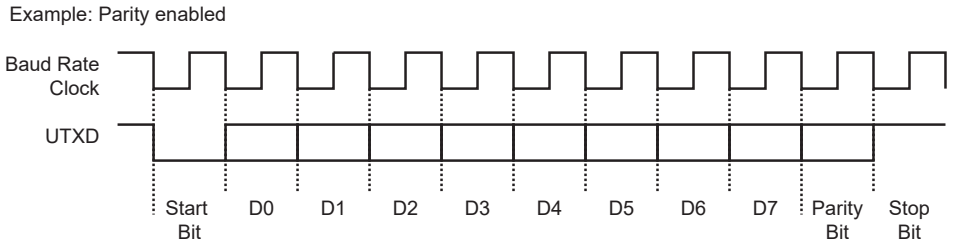
The programmer can disable the transmitter by writing UART_CR with the bit TXDIS at 1. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed into the internal shift register and/or a character has been written in the UART_THR, the characters are completed before the transmitter is actually stopped.

The programmer can also put the transmitter in its reset state by writing the UART_CR with the bit RSTTX at 1. This immediately stops the transmitter, whether or not it is processing characters.

#### 47.5.3.2 Transmit Format

The UART transmitter drives the pin UTXD at the baud rate clock speed. The line is driven depending on the format defined in UART_MR and the data stored in the internal shift register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown in the following figure. The field PARE in UART_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

**Figure 47-10. Character Transmission**

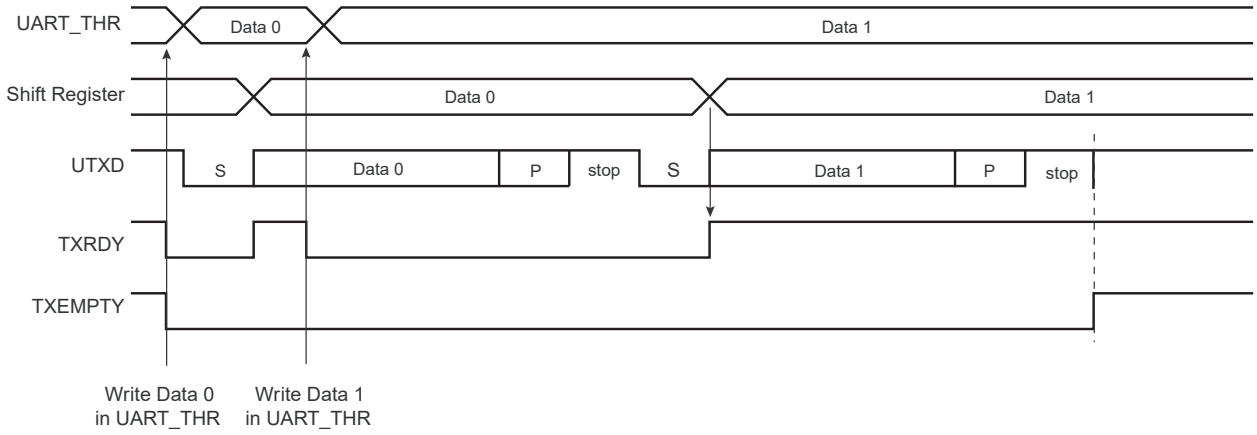


#### 47.5.3.3 Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in UART_SR. The transmission starts when the programmer writes in the UART_THR, and after the written character is transferred from UART_THR to the internal shift register. The TXRDY bit remains high until a second character is written in UART_THR. As soon as the first character is completed, the last character written in UART_THR is transferred into the internal shift register and TXRDY rises again, showing that the holding register is empty.

When both the internal shift register and UART_THR are empty, i.e., all the characters written in UART_THR have been processed, the TXEMPTY bit rises after the last stop bit has been completed.

**Figure 47-11. Transmitter Control**



### 47.5.4 DMA Support

Both the receiver and the transmitter of the UART are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

### 47.5.5 Comparison Function on Received Character

When a comparison is performed on a received character, the result of the comparison is reported on the CMP flag in UART_SR when UART_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to the RSTSTA bit in UART_CR.

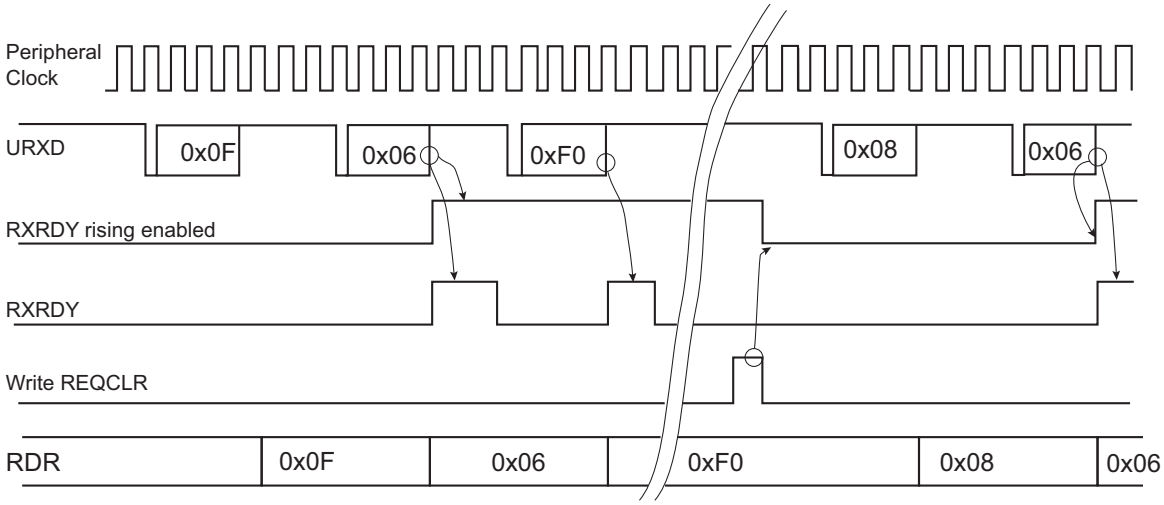
UART_CMPR (see UART Comparison Register) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if either received character equals VAL1 or VAL2.

By programming the CMPMODE bit to 1, the comparison function result triggers the start of the loading of UART_RHR (see the figure below). The trigger condition occurs as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in UART_CMPR. The comparison trigger event can be restarted by writing a one to the REQCLR bit in UART_CR.

**Figure 47-12. Receive Holding Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06



### 47.5.6 Asynchronous and Partial Wake-up (SleepWalking)

Asynchronous and partial wake-up (SleepWalking) is a means of data pre-processing that qualifies an incoming event, thus allowing the UART to decide whether or not to wake up the system. SleepWalking is used primarily when the system is in Wait mode (refer to section “Power Management Controller (PMC)”) but can also be enabled when the system is fully running.

No access must be performed in the UART between the enable of asynchronous partial wake-up and the wake-up performed by the UART.

If the system is in Wait mode and asynchronous and partial wake-up is enabled, the maximum baud rate that can be achieved equals 19200.

If the system is running or in Sleep mode, the maximum baud rate that can be achieved equals 115200 or higher. This limit is bounded by the peripheral clock frequency divided by 16.

The UART_RHR must be read before enabling asynchronous and partial wake-up.

When SleepWalking is enabled for the UART (refer to section “Power Management Controller (PMC)”), the PMC decodes a clock request from the UART. The request is generated as soon as there is a falling edge on the URXD line as this may indicate the beginning of a start bit. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the UART.

As soon as the clock is provided by the PMC, the UART processes the received frame and compares the received character with VAL1 and VAL2 in UART_CMPR (UART Comparison Register).

The UART instructs the PMC to disable the clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in UART_CMPR (see Asynchronous Event Generating Only Partial Wake-up).

If the received character value meets the conditions, the UART instructs the PMC to exit the full system from Wait mode (see Asynchronous Wake-up Use Case Examples).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, then the wake-up is triggered if the received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 255, the wake-up is triggered as soon as a character is received.

The matching condition can be configured to include the parity bit (CMPPAR in UART_CMPR). Thus, if the received data matches the comparison condition defined by VAL1 and VAL2 but a parity error is encountered, the matching condition is cancelled and the UART instructs the PMC to disable the clock (see Asynchronous Event Generating Only Partial Wake-up).

If the processor and peripherals are running, the UART can be configured in Asynchronous and partial wake-up mode by enabling the PMC_SLPWK_ER (refer to "Power Management Controller (PMC)"). When activity is detected on the receive line, the UART requests the clock from the PMC and the comparison is performed. If there is a comparison match, the UART continues to request the clock. If there is no match, the clock is switched off for the UART only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the UART (refer to PMC_SLPWK_ER in "Power Management Controller (PMC)").

When the system is kept in active/running mode and the UART enters Asynchronous and Partial Wake-up mode, the flag CMP must be programmed as the unique source of the UART interrupt.

When the system exits Wait mode as the result of a matching condition, the RXRDY flag is used to determine if the UART is the source of exit.

**Note:** If the SleepWalking function is enabled on the UART, a divide by 8 of the peripheral clock versus the bus clock is not possible. Other dividers can be used with no constraints.

**Figure 47-13. Asynchronous Wake-up Use Case Examples**

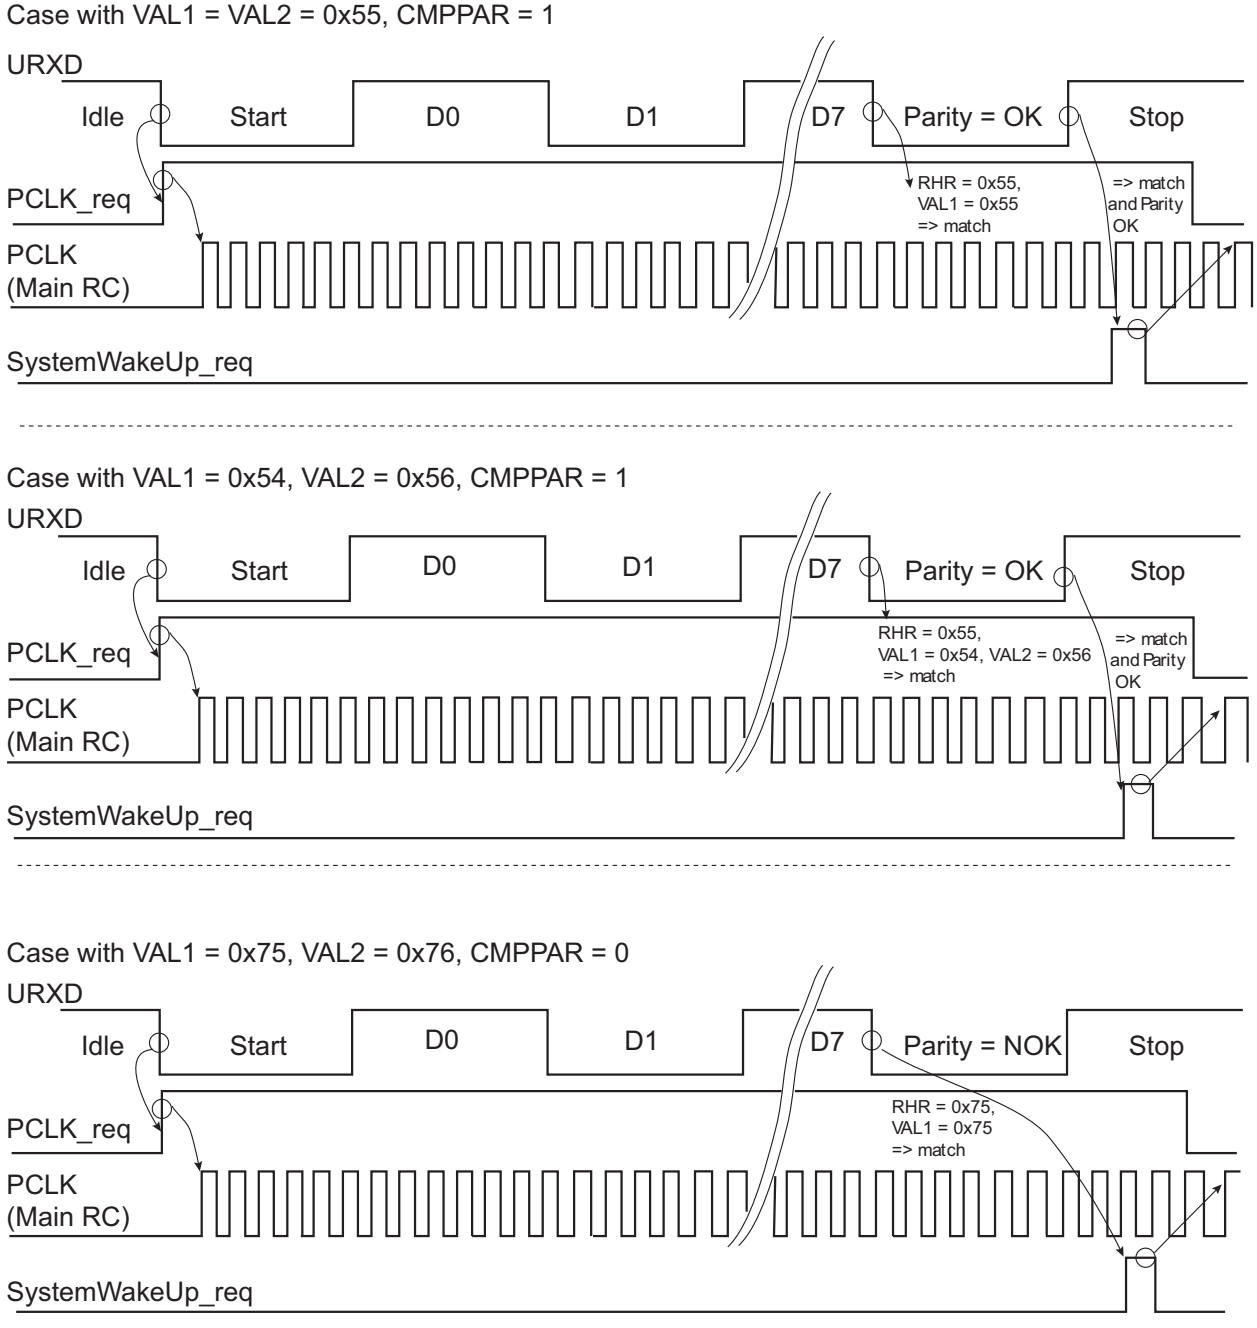


**Figure 47-14. Asynchronous Event Generating Only Partial Wake-up**

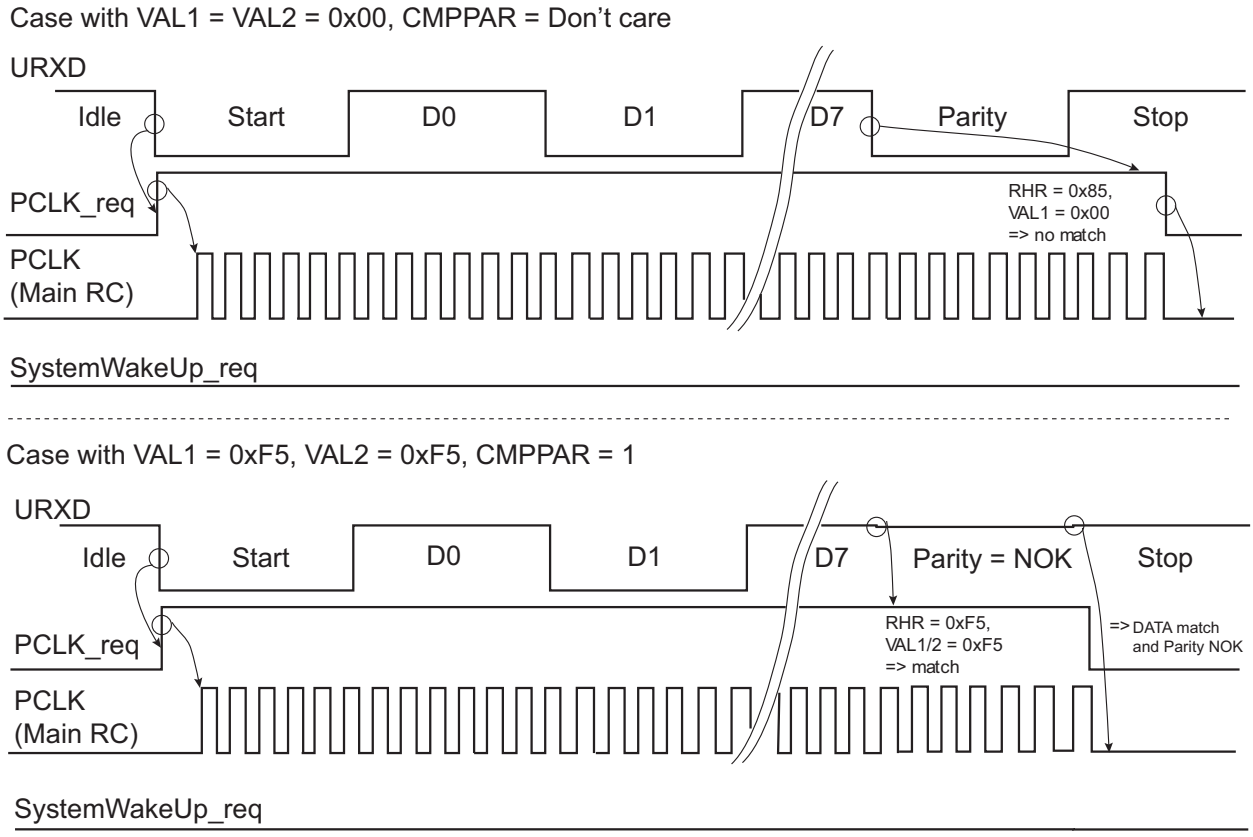


### 47.5.7 Register Write Protection

To prevent any single software error from corrupting UART behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the UART Write Protection Mode Register (UART_WPMR).

The following registers can be write-protected:

- UART Mode Register
- UART Baud Rate Generator Register
- UART Comparison Register
- UART Receiver Time-out Register

### 47.5.8 Test Modes

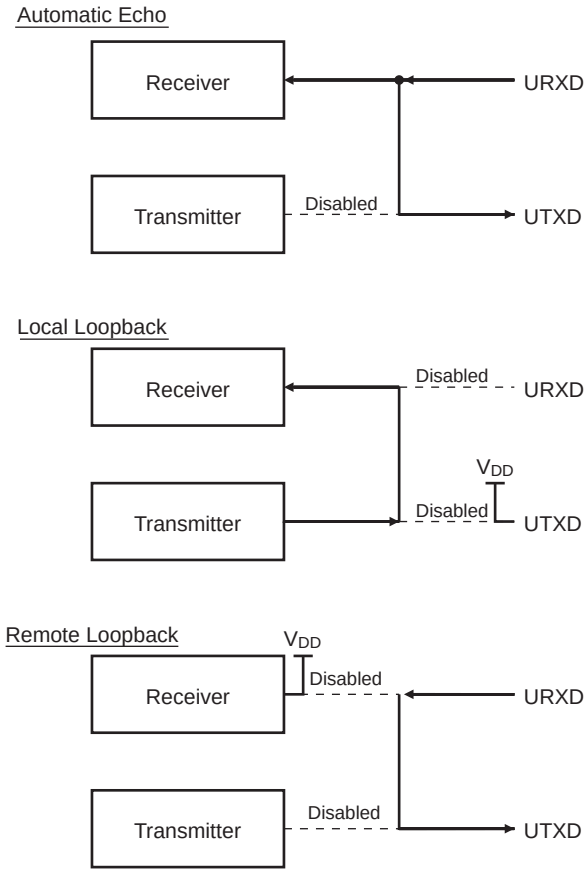
The UART supports three test modes. These modes of operation are programmed by using the CHMODE field in UART_MR.

The Automatic Echo mode allows a bit-by-bit retransmission. When a bit is received on the URXD line, it is sent to the UTXD line. The transmitter operates normally, but has no effect on the UTXD line.

The Local Loopback mode allows the transmitted characters to be received. UTXD and URXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The URXD pin level has no effect and the UTXD line is held high, as in idle state.

The Remote Loopback mode directly connects the URXD pin to the UTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

**Figure 47-15. Test Modes**



## 47.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | UART_CR | 7:0 | TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | | |
| | | 15:8 | | | | REQCLR | STTTO | RETTO | | RSTSTA |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x04 | UART_MR | 7:0 | | | | FILTER | | | | |
| | | 15:8 | CHMODE[1:0] | | | BRSRCCK | PAR[2:0] | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |

### 47.6.1 UART Control Register

**Name:** UART_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | REQCLR | STTTO | RETTO | | RSTSTA |
| Access | | | | W | W | W | | W |
| Reset | | | | – | – | – | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | | |
| Access | W | W | W | W | W | W | | |
| Reset | – | – | – | – | – | – | | |

**Bit 12 – REQCLR** Request Clear

- SleepWalking enabled:

0: No effect.

1: Bit REQCLR clears the potential clock request currently issued by UART, thus the potential system wake-up is cancelled.

- SleepWalking disabled:

0: No effect.

1: Bit REQCLR restarts the comparison trigger to enable receive holding register loading.

**Bit 11 – STTTO** Start Time-out

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Starts waiting for a character before clocking the time-out counter. Resets status bit TIMEOUT in UART_SR. |

**Bit 10 – RETTO** Rearm Time-out

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Restarts time-out. |

**Bit 8 – RSTSTA** Reset Status

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the status bits PARE, FRAME, CMP and OVRE in the UART_SR. |

**Bit 7 – TXDIS** Transmitter Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The transmitter is disabled. If a character is being processed and a character has been written in the UART_THR and RSTTX is not set, both characters are completed before the transmitter is stopped. |

**Bit 6 – TXEN** Transmitter Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The transmitter is enabled if TXDIS is 0. |

**Bit 5 – RXDIS** Receiver Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped. |

**Bit 4 – RXEN** Receiver Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The receiver is enabled if RXDIS is 0. |

**Bit 3 – RSTTX** Reset Transmitter

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted. |

**Bit 2 – RSTRX** Reset Receiver

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The receiver logic is reset and disabled. If a character is being received, the reception is aborted. |

### 47.6.2 UART Mode Register

**Name:** UART_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CHMODE[1:0] | | | BRSRCCK | PAR[2:0] | | | |
| Access | R/W | R/W | | R/W | R/W | R/W | R/W | |
| Reset | 0 | 0 | | 0 | 0 | 0 | 0 | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | FILTER | | | | |
| Access | | | | R/W | | | | |
| Reset | | | | 0 | | | | |

**Bits 15:14 – CHMODE[1:0]** Channel Mode

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Normal mode |
| 1 | AUTOMATIC | Automatic echo |
| 2 | LOCAL_LOOPBACK | Local loopback |
| 3 | REMOTE_LOOPBACK | Remote loopback |

**Bit 12 – BRSRCCK** Baud Rate Source Clock
0 (PERIPH_CLK): The baud rate is driven by the peripheral clock

1 (GCLK): The baud rate is driven by a PMC-programmable clock GCLK (refer to section "Power Management Controller (PMC)").

**Bits 11:9 – PAR[2:0]** Parity Type

| Value | Name | Description |
|---|---|---|
| 0 | EVEN | Even Parity |
| 1 | ODD | Odd Parity |
| 2 | SPACE | Space: parity forced to 0 |
| 3 | MARK | Mark: parity forced to 1 |
| 4 | NO | No parity |

**Bit 4 – FILTER** Receiver Digital Filter
0 (DISABLED): UART does not filter the receive line.

1 (ENABLED): UART filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority).

### 47.6.3 UART Interrupt Enable Register

**Name:** UART_IER
**Offset:** 0x08
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CMP | | | | | | TXEMPTY | TIMEOUT |
| Access | W | | | | | | W | W |
| Reset | – | | | | | | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PARE | FRAME | OVRE | | | | TXRDY | RXRDY |
| Access | W | W | W | | | | W | W |
| Reset | – | – | – | | | | – | – |

**Bit 15 – CMP** Enable Comparison Interrupt

**Bit 9 – TXEMPTY** Enable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Enable Time-out Interrupt

**Bit 7 – PARE** Enable Parity Error Interrupt

**Bit 6 – FRAME** Enable Framing Error Interrupt

**Bit 5 – OVRE** Enable Overrun Error Interrupt

**Bit 1 – TXRDY** Enable TXRDY Interrupt

**Bit 0 – RXRDY** Enable RXRDY Interrupt

### 47.6.4 UART Interrupt Disable Register

**Name:** UART_IDR
**Offset:** 0x0C
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CMP | | | | | | TXEMPTY | TIMEOUT |
| Access | W | | | | | | W | W |
| Reset | – | | | | | | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PARE | FRAME | OVRE | | | | TXRDY | RXRDY |
| Access | W | W | W | | | | W | W |
| Reset | – | – | – | | | | – | – |

**Bit 15 – CMP** Disable Comparison Interrupt

**Bit 9 – TXEMPTY** Disable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Disable Time-out Interrupt

**Bit 7 – PARE** Disable Parity Error Interrupt

**Bit 6 – FRAME** Disable Framing Error Interrupt

**Bit 5 – OVRE** Disable Overrun Error Interrupt

**Bit 1 – TXRDY** Disable TXRDY Interrupt

**Bit 0 – RXRDY** Disable RXRDY Interrupt

### 47.6.5 UART Interrupt Mask Register

**Name:** UART_IMR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

**Bit 15 – CMP** Mask Comparison Interrupt

**Bit 9 – TXEMPTY** Mask TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Mask Time-out Interrupt

**Bit 7 – PARE** Mask Parity Error Interrupt

**Bit 6 – FRAME** Mask Framing Error Interrupt

**Bit 5 – OVRE** Mask Overrun Error Interrupt

**Bit 1 – TXRDY** Disable TXRDY Interrupt

**Bit 0 – RXRDY** Mask RXRDY Interrupt

### 47.6.6 UART Status Register

**Name:** UART_SR
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CMP | | | | | | TXEMPTY | TIMEOUT |
| Access | R | | | | | | R | R |
| Reset | 0 | | | | | | 0 | 0 |

| Access | R | R | R | | | | R | R |
| Reset | 0 | 0 | 0 | | | | 0 | 0 |

**Bit 15 – CMP** Comparison Match

| Value | Description |
|---|---|
| 0 | No received character matches the comparison criteria programmed in VAL1, VAL2 fields and in CMPPAR bit since the last RSTSTA. |
| 1 | The received character matches the comparison criteria. |

**Bit 9 – TXEMPTY** Transmitter Empty

| Value | Description |
|---|---|
| 0 | There are characters in UART_THR, or characters being processed by the transmitter, or the transmitter is disabled. |
| 1 | There are no characters in UART_THR and there are no characters being processed by the transmitter. |

**Bit 8 – TIMEOUT** Receiver Time-out

| Value | Description |
|---|---|
| 0 | There has not been a time-out since the last Start Time-out command (STTTO in UART_CR) or the Time-out Register is 0. |
| 1 | There has been a time-out since the last Start Time-out command (STTTO in UART_CR). |

**Bit 7 – PARE** Parity Error

| Value | Description |
|---|---|
| 0 | No parity error has occurred since the last RSTSTA. |
| 1 | At least one parity error has occurred since the last RSTSTA. |

**Bit 6 – FRAME** Framing Error

| Value | Description |
|---|---|
| 0 | No framing error has occurred since the last RSTSTA. |
| 1 | At least one framing error has occurred since the last RSTSTA. |

**Bit 5 – OVRE** Overrun Error

| Value | Description |
|---|---|
| 0 | No overrun error has occurred since the last RSTSTA. |
| 1 | At least one overrun error has occurred since the last RSTSTA. |

**Bit 1 – TXRDY** Transmitter Ready

| Value | Description |
|---|---|
| 0 | A character has been written to UART_THR and not yet transferred to the internal shift register, or the transmitter is disabled. |
| 1 | There is no character written to UART_THR not yet transferred to the internal shift register. |

**Bit 0 – RXRDY** Receiver Ready

| Value | Description |
|---|---|
| 0 | No character has been received since the last read of the UART_RHR, or the receiver is disabled. |
| 1 | At least one complete character has been received, transferred to UART_RHR and not yet read. |

### 47.6.7 UART Receiver Holding Register

**Name:** UART_RHR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Bits 15:0 – CD[15:0]** Clock Divisor

| Value | Description |
|---|---|
| 0 | Baud rate clock is disabled |
| 1 to 65,535 | If BRSRCCK = 0:<br>$\mathrm{CD} = \frac{\mathrm{f}_{\text{peripheral clock}}}{16 \times \text{Baud Rate}}$<br>If BRSRCCK = 1:<br>$\mathrm{CD} = \frac{\mathrm{f}_{\mathrm{GCLKx}}}{16 \times \text{Baud Rate}}$ |

### 47.6.10 UART Comparison Register

**Name:** UART_CMPR
**Offset:** 0x24
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | VAL2[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | CMPPAR | | CMPMODE | | | | |
| Access | | R/W | | R/W | | | | |
| Reset | | 0 | | 0 | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | VAL1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:16 – VAL2[7:0]** Second Comparison Value for Received Character

| Value | Description |
|---|---|
| 0-255 | The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in UART_SR. If asynchronous partial wake-up (SleepWalking) is enabled in PMC_SLPWK_ER, the UART requests a system wake-up if condition is met. |

**Bit 14 – CMPPAR** Compare Parity

| Value | Description |
|---|---|
| 0 | The parity is not checked and a bad parity cannot prevent from waking up the system. |
| 1 | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wake-up is performed. |

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name | Description |
|---|---|---|
| 0 | FLAG_ONLY | Any character is received and comparison function drives CMP flag. |
| 1 | START_CONDITION | Comparison condition must be met to start reception. |

**Bits 7:0 – VAL1[7:0]** First Comparison Value for Received Character

| Value | Description |
|---|---|
| 0–255 | The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to set CMP flag in UART_SR. If asynchronous partial wake-up (SleepWalking) is enabled in PMC_SLPWK_ER, the UART requests a system wake-up if the condition is met. |

### 47.6.11 UART Receiver Time-out Register

**Name:** UART_RTOR
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TO[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 7:0 – TO[7:0]** Time-out Value

| Value | Description |
|---|---|
| 0 | The receiver time-out is disabled. |
| 1–255 | The receiver time-out is enabled and the time-out delay is TO x bit period. |

### 47.6.12 UART Write Protection Mode Register

**Name:** UART_WPMR
**Offset:** 0xE4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | WPKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x554152 | PASSWD | Writing any other value in this field aborts the write operation. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See Register Write Protection for the list of registers that can be protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII). |

# 48. Serial Peripheral Interface (SPI)

## 48.1 Description

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master”' which controls the data flow, while the other devices act as “slaves" which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

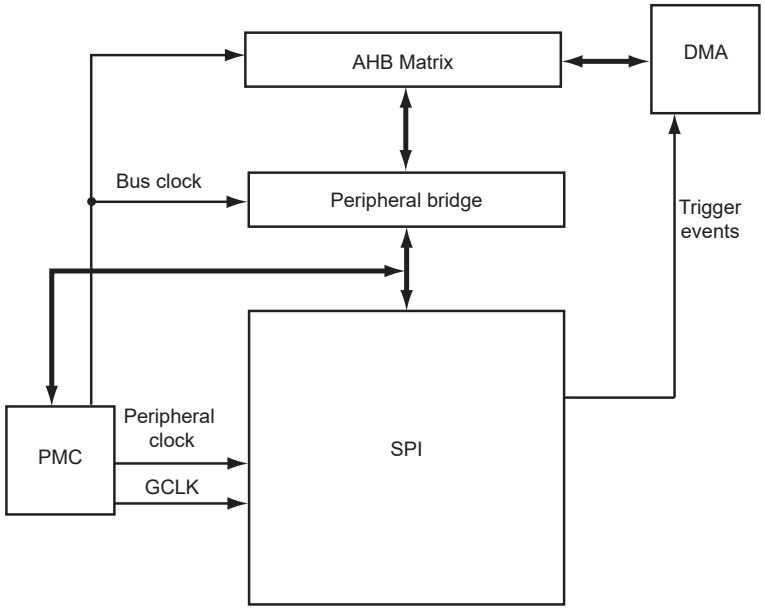
## 48.2 Embedded Characteristics

- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
  - Selectable mode fault detection
- Master Mode can Drive SPCK up to Peripheral Clock
- 16-data Transmit and Receive FIFOs
- Master Mode Bit Rate can be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors

- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

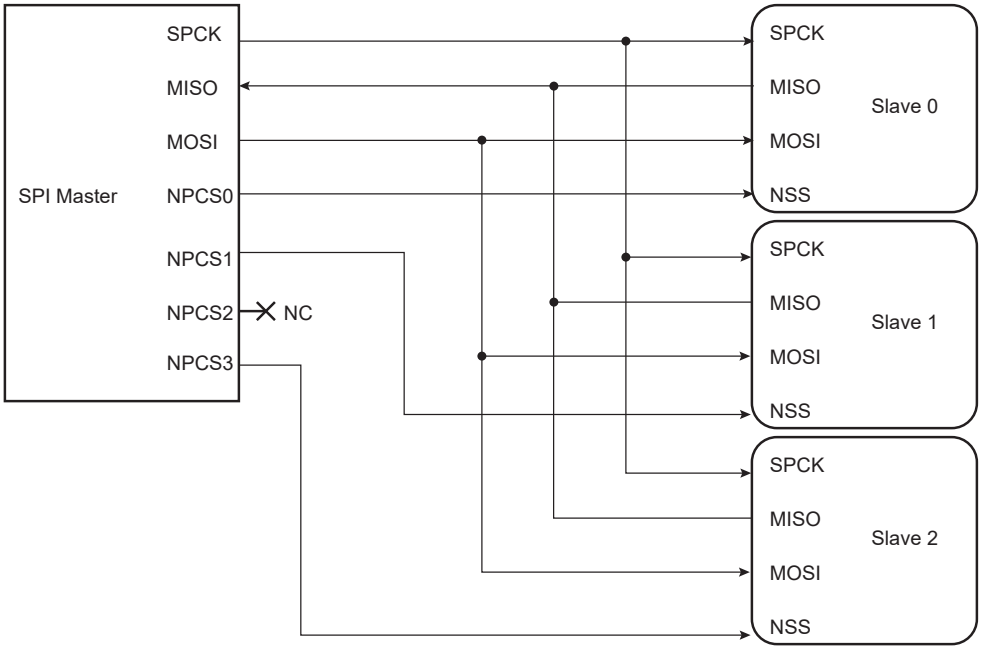
## 48.3 Block Diagram

**Figure 48-1. Block Diagram**



## 48.4 Application Block Diagram

**Figure 48-2. Application Block Diagram: Single Master/Multiple Slave Implementation**



## 48.5 Signal Description

**Table 48-1. Signal Description**

| Pin Name | Pin Description | Type | |
|---|---|---|---|
| | | Master | Slave |
| MISO | Master In Slave Out | Input | Output |
| MOSI | Master Out Slave In | Output | Input |
| SPCK | Serial Clock | Output | Input |
| NPCS1–NPCS3 | Peripheral Chip Selects | Output | Unused |
| NPCS0/NSS | Peripheral Chip Select/Slave Select | Output | Input |

## 48.6 Product Dependencies

### 48.6.1 I/O Lines

The pins used for interfacing the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the SPI pins to their peripheral functions.

### 48.6.2 Power Management

The SPI can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SPI clock.

### 48.6.3 Interrupt

The SPI interface has an interrupt line connected to the interrupt controller. Handling the SPI interrupt requires programming the interrupt controller before configuring the SPI.

### 48.6.4 Direct Memory Access Controller (DMAC)

The SPI interface can be used in conjunction with the DMAC in order to reduce processor overhead. For a full description of the DMAC, refer to the relevant section.

## 48.7 Functional Description

### 48.7.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by setting the MSTR bit in the SPI Mode Register (SPI_MR):
  - Pins NPCS0 to NPCS3 are all configured as outputs
  - The SPCK pin is driven
  - The MISO line is wired on the receiver input
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in SPI_MR is written to ‘0’:
  - The MISO line is driven by the transmitter output
  - The MOSI line is wired on the receiver input

– The SPCK pin is driven by the transmitter to synchronize the receiver.
– The NPCS0 pin becomes an input, and is used as a slave select signal (NSS)
– The NPCS1 to NPCS3 pins are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The baud rate generator is activated only in Master mode.

### 48.7.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select registers (SPI_CSRx). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

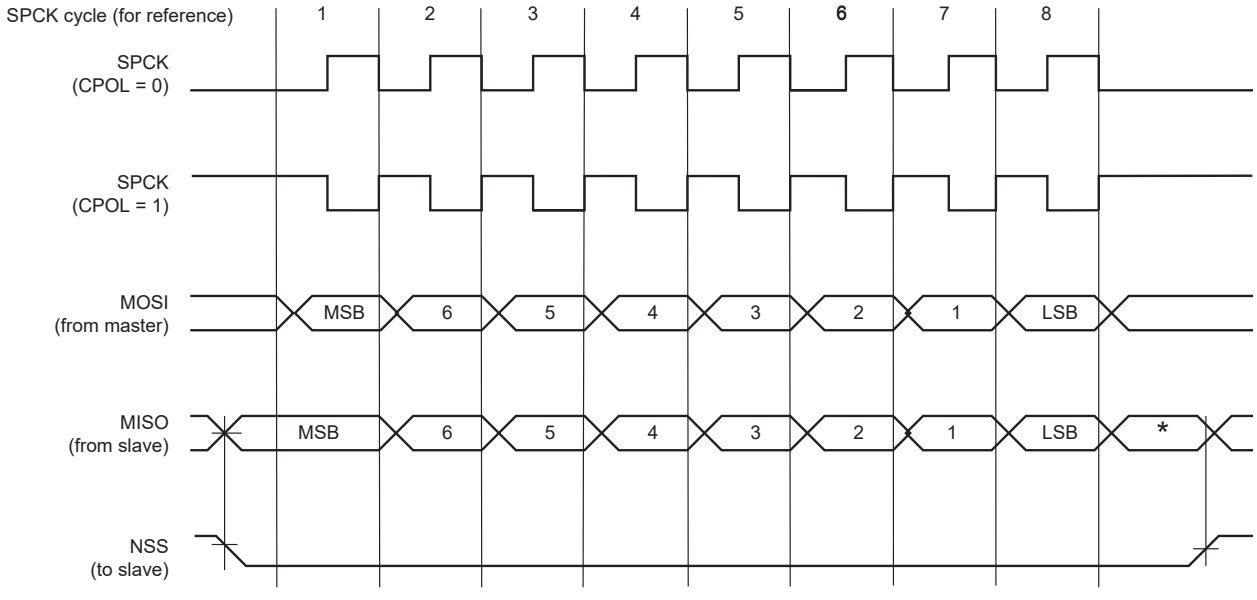
The table below shows the four modes and corresponding parameter settings.

**Table 48-2. SPI Bus Protocol Modes**

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|---|---|---|---|---|---|
| 0 | 0 | 1 | Falling | Rising | Low |
| 1 | 0 | 0 | Rising | Falling | Low |
| 2 | 1 | 1 | Rising | Falling | High |
| 3 | 1 | 0 | Falling | Rising | High |

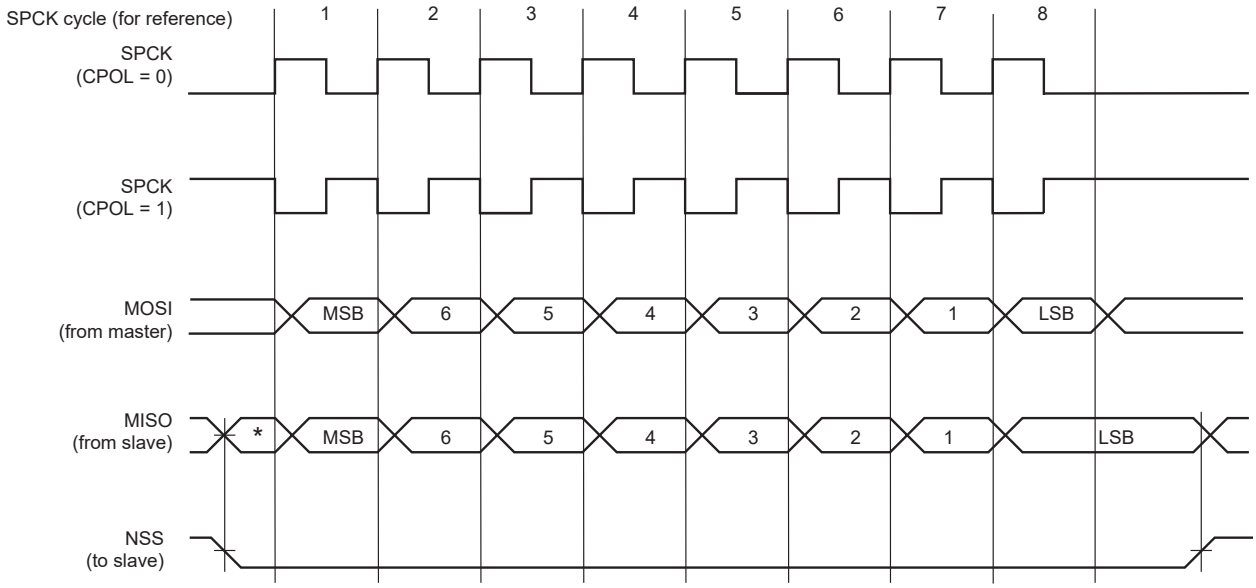
The following figures show examples of data transfers.

**Figure 48-3. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**



* Not defined.

**Figure 48-4. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**



* Not defined.

### 48.7.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (SPI_TDR) and the Receive Data Register (SPI_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to SPI_TDR. The written data is immediately transferred into the internal shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted into the shift register. Data cannot be loaded in SPI_RDR without transmitting data. If there is no data to transmit, dummy data can be used (SPI_TDR filled with ones). If SPI_MR.WDRBT is set, transmission can occur only if SPI_RDR has been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status register (SPI_SR) can be discarded.

Before writing SPI_TDR, SPI_MR.PCS must be set in order to select a slave.

If new data is written in SPI_TDR during the transfer, it is kept in SPI_TDR until the current transfer is completed. Then, the received data is transferred from the shift register to SPI_RDR, the data in SPI_TDR is loaded in the shift register and a new transfer starts.

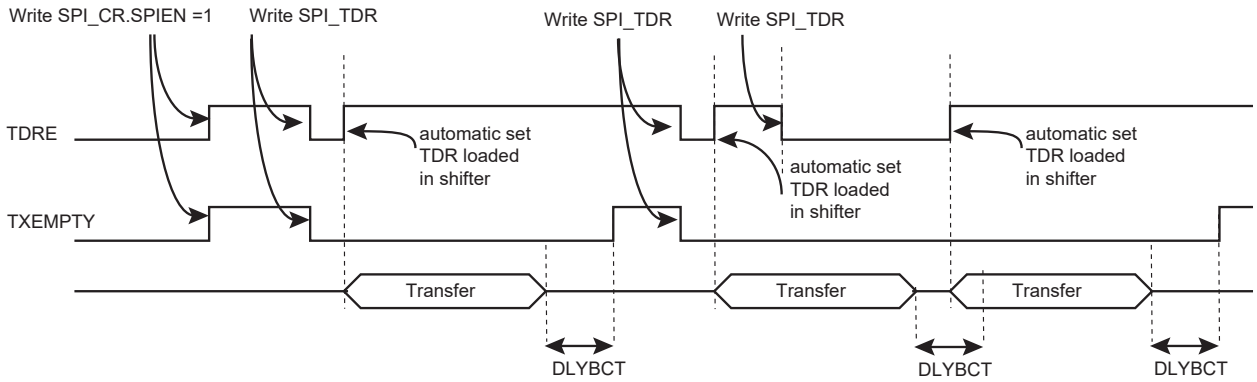
As soon as SPI_TDR is written, the Transmit Data Register Empty (TDRE) flag in SPI_SR is cleared. When the data written in SPI_TDR is loaded into the shift register, TDRE in SPI_SR is set. The TDRE flag is used to trigger the Transmit DMA channel.

See the figure below.

The end of transfer is indicated by the TXEMPTY flag in SPI_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:** When the SPI is enabled, the TDRE and TXEMPTY flags are set.

**Figure 48-5. TDRE and TXEMPTY Flag Behavior**



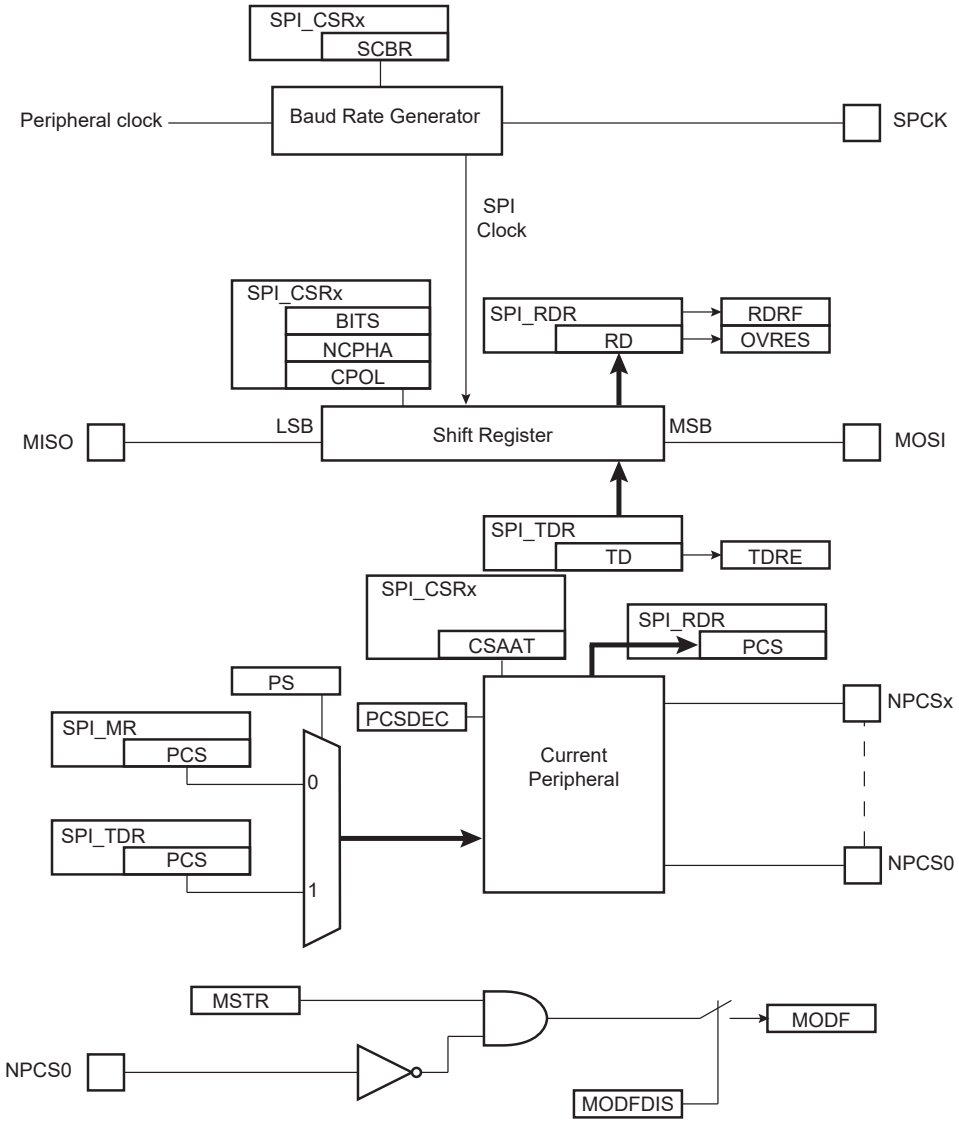
The transfer of received data from the internal shift register to SPI_RDR is indicated by the Receive Data Register Full (RDRF) bit in SPI_SR. When the received data is read, SPI_SR.RDRF is cleared.

If SPI_RDR has not been read before new data is received, the Overrun Error (OVRES) flag in SPI_SR is set. As long as this flag is set, data is loaded in SPI_RDR. The user has to read SPI_SR to clear OVRES.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

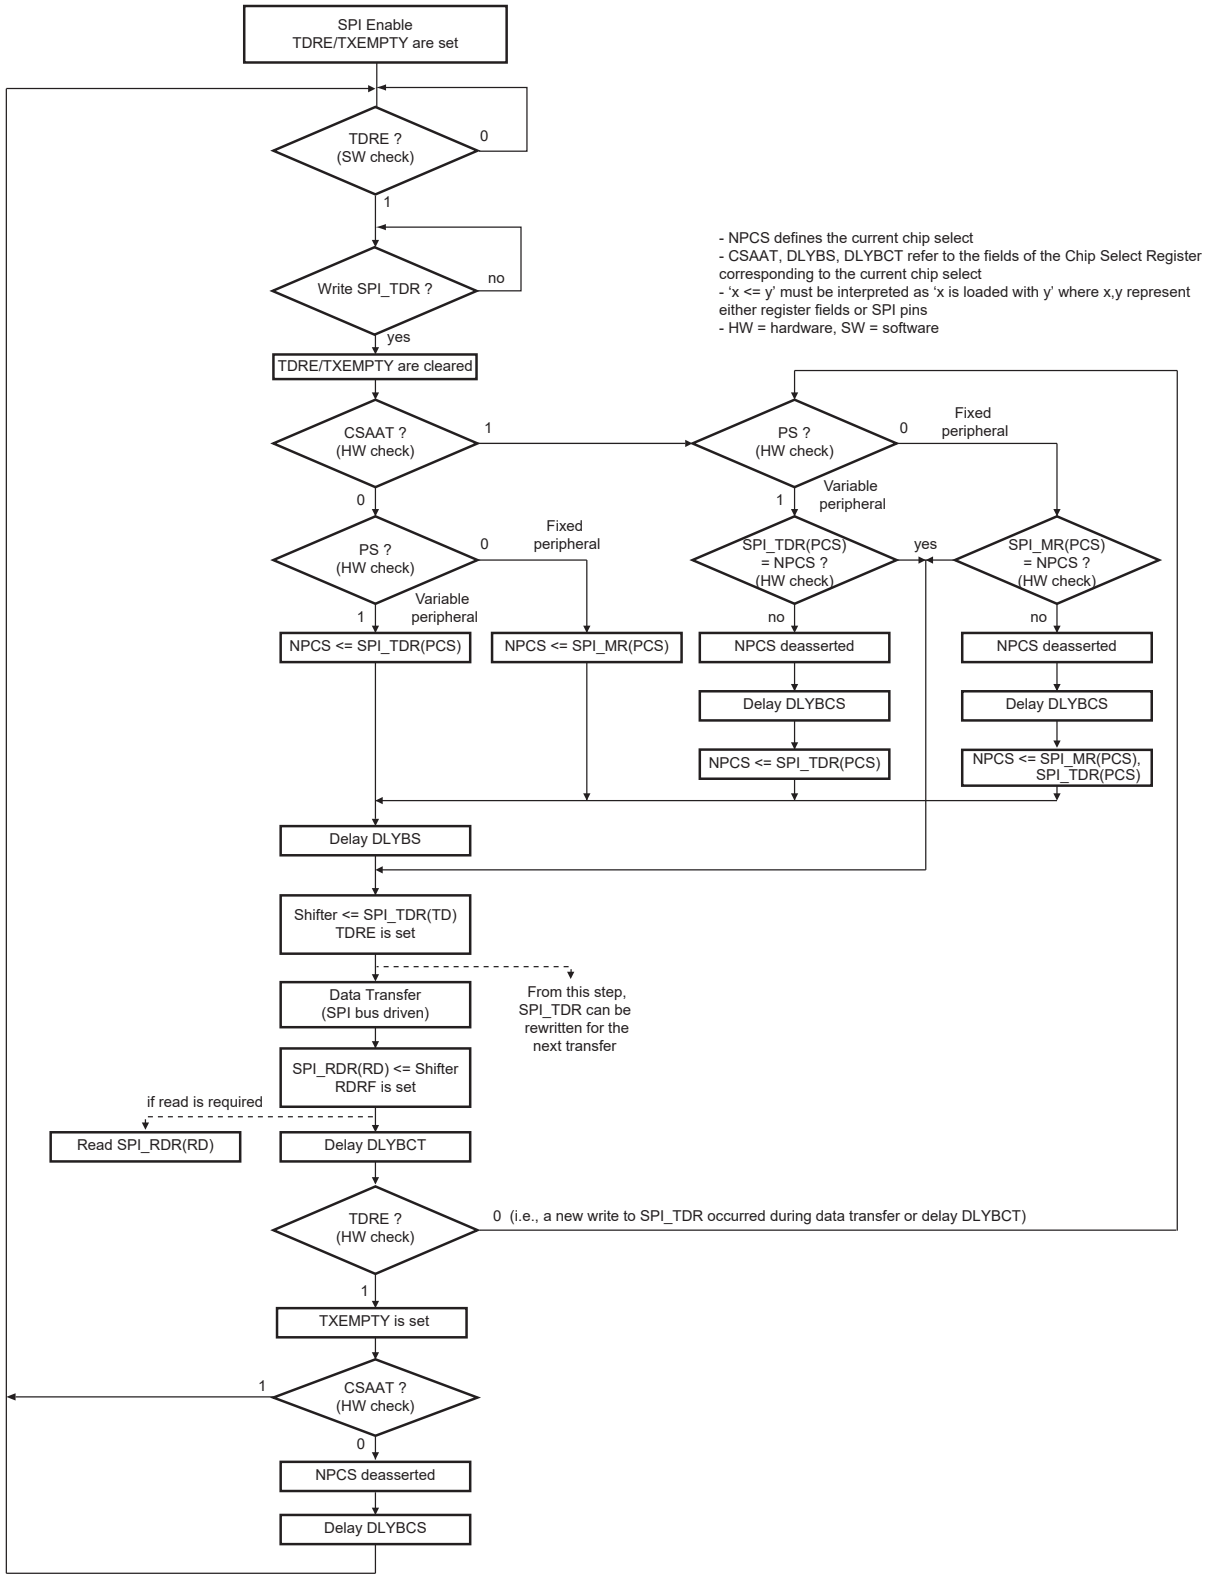
### 48.7.3.1 Master Mode Block Diagram

**Figure 48-6. Master Mode Block Diagram**



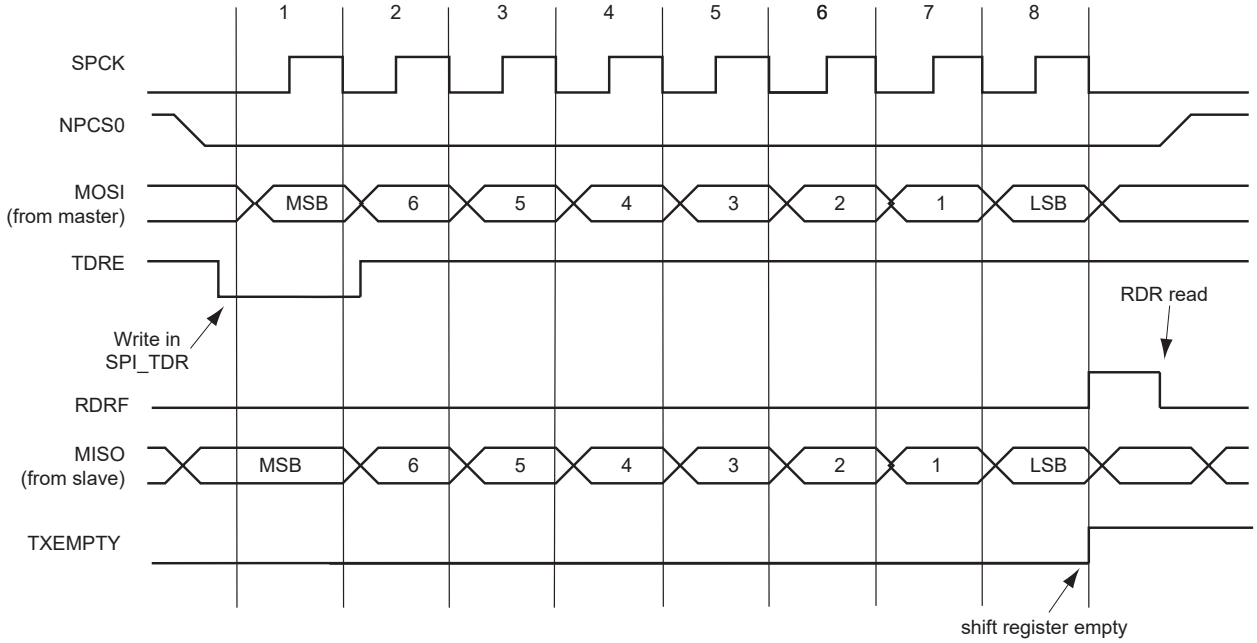
### 48.7.3.2 Master Mode Flow Diagram

**Figure 48-7. Master Mode Flow Diagram**



The figure below shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within SPI_SR during an 8-bit data transfer in Fixed mode without the DMA involved.

**Figure 48-8. Status Register Flags Behavior**



### 48.7.3.3 Clock Generation

The SPI Baud rate clock is generated by dividing the peripheral clock by a value between 1 and 255.

If SPI_CSRx.SCBR is programmed to 1, the operating baud rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SPI_CSRx.SCBR is at 0 can lead to unpredictable results.

At reset, SPI_CSRx.SCBR=0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in SPI_CSRx.SCBR. This allows the SPI to automatically adapt the baud rate for each interfaced peripheral without reprogramming.

### 48.7.3.4 Transfer Delays

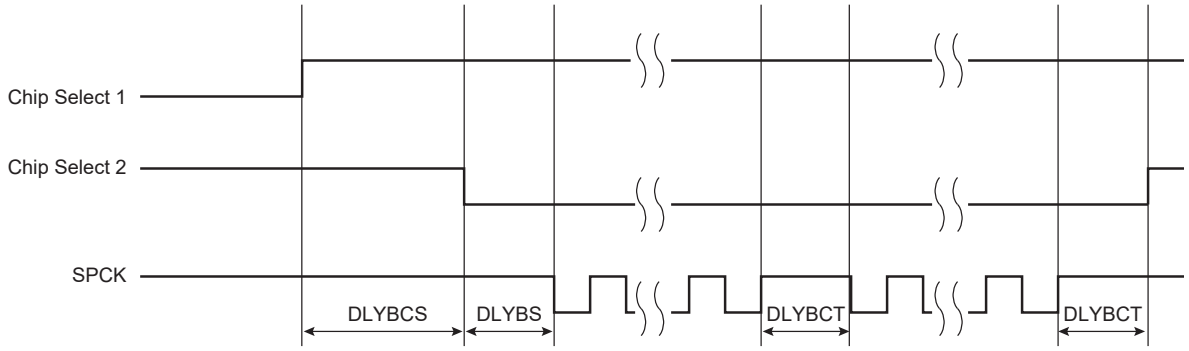
The following figure shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- Delay between the chip selects—programmable only once for all chip selects by writing field SPI_MR.DLYBCS. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, DLYBCS does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to details on the SPI slave device in the section “Electrical Characteristics”.
- Delay before SPCK—independently programmable for each chip select by writing SPI_CSRx.DLYBS. The SPI slave device activation delay is managed through DLYBS. Refer to details on the SPI slave device in the section “Electrical Characteristics” to define DLYBS.

- Delay between consecutive transfers—independently programmable for each chip select by writing SPI_CSRx.DLYBCT. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 48-9. Programmable Delays**



### 48.7.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- Fixed Peripheral Select Mode: SPI exchanges data with only one peripheral.
  Fixed Peripheral Select mode is enabled by clearing SPI_MR.PS. In this case, the current peripheral is defined by SPI_MR.PCS. SPI_TDR.PCS has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram SPI_MR.PCS.
  Variable Peripheral Select mode is enabled by setting SPI_MR.PS. SPI_TDR.PCS is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to SPI_TDR in the following format:
  [xxxxxxx(7-bit) + LASTXFER(1-bit)(1)+ xxxx(4-bit) + PCS (4-bit) + TD (8- to 16-bit data)]

  with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section SPI Transmit Data Register.

  **Note:**
  1. Optional

  For details on CSAAT, LASTXFER and CSNAAT, see section Peripheral Deselection with another DMA.

  If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (SPI_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if SPI_CR.SPIEN has previously been written.

### 48.7.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, SPI_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming SPI_MR. Data written in SPI_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

#### 48.7.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 slave peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see figure below). This can be enabled by setting SPI_MR.PCSDEC.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

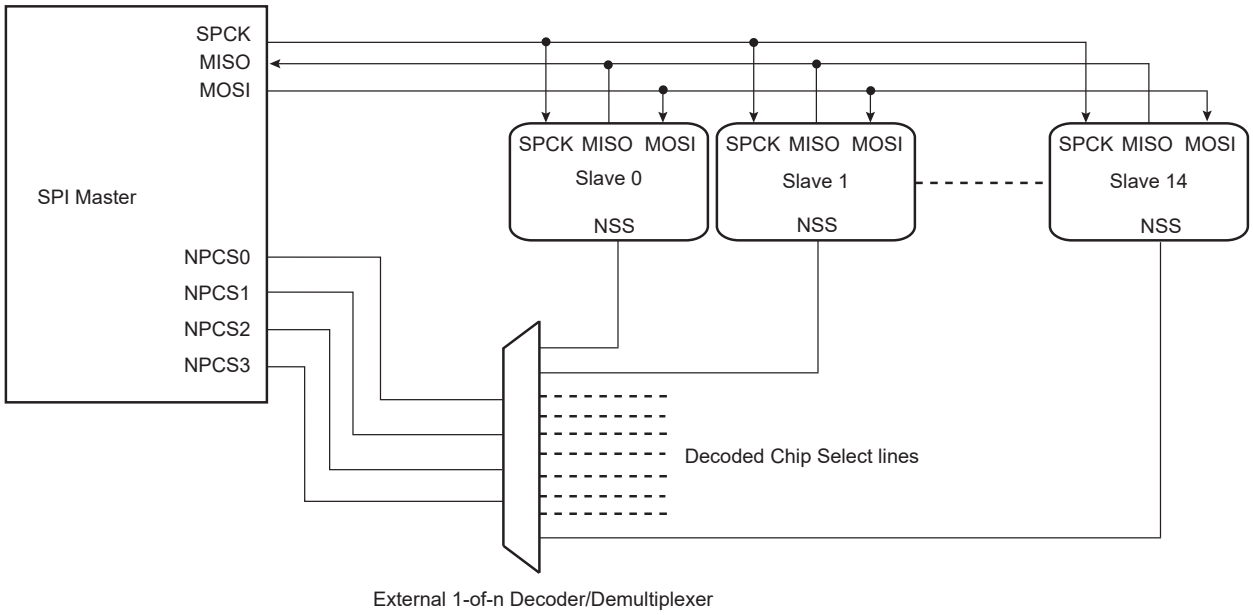
When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either SPI_MR or SPI_TDR (depending on PS).

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has four chip select registers (SPI_CSR0...SPI_CSR3). As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, SPI_CRS0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If SPI_CSRx.CSAAT bit is used, with or without the DMAC, the Mode Fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since Mode Fault detection is only on NPCS0.

**Figure 48-10. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**



#### 48.7.3.8 Peripheral Deselection without DMA

During a transfer of more than one unit of data on a chip select without the DMA, SPI_TDR is loaded by the processor, the TDRE flag rises as soon as the content of SPI_TDR is transferred into the internal shift register. When this flag is detected high, SPI_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload SPI_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in SPI_CSR, gives even less time for the processor to reload SPI_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the chip select registers [SPI_CSR0...SPI_CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit at 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if SPI_TDR is not reloaded, the chip select remains active. To deassert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in SPI_CR must be set after writing the last data to transmit into SPI_TDR.

#### 48.7.3.9 Peripheral Deselection with DMA

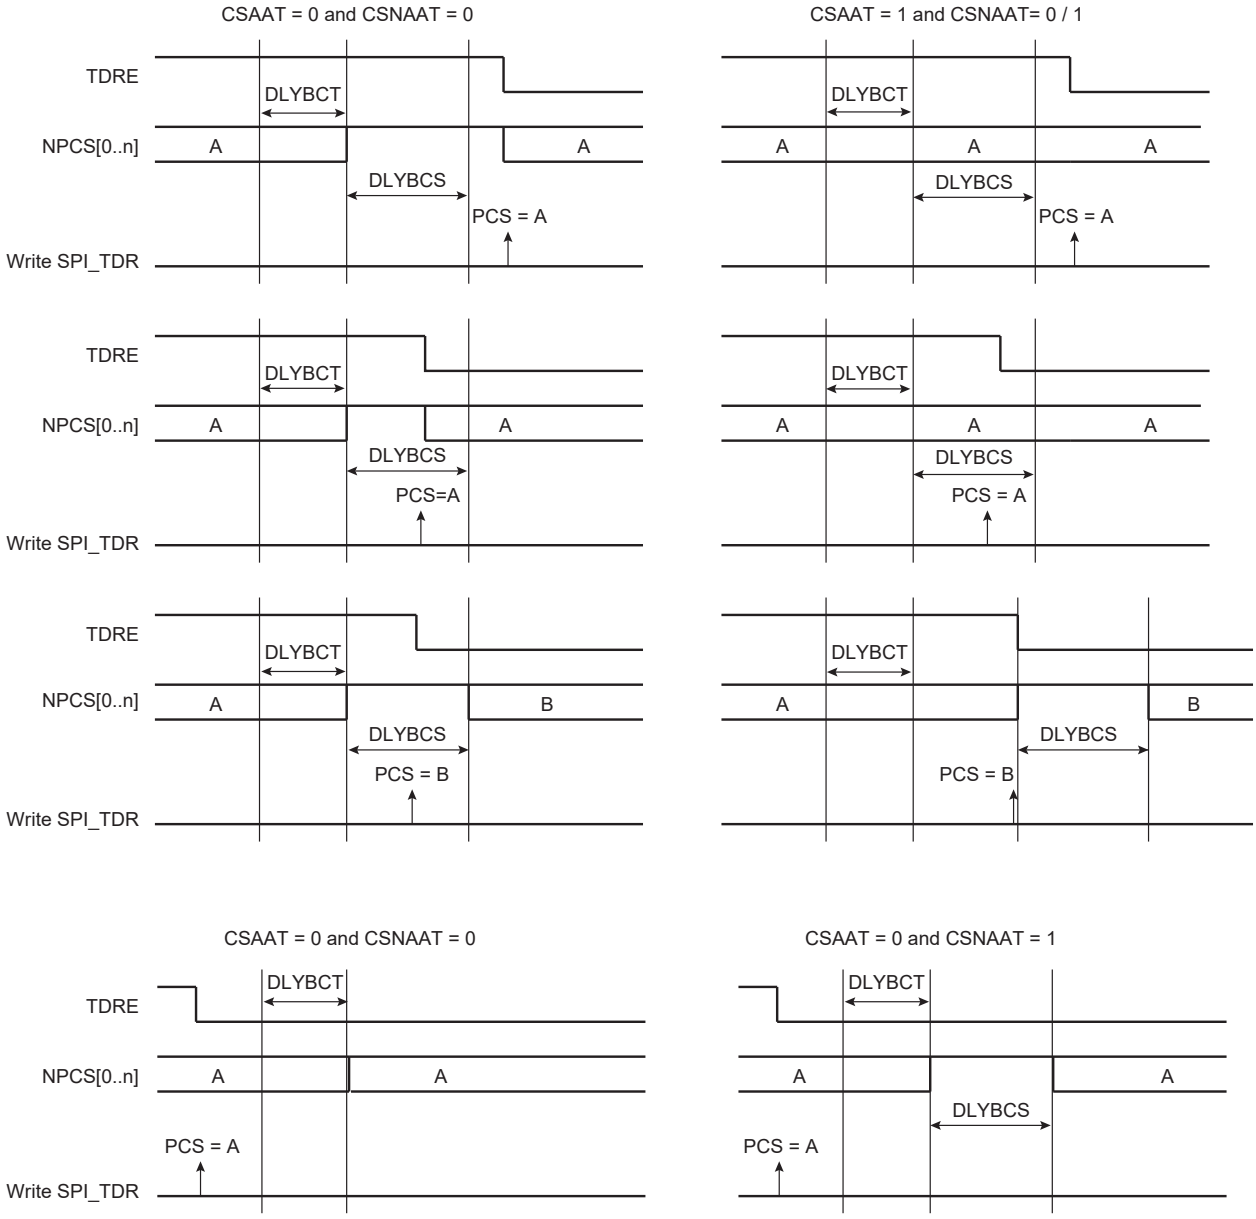
DMA provides faster reloads of SPI_TDR compared to software. However, depending on the system activity, it is not guaranteed that SPI_TDR is written with the next data before the end of the current transfer. Consequently, data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is configured to 0, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a chip select, the TDRE flag rises as soon as the content of SPI_TDR is transferred into the internal shift register. When this flag is detected, SPI_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two

transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, SPI_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit at 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is configured to 0 for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 48-11. Peripheral Deselection**



### 48.7.3.10 Mode Fault Detection

The SPI has the capability to operate in multimaster environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit any data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multimaster

environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, SPI_SR.MODF bit is set until SPI_SR is read and the SPI is automatically disabled until it is reenabled by setting SPI_CR.SPIEN bit.

By default, the mode fault detection is enabled. The user can disable it by setting SPI_MR.MODFDIS bit.

### 48.7.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data is loaded in SPI_RDR depending on the configuration of SPI_CSR0.BITS. These bits are processed following a phase and a polarity defined respectively by the NCPHA and CPOL bits in SPI_CSR0. Note that the fields BITS, CPOL and NCPHA of the other chip select registers (SPI_CSR1...SPI_CSR3) have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on SPI_CSRx.BITS, see the note in section SPI Chip Select Register.

When all bits are processed, the received data is transferred in SPI_RDR and the RDRF bit rises. If SPI_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in SPI_SR is set. As long as this flag is set, data is loaded in SPI_RDR. The user must read SPI_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the internal shift register. If no data has been written in SPI_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the internal shift register resets to 0.

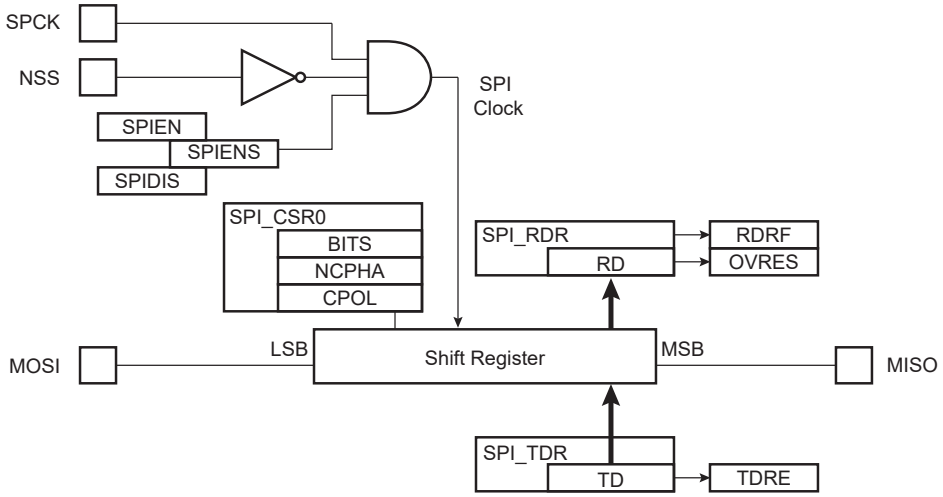
When a first data is written in SPI_TDR, it is transferred immediately in the internal shift register and the TDRE flag rises. If new data is written, it remains in SPI_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in SPI_TDR is transferred in the internal shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, new data is loaded in the internal shift register from SPI_TDR. If no character is ready to be transmitted, i.e., no character has been written in SPI_TDR since the last load from SPI_TDR to the internal shift register, SPI_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in SPI_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 48-12. Slave Mode Functional Block Diagram**



### 48.7.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (SPI_MR.MSTR=0).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section SPI Asynchronous and Partial Wakeup (SleepWalking)).

In Active mode, the CMP flag in SPI_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (SPI_CMPR). The CMP flag is set as soon as SPI_RDR is loaded with the new received character. The CMP flag is cleared by reading SPI_SR.

SPI_CMPR (see section SPI Comparison Register) can be programmed to provide different comparison methods. These are listed below:

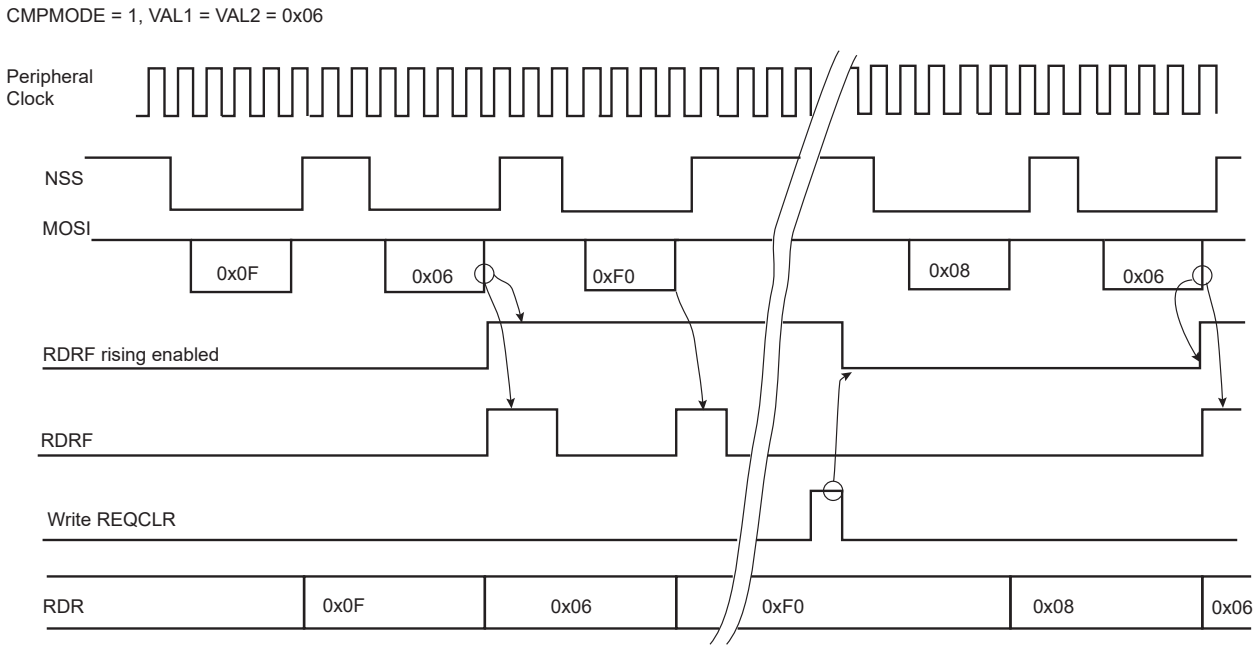
- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When SPI_MR.CMPMODE is cleared, all received data is loaded in SPI_RDR and the CMP flag provides the status of the comparison result.

By setting SPI_MR.CMPMODE, the comparison result triggers the start of SPI_RDR loading (see the following figure). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in SPI_CMPR. The comparison trigger event is restarted by setting SPI_CR.REQCLR if SleepWalking is disabled.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see SPI_CSR0.BITS).

**Figure 48-13. Receive Data Register Management**



### 48.7.6 SPI Asynchronous and Partial Wakeup (SleepWalking)

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the section “Power Management Controller (PMC)” for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wakeup can be used only when SPI is configured in Slave mode (SPI_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 5 µs.

SPI_RDR must be read before enabling the asynchronous and partial wakeup.

When asynchronous and partial wakeup is enabled for the SPI (refer to the section “Power Management Controller (PMC)”), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with SPI_CMPR.VAL1 and SPI_CMPR.VAL2 (see section SPI Comparison Register).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by SPI_CMPR.VAL1 and SPI_CMPR.VAL2 (see figure Asynchronous Event Generating Only Partial Wakeup).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see figure Asynchronous Wakeup Use Case Example).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 = VAL2, then the comparison is performed on a single value and the wakeup is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wakeup is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wakeup is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wakeup mode by enabling the PMC_SLPWK_ER (refer to the section “Power Management Controller (PMC)”). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wakeup mode is enabled for the SPI (refer to PMC_SLPWK_ER in the section “Power Management Controller (PMC)”).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wakeup mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

**Figure 48-14. Asynchronous Wakeup Use Case Example**

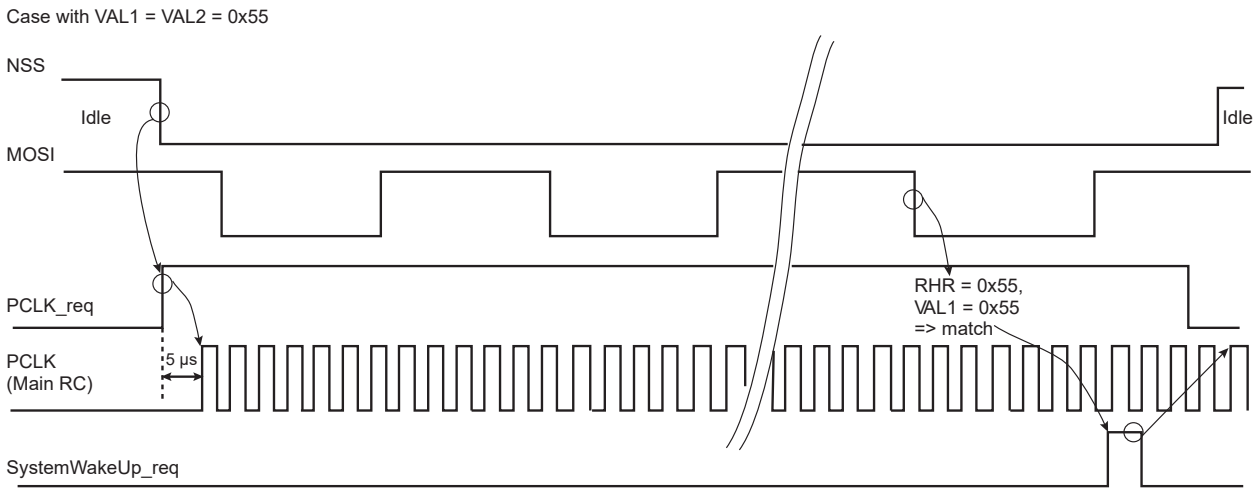


**Figure 48-15. Asynchronous Event Generating Only Partial Wakeup**

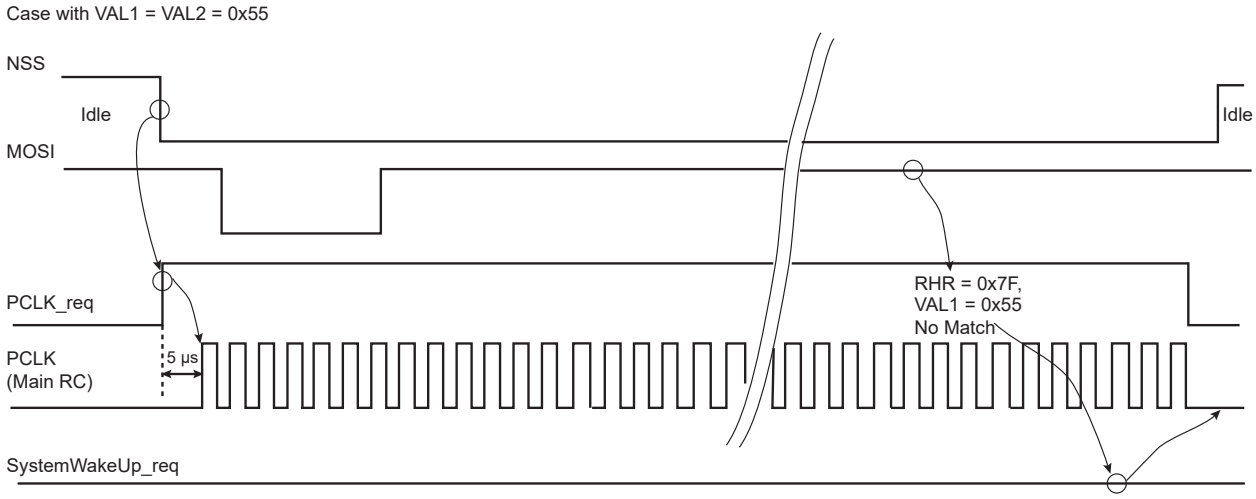


### 48.7.7 FIFOs

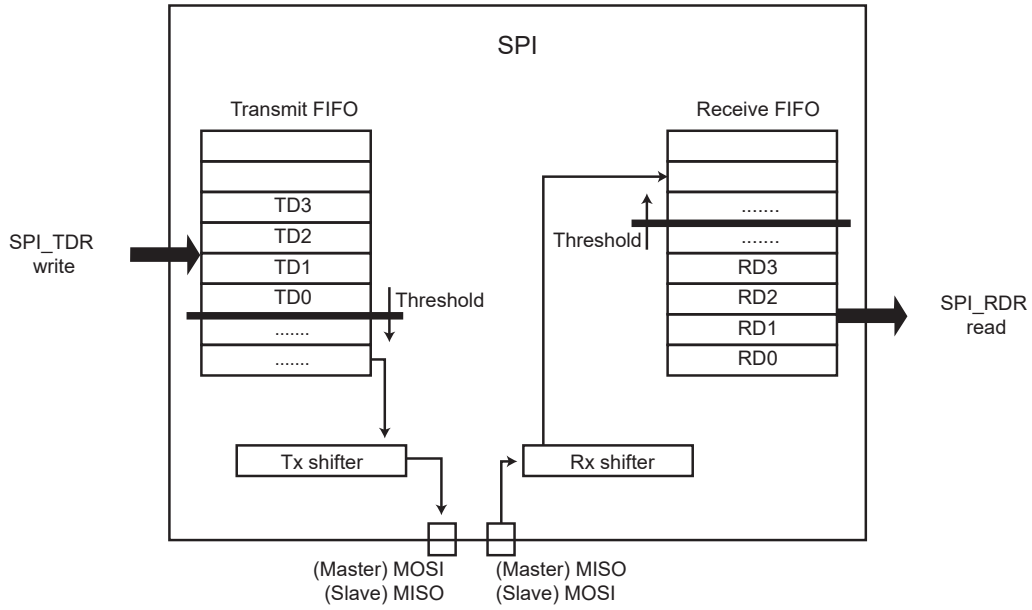
#### 48.7.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using SPI_CR.FIFOEN/FIFODIS. The SPI must be disabled (SPI_CR.SPIDIS) before enabling or disabling the SPI FIFOs.

Writing SPI_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to SPI_TDR/RDR. Refer to sections Single Data Mode and Multiple Data Mode.

**Figure 48-16. FIFOs Block Diagram**



#### 48.7.7.2 Sending Data with FIFO Enabled

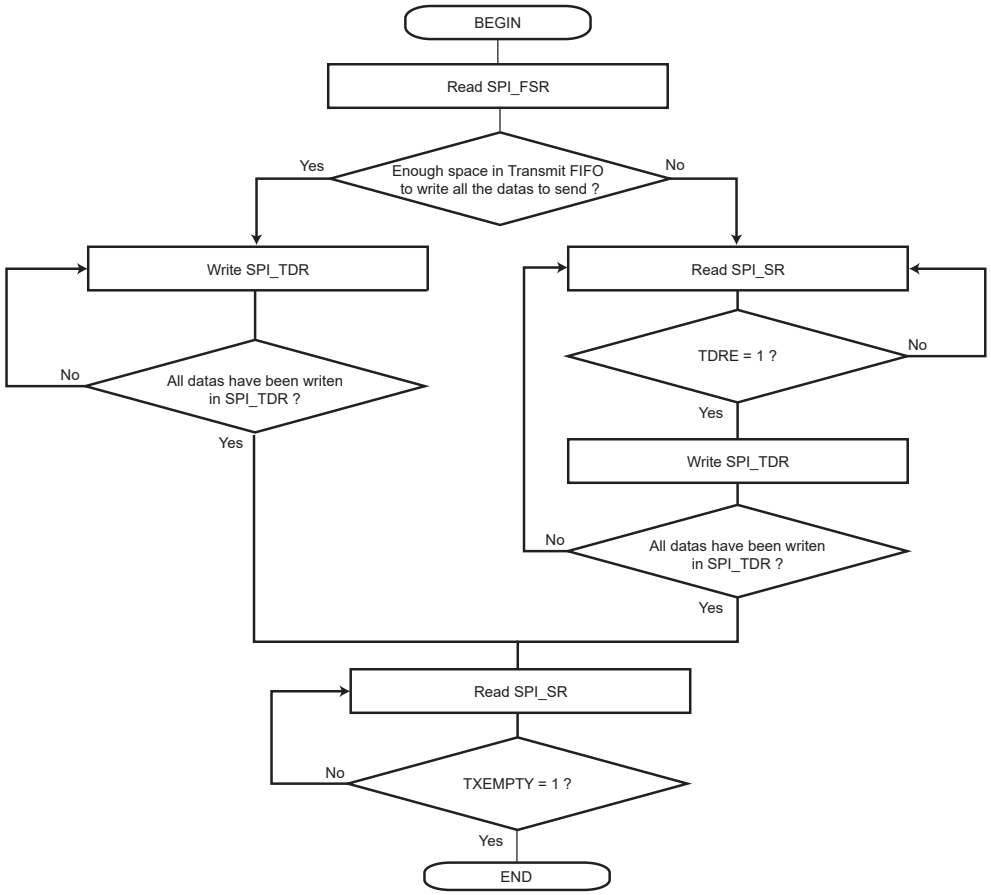
When the Transmit FIFO is enabled, write access to SPI_TDR loads the Transmit FIFO.

The FIFO level is provided in SPI_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor SPI_SR.TDRE and the data can be successively written in SPI_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in SPI_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 48-17. Sending Data with FIFO**

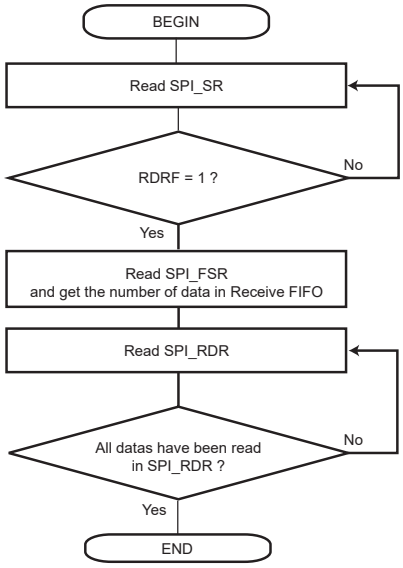


#### 48.7.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, SPI_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to ‘1’), the exact number of data can be checked with SPI_FLR.RXFL. All the data can be read successively in SPI_RDR without checking the RDRF flag between each access.

**Figure 48-18. Receiving Data with FIFO**



#### 48.7.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using SPI_CR.TXFCLR/RXFCLR.

#### 48.7.7.5 TXEMPTY, TDRE and RDRF Behavior

SPI_SR.TXEMPTY, SPI_SR.TDRE and SPI_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. Refer to figure TDRE in Single Data Mode and TXRDYM=0.

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. Refer to figure RDRF in Single Data Mode and RXRDYM=0.

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (SPI_FMR) to reduce the number of accesses to SPI_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (SPI_MR.PS=1), SPI_FMR.TXRDYM/RXRDYM must be cleared.
- In Master mode (SPI_MR.MSTR=1), SPI_FMR.RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See section SPI FIFO Mode Register for the FIFO configuration.

**Figure 48-19. TDRE in Single Data Mode and TXRDYM=0**

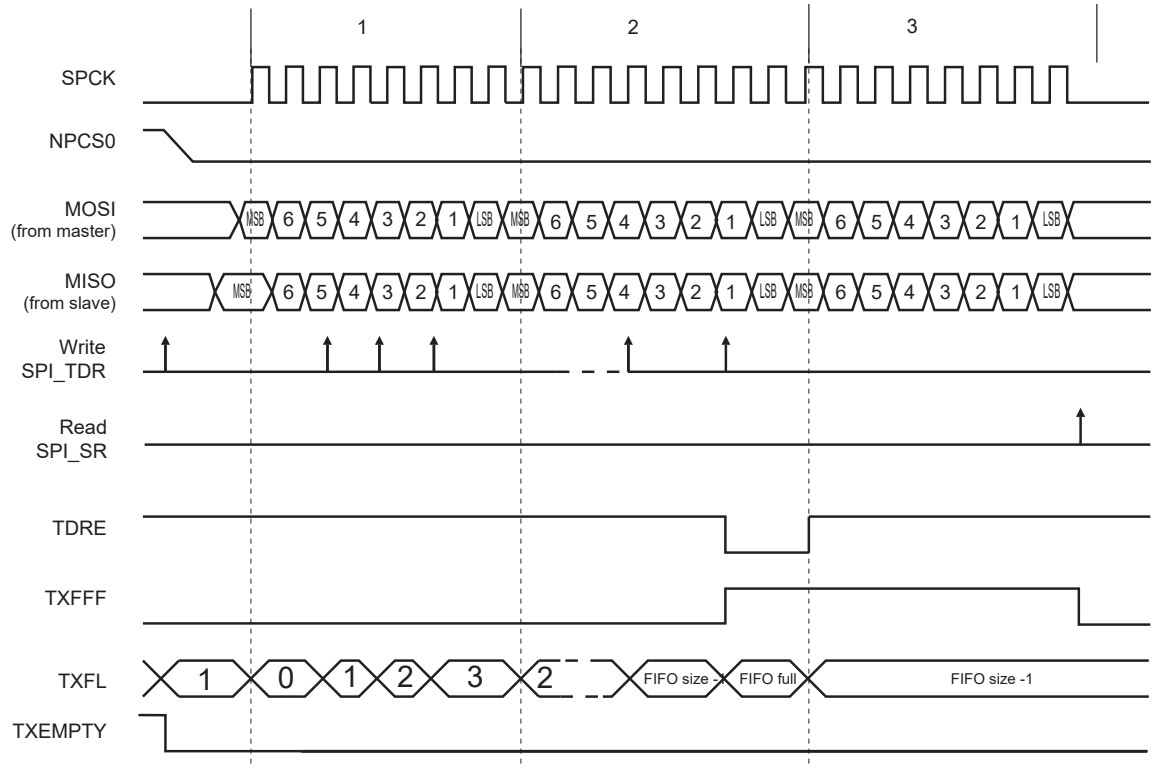


**Figure 48-20. RDRF in Single Data Mode and RXRDYM=0**

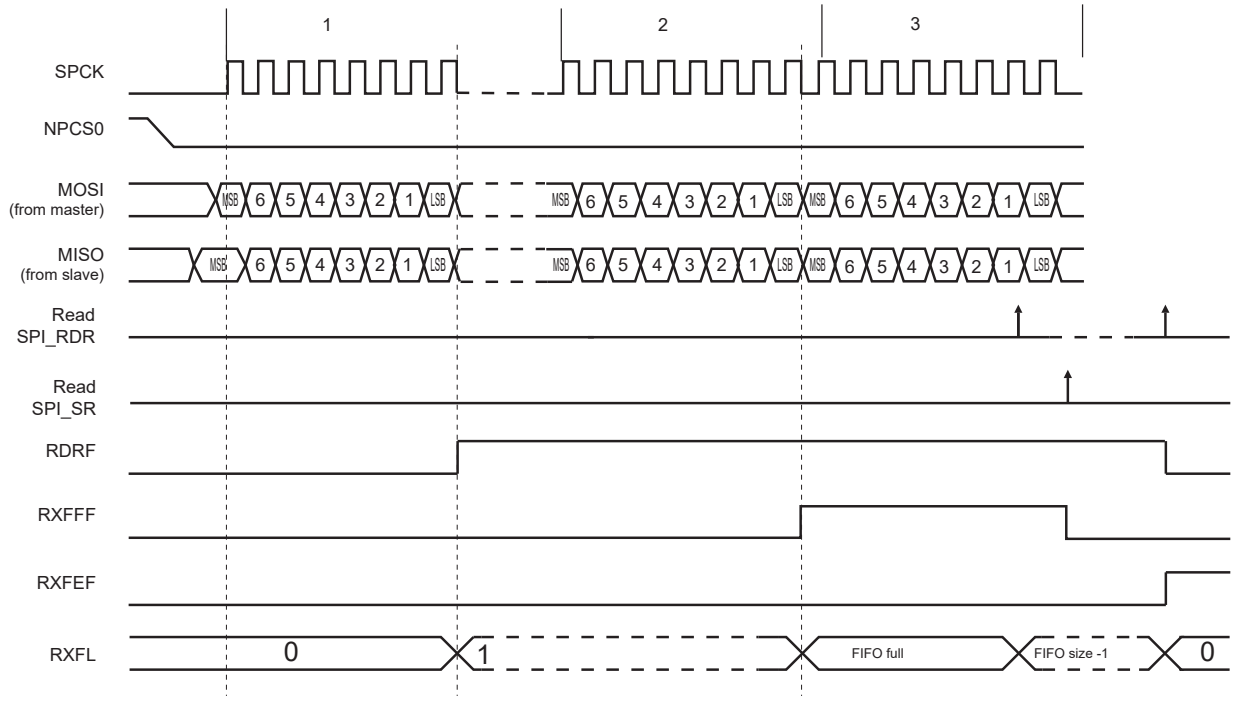

### 48.7.7.6 Single Data Mode

In Single Data mode, only one data is written every time SPI_TDR is accessed, and only one data is read every time SPI_RDR is accessed.

When SPI_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When SPI_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (SPI_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (SPI_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections SPI Transmit Data Register and SPI Receive Data Register.

#### 48.7.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on SPI_MR.PS bit value and SPI_CSRx.BITS field value.

The same conditions for transfer type apply when FIFOs are disabled.

### 48.7.7.7 Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When SPI_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When SPI_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (SPI_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when SPI_MR.PS=0.

In Multiple Data mode, up to two data can be written in one SPI_TDR write access. It is also possible to read up to four data in one SPI_RDR access if SPI_CSRx.BITS is configured to ‘0’ (8-bit data size) and up to two data if SPI_CSRx.BITS is configured to a value other than ‘0’ (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections SPI Receive Data Register (FIFO Multiple Data, 8-bit), SPI Receive Data Register (FIFO Mutliple Data, 16-bit) and SPI Transmit Data Register (FIFO Multiple Data, 8 to 16-bit).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six SPI_TDR-byte write accesses
- three SPI_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six SPI_RDR-byte read accesses
- three SPI_RDR-halfword read accesses
- one SPI_RDR-word read access and one SPI_RDR-halfword read access

#### 48.7.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same SPI_TDR/SPI_RDR access. The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of SPI_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in SPI_TDR, it is useful to configure the TXRDYM field to the value ‘1’ so that the TDRE flag is at ‘1’ only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in SPI_RDR, it is useful to configure the RXRDYM field to the value ‘2’ so that the RDRF flag is at ‘1’ only when at least four unread data are in the Receive FIFO.

#### 48.7.7.7.2 DMAC

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX_SPI_FMR.TXRDYM/RXRDYM configuration. See section Multiple Data Mode for constraints.

### 48.7.7.8 FIFO Pointer Error

A FIFO overflow is reported in SPI_SR.

If the Transmit FIFO is full and a write access is performed on SPI_TDR, it generates a Transmit FIFO pointer error and sets SPI_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in SPI_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and SPI_SR.TXFPTEF is set.

A FIFO underflow is reported in SPI_SR.

In Multiple Data mode, if the number of data read in SPI_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and SPI_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in SPI_TDR/SPI_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using SPI_CR.SWRST (configuration will be lost).

### 48.7.7.9 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using SPI_FMR.TXFTHRES. Each time the Transmit FIFO goes from the ‘above threshold’ to the ‘equal or below threshold’ state, SPI_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using SPI_FMR.RXFTHRES. Each time the Receive FIFO goes from the ‘below threshold’ to the ‘equal or above threshold’ state, SPI_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using SPI_IER and SPI_IDR.

### 48.7.7.10 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through SPI_IER and SPI_IDR.

FIFO flags state can be read in SPI_SR. They are cleared when SPI_SR is read.

### 48.7.8 Register Write Protection

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected in the SPI Write Protection Mode Register (SPI_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the SPI Write Protection Status Register (SPI_WPSR) is set and the WPVSRC field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SPI_WPSR.

The following registers are write-protected when WPEN is set in SPI_WPMR:

- SPI Mode Register
- SPI Chip Select Register

## 48.8 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SPI_CR | 7:0 | SWRST | | | | | | SPIDIS | SPIEN |
| | | 15:8 | | | | REQCLR | | | | |
| | | 23:16 | | | | | | | RXFCLR | TXFCLR |
| | | 31:24 | FIFODIS | FIFOEN | | | | | | LASTXFER |
| 0x04 | SPI_MR | 7:0 | LLB | | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS | MSTR |
| | | 15:8 | | | | CMPMODE | | | | LSBHALF |
| | | 23:16 | | | | | PCS[3:0] | | | |
| | | 31:24 | DLYBCS[7:0] | | | | | | | |
| 0x08 | SPI_RDR | 7:0 | RD[7:0] | | | | | | | |
| | | 15:8 | RD[15:8] | | | | | | | |
| | | 23:16 | | | | | PCS[3:0] | | | |
| | | 31:24 | | | | | | | | |
| 0x08 | SPI_RDR (FIFO_MULTI_DATA_8) | 7:0 | RD0[7:0] | | | | | | | |
| | | 15:8 | RD1[7:0] | | | | | | | |
| | | 23:16 | RD2[7:0] | | | | | | | |
| | | 31:24 | RD3[7:0] | | | | | | | |
| 0x08 | SPI_RDR (FIFO_MULTI_DATA_16) | 7:0 | RD0[7:0] | | | | | | | |
| | | 15:8 | RD0[15:8] | | | | | | | |
| | | 23:16 | RD1[7:0] | | | | | | | |
| | | 31:24 | RD1[15:8] | | | | | | | |
| 0x0C | SPI_TDR | 7:0 | TD[7:0] | | | | | | | |
| | | 15:8 | TD[15:8] | | | | | | | |
| | | 23:16 | | | | | PCS[3:0] | | | |
| | | 31:24 | | | | | | | | LASTXFER |
| 0x0C | SPI_TDR (FIFO_MULTI_DATA) | 7:0 | TD0[7:0] | | | | | | | |
| | | 15:8 | TD0[15:8] | | | | | | | |
| | | 23:16 | TD1[7:0] | | | | | | | |
| | | 31:24 | TD1[15:8] | | | | | | | |
| 0x10 | SPI_SR | 7:0 | | | | | OVRES | MODF | TDRE | RDRF |
| | | 15:8 | | | | | CMP | UNDES | TXEMPTY | NSSR |

### 48.8.1 SPI Control Register

**Name:** SPI_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | FIFODIS | FIFOEN | | | | | | LASTXFER |
| Access | W | W | | | | | | W |
| Reset | – | – | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | RXFCLR | TXFCLR |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | REQCLR | | | | |
| Access | | | | W | | | | |
| Reset | | | | – | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SWRST | | | | | | SPIDIS | SPIEN |
| Access | W | | | | | | W | W |
| Reset | – | | | | | | – | – |

**Bit 31 – FIFODIS** FIFO Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the Transmit and Receive FIFOs. |

**Bit 30 – FIFOEN** FIFO Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the Transmit and Receive FIFOs. |

**Bit 24 – LASTXFER** Last Transfer
Refer to section Peripheral Selection for more details.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The current NPCS is deasserted after the character written in TD has been transferred. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

**Bit 17 – RXFCLR** Receive FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Receive FIFO. |

**Bit 16 – TXFCLR** Transmit FIFO Clear

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Empties the Transmit FIFO. |

**Bit 12 – REQCLR** Request to Clear the Comparison Trigger
SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable SPI_RDR loading.

**Bit 7 – SWRST** SPI Software Reset
The SPI is in Slave mode after software reset.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Reset the SPI. A software-triggered hardware reset of the SPI interface is performed. |

**Bit 1 – SPIDIS** SPI Disable
All pins are set in Input mode after completion of the transmission in progress, if any.

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if SPI_THR is loaded.

If both SPIEN and SPIDIS are equal to one when SPI_CR is written, the SPI is disabled.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the SPI. |

**Bit 0 – SPIEN** SPI Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the SPI to transfer and receive data. |

### 48.8.2 SPI Mode Register

**Name:** SPI_MR
**Offset:** 0x04
**Reset:** 0x0
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in theSPI Write Protection Mode Register .

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DLYBCS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PCS[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | CMPMODE | | | | LSBHALF |
| Access | | | | R/W | | | | R/W |
| Reset | | | | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LLB | | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS | MSTR |
| Access | R/W | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DLYBCS[7:0]** Delay Between Chip Selects
This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is lower than 6, six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If BRSRCCLK = 0:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{\text{f}_{\text{peripheral clock}}}$$

If BRSRCCLK = 1:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{\text{f}_{\text{GCLK}}}$$

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select
This field is only used if fixed peripheral select is active (PS = 0).

If SPI_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name | Description |
|---|---|---|
| 0 | FLAG_ONLY | Any character is received and comparison function drives CMP flag. |
| 1 | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

**Bit 8 – LSBHALF** LSB Timing Selection

| Value | Description |
|---|---|
| 0 | To be used only if SPI slave LSB timing is 100% compliant with SPI standard (LSB duration is a full bit time). This value gives the better margin for SPI slave response delay (less than 1 SPCK clock cycle). |
| 1 | To be selected if the SPI slave LSB timing does not behave as the SPI standard (not triggered by NPCS deassertion in mode), the slave response delay is limited to less than 1/2 SPCK cycle. |

**Bit 7 – LLB** Local Loopback Enable
LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description |
|---|---|
| 0 | Local loopback path disabled. |
| 1 | Local loopback path enabled. |

**Bit 5 – WDRBT** Wait Data Read Before Transfer

| Value | Description |
|---|---|
| 0 | No Effect. In Master mode, a transfer can be initiated regardless of SPI_RDR state. |
| 1 | In Master mode, a transfer can start only if SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

**Bit 4 – MODFDIS** Mode Fault Detection

| Value | Description |
|---|---|
| 0 | Mode fault detection enabled |
| 1 | Mode fault detection disabled |

**Bit 3 – BRSRCCLK** Bit Rate Source Clock
If bit BRSRCCLK = 1, the SCBR field in SPI_CSRx must be programmed with a value greater than 1.

0 (PERIPH_CLK): The peripheral clock is the source clock for the bit rate generation.

1 (GCLK): PMC GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

**Bit 2 – PCSDEC** Chip Select Decode
When PCSDEC = 1, up to 15 chip select signals can be generated with the four NPCS lines using an external 4-bit to 16-bit decoder. The chip select registers define the characteristics of the 15 chip selects, with the following rules:

SPI_CSR0 defines peripheral chip select signals 0 to 3.

SPI_CSR1 defines peripheral chip select signals 4 to 7.

SPI_CSR2 defines peripheral chip select signals 8 to 11.

SPI_CSR3 defines peripheral chip select signals 12 to 14.

| Value | Description |
|---|---|
| 0 | The chip select lines are directly connected to a peripheral device. |
| 1 | The four NPCS chip select lines are connected to a 4-bit to 16-bit decoder. |

**Bit 1 – PS** Peripheral Select

| Value | Description |
|---|---|
| 0 | Fixed Peripheral Select |
| 1 | Variable Peripheral Select |

**Bit 0 – MSTR** Master/Slave Mode

| Value | Description |
|---|---|
| 0 | SPI is in Slave mode |
| 1 | SPI is in Master mode |

### 48.8.3 SPI Receive Data Register

**Name:** SPI_RDR
**Offset:** 0x08
**Reset:** 0x0
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PCS[3:0] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RD[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RD[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select
In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

When using Variable Peripheral Select mode (PS = 1 in SPI_MR), it is mandatory to set SPI_MR.WDRBT bit if the PCS field must be processed in SPI_RDR.

**Bits 15:0 – RD[15:0]** Receive Data
Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.4 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** SPI_RDR (FIFO_MULTI_DATA_8)
**Offset:** 0x08
**Reset:** 0x0
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in SPI_CR), refer to section Multiple Data Mode.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RD3[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RD2[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RD1[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RD0[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0:7, 8:15, 16:23, 24:31 – RDx** Receive Data
First unread data in the Receive FIFO. Data received by the SPI interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.5 SPI Receive Data Register (FIFO Multiple Data, 16-bit)

**Name:** SPI_RDR (FIFO_MULTI_DATA_16)
**Offset:** 0x08
**Reset:** 0x0
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in SPI_CR), refer to section Multiple Data Mode.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RD1[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RD0[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0:15, 16:31 – RDx** Receive Data
First unread data in the Receive FIFO. Data received by the SPI interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.6 SPI Transmit Data Register

**Name:** SPI_TDR
**Offset:** 0x0C
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | LASTXFER |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | PCS[3:0] | | | |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TD[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 24 – LASTXFER** Last Transfer
This field is only used if variable peripheral select is active (SPI_MR.PS = 1).

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | The current NPCS is deasserted after the transfer of the character written in TD. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select
This field is only used if variable peripheral select is active (SPI_MR.PS = 1).

If SPI_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don’t care)

If SPI_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

**Bits 15:0 – TD[15:0]** Transmit Data
Data to be transmitted by the SPI interface is stored in this register. Information to be transmitted must be written to this register in a right-justified format.

### 48.8.7 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** SPI_TDR (FIFO_MULTI_DATA)
**Offset:** 0x0C
**Reset:** –
**Property:** Write-only

If FIFO is enabled (FIFOEN bit in SPI_CR), refer to section Multiple Data Mode.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | TD1[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | OVRES | MODF | TDRE | RDRF |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 31 – RXFPTEF** Receive FIFO Pointer Error Flag
See FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Receive FIFO pointer occurred. |
| 1 | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 30 – TXFPTEF** Transmit FIFO Pointer Error Flag
See FIFO Pointer Error for details.

| Value | Description |
|---|---|
| 0 | No Transmit FIFO pointer occurred. |
| 1 | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description |
|---|---|
| 0 | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared. |
| 1 | Number of unread data in Receive FIFO has reached RXFTHRES threshold (coming from “below threshold” state to “equal or above threshold” state). |

**Bit 28 – RXFFF** Receive FIFO Full Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty or RXFE flag has been cleared. |
| 1 | Receive FIFO has become full (coming from “not full” state to “full” state). |

**Bit 27 – RXFEF** Receive FIFO Empty Flag

| Value | Description |
|---|---|
| 0 | Receive FIFO is not empty or RXFE flag has been cleared. |
| 1 | Receive FIFO has become empty (coming from “not empty” state to “empty” state). |

**Bit 26 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Number of data in Transmit FIFO is above TXFTHRES threshold. |
| 1 | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of SPI_SR. |

**Bit 25 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not full or TXFF flag has been cleared. |
| 1 | Transmit FIFO has been filled since the last read of SPI_SR. |

**Bit 24 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description |
|---|---|
| 0 | Transmit FIFO is not empty. |
| 1 | Transmit FIFO has been emptied since the last read of SPI_SR. |

**Bit 16 – SPIENS** SPI Enable Status

| Value | Description |
|---|---|
| 0 | SPI is disabled. |
| 1 | SPI is enabled. |

**Bit 11 – CMP** Comparison Status (cleared on read)

| Value | Description |
|---|---|
| 0 | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in SPI_CMPR since the last read of SPI_SR. |
| 1 | A received character matched the comparison criteria since the last read of SPI_SR. |

**Bit 10 – UNDES** Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description |
|---|---|
| 0 | No underrun has been detected since the last read of SPI_SR. |
| 1 | A transfer starts whereas no data has been loaded in SPI_TDR. |

**Bit 9 – TXEMPTY** Transmission Registers Empty (cleared by writing SPI_TDR)

| Value | Description |
|---|---|
| 0 | As soon as data is written in SPI_TDR. |
| 1 | SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description |
|---|---|
| 0 | No rising edge detected on NSS pin since the last read of SPI_SR. |
| 1 | A rising edge occurred on NSS pin since the last read of SPI_SR. |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)
An overrun occurs when SPI_RDR is loaded at least twice from the internal shift register since the last read of SPI_RDR.

| Value | Description |
|---|---|
| 0 | No overrun has been detected since the last read of SPI_SR. |
| 1 | An overrun has occurred since the last read of SPI_SR. |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No mode fault has been detected since the last read of SPI_SR. |
| 1 | A mode fault occurred since the last read of SPI_SR. |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing SPI_TDR)
When FIFOs are disabled:

0: Data has been written to SPI_TDR and not yet transferred to the internal shift register.

1: The last data written in SPI_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in section TXEMPTY, TDRE and RDRF Behavior.

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading SPI_RDR)
When FIFOs are disabled:

0: No data has been received since the last read of SPI_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to SPI_RDR since the last read of SPI_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in section TXEMPTY, TDRE and RDRF Behavior.

### 48.8.9 SPI Interrupt Enable Register

**Name:** SPI_IER
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|
| | | | | | OVRES | MODF | TDRE | RDRF |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Mask

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Mask

**Bit 29 – RXFTHF** RXFTHF Interrupt Mask

**Bit 28 – RXFFF** RXFFF Interrupt Mask

**Bit 27 – RXFEF** RXFEF Interrupt Mask

**Bit 26 – TXFTHF** TXFTHF Interrupt Mask

**Bit 25 – TXFFF** TXFFF Interrupt Mask

**Bit 24 – TXFEF** TXFEF Interrupt Mask

**Bit 11 – CMP** Comparison Interrupt Mask

**Bit 10 – UNDES** Underrun Error Interrupt Mask

**Bit 9 – TXEMPTY** Transmission Registers Empty Mask

**Bit 8 – NSSR** NSS Rising Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – MODF** Mode Fault Error Interrupt Mask

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 48.8.12 SPI Chip Select Register

**Name:** SPI_CSRx
**Offset:** 0x30 + x*0x04 [x=0..3]
**Reset:** 0
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

SPI_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DLYBCT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DLYBS[7:0] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | SCBR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BITS[3:0] | | | | CSAAT | CSNAAT | NCPHA | CPOL |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DLYBCT[7:0]** Delay Between Consecutive Transfers
This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If SPI_MR.BRSRCCLK = 0: DLYBCT = Delay Between Consecutive Transfers × $f_{peripheral\ clock}$ / 32

If SPI_MR.BRSRCCLK = 1: DLYBCT = Delay Between Consecutive Transfers × $f_{GCLK}$ / 32

**Bits 23:16 – DLYBS[7:0]** Delay Before SPCK
This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If SPI_MR.BRSRCCLK = 0: DLYBS = Delay Before SPCK × $f_{peripheral\ clock}$

If SPI_MR.BRSRCCLK = 1: DLYBS = Delay Before SPCK × $f_{GCLK}$

**Bits 15:8 – SCBR[7:0]** Serial Clock Bit Rate
In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by SPI_MR.BRSRCCLK bit. The bit rate is selected by writing a value from1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If SPI_MR.BRSRCCLK = 0: SCBR = $f_{peripheral\ clock}$ / SPCK Bit Rate

If SPI_MR.BRSRCCLK = 1: SCBR = $f_{GCLK}$ / SPCK Bit Rate

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If SPI_MR.BRSRCCLK = 1, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the SCBR fields in SPI_CSRx is set to 1, the other SCBR fields in SPI_CSRx must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

**Bits 7:4 – BITS[3:0]** Bits Per Transfer
(See Note under the register table in SPI Chip Select Register.)

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name | Description |
|---|---|---|
| 0 | 8_BIT | 8 bits for transfer |
| 1 | 9_BIT | 9 bits for transfer |
| 2 | 10_BIT | 10 bits for transfer |
| 3 | 11_BIT | 11 bits for transfer |
| 4 | 12_BIT | 12 bits for transfer |
| 5 | 13_BIT | 13 bits for transfer |
| 6 | 14_BIT | 14 bits for transfer |
| 7 | 15_BIT | 15 bits for transfer |
| 8 | 16_BIT | 16 bits for transfer |
| 9 | – | Reserved |
| 10 | – | Reserved |
| 11 | – | Reserved |
| 12 | – | Reserved |
| 13 | – | Reserved |
| 14 | – | Reserved |
| 15 | – | Reserved |

**Bit 3 – CSAAT** Chip Select Active After Transfer

| Value | Description |
|---|---|
| 0 | The Peripheral Chip Select Line rises as soon as the last transfer is achieved. |
| 1 | The Peripheral Chip Select Line does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

**Bit 2 – CSNAAT** Chip Select Not Active After Transfer (ignored if CSAAT = 1)

| Value | Description |
|---|---|
| 0 | The Peripheral Chip Select Line does not rise between two transfers if SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same chip select. |
| 1 | The Peripheral Chip Select Line rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:<br>If SPI_MR.BRSRCCLK = 0:<br>$\frac{\mathrm{DLYBCS}}{f_{\text{peripheral clock}}}$<br>If SPI_MR.BRSRCCLK = 1:<br>$\frac{\mathrm{DLYBCS}}{f_{\mathrm{GCLK}}}$<br>If field DLYBCS is lower than 6, a minimum of six periods is introduced. |

**Bit 1 – NCPHA** Clock Phase
NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description |
|---|---|
| 0 | Data is changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1 | Data is captured on the leading edge of SPCK and changed on the following edge of SPCK. |

**Bit 0 – CPOL** Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description |
|---|---|
| 0 | The inactive state value of SPCK is logic level zero. |
| 1 | The inactive state value of SPCK is logic level one. |

### 48.8.13 SPI FIFO Mode Register

**Name:** SPI_FMR
**Offset:** 0x40
**Reset:** 0x0
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFTHRES[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | RXRDYM[1:0] | | | | TXRDYM[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

**Bits 29:24 – RXFTHRES[5:0]** Receive FIFO Threshold

| Value | Description |
|---|---|
| 0–16 | Defines the Receive FIFO threshold value (number of data). SPI_SR.RXFTH will be set when the Receive FIFO goes from “below” threshold state to “equal or above” threshold state. |

**Bits 21:16 – TXFTHRES[5:0]** Transmit FIFO Threshold

| Value | Description |
|---|---|
| 0–16 | Defines the Transmit FIFO threshold value (number of data). SPI_SR.TXFTH will be set when the Transmit FIFO goes from “above” threshold state to “equal or below” threshold state. |

**Bits 5:4 – RXRDYM[1:0]** Receive Data Register Full Mode
If FIFOs are enabled, the SPI_SR.RDRF flag behaves as follows:

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO. |

| Value | Name | Description |
|---|---|---|
| 1 | TWO_DATA | RDRF will be at level ‘1’ when at least two unread data are in the Receive FIFO.<br>Cannot be used when SPI_MR.MSTR =1, or if SPI_MR.PS =1. |
| 2 | FOUR_DATA | RDRF will be at level ‘1’ when at least four unread data are in the Receive FIFO.<br>Cannot be used when SPI_CSRx.BITS is greater than 0, or if SPI_MR.MSTR =1, or if SPI_MR.PS =1. |

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode
If FIFOs are enabled, the SPI_SR.TDRE flag behaves as follows:

| Value | Name | Description |
|---|---|---|
| 0 | ONE_DATA | TDRE will be at level ‘1’ when at least one data can be written in the Transmit FIFO. |
| 1 | TWO_DATA | TDRE will be at level ‘1’ when at least two data can be written in the Transmit FIFO.<br>Cannot be used if SPI_MR.PS =1. |

### 48.8.14 SPI FIFO Level Register

**Name:** SPI_FLR
**Offset:** 0x44
**Reset:** 0x0
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | RXFL[5:0] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TXFL[5:0] | | | | | |
| Access | | | R | R | R | R | R | R |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 21:16 – RXFL[5:0]** Receive FIFO Level

| Value | Description |
|---|---|
| 0 | There is no unread data in the Receive FIFO. |
| 1-16 | Indicates the number of unread data in the Receive FIFO. |

**Bits 5:0 – TXFL[5:0]** Transmit FIFO Level

| Value | Description |
|---|---|
| 0 | There is no data in the Transmit FIFO. |
| 1-16 | Indicates the number of data in the Transmit FIFO. |

### 48.8.15 SPI Comparison Register

**Name:** SPI_CMPR
**Offset:** 0x48
**Reset:** 0x0
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | VAL2[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | VAL2[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| | VAL1[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | VAL1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – VAL2[15:0]** Second Comparison Value for Received Character

| Value | Description |
|---|---|
| 0-65535 | The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in SPI_CSR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met. |

**Bits 15:0 – VAL1[15:0]** First Comparison Value for Received Character

| Value | Description |
|---|---|
| 0-65535 | The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to set CMP flag in SPI_SR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met. |

### 48.8.16 SPI Write Protection Mode Register

**Name:** SPI_WPMR
**Offset:** 0xE4
**Reset:** 0x0
**Property:** Read/Write

See section Register Write Protection for the list of registers that can be write-protected.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | WPKEY[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII) |
| 1 | Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII) |

### 48.8.17 SPI Write Protection Status Register

**Name:** SPI_WPSR
**Offset:** 0xE8
**Reset:** 0x0
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 15:8 – WPVSRC[7:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of SPI_WPSR. |
| 1 | A write protection violation has occurred since the last read of SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 49. Quad Serial Peripheral Interface (QSPI)

## 49.1 Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Master mode.

The QSPI can be used in SPI mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors, or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories such as ROM, SRAM, DRAM, embedded Flash memory, etc.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories.

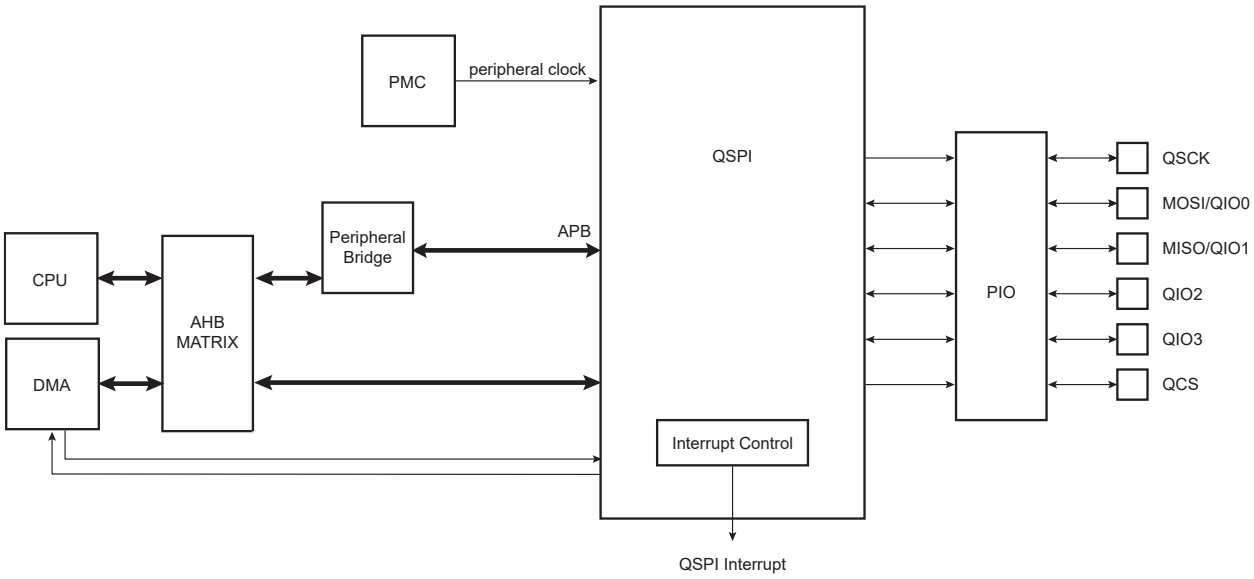
**Note:** Stacked devices with a rollover in the memory address space at each die boundary are not supported.

## 49.2 Embedded Characteristics

- Master SPI Interface
  - Programmable clock phase and clock polarity
  - Programmable transfer delays between consecutive transfers, between clock and data, between deactivation and activation of chip select
- SPI Mode
  - Interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - 8-bit/16-bit/32-bit programmable data length
- Serial Memory Mode
  - Interface to serial Flash memories operating in Single-bit SPI, Dual SPI and Quad SPI
  - Interface to serial Flash Memories operating in Single Data Rate Mode
  - Supports “Execute In Place” (XIP)— code execution by the system directly from a serial Flash memory
  - Flexible instruction register for compatibility with all serial Flash memories
  - 32-bit address mode (default is 24-bit address) to support serial Flash memories larger than 128 Mbits
  - Continuous read mode
  - Scrambling/unscrambling “On-The-Fly”
- Connection to DMA Channel Capabilities Optimizes Data Transfers
  - One channel for the receiver, one channel for the transmitter
- Register Write Protection

## 49.3 Block Diagram

**Figure 49-1. Block Diagram**



## 49.4 Signal Description

**Table 49-1. Signal Description**

| Pin Name | Pin Description | Type |
|---|---|---|
| QSCK | Serial Clock | Output |
| MOSI (QIO0) (1)(2) | Data Output (Data Input Output 0) | Output (Input/Output) |
| MISO (QIO1) (1)(2) | Data Input (Data Input Output 1) | Input (Input/Output) |
| QIO2 (3) | Data Input Output 2 | Input/Output |
| QIO3 (3) | Data Input Output 3 | Input/Output |
| QCS | Peripheral Chip Select | Output |

**Note:**

1. MOSI and MISO are used for single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.

## 49.5 Product Dependencies

### 49.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

### 49.5.2 Power Management

The QSPI may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clock.

### 49.5.3 Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

### 49.5.4 Direct Memory Access Controller (DMA)

The QSPI can be used in conjunction with the Direct Memory Access Controller (DMA) in order to reduce processor overhead. For a full description of the DMA, refer to the section “DMA Controller (XDMAC)”.

## 49.6 Functional Description

### 49.6.1 Serial Clock Baud Rate

The QSPI baud rate clock is generated by dividing the peripheral clock by a value between 1 and 256.

### 49.6.2 Serial Clock Phase and Polarity

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI_SCR). The CPHA bit in the QSPI_SCR programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced slave must use the same parameter values to communicate.

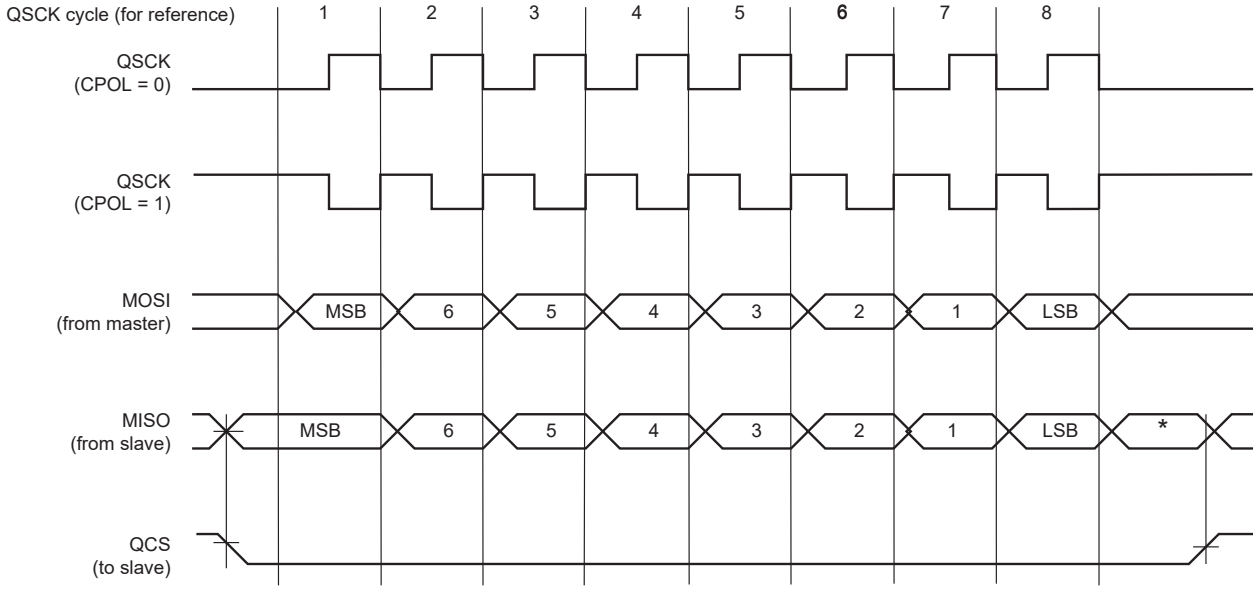
The table below shows the four modes and corresponding parameter settings.

**Table 49-2. QSPI Bus Clock Modes**

| QSPI Clock Mode | QSPI_SCR.CPOL | QSPI_SCR.CPHA | Shift QSCK Edge | Capture QSCK Edge | QSCK Inactive Level |
|---|---|---|---|---|---|
| 0 | 0 | 0 | Falling | Falling | Low |
| 1 | 0 | 1 | Rising | Rising | Low |
| 2 | 1 | 0 | Rising | Rising | High |
| 3 | 1 | 1 | Falling | Falling | High |

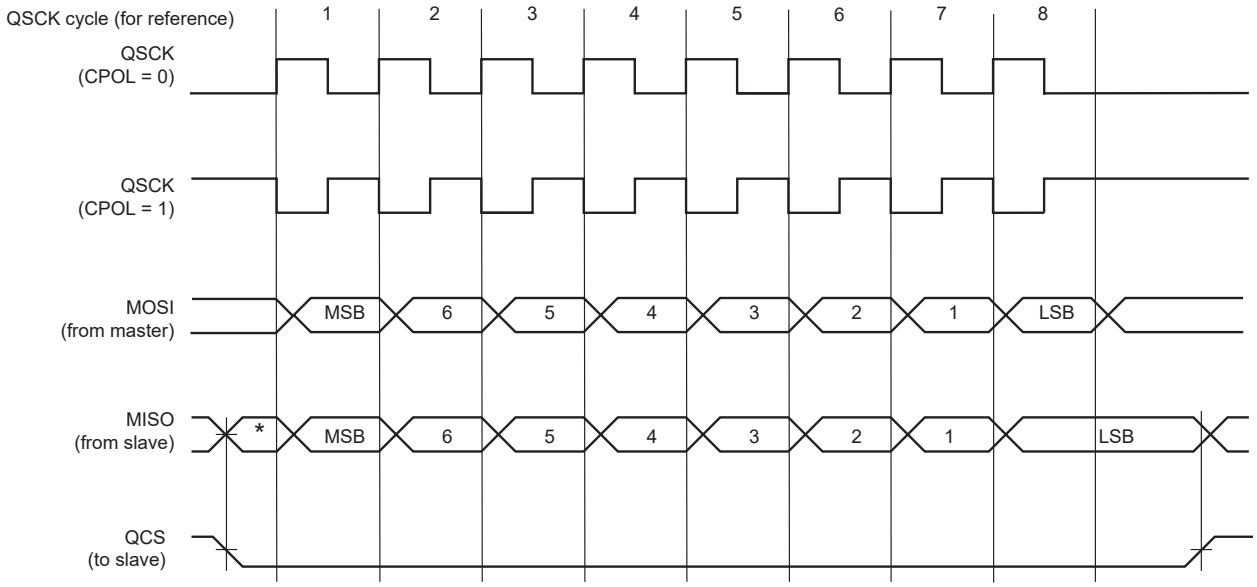
The following figures show examples of data transfers.

**Figure 49-2. QSPI Transfer Format (QSPI_SCR.CPHA = 0, 8 bits per transfer)**



* Not defined, but normally MSB of previous character received.

**Figure 49-3. QSPI Transfer Format (QSPI_SCR.CPHA = 1, 8 bits per transfer)**



* Not defined but normally LSB of previous character transmitted.

### 49.6.3 Transfer Delays

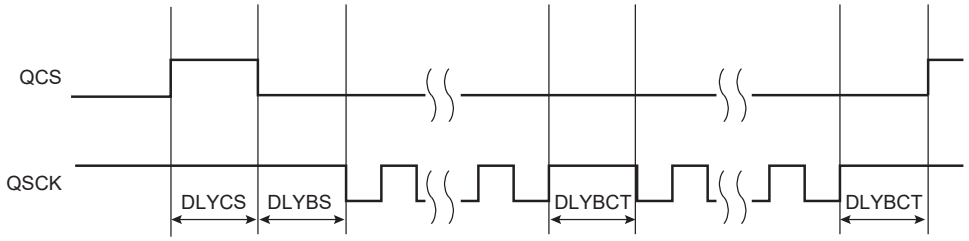
The figure below shows several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI_MR.DLYCS. Allows to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI_SR.DLYBS. Allows the start of QSCK to be delayed after the chip select has been asserted.

- The delay between consecutive transfers, programmed by writing QSPI_MR.DLYBCT. Allows insertion of a delay between two consecutive transfers. In Serial Memory mode, this delay is not programmable and DLYBCT is ignored. In this mode, DLYBCT must be written to ‘0’.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 49-4. Programmable Delays**



### 49.6.4 QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI Master.

To activate this mode, QSPI_MR.SMM must be written to ‘0’ in QSPI_MR.

#### 49.6.4.1 SPI Mode Operations

The QSPI in standard SPI mode operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave connected to the SPI bus. The QSPI drives the chip select line to the slave (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI_TDR) and the Receive Data register (QSPI_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to the QSPI_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the Status register (QSPI_SR) can be discarded.

If new data is written in QSPI_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to the QSPI_RDR, the data in QSPI_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in the QSPI_SR. When new data is written in QSPI_TDR, this bit is cleared. QSPI_SR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in the QSPI_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI_SR.TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

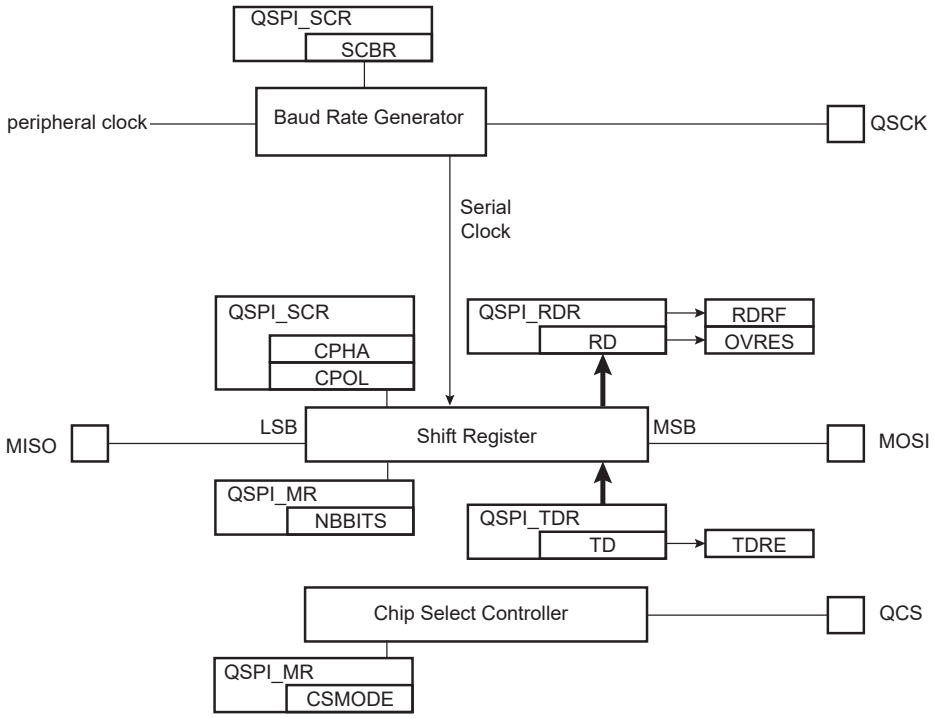
The transfer of received data from the internal shift register in QSPI_RDR is indicated by the Receive Data Register Full (RDRF) bit in the QSPI_SR. When the received data is read, QSPI_SR.RDRF bit is cleared.

If the QSPI_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI_SR is set. As long as this flag is set, data is loaded in QSPI_RDR. The user must read the QSPI_SR to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode, and a flow chart describing how transfers are handled.

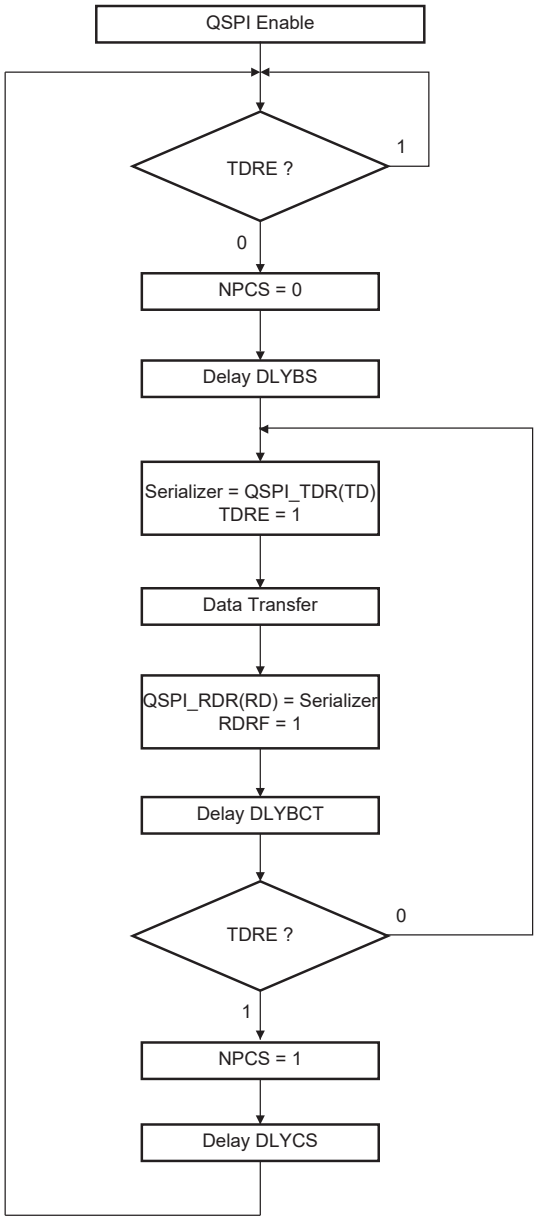
#### 49.6.4.2 SPI Mode Block Diagram

**Figure 49-5. SPI Mode Block Diagram**



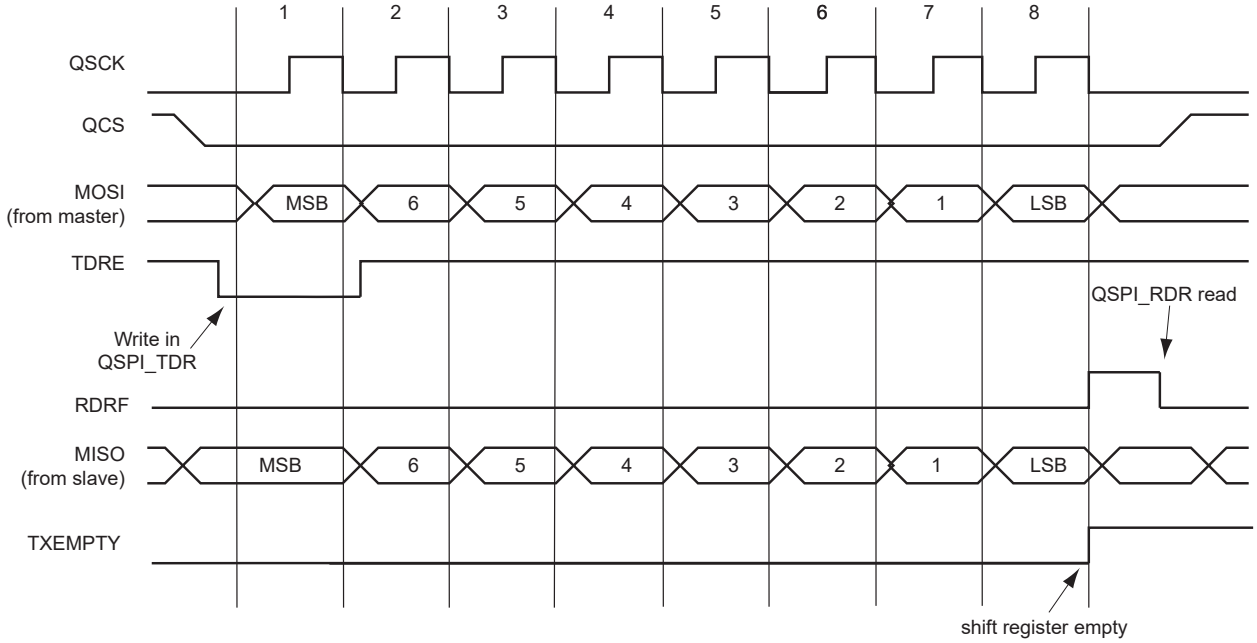
#### 49.6.4.3 SPI Mode Flow Diagram

**Figure 49-6. SPI Mode Flow Diagram**



The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI_SR during an 8-bit data transfer in Fixed mode, without DMA.

**Figure 49-7. Status Register Flags Behavior**



#### 49.6.4.4 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, the QSPI_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. Depending on the application software handling the QSPI_SR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI_MR gives even less time for the processor to reload the QSPI_TDR. With some SPI slave peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI_MR.CSMODE may be configured to ‘1’. This allows the chip select lines to remain in their current state (low = active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI_CR). Even if the QSPI_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI_CR.LASTXFER must be written to ‘1’ at the same time or after writing the last data to transmit into the QSPI_TDR.

#### 49.6.4.5 Peripheral Deselection with DMA

When the DMA Controller is used, the Chip Select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading the QSPI_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI_MR.CSMODE to ‘1’ may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM, may lengthen the reload time of the QSPI_TDR by the DMA as well. This means that the QSPI_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and according to some SPI Slave devices, the communication might get lost. It may be necessary to configure QSPI_MR.CSMODE to ‘1’.

When QSPI_MR.CSMODE is configured to ‘0’, the QCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the flag TDRE rises as soon as the content of the QSPI_TDR is transferred into the internal shifter. When this flag is detected, the QSPI_TDR can be reloaded. If this reload occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. This might lead to difficulties for interfacing with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, the QSPI_MR may be configured with QSPI_MR.CSMODE at ‘2’.

### 49.6.5 QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XIP execute in place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with single-bit SPI, Dual SPI and Quad SPI protocols.

To activate this mode, QSPI_MR.SMM must be written to ‘1’.

In Serial Memory mode, data is transferred either by QSPI_TDR and QSPI_RDR or by writing or read in the QSPI memory space (0x90000000/0x98000000/0xD0000000/0xD8000000) depending on TFRTYP and SMRM configuration.

#### 49.6.5.1 Instruction Frame

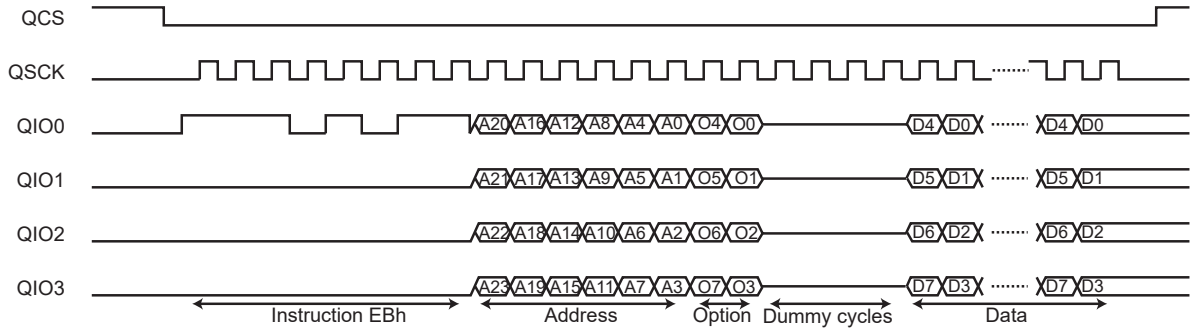
In order to control serial Flash memories, the QSPI is able to send instructions via the SPI bus (ex: READ, PROGRAM, ERASE, LOCK, etc.). Because the instruction set implemented in serial Flash memories is memory vendor-dependent, the QSPI includes a complete Instruction Frame register (QSPI_IFR), which makes it very flexible and compatible with all serial Flash memories.

An instruction frame includes:

- An instruction code (size: 8 bits). The instruction is optional in some cases (see section Continuous Read mode).
- An address (size: 24 bits or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default the address is 24 bits long, but it can be 32 bits long to support serial Flash memories larger than 128 Mbits (16 Mbytes).
- An option code (size: 1/2/4/8 bits). The option code is not required, but it is useful to activate the XIP mode or the Continuous Read mode (see section Continuous Read mode) for READ instructions, in some serial Flash memory devices. These modes improve the data read latency.
- Dummy cycles. Dummy cycles are optional but required by some READ instructions.
- Data bytes are optional. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with Single-bit SPI, Dual SPI or Quad SPI protocols.

**Figure 49-8. Instruction Frame**



### 49.6.5.2 Instruction Frame Transmission

To send an instruction frame, the user must first configure the address to send by writing the field ADDR in the Instruction Address register (QSPI_IAR). This step is required if the instruction frame includes an address and no data. When data is present, the address of the instruction is defined by the address of the data accesses in the QSPI memory space, not by QSPI_IAR.

If the instruction frame includes the instruction code and/or the option code, the user must configure the instruction code and/or the option code to send by writing the fields INST and OPT in the Instruction Code register (QSPI_ICR).

Then, the user must write QSPI_IFR to configure the instruction frame depending on which instruction must be sent. If the instruction frame does not include data, writing in this register triggers the send of the instruction frame in the QSPI. If the instruction frame includes data, the send of the instruction frame is triggered by the first data access in the QSPI memory space.

The instruction frame is configured by the following bits and fields of QSPI_IFR:

- WIDTH field—used to configure which data lanes are used to send the instruction code, the address, the option code and to transfer the data. It is possible to use two unidirectional data lanes (MISO-MOSI Single-bit SPI), two bidirectional data lanes (QIO0-QIO1 Dual SPI) or four bidirectional data lanes (QIO0–QIO3 Quad SPI).
- INSTEN bit—used to enable the send of an instruction code.
- ADDREN bit—used to enable the send of an address after the instruction code.
- OPTEN bit—used to enable the send of an option code after the address.
- DATAEN bit—used to enable the transfer of data (READ or PROGRAM instruction).
- OPTL field—used to configure the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRL bit—used to configure the address length.
- TFRTYP field—used to define which type of data transfer must be performed.
- NBDUM field—used to configure the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are inserted by the serial Flash memory.

Refer to 49.6.5.2 Instruction Frame Transmission.

If data transfer is enabled, the user can access the serial memory by reading or writing the QSPI memory space:

- To read in the serial memory, but not a memory data, for example a JEDEC-ID or the QSPI_SR, QSPI_IFR.TFRTYP must be written to ‘0’.
- To read in the serial memory, and particularly a memory data, TFRTYP must be written to ‘1’.
- To write in the serial memory, but not a memory data, for example writing the configuration or the QSPI_SR, TFRTYP must be written to ‘2’.
- If the user wants to write in the serial memory in particular to program a memory data, TFRTYP must be written to ‘3’ .

If QSPI_IFR.TFRTYP has a value other than ‘1’ and QSPI_MR.SMRM = 0, the address sent in the instruction frame is the address of the first system bus accesses. The addresses of the next accesses are not used by the QSPI. At each system bus access, an SPI transfer is performed with the same size. For example, a halfword system bus access leads to a 16-bit SPI transfer, and a byte system bus access leads to an 8-bit SPI transfer.

If SMRM = 1 and TFRTYP= (0 or 2), accesses are made via the QSPI registers and the address sent in the instruction frame is the address defined in QSPI_IAR.

Each time QSPI_IFR is written (in case of read access), or each time QSPI_TDR is written (in case of write transfer), an SPI transfer is performed with a byte size. Another byte is read each time QSPI_RDR is read (flag RDRF shows when a data can be read in QSPI_RDR) or written each time QSPI_TDR is written (flag TDRE shows when a new data can be written). The SPI transfer ends by writing QSPI_CR.LASTXFER.

If TFRTYP = 1, the address of the first instruction frame is the one of the first read access in the QSPI memory space. Each time the read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the last system bus access address. In this way, the system can read data at a random location in the serial memory. The size of the SPI transfers may differ from the size of the system bus read accesses.

When data transfer is not enabled, the end of the instruction frame is indicated when QSPI_SR.INSTRE rises. (The QSPI_SR.CSR flag indicates when chip select rises. A delay between these flags may exist in case of high clock division or a high DLYBCT value).

When data transfer is enabled, the user must indicate when the data transfer is completed in the QSPI memory space by setting QSPI_CR.LASTXFR. The end of the instruction frame is indicated when QSPI_SR.INSTRE rises.

The following figure illustrates instruction transmission management.

#### 49.6.5.3 Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI_IFR.DATAEN = 1 and QSPI_IFR.TFRTYP = 1.

In this mode, the QSPI is able to read data at random address into the serial Flash memory, allowing the CPU to execute code directly from it (XIP execute-in-place).

In order to fetch data, the user must first configure the instruction frame by writing the QSPI_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses match the address of the data inside the serial Flash memory.

When Fetch mode is enabled, several instruction frames can be sent before writing QSPI_CR.LASTXFR. Each time the system bus read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the corresponding address.

#### 49.6.5.4 Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

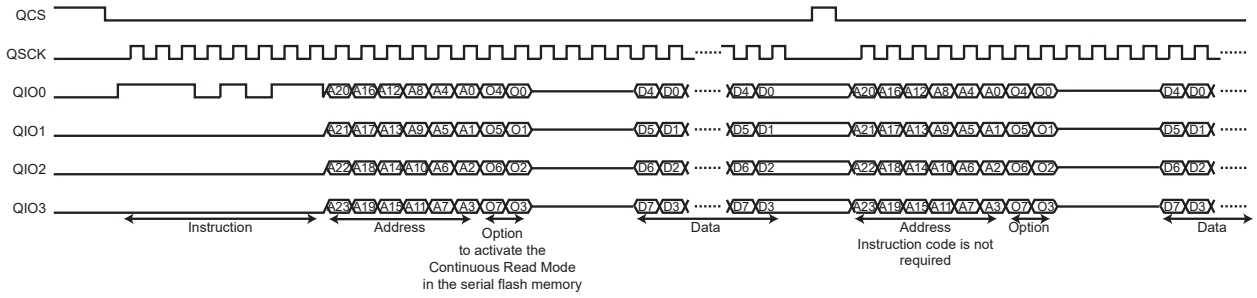
In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI_IFR.TFRTYP = 1). The addresses of the system bus read accesses are often nonsequential and this leads to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to '1' in the QSPI_IFR (TFRTYP must equal 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

**⚠ CAUTION** If the Continuous Read mode is not supported by the serial Flash memory or disabled, CRM bit must not be written to '1', otherwise data read out of the serial Flash memory is unpredictable.

**Figure 49-9. Continuous Read Mode**



#### 49.6.5.5 Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI_SCR.CPOL = 0 and QSPI_SCR.CPHA = 0; see section Serial Clock Phase and Polarity).

All system bus accesses described below refer to the system bus address phase. System bus wait cycles and system bus data phases are not shown.

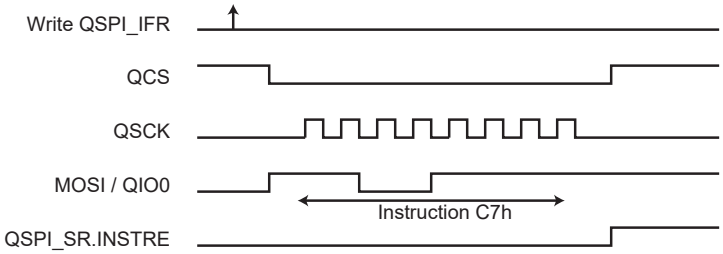
Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000_00C7 in QSPI_ICR.
- Write 0x0000_0010 in QSPI_IFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-10. Instruction Transmission Waveform 1**



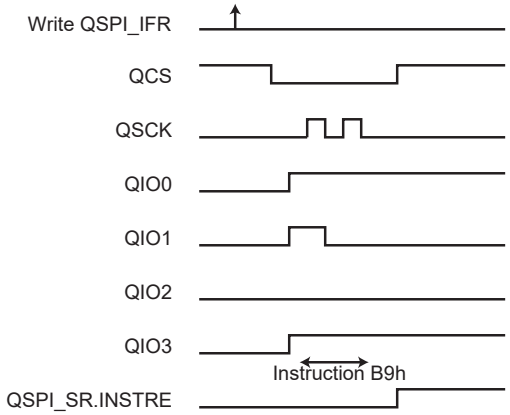
Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000_00B9 in QSPI_ICR.
- Write 0x0000_0016 in QSPI_IFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-11. Instruction Transmission Waveform 2**



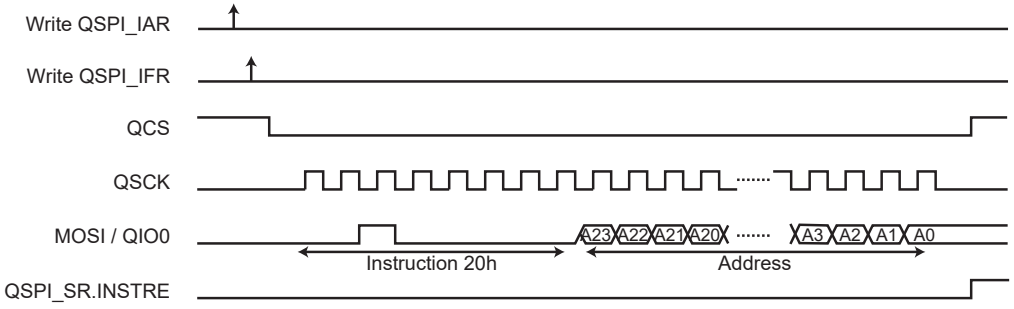
Example 3:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

- Write the address (of the block to erase) in QSPI_AR.
- Write 0x0000_0020 in QSPI_ICR.
- Write 0x0000_0030 in QSPI_IFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-12. Instruction Transmission Waveform 3**



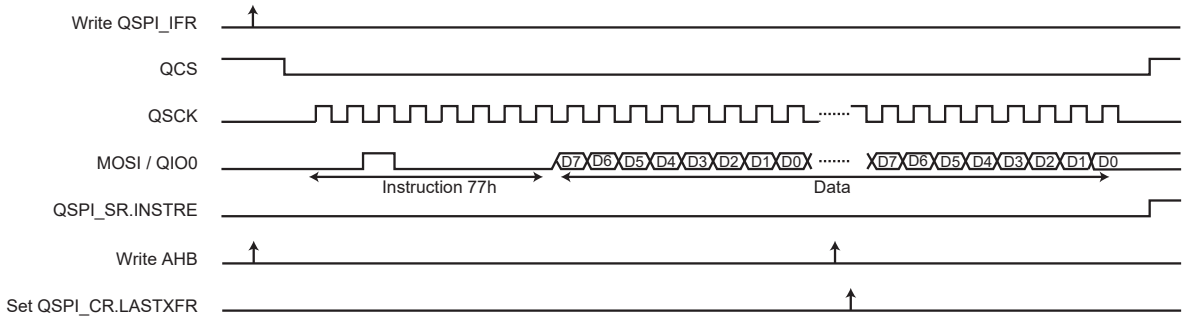
Example 4:

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000_0077 in QSPI_ICR.
- Write 0x0000_2090 in QSPI_IFR.
- Read QSPI_IFR (dummy read) to synchronize system bus accesses.
- Write data in the system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of system bus write accesses is not used.
- Write a '1' to QSPI_CR.LASTXFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-13. Instruction Transmission Waveform 4**



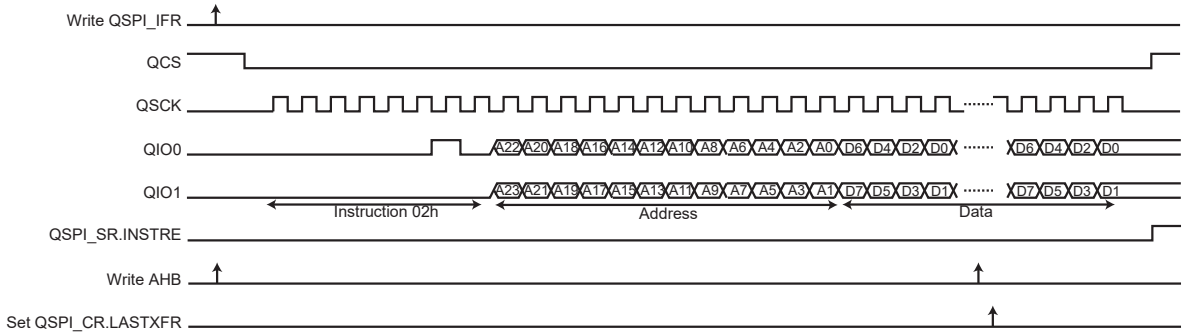
Example 5:

Instruction in Single-bit SPI, with address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000_0002 in QSPI_ICR.
- Write 0x0000_30B3 in QSPI_IFR.
- Read QSPI_IFR (dummy read) to synchronize system bus accesses.
- Write data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).
  The address of the first system bus write access is sent in the instruction frame.
  The address of the next system bus write accesses is not used.
- Write a '1' to QSPI_CR.LASTXFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-14. Instruction Transmission Waveform 5**



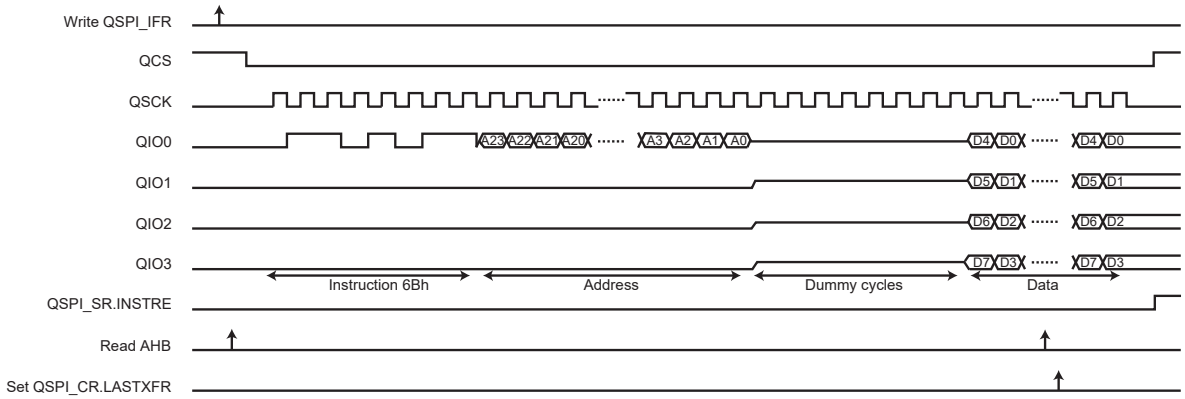
Example 6:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD_OUTPUT READ ARRAY (6Bh)

- Write 0x0000_006B in QSPI_ICR.
- Write 0x0008_10B2 in QSPI_IFR.
- Read QSPI_IR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).
  The address of the first system bus read access is sent in the instruction frame.
  The address of the next system bus read accesses is not used.
- Write a '1' to QSPI_CR.LASTXFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-15. Instruction Transmission Waveform 6**



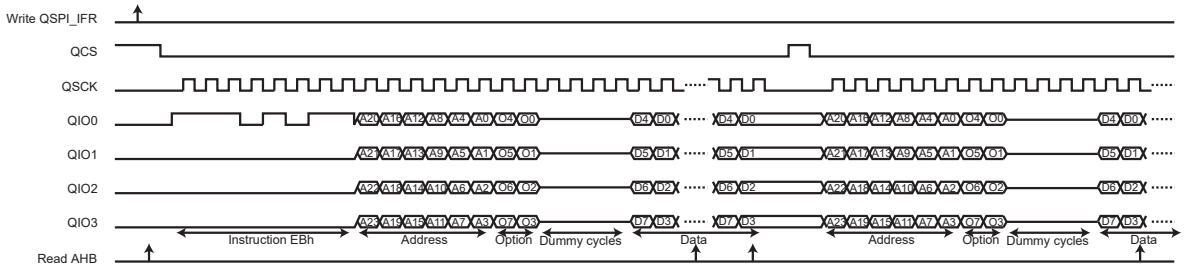
Example 7:

Instruction in Single-bit SPI, with address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles, with fetch and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030_00EB in QSPI_ICR.
- Write 0x0004_33F4 in QSPI_IFR.
- Read QSPI_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).
  Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI_CR.LASTXFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-16. Instruction Transmission Waveform 7**



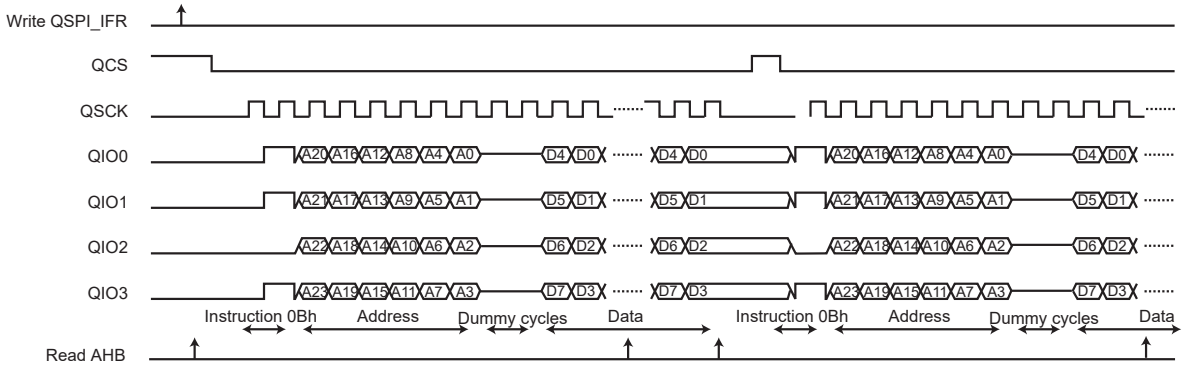
Example 8:

Instruction in Quad SPI, with address in Quad SPI, without option, with data read in Quad SPI, with two dummy cycles, with fetch.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000_000B in QSPI_ICR.
- Write 0x0002_20B6 in QSPI_IFR.
- Read QSPI_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).
  Fetch is enabled, the address of the system bus read accesses is always used.
- Write a ‘1’ to QSPI_CR.LASTXFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-17. Instruction Transmission Waveform 8**



Example 9:

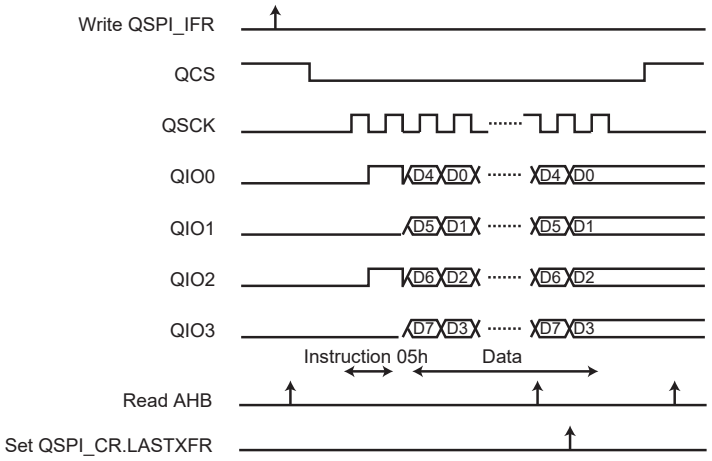
Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

Command: HIGH-SPEED READ (05h)

- Write 0x0000_0005 in QSPI_ICR.
- Write 0x0000_0096 in QSPI_IFR.
- Read QSPI_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).
  Fetch is disabled.
- Write a ‘1’ to QSPI_CR.LASTXFR.

- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-18. Instruction Transmission Waveform 9**



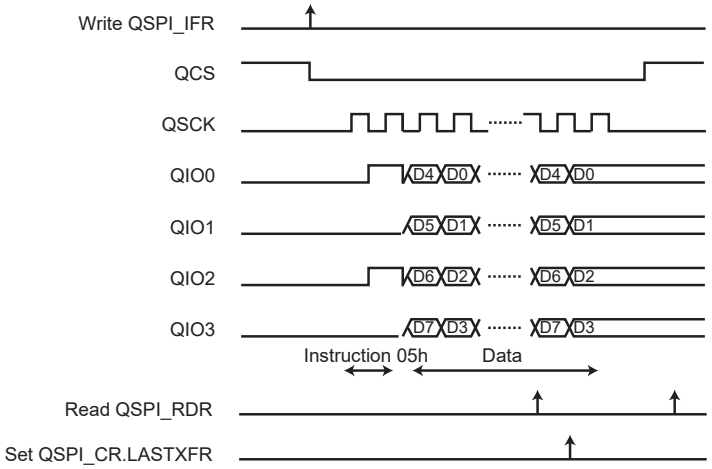
Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch, read launched through APB interface.

Command: HIGH-SPEED READ (05h)

- Set SMRM to ‘1’ in QSPI_MR
- Write 0x0000_0005 in QSPI_ICR.
- Write 0x0100_0096 in QSPI_IFR (will start the transfer).
- Wait flag RDRF and Read data in the QSPI_RDR register
  Fetch is disabled.
- Write a ‘1’ to QSPI_CR.LASTXFR.
- Wait for QSPI_SR.INSTRE to rise.

**Figure 49-19. Instruction Transmission Waveform 10**



### 49.6.6 Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories. Data is scrambled when written to memory and unscrambled when data is read.

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI slave device (e.g., memory).

The scrambling/unscrambling function can be enabled by writing a '1' to the SCREN bit in the QSPI Scrambling Mode Register (QSPI_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key Register (QSPI_SKR). QSPI_SKR is only accessible in Write mode.

If QSPI_SMR.RVDIS is written to '0', the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI_SMR.RVDIS is written to '1', the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

### 49.6.7 Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the QSPI Write Protection Mode Register (QSPI_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the QSPI Write Protection Status Register (QSPI_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the QSPI_WPSR.

The following registers can be write-protected when WPEN is set in QSPI_WPMR:

- QSPI Mode Register
- QSPI Serial Clock Register
- QSPI Scrambling Mode Register
- QSPI Scrambling Key Register

## 49.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | QSPI_CR | 7:0 | SWRST | | | | | | QSPIDIS | QSPIEN |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | LASTXFER |
| 0x04 | QSPI_MR | 7:0 | | | CSMODE[1:0] | | SMRM | WDRBT | LLB | SMM |
| | | 15:8 | | | | | NBBITS[3:0] | | | |
| | | 23:16 | DLYBCT[7:0] | | | | | | | |
| | | 31:24 | DLYCS[7:0] | | | | | | | |
| 0x08 | QSPI_RDR | 7:0 | RD[7:0] | | | | | | | |
| | | 15:8 | RD[15:8] | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x0C | QSPI_TDR | 7:0 | TD[7:0] | | | | | | | |
| | | 15:8 | TD[15:8] | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x10 | QSPI_SR | 7:0 | | | | | OVRES | TXEMPTY | TDRE | RDRF |
| | | 15:8 | | | | | | INSTRE | CSS | CSR |
| | | 23:16 | | | | | | | | |

### 49.7.1 QSPI Control Register

**Name:** QSPI_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | LASTXFER |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SWRST | | | | | | QSPIDIS | QSPIEN |
| Access | W | | | | | | W | W |
| Reset | – | | | | | | – | – |

**Bit 24 – LASTXFER** Last Transfer

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The chip select is deasserted after the character written in QSPI_TDR.TD has been transferred. |

**Bit 7 – SWRST** QSPI Software Reset
DMA channels are not affected by software reset.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Reset the QSPI. A software-triggered hardware reset of the QSPI interface is performed. |

**Bit 1 – QSPIDIS** QSPI Disable
As soon as QSPIDIS is set, the QSPI finishes its transfer.

All pins are set in Input mode and no data is received or transmitted.

If a transfer is in progress, the transfer is finished before the QSPI is disabled.

If both QSPIEN and QSPIDIS are equal to one when QSPI_CR is written, the QSPI is disabled.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the QSPI. |

**Bit 0 – QSPIEN** QSPI Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the QSPI to transfer and receive data. |

### 49.7.2 QSPI Mode Register

**Name:** QSPI_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the QSPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DLYCS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DLYBCT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | NBBITS[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | CSMODE[1:0] | | SMRM | WDRBT | LLB | SMM |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:24 – DLYCS[7:0]** Minimum Inactive QCS Delay
This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time guarantees the slave minimum deselect time.

If DLYCS written to ‘0’, one peripheral clock period is inserted by default.

Otherwise, the following equation determines the delay:

DLYCS = Minimum inactive × $f_{peripheral\ clock}$

**Bits 23:16 – DLYBCT[7:0]** Delay Between Consecutive Transfers
This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT is written to ‘0’, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. In Serial Memory mode (SMM = 1), DLYBCT must be written to ‘0’ and no delay is inserted.

Otherwise, the following equation determines the delay:

DLYBCT = (Delay Between Consecutive Transfers × $f_{peripheral\ clock}$) / 32

**Bits 11:8 – NBBITS[3:0]** Number Of Bits Per Transfer

| Value | Name | Description |
|---|---|---|
| 0 | 8_BIT | 8 bits for transfer |
| 8 | 16_BIT | 16 bits for transfer |

**Bits 5:4 – CSMODE[1:0]** Chip Select Mode
The CSMODE field determines how the chip select is deasserted

**Note:** This field is forced to LASTXFER when SMM is written to '1'.

| Value | Name | Description |
|---|---|---|
| 0 | NOT_RELOADED | The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer. |
| 1 | LASTXFER | The chip select is deasserted when the bit LASTXFER is written to '1' and the character written in QSPI_TDR.TD has been transferred. |
| 2 | SYSTEMATICALLY | The chip select is deasserted systematically after each transfer. |

**Bit 3 – SMRM** Serial Memory Register Mode

| Value | Description |
|---|---|
| 0 | Serial Memory registers are written via AHB access. See section Instruction Frame Transmission for details. |
| 1 | Serial Memory registers are written via APB access. See section Instruction Frame Transmission for details. |

**Bit 2 – WDRBT** Wait Data Read Before Transfer
0 (DISABLED): No effect. In SPI mode, a transfer can be initiated whatever the state of the QSPI_RDR is.

1 (ENABLED): In SPI mode, a transfer can start only if the QSPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

**Bit 1 – LLB** Local Loopback Enable
0 (DISABLED): Local loopback path disabled.

1 (ENABLED): Local loopback path enabled.

LLB controls the local loopback on the data serializer for testing in SPI mode only. (MISO is internally connected on MOSI).

**Bit 0 – SMM** Serial Memory Mode
0 (SPI): The QSPI is in SPI mode.

1 (MEMORY): The QSPI is in Serial Memory mode.

### 49.7.3 QSPI Receive Data Register

**Name:** QSPI_RDR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RD[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RD[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:0 – RD[15:0]** Receive Data
Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

### 49.7.4 QSPI Transmit Data Register

**Name:** QSPI_TDR
**Offset:** 0x0C
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TD[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 15:0 – TD[15:0]** Transmit Data
Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

### 49.7.5 QSPI Status Register

**Name:** QSPI_SR
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | QSPIENS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | INSTRE | CSS | CSR |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | OVRES | TXEMPTY | TDRE | RDRF |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 24 – QSPIENS** QSPI Enable Status

| Value | Description |
|---|---|
| 0 | QSPI is disabled. |
| 1 | QSPI is enabled. |

**Bit 10 – INSTRE** Instruction End Status (cleared on read)

| Value | Description |
|---|---|
| 0 | No instruction end has been detected since the last read of QSPI_SR. |
| 1 | At least one instruction end has been detected since the last read of QSPI_SR. |

**Bit 9 – CSS** Chip Select Status

| Value | Description |
|---|---|
| 0 | The chip select is asserted. |
| 1 | The chip select is not asserted. |

**Bit 8 – CSR** Chip Select Rise (cleared on read)

| Value | Description |
|---|---|
| 0 | No chip select rise has been detected since the last read of QSPI_SR. |
| 1 | At least one chip select rise has been detected since the last read of QSPI_SR. |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)
An overrun occurs when QSPI_RDR is loaded at least twice from the serializer since the last read of the QSPI_RDR.

| Value | Description |
|---|---|
| 0 | No overrun has been detected since the last read of QSPI_SR. |
| 1 | At least one overrun error has occurred since the last read of QSPI_SR. |

**Bit 2 – TXEMPTY** Transmission Registers Empty (cleared by writing QSPI_TDR)

| Value | Description |
|---|---|
| 0 | As soon as data is written in QSPI_TDR. |
| 1 | QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay. |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing QSPI_TDR)
TDRE equals zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

| Value | Description |
|---|---|
| 0 | Data has been written to QSPI_TDR and not yet transferred to the serializer. |
| 1 | The last data written in the QSPI_TDR has been transferred to the serializer. |

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading QSPI_RDR)

| Value | Description |
|---|---|
| 0 | No data has been received since the last read of QSPI_RDR. |
| 1 | Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR. |

### 49.7.6 QSPI Interrupt Enable Register

**Name:** QSPI_IER
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | INSTRE | CSS | CSR |
| Access | | | | | | W | W | W |

| | | | | | OVRES | TXEMPTY | TDRE | RDRF |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

**Bit 10 – INSTRE** Instruction End Interrupt Enable

**Bit 9 – CSS** Chip Select Status Interrupt Enable

**Bit 8 – CSR** Chip Select Rise Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – TXEMPTY** Transmission Registers Empty Enable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 49.7.7 QSPI Interrupt Disable Register

**Name:** QSPI_IDR
**Offset:** 0x18
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | INSTRE | CSS | CSR |
| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | OVRES | TXEMPTY | TDRE | RDRF |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

**Bit 10 – INSTRE** Instruction End Interrupt Disable

**Bit 9 – CSS** Chip Select Status Interrupt Disable

**Bit 8 – CSR** Chip Select Rise Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – TXEMPTY** Transmission Registers Empty Disable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 49.7.8 QSPI Interrupt Mask Register

**Name:** QSPI_IMR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |

**Bit 10 – INSTRE** Instruction End Interrupt Mask

**Bit 9 – CSS** Chip Select Status Interrupt Mask

**Bit 8 – CSR** Chip Select Rise Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – TXEMPTY** Transmission Registers Empty Mask

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 49.7.9 QSPI Serial Clock Register

**Name:** QSPI_SCR
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the QSPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DLYBS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | SCBR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | CPHA | CPOL |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bits 23:16 – DLYBS[7:0]** Delay Before QSCK
This field defines the delay from QCS valid to the first valid QSCK transition.

When DLYBS equals zero, the QCS valid to QSCK transition is 1/2 the QSCK clock period.

Otherwise, the following equation determines the delay:

DLYBS = Delay Before QSCK × $f_{peripheral\ clock}$

**Bits 15:8 – SCBR[7:0]** Serial Clock Baud Rate
The QSPI uses a modulus counter to derive the QSCK baud rate from the peripheral clock. The baud rate is selected by writing a value from 0 to 255 in the SCBR field. The following equation determines the QSCK baud rate:

SCBR = ($f_{peripheral\ clock}$ / QSCK Baudrate) - 1

**Bit 1 – CPHA** Clock Phase
CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description |
|---|---|
| 0 | Data is captured on the leading edge of QSCK and changed on the following edge of QSCK. |

| Value | Description |
|---|---|
| 1 | Data is changed on the leading edge of QSCK and captured on the following edge of QSCK. |

**Bit 0 – CPOL** Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description |
|---|---|
| 0 | The inactive state value of QSCK is logic level zero. |
| 1 | The inactive state value of QSCK is logic level one. |

### 49.7.10 QSPI Instruction Address Register

**Name:** QSPI_IAR
**Offset:** 0x30
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DATAEN | OPTEN | ADDREN | INSTEN | | WIDTH[2:0] | | |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 20:16 – NBDUM[4:0]** Number Of Dummy Cycles
The NBDUM field defines the number of dummy cycles required by the serial Flash memory before data transfer.

**Bit 14 – CRM** Continuous Read Mode
0 (DISABLED): Continuous Read mode is disabled.

1 (ENABLED): Continuous Read mode is enabled.

**Bits 13:12 – TFRTYP[1:0]** Data Transfer Type

| Value | Name | Description |
|---|---|---|
| 0 | TRSFR_READ | Read transfer from the serial memory.<br>Scrambling is not performed.<br>Read at random location (fetch) in the serial Flash memory is not possible. |
| 1 | TRSFR_READ_MEMORY | Read data transfer from the serial memory.<br>If enabled, scrambling is performed.<br>Read at random location (fetch) in the serial Flash memory is possible. |

| Value | Name | Description |
|---|---|---|
| 2 | TRSFR_WRITE | Write transfer into the serial memory.<br>Scrambling is not performed. |
| 3 | TRSFR_WRITE_MEMORY | Write data transfer into the serial memory.<br>If enabled, scrambling is performed. |

**Bit 10 – ADDRL** Address Length
The ADDRL bit determines the length of the address.

0 (24_BIT): The address is 24 bits long.

1 (32_BIT): The address is 32 bits long.

**Bits 9:8 – OPTL[1:0]** Option Code Length
The OPTL field determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).

| Value | Name | Description |
|---|---|---|
| 0 | OPTION_1BIT | The option code is 1 bit long. |
| 1 | OPTION_2BIT | The option code is 2 bits long. |
| 2 | OPTION_4BIT | The option code is 4 bits long. |
| 3 | OPTION_8BIT | The option code is 8 bits long. |

**Bit 7 – DATAEN** Data Enable

| Value | Description |
|---|---|
| 0 | No data is sent/received to/from the serial Flash memory. |
| 1 | Data is sent/received to/from the serial Flash memory. |

**Bit 6 – OPTEN** Option Enable

| Value | Description |
|---|---|
| 0 | The option is not sent to the serial Flash memory. |
| 1 | The option is sent to the serial Flash memory. |

**Bit 5 – ADDREN** Address Enable

| Value | Description |
|---|---|
| 0 | The transfer address is not sent to the serial Flash memory. |
| 1 | The transfer address is sent to the serial Flash memory. |

**Bit 4 – INSTEN** Instruction Enable

| Value | Description |
|---|---|
| 0 | The instruction is not sent to the serial Flash memory. |
| 1 | The instruction is sent to the serial Flash memory. |

**Bits 2:0 – WIDTH[2:0]** Width of Instruction Code, Address, Option Code and Data

| Value | Name | Description |
|---|---|---|
| 0 | SINGLE_BIT_SPI | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI |
| 1 | DUAL_OUTPUT | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI |
| 2 | QUAD_OUTPUT | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI |
| 3 | DUAL_IO | Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI |
| 4 | QUAD_IO | Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI |
| 5 | DUAL_CMD | Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI |
| 6 | QUAD_CMD | Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI |

### 49.7.13 QSPI Scrambling Mode Register

**Name:** QSPI_SMR
**Offset:** 0x40
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the QSPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | RVDIS | SCREN |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – RVDIS** Scrambling/Unscrambling Random Value Disable

| Value | Description |
|---|---|
| 0 | The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices. |
| 1 | The scrambling/unscrambling algorithm includes only the user scrambling key. |

**Bit 0 – SCREN** Scrambling/Unscrambling Enable
0 (DISABLED): The scrambling/unscrambling is disabled.

1 (ENABLED): The scrambling/unscrambling is enabled.

### 49.7.14 QSPI Scrambling Key Register

**Name:** QSPI_SKR
**Offset:** 0x44
**Reset:** –
**Property:** Write-only

This register can only be written if bit WPEN is cleared in the QSPI Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | USRK[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | USRK[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |

| | | | | | | | | WPEN |
| Access | | | | | | | | |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x515350 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See section Register Write Protection for the list of registers that can be protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII) |
| 1 | Enables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII) |

### 49.7.16 QSPI Write Protection Status Register

**Name:** QSPI_WPSR
**Offset:** 0xE8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 15:8 – WPVSRC[7:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of the QSPI_WPSR. |
| 1 | A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 50. Secure Digital MultiMedia Card Controller (SDMMC)

## 50.1 Description

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices, sampling tuning procedure, PAD calibrationand enhanced features.

The SDMMC is clocked by three asynchronous clocks and requires the PMC to be configured first.

## 50.2 Embedded Characteristics

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V4.51
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/ 4-bit SD/SDIO Devices
- Support for 1-bit/4-bit/8-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR12 (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO UHS-I SDR25 (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR50 (Maximum SDCLK Frequency = 100 MHz)
- Support for SD/SDIO UHS-I SDR104 (Maximum SDCLK Frequency = 120 MHz)
- Support for SD/SDIO UHS-I DDR50 (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC HS200 (Maximum SDCLK Frequency = 120 MHz)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA Capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Supports for SDIO Card Interrupt

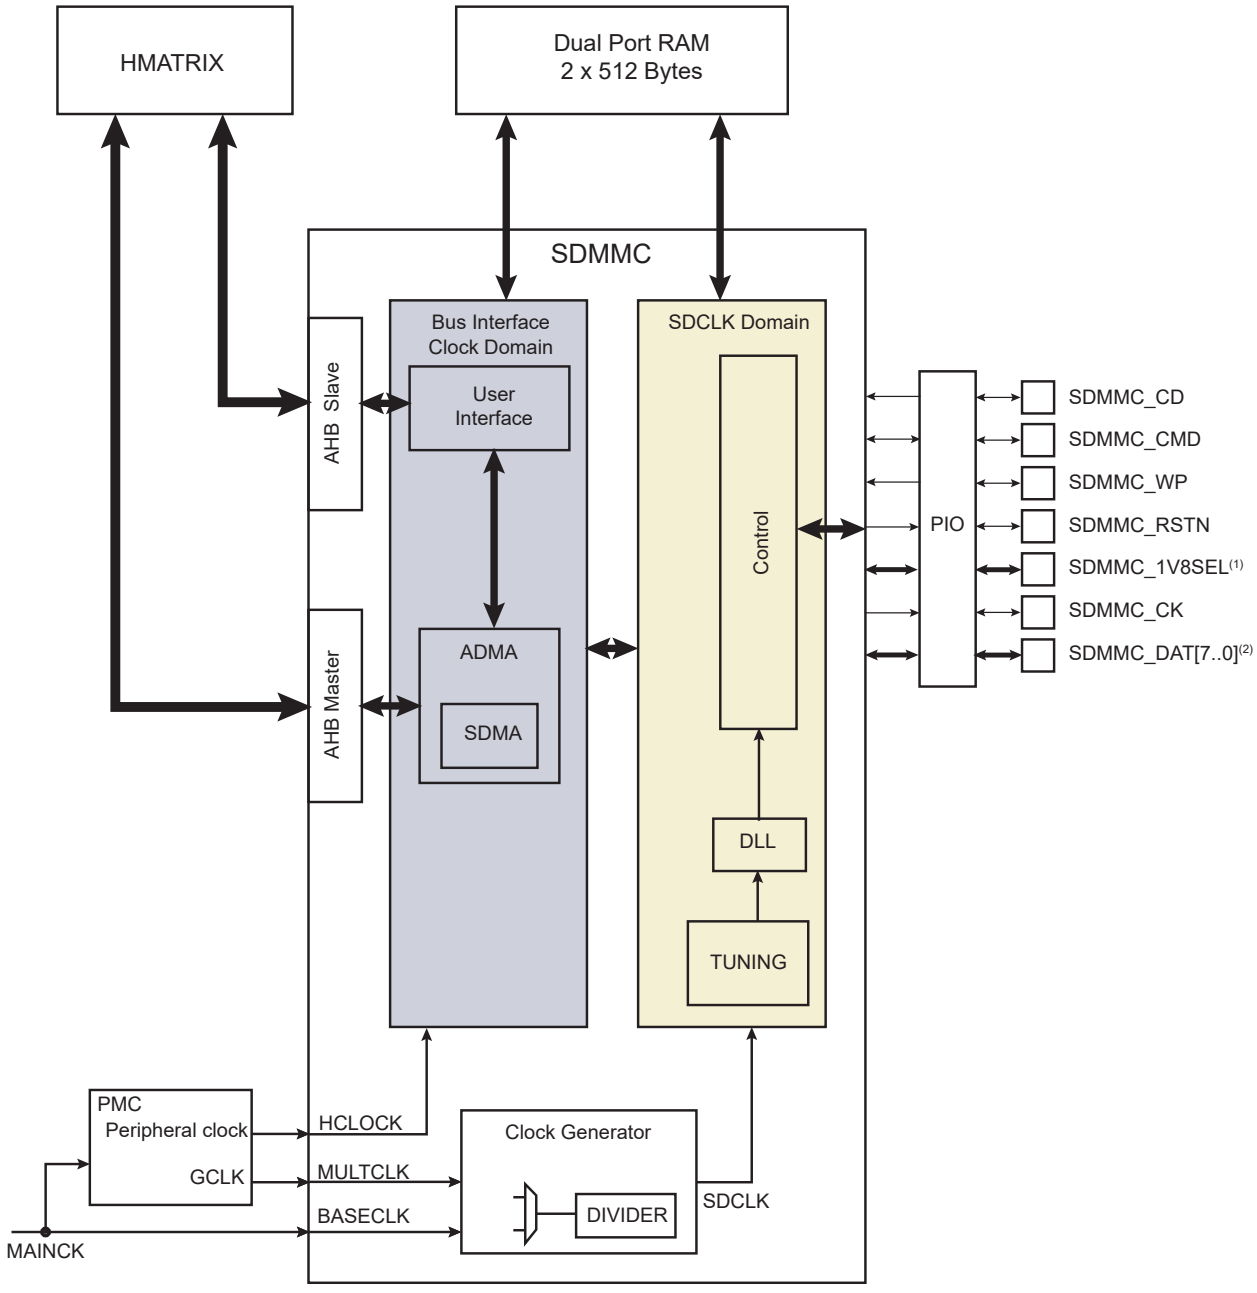
## 50.3 Reference Documents

**Table 50-1. Reference Documents**

| Name | Link |
|---|---|
| SD Host Controller Simplified Specification V3.00 | https://www.sdcard.org |
| SDIO Simplified Specification V3.00 | |
| Physical Layer Simplified Specification V3.01 | |
| Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51 | http://www.jedec.org |

## 50.4 Block Diagram

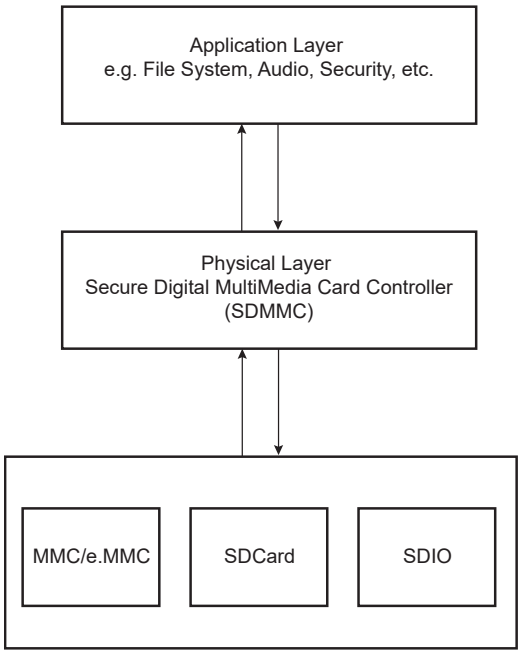
**Figure 50-1. Block Diagram**



Notes: 1. SDMMC_1V8SEL not available on SDMMC1.
2. Limited to SDMMC_DAT[3..0] on SDMMC1.

## 50.5 Application Block Diagram

**Figure 50-2. Application Block Diagram**



## 50.6 Pin Name List

**Table 50-2. I/O Lines Description for 8-bit Configuration**

| Pin Name(1) | Pin Description | Type |
|---|---|---|
| SDMMC_CD | SDCard / SDIO / e.MMC Card Detect | Input |
| SDMMC_CMD | SDCard / SDIO / e.MMC Command/Response Line | I/O |
| SDMMC_WP | SDCard Connector Write Protect Signal | Input |
| SDMMC_RSTN | e.MMC Reset Signal | Output |
| SDMMC_1V8SEL | SDCard Signal Voltage Selection | Output |
| SDMMC_CK | SDCard / SDIO / e.MMC Clock Signal | Output |
| SDMMC_DAT[7..0] | SDCard / SDIO / e.MMC Data Lines | I/O |

Notes: 1. When several SDMMCs are embedded in a product, SDMMC_CK refers to SDMMCx_CK, SDMMC_CMD to SDMMCx_CMD, SDMMC_DATy to SDMMCx_DATy, SDMMC_WP to SDMMCx_WP, SDMMC_1V8SEL to SDMMCx_1V8SEL, SDMMC_CD to SDMMCx_CD and SDMMC_RSTN to SDMMCx_RSTN.

## 50.7 Product Dependencies

### 50.7.1 I/O Lines

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

### 50.7.2 Power Management

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

### 50.7.3 Interrupt Sources

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

## 50.8 SD/SDIO Operating Mode

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

## 50.9 e.MMC Operating Mode

The SDMMC supports management of e.MMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to e.MMC devices, some registers have been added to those described in this specification in order to manage e.MMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for e.MMC management, but e.MMC-specific features are managed using SDMMC_MC1R and SDMMC_MC2R.

### 50.9.1 Boot Operation Mode

In Boot Operation mode, the processor can read boot data from the e.MMC device by keeping the CMD line low after poweron before issuing the CMD1. The data can be read from either one of the boot partitions or the user area according to BOOT_PARTITION_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

#### 50.9.1.1 Boot Procedure, Processor Mode

1. Configure the SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to the BOOT_BUS_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

   b. Select the speed mode (using SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD Register.

   c. Set the SDCLK frequency according to the selected speed mode.

   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC_MC1R.BOOTA = 1).

e. Enable the interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).

f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3)

g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.DTDSEL = 1).

h. Select the NonDMA transfer (SDMMC_TMR.DMAEN = 0).

i. Optional: select the Auto CMD method (using SDMMC_TMR.ACMDEN).

j. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).

k. Set the required number of read blocks (using SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to '1'.

2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to '1'.

#### 50.9.1.2 Boot Procedure, SDMA Mode

1. Configure SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to BOOT_BUS_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51" ).

   b. Select the speed mode (SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD Register.

   c. Set the SDCLK frequency according to the selected speed mode.

   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC_MC1R.BOOTA = 1).

   e. Enable interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).

   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3).

   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.TDSEL = 1).

   h. Select the SDMA transfer (SDMMC_TMR.DMAEN = 1 and SDMMC_HC1R.DMASEL = 0).

   i. Write the SDMA system address where the boot data will be copied (SDMMC_SSAR.ADDR).

   j. Optional: select the Auto CMD method (SDMMC_TMR.ACMDEN).
   Note: Auto CMD23 cannot be used with SDMA.

   k. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).

   l. Set the required number of read blocks (SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to 1.
2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.

5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to ‘1’.

#### 50.9.1.3 Boot Procedure, ADMA Mode

1. Configure the SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to BOOT_BUS_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

   b. Select the speed mode (SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD register.

   c. Set the SDCLK frequency according to the selected speed mode.

   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC_MC1R.BOOTA = 1).

   e. Enable interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).

   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3).

   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.DTDSEL = 1).

   h. Select the ADMA transfer (SDMMC_TMR.DMAEN = 1 and SDMMC_HC1R.DMASEL = 2 or 3).

   i. Write the address of the descriptor table in the ADMA system address (SDMMC_ASARx [0..1].ADMASA).

   j. Optional: select the Auto CMD method (SDMMC_TMR.ACMDEN).

   k. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).

   l. Set the required number of read blocks (SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to ‘1’.
2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to ‘1’.

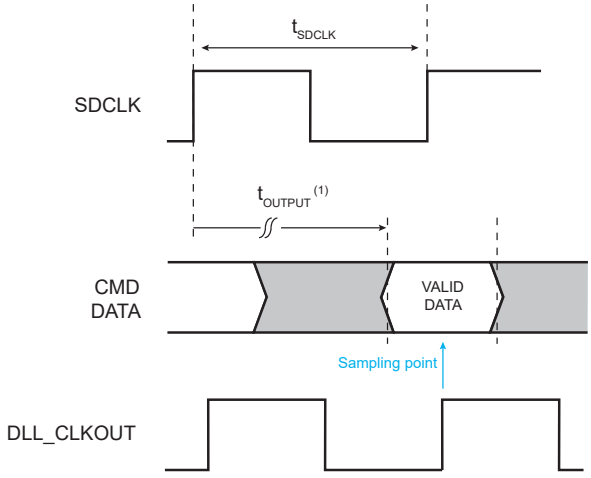
## 50.10 SDR104 / HS200 Tuning

### 50.10.1 DLL and Sampling Point

In SD/SDIO SDR104 mode (SDMMC_HC2R.VS18EN = 1 and SDMMC_HC2R.UHSMS = 3) or e.MMC HS200 mode (HS200EN = $B_{(hexa)}$), a tuning procedure must be performed first in order to adjust the sampling point for read transactions. For more details regarding the basic tuning procedure, see section “Sampling Clock Tuning Procedure” in the “SD Host Controller Simplified Specification V3.00” .

As the position of data and command coming from the device varies, a DLL is used to generate an accurate sampling point (DLL_CLKOUT) (see the figure below).

**Figure 50-3. DLL Sampling Point**

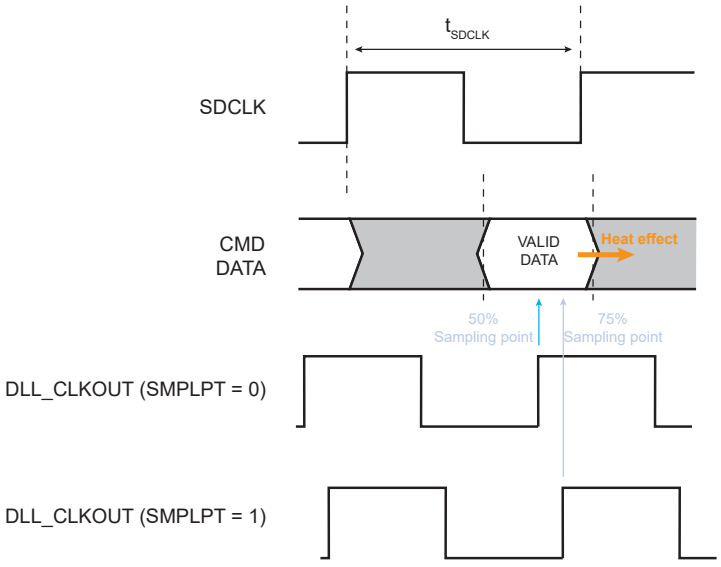


Note: 1. $t_{OUTPUT}$ varies from 0 to 2 x $t_{SDCLK}$

The minimum SDLCK frequency is 100 MHz when SD/SDIO SDR104 or e.MMC HS200 is selected.

The sampling point can be selected to be located at 50% or 75% of the data window to anticipate the effect of the temperature rise. If SDMMC_TUNCR.SMPLPT is cleared, the sampling point is centered (50% of the data window). If SDMMC_TUNCR.SMPLPT is set to ‘1’, the sampling point is set at 75% of the data window (see the figure below).

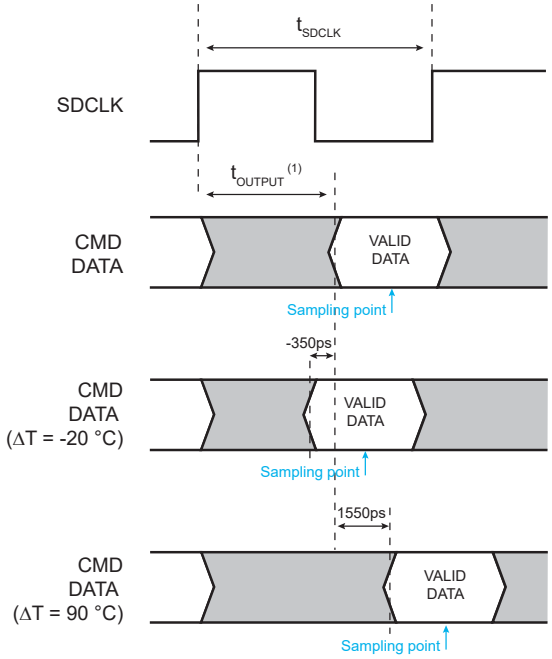
**Figure 50-4. SDR104/HS200 Sampling Point Selection**



### 50.10.2 Retuning Method

Once the data window sampling point has been tuned following the tuning procedure, the data window can be shifted by temperature drift. Thus, the tuning procedure must be applied periodically to adjust the sampling point position. The SDMMC implements a retuning timer which periodically instructs the software to restart the tuning procedure.

**Figure 50-5. Temperature Effect on Data Window**



Note: 1. $t_{OUTPUT}$ varies from 0 to 2 x $t_{SDCLK}$

#### 50.10.2.1 SDMMC Tuning Sequence

The SDMMC tuning sequence must only be done when SD/SDIO SDR104 or e.MMC HS200 is selected and for a 100-MHz SDCLK frequency or higher.

1. Enable the retuning timer (SDMMC_RTC1R.TMREN = 1).
2. Configure the retuning period by setting SDMMC_RTCVR.TCVAL.
3. Set SDMMC_RTISTER.TEVT to ‘1’ so that the TEVT status flag in SDMMC_RTISTR rises each time the retuning timer counter period elapses.
4. Set SDMMC_RTISIER.TEVT to ‘1’ to generate an interrupt on the TEVT status flag assertion (optional).
5. Execute the tuning procedure as defined in “Sampling Clock Tuning Procedure” in the “SD Host Controller Simplified Specification V3.00” .
6. Start the retuning timer count (write SDMMC_RTC2R.RLD to 1). At this step, data can be read by the SDMMC.
7. Each time SDMMC_RTISTR.TEVT is set to ‘1’:
   a. Execute the tuning procedure as defined in “Sampling Clock Tuning Procedure” in the “SD Host Controller Simplified Specification V3.00” before issuing the next command.
   b. Restart the retuning timer count (write SDMMC_RTC2R.RLD to ‘1’).
   c. Resume data reading from the device.

When several instances of SDMMC are implemented in a product, the TEVT status flag of each SDMMC instance can be checked by reading SDMMC_RTSSR.

## 50.11 I/O Calibration

The need for output impedance calibration arises with higher data rates. As the data rate increases, some transmission line effects can occur and lead to the generation of undershoots and overshoots, hence degrading the signal quality.

To avoid these transmission problems, an I/O calibration cell is used to adjust the output impedance to the driven I/Os.

The I/O calibration sequence is mandatory when one of the SD/SDIO UHS-I modes (SDMMC_HC2R.VS18EN = 1) or e.MMC HS200 (HS200EN = $B_{(hexa)}$) is selected. It must be performed periodically to prevent the output impedance drift. Once the calibration is finished, the I/O calibration cell provides two four-bit control words (CALP[3:0] and CALN[3:0] in the Calibration Control register (SDMMC_CALCR)) to tune the output impedance, and thus reach the best transmission performances.

The I/O calibration sequence can be started manually by writing a ‘1’ to SDMMC_CALCR.EN. This bit is cleared automatically at the end of the calibration.

The I/O calibration sequence can also be performed automatically if SDMMC_CALCR.TUNDIS is cleared. In this case, the calibration starts automatically at the beginning of the tuning procedure when writing a ‘1’ to SDMMC_HC2R.EXTUN.

The I/O calibration cell requires a startup time defined by SDMMC_CALCR.CNTVAL. Thus, CNTVAL must be configured prior to start the calibration sequence. If SDMMC_CALCR.ALWYSON is set to ‘1’, the startup time is only required for the first calibration sequence as the analog circuitry is not shut down at the end of the calibration. In order to reduce the power consumption, the analog circuitry can be shut down at the end of the calibration sequence by clearing ALWYSON. In this case, the startup time is performed each time a calibration sequence is started.

## 50.12 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SDMMC_SSAR | 7:0 | ADDR/ARG2[7:0] | | | | | | | |
| | | 15:8 | ADDR/ARG2[15:8] | | | | | | | |

### 50.12.1 SDMMC SDMA System Address / Argument 2 Register

**Name:** SDMMC_SSAR
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

This register contains the physical system memory address used for SDMA transfers or the second argument for Auto CMD23.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ADDR/ARG2[31:24] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ADDR/ARG2[23:16] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ADDR/ARG2[15:8] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ADDR/ARG2[7:0] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ADDR/ARG2[31:0]** SDMA System Address/Argument 2
ADDR: This field is the system memory address for a SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

ARG2: This field is used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC_BCR. In this case, 65535 blocks is the maximum value.

### 50.12.2 SDMMC Block Size Register

**Name:** SDMMC_BSR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | BOUNDARY[2:0] | | | | | BLKSIZE[9:8] | |
| Access | | R/W | R/W | R/W | | | R/W | R/W |
| Reset | | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BLKSIZE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 14:12 – BOUNDARY[2:0]** SDMA Buffer Boundary
This field specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC_TMR.DMAEN is set.

| Value | Name | Description |
|---|---|---|
| 0 | 4K | 4-Kbyte boundary |
| 1 | 8K | 8-Kbyte boundary |
| 2 | 16K | 16-Kbyte boundary |
| 3 | 32K | 32-Kbyte boundary |
| 4 | 64K | 64-Kbyte boundary |
| 5 | 128K | 128-Kbyte boundary |
| 6 | 256k | 256-Kbyte boundary |
| 7 | 512K | 512-Kbyte boundary |

**Bits 9:0 – BLKSIZE[9:0]** Transfer Block Size
This field specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

### 50.12.3 SDMMC Block Count Register

**Name:** SDMMC_BCR
**Offset:** 0x06
**Reset:** 0x0000
**Property:** Read/Write

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | BLKCNT[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BLKCNT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:0 – BLKCNT[15:0]** Block Count for Current Transfer
This field is used only if SDMMC_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

### 50.12.4 SDMMC Argument 1 Register

**Name:** SDMMC_ARG1R
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ARG1[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ARG1[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ARG1[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ARG1[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ARG1[31:0]** Argument 1
This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

### 50.12.5 SDMMC Transfer Mode Register

**Name:** SDMMC_TMR
**Offset:** 0x0C
**Reset:** 0x0000
**Property:** Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC_PSR.CMDINHD is 1.

**Table 50-3. Determining the Transfer Type**

| MSBSEL | BCEN | BLKCNT (SDMMC_BCR) | Function |
|---|---|---|---|
| 0 | Don't care | Don't care | Single Transfer |
| 1 | 0 | Don't care | Infinite Transfer |
| 1 | 1 | Not Zero | Multiple Transfer |
| 1 | 1 | Zero | Stop Multiple Transfer |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | MSBSEL | DTDSEL | ACMDEN[1:0] | | BCEN | DMAEN |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 5 – MSBSEL** Multi/Single Block Selection
This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC_BCR (see the table above, "Determining the Transfer Type").

**Bit 4 – DTDSEL** Data Transfer Direction Selection
This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD Card/SDIO/e.MMC) to the SDMMC, and to 0 for all other commands.

0 (WRITE): Writes data from the SDMMC to the device.

1 (READ): Reads data from the device to the SDMMC.

**Bits 3:2 – ACMDEN[1:0]** Auto Command Enable
Two methods can be used to stop Multiple-block read and write operation:

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)
- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

**Note:** The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC_SSAR.

This field determines the use of auto command functions.

| Value | Name | Description |
|---|---|---|
| 0 | DISABLED | Auto Command Disabled |
| 1 | CMD12 | Auto CMD12 Enabled |
| 2 | CMD23 | Auto CMD23 Enabled |
| 3 | – | Reserved |

**Bit 1 – BCEN** Block Count Enable
This bit is used to enable SDMMC_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC_BCR is disabled, which is useful when executing an infinite transfer (see the table above). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

0 (DISABLED): Block count is disabled.

1 (ENABLED): Block count is enabled.

**Bit 0 – DMAEN** DMA Enable
This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00” . DMA can be enabled only if it is supported as indicated by the bit SDMMC_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC_CR.

0 (DISABLED): DMA functionality is disabled.

1 (ENABLED): DMA functionality is enabled.

### 50.12.6 SDMMC Command Register

**Name:** SDMMC_CR
**Offset:** 0x0E
**Reset:** 0x0000
**Property:** Read/Write

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | CMDIDX[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CMDTYP[1:0] | | DPSEL | CMDICEN | CMDCCEN | | RESPTYP[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | | 0 | 0 |

**Bits 13:8 – CMDIDX[5:0]** Command Index
This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01” , “SDIO Simplified Specification V3.00” , and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

**Bits 7:6 – CMDTYP[1:0]** Command Type

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Other commands |
| 1 | SUSPEND | CMD52 to write “Bus Suspend” in the Card Common Control Registers (CCCR) (for SDIO only) |
| 2 | RESUME | CMD52 to write “Function Select” in the Card Common Control Registers (CCCR) (for SDIO only) |
| 3 | ABORT | CMD12, CMD52 to write “I/O Abort” in the Card Common Control Registers (CCCR) (for SDIO only) |

**Bit 5 – DPSEL** Data Present Select
This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

| Value | Description |
|---|---|
| 0 | No data present |
| 1 | Data present |

**Bit 4 – CMDICEN** Command Index Check Enable
If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC_EISTR. If this bit is set to 0, the Index field of the response is not checked.

0 (DISABLED): The Command Index Check is disabled.

1 (ENABLED): The Command Index Check is enabled.

**Bit 3 – CMDCCEN** Command CRC Check Enable
If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

0 (DISABLED): The Command CRC Check is disabled.

1 (ENABLED): The Command CRC Check is enabled.

**Bits 1:0 – RESPTYP[1:0]** Response Type
This field is set according to the response type expected for the command index (CMDIDX).

| Value | Name | Description |
|---|---|---|
| 0 | NORESP | No Response |
| 1 | RL136 | Response Length 136 |
| 2 | RL48 | Response Length 48 |
| 3 | RL48BUSY | Response Length 48 with Busy |

### 50.12.7 SDMMC Response Register x

**Name:** SDMMC_RRx
**Offset:** 0x10 + x*0x04 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | CMDRESP[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CMDRESP[23:16] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | CMDRESP[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – CMDRESP[31:0]** Command Response
The table below describes the mapping of command responses from the SD_SDIO/e.MMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD_SDIO/e.MMC bus.

| Type of response | Meaning of response | Response field | Response register |
|---|---|---|---|
| R1, R1b (normal response) | Card Status | R[39:8] | SDMMC_RR0[31:0] |
| R1b (Auto CMD12 response) | Card Status for Auto CMD12 | R[39:8] | SDMMC_RR3[31:0] |
| R1 (Auto CMD23 response) | Card Status for Auto CMD23 | R[39:8] | SDMMC_RR3[31:0] |
| R2 (CID, CSD register) | CID or CSD register | R[127:8] | SDMMC_RR0[31:0]<br>SDMMC_RR1[31:0]<br>SDMMC_RR2[31:0]<br>SDMMC_RR3[23:0] |
| R3 (OCR register) | OCR register for memory | R[39:8] | SDMMC_RR0[31:0] |
| R4 (OCR register) | OCR register for I/O | R[39:8] | SDMMC_RR0[31:0] |
| R5, R5b | SDIO response | R[39:8] | SDMMC_RR0[31:0] |

.....continued

| Type of response | Meaning of response | Response field | Response register |
|---|---|---|---|
| R6 (Published RCA response) | New published RCA[31:16] and Card status bits | R[39:8] | SDMMC_RR0[31:0] |

### 50.12.8 SDMMC Buffer Data Port Register

**Name:** SDMMC_BDPR
**Offset:** 0x20
**Reset:** –
**Property:** Read/Write

**Note:** The reset value is an unpredictable value read from the dual port RAM.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BUFDATA[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – BUFDATA[31:0]** Buffer Data
The SDMMC data buffer can be accessed through this 32-bit Data Port register.

### 50.12.9 SDMMC Present State Register

**Name:** SDMMC_PSR
**Offset:** 0x24
**Reset:** 0x00F80000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CMDLL |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DATLL[3:0] | | | | WRPPL | CARDDPL | CARDSS | CARDINS |
| Access | R | R | R | R | R | R | R | R |
| Reset | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | BUFRDEN | BUFWREN | RTACT | WTACT |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | DLACT | CMDINHD | CMDINHC |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 24 – CMDLL** CMD Line Level
This status is used to check the CMD line level to recover from errors, and for debugging.

**Bits 23:20 – DATLL[3:0]** DAT[3:0] Line Level
This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

**Bit 19 – WRPPL** Write Protect Pin Level
The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDMMC_WP pin.

| Value | Description |
|---|---|
| 0 | Write protected (SDMMC_WP = 0) |
| 1 | Write enabled (SDMMC_WP = 1) |

**Bit 18 – CARDDPL** Card Detect Pin Level
This bit reflects the inverse value of the SDMMC_CD pin. Debouncing is not performed on this bit. This bit may be valid when CARDSS is set to 1, but it is not guaranteed because of the propagation delay. Use of this bit is limited to testing since it must be debounced by software.

| Value | Description |
|---|---|
| 0 | No card present (SDMMC_CD = 1). |

| Value | Description |
|---|---|
| 1 | Card present (SDMMC_CD = 0). |

**Bit 17 – CARDSS** Card State Stable
This bit is used for testing. If it is 0, the CARDDPL is not stable. If this bit is set to 1, it means that the CARDDPL is stable. No Card state can be detected if this bit is set to 1 and CARDINS is set to 0.

The Software Reset For All (SWRSTALL) in SDMMC_SRR does not affect this bit.

| Value | Description |
|---|---|
| 0 | Reset or debouncing. |
| 1 | No card or card inserted. |

**Bit 16 – CARDINS** Card Inserted
This bit indicates whether a card has been inserted. The SDMMC debounces this signal so that the user does not need to wait for it to stabilize.

A change from 0 to 1 raises the Card Insertion (CINS) status flag in SDMMC_NISTR if SDMMC_NISTER.CINS is set to 1. An interrupt is generated if SDMMC_NISIER.CINS is set to 1.

A change from 1 to 0 raises the Card Removal (CREM) status flag in SDMMC_NISTR if SDMMC_NISTER.CREM is set to 1. An interrupt is generated if SDMMC_NISIER.CREM is set to 1.

The Software Reset For All (SWRSTALL) in SDMMC_SRR does not affect this bit.

**Bit 11 – BUFRDEN** Buffer Read Enable
This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.

A change from 1 to 0 occurs when all the block data is read from the buffer.

A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC_NISTR if SDMMC_NISTER.BRDRDY is set to 1. An interrupt is generated if SDMMC_NISIER.BRDRDY is set to 1.

**Bit 10 – BUFWREN** Buffer Write Enable
This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.

A change from 1 to 0 occurs when all the block data are written to the buffer.

A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC_NISTR if SDMMC_NISTER.BWRRDY is set to 1. An interrupt is generated if SDMMC_NISIER.BWRRDY is set to 1.

**Bit 9 – RTACT** Read Transfer Active
This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1.

**Bit 8 – WTACT** Write Transfer Active
This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC_NISTR if SDMMC_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

**Bit 2 – DLACT** DAT Line Active
This bit indicates whether one of the DAT lines on the bus is in use.

In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC_NISTR if SDMMC_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  – After the end bit of the read command.
  – When writing 1 to SDMMC_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  – When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  – When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).
- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact

that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/ Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  – After the end bit of the write command.
  – When writing 1 to SDMMC_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  – When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  – When the card releases Write Busy prior to wait for write transfer as a result of a Stop At Block Gap Request (STPBGR).

Command with Busy:

This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the “SD Host Controller Simplified Specification V3.00” .

| Value | Description |
|---|---|
| 0 | DAT line inactive. |
| 1 | DAT line active. |

**Bit 1 – CMDINHD** Command Inhibit (DAT)
This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1.

Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

| Value | Description |
|---|---|
| 0 | Can issue a command which uses the DAT line(s). |
| 1 | Cannot issue a command which uses the DAT line(s). |

**Bit 0 – CMDINHC** Command Inhibit (CMD)
If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC_CR is written. This bit is cleared when the

command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.

Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC_CR.

Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.

A change from 1 to 0 raises the Command Complete (CMDC) status flag in SDMMC_NISTR if SDMMC_NISTER.CMDC is set to 1. An interrupt is generated if SDMMC_NISIER.CMDC is set to 1.

If the SDMMC cannot issue the command because of a command conflict error (see SDMMC_EISTR.CMDCRC) or because of a ‘Command Not Issued By Auto CMD12’ error (see section “SDMMC Auto CMD Error Status Register”), this bit remains 1 and Command Complete is not set.

| Value | Description |
|---|---|
| 0 | Can issue a command using only CMD line. |
| 1 | Cannot issue a command. |

### 50.12.10 SDMMC Host Control 1 Register (SD_SDIO)

**Name:** SDMMC_HC1R (SD_SDIO)
**Offset:** 0x28
**Reset:** 0x00
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CARDDSEL | CARDDTL | | DMASEL[1:0] | | HSEN | DW | LEDCTRL |
| Access | R/W | R/W | | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | | 0 | 0 | 0 | 0 | 0 |

**Bit 7 – CARDDSEL** Card Detect Signal Selection
This bit selects the source for the card detection.

| Value | Description |
|---|---|
| 0 | The SDMMC_CD pin is selected. |
| 1 | The Card Detect Test Level (CARDDTL) is selected (for test purposes). |

**Bit 6 – CARDDTL** Card Detect Test Level
This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

| Value | Description |
|---|---|
| 0 | No card. |
| 1 | Card inserted. |

**Bits 4:3 – DMASEL[1:0]** DMA Select
One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC_TMR.

| Value | Name | Description |
|---|---|---|
| 0 | SDMA | SDMA is selected |
| 1 | – | Reserved |
| 2 | ADMA32 | 32-bit Address ADMA2 is selected |
| 3 | – | Reserved |

**Bit 2 – HSEN** High Speed Enable
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when HSEN is 1.

| Value | Description |
|---|---|
| 0 | Normal Speed mode. |
| 1 | High Speed mode. |

**Bit 1 – DW** Data Width
This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1_BIT): 1-bit mode.

1 (4_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

**Bit 0 – LEDCTRL** LED Control
This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

0 (OFF): LED off.

1 (ON): LED on.

### 50.12.11 SDMMC Host Control 1 Register (e.MMC)

**Name:** SDMMC_HC1R (e.MMC)
**Offset:** 0x28
**Reset:** 0x00
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | EXTDW | DMASEL[1:0] | | HSEN | DW | |
| Access | | | R/W | R/W | R/W | R/W | R/W | |
| Reset | | | 0 | 0 | 0 | 0 | 0 | |

**Bit 5 – EXTDW** Extended Data Width
This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

**Bits 4:3 – DMASEL[1:0]** DMA Select
One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC_TMR.

| Value | Name | Description |
|---|---|---|
| 0 | SDMA | SDMA is selected |
| 1 | – | Reserved |
| 2 | ADMA32 | 32-bit Address ADMA2 is selected |
| 3 | – | Reserved |

**Bit 2 – HSEN** High Speed Enable
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when HSEN is 1.

| Value | Description |
|---|---|
| 0 | Normal Speed mode. |
| 1 | High Speed mode. |

**Bit 1 – DW** Data Width
This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1_BIT): 1-bit mode.

1 (4_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

### 50.12.12 SDMMC Power Control Register

**Name:** SDMMC_PCR
**Offset:** 0x29
**Reset:** 0x0E
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SDBPWR |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – SDBPWR** SD Bus Power
This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC_CMD and SDMMC_DAT[7:0] (tri-state) and drives SDMMC_CK to low level.

### 50.12.13 SDMMC Block Gap Control Register (SD_SDIO)

**Name:** SDMMC_BGCR (SD_SDIO)
**Offset:** 0x2A
**Reset:** 0x00
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | INTBG | RWCTRL | CONTR | STPBGR |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 3 – INTBG** Interrupt at Block Gap
This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

| Value | Name | Description |
|---|---|---|
| 0 | DISABLED | Interrupt detection disabled. |
| 1 | ENABLED | Interrupt detection enabled. |

**Bit 2 – RWCTRL** Read Wait Control
The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

| Value | Description |
|---|---|
| 0 | Disables Read Wait control. |
| 1 | Enables Read Wait control. |

**Bit 1 – CONTR** Continue Request
This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

– In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.

– In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Restart. |

**Bit 0 – STPBGR** Stop At Block Gap Request
This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|---|---|
| 0 | Transfer |
| 1 | Stop |

### 50.12.14 SDMMC Block Gap Control Register (e.MMC)

**Name:** SDMMC_BGCR (e.MMC)
**Offset:** 0x2A
**Reset:** 0x00
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | CONTR | STPBGR |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – CONTR** Continue Request
This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

– In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.

– In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Restart. |

**Bit 0 – STPBGR** Stop At Block Gap Request
This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|---|---|
| 0 | Transfer |

| Value | Description |
|---|---|
| 1 | Stop |

### 50.12.15 SDMMC Wakeup Control Register (SD_SDIO)

**Name:** SDMMC_WCR (SD_SDIO)
**Offset:** 0x2B
**Reset:** 0x00
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | WKENCREM | WKENCINS | WKENCINT |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – WKENCREM** Wakeup Event Enable on Card Removal
This bit enables a wakeup event via Card Removal (CREM) in SDMMC_NISTR. FN_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 1 – WKENCINS** Wakeup Event Enable on Card Insertion
This bit enables a wakeup event via Card Insertion (CINS) in SDMMC_NISTR. FN_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 0 – WKENCINT** Wakeup Event Enable on Card Interrupt
This bit enables a wakeup event via Card Interrupt (CINT) in SDMMC_NISTR. This bit can be set to 1 if FN_WUS (Wakeup Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

### 50.12.16 SDMMC Clock Control Register

**Name:** SDMMC_CCR
**Offset:** 0x2C
**Reset:** 0x0000
**Property:** Read/Write

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | SDCLKFSEL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | USDCLKFSEL[1:0] | | CLKGSEL | | | SDCLKEN | INTCLKS | INTCLKEN |
| Access | R/W | R/W | R/W | | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | | | 0 | 0 | 0 |

**Bits 15:8 – SDCLKFSEL[7:0]** SDCLK Frequency Select
This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).

The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

– 10-bit Divided Clock Mode (CLKGSEL = 0): $f_{\mathrm{SDCLK}} = f_{\mathrm{BASECLK}}/(2 \times \mathrm{DIV})$. If DIV = 0 then $f_{\mathrm{SDCLK}} = f_{\mathrm{BASECLK}}$

– Programmable Clock Mode (CLKGSEL = 1): $f_{\mathrm{SDCLK}} = f_{\mathrm{MULTCLK}}/(\mathrm{DIV} + 1)$

When HSEN is set in SDMMC_HC1R, or DDR is set in SDMMC_MC1R, the clock divider (DIV) must be non-zero.This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC_HC2R.

If PVALEN = 0, this field is set by the user.

If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC_PVR.

**Bits 7:6 – USDCLKFSEL[1:0]** Upper Bits of SDCLK Frequency Select
These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

**Bit 5 – CLKGSEL** Clock Generator Select
This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.

This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC_HC2R.

If PVALEN = 0, this bit is set by the user.

If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC_PVRx.

| Value | Description |
|---|---|
| 0 | Divided Clock mode (BASECLK is used to generate SDCLK). |

| Value | Description |
|---|---|
| 1 | Programmable Clock mode (MULTCLK is used to generate SDCLK). |

**Bit 2 – SDCLKEN** SD Clock Enable
The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If Card Inserted (CARDINS) in SDMMC_PSR is cleared, this bit is also cleared.

| Value | Description |
|---|---|
| 0 | SD Clock disabled |
| 1 | SD Clock enabled |

**Bit 1 – INTCLKS** Internal Clock Stable
This bit is set to 1 when the SD clock is stable after setting SDMMC_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

| Value | Description |
|---|---|
| 0 | Internal clock not ready. |
| 1 | Internal clock ready. |

**Bit 0 – INTCLKEN** Internal Clock Enable
This bit is set to 0 when the SDMMC is not used or is awaiting a wakeup interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.

This bit does not affect card detection.

| Value | Description |
|---|---|
| 0 | The internal clock stops. |
| 1 | The internal clock oscillates. |

### 50.12.17 SDMMC Timeout Control Register

**Name:** SDMMC_TCR
**Offset:** 0x2E
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | DTCVAL[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 3:0 – DTCVAL[3:0]** Data Timeout Counter Value
This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC_EISTER).

$$\mathrm{TIMEOUT}_{(\mu s)} = \frac{2^{13 + \mathrm{DTCVAL}}}{f_{\mathrm{FTEOCLK(MHz)}}}$$

**Note:** DTCVAL = $f_{(Hexa)}$ is reserved.

### 50.12.18 SDMMC Software Reset Register

**Name:** SDMMC_SRR
**Offset:** 0x2F
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | SWRSTDAT | SWRSTCMD | SWRSTALL |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – SWRSTDAT** Software Reset for DAT Line
Only part of a data circuit is reset. The DMA circuit is also reset.

The following registers and bits are cleared by this bit:

"SDMMC Buffer Data Port Register"

– Buffer is cleared and initialized.

"SDMMC Present State Register"

– Buffer Read Enable (BUFRDEN)

– Buffer Write Enable (BUFWREN)

– Read Transfer Active (RTACT)

– Write Transfer Active (WTACT)

– DAT Line Active (DATLL)

– Command Inhibit (DAT) (CMDINHD)

"SDMMC Block Gap Control Register (SD_SDIO)"

– Continue Request (CONTR)

– Stop At Block Gap Request (STPBGR)

"SDMMC Normal Interrupt Status Register (SD_SDIO)"

– Buffer Read Ready (BRDRDY)

– Buffer Write Ready (BWRRDY)

– DMA Interrupt (DMAINT)

– Block Gap Event (BLKGE)

– Transfer Complete (TRFC)

| Value | Description |
|---|---|
| 0 | Work |
| 1 | Reset |

**Bit 1 – SWRSTCMD** Software Reset for CMD Line
Only part of a command circuit is reset.

The following registers and bits are cleared by this bit:

"SDMMC Present State Register"

– Command Inhibit (CMD) (CMDINHC)

"SDMMC Normal Interrupt Status Register (SD_SDIO)" and "SDMMC Normal Interrupt Status Register (e.MMC)"

– Command Complete (CMDC)

| Value | Description |
|---|---|
| 0 | Work |
| 1 | Reset |

**Bit 0 – SWRSTALL** Software Reset for All
This reset affects the entire SDMMC except the card detection circuit. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC_CA0R and SDMMC_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.

List of registers cleared to '0':

– "SDMMC SDMA System Address / Argument 2 Register"

– "SDMMC Block Size Register"

– "SDMMC Block Count Register"

– "SDMMC Argument 1 Register"

– "SDMMC Command Register"

– "SDMMC Transfer Mode Register"

– "SDMMC Response Register"

– "SDMMC Buffer Data Port Register"

– "SDMMC Present State Register" (except CMDLL, DATLL, WRPPL, CARDDDPL, CARDSS, CARDINS)

– "SDMMC Host Control 1 Register (SD_SDIO)"

– "SDMMC Host Control 1 Register (e.MMC)"

– "SDMMC Power Control Register"

– "SDMMC Block Gap Control Register (SD_SDIO)"

– "SDMMC Block Gap Control Register (e.MMC)"

– "SDMMC Wakeup Control Register (SD_SDIO)"

– "SDMMC Clock Control Register"

– "SDMMC Timeout Control Register"

– "SDMMC Normal Interrupt Status Register (SD_SDIO)"

– "SDMMC Error Interrupt Status Register (SD_SDIO)"

– "SDMMC Normal Interrupt Status Enable Register (SD_SDIO)"

– "SDMMC Error Interrupt Status Enable Register (SD_SDIO)"

– “SDMMC Normal Interrupt Signal Enable Register (SD_SDIO)”
– “SDMMC Error Interrupt Signal Enable Register (SD_SDIO)”
– “SDMMC Auto CMD Error Status Register”
– “SDMMC Host Control 2 Register (SD_SDIO)”
– “SDMMC ADMA Error Status Register”
– “SDMMC ADMA System Address Register”
– “SDMMC Slot Interrupt Status Register”
– “SDMMC e.MMC Control 1 Register”
– “SDMMC e.MMC Control 2 Register”
– “SDMMC AHB Control Register”
– “SDMMC Clock Control 2 Register”
– “SDMMC Retuning Control 1 Register”
– “SDMMC Retuning Counter Value Register”
– “SDMMC Retuning Interrupt Status Enable Register”
– “SDMMC Retuning Interrupt Signal Enable Register”
– “SDMMC Retuning Interrupt Status Register”
– “SDMMC Tuning Control Register”
– “SDMMC Capabilities Control Register” (except KEY)
– “SDMMC Calibration Control Register” (except CALN, CALP)

| Value | Description |
|---|---|
| 0 | Work |
| 1 | Reset |

### 50.12.19 SDMMC Normal Interrupt Status Register (SD_SDIO)

**Name:** SDMMC_NISTR (SD_SDIO)
**Offset:** 0x30
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ERRINT | | | | | | | CINT |
| Access | R | | | | | | | R/W |
| Reset | 0 | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CREM | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – ERRINT** Error Interrupt
If any of the bits in SDMMC_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 8 – CINT** Card Interrupt
Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wakeup. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system.

When this bit has been set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC_NISTER may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC_NISTER.CINT to '1' and start sampling the interrupt signal again.

Interrupt detected by DAT[1] is supported when there is one card per slot.

This bit can only be set to '1' if SDMMC_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CREM is set to '1'.

| Value | Description |
|---|---|
| 0 | No card interrupt. |
| 1 | Card interrupt. |

**Bit 7 – CREM** Card Removal
This status is set to '1' if Card Inserted (CARDINS) in SDMMC_PSR changes from '1' to '0'. When the user writes this bit to '1' to clear this status, the status of SDMMC_PSR.CARDINS must be confirmed

because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CREM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Card state unstable or card inserted. |
| 1 | Card removed. |

**Bit 6 – CINS** Card Insertion
This status is set if Card Inserted (CARDINS) in SDMMC_PSR changes from '0' to '1'. When the user writes this bit to '1' to clear this status, the status of SDMMC_PSR.CARDINS must be confirmed because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC_NISTER.CINS is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CINS is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Card state unstable or card removed. |
| 1 | Card inserted. |

**Bit 5 – BRDRDY** Buffer Read Ready
This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Not ready to read buffer. |
| 1 | Ready to read buffer. |

**Bit 4 – BWRRDY** Buffer Write Ready
This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC_PSR.

This bit can only be set to '1' if SDMMC_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Not ready to write buffer. |
| 1 | Ready to write buffer. |

**Bit 3 – DMAINT** DMA Interrupt
This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC_BSR.

In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No DMA Interrupt. |
| 1 | DMA Interrupt. |

**Bit 2 – BLKGE** Block Gap Event
If the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.

**In the case of a Read transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

**In the case of a Write transaction:**

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No block gap event. |
| 1 | Transaction stopped at block gap. |

**Bit 1 – TRFC** Transfer Complete
This bit is set when a read/write transfer and a command with Busy is completed.

**In the case of a Read Transaction:**

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of a Write Transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of command with Busy:**

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.

This bit can only be set to '1' if SDMMC_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

| TRFC | DATTEO | Meaning of the status |
|---|---|---|
| 0 | 0 | Interrupted by another factor |
| 0 | 1 | Timeout occurred during transfer |
| 1 | Don’t Care | Command execution complete |

| Value | Description |
|---|---|
| 0 | Command execution is not complete. |
| 1 | Command execution is complete. |

**Bit 0 – CMDC** Command Complete
This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC_PSR for details on how to control this bit.

This bit can only be set to 1 if SDMMC_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC_NISIER.CMDC is set to 1.

Writing this bit to 1 clears this bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

| CMDC | CMDTEO | Meaning of the status |
|---|---|---|
| 0 | 0 | Interrupted by another factor |
| Don’t care | 1 | Response not received within 64 SDCLK cycles |
| 1 | 0 | Response received |

| Value | Description |
|---|---|
| 0 | No command complete. |
| 1 | Command complete. |

### 50.12.20 SDMMC Normal Interrupt Status Register (e.MMC)

**Name:** SDMMC_NISTR (e.MMC)
**Offset:** 0x30
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ERRINT | BOOTAR | | | | | | |
| Access | R | R/W | | | | | | |
| Reset | 0 | 0 | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – ERRINT** Error Interrupt
If any of the bits in SDMMC_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 14 – BOOTAR** Boot Acknowledge Received
This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC.

This bit can only be set to '1' if SDMMC_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BOOTAR is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Boot Acknowledge pattern not received. |
| 1 | Boot Acknowledge pattern received. |

**Bit 5 – BRDRDY** Buffer Read Ready
This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Not ready to read buffer. |
| 1 | Ready to read buffer. |

**Bit 4 – BWRRDY** Buffer Write Ready
This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC_PSR.

This bit can only be set to '1' if SDMMC_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | Not ready to write buffer. |
| 1 | Ready to write buffer. |

**Bit 3 – DMAINT** DMA Interrupt
This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC_BSR.

In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No DMA interrupt. |
| 1 | DMA interrupt. |

**Bit 2 – BLKGE** Block Gap Event
If the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.

**In the case of a Read transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

**In the case of a Write transaction:**

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No block gap event. |
| 1 | Transaction stopped at block gap. |

**Bit 1 – TRFC** Transfer Complete
This bit is set when a read/write transfer and a command with Busy is completed.

**In the case of a Read Transaction:**

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of a Write Transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of command with Busy:**

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.

This bit can only be set to '1' if SDMMC_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

| TRFC | DATTEO | Meaning of the status |
|---|---|---|
| 0 | 0 | Interrupted by another factor |
| 0 | 1 | Timeout occurred during transfer |
| 1 | Don’t Care | Command execution complete |

| Value | Description |
|---|---|
| 0 | Command execution is not complete. |
| 1 | Command execution is complete. |

**Bit 0 – CMDC** Command Complete
This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC_PSR for details on how to control this bit.

This bit can only be set to '1' if SDMMC_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CMDC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

| CMDC | CMDTEO | Meaning of the status |
|---|---|---|
| 0 | 0 | Interrupted by another factor |
| Don’t care | 1 | Response not received within 64 SDCLK cycles |
| 1 | 0 | Response received |

| Value | Description |
|---|---|
| 0 | No command complete. |
| 1 | Command complete. |

### 50.12.21 SDMMC Error Interrupt Status Register (SD_SDIO)

**Name:** SDMMC_EISTR (SD_SDIO)
**Offset:** 0x32
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ADMA | ACMD |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W | R/W | R/W | | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 9 – ADMA** ADMA Error
This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC_AESR indicates that an error occurred in ST_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 8 – ACMD** Auto CMD Error
Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 7 – CURLIM** Current Limit Error
By setting SD Bus Power (SDBPWR) in SDMMC_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 6 – DATEND** Data End Bit Error
This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 5 – DATCRC** Data CRC error
This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 4 – DATTEO** Data Timeout Error
This bit is set to '1' when detecting one of following timeout conditions.

– Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).

– Busy timeout after Write CRC status.

– Write CRC Status timeout.

– Read data timeout

This bit can only be set to '1' if SDMMC_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 3 – CMDIDX** Command Index Error
This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 2 – CMDEND** Command End Bit Error
This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 1 – CMDCRC** Command CRC Error
The Command CRC Error is generated in two cases.

If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).

This bit can only be set to '1' if SDMMC_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDCRC is set to '1'.

Writing this bit to '1' clears this bit.

**Bit 0 – CMDTEO** Command Timeout Error
This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

| CMDCRC | CMDTEO | Types of error |
|---|---|---|
| 0 | 0 | No error |
| 0 | 1 | Response timeout error |
| 1 | 0 | Response CRC error |
| 1 | 1 | CMD line conflict |

### 50.12.22 SDMMC Error Interrupt Status Register (e.MMC)

**Name:** SDMMC_EISTR (e.MMC)
**Offset:** 0x32
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | BOOTAE | | | ADMA | ACMD |
| Access | | | | R/W | | | R/W | R/W |
| Reset | | | | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 12 – BOOTAE** Boot Acknowledge Error
This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.

This bit can only be set to '1' if SDMMC_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC_EISIER.BOOTAE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 9 – ADMA** ADMA Error
This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00” ). ADMA Error Status (ERRST) in SDMMC_AESR indicates that an error occurred in ST_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 8 – ACMD** Auto CMD Error
Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to

'1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 7 – CURLIM** Current Limit Error
By setting SD Bus Power (SDBPWR) in SDMMC_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 6 – DATEND** Data End Bit Error
This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 5 – DATCRC** Data CRC Error
This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER. DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 4 – DATTEO** Data Timeout error
This bit is set to '1' when detecting one of following timeout conditions.

– Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” ).

– Busy timeout after Write CRC Status.

– Write CRC Status timeout.

– Read data timeout

This bit can only be set to '1' if SDMMC_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 3 – CMDIDX** Command Index Error
This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 2 – CMDEND** Command End Bit Error
This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 1 – CMDCRC** Command CRC Error
The Command CRC Error is generated in two cases.

If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see he table “Relations between CMDCRC and CMDTEO”).

This bit can only be set to '1' if SDMMC_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDCRC is set to '1'.

Writing this bit to 1 clears this bit.

**Bit 0 – CMDTEO** Command Timeout Error
This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table “Relations between CMDCRC and CMDTEO”, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

| CMDCRC | CMDTEO | Types of error |
|---|---|---|
| 0 | 0 | No error |
| 0 | 1 | Response timeout error |
| 1 | 0 | Response CRC error |
| 1 | 1 | CMD line conflict |

### 50.12.23 SDMMC Normal Interrupt Status Enable Register (SD_SDIO)

**Name:** SDMMC_NISTER (SD_SDIO)
**Offset:** 0x34
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CINT |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CREM | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 8 – CINT** Card Interrupt Status Enable
If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.

0 (MASKED): The CINT status flag in SDMMC_NISTR is masked.

1 (ENABLED): The CINT status flag in SDMMC_NISTR is enabled.

**Bit 7 – CREM** Card Removal Status Enable
0 (MASKED): The CREM status flag in SDMMC_NISTR is masked.

1 (ENABLED): The CREM status flag in SDMMC_NISTR is enabled.

**Bit 6 – CINS** Card Insertion Status Enable
0 (MASKED): The CINS status flag in SDMMC_NISTR is masked.

1 (ENABLED): The CINS status flag in SDMMC_NISTR is enabled.

**Bit 5 – BRDRDY** Buffer Read Ready Status Enable
0 (MASKED): The BRDRDY status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BRDRDY status flag in SDMMC_NISTR is enabled.

**Bit 4 – BWRRDY** Buffer Write Ready Status Enable
0 (MASKED): The BWRRDY status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BWRRDY status flag in SDMMC_NISTR is enabled.

**Bit 3 – DMAINT** DMA Interrupt Status Enable
0 (MASKED): The DMAINT status flag in SDMMC_NISTR is masked.

1 (ENABLED): The DMAINT status flag in SDMMC_NISTR is enabled.

**Bit 2 – BLKGE** Block Gap Event Status Enable
0 (MASKED): The BLKGE status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BLKGE status flag in SDMMC_NISTR is enabled.

**Bit 1 – TRFC** Transfer Complete Status Enable
0 (MASKED): The TRFC status flag in SDMMC_NISTR is masked.

1 (ENABLED): The TRFC status flag in SDMMC_NISTR is enabled.

**Bit 0 – CMDC** Command Complete Status Enable
0 (MASKED): The CMDC status flag in SDMMC_NISTR is masked.

1 (ENABLED): The CMDC status flag in SDMMC_NISTR is enabled.

### 50.12.24 SDMMC Normal Interrupt Status Enable Register (e.MMC)

**Name:** SDMMC_NISTER (e.MMC)
**Offset:** 0x34
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | BOOTAR | | | | | | |
| Access | | R/W | | | | | | |
| Reset | | 0 | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 14 – BOOTAR** Boot Acknowledge Received Status Enable
0 (MASKED): The BOOTAR status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BOOTAR status flag in SDMMC_NISTR is enabled.

**Bit 5 – BRDRDY** Buffer Read Ready Status Enable
0 (MASKED): The BRDRDY status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BRDRDY status flag in SDMMC_NISTR is enabled.

**Bit 4 – BWRRDY** Buffer Write Ready Status Enable
0 (MASKED): The BWRRDY status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BWRRDY status flag in SDMMC_NISTR is enabled.

**Bit 3 – DMAINT** DMA Interrupt Status Enable
0 (MASKED): The DMAINT status flag in SDMMC_NISTR is masked.

1 (ENABLED): The DMAINT status flag in SDMMC_NISTR is enabled.

**Bit 2 – BLKGE** Block Gap Event Status Enable
0 (MASKED): The BLKGE status flag in SDMMC_NISTR is masked.

1 (ENABLED): The BLKGE status flag in SDMMC_NISTR is enabled.

**Bit 1 – TRFC** Transfer Complete Status Enable
0 (MASKED): The TRFC status flag in SDMMC_NISTR is masked.

1 (ENABLED): The TRFC status flag in SDMMC_NISTR is enabled.

**Bit 0 – CMDC** Command Complete Status Enable
0 (MASKED): The CMDC status flag in SDMMC_NISTR is masked.

1 (ENABLED): The CMDC status flag in SDMMC_NISTR is enabled.

### 50.12.25 SDMMC Error Interrupt Status Enable Register (SD_SDIO)

**Name:** SDMMC_EISTER (SD_SDIO)
**Offset:** 0x36
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ADMA | ACMD |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 9 – ADMA** ADMA Error Status Enable
0 (MASKED): The ADMA status flag in SDMMC_EISTR is masked.

1 (ENABLED): The ADMA status flag in SDMMC_EISTR is enabled.

**Bit 8 – ACMD** Auto CMD Error Status Enable
0 (MASKED): The ACMD status flag in SDMMC_EISTR is masked.

1 (ENABLED): The ACMD status flag in SDMMC_EISTR is enabled.

**Bit 7 – CURLIM** Current Limit Error Status Enable
0 (MASKED): The CURLIM status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CURLIM status flag in SDMMC_EISTR is enabled.

**Bit 6 – DATEND** Data End Bit Error Status Enable
0 (MASKED): The DATEND status flag in SDMMC_EISTR is masked.

1 (ENABLED): The DATEND status flag in SDMMC_EISTR is enabled.

**Bit 5 – DATCRC** Data CRC Error Status Enable
0 (MASKED): The DATCRC status flag in SDMMC_EISTR is masked.

1 (ENABLED): The DATCRC status flag in SDMMC_EISTR is enabled.

**Bit 4 – DATTEO** Data Timeout Error Status Enable
0 (MASKED): The DATTEO status flag in SDMMC_EISTR is masked.

1 (ENABLED): The DATTEO status flag in SDMMC_EISTR is enabled.

**Bit 3 – CMDIDX** Command Index Error Status Enable
0 (MASKED): The CMDIDX status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDIDX status flag in SDMMC_EISTR is enabled.

**Bit 2 – CMDEND** Command End Bit Error Status Enable
0 (MASKED): The CMDEND status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDEND status flag in SDMMC_EISTR is enabled.

**Bit 1 – CMDCRC** Command CRC Error Status Enable
0 (MASKED): The CMDCRC status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDCRC status flag in SDMMC_EISTR is enabled.

**Bit 0 – CMDTEO** Command Timeout Error Status Enable
0 (MASKED): The CMDTEO status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDTEO status flag in SDMMC_EISTR is enabled.

### 50.12.26 SDMMC Error Interrupt Status Enable Register (e.MMC)

**Name:** SDMMC_EISTER (e.MMC)
**Offset:** 0x36
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | BOOTAE | | | ADMA | ACMD |
| Access | | | | R/W | | | R/W | R/W |
| Reset | | | | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 12 – BOOTAE** Boot Acknowledge Error Status Enable
0 (MASKED): The BOOTAE status flag in SDMMC_EISTR is masked.

1 (ENABLED): The BOOTAE status flag in SDMMC_EISTR is enabled.

**Bit 9 – ADMA** ADMA Error Status Enable
0 (MASKED): The ADMA status flag in SDMMC_EISTR is masked.

1 (ENABLED): The ADMA status flag in SDMMC_EISTR is enabled.

**Bit 8 – ACMD** Auto CMD Error Status Enable
0 (MASKED): The ACMD status flag in SDMMC_EISTR is masked.

1 (ENABLED): The ACMD status flag in SDMMC_EISTR is enabled.

**Bit 7 – CURLIM** Current Limit Error Status Enable
0 (MASKED): The CURLIM status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CURLIM status flag in SDMMC_EISTR is enabled.

**Bit 6 – DATEND** Data End Bit Error Status Enable
0 (MASKED): The DATEND status flag in SDMMC_EISTR is masked.

1 (ENABLED): The DATEND status flag in SDMMC_EISTR is enabled.

**Bit 5 – DATCRC** Data CRC Error Status Enable
0 (MASKED): The DATCRC status flag in SDMMC_EISTR is masked.

1 (ENABLED): The DATCRC status flag in SDMMC_EISTR is enabled.

**Bit 4 – DATTEO** Data Timeout Error Status Enable
0 (MASKED): The DATTEO status flag in SDMMC_EISTR is masked.

1 (ENABLED): The DATTEO status flag in SDMMC_EISTR is enabled.

**Bit 3 – CMDIDX** Command Index Error Status Enable
0 (MASKED): The CMDIDX status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDIDX status flag in SDMMC_EISTR is enabled.

**Bit 2 – CMDEND** Command End Bit Error Status Enable
0 (MASKED): The CMDEND status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDEND status flag in SDMMC_EISTR is enabled.

**Bit 1 – CMDCRC** Command CRC Error Status Enable
0 (MASKED): The CMDCRC status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDCRC status flag in SDMMC_EISTR is enabled.

**Bit 0 – CMDTEO** Command Timeout Error Status Enable
0 (MASKED): The CMDTEO status flag in SDMMC_EISTR is masked.

1 (ENABLED): The CMDTEO status flag in SDMMC_EISTR is enabled.

### 50.12.27 SDMMC Normal Interrupt Signal Enable Register (SD_SDIO)

**Name:** SDMMC_NISIER (SD_SDIO)
**Offset:** 0x38
**Reset:** 0x0000
**Property:** Read/Write

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CINT |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CREM | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 8 – CINT** Card Interrupt Signal Enable
0 (MASKED): No interrupt is generated when the CINT status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the CINT status rises in SDMMC_NISTR.

**Bit 7 – CREM** Card Removal Signal Enable
0 (MASKED): No interrupt is generated when the CREM status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the CREM status rises in SDMMC_NISTR.

**Bit 6 – CINS** Card Insertion Signal Enable
0 (MASKED): No interrupt is generated when the CINS status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the CINS status rises in SDMMC_NISTR.

**Bit 5 – BRDRDY** Buffer Read Ready Signal Enable
0 (MASKED): No interrupt is generated when the BRDRDY status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BRDRDY status rises in SDMMC_NISTR.

**Bit 4 – BWRRDY** Buffer Write Ready Signal Enable
0 (MASKED): No interrupt is generated when the BWRRDY status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC_NISTR.

**Bit 3 – DMAINT** DMA Interrupt Signal Enable
0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC_NISTR.

**Bit 2 – BLKGE** Block Gap Event Signal Enable
0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC_NISTR.

**Bit 1 – TRFC** Transfer Complete Signal Enable
0 (MASKED): No interrupt is generated when the TRFC status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the TRFC status rises in SDMMC_NISTR.

**Bit 0 – CMDC** Command Complete Signal Enable
0 (MASKED): No interrupt is generated when the CMDC status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the CMDC status rises in SDMMC_NISTR.

### 50.12.28 SDMMC Normal Interrupt Signal Enable Register (e.MMC)

**Name:** SDMMC_NISIER (e.MMC)
**Offset:** 0x38
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | BOOTAR | | | | | | |
| Access | | R/W | | | | | | |
| Reset | | 0 | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 14 – BOOTAR** Boot Acknowledge Received Signal Enable
0 (MASKED): No interrupt is generated when the BOOTAR status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BOOTAR status rises in SDMMC_NISTR.

**Bit 5 – BRDRDY** Buffer Read Ready Signal Enable
0 (MASKED): No interrupt is generated when the BRDRDY status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BRDRDY status rises in SDMMC_NISTR.

**Bit 4 – BWRRDY** Buffer Write Ready Signal Enable
0 (MASKED): No interrupt is generated when the BWRRDY status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC_NISTR.

**Bit 3 – DMAINT** DMA Interrupt Signal Enable
0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC_NISTR.

**Bit 2 – BLKGE** Block Gap Event Signal Enable
0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC_NISTR.

**Bit 1 – TRFC** Transfer Complete Signal Enable
0 (MASKED): No interrupt is generated when the TRFC status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the TRFC status rises in SDMMC_NISTR.

**Bit 0 – CMDC** Command Complete Signal Enable
0 (MASKED): No interrupt is generated when the CMDC status rises in SDMMC_NISTR.

1 (ENABLED): An interrupt is generated when the CMDC status rises in SDMMC_NISTR.

### 50.12.29 SDMMC Error Interrupt Signal Enable Register (SD_SDIO)

**Name:** SDMMC_EISIER (SD_SDIO)
**Offset:** 0x3A
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ADMA | ACMD |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 9 – ADMA** ADMA Error Signal Enable
0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC_EISTR.

**Bit 8 – ACMD** Auto CMD Error Signal Enable
0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC_EISTR.

**Bit 7 – CURLIM** Current Limit Error Signal Enable
0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC_EISTR.

**Bit 6 – DATEND** Data End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC_EISTR.

**Bit 5 – DATCRC** Data CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC_EISTR.

**Bit 4 – DATTEO** Data Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC_EISTR.

**Bit 3 – CMDIDX** Command Index Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.

**Bit 2 – CMDEND** Command End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC_EISTR.

**Bit 1 – CMDCRC** Command CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the CDMCRC status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.

### 50.12.30 SDMMC Error Interrupt Signal Enable Register (e.MMC)

**Name:** SDMMC_EISIER (e.MMC)
**Offset:** 0x3A
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | BOOTAE | | | ADMA | ACMD |
| Access | | | | | | | | |
| Reset | | | | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 12 – BOOTAE** Boot Acknowledge Error Signal Enable
0 (MASKED): No interrupt is generated when the BOOTAE status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the BOOTAE status rises in SDMMC_EISTR.

**Bit 9 – ADMA** ADMA Error Signal Enable
0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC_EISTR.

**Bit 8 – ACMD** Auto CMD Error Signal Enable
0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC_EISTR.

**Bit 7 – CURLIM** Current Limit Error Signal Enable
0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC_EISTR.

**Bit 6 – DATEND** Data End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC_EISTR.

**Bit 5 – DATCRC** Data CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC_EISTR.

**Bit 4 – DATTEO** Data Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC_EISTR.

**Bit 3 – CMDIDX** Command Index Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.

**Bit 2 – CMDEND** Command End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC_EISTR.

**Bit 1 – CMDCRC** Command CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the CDMCRC status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.

### 50.12.31 SDMMC Auto CMD Error Status Register

**Name:** SDMMC_ACESR
**Offset:** 0x3C
**Reset:** 0x0000
**Property:** Read-only

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CMDNI | | | ACMDIDX | ACMDEND | ACMDCRC | ACMDTEO | ACMD12NE |
| Access | R | | | R | R | R | R | R |
| Reset | 0 | | | 0 | 0 | 0 | 0 | 0 |

**Bit 7 – CMDNI** Command Not Issued by Auto CMD12 Error
This bit is set to 1 when CMD_wo_DAT is not executed due to an Auto CMD12 error (SDMMC_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 4 – ACMDIDX** Auto CMD Index Error
This bit is set to 1 when the Command Index error occurs in response to a command.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 3 – ACMDEND** Auto CMD End Bit Error
This bit is set to 1 when detecting that the end bit of the command response is 0.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bit 2 – ACMDCRC** Auto CMD CRC Error
This bit is set to 1 when detecting a CRC error in the command response (see the table above for more details).

**Bit 1 – ACMDTEO** Auto CMD Timeout Error
This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC_ACESR[4:2]) are meaningless.

**Table 50-4. Relation between ACMDCRC and ACMDTEO**

| ACMDCRC | ACMDTEO | Types of error |
|---|---|---|
| 0 | 0 | No error |
| 0 | 1 | Response Timeout error |
| 1 | 0 | Response CRC error |
| 1 | 1 | CMD line conflict |

**Bit 0 – ACMD12NE** Auto CMD12 Not Executed
If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC_ACESR[4:1]) are meaningless.

This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

### 50.12.32 SDMMC Host Control 2 Register (SD_SDIO)

**Name:** SDMMC_HC2R (SD_SDIO)
**Offset:** 0x3E
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | PVALEN | ASINTEN | | | | | | |
| Access | R/W | R/W | | | | | | |
| Reset | 0 | 0 | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SCLKSEL | EXTUN | DRVSEL[1:0] | | VS18EN | UHSMS[2:0] | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – PVALEN** Preset Value Enable
As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC_CCR and DRVSEL in SDMMC_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC_CCR and DRVSEL in SDMMC_HC2R are set by the SDMMC as specified in SDMMC_PVR.

| Value | Description |
|---|---|
| 0 | SDCLK and Driver strength are controlled by the user. |
| 1 | Automatic selection by Preset Value is enabled. |

**Bit 14 – ASINTEN** Asynchronous Interrupt Enable
This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

| Value | Description |
|---|---|
| 0 | Disabled |
| 1 | Enabled |

**Bit 7 – SCLKSEL** Sampling Clock Select
The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete the tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description |
|---|---|
| 0 | The fixed clock is used to sample data. |
| 1 | The tuned clock is used to sample data. |

**Bit 6 – EXTUN** Execute Tuning
This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description |
|---|---|
| 0 | Not tuned or tuning completed. |
| 1 | Execute tuning. |

**Bits 5:4 – DRVSEL[1:0]** Driver Strength Select
The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC_CA1R.

This field depends on the setting of Preset Value Enable (PVALEN):

– PVALEN = 0: This field is set by the user.

– PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC_PVRx.

| Value | Name | Description |
|---|---|---|
| 0 | TYPEB | Driver Type B is selected (Default) |
| 1 | TYPEA | Driver Type A is selected |
| 2 | TYPEC | Driver Type C is selected |
| 3 | TYPED | Driver Type D is selected |

**Bit 3 – VS18EN** 1.8V Signaling Enable
This bit controls the SDMMC_1V8SEL output, which in turn may control an external voltage regulator for the I/O cell and card I/Os. 3.3V or some other fixed voltage is supplied to the card/device regardless of the signaling voltage.

Setting this bit from 0 to 1 starts changing the signal voltage from 3.3V to 1.8V. The 1.8V regulator output must be stable within 5 ms.

Clearing this bit from 1 to 0 starts changing the signal voltage from 1.8V to 3.3V. The 3.3V regulator output must be stable within 5 ms.

The user can set this bit to 1 when the SDMMC supports 1.8V signaling (one of the support bits is set to 1: SDR50SUP, SDR104SUP or DDR50SUP in SDMMC_CA1R) and the card or device supports UHS-I (S18A = 1. See “Bus Switch Voltage Switch Sequence in the “Physical Layer Simplified Specification V3.01” ).

| Value | Description |
|---|---|
| 0 | 3.3V signaling. |
| 1 | 1.8V signaling. |

**Bits 2:0 – UHSMS[2:0]** UHS Mode Select
This field is used to select one of the UHS-I modes and is effective when 1.8V Signal Enable (VS18EN) is set to 1.

This field is effective only if SDMMC_MC1R.DDR is set to 0.

If Preset Value Enable is set to 1, the SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC_CCR and Driver Strength Select (DRVSEL) according to SDMMC_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

| Value | Name | Description |
|---|---|---|
| 0 | SDR12 | UHS SDR12 Mode |
| 1 | SDR25 | UHS SDR25 Mode |
| 2 | SDR50 | UHS SDR50 Mode |
| 3 | SDR104 | UHS SDR104 Mode |
| 4 | DDR50 | UHS DDR50 Mode |

### 50.12.33 SDMMC Host Control 2 Register (e.MMC)

**Name:** SDMMC_HC2R (e.MMC)
**Offset:** 0x3E
**Reset:** 0x0000
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | PVALEN | | | | | | | |
| Access | R/W | | | | | | | |
| Reset | 0 | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SCLKSEL | EXTUN | DRVSEL[1:0] | | HS200EN[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – PVALEN** Preset Value Enable
As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC_CCR and DRVSEL in SDMMC_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC_CCR and DRVSEL in SDMMC_HC2R are set by the SDMMC as specified in SDMMC_PVR.

| Value | Description |
|---|---|
| 0 | SDCLK and Driver strength are controlled by the user. |
| 1 | Automatic selection by Preset Value is enabled. |

**Bit 7 – SCLKSEL** Sampling Clock Select
The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete a tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description |
|---|---|
| 0 | The fixed clock is used to sample data. |
| 1 | The tuned clock is used to sample data. |

**Bit 6 – EXTUN** Execute Tuning
This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description |
|---|---|
| 0 | Not tuned or tuning completed |
| 1 | Execute tuning |

**Bits 5:4 – DRVSEL[1:0]** Driver Strength Select
The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC_CA1R.

This field depends on setting of Preset Value Enable (PVALEN):

– PVALEN = 0: This field is set by the user.

– PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC_PVRx.

| Value | Name | Description |
|---|---|---|
| 0 | TYPEB | Driver Type B is selected (Default) |
| 1 | TYPEA | Driver Type A is selected |
| 2 | TYPEC | Driver Type C is selected |
| 3 | TYPED | Driver Type D is selected |

**Bits 3:0 – HS200EN[3:0]** HS200 Mode Enable
This field is used to select the e.MMC HS200 mode. When HS200EN is set to $B_{(hexa)}$, the HS200 mode is enabled. Any other value except 0 is forbidden when interfacing an e.MMC device.

If Preset Value Enable is set to 1, SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC_CCR and Driver Strength Select (DRVSEL) according to SDMMC_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Note: This field is effective only if DDR in SDMMC_MC1R is set to 0.

### 50.12.34 SDMMC Capabilities 0 Register

**Name:** SDMMC_CA0R
**Offset:** 0x40
**Property:** Read/Write

**Reset:** Register reset values depend on the instance of the SDMMC:

| Instance | Reset Value |
|---|---|
| SDMMC0 | 0x27EC0C8C |
| SDMMC1 | 0x27E80C8C |

**Note:** The Capabilities 0 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC_CACR.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SLTYPE[1:0] | | ASINTSUP | SB64SUP | | V18VSUP | V30VSUP | V33VSUP |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | SRSUP | SDMASUP | HSSUP | | ADMA2SUP | ED8SUP | MAXBLKL[1:0] | |
| Access | R/W | R/W | R/W | | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | BASECLKF[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TEOCLKU | | TEOCLKF[5:0] | | | | | |
| Access | R/W | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

**Bits 31:30 – SLTYPE[1:0]** Slot Type
This field indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot.

Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot.

The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

| Value | Name |
|---|---|
| 0 | Removable Card Slot |
| 1 | Embedded Slot for One Device |
| 2 | Reserved |
| 3 | Reserved |

**Bit 29 – ASINTSUP** Asynchronous Interrupt Support
See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

| Value | Description |
|---|---|
| 0 | Asynchronous interrupt not supported. |
| 1 | Asynchronous interrupt supported. |

**Bit 28 – SB64SUP** 64-Bit System Bus Support
Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

| Value | Description |
|---|---|
| 0 | 64-bit address bus not supported. |
| 1 | 64-bit address bus supported. |

**Bit 26 – V18VSUP** Voltage Support 1.8V

| Value | Description |
|---|---|
| 0 | 1.8V Voltage supply not supported. |
| 1 | 1.8V Voltage supply supported. |

**Bit 25 – V30VSUP** Voltage Support 3.0V

| Value | Description |
|---|---|
| 0 | 3.0V Voltage supply not supported. |
| 1 | 3.0V Voltage supply supported. |

**Bit 24 – V33VSUP** Voltage Support 3.3V

| Value | Description |
|---|---|
| 0 | 3.3V Voltage supply not supported. |
| 1 | 3.3V Voltage supply supported. |

**Bit 23 – SRSUP** Suspend/Resume Support
This bit indicates whether the SDMMC supports the Suspend/Resume functionality. If this bit is set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00” ) is not supported.

| Value | Description |
|---|---|
| 0 | Suspend/Resume not supported. |
| 1 | Suspend/Resume supported. |

**Bit 22 – SDMASUP** SDMA Support
This bit indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

| Value | Description |
|---|---|
| 0 | SDMA not supported. |
| 1 | SDMA supported. |

**Bit 21 – HSSUP** High Speed Support
This bit indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

| Value | Description |
|---|---|
| 0 | High Speed not supported. |
| 1 | High Speed supported. |

**Bit 19 – ADMA2SUP** ADMA2 Support
This bit indicates whether the SDMMC is capable of using ADMA2.

| Value | Description |
|---|---|
| 0 | ADMA2 not supported. |
| 1 | ADMA2 supported. |

**Bit 18 – ED8SUP** 8-Bit Support for Embedded Device
This bit indicates whether the SDMMC is capable of using the 8-bit Bus Width mode.

| Value | Description |
|---|---|
| 0 | 8-bit bus width not supported. |
| 1 | 8-bit bus width supported. |

**Bits 17:16 – MAXBLKL[1:0]** Max Block Length
This field indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

| Value | Name | Description |
|---|---|---|
| 0 | 512 | 512 bytes |
| 1 | 1024 | 1024 bytes |
| 2 | 2048 | 2048 bytes |
| 3 | NONE | Reserved |

**Bits 15:8 – BASECLKF[7:0]** Base Clock Frequency
This value indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC_CCR).

If this field is set to 0, the user must get the information via another method.

$f_{\mathrm{BASECLK}} = \mathrm{BASECLKF}_{\mathrm{MHz}}$

**Bit 7 – TEOCLKU** Timeout Clock Unit
This bit shows the unit of the base clock frequency used to detect Data Timeout Error.

| Value | Description |
|---|---|
| 0 | KHz |
| 1 | MHz |

**Bits 5:0 – TEOCLKF[5:0]** Timeout Clock Frequency
This bit shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.

If this field is set to 0, the user must get the information via another method.

The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.

– TEOCLKU = 0: $f_{\mathrm{TEOCLK}} = \mathrm{TEOCLKF}_{\mathrm{KHz}}$

– TEOCLKU = 1: $f_{\mathrm{TEOCLK}} = \mathrm{TEOCLKF}_{\mathrm{MHz}}$

### 50.12.35 SDMMC Capabilities 1 Register

**Name:** SDMMC_CA1R
**Offset:** 0x44
**Property:** Read/Write

**Note:** The Capabilities 1 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC_CACR.

**Note:** Register reset values depend on the instance of the SDMMC:

| Instance | Reset Value |
|---|---|
| SDMMC0 | 0x00200F77 |
| SDMMC1 | 0x00200070 |

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CLKMULT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RTMOD[1:0] | | TSDR50 | | TCNTRT[3:0] | | | |
| Access | R/W | R/W | R/W | | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | DRVDSUP | DRVCSUP | DRVASUP | | DDR50SUP | SDR104SUP | SDR50SUP |
| Access | | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | | | | | | |

**Bits 23:16 – CLKMULT[7:0]** Clock Multiplier
This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC_CCR).

Reading this field to 0 means that the Programmable Clock mode is not supported.

$f_{\mathrm{MULTCLK}} = f_{\mathrm{BASECLK}} \times (\mathrm{CLKMULT} + 1)$

**Bits 15:14 – RTMOD[1:0]** Retuning Modes
This field selects the retuning method and limits the maximum data length.

There are two retuning timings: Retuning Request (RTREQ) controlled by the SDMMC, and expiration of a Retuning timer controlled by the user. By receiving either timing, the user executes the retuning procedure just before a next command issue.

The maximum data length per read/write command is restricted so that retuning procedures can be inserted during data transfers.

**Retuning Mode 1:**

The SDMMC does not have any internal logic to detect when retuning needs to be performed. In this case, the user should maintain all retuning timings by using the Retuning Timer. To enable inserting the retuning procedure during data transfers, the data length per Read/Write command must be limited to 4 Mbytes.

**Retuning Mode 2:**

The SDMMC has the capability to indicate the retuning timing by Retuning Request (RTREQ) during data transfers. Then the data length per Read/Write command must be limited to 4 Mbytes.

During nondata transfer, retuning timing is determined by either Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

**Retuning Mode 3:**

The SDMMC has the capability to take care of the retuning during data transfer (Auto Retuning). Retuning Request is not generated during data transfers and there is no limitation to data length per Read/Write command.

During nondata transfer, retuning timing is determined either by Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

| Value | Name | Description | Data Length |
|---|---|---|---|
| 0 | MODE1 | Timer | 4 Mbytes (Max) |
| 1 | MODE2 | Timer and Retuning Request | 4 Mbytes (Max) |
| 2 | MODE3 | Auto Retuning (for transfer) Timer and Retuning Request | Any |
| 3 | – | Reserved | – |

**Bit 13 – TSDR50** Use Tuning for SDR50
If this bit is set to 1, the SDMMC requires tuning to operate SDR50 (tuning is always required to operate SDR104).

| Value | Description |
|---|---|
| 0 | SDR50 does not require tuning. |
| 1 | SDR50 requires tuning. |

**Bits 11:8 – TCNTRT[3:0]** Timer Count For Retuning
This field indicates an initial value of the Retuning Timer for Retuning Mode (RTMOD) 1 to 3. Reading this field at 0 means that the Retuning Timer is disabled. The Retuning Timer initial value ranges from 0 to 1024 seconds.

$t_{TIMER} = 2^{(TCNTRT - 1)}$Seconds

**Bit 6 – DRVDSUP** Driver Type D Support

| Value | Description |
|---|---|
| 0 | Driver type D is not supported. |
| 1 | Driver type D is supported. |

**Bit 5 – DRVCSUP** Driver Type C Support

| Value | Description |
|---|---|
| 0 | Driver type C is not supported. |
| 1 | Driver type C is supported. |

**Bit 4 – DRVASUP** Driver Type A Support

| Value | Description |
|---|---|
| 0 | Driver type A is not supported. |
| 1 | Driver type A is supported. |

**Bit 2 – DDR50SUP** DDR50 Support

| Value | Description |
|---|---|
| 0 | DDR50 mode is not supported. |
| 1 | DDR50 mode is supported. |

**Bit 1 – SDR104SUP** SDR104 Support

| Value | Description |
|---|---|
| 0 | SDR104 mode is not supported. |
| 1 | SDR104 mode is supported. |

**Bit 0 – SDR50SUP** SDR50 Support

| Value | Description |
|---|---|
| 0 | SDR50 mode is not supported. |
| 1 | SDR50 mode is supported. |

### 50.12.36 SDMMC Maximum Current Capabilities Register

**Name:** SDMMC_MCCAR
**Offset:** 0x48
**Reset:** 0x00000000
**Property:** Read/Write

**Note:** The Maximum Current Capabilities Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC_CACR.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | MAXCUR18V[7:0] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | MAXCUR30V[7:0] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | MAXCUR33V[7:0] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:16 – MAXCUR18V[7:0]** Maximum Current for 1.8V
This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.

$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR18}V$

**Bits 15:8 – MAXCUR30V[7:0]** Maximum Current for 3.0V
This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.

$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR30}V$

**Bits 7:0 – MAXCUR33V[7:0]** Maximum Current for 3.3V
This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.

$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR33}V$

### 50.12.37 SDMMC Force Event Register for Auto CMD Error Status

**Name:** SDMMC_FERACES
**Offset:** 0x50
**Reset:** –
**Property:** Write-only

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CMDNI | | | ACMDIDX | ACMDEND | ACMDCRC | ACMDTEO | ACMD12NE |
| Access | W | | | W | W | W | W | W |
| Reset | – | | | – | – | – | – | – |

**Bit 7 – CMDNI** Force Event for Command Not Issued by Auto CMD12 Error
For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC_ACESR.

Writing this bit to 0 has no effect.

**Bit 4 – ACMDIDX** Force Event for Auto CMD Index Error
For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC_ACESR.

Writing this bit to 0 has no effect.

**Bit 3 – ACMDEND** Force Event for Auto CMD End Bit Error
For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC_ACESR.

Writing this bit to 0 has no effect.

**Bit 2 – ACMDCRC** Force Event for Auto CMD CRC Error
For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC_ACESR.

Writing this bit to 0 has no effect.

**Bit 1 – ACMDTEO** Force Event for Auto CMD Timeout Error
For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC_ACESR.

Writing this bit to 0 has no effect.

**Bit 0 – ACMD12NE** Force Event for Auto CMD12 Not Executed
For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC_ACESR.

Writing this bit to 0 has no effect.

### 50.12.38 SDMMC Force Event Register for Error Interrupt Status

**Name:** SDMMC_FEREIS
**Offset:** 0x52
**Reset:** –
**Property:** Write-only

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | BOOTAE | | | ADMA | ACMD |
| Access | | | | W | | | W | W |
| Reset | | | | – | | | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bit 12 – BOOTAE** Force Event for Boot Acknowledge Error
For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 9 – ADMA** Force Event for ADMA Error
For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 8 – ACMD** Force Event for Auto CMD Error
For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 7 – CURLIM** Force Event for Current Limit Error
For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 6 – DATEND** Force Event for Data End Bit Error
For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 5 – DATCRC** Force Event for Data CRC error
For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 4 – DATTEO** Force Event for Data Timeout error
For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 3 – CMDIDX** Force Event for Command Index Error
For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 2 – CMDEND** Force Event for Command End Bit Error
For test purposes, the user can write this bit to 1 to raise the CDMEND status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 1 – CMDCRC** Force Event for Command CRC Error
For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

**Bit 0 – CMDTEO** Force Event for Command Timeout Error
For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC_EISTR.

Writing this bit to 0 has no effect.

### 50.12.39 SDMMC ADMA Error Status Register

**Name:** SDMMC_AESR
**Offset:** 0x54
**Reset:** 0x00
**Property:** Read-only

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | LMIS | ERRST[1:0] | |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

**Bit 2 – LMIS** ADMA Length Mismatch Error
This error occurs in the following two cases:

– While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).

– The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

| Value | Description |
|---|---|
| 0 | No error. |
| 1 | Error. |

**Bits 1:0 – ERRST[1:0]** ADMA Error State
This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

| Value | Name | Description |
|---|---|---|
| 0 | ST_STOP (Stop DMA) | Points to the descriptor following the error descriptor |
| 1 | ST_FDS (Fetch Descriptor) | Points to the error descriptor |
| 2 | – | (Not used) |
| 3 | ST_TRF (Transfer Data) | Points to the descriptor following the error descriptor |

### 50.12.40 SDMMC ADMA System Address Register 0

**Name:** SDMMC_ASAR0
**Offset:** 0x58
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ADMASA[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ADMASA[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ADMASA[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ADMASA[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ADMASA[31:0]** ADMA System Address
This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

### 50.12.41 SDMMC Preset Value Register

**Name:** SDMMC_PVRx
**Offset:** 0x60 + x*0x02 [x=0..7]
**Reset:** 0x00000000
**Property:** Read/Write

One of the Preset Value Registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC_PVRs.

**Table 50-5. Preset Value Register Select Condition**

| Selected Bus Speed Mode | VS18EN (SDMMC_HC2R) | HSEN (SDMMC_HC1R) | UHSMS (SDMMC_HC2R) |
|---|---|---|---|
| Default Speed | 0 | 0 | don't care |
| High Speed | 0 | 1 | don't care |
| SDR12 | 1 | don't care | 0 |
| SDR25 | 1 | don't care | 1 |
| SDR50 | 1 | don't care | 2 |
| SDR104/HS200 | 1 | don't care | 3 |
| DDR50 | 1 | don't care | 4 |
| Reserved | 1 | don't care | Other values |

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

**Table 50-6. Preset Value Registers**

| SDMMC_PVRx | Selected Bus Speed Mode | Signal Voltage |
|---|---|---|
| SDMMC_PVR0 | Initialization | 3.3V or 1.8V |
| SDMMC_PVR1 | Default Speed | 3.3V |
| SDMMC_PVR2 | High Speed | 3.3V |
| SDMMC_PVR3 | SDR12 | 1.8V |
| SDMMC_PVR4 | SDR25 | 1.8V |
| SDMMC_PVR5 | SDR50 | 1.8V |
| SDMMC_PVR6 | SDR104/HS200 | 1.8V |
| SDMMC_PVR7 | DDR50 | 1.8V |

When Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, SDCLK Frequency Select (SDLCKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC_CCR, and Driver Strength Select (DRVSEL) in SDMMC_HC2R are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC_PVR0) is not selected by Bus Speed mode. Before starting the initialization

sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC_CCR. PVALEN can be set to 1 after the initialization is completed.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | DRVSEL[1:0] | | | | | CLKGSEL | SDCLKFSEL[9:8] | |
| Access | R/W | R/W | | | | R/W | R/W | R/W |
| Reset | 0 | 0 | | | | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SDCLKFSEL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:14 – DRVSEL[1:0]** Driver Strength Select
See DRVSEL in SDMMC_HC2R.

**Bit 10 – CLKGSEL** Clock Generator Select
See CLKGSEL in SDMMC_CCR.

**Bits 9:0 – SDCLKFSEL[9:0]** SDCLK Frequency Select
See SDCLKFSEL in SDMMC_CCR.

### 50.12.42 SDMMC Slot Interrupt Status Register

**Name:** SDMMC_SISR
**Offset:** 0xFC
**Reset:** 0x0000
**Property:** Read-only

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | INTSSL[1:0] | |
| Access | | | | | | | R | R |
| Reset | | | | | | | 0 | 0 |

**Bits 1:0 – INTSSL[1:0]** Interrupt Signal for Each Slot
These status bits indicate the logical OR of Interrupt Signals and Wakeup Signal for each SDMMC instance in the product (INTSSL[x] corresponds to SDMMCx instance in the product).

### 50.12.43 SDMMC Host Controller Version Register

**Name:** SDMMC_HCVR
**Offset:** 0xFE
**Reset:** 0x1502
**Property:** Read-only

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | VVER[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SVER[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | | | | | | | | |

**Bits 15:8 – VVER[7:0]** Vendor Version Number
Reserved. Value subject to change. No functionality associated. This is the internal version of the module.

**Bits 7:0 – SVER[7:0]** Specification Version Number
This status indicates the SD Host Controller Specification Version.

| Value | Name |
|---|---|
| 0 | SD Host Specification Version 1.00 |
| 1 | SD Host Specification Version 2.00, including the feature of the ADMA and Test Register |
| 2 | SD Host Specification Version 3.00 |

### 50.12.44 SDMMC Additional Present State Register

**Name:** SDMMC_APSR
**Offset:** 0x200
**Reset:** –
**Property:** Read-only

**Reset:**

Reset value depends on the instance of the SDMMC:

| Instance | Reset Value |
|---|---|
| SDMMC0 | 0x0000000F |
| SDMMC1 | 0x00000000 |

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | HDATLL[3:0] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | – | – | – | – |

**Bits 3:0 – HDATLL[3:0]** DAT[7:4] High Line Level
This status is used to check the DAT[7:4] line level to recover from errors, and for debugging.

### 50.12.45 SDMMC e.MMC Control 1 Register

**Name:** SDMMC_MC1R
**Offset:** 0x204
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FCD | RSTN | BOOTA | OPD | DDR | | CMDTYP[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | | 0 | 0 |

**Bit 7 – FCD** e.MMC Force Card Detect
When using e.MMC, the user can set this bit to 1 to bypass the card detection procedure using the SDMMC_CD signal.

0 (DISABLED): e.MMC Forced Card Detect is disabled. The SDMMC_CD signal is used and debounce timing is applied.

1 (ENABLED): e.MMC Forced Card Detect is enabled.

**Bit 6 – RSTN** e.MMC Reset Signal
This bit controls the e.MMC reset signal.

| Value | Description |
|---|---|
| 0 | Reset signal is inactive. |
| 1 | Reset signal is active. |

**Bit 5 – BOOTA** e.MMC Boot Acknowledge Enable
This bit must be set according to the value of BOOT_ACK in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.

If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC_EISTR if BOOTAE is set in SDMMC_EISTER. An interrupt is generated if BOOTAE is set in SDMMC_EISIER.

If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC_EISTR if DATTEO is set in SDMMC_EISTER. An interrupt is generated if DATTEO is set in SDMMC_EISIER.

**Bit 4 – OPD** e.MMC Open Drain Mode
This bit sets the command line in open drain.

| Value | Description |
|---|---|
| 0 | The command line is in push-pull. |
| 1 | The command line is in open drain. |

**Bit 3 – DDR** e.MMC HSDDR Mode
This bit selects the High Speed DDR mode.

The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when DDR is 1.

| Value | Description |
|---|---|
| 0 | High Speed DDR is not selected. |
| 1 | High Speed DDR is selected. |

**Bits 1:0 – CMDTYP[1:0]** e.MMC Command Type

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | The command is not an e.MMC specific command. |
| 1 | WAITIRQ | This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See “Interrupt Mode” in the “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” . |
| 2 | STREAM | This bit must be set to 1 in the case of Stream Read(CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41. |
| 3 | BOOT | Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device. |

### 50.12.46 SDMMC e.MMC Control 2 Register

**Name:** SDMMC_MC2R
**Offset:** 0x205
**Reset:** –
**Property:** Write-only

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ABOOT | SRESP |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

**Bit 1 – ABOOT** e.MMC Abort Boot
This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

**Bit 0 – SRESP** e.MMC Abort Wait IRQ
This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.

This bit is only effective when CMD_TYP in SDMMC_MC1R is set to WAITIRQ.

### 50.12.47 SDMMC AHB Control Register

**Name:** SDMMC_ACR
**Offset:** 0x208
**Reset:** 0x00
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bits 1:0 – BMAX[1:0]** AHB Maximum Burst
This field selects the maximum burst size in case of DMA transfer.

| Value | Name | Description |
|---|---|---|
| 0 | INCR16 | The maximum burst size is INCR16. |
| 1 | INCR8 | The maximum burst size is INCR8. |
| 2 | INCR4 | The maximum burst size is INCR4. |
| 3 | SINGLE | Only SINGLE transfers are performed. |

### 50.12.48 SDMMC Clock Control 2 Register

**Name:** SDMMC_CC2R
**Offset:** 0x20C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | FSDCLKD |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – FSDCLKD** Force SDCLK Disabled
The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

| Value | Description |
|---|---|
| 0 | The SDCLK is forced and it cannot be stopped immediately after the transaction. |
| 1 | The SDCLK is not forced and it can be stopped immediately after the transaction. |

### 50.12.49 SDMMC Retuning Control 1 Register

**Name:** SDMMC_RTC1R
**Offset:** 0x210
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | TMREN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – TMREN** Retuning Timer Enable
Enable the retuning timer.

0 (DISABLED): The retuning timer is disabled.

1 (ENABLED): The retuning timer is enabled.

### 50.12.50 SDMMC Retuning Control 2 Register

**Name:** SDMMC_RTC2R
**Offset:** 0x211
**Reset:** –
**Property:** Write-only

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | RLD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – RLD** Retuning Timer Reload
This bit is only efficient if the Retuning timer is enabled (SDMMC_RTC1R.TMREN set to 1). Once the Timer Counter Value (TCVAL) is set to a nonzero value in SDMMC_RTCVR, setting this bit to 1 starts the timer count. The retuning timer count restarts each time this bit is written to 1.

Writing this bit to 0 has no effect.

### 50.12.51 SDMMC Retuning Counter Value Register

**Name:** SDMMC_RTCVR
**Offset:** 0x214
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | TCVAL[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 3:0 – TCVAL[3:0]** Retuning Timer Counter Value
The TCVAL value is used to define the time before expiration of the retuning timer where:

$$\text{Time} = 2^{\text{TCVAL} - 1}\text{seconds}$$

This value must range between 1 and 11. Any other value results in the retuning timer being disabled.

### 50.12.52 SDMMC Retuning Interrupt Status Enable Register

**Name:** SDMMC_RTISTER
**Offset:** 0x218
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | TEVT |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – TEVT** Retuning Timer Event
0 (MASKED): The TEVT status flag in SDMMC_RTISTR is masked.

1 (ENABLED): The TEVT status flag in SDMMC_RTISTR is enabled.

### 50.12.53 SDMMC Retuning Interrupt Signal Enable Register

**Name:** SDMMC_RTISIER
**Offset:** 0x219
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | TEVT |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – TEVT** Retuning Timer Event
0 (MASKED): No interrupt is generated when the TEVT status rises in SDMMC_RTISTR.

1 (ENABLED): An interrupt is generated when the TEVT status rises in SDMMC_RTISTR.

### 50.12.54 SDMMC Retuning Interrupt Status Register

**Name:** SDMMC_RTISTR
**Offset:** 0x21C
**Reset:** 0x00
**Property:** Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | TEVT |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – TEVT** Retuning Timer Event
This bit is set to 1 when the retuning timer count is elapsed if SDMMC_RTISTER.TEVT is set to 1. An interrupt is generated if SDMMC_RTISIER.TEVT is set to 1.

Writing this bit to 1 clears this bit.

| Value | Description |
|---|---|
| 0 | No retuning timer event. |
| 1 | Retuning timer event. |

### 50.12.55 SDMMC Retuning Status Slots Register

**Name:** SDMMC_RTSSR
**Offset:** 0x21D
**Reset:** 0x00
**Property:** Read-only

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | TEVTSLOT[1:0] | |
| Access | | | | | | | R | R |
| Reset | | | | | | | 0 | 0 |

**Bits 1:0 – TEVTSLOT[1:0]** Retuning Timer Event Slots
Indicates the TEVT status for each SDMMC instance in the product (TEVTSLOT[x] corresponds to SDMMCx instance in the product).

### 50.12.56 SDMMC Tuning Control Register

**Name:** SDMMC_TUNCR
**Offset:** 0x220
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SMPLPT |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – SMPLPT** Sampling Point
This bit selects the position of the sampling point into the data window for SDR104 and HS200 modes.

| Value | Description |
|---|---|
| 0 | Sampling point is set at 50% of the data window. |
| 1 | Sampling point is set at 75% of the data window. |

### 50.12.57 SDMMC Capabilities Control Register

**Name:** SDMMC_CACR
**Offset:** 0x230
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CAPWREN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 15:8 – KEY[7:0]** Key

| Value | Name | Description |
|---|---|---|
| 46h | KEY | Writing any other value in this field aborts the write operation of the CAPWREN bit.<br>Always reads as 0. |

**Bit 0 – CAPWREN** Capabilities Write Enable
This bit can only be written if the value of KEY is 46h.

| Value | Description |
|---|---|
| 0 | Capabilities registers (SDMMC_CA0R, SDMMC_CA1R and SDMMC_CA1R) cannot be written. |
| 1 | Capabilities registers (SDMMC_CA0R, SDMMC_CA1R and SDMMC_CA1R) can be written. |

### 50.12.58 SDMMC Calibration Control Register

**Name:** SDMMC_CALCR
**Offset:** 0x240
**Reset:** 0x0000500E
**Property:** Read/Write

| | CNTVAL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | BPEN | TUNDIS | ALWYSON | CLKDIV[2:0] | | | EN |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 1 | 1 | 1 | 0 |

**Bits 31:28 – CALPBP[3:0]** Calibration P Bypass Value
Calibration code applied for the p-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 27:24 – CALP[3:0]** Calibration P Status
Calibration code for the p-channel transistors to match the required output impedance.

**Bits 23:20 – CALNBP[3:0]** Calibration N Bypass Value
Calibration code applied for the n-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 19:16 – CALN[3:0]** Calibration N Status
Calibration code for the n-channel transistors to match the required output impedance.

**Bits 15:8 – CNTVAL[7:0]** Calibration Counter Value
Defines the number of XXXX cycles (divided by 4) required to cover the I/O calibration cell startup time.

$$\mathrm{CNTVAL}_{\mathrm{Minimum}} = \frac{t_{\mathrm{STARTUP}}}{4 \times t_{\mathrm{HCLOCK}}}$$

$t_{STARTUP}$ = 2 µs

**Bit 6 – BPEN** Calibration Bypass Enabled

| Value | Description |
|---|---|
| 0 | Calibration bypass is not enabled. |
| 1 | Calibration bypass is enabled. CALPBP and CALNBP codes are applied to the calibration cell. |

**Bit 5 – TUNDIS** Calibration During Tuning Disabled

| Value | Description |
|---|---|
| 0 | Calibration is launched before each tuning. |
| 1 | Calibration is not launched at tuning. |

**Bit 4 – ALWYSON** Calibration Analog Always ON

| Value | Description |
|---|---|
| 0 | Calibration analog is shut down after each calibration. |
| 1 | Calibration analog remains powered after calibration. |

**Bits 3:1 – CLKDIV[2:0]** Calibration Clock Division
The clock applied to the calibration cell is divided by CLKDIV + 1

**Bit 0 – EN** PADs Calibration Enable

| Value | Description |
|---|---|
| 0 | SDMMC I/O calibration disabled. |
| 1 | SDMMC I/O calibration enabled. |

# 51. Image Sensor Controller (ISC)

## 51.1 Description

The Image Sensor Controller (ISC) system manages incoming data from a parallel sensor. It supports a single active interface. The parallel interface protocol can use a free-running clock or a gated clock strategy. It supports the ITU-R BT 656/1120 422 protocol with a data width of 8 bits or 10 bits and raw Bayer format. The internal image processor includes adjustable white balance, color filter array interpolation, color correction, gamma correction, 12 bits to 10 bits compression, programmable color space conversion, horizontal and vertical chrominance subsampling module. The module also integrates a triple channel direct memory access controller master interface.

## 51.2 Embedded Characteristics

- Parallel 12-bit Interface for Raw Bayer, YCbCr, Monochrome and JPEG Compressed Sensor Interface
- BT.601/656/1120 Video Interface Supported
- Progressive Systems and Segmented Frame Systems
- Raw Bayer, YCbCr, Luminance (Black and White) Pixel Format Supported
- Resolution up to 2592 x 1944
- Input Pixel Clock up to 96 MHz
- Output Master Clock Generation
- Cropping
- Adjustable White Balance
- Raw Bayer Color Filter Array Interpolation
- Color Correction
- Gamma Correction
- Color Space Conversion
- Contrast and Brightness Control
- 4:4:4 to 4:2:2 Subsampler
- 4:2:2 to 4:2:0 Subsampler
- Rounding, Limiting and Packing unit
- Histogram Generation
- System Interface: Direct Memory Access Interface with Packed, Semi Planar and Planar output format
- Output Memory Format: 16 bpp RGB, 32 bpp RGB, 16 bpp, YCbCr 444, YCbCr 422, YCbCr 420, up to 12 bit raw Bayer

© 2018 Microchip Technology Inc.

## 51.3 Block Diagram and Use Cases

### 51.3.1 Image Sensor Controller Functional Diagrams

**Figure 51-1. ISC Block Diagram**

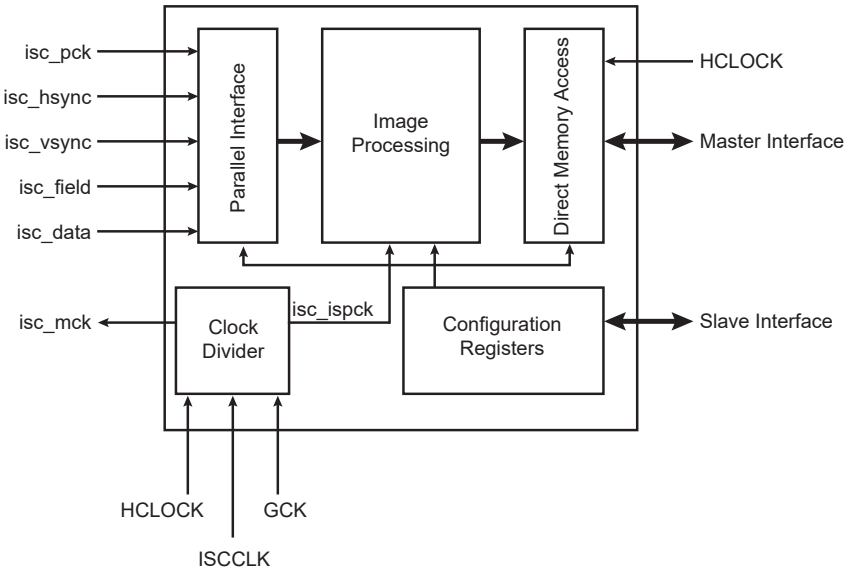

**Figure 51-2. ISC Raw Bayer Signal Processor**

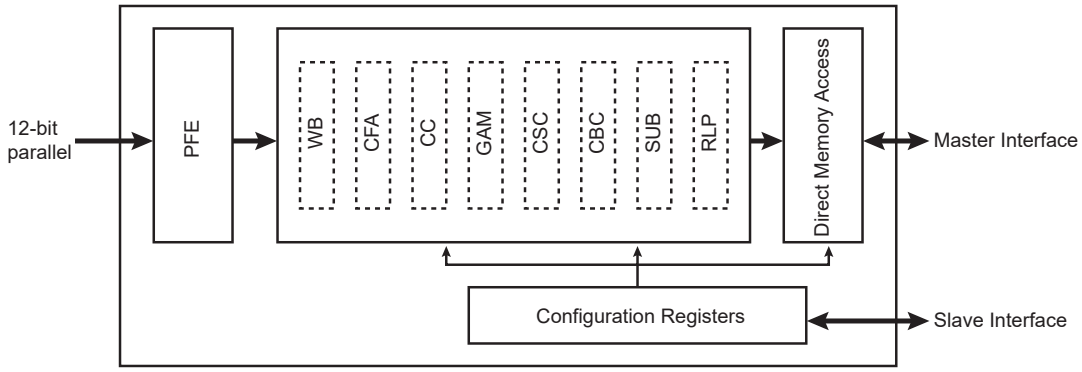
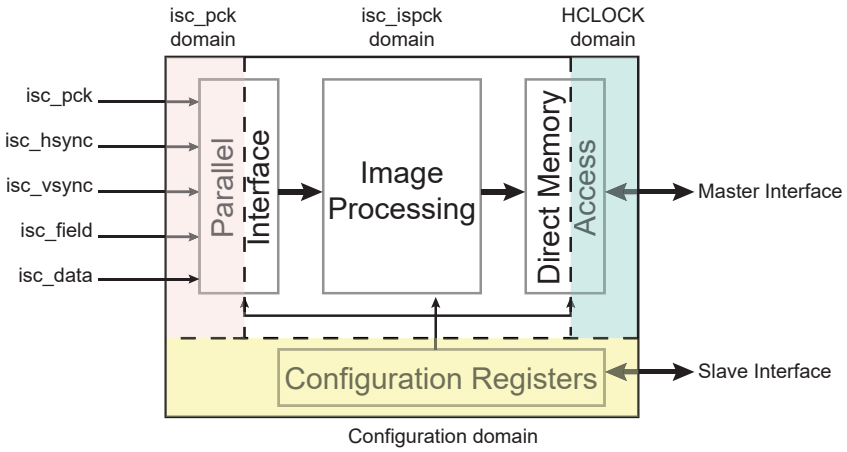


The ISC video pipeline integrates the following submodules:

- PFE: Parallel Front End to sample the camera sensor input stream
- WB: Programmable white balance in the Bayer domain
- CFA: Color filter array interpolation module
- CC: Programmable color correction
- GAM: Gamma correction
- CSC: Programmable color space conversion
- CBC: Contrast and Brightness control
- SUB: This module performs YCbCr444 to YCbCr420 chrominance subsampling.
- RLP: This module performs rounding, range limiting and packing of the incoming data.

### 51.3.2 Image Sensor Controller Clock Domain Diagram

**Figure 51-3. Clock Domain Hierarchy**



### 51.3.3 Image Sensor Controller Typical Use Cases

**Figure 51-4. Raw Bayer Sensor**

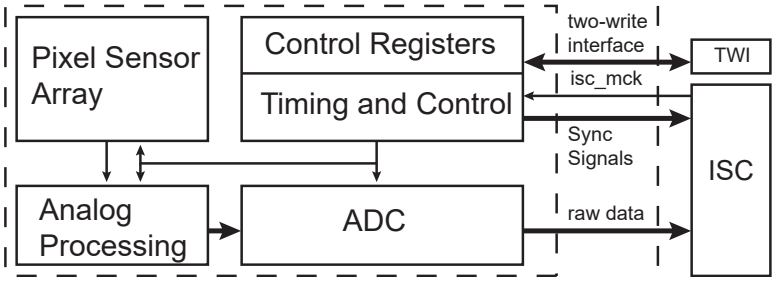


**Figure 51-5. Raw Bayer Sensor with Embedded Image Processor**

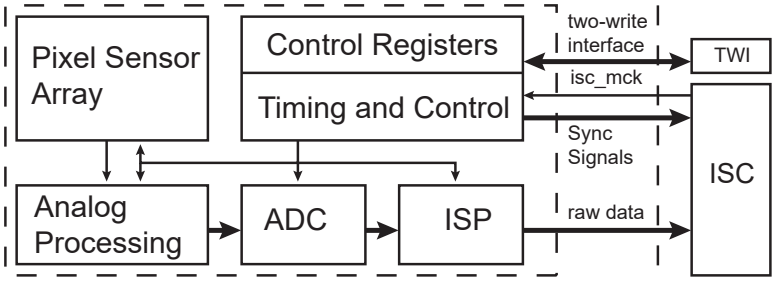

**Figure 51-6. BT656 Video Interface Sensor**

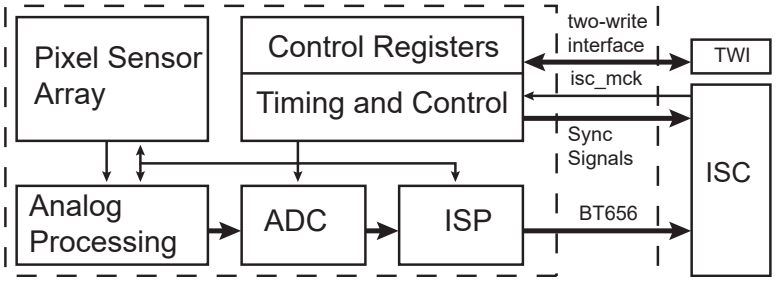

**Figure 51-7. Sensor with JPEG Output**

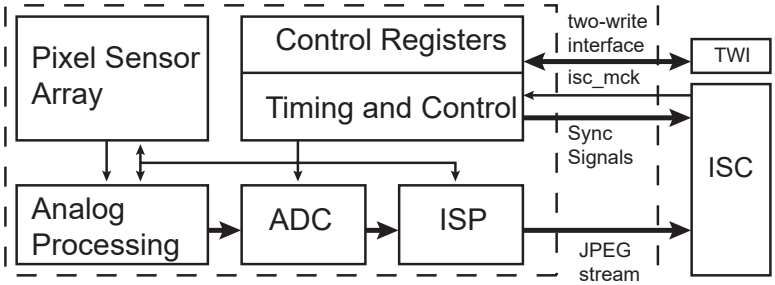

**Figure 51-8. Serial CMOS Sensor with External Parallel Bridge**

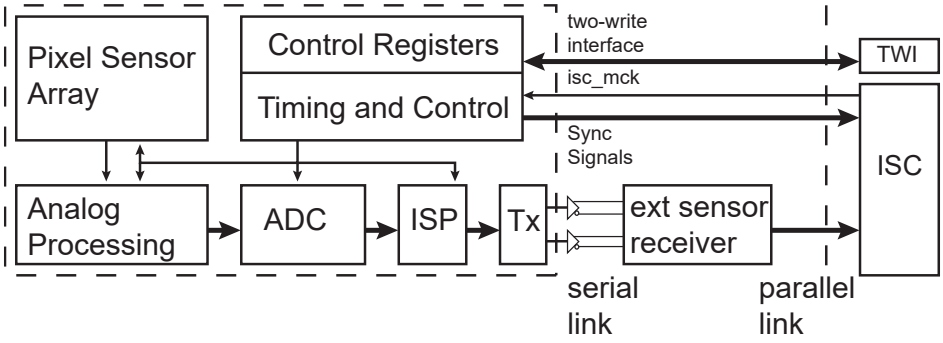


## 51.4 Product Dependencies

### 51.4.1 I/O Lines

The pins used for interfacing the ISC are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the ISC pins to their peripheral function. If I/O lines of the ISC are not used by the application, they can be used for other purposes by the PIO controller.

### 51.4.2 Power Management

The peripheral clock is not continuously provided to the ISC. The programmer must first enable the ISC clock in the Power Management Controller (PMC) before using the ISC.

### 51.4.3 Interrupt Sources

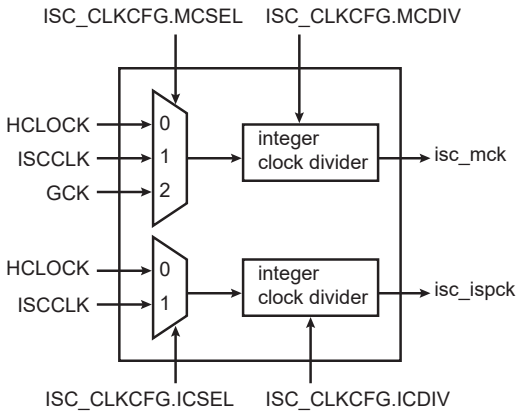
The ISC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ISC interrupt requires the Interrupt Controller to be programmed first.

## 51.5 Functional Description

### 51.5.1 ISC Clock Management

The ISC module provides the isc_mck output clock to the image sensor. The isc_mck clock has three selectable clock sources (ISC_CLKCFG.MCSEL) and one programmable clock divider (ISC_CLKCFG.MCDIV). The clock is enabled using the ISC_CLKEN.MCEN. The isc_mck is driven by the ISC and is the external reference clock of the CMOS sensor.

**Figure 51-9. Clock Divider Block Diagram**



The ISC digital pipeline requires internally a functional clock named isc_ispck. This clock is also fully programmable. This isc_ispck is enabled using the ISC_CLKEN.ICEN. This clock is mandatory for ISC operation. The ISC module is designed to accept input signals that are asynchronous to the isc_ispck. Synchronization is done internally as long as the following relationship holds:

isc_pck frequency is less than or equal to isc_ispck, and isc_ispck is greater than or equal to HCLOCK.

#### 51.5.1.1 Software Requirement

A software write operation to the ISC_CLKEN or ISC_CLKDIS register requires double clock domain synchronization and is not permitted when the ISC_CLKSR.SIP is asserted.

### 51.5.2 Parallel Interface Timing Description

The parallel interface protocol supports two operating modes.

**Figure 51-10. Free-Running Pixel Clock**

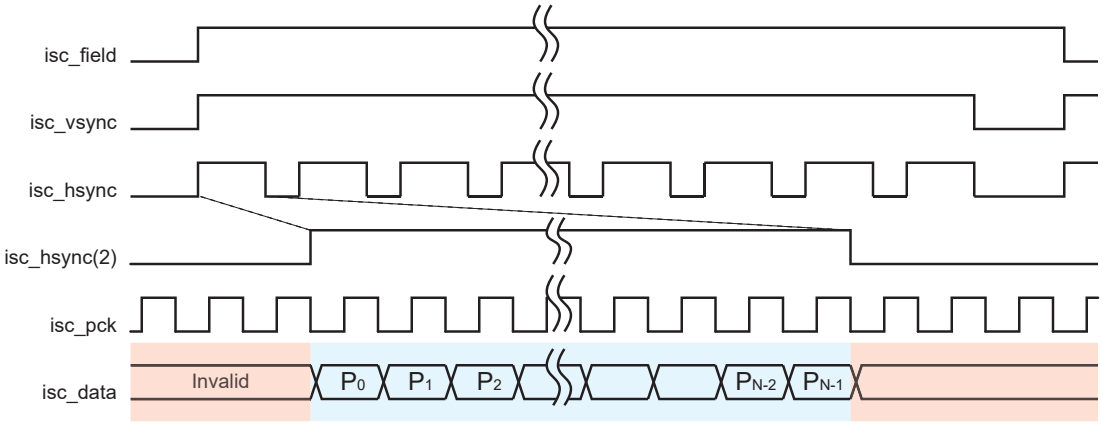


**Figure 51-11. Gated Pixel Clock**

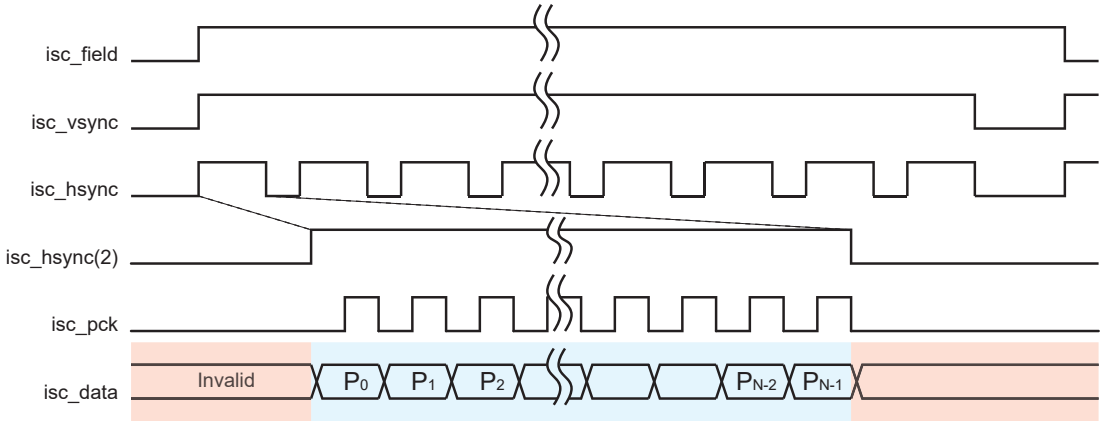

### 51.5.3 BT.601/656/1120 Embedded Timing Synchronization Operation

The ISC module supports embedded synchronization decoding. When the ISC_PFE_CFG0.CCIR656 is set, the decoder is activated and signals isc_vsync isc_hsync are not used to decode the valid pixels. If the CCIR10_8N is set, the bitstream is 10 bits wide, otherwise it is only 8 bits wide. When the ISC_PFE_CFG0.CCIR_CRC is set, the decoder automatically corrects the error.

**Figure 51-12. Field/Segment Timing Relationship for Interlaced and Segmented Frame Systems**

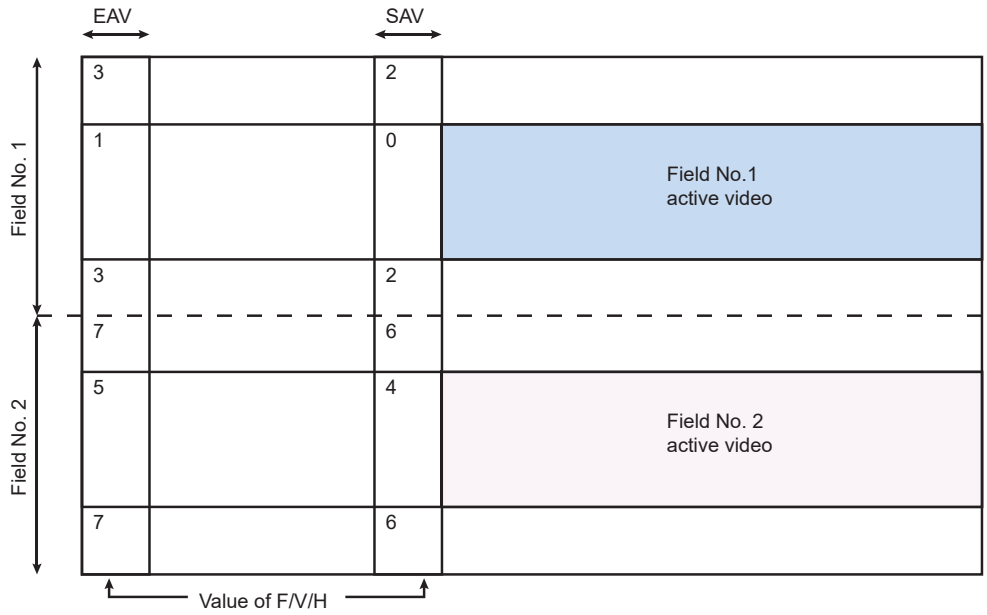

**Figure 51-13. Frame Timing Relationship for Progressive Systems**

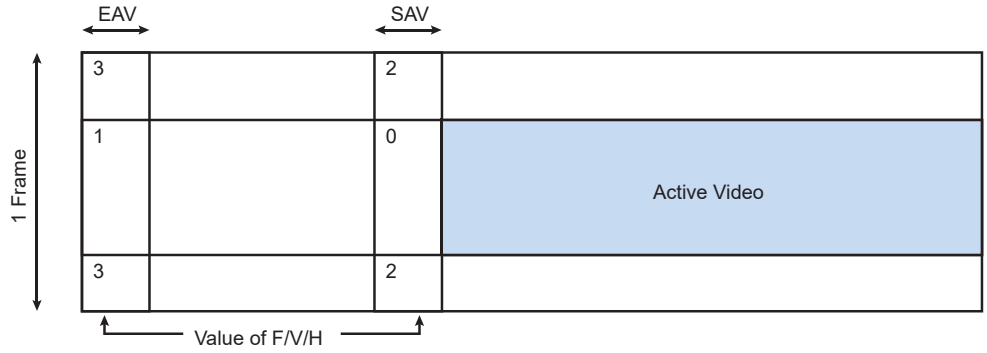

### 51.5.4 Parallel Interface External Sensor Connections

#### 51.5.4.1 YCbCr, 10-bit CCIR656 with Embedded Synchronization

This mode is activated when ISC_PFE_CFG0.CCIR656 and ISC_PFE_CFG0.CCIR10_8N are both set.

| Interface Bit | First Word | Second Word | Third Word | Fourth Word |
|---|---|---|---|---|
| isc_data[11](MSB) | 1 | 0 | 0 | 1 |
| isc_data[10] | 1 | 0 | 0 | F |
| isc_data[9] | 1 | 0 | 0 | V |
| isc_data[8] | 1 | 0 | 0 | H |
| isc_data[7] | 1 | 0 | 0 | P3 |
| isc_data[6] | 1 | 0 | 0 | P2 |
| isc_data[5] | 1 | 0 | 0 | P1 |
| isc_data[4] | 1 | 0 | 0 | P0 |
| isc_data[3] | 1 | 0 | 0 | 0 |
| isc_data[2] | 1 | 0 | 0 | 0 |
| isc_data[1] | Not Used | Not Used | Not Used | Not Used |
| isc_data[0] | Not Used | Not Used | Not Used | Not Used |

#### 51.5.4.2 YCbCr, 8-bit CCIR656 with Embedded Synchronization

This mode is activated when ISC_PFE_CFG0.CCIR656 is set and ISC_PFE_CFG0.CCIR10_8N is cleared.

| Interface Bit | First Word | Second Word | Third Word | Fourth Word |
|---|---|---|---|---|
| isc_data[11](MSB) | 1 | 0 | 0 | 1 |
| isc_data[10] | 1 | 0 | 0 | F |
| isc_data[9] | 1 | 0 | 0 | V |
| isc_data[8] | 1 | 0 | 0 | H |
| isc_data[7] | 1 | 0 | 0 | P3 |

.....continued

| Interface Bit | First Word | Second Word | Third Word | Fourth Word |
|---|---|---|---|---|
| isc_data[6] | 1 | 0 | 0 | P2 |
| isc_data[5] | 1 | 0 | 0 | P1 |
| isc_data[4] | 1 | 0 | 0 | P0 |
| isc_data[3] | Not Used | Not Used | Not Used | Not Used |
| isc_data[2] | Not Used | Not Used | Not Used | Not Used |
| isc_data[1] | Not Used | Not Used | Not Used | Not Used |
| isc_data[0] | Not Used | Not Used | Not Used | Not Used |

#### 51.5.4.3 RAW Bayer Parallel Interface

The table below shows how to connect the data bus of a RAW Bayer sensor.

| Interface | Bayer 12-bit | Bayer 11-bit | Bayer 10-bit | Bayer 9-bit | Bayer 8-bit |
|---|---|---|---|---|---|
| isc_data[11](MSB) | DOUT[11] | DOUT[10] | DOUT[9] | DOUT[8] | DOUT[7] |

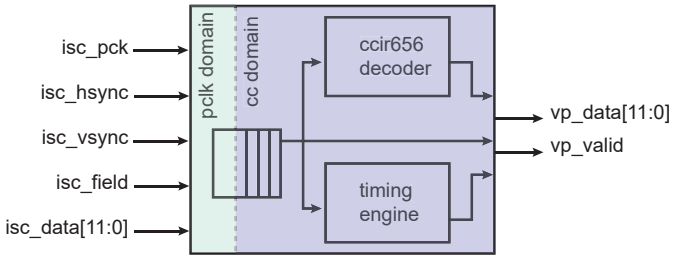
### 51.5.5 Parallel Front End (PFE) Module

**Figure 51-14. PFE Block Diagram**



The Parallel Front End module performs data resampling across clock domain boundary. It includes a CCIR656 decoder used to convert a standard ITU-R BT.656 stream to 24-bit digital video. It also generates pixels, syncs flags and valid signals to the main video pipeline. It ouputs field, video and synchronization signals. The PFE can optionally crop and limit the incoming pixel stream to a predefined horizontal and vertical value. By default, the PFE only relies on the cmos sensor horizontal and vertical reference to sample the incoming pixel stream. A pixel is sampled if, and only if, the vertical and horizontal synchronizations are valid and a pixel clock edge is detected. ISC_PFE_CFG0.BPS shows the number of bits per sample. The PFE module outputs a 12-bit data on the vp_data[11:0] bus, and asserts the vp_valid signal when the data can be sampled.

| PFE VP_DATA Mapping | Raw Bayer 12-bit | Raw Bayer 10-bit | YUV422 8-bit | YUV422 10-bit | Mono 12-bit |
|---|---|---|---|---|---|
| VP_DATA[11] | RGGB[11] | RGGB[9] | YC422[7] | YC422[9] | Y[11] |
| VP_DATA[10] | RGGB[10] | RGGB[8] | YC422[6] | YC422[8] | Y[10] |
| VP_DATA[9] | RGGB[9] | RGGB[7] | YC422[5] | YC422[7] | Y[9] |
| VP_DATA[8] | RGGB[8] | RGGB[6] | YC422[4] | YC422[6] | Y[8] |
| VP_DATA[7] | RGGB[7] | RGGB[5] | YC422[3] | YC422[5] | Y[7] |
| VP_DATA[6] | RGGB[6] | RGGB[4] | YC422[2] | YC422[4] | Y[6] |
| VP_DATA[5] | RGGB[5] | RGGB[3] | YC422[1] | YC422[3] | Y[5] |

.....continued

| PFE VP_DATA Mapping | Raw Bayer 12-bit | Raw Bayer 10-bit | YUV422 8-bit | YUV422 10-bit | Mono 12-bit |
|---|---|---|---|---|---|
| VP_DATA[4] | RGGB[4] | RGGB[2] | YC422[0] | YC422[2] | Y[4] |
| VP_DATA[3] | RGGB[3] | RGGB[1] | YC422[7] or 0 | YC422[1] | Y[3] |
| VP_DATA[2] | RGGB[2] | RGGB[0] | YC422[6] or 0 | YC422[0] | Y[2] |
| VP_DATA[1] | RGGB[1] | RGGB[9] or 0 | YC422[5] or 0 | YC422[9] or 0 | Y[1] |
| VP_DATA[0] | RGGB[0] | RGGB[8] or 0 | YC422[4] or 0 | YC422[8] or 0 | Y[0] |

**Note:** When ISC_PFE_CFG0.REP is set, missing VP_DATA LSBs are replaced with replicated LSBs of the incoming stream, otherwise they are forced to zero.

The PFE module also includes logic to synchronize capture request with the incoming pixel stream. Two operating modes are available: Single Shot and Continuous Acquisition. When the ISC_PFE_CFG0.CONT is cleared, the ISC transfers a single image to memory,

**Figure 51-15. Single Shot Mode**

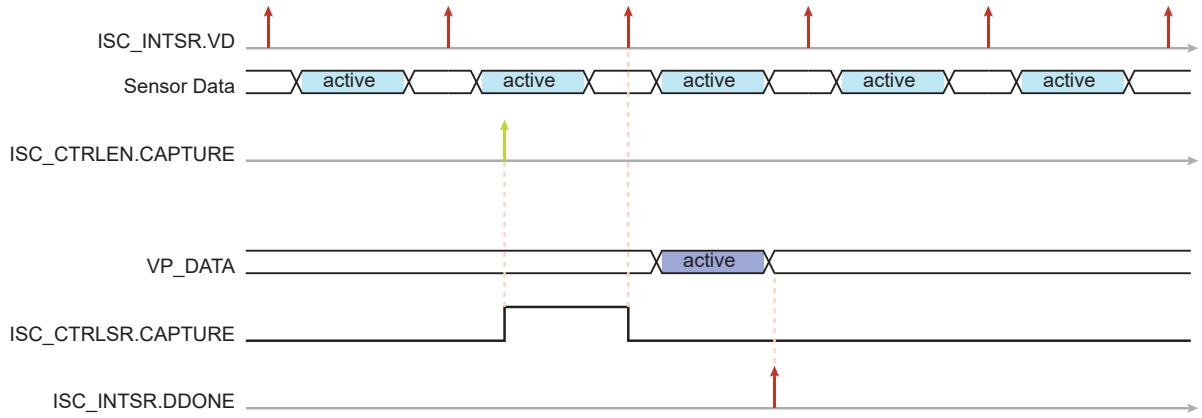


**Figure 51-16. Continuous Acquisition Mode**

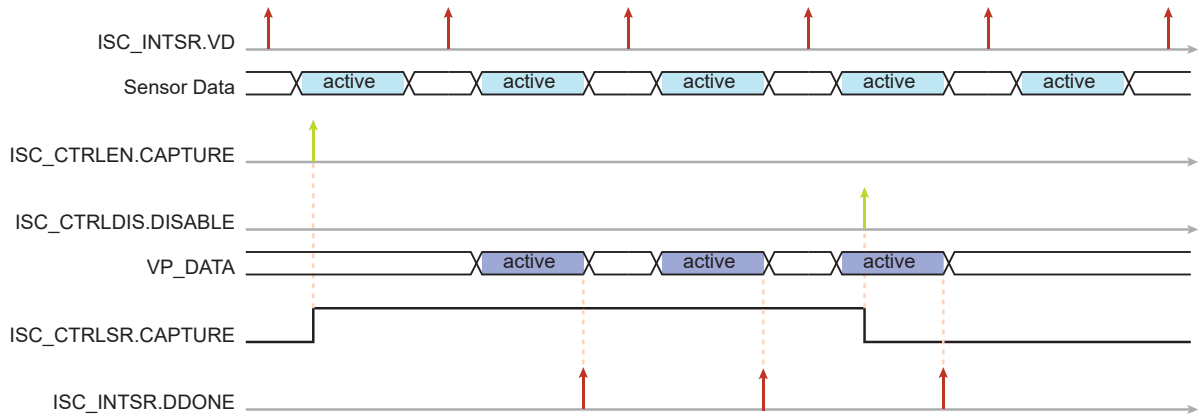
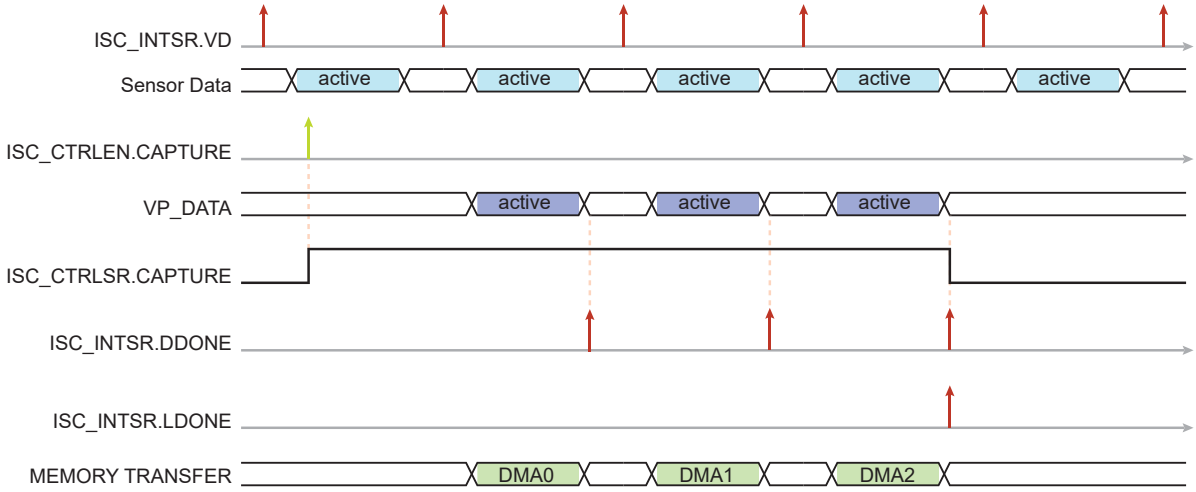


When Continuous Acquisition mode is activated (ISC_PFE_CFG0.CONT is set), the data transfer terminates when either a DMA end of list is reached, a software disable is performed or a software reset is activated. The ISC_INTSR.DDONE is set at the end of the DMA data transfer.

**Figure 51-17. Continuous Acquisition, DMA Terminated**



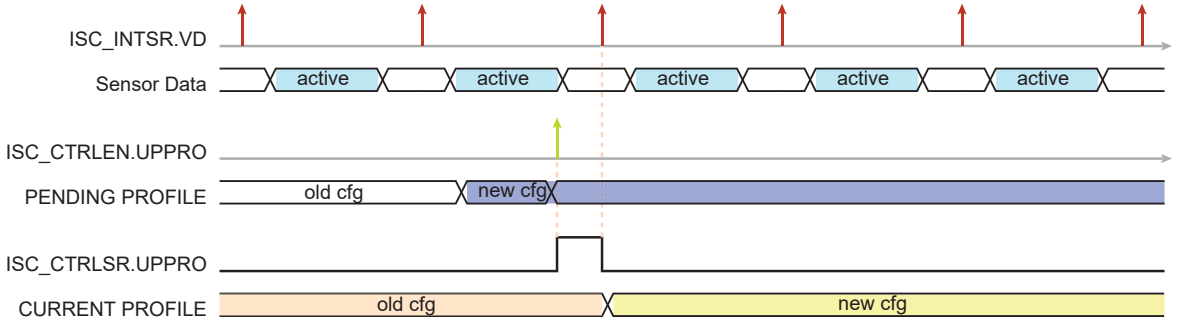
The linked list DMA transfer is terminated when an item of the list is programmed with ISC_DCTRL.DE cleared or when ISC_DNDA.NDA is equal to zero. This configuration also clears ISC_CTRLSR.CAPTURE and sets the ISC_INTSR.LDONE interrupt flag.

The linked list DMA transfer starts if ISC_DCTRL.DE is set and if ISC_DNDA.NDA is different from zero.

#### 51.5.5.1 Update the ISC Profile

Each ISC register is double-buffered to simplify the software configuration and the synchronization with the associated frame buffer. When the configuration of the ISC is modified, ISC_CTRLEN.UPPRO must be set to transfer the configuration from the input buffer to the ISC video pipeline.

**Figure 51-18. Update Profile Timing Diagram**



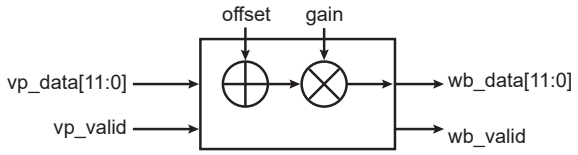
#### 51.5.5.2 Software Requirements

Writing to the ISC_CTRLEN or ISC_CTRLDIS register requires a double domain synchronization, so it is forbidden to write these registers when ISC_CTRLSR.SIP is asserted.

### 51.5.6 White Balance (WB) Module

The White Balance (WB) module captures the vp_data[11:0] bus from the PFE module when the vp_valid signal is asserted, and it generates a wb_data[11:0] data along with its validity signal wb_valid. When ISC_WB_CTRL.ENABLE is set, each Bayer color component (R, Gr, B, Gb) can be manually adjusted using an offset and a gain. The Bayer pattern is adjustable using ISC_WB_CFG.BAYCFG.

**Figure 51-19. WB Block Diagram**



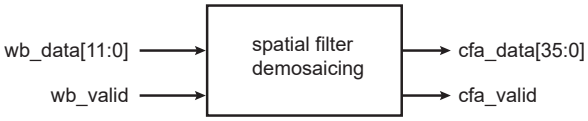
There are four {gain, offset} sets for each Bayer component. The output value is clipped.

| ISC_WB_CTRL.ENABLE | WB_DATA Slice | Value |
|---|---|---|
| 0 | wb_data[11:0] | vp_data[11:0] |
| 1 | wb_data[11:0] | clipped((vp_data[11:0]+offset)*gain) |

### 51.5.7 Color Filter Array (CFA) Interpolation Module

In a single-sensor system, each cell on the sensor has a specific color filter and microlens positioned above it. The raw data obtained from the sensor do not have the full R/G/B information at each cell position. Color interpolation is required to retrieve the missing components. The CFA module samples the wb_data[11:0] 12-bit bus when wb_valid is asserted and generates a 36-bit width data bus cfa_data[35:0] with the validity bit cfa_valid.

**Figure 51-20. CFA Block Diagram**



| ISC_CFA_CTRL.ENABLE | CFA_DATA Slice | Value |
|---|---|---|
| 0 | cfa_data[35:24] | wb_data[11:0] |
| | cfa_data[23:12] | wb_data[11:0] |
| | cfa_data[11:0] | wb_data[11:0] |
| 1 | cfa_data[35:24] | R = spatial_filter_R(wb_data[11:0]) |
| | cfa_data[23:12] | G = spatial_filter_G(wb_data[11:0]) |
| | cfa_data[11:0] | B = spatial_filter_B(wb_data[11:0]) |

The filter kernel size is 5, and requires two additional lines to initialize the filter. When ISC_CFA_CFG.EITPOL is set, the missing information is interpolated from the nearest neighbor. If ISC_CFA_CFG.EITPOL is cleared, only valid pixels are used to initialize the filter kernel, but the output number of lines is less than the input number of lines. In that case, four lines are consumed to fill the kernel.

#### 51.5.7.1 Frame Size Requirement when Edge Interpolation is Off, ISC_CFA_CFG.EITPOL Cleared

- Minimum number of rows (in): 5
- Minimum number of columns (in): 5
- Number or rows after CFA: Number of rows (in) - 4

- Number of columns after CFA: Number of columns (in) - 4

#### 51.5.7.2 Frame Size Requirement when Edge Interpolation is On, ISC_CFA_CFG.EITPOL Set

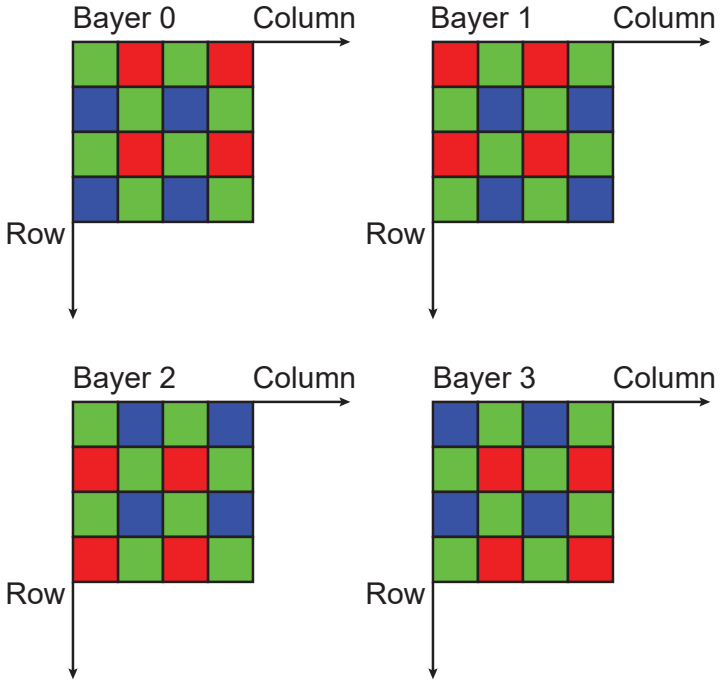
- Minimum number of rows (in): 3
- Minimum number of columns (in): 3
- Number of rows after CFA: Number of rows (in)
- Number of columns after CFA: Number of columns (in)

#### 51.5.7.3 Bayer Mode and Edge Interpolation Description

When Edge Interpolation mode (ISC_CFA_CFG.EITPOL) is activated, dummy lines are generated using rows and columns replication.

The CFA module supports four sensor alignments using ISC_CFA_CFG.BAYCFG. See the figure below.

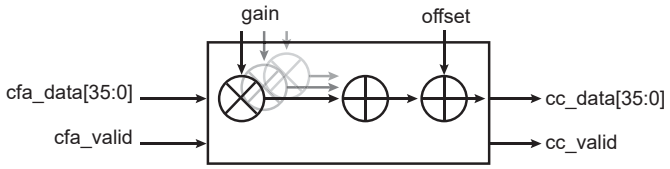
**Figure 51-21. Supported Color Filter Array Patterns**



### 51.5.8 Color Correction (CC) Module

RGB color correction is used to compensate for cross color bleeding in the filter used with the image sensor. The module samples the cfa_data[35:0] 36-bit bus when cfa_valid is asserted and generate a cc_data[35:0] 36-bit wide bus and a cc_valid signal.

**Figure 51-22. CC Block Diagram**



There are three {gain, offset} sets for color component R, G, B.

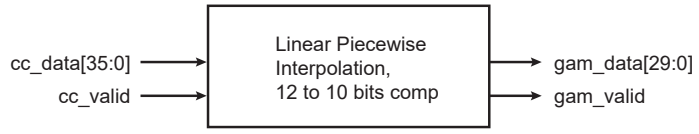
| ISC_CC_CTRL.ENABLE | CC_DATA Slice | Value |
|---|---|---|
| 0 | cc_data[35:24] | cfa_data[11:0] |
| | cc_data[23:12] | cfa_data[11:0] |
| | cc_data[11:0] | cfa_data[11:0] |
| 1 | cc_data[35:24] | R=clipped(sum(cfa_data_x * gain_Rx) + offset_R) |
| | cc_data[23:12] | G=clipped(sum(cfa_data_x * gain_gx) + offset_g) |
| | cc_data[11:0] | B=clipped(sum(cfa_data_x * gain_Bx) + offset_B) |

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} \text{RRGAIN} & \text{RGGAIN} & \text{RBGAIN} \\ \text{GRGAIN} & \text{GGGAIN} & \text{GBGAIN} \\ \text{BRGAIN} & \text{BGGAIN} & \text{BBGAIN} \end{bmatrix} \times \begin{bmatrix} \text{cfa_data}[35:24] \\ \text{cfa_data}[23:12] \\ \text{cfa_data}[11:0] \end{bmatrix} + \begin{bmatrix} \text{ROFST} \\ \text{GOFST} \\ \text{BOFST} \end{bmatrix}$$

### 51.5.9 Gamma Curve (GAM) Module

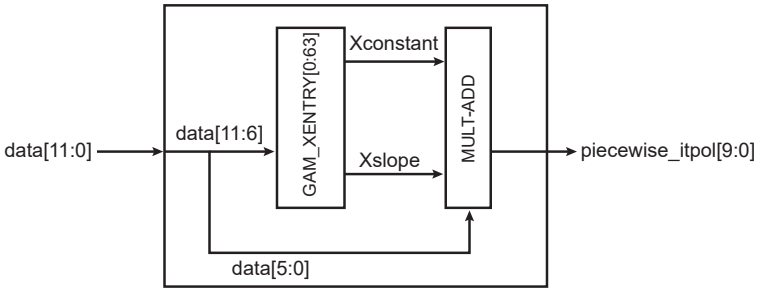
The GAM module samples the cc_data[35:0] bus when cc_valid is asserted, and generates gam_data[29:0] 30-bit width data along with the validity signal gam_valid. Imaging devices have non-linear characteristics, but the transfer function is approximated by a power function. The intensity of each of the linear RGB components is transformed to a non-linear signal through the use of the gamma correction submodule. The power function is linearly interpolated using 64 breakpoints. This also performs a 12-bit to 10-bit compression. The polynomial for the linear interpolation between breakpoints is i and i +1. Consequently, for each breakpoint, two values are required: constant and slope. The table values are programmable through the user interface when the gamma correction module is disabled (ISC_GAM_CTRL.ENABLE is cleared). ISC_GAM_RENTRY is used for Red gamma correction. ISC_GAM_GENTRY is used for Green gamma correction. ISC_GAM_BENTRY is used for Blue gamma correction. Each table entry is composed of a 10-bit (signed) slope and a 10-bit constant.

**Figure 51-23. GAM Block Diagram**



| ISC_GAM_CTRL.ENABLE | ISC_GAM_CTRL.XLUT | GAM_DATA Slice | Value |
|---|---|---|---|
| 0 | 0 | gam_data[29:0] | cc_data[29:0] |
| 1 | 0 | gam_data[29:20] | cc_data[35:26] |
| | | gam_data[19:10] | cc_data[23:14] |
| | | gam_data[9:0] | cc_data[11:2] |
| 1 | 1 | gam_data[29:20] | R=piecewise_itpol(cc_data_r[35:24]) |
| | | gam_data[19:10] | G=piecewise_itpol(cc_data_r[23:12]) |
| | | gam_data[9:0] | B=piecewise_itpol(cc_data_r[11:0]) |

**Figure 51-24. Piecewise Linear Interpolation Block Diagram**

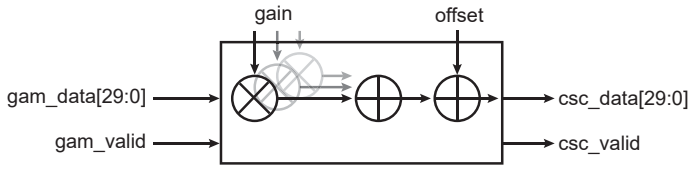


The interpolation consists of three tables that store the function values GAM_XENTRY[0:63] where X stands for R, G and B. The input of the table has six bits. It outputs a slope and a constant. The slope is later multiplied by the data lsb (6-bit) and added to a constant. The final value is the gamma-corrected value of the input. This module performs a 12-to-10 compression.

### 51.5.10 Color Space Conversion (CSC) Module

By converting an image from RGB to YCbCr color space, it is possible to separate Y, Cb and Cr information. The CSC samples the gam_data[29:0] 30-bit data bus, extracts YCbCr information from the sampled data, and then generates the color-converted data csc_data[29:0] and the validity signal csc_valid.

**Figure 51-25. CSC Block Diagram**



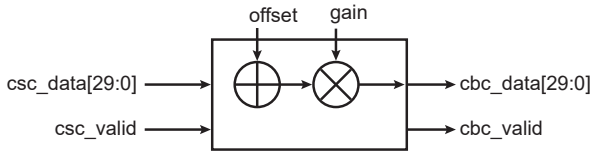
| ISC_CSC_CTRL.ENABLE | CSC_DATA Slice | Value |
|---|---|---|
| 0 | csc_data[29:0] | gam_data[29:0] |
| 1 | csc_data[29:20] | Y = clipped(sum(gam_data_x * gain_Yx) + offset_y << 2) |
| | csc_data[19:10] | Cb = clipped(sum(gam_data_x * gain_Cbx)+offset_cb << 2) |
| | csc_data[9:0] | Cr = clipped(sum(gam_data_x * gain_Crx)+offset_cr << 2) |

$$\begin{bmatrix} Y \\ CB \\ CR \end{bmatrix} = \begin{bmatrix} YR & YG & YB \\ CBR & CBG & CBB \\ CRR & CRG & CRB \end{bmatrix} \times \begin{bmatrix} gam_data[29:20] \\ gam_data[19:10] \\ gam_data[9:0] \end{bmatrix} + \begin{bmatrix} YOFST \\ CBOFST \\ CROFST \end{bmatrix}$$

### 51.5.11 Contrast and Brightness

Luminance is adjusted through the use of Brightness Offset and Contrast Gain. Chrominance is left unchanged. The CBC samples the csc_data[29:0] 30-bit bus when csc_valid is asserted and generates cbc_data[29:0] with the validity signal cbc_valid.

**Figure 51-26. CBC Block Diagram**

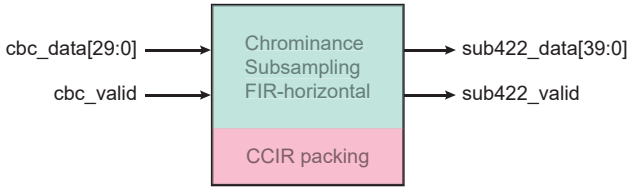


| ISC_CBC_CTRL.ENABLE | ISC_CBC_CFG.CCIR | CBC_DATA Slice | Value |
|---|---|---|---|
| 0 | 0 | cbc_data[29:0] | csc_data[29:0] |
| 1 | 0 | cbc_data[29:20] | Y = clipped((csc_data[29:20]+offset)*gain) |
| | | cbc_data[19:10] | Cb = csc_data[19:10] |
| | | cbc_data[9:0] | Cr = csc_data[9:0] |
| 1 | 1 | cbc_data[29:10] | 0 |
| | | cbc_data[9:0] | ccir656 stream with luminance correction |

### 51.5.12 4:4:4 To 4:2:2 Chrominance Horizontal Subsampler (SUB422) Module

The color space conversion output stream is a full-bandwidth YCbCr 4:4:4 signal. The chrominance subsampling divides the horizontal chrominance sampling rate by two. A horizontal low pass filter is applied to avoid aliasing effect. The SUB422 module samples 444 full scale YCbCr cbc_data[29:0] 30-bit data, performs horizontal subsampling and generates the sub422_data[39:0] 40-bit data bus with its validity signal sub422_valid.

**Figure 51-27. SUB422 Block Diagram**



| ISC_SUB422_CTRL.ENABLE | ISC_SUB422_CFG.CCIR | SUB422_DATA Slice | Value |
|---|---|---|---|
| 0 | 0 | sub422_data[29:0] | cbc_data[29:0] |
| 1 | 0 | sub422_data[39:30] | Y1= cbc_data1[29:20] |
| | | sub422_data[29:20] | Y0 = cbc_data0[29:20] |
| | | sub422_data[19:10] | Cb = filter_hor(cbc_data[19:10]) |
| | | sub422_data[9:0] | Cr = filter_hor(cbc_data[9:0]) |

| .....continued | | | |
|---|---|---|---|
| **ISC_SUB422_CTRL.ENABLE** | **ISC_SUB422_CFG.CCIR** | **SUB422_DATA Slice** | **Value** |
| 1 | 1 | sub422_data[39:30] | Y1 = cbc_data[9:0] |
| | | sub422_data[29:20] | Y0 = cbc_data[9:0] |
| | | sub422_data[19:10] | Cb = cbc_data[9:0] |
| | | sub422_data[9:0] | Cr = cbc_data[9:0] |

The filter_hor function included in the sub422 module is the chrominance horizontal filter.

| sub422 data slice | YCbCr mapping |
|---|---|
| sub422_data[39:30] | Y1 (sample n) |
| sub422_data[29:20] | Y0 (sample n-1) |
| sub422_data[19:10] | Cb (from filter) |
| sub422_data[9:0] | Cr (from filter) |

The filter chrominance position is selectable through the use of ISC_SUB422_CFG.FILTER.

**Figure 51-28. Cosited Filter Configuration**

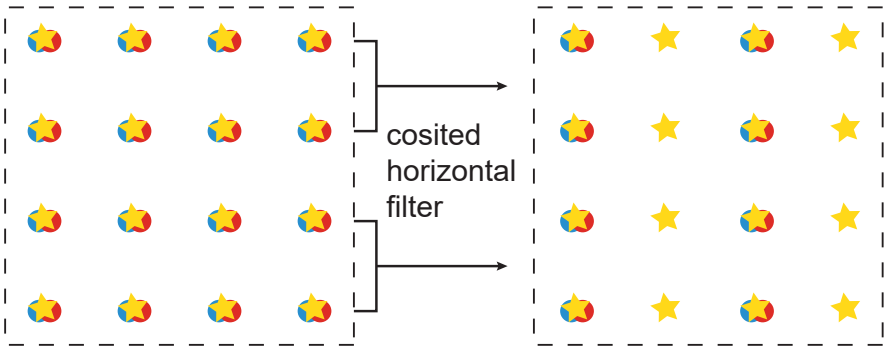


**Figure 51-29. Centered Filter Configuration**

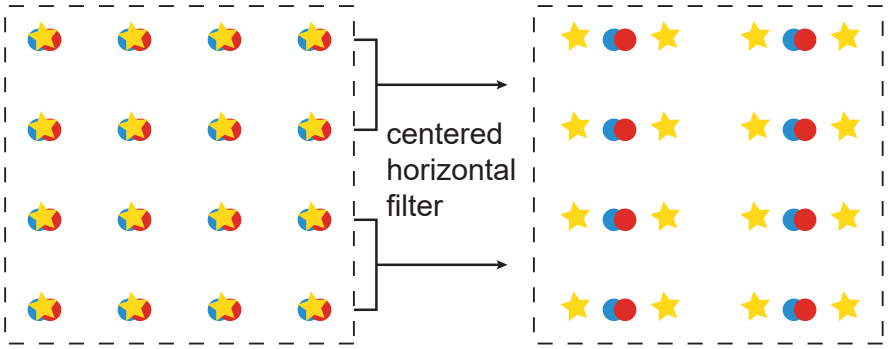


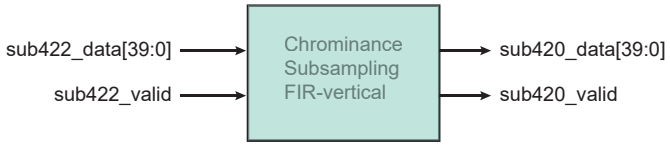
The SUB422 module performs luminance and chrominance packing. When the line length is odd, the missing luminance is a copy of the last but one luminance. It also means that the final dma stream written to memory is equal to the original horizontal size plus one when the line length is odd.

| SUB422_DATA Slice | Line Length Even | Line Length Odd |
|---|---|---|
| sub422_data[39:30] | Y(n) | Y(n-1) |
| sub422_data[29:20] | Y(n-1) | Y(n-1) |
| sub422_data[19:10] | Cb (filtered) | Cb (filtered) |
| sub422_data[9:0] | Cr (filtered) | Cr (filtered) |

### 51.5.13 4:2:2 To 4:2:0 Chrominance Vertical Subsampler (SUB420) Module

The chrominance subsampling divides the vertical chrominance sampling rate by two. A vertical low pass filter is applied to avoid aliasing effect. Two different filters are used when the source frame is interlaced, and the filter configuration depends on the field value (the field is propagated in the video pipeline).

**Figure 51-30. SUB420 Block Diagram**



The SUB420 module samples the sub422_data[39:0] 40-bit data when sub422_valid is asserted, then it performs a vertical subsampling and generates a valid sub420_data[39:0] 40-bit word and the corresponding sub420_valid signal.

| ISC_CFA_CTRL.ENABLE | SUB420_DATA Slice | Value |
|---|---|---|
| 0 | sub420_data[39:0] | sub422_data[39:0] |
| 1 | sub420_data[39:30] | Y1 = sub422_data[39:30] |
| | sub420_data[29:20] | Y0 = sub422_data[29:20] |
| | sub420_data[19:10] | Cb = filter_ver(sub422[19:10]) |
| | sub420_data[9:0] | Cr = filter_ver(sub422[9:0]) |

The vertical filter is a two-tap filter; for progressive content the coefficient i {1, 1}. When an interlaced field is downsampled, the coefficients are different between the top and the bottom fields.

**Figure 51-31. Vertical Chrominance Filter for Progressive Content (Cosited Chrominance Example)**

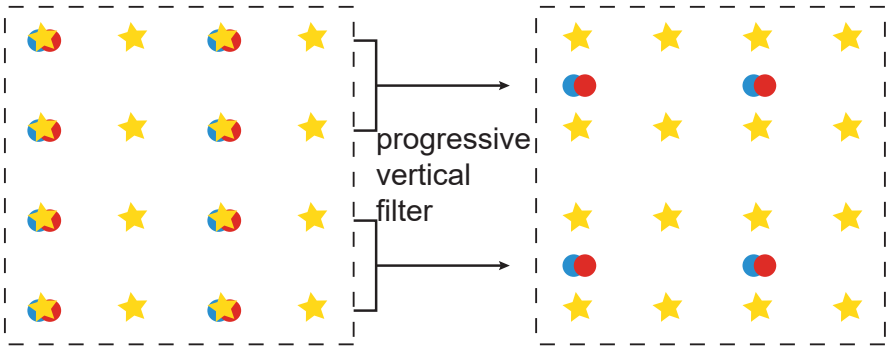


**Figure 51-32. Field-dependent Chrominance Filter for Interlaced Content (Cosited Chrominance Example)**

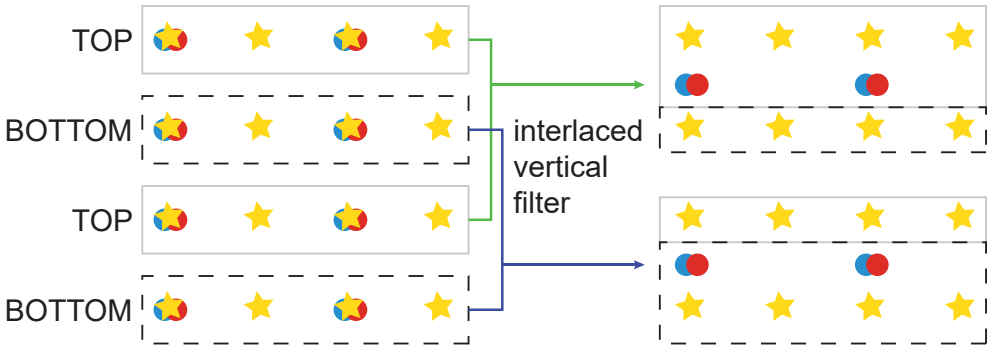

**Table 51-1. Filter Configuration**

| ISC_SUB420_CTRL.FILTER | Field | Filter Configuration |
|---|---|---|
| 0 | progressive | {1, 1} |
| 1 | 0 (TOP) | {3, 1} |
| | 1 (BOTTOM) | {1, 3} |

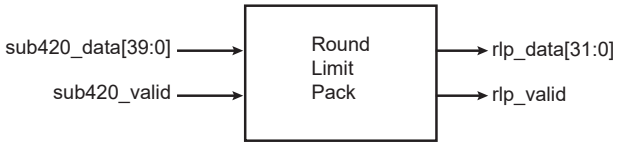
**Table 51-2. Output Line Length Configuration**

| SUB420 Input Number of Rows | SUB420 Luminance Rows | SUB420 Chrominance Rows |
|---|---|---|
| M rows, M odd | M rows | (M+1)/2 rows |
| M rows, M even | M rows | M/2 rows |

### 51.5.14 Rounding, Limiting and Packing (RLP) Module

This module is used to round, limit and pack in the incoming pixel stream before the DMA master module. The RLP samples the sub420_data[39:0] 40-bit data bus and generates rlp_data[31:0] 32-bit data words with the associated validity signal rlp_valid.

**Figure 51-33. RLP Block Diagram**



| ISC_RLP_CFG | RLP_DATA Slice | Value |
|---|---|---|
| DAT8 | rlp_data[31:8] | 0 |
| | rlp_data[7:0] | sub420_data[11:4] |
| DAT9 | rlp_data[31:9] | 0 |
| | rlp_data[8:0] | sub420_data[11:3] |
| DAT10 | rlp_data[31:10] | 0 |
| | rlp_data[9:0] | sub420_data[11:2] |

.....continued

| ISC_RLP_CFG | RLP_DATA Slice | Value |
|---|---|---|
| DAT11 | rlp_data[31:11] | 0 |
| | rlp_data[10:0] | sub420_data[11:1] |

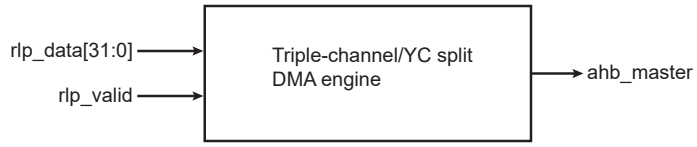
### 51.5.15 DMA Interface

The descriptor-based DMA interface supports multiple buffers. A DMA stride value shows the offset between two consecutive lines (in bytes). If the stride is set to zero, the frame buffer is contiguous. When ISC_DCTRL.WB is set (Write Back), the DMA interface performs a single write operation to the ISC_DCTRL register, and sets ISC_DCTRL[7] to one and ISC_DCTRL[6] to the value of the frame field when interlaced content is being used. That means that interlaced fields are tagged with their relevant field values. The Write Back operation is always performed when the whole frame has been transferred to memory.

**Figure 51-34. DMA Engine Block Diagram**



| ISC_DCFG.IMODE | DMA Engine Input Data |
|---|---|
| PACKED8 | rlp_data[7:0] |
| PACKED16 | rlp_data[15:0] |
| PACKED32 | rlp_data[31:0] |
| YC422SP | rlp_data[31:0] |
| YC422P | rlp_data[31:0] |
| YC420SP | rlp_data[31:0] |
| YC420P | rlp_data[31:0] |

When a bus error is detected, an interrupt flag is set. If the error occurs on a write operation, ISC_INTSR.WERR is asserted. If the error occurs on a read operation, ISC_INTSR.RERR is asserted. ISC_INTSR.WERRID gives details on the first error channel identifier.

#### 51.5.15.1 Descriptor Memory Address Mapping

| YC420P | Y address | Cb address | Cr address |

#### 51.5.15.2 Descriptor Memory Mapping

Three descriptor views are available. Descriptor view 0 is used when the pixel or data stream is packed. Descriptor view 1 is used for YCbCr semi-planar pixel stream. Descriptor view 2 is used for YCbCr planar pixel stream.

### 51.5.16 Histogram Module

For each possible pixel value, the histogram counts the number of times the value was encountered in the current image. RGGB Bayer, RAW data or luminance histogram are available. There are 512 entries

in the histogram entries, and each histogram bin can count up to 2^20 data. As the table entries are limited, each bin is actually a range, i.e., least significant bits are ignored. A write to ISC_CTRLEN.HISREQ initiates a new histogram. The counting operation ends when ISC_INTSR.HISDONE is set. At that time, a software or hardware dma transfer copies the table from the interface to the internal or external memory. To clear the table content (for a new operation), use ISC_CTRLEN.HISCLR. An automatic clear (reset after read) is available when ISC_HIS_CFG.RAR is set. In that case, as soon as the data is read from the table, the table entry is cleared.

### 51.6.1 ISC Control Enable Register 0

**Name:** ISC_CTRLEN
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Enables the corresponding command.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | FUPPRO | |
| Access | | | | | | | W | |
| Reset | | | | | | | – | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | HISCLR | HISREQ | UPPRO | CAPTURE |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

**Bit 9 – FUPPRO** Force Update Color Profile

**Bit 3 – HISCLR** Histogram Clear

**Bit 2 – HISREQ** Histogram Request

**Bit 1 – UPPRO** Update Profile

**Bit 0 – CAPTURE** Capture Input Stream Command

### 51.6.2 ISC Control Disable Register 0

**Name:** ISC_CTRLDIS
**Offset:** 0x04
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:
0: No effect.

1: Performs the corresponding command.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SWRST |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DISABLE |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – SWRST** Software Reset

**Bit 0 – DISABLE** Capture Disable

### 51.6.3 ISC Control Status Register 0

**Name:** ISC_CTRLSR
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SIP | | | | | | | |
| Access | R | | | | | | | |
| Reset | 0 | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | FIELD | | HISREQ | UPPRO | CAPTURE |
| Access | | | | R | | R | R | R |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bit 31 – SIP** Synchronization In Progress

| Value | Description |
|---|---|
| 0 | The double domain synchronization is terminated. |
| 1 | The double domain synchronization is in progress. |

**Bit 4 – FIELD** Field Status (only relevant when the video stream is interlaced)

| Value | Description |
|---|---|
| 0 | The current field/segment is a top field |
| 1 | The current field/segment is a bottom field. |

**Bit 2 – HISREQ** Histogram Request Pending

| Value | Description |
|---|---|
| 0 | There is no histogram pending request. |
| 1 | Indicates that the histogram request is still pending. |

**Bit 1 – UPPRO** Profile Update Pending

| Value | Description |
|---|---|
| 0 | There is no profile update pending request. |
| 1 | Indicates that the profile update request is still pending. |

**Bit 0 – CAPTURE** Capture pending

| Value | Description |
|---|---|
| 0 | Capture mode is disabled. |
| 1 | Capture is pending. |

### 51.6.4 ISC Parallel Front End Configuration 0 Register

**Name:** ISC_PFE_CFG0
**Offset:** 0x0C
**Reset:** 0x00000000
**Property:** Read/Write

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – REP** Up Multiply with Replication

| Value | Description |
|---|---|
| 0 | Unused bits are stuck at 0. |
| 1 | Unused bits are copied from MSB. |

**Bits 30:28 – BPS[2:0]** Bits Per Sample

| Value | Name | Description |
|---|---|---|
| 0 | TWELVE | 12-bit input |
| 1 | ELEVEN | 11-bit input |
| 2 | TEN | 10-bit input |
| 3 | NINE | 9-bit input |
| 4 | EIGHT | 8-bit input |

**Bit 27 – CCIR_REP** CCIR Replication

| Value | Description |
|---|---|
| 0 | Unused bits are stuck at 0. |
| 1 | Unused bits are copied from MSB. |

**Bits 23:16 – SKIPCNT[7:0]** Frame Skipping Counter

**Bit 13 – ROWEN** Row Cropping Enable

| Value | Description |
|---|---|
| 0 | Row Cropping is disabled. |
| 1 | Row Cropping is enabled. |

**Bit 12 – COLEN** Column Cropping Enable

| Value | Description |
|---|---|
| 0 | Column Cropping is disabled. |
| 1 | Column Cropping is enabled. |

**Bit 11 – CCIR10_8N** CCIR 10 bits or 8 bits

| Value | Description |
|---|---|
| 0 | 8-bit mode. |
| 1 | 10-bit mode. |

**Bit 10 – CCIR_CRC** CCIR656 CRC Decoder

| Value | Description |
|---|---|
| 0 | Embedded CRC is discarded. |
| 1 | Embedded CRC is decoded. |

**Bit 9 – CCIR656** CCIR656 input mode

| Value | Description |
|---|---|
| 0 | HSYNC and VSYNC signals are used to synchronize the input stream. |
| 1 | Embedded synchronization is used. |

**Bit 8 – GATED** Gated input clock

| Value | Description |
|---|---|
| 0 | The external pixel clock is free running. |
| 1 | The external pixel clock is gated. |

**Bit 7 – CONT** Continuous Acquisition

| Value | Description |
|---|---|
| 0 | Single Shot mode. |
| 1 | Video mode. |

**Bits 6:4 – MODE[2:0]** Parallel Front End Mode

| Value | Name | Description |
|---|---|---|
| 0 | PROGRESSIVE | Video source is progressive. |
| 1 | DF_TOP | Video source is interlaced, two fields are captured starting with top field. |
| 2 | DF_BOTTOM | Video source is interlaced, two fields are captured starting with bottom field. |
| 3 | DF_IMMEDIATE | Video source is interlaced, two fields are captured immediately. |
| 4 | SF_TOP | Video source is interlaced, one field is captured starting with the top field. |

| Value | Name | Description |
|---|---|---|
| 5 | SF_BOTTOM | Video source is interlaced, one field is captured starting with the bottom field. |
| 6 | SF_IMMEDIATE | Video source is interlaced, one field is captured starting immediately. |

**Bit 3 – FPOL** Field Polarity

| Value | Description |
|---|---|
| 0 | Top field is sampled when F value is 0; Bottom field is sampled when F value is 1. |
| 1 | Top field is sampled when F value is 1; Bottom field is sampled when F value is 0. |

**Bit 2 – PPOL** Pixel Clock Polarity

| Value | Description |
|---|---|
| 0 | The pixel stream is sampled on the rising edge of the pixel clock. |
| 1 | The pixel stream is sampled on the falling edge of the pixel clock. |

**Bit 1 – VPOL** Vertical Synchronization Polarity

| Value | Description |
|---|---|
| 0 | VSYNC signal is active high, i.e. valid pixels are sampled when VSYNC is asserted. |
| 1 | VSYNC signal is active low, i.e. valid pixels are sampled when VSYNC is deasserted. |

**Bit 0 – HPOL** Horizontal Synchronization Polarity

| Value | Description |
|---|---|
| 0 | HSYNC signal is active high, i.e. valid pixels are sampled when HSYNC is asserted. |
| 1 | HSYNC signal is active low, i.e. valid pixels are sampled when HSYNC is deasserted. |

### 51.6.5 ISC Parallel Front End Configuration 1 Register

**Name:** ISC_PFE_CFG1
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | COLMAX[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Reset | | | 0 | 0 | | | 0 | 0 |

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No CCIR CRC error detected since the last read of the Interrupt Status register. |
| 1 | A CCIR CRC error has been detected. |

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | A horizontal synchronization is detected. |
| 1 | No horizontal synchronization is detected. |

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | A vertical synchronization is detected. |
| 1 | No vertical synchronization is detected. |

**Bit 25 – DAOV** Data Overflow Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No data overflow error occurred since the last reset of the Interrupt Status register. |
| 1 | A data overflow occurred. |

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No vertical front porch error occurred since the last read of the Interrupt Status register. |
| 1 | The vertical synchronization has been detected but the DMA channel is still busy. |

**Bit 20 – RERR** Read Channel Error Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No read channel error since the last read of the Interrupt Status register. |
| 1 | A read channel error occurred when the ISC read the descriptor. |

**Bits 18:17 – WERRID[1:0]** Write Channel Error Identifier (cleared on read)

| Value | Name | Description |
|---|---|---|
| 0 | CH0 | An error occurred for Channel 0 (RAW/RGB/Y) |
| 1 | CH1 | An error occurred for Channel 1 (CbCr/Cb) |
| 2 | CH2 | An error occurred for Channel 2 (Cr) |
| 3 | WB | Write back channel error |

**Bit 16 – WERR** Write Channel Error Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No write channel error since the last read of the Interrupt Status register. |
| 1 | A write channel error occurred. |

**Bit 13 – HISCLR** Histogram Clear Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No Histogram Clear Interrupt has been raised since the last read of the Interrupt Status register. |
| 1 | The Histogram Clear Interrupt has occurred. |

**Bit 12 – HISDONE** Histogram Completed Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No Histogram Completed Interrupt has been raised since the last read of the Interrupt Status register. |
| 1 | The Histogram Completed Interrupt has occurred. |

**Bit 9 – LDONE** DMA List Done Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No DMA List Done Interrupt has occurred since the last read of the Interrupt Status register. |
| 1 | The DMA List Done Interrupt has occurred. |

**Bit 8 – DDONE** DMA Done Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No DMA Transfer Done Interrupt has occurred since the last read of the Interrupt Status register. |
| 1 | The DMA Transfer Done Interrupt has occurred. |

**Bit 5 – DIS** Disable Completed Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | The disable has not occurred since the last read of the Interrupt Status register. |
| 1 | The disable has completed. |

**Bit 4 – SWRST** Software Reset Completed Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No software reset completion since the last read of the Interrupt Status register. |
| 1 | The software reset has completed. |

**Bit 1 – HD** Horizontal Synchronization Detected Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No horizontal synchronization detection since the last read of the Interrupt Status register. |
| 1 | A horizontal synchronization has been detected. |

**Bit 0 – VD** Vertical Synchronization Detected Interrupt (cleared on read)

| Value | Description |
|---|---|
| 0 | No vertical synchronization detection since the last read of the Interrupt Status register. |
| 1 | A vertical synchronization has been detected. |

### 51.6.15 ISC White Balance Control Register

**Name:** ISC_WB_CTRL
**Offset:** 0x58
**Reset:** 0x00000000
**Property:** Read/Write

| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

**Bit 4 – BIPART** Bipartite Table Configuration

| Value | Description |
|---|---|
| 0 | Bipartite table is disabled. There are 64 points of interpolation from 0 to 4095. |
| 1 | Bipartite table is enabled. There are 32 points of interpolation (spacing is 8) from 0 to 255, then there are 30 points of interpolation from 256 to 4095. |

**Bit 3 – RENABLE** Gamma Correction Enable for R Channel

| Value | Description |
|---|---|
| 0 | 12-bit to 10-bit compression is performed skipping two bits. |
| 1 | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the red channel. |

**Bit 2 – GENABLE** Gamma Correction Enable for G Channel

| Value | Description |
|---|---|
| 0 | 12-bit to 10-bit compression is performed skipping two bits. |
| 1 | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the green channel. |

**Bit 1 – BENABLE** Gamma Correction Enable for B Channel

| Value | Description |
|---|---|
| 0 | 12-bit to 10-bit compression is performed skipping two bits. |
| 1 | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the blue channel. |

**Bit 0 – ENABLE** Gamma Correction Enable

| Value | Description |
|---|---|
| 0 | Gamma correction is disabled. |
| 1 | Gamma correction is enabled. |

| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bit 7 – DONE** Descriptor Processing Status
This bit appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

| Value | Description |
|---|---|
| 0 | Descriptor not processed yet. |
| 1 | Descriptor processed. |

**Bit 6 – FIELD** Value of Captured Frame Field Signal
This bit is only relevant for interlaced content. It appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

| Value | Description |
|---|---|
| 0 | Field value is 0. |
| 1 | Field value is 1. |

**Bit 5 – WB** Write Back Operation Enable

| Value | Description |
|---|---|
| 0 | Write Back operation is skipped. |
| 1 | Write Back operation is performed. |

**Bit 4 – IE** Interrupt Enable

| Value | Description |
|---|---|
| 0 | DMA Done interrupt is generated. |
| 1 | DMA Done interrupt is not set. |

**Bits 2:1 – DVIEW[1:0]** Descriptor View

| Value | Name | Description |
|---|---|---|
| 0 | PACKED | Address {0} Stride {0} are updated |
| 1 | SEMIPLANAR | Address {0,1} Stride {0,1} are updated |
| 2 | PLANAR | Address {0,1,2} Stride {0,1,2} are updated |

**Bit 0 – DE** Descriptor Enable

| Value | Description |
|---|---|
| 0 | Descriptor disabled. |
| 1 | Descriptor enabled. |

# 52. Controller Area Network (MCAN)

## 52.1 Description

The Controller Area Network (MCAN) performs communication according to CAN Protocol Version 2.0 Part A,B and Bosch CAN FD Specification V1.0 (Non-ISO). Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.

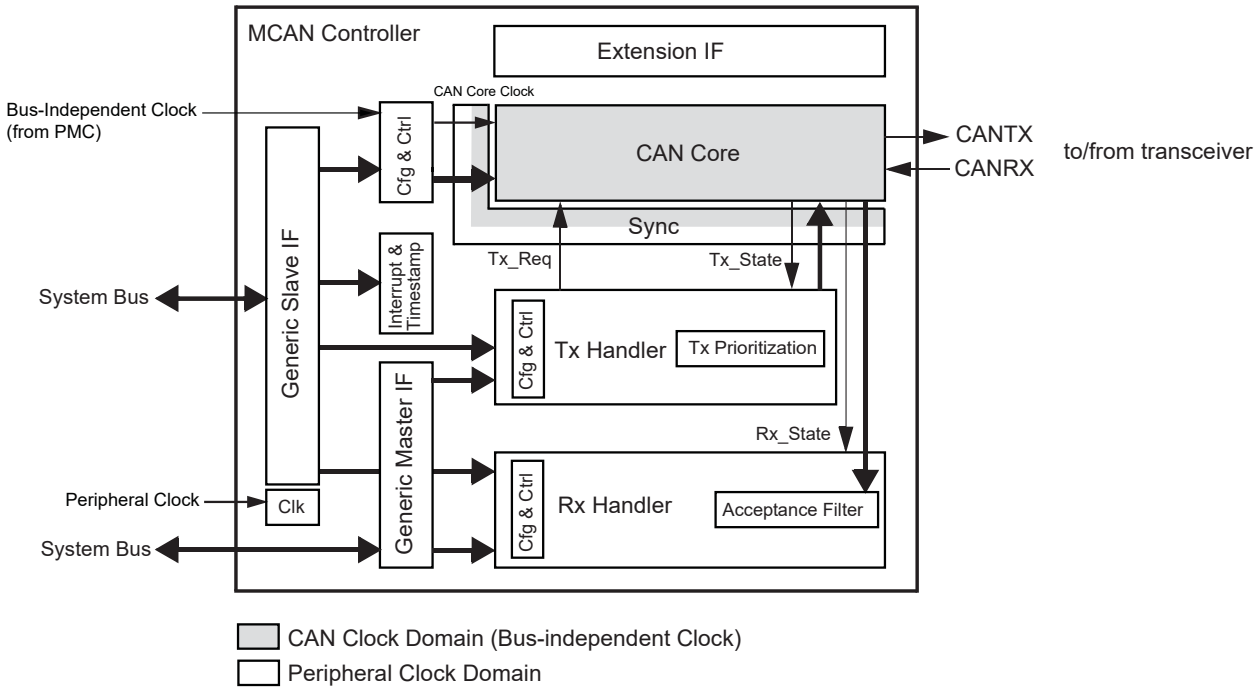
**WARNING** MCAN implements the non-ISO CAN FD frame format and therefore does not pass the CAN FD Conformance Test according to ISO 16845-1:2016.

## 52.2 Embedded Characteristics

- Classic CAN (2.0 A,B) in Conformance with ISO11898-1:2015 and ISO16845-1:2016
- CAN FD Frame Format according to Bosch CAN FD Specification V1.0 (Non-ISO)
- CAN-FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

## 52.3 Block Diagram

**Figure 52-1. MCAN Block Diagram**



**Note:** Refer to section “Power Management Controller (PMC)” for details about the bus-independent clock (GCLK).

## 52.4 Product Dependencies

### 52.4.1 I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

### 52.4.2 Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select the UPLLCK (480 MHz) as source clock and divide by 24,12, or 6. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

### 52.4.3 Interrupt Sources

The two MCAN interrupt lines (MCAN_INT0, MCAN_INT1) are connected on internal sources of the Interrupt Controller.

Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN_INT0 or to MCAN_INT1. By default, all interrupt sources are routed to interrupt line MCAN_INT0/1. By programming MCAN_ILE.EINT0 and MCAN_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

#### 52.4.4 Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in Message RAM.

The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured in 0x00200000.

## 52.5 Functional Description

### 52.5.1 Operating Modes

#### 52.5.1.1 Software Initialization

Software initialization is started by setting bit MCAN_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MCAN_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN_CCCR.INIT does not change any configuration register. Resetting MCAN_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN_CCCR.INIT and MCAN_CCCR.CCE are set (protected write).

MCAN_CCCR.CCE can only be configured when MCAN_CCCR.INIT = ‘1’. MCAN_CCCR.CCE is automatically cleared when MCAN_CCCR.INIT = ‘0’.

The following registers are cleared when MCAN_CCCR.CCE = ‘1’:

- High Priority Message Status (MCAN_HPMS)
- Receive FIFO 0 Status (MCAN_RXF0S)
- Receive FIFO 1 Status (MCAN_RXF1S)
- Transmit FIFO/Queue Status (MCAN_TXFQS)
- Transmit Buffer Request Pending (MCAN_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN_TXBCF)
- Transmit Event FIFO Status (MCAN_TXEFS)

The Timeout Counter value MCAN_TOCV.TOC is loaded with the value configured by MCAN_TOCC.TOP when MCAN_CCCR.CCE = ‘1’.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN_CCCR.CCE = ‘1’.

The following registers are only writeable while MCAN_CCCR.CCE = ‘0’

- Transmit Buffer Add Request (MCAN_TXBAR)
- Transmit Buffer Cancellation Request (MCAN_TXBCR)

MCAN_CCCR.TEST and MCAN_CCCR.MON can only be set when MCAN_CCCR.INIT = ‘1’ and MCAN_CCCR.CCE = ‘1’. Both bits may be cleared at any time. MCAN_CCCR.DAR can only be configured when MCAN_CCCR.INIT = ‘1’ and MCAN_CCCR.CCE = ‘1’.

#### 52.5.1.2 Normal Operation

Once the MCAN is initialized and MCAN_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

#### 52.5.1.3 CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN_PSR.PXE. When Protocol Exception Handling is enabled (MCAN_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN_PSR.ACT = 2) to Integrating (MCAN_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = ‘1’, transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = ‘0’, received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN_CCCR.FDOE = 1 and MCAN_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN_CCCR.FDOE = 1 and MCAN_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.

- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

**Table 52-1. Coding of DLC in CAN FD**

| DLC | 9 | 10 | 11 | 12 | 13 | 14 | 15 |
|---|---|---|---|---|---|---|---|
| Number of Data Bytes | 12 | 16 | 20 | 24 | 32 | 48 | 64 |

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the FastData Bit Timing and Prescaler register (MCAN_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of 4 $t_q$, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

#### 52.5.1.4 Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

##### 52.5.1.4.1 Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver to the receive input CANRX plus the transmitter delay compensation offset as configured by

MCAN_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN_PSR.TDCV shows the actual transmitter delay compensation value. MCAN_PSR.TDCV is cleared when MCAN_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:

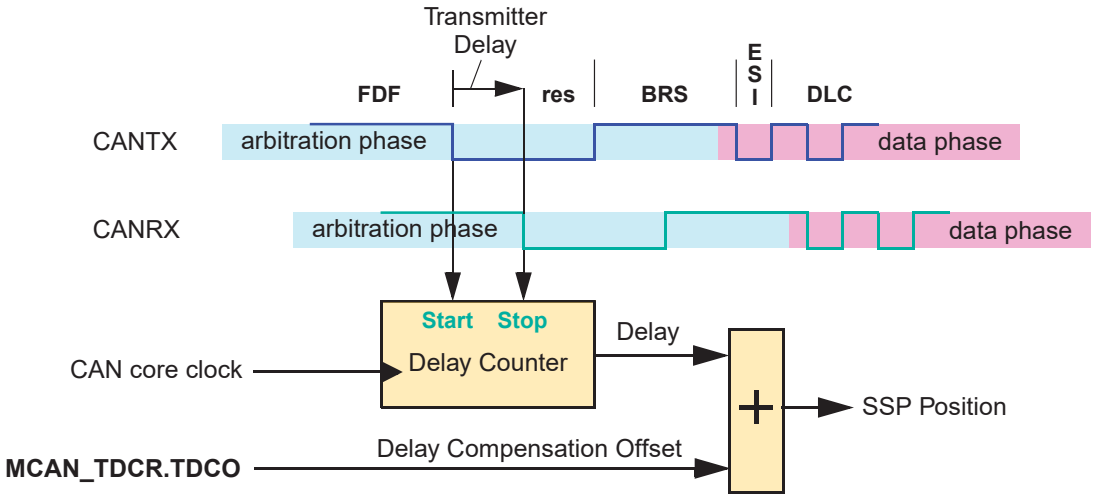
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

#### 52.5.1.4.2 Transmitter Delay Measurement

If transmitter delay compensation is enabled by programming MCAN_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

**Figure 52-2. Transmitter Delay Measurement**



To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a to early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN_TDCR.TDCF AND CANRX is low.

### 52.5.1.5 Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or

overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN_CCCR.ASM. The bit can only be set by the processor when both MCAN_CCCR.CCE and MCAN_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.

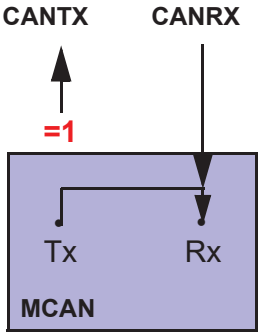
**Note:** The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

#### 52.5.1.6 Bus Monitoring Mode

The MCAN is set in Bus Monitoring mode by setting MCAN_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

**Figure 52-3. Pin Control in Bus Monitoring Mode**



**Bus Monitoring Mode**

#### 52.5.1.7 Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN_CCCR.DAR.

#### 52.5.1.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx set

  Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx set

  Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:
  Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx not set

  Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

### 52.5.1.8 Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCAN_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

### 52.5.1.9 Test Modes

To enable write access to the MCAN Test register (MCAN_TEST) (see Section 7.6), bit MCAN_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN_TEST.RX.

**Note:** Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

#### 52.5.1.9.1 External Loop Back Mode

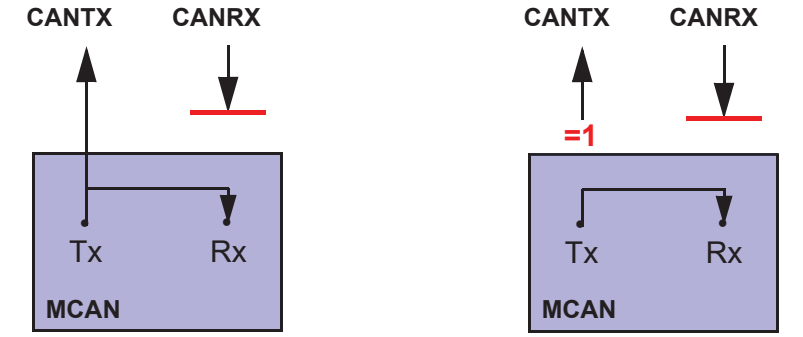
The MCAN can be set in External Loop Back mode by setting the bit MCAN_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

#### 52.5.1.9.2 Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN_TEST.LBCK and MCAN_CCCR.MON. This mode can be used for a “Hot Selftest”, meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

**Figure 52-4. Pin Control in Loop Back Modes**



### 52.5.2 Timestamp Generation

For timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1…16). The counter is readable via MCAN_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN_IR.TSW is set.

On start of frame reception / transmission, the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCAN_TSCC.TSS, an external 16-bit timestamp can be used.

### 52.5.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN_TOCC). The actual counter value can be read from MCAN_TOCV.TOC. The Timeout Counter can only be started while MCAN_CCCR.INIT = ‘0’. It is stopped when MCAN_CCCR.INIT = ‘1’, e.g. when the MCAN enters Bus_Off state.

The operating mode is selected by MCAN_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN_CCCR.INIT is reset. A write to MCAN_TOCV presets the counter to the value configured by MCAN_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN_TOCV has no effect.

When the counter reaches zero, interrupt flag MCAN_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN_TOCC.TOP.

**Note:** The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

### 52.5.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### 52.5.4.1 Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN_GFC)
- Standard ID Filter Configuration (MCAN_SIDFC)
- Extended ID Filter Configuration (MCAN_XIDFC)
- Extended ID and Mask (MCAN_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN_IR.HPM)

- Set High Priority Message interrupt flag (MCAN_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

- Rx Buffer
  New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN_PSR.LEC and MCAN_PSR.DLEC.
- Rx FIFO
  Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN_PSR.LEC and MCAN_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in Rx FIFO Overwrite Mode have to be considered.
  **Note:** When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

#### 52.5.4.1.1 Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = “00”: The Message ID of received frames is ANDed with MCAN_XIDAM before the range filter is applied.
- EFT = “11”: MCAN_XIDAM is not used for range filtering.

#### 52.5.4.1.2 Filter for Specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

#### 52.5.4.1.3 Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

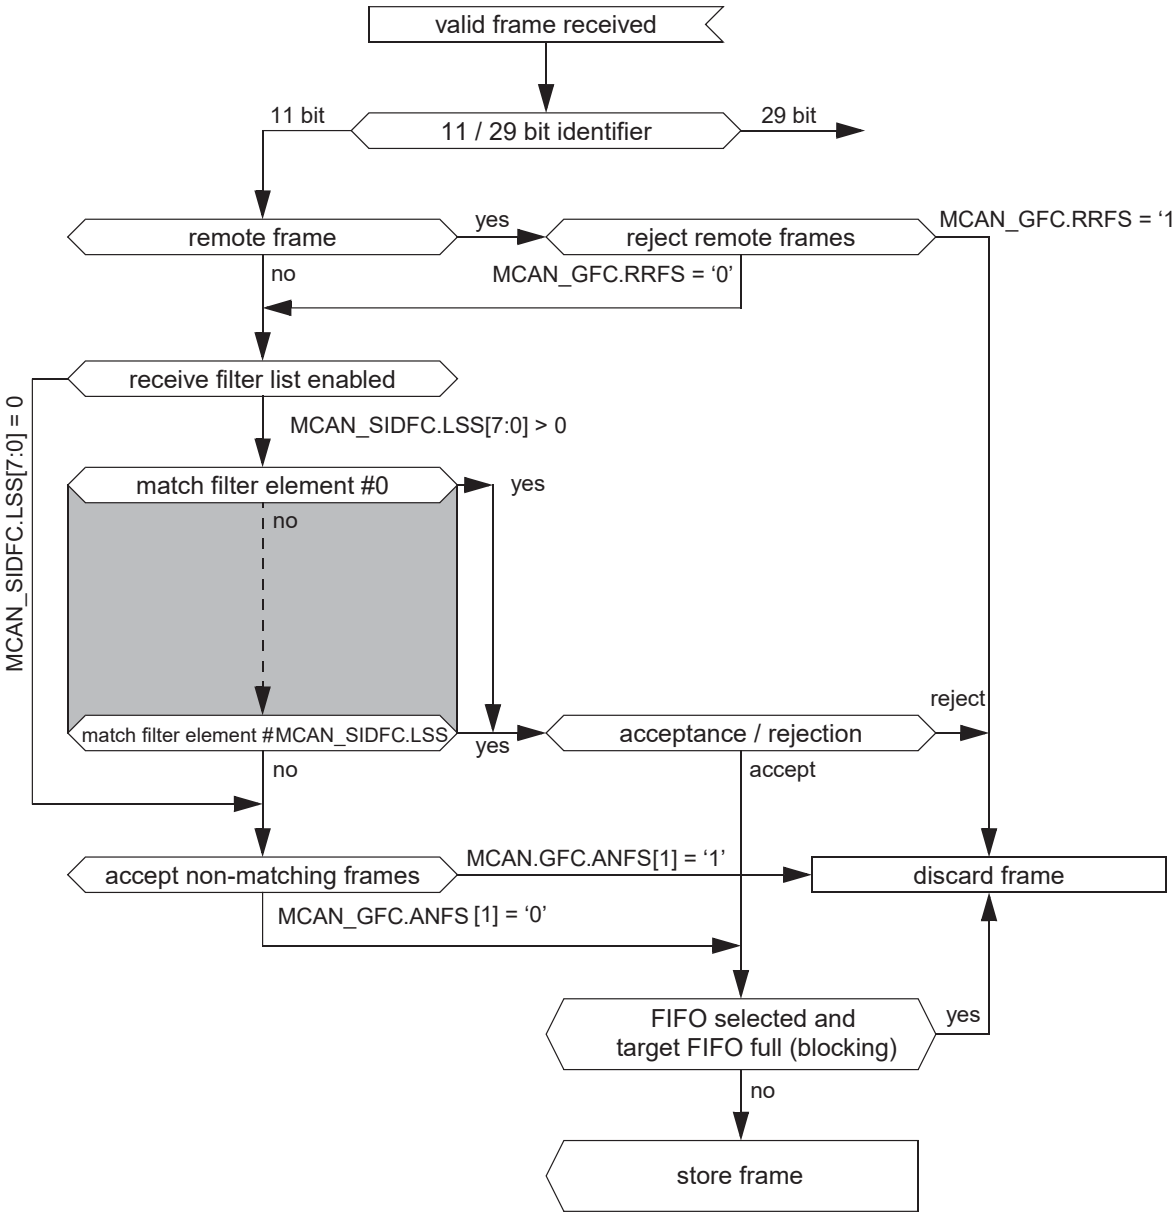
In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

#### 52.5.4.1.4 Standard Message ID Filtering

The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in 52.5.7.5 Standard Message ID Filter Element.

Controlled by MCAN_GFC and MCAN_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

**Figure 52-5. Standard Message ID Filter Path**



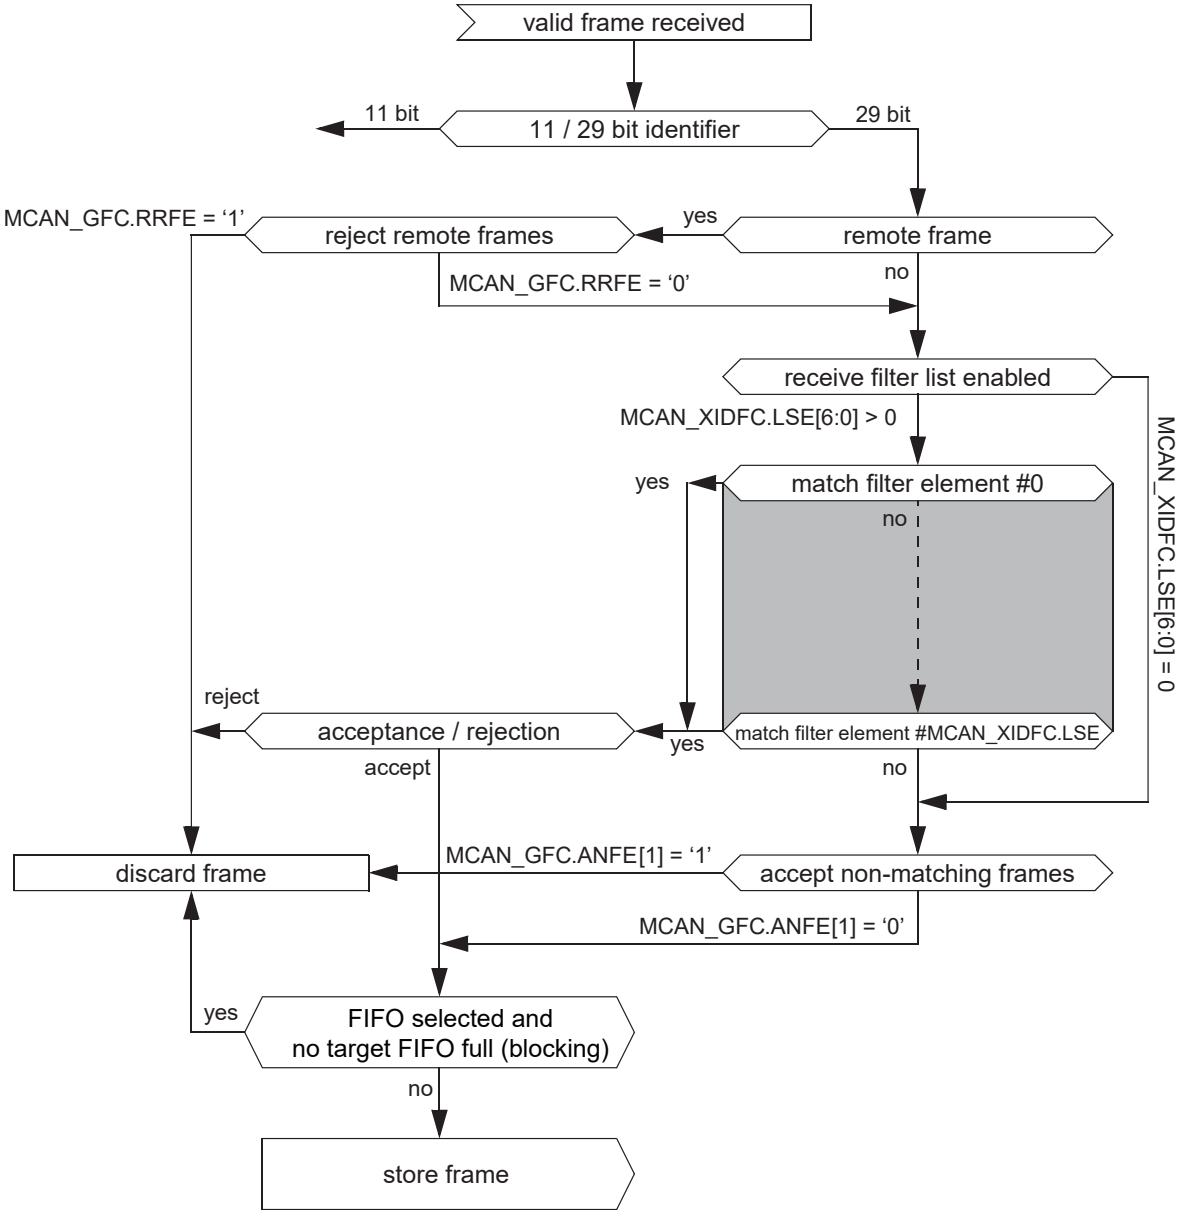
***Extended Message ID Filtering***

The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in 52.5.7.6 Extended Message ID Filter Element.

Controlled by MCAN_GFC and MCAN_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN_XIDAM is ANDed with the received identifier before the filter list is executed.

**Figure 52-6. Extended Message ID Filter Path**



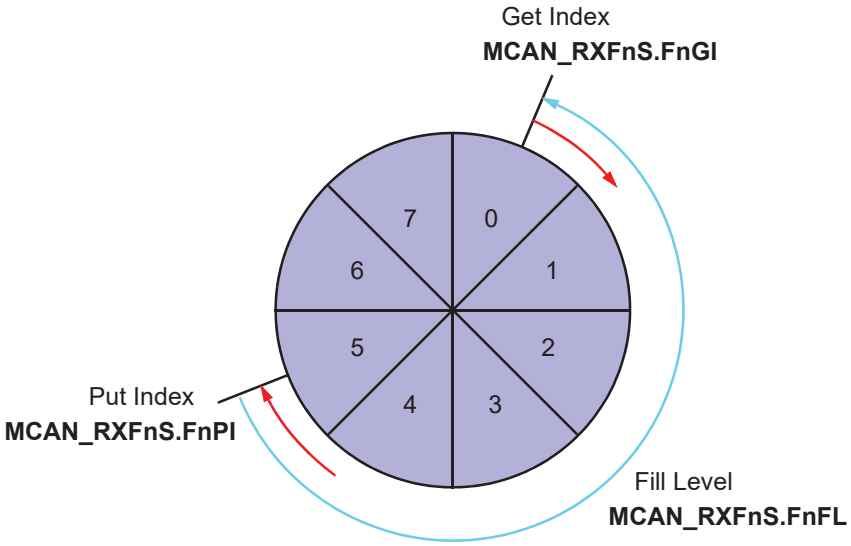
### 52.5.4.2 Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN_RXF0C) and the Rx FIFO 1 Configuration register (MCAN_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see Acceptance Filtering. The Rx FIFO element is described in Rx Buffer and FIFO Element.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN_RXFnC.FnWM, interrupt flag MCAN_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN_RXFnS.FnF. In addition, the interrupt flag MCAN_IR.RFnF is set.

**Figure 52-7. Rx FIFO Status**



When reading from an Rx FIFO, Rx FIFO Get Index MCAN_RXFnS.FnGI × FIFO Element Size has to be added to the corresponding Rx FIFO start address MCAN_RXFnC.FnSA.

**Table 52-2. Rx Buffer / FIFO Element Size**

| MCAN_RXESC.RBDS[2:0]<br>MCAN_RXESC.FnDS[2:0] | Data Field<br>[bytes] | FIFO Element Size<br>[RAM words] |
|---|---|---|
| 0 | 8 | 4 |
| 1 | 12 | 5 |
| 2 | 16 | 6 |
| 3 | 20 | 7 |
| 4 | 24 | 8 |
| 5 | 32 | 10 |
| 6 | 48 | 14 |
| 7 | 64 | 18 |

#### 52.5.4.2.1 Rx FIFO Blocking Mode

The Rx FIFO Blocking mode is configured by MCAN_RXFnC.FnOM = '0'. This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by MCAN_RXFnS.FnF = '1'. In addition, the interrupt flag MCAN_IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by MCAN_RXFnS.RFnL = '1'. In addition, the interrupt flag MCAN_IR.RFnL is set.

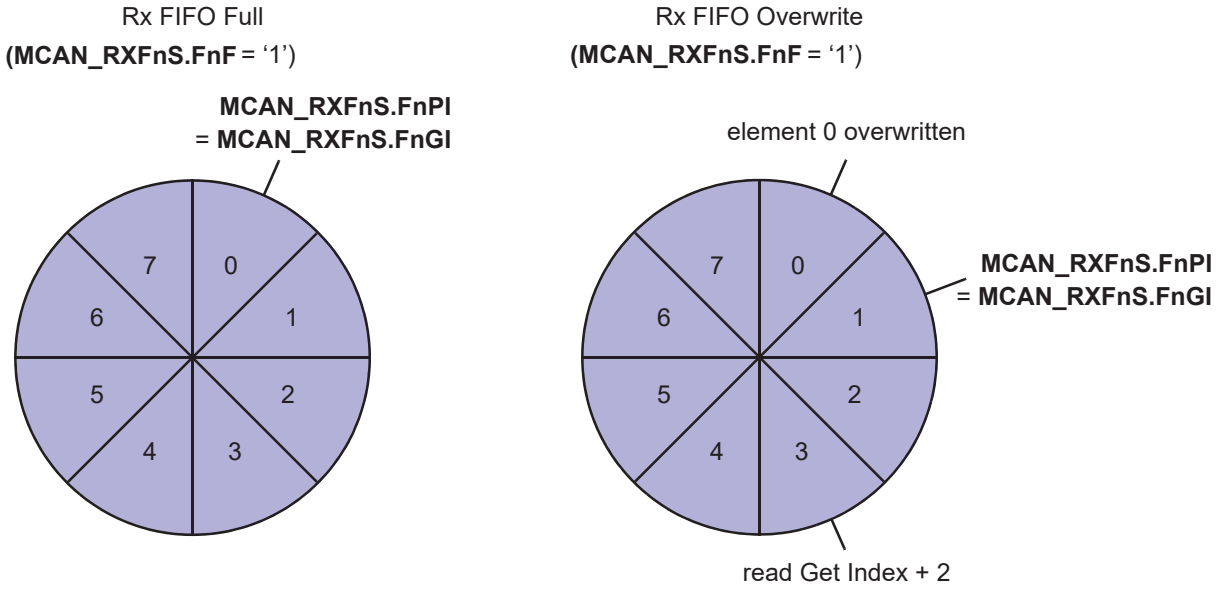
#### 52.5.4.2.2 Rx FIFO Overwrite Mode

The Rx FIFO Overwrite mode is configured by MCAN_RXFnC.FnOM = '1'.

When an Rx FIFO full condition (MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI) is signalled by MCAN_RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

**Figure 52-8. Rx FIFO Overflow Handling**



After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN_RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN_RXFnS.FnF = '0').

### 52.5.4.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCAN_RXBC.RBSA.

For each Rx Buffer, a Standard or Extended Message ID Filter Element with SFEC / EFEC = 7 and SFID2 / EFID2[10:9] = 0 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag MCAN_IR.DRX (Message stored in dedicated Rx Buffer) in MCAN_IR is set.

**Table 52-3. Example Filter Configuration for Rx Buffers**

| Filter Element | SFID1[10:0] EFID1[28:0] | SFID2[10:9] EFID2[10:9] | SFID2[5:0] EFID2[5:0] |
|---|---|---|---|
| 0 | ID message 1 | 0 | 0 |

| .....continued | | | |
|---|---|---|---|
| **Filter Element** | **SFID1[10:0] EFID1[28:0]** | **SFID2[10:9] EFID2[10:9]** | **SFID2[5:0] EFID2[5:0]** |
| 1 | ID message 2 | 0 | 1 |
| 2 | ID message 3 | 0 | 2 |

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN_NDAT1) and New Data 2 register (MCAN_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

#### 52.5.4.3.1 Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

### 52.5.4.4 Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see Rx Buffer and FIFO Element).

Advantage: Fixed start address for the DMA transfers (relative to MCAN_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_can_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m_can_dma_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

#### 52.5.4.4.1 Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

**Table 52-4. Example Filter Configuration for Debug Messages**

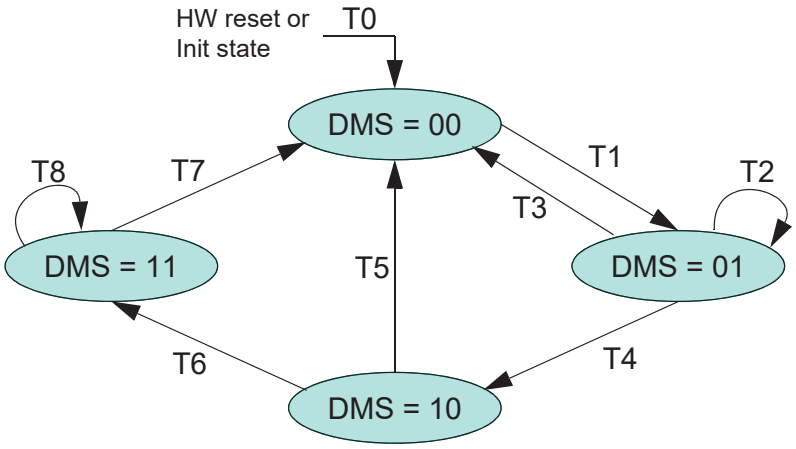
| Filter Element | SFID1[10:0] EFID1[28:0] | SFID2[10:9] EFID2[10:9] | SFID2[5:0] EFID2[5:0] |
|---|---|---|---|
| 0 | ID debug message A | 1 | 11 1101 |
| 1 | ID debug message B | 2 | 11 1110 |
| 2 | ID debug message C | 3 | 11 1111 |

#### 52.5.4.4.2 Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN_RXF1S.DMS.

**Figure 52-9. Debug Message Handling State Machine**



T0: reset m_can_dma_req output, enable reception of debug messages A, B, and C

T1: reception of debug message A

T2: reception of debug message A

T3: reception of debug message C

T4: reception of debug message B

T5: reception of debug messages A, B

T6: reception of debug message C

T7: DMA transfer completed

T8: reception of debug message A,B,C (message rejected)

### 52.5.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx

Buffer element is described in Tx Buffer Element. The table below describes the possible configurations for frame transmission.

**Table 52-5. Possible Configurations for Frame Transmission**

| MCAN_CCCR | | Tx Buffer Element | | Frame Transmission |
|---|---|---|---|---|
| BRSE | FDOE | FDF | BRS | |
| ignored | 0 | ignored | ignored | Classic CAN |
| 0 | 1 | 0 | ignored | Classic CAN |
| 0 | 1 | 1 | ignored | FD without bit rate switching |
| 1 | 1 | 0 | ignored | Classic CAN |
| 1 | 1 | 1 | 0 | FD without bit rate switching |
| 1 | 1 | 1 | 1 | FD with bit rate switching |

**Note:** AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN_TXBRP is updated, or when a transmission has been started.

#### 52.5.5.1 Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

#### 52.5.5.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCAN_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0…31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

**Table 52-6. Tx Buffer / FIFO / Queue Element Size**

| TXESC.TBDS[2:0] | Data Field [bytes] | Element Size [RAM words] |
|---|---|---|
| 0 | 8 | 4 |
| 1 | 12 | 5 |
| 2 | 16 | 6 |
| 3 | 20 | 7 |
| 4 | 24 | 8 |
| 5 | 32 | 10 |
| 6 | 48 | 14 |
| 7 | 64 | 18 |

#### 52.5.5.3 Tx FIFO

Tx FIFO operation is configured by programming MCAN_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level MCAN_TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCAN_TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCAN_TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table Table 52-6). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/ Queue Put Index MCAN_TXFQS.TFQPI (0…31) × Element Size to the Tx Buffer Start Address MCAN_TXBC.TBSA.

#### 52.5.5.4 Tx Queue

Tx Queue operation is configured by programming MCAN_TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCAN_TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCAN_TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

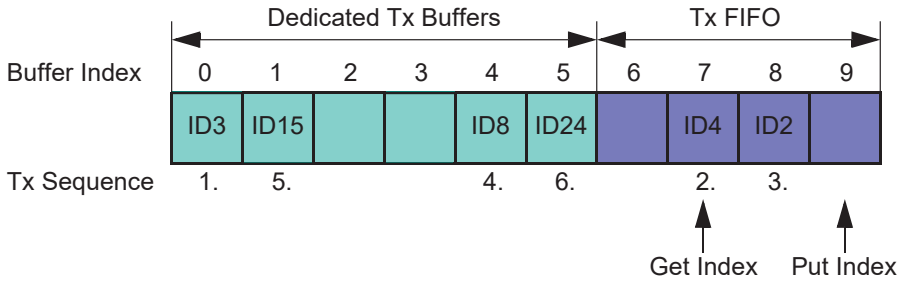
The application may use register MCAN_TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table Tx Buffer / FIFO / Queue Element Size). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS.TFQPI (0…31) × Element Size to the Tx Buffer Start Address MCAN_TXBC.TBSA.

#### 52.5.5.5 Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by MCAN_TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCAN_TXBC.TFQS. In case MCAN_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-10. Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO**



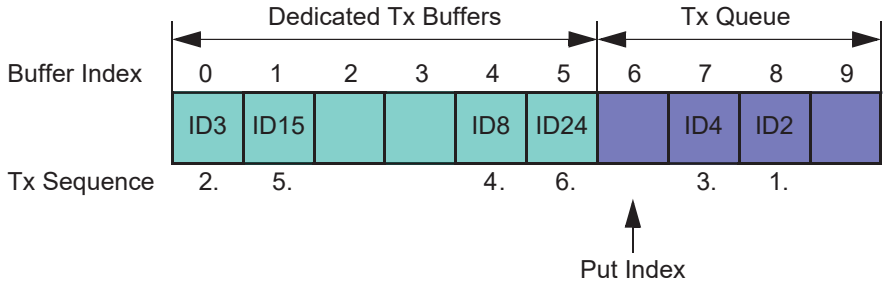
Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

#### 52.5.5.6 Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN_TXBC.TFQS. In case MCAN_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-11. Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue**



Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.7 Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN_TXBTO and MCAN_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN_TXBCF bit is set.

**Note:** In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

### 52.5.5.8 Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in Debug on CAN Support.

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN_TXEFC.EFWM, interrupt flag MCAN_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN_TXEFC.EFSA.

### 52.5.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN_RXF0A, MCAN_RXF1A and MCAN_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**Note:** The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

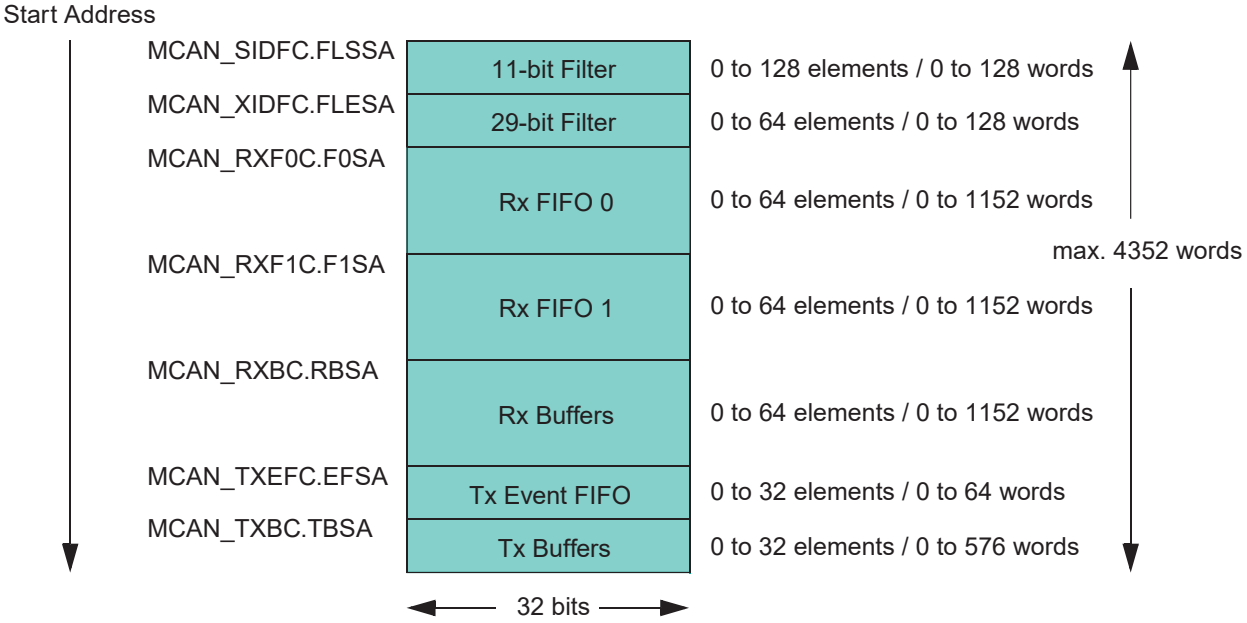
### 52.5.7 Message RAM

#### 52.5.7.1 Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN_RXESC.F0DS, MCAN_RXESC.F1DS, MCAN_RXESC.RBDS, and MCAN_TXESC.TBDS.

**Figure 52-12. Message RAM Configuration**



When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

**Note:** The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

#### 52.5.7.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN_RXESC.

**Table 52-7. Rx Buffer and FIFO Element**

| | 31 | | | 24 | 23 | | | | 16 | 15 | | 8 | 7 | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| R0 | ESI | XTD | RTR | ID[28:0] | | | | | | | | | | | |
| R1 | ANMF | FIDX[6:0] | | | – | FDF | BRS | DLC[3:0] | | RXTS[15:0] | | | | | |
| R2 | DB3[7:0] | | | | DB2[7:0] | | | | | DB1[7:0] | | | DB0[7:0] | | |
| R3 | DB7[7:0] | | | | DB6[7:0] | | | | | DB5[7:0] | | | DB4[7:0] | | |
| ... | ... | | | | ... | | | | | ... | | | ... | | |
| Rn | DBm[7:0] | | | | DBm-1[7:0] | | | | | DBm-2[7:0] | | | DBm-3[7:0] | | |

• R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

• R0 Bit 30 XTD: Extended Identifier

Signals to the processor whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• R0 Bit 29 RTR: Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

**Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), bit RTR reflects the state of the reserved bit r1.

• R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN_GFC.ANFS and MCAN_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

• R1 Bits 30:24 FIDX[6:0]: Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MCAN_SIDFC.LSS - 1 resp. MCAN_XIDFC.LSE - 1.

• R1 Bit 21 FDF: FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• R1 Bit 20 BRS: Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

**Note:**
Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN_CCCR.BRSE = 1.

• R1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

• R1 Bits 15:0 RXTS[15:0]: Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC.TCP.

• R2 Bits 31:24 DB3[7:0]: Data Byte 3

• R2 Bits 23:16 DB2[7:0]: Data Byte 2

• R2 Bits 15:8 DB1[7:0]: Data Byte 1

• R2 Bits 7:0 DB0[7:0]: Data Byte 0

• R3 Bits 31:24 DB7[7:0]: Data Byte 7

• R3 Bits 23:16 DB6[7:0]: Data Byte 6

• R3 Bits 15:8 DB5[7:0]: Data Byte 5

• R3 Bits 7:0 DB4[7:0]: Data Byte 4

... ... ...

• Rn Bits 31:24 DBm[7:0]: Data Byte m

• Rn Bits 23:16 DBm-1[7:0]: Data Byte m-1

• Rn Bits 15:8 DBm-2[7:0]: Data Byte m-2

• Rn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN_RXESC), between two and sixteen 32-bit words (Rn = 3 ..17) are used for storage of a CAN message's data field.

### 52.5.7.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

**Table 52-8. Tx Buffer Element**

| | 31 | | | 24 | 23 | | | | 16 | 15 | 8 | 7 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| T0 | ESI | XTD | RTR | ID[28:0] | | | | | | | | | |

| Tn | DBm[7:0] | | | | DBm-1[7:0] | | | | | DBm-2[7:0] | | DBm-3[7:0] | |

• T0 Bit 30 ESI: Error State Indicator

T0 Bit 31 ESI: Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

**Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

• T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

**Note:** When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN_CCCR.FDOE enables the transmission in CAN FD format.

• T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

• T1 Bits 31:24 MM[7:0]: Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

• T1 Bit 23 EFC: Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

• T1 Bit 21 FDF: FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

• T1 Bit 20 BRS: Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

**Note:**
Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN_CCCR.BRSE = 1.

• T1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

• T2 Bits 31:24 DB3[7:0]: Data Byte 3

• T2 Bits 23:16 DB2[7:0]: Data Byte 2

• T2 Bits 15:8 DB1[7:0]: Data Byte 1

• T2 Bits 7:0 DB0[7:0]: Data Byte 0

• T3 Bits 31:24 DB7[7:0]: Data Byte 7

• T3 Bits 23:16 DB6[7:0]: Data Byte 6

• T3 Bits 15:8 DB5[7:0]: Data Byte 5

• T3 Bits 7:0 DB4[7:0]: Data Byte 4

... ... ...

• Tn Bits 31:24 DBm[7:0]: Data Byte m

• Tn Bits 23:16 DBm-1[7:0]: Data Byte m-1

• Tn Bits 15:8 DBm-2[7:0]: Data Byte m-2

• Tn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

#### 52.5.7.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

**Table 52-9. Tx Event FIFO Element**

| | 31 | | | 24 | 23 | | | | | | 16 | 15 | 8 | 7 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| E0 | ESI | XTD | RTR | ID[28:0] | | | | | | | | | | | |
| E1 | MM[7:0] | | | | ET [1:0] | FDF | BRS | DLC[3:0] | | | | TXTS[15:0] | | | |

• E0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

• E0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• E0 Bit 29 RTR: Remote Transmission Request

0: Data frame transmitted.

1: Remote frame transmitted.

• E0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• E1 Bits 31:24 MM[7:0]: Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

• E1 Bit 23:22 ET[1:0]: Event Type

0: Reserved

1: Tx event

2: Transmission in spite of cancellation (always set for transmissions in DAR mode)

3: Reserved

• E1 Bit 21 FDF: FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• E1 Bit 20 BRS: Bit Rate Switch

0: Frame transmitted without bit rate switching.

1: Frame transmitted with bit rate switching.

• E1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.

9-15: CAN: frame with 8 data bytes transmitted.

9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

• E1 Bits 15:0 TXTS[15:0]: Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC.TCP.

#### 52.5.7.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN_SIDFC.FLSSA plus the index of the filter element (0…127).

**Table 52-10. Standard Message ID Filter Element**

| | 31 | | | | | 24 | 23 | 16 | 15 | 8 | 7 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| S0 | SFT[1:0] | | SFEC [2:0] | | | SFID1[10:0] | | | – | SFID2[10:0] | | |

• Bits 31:30 SFT[1:0]: Standard Filter Type

0: Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)

1: Dual ID filter for SF1ID or SF2ID

2: Classic filter: SF1ID = filter, SF2ID = mask

3: Reserved

• Bit 29:27 SFEC[2:0]: Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

0: Disable filter element

1: Store in Rx FIFO 0 if filter matches

2: Store in Rx FIFO 1 if filter matches

3: Reject ID if filter matches

4: Set priority if filter matches

5: Set priority and store in FIFO 0 if filter matches

6: Set priority and store in FIFO 1 if filter matches

7: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

• Bits 26:16 SFID1[10:0]: Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

• Bits 10:0 SFID2[10:0]: Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

0: Store message in a Rx buffer

1: Debug Message A

2: Debug Message B

3: Debug Message C

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

#### 52.5.7.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN_XIDFC.FLESA plus two times the index of the filter element (0…63).

**Table 52-11. Extended Message ID Filter Element**

| | 31 | | | 24 | 23 | 16 | 15 | 8 | 7 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|
| F0 | EFEC [2:0] | | | EFID1[28:0] | | | | | | |
| F1 | EFT[1:0] | | – | EFID2[28:0] | | | | | | |

• F0 Bit 31:29 EFEC[2:0]: Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110”, a match sets the interrupt flag MCAN_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN_HPMS is updated with the status of the priority match.

0: Disable filter element

1: Store in Rx FIFO 0 if filter matches

2: Store in Rx FIFO 1 if filter matches

3: Reject ID if filter matches

4: Set priority if filter matches

5: Set priority and store in FIFO 0 if filter matches

6: Set priority and store in FIFO 1 if filter matches

7: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

• F0 Bits 28:0 EFID1[28:0]: Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN_XIDAM masking mechanism (see Extended Message ID Filtering) is used.

• F1 Bits 31:30 EFT[1:0]: Extended Filter Type

0: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)

1: Dual ID filter for EF1ID or EF2ID

2: Classic filter: EF1ID = filter, EF2ID = mask

3: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), MCAN_XIDAM mask not applied

• F1 Bits 28:0 EFID2[28:0]: Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

• EFEC = “001”...“110”–Second ID of extended ID filter element

• EFEC = “111”–Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

0: Store message in an Rx buffer

1: Debug Message A

2: Debug Message B

3: Debug Message C

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

### 52.5.8 Hardware Reset Description

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN_CCCR.INIT = ‘1’) in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN_CCCR.INIT to ‘0’.

### 52.5.9 Access to Reserved Register Addresses

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN_IR.ARA is set and, if enabled, the selected interrupt line is risen.

## 52.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x04 | MCAN_ENDN | 7:0 | ETV[7:0] | | | | | | | |

### 52.6.3 MCAN Data Bit Timing and Prescaler Register

**Name:** MCAN_DBTP
**Offset:** 0x0C
**Reset:** 0x00000A33
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

The CAN bit time may be programmed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 CAN core clock periods. $t_q$ = (DBRP + 1) CAN core clock periods.

DTSEG1 is the sum of Prop_Seg and Phase_Seg1. DTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [DTSEG1 + DTSEG2 + 3] $t_q$
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] $t_q$.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x00000A33 configures the MCAN for a fast bit rate of 500 kbit/s.

The bit rate configured for the CAN FD data phase via MCAN_DBTP must be higher than or equal to the bit rate configured for the arbitration phase via MCAN_NBTP.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 1 | 1 | | 0 | 1 | 1 |

**Bit 23 – TDC** Transmitter Delay Compensation
0 (DISABLED): Transmitter Delay Compensation disabled.

1 (ENABLED): Transmitter Delay Compensation enabled.

**Bits 20:16 – DBRP[4:0]** Data Bit Rate Prescaler
The value by which the peripheral clock is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 12:8 – DTSEG1[4:0]** Data Time Segment Before Sample Point
0: Forbidden.

1 to 31: The duration of time segment is $t_q$ x (DTSEG1 + 1).

**Bits 7:4 – DTSEG2[3:0]** Data Time Segment After Sample Point
The duration of time segment is $t_q$ x (DTSEG2 + 1).

**Bits 2:0 – DSJW[2:0]** Data (Re) Synchronization Jump Width
The duration of a synchronization jump is $t_q$ x (DSJW + 1).

### 52.6.4 MCAN Test Register

**Name:** MCAN_TEST
**Offset:** 0x10
**Reset:** 0x00000000
**Property:** Read/Write

Write access to the Test Register has to be enabled by setting bit MCAN_CCCR.TEST to ‘1’.

All MCAN Test Register functions are set to their reset values when bit MCAN_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for MCAN_TEST.RX is undefined.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| | RX | TX[1:0] | | LBCK | | | | |
| Access | R | R/W | R/W | R/W | | | | |
| Reset | x | 0 | 0 | 0 | | | | |

**Bit 7 – RX** Receive Pin (read-only)
Monitors the actual value of pin CANRX.

The reset value for this bit is undefined.

| Value | Description |
|---|---|
| 0 | The CAN bus is dominant (CANRX = ‘0’). |
| 1 | The CAN bus is recessive (CANRX = ‘1’). |

**Bits 6:5 – TX[1:0]** Control of Transmit Pin (read/write)

| Value | Name | Description |
|---|---|---|
| 0 | RESET | Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time. |
| 1 | SAMPLE_POINT_MONITORING | Sample Point can be monitored at pin CANTX. |
| 2 | DOMINANT | Dominant (‘0’) level at pin CANTX. |

| Value | Name | Description |
|---|---|---|
| 3 | RECESSIVE | Recessive (‘1’) at pin CANTX. |

**Bit 4 – LBCK** Loop Back Mode (read/write)
0 (DISABLED): Reset value. Loop Back mode is disabled.

1 (ENABLED): Loop Back mode is enabled (see Test Modes).

### 52.6.5 MCAN RAM Watchdog Register

**Name:** MCAN_RWD
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCAN_RWD.WDC. The counter is reloaded with MCAN_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WDV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDC[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:8 – WDV[7:0]** Watchdog Value (read-only)
Watchdog Counter Value for the current message located in RAM.

**Bits 7:0 – WDC[7:0]** Watchdog Configuration (read/write)
Start value of the Message RAM Watchdog Counter. The counter is disabled when WDC is cleared.

### 52.6.6 MCAN CC Control Register

**Name:** MCAN_CCCR
**Offset:** 0x18
**Reset:** 0x00000001
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | TXP | EFBI | PXHD | | | BRSE | FDOE |
| Access | | R/W | R/W | R/W | | | R/W | R/W |
| Reset | | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TEST | DAR | MON | CSR | CSA | ASM | CCE | INIT |
| Access | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

**Bit 14 – TXP** Transmit Pause (read/write, write protection)
If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see Tx Handling).

| Value | Description |
|---|---|
| 0 | Transmit pause disabled. |
| 1 | Transmit pause enabled. |

**Bit 13 – EFBI** Edge Filtering during Bus Integration (read/write, write protection)

| Value | Description |
|---|---|
| 0 | Edge filtering is disabled. |
| 1 | Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization. |

**Bit 12 – PXHD** Protocol Exception Event Handling (read/write, write protection)

| Value | Description |
|---|---|
| 0 | Protocol exception handling enabled. |
| 1 | Protocol exception handling disabled. |

**Bit 9 – BRSE** Bit Rate Switching Enable (read/write, write protection)
0 (DISABLED): Bit rate switching for transmissions disabled.

1 (ENABLED): Bit rate switching for transmissions enabled.

**Bit 8 – FDOE** CAN FD Operation Enable (read/write, write protection)
0 (DISABLED): FD operation disabled.

1 (ENABLED): FD operation enabled.

**Bit 7 – TEST** Test Mode Enable (read/write, write protection against '1')
0 (DISABLED): Normal operation, MCAN_TEST register holds reset values.

1 (ENABLED): Test mode, write access to MCAN_TEST register enabled.

**Bit 6 – DAR** Disable Automatic Retransmission (read/write, write protection)
0 (AUTO_RETX): Automatic retransmission of messages not transmitted successfully enabled.

1 (NO_AUTO_RETX): Automatic retransmission disabled.

**Bit 5 – MON** Bus Monitoring Mode (read/write, write protection against '1')
0 (DISABLED): Bus Monitoring mode is disabled.

1 (ENABLED): Bus Monitoring mode is enabled.

**Bit 4 – CSR** Clock Stop Request (read/write)
0 (NO_CLOCK_STOP): No clock stop is requested.

1 (CLOCK_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

**Bit 3 – CSA** Clock Stop Acknowledge (read-only)

| Value | Description |
|---|---|
| 0 | No clock stop acknowledged. |
| 1 | MCAN may be set in power down by stopping the peripheral clock and the CAN core clock. |

**Bit 2 – ASM** Restricted Operation Mode (read/write, write protection against '1')
For a description of the Restricted Operation mode see Restricted Operation Mode.

0 (NORMAL): Normal CAN operation.

1 (RESTRICTED): Restricted Operation mode active.

**Bit 1 – CCE** Configuration Change Enable (read/write, write protection)
0 (PROTECTED): The processor has no write access to the protected configuration registers.

1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN_CCCR.INIT = '1').

**Bit 0 – INIT** Initialization (read/write)
Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

0 (DISABLED): Normal operation.

1 (ENABLED): Initialization is started.

### 52.6.7 MCAN Nominal Bit Timing and Prescaler Register

**Name:** MCAN_NBTP
**Offset:** 0x1C
**Reset:** 0x06000A03
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods. $t_q = t_{core\ clock}$ x (NBRP + 1).

NTSEG1 is the sum of Prop_Seg and Phase_Seg1. NTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] $t_q$
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] $t_q$.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | NSJW[6:0] | | | | | | | NBRP[8:8] |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |

| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

**Bits 31:25 – NSJW[6:0]** Nominal (Re) Synchronization Jump Width
0 to 127: The duration of a synchronization jump is $t_q$ x (NSJW + 1).

**Bits 24:16 – NBRP[8:0]** Nominal Bit Rate Prescaler
0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum (tq) = $t_{core\ clock}$ x (NBRP + 1)

**Bits 15:8 – NTSEG1[7:0]** Nominal Time Segment Before Sample Point

| Value | Description |
|---|---|
| 0 | Reserved; do not use. |
| 1 to 255 | The duration of time segment is $t_q$ x (NTSEG1 + 1). |

**Bits 6:0 – NTSEG2[6:0]** Nominal Time Segment After Sample Point

| Value | Description |
|---|---|
| 0 | Reserved; do not use. |
| 1 to 127 | The duration of time segment is $t_q$ x (NTSEG2 + 1). |

### 52.6.8 MCAN Timestamp Counter Configuration Register

**Name:** MCAN_TSCC
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read/Write

For a description of the Timestamp Counter see Timestamp Generation.

With CAN FD, an external counter is required for timestamp generation (TSS = 2).

**Bits 19:16 – TCP[3:0]** Timestamp Counter Prescaler
Configures the timestamp and timeout counters time unit in multiples of CAN bit times [ 1…16 ]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 1:0 – TSS[1:0]** Timestamp Select

| Value | Name | Description |
|---|---|---|
| 0 | ALWAYS_0 | Timestamp counter value always 0x0000 |
| 1 | TCP_INC | Timestamp counter value incremented according to TCP |
| 2 | EXT_TIMESTAMP | External timestamp counter value used |
| 3 | ALWAYS_0 | Timestamp counter value always 0x0000 |

### 52.6.9 MCAN Timestamp Counter Value Register

**Name:** MCAN_TSCV
**Offset:** 0x24
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | TSC[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TSC[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:0 – TSC[15:0]** Timestamp Counter (cleared on write)
The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [ 1… 16 ] depending on the configuration of MCAN_TSCC.TCP. A wrap around sets interrupt flag MCAN_IR.TSW. Write access resets the counter to zero.

When MCAN_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.

**Note:** A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN_TSCV.

### 52.6.10 MCAN Timeout Counter Configuration Register

**Name:** MCAN_TOCC
**Offset:** 0x28
**Reset:** 0xFFFF0000
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

For a description of the Timeout Counter, see Timeout Counter.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 31:16 – TOP[15:0]** Timeout Period
Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

**Bits 2:1 – TOS[1:0]** Timeout Select
When operating in Continuous mode, a write to MCAN_TOCV presets the counter to the value configured by MCAN_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

| Value | Name | Description |
|---|---|---|
| 0 | CONTINUOUS | Continuous operation. |
| 1 | TX_EV_TIMEOUT | Timeout controlled by Tx Event FIFO. |
| 2 | RX0_EV_TIMEOUT | Timeout controlled by Receive FIFO 0. |
| 3 | RX1_EV_TIMEOUT | Timeout controlled by Receive FIFO 1. |

**Bit 0 – ETOC** Enable Timeout Counter
0 (NO_TIMEOUT): Timeout Counter disabled.

1 (TOS_CONTROLLED): Timeout Counter enabled.

For use of timeout function with CAN FD, see Timeout Counter.

### 52.6.11 MCAN Timeout Counter Value Register

**Name:** MCAN_TOCV
**Offset:** 0x2C
**Reset:** 0x0000FFFF
**Property:** Read/Write

| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Bits 15:0 – TOC[15:0]** Timeout Counter (cleared on write)
The Timeout Counter is decremented in multiples of CAN bit times [ 1…16 ] depending on the configuration of MCAN_TSCC.TCP. When decremented to zero, interrupt flag MCAN_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN_TOCC.TOS.

### 52.6.12 MCAN Error Counter Register

**Name:** MCAN_ECR
**Offset:** 0x40
**Reset:** 0x00000000
**Property:** Read-only

When MCAN_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RP | REC[6:0] | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TEC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:16 – CEL[7:0]** CAN Error Logging (cleared on read)
The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

**Bit 15 – RP** Receive Error Passive

| Value | Description |
|---|---|
| 0 | The Receive Error Counter is below the error passive level of 128. |
| 1 | The Receive Error Counter has reached the error passive level of 128. |

**Bits 14:8 – REC[6:0]** Receive Error Counter
Actual state of the Receive Error Counter, values between 0 and 127.

**Bits 7:0 – TEC[7:0]** Transmit Error Counter
Actual state of the Transmit Error Counter, values between 0 and 255.

### 52.6.13 MCAN Protocol Status Register

**Name:** MCAN_PSR
**Offset:** 0x44
**Reset:** 0x00000707
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | | | | | | | | |
| Reset | | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BO | EW | EP | ACT[1:0] | | LEC[2:0] | | |
| Access | R | R | R | R | R | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

**Bits 22:16 – TDCV[6:0]** Transmitter Delay Compensation Value
0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN_TDCR.TDCO.

**Bit 14 – PXE** Protocol Exception Event (cleared on read)

| Value | Description |
|---|---|
| 0 | No protocol exception event occurred since last read access |
| 1 | Protocol exception event occurred |

**Bit 13 – RFDF** Received a CAN FD Message (cleared on read)
This bit is set independently from acceptance filtering.

| Value | Description |
|---|---|
| 0 | Since this bit was reset by the CPU, no CAN FD message has been received |
| 1 | Message in CAN FD format with FDF flag set has been received |

**Bit 12 – RBRS** BRS Flag of Last Received CAN FD Message (cleared on read)
This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description |
|---|---|
| 0 | Last received CAN FD message did not have its BRS flag set. |

| Value | Description |
|---|---|
| 1 | Last received CAN FD message had its BRS flag set. |

**Bit 11 – RESI** ESI Flag of Last Received CAN FD Message (cleared on read)
This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description |
|---|---|
| 0 | Last received CAN FD message did not have its ESI flag set. |
| 1 | Last received CAN FD message had its ESI flag set. |

**Bits 10:8 – DLEC[2:0]** Data Phase Last Error Code (set to 111 on read)
Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

**Bit 7 – BO** Bus_Off Status

| Value | Description |
|---|---|
| 0 | The MCAN is not Bus_Off. |
| 1 | The MCAN is in Bus_Off state. |

**Bit 6 – EW** Warning Status

| Value | Description |
|---|---|
| 0 | Both error counters are below the Error_Warning limit of 96. |
| 1 | At least one of error counter has reached the Error_Warning limit of 96. |

**Bit 5 – EP** Error Passive

| Value | Description |
|---|---|
| 0 | The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected. |
| 1 | The MCAN is in the Error_Passive state. |

**Bits 4:3 – ACT[1:0]** Activity
Monitors the CAN communication state of the CAN module.

| Value | Name | Description |
|---|---|---|
| 0 | SYNCHRONIZING | Node is synchronizing on CAN communication |
| 1 | IDLE | Node is neither receiver nor transmitter |
| 2 | RECEIVER | Node is operating as receiver |
| 3 | TRANSMITTER | Node is operating as transmitter |

**Bits 2:0 – LEC[2:0]** Last Error Code (set to 111 on read)
The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

| Value | Name | Description |
|---|---|---|
| 0 | NO_ERROR | No error occurred since LEC has been reset by successful reception or transmission. |
| 1 | STUFF_ERROR | More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. |

| Value | Name | Description |
|---|---|---|
| 2 | FORM_ERROR | A fixed format part of a received frame has the wrong format. |
| 3 | ACK_ERROR | The message transmitted by the MCAN was not acknowledged by another node. |
| 4 | BIT1_ERROR | During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value ‘1’), but the monitored bus value was dominant. |
| 5 | BIT0_ERROR | During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value ‘0’), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). |
| 6 | CRC_ERROR | The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data. |
| 7 | NO_CHANGE | Any read access to the Protocol Status Register re-initializes the LEC to ‘7’. When the LEC shows value ‘7’, no CAN bus event was detected since the last processor read access to the Protocol Status Register. |

### 52.6.14 MCAN Transmitter Delay Compensation Register

**Name:** MCAN_TDCR
**Offset:** 0x48
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | TDCO[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | TDCF[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 14:8 – TDCO[6:0]** Transmitter Delay Compensation Offset
0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

**Bits 6:0 – TDCF[6:0]** Transmitter Delay Compensation Filter
0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

### 52.6.15 MCAN Interrupt Register

**Name:** MCAN_IR
**Offset:** 0x50
**Reset:** 0x00000000
**Property:** Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 29 – ARA** Access to Reserved Address

| Value | Description |
|---|---|
| 0 | No access to reserved address occurred |
| 1 | Access to reserved address occurred |

**Bit 28 – PED** Protocol Error in Data Phase

| Value | Description |
|---|---|
| 0 | No protocol error in data phase |
| 1 | Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7) |

**Bit 27 – PEA** Protocol Error in Arbitration Phase

| Value | Description |
|---|---|
| 0 | No protocol error in arbitration phase |
| 1 | Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7) |

**Bit 26 – WDI** Watchdog Interrupt

| Value | Description |
|---|---|
| 0 | No Message RAM Watchdog event occurred. |
| 1 | Message RAM Watchdog event due to missing READY. |

**Bit 25 – BO** Bus_Off Status

| Value | Description |
|---|---|
| 0 | Bus_Off status unchanged. |
| 1 | Bus_Off status changed. |

**Bit 24 – EW** Warning Status

| Value | Description |
|---|---|
| 0 | Error_Warning status unchanged. |
| 1 | Error_Warning status changed. |

**Bit 23 – EP** Error Passive

| Value | Description |
|---|---|
| 0 | Error_Passive status unchanged. |
| 1 | Error_Passive status changed. |

**Bit 22 – ELO** Error Logging Overflow

| Value | Description |
|---|---|
| 0 | CAN Error Logging Counter did not overflow. |
| 1 | Overflow of CAN Error Logging Counter occurred. |

**Bit 19 – DRX** Message stored to Dedicated Receive Buffer
The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

| Value | Description |
|---|---|
| 0 | No Receive Buffer updated. |
| 1 | At least one received message stored into a Receive Buffer. |

**Bit 18 – TOO** Timeout Occurred

| Value | Description |
|---|---|
| 0 | No timeout. |
| 1 | Timeout reached. |

**Bit 17 – MRAF** Message RAM Access Failure
The flag is set, when the Rx Handler

• has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.

• was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.

The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see Restricted Operation Mode). To leave Restricted Operation mode, the processor has to reset MCAN_CCCR.ASM.

| Value | Description |
|---|---|
| 0 | No Message RAM access failure occurred. |
| 1 | Message RAM access failure occurred. |

**Bit 16 – TSW** Timestamp Wraparound

| Value | Description |
|---|---|
| 0 | No timestamp counter wrap-around. |
| 1 | Timestamp counter wrapped around. |

**Bit 15 – TEFL** Tx Event FIFO Element Lost

| Value | Description |
|---|---|
| 0 | No Tx Event FIFO element lost. |
| 1 | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

**Bit 14 – TEFF** Tx Event FIFO Full

| Value | Description |
|---|---|
| 0 | Tx Event FIFO not full. |
| 1 | Tx Event FIFO full. |

**Bit 13 – TEFW** Tx Event FIFO Watermark Reached

| Value | Description |
|---|---|
| 0 | Tx Event FIFO fill level below watermark. |
| 1 | Tx Event FIFO fill level reached watermark. |

**Bit 12 – TEFN** Tx Event FIFO New Entry

| Value | Description |
|---|---|
| 0 | Tx Event FIFO unchanged. |
| 1 | Tx Handler wrote Tx Event FIFO element. |

**Bit 11 – TFE** Tx FIFO Empty

| Value | Description |
|---|---|
| 0 | Tx FIFO non-empty. |
| 1 | Tx FIFO empty. |

**Bit 10 – TCF** Transmission Cancellation Finished

| Value | Description |
|---|---|
| 0 | No transmission cancellation finished. |
| 1 | Transmission cancellation finished. |

**Bit 9 – TC** Transmission Completed

| Value | Description |
|---|---|
| 0 | No transmission completed. |
| 1 | Transmission completed. |

**Bit 8 – HPM** High Priority Message

| Value | Description |
|---|---|
| 0 | No high priority message received. |
| 1 | High priority message received. |

**Bit 7 – RF1L** Receive FIFO 1 Message Lost

| Value | Description |
|---|---|
| 0 | No Receive FIFO 1 message lost. |
| 1 | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

**Bit 6 – RF1F** Receive FIFO 1 Full

| Value | Description |
|---|---|
| 0 | Receive FIFO 1 not full. |
| 1 | Receive FIFO 1 full. |

**Bit 5 – RF1W** Receive FIFO 1 Watermark Reached

| Value | Description |
|---|---|
| 0 | Receive FIFO 1 fill level below watermark. |
| 1 | Receive FIFO 1 fill level reached watermark. |

**Bit 4 – RF1N** Receive FIFO 1 New Message

| Value | Description |
|---|---|
| 0 | No new message written to Receive FIFO 1. |
| 1 | New message written to Receive FIFO 1. |

**Bit 3 – RF0L** Receive FIFO 0 Message Lost

| Value | Description |
|---|---|
| 0 | No Receive FIFO 0 message lost. |
| 1 | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero. |

**Bit 2 – RF0F** Receive FIFO 0 Full

| Value | Description |
|---|---|
| 0 | Receive FIFO 0 not full. |
| 1 | Receive FIFO 0 full. |

**Bit 1 – RF0W** Receive FIFO 0 Watermark Reached

| Value | Description |
|---|---|
| 0 | Receive FIFO 0 fill level below watermark. |
| 1 | Receive FIFO 0 fill level reached watermark. |

**Bit 0 – RF0N** Receive FIFO 0 New Message

| Value | Description |
|---|---|
| 0 | No new message written to Receive FIFO 0. |
| 1 | New message written to Receive FIFO 0. |

### 52.6.16 MCAN Interrupt Enable Register

**Name:** MCAN_IE
**Offset:** 0x54
**Reset:** 0x00000000
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 2 – RF0FE** Receive FIFO 0 Full Interrupt Enable

**Bit 1 – RF0WE** Receive FIFO 0 Watermark Reached Interrupt Enable

**Bit 0 – RF0NE** Receive FIFO 0 New Message Interrupt Enable

### 52.6.17 MCAN Interrupt Line Select Register

**Name:** MCAN_ILS
**Offset:** 0x58
**Reset:** 0x00000000
**Property:** Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN_INT0.

1: Interrupt assigned to interrupt line MCAN_INT1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bit 12 – TEFNL** Tx Event FIFO New Entry Interrupt Line

**Bit 11 – TFEL** Tx FIFO Empty Interrupt Line

**Bit 10 – TCFL** Transmission Cancellation Finished Interrupt Line

**Bit 9 – TCL** Transmission Completed Interrupt Line

**Bit 8 – HPML** High Priority Message Interrupt Line

**Bit 7 – RF1LL** Receive FIFO 1 Message Lost Interrupt Line

**Bit 6 – RF1FL** Receive FIFO 1 Full Interrupt Line

**Bit 5 – RF1WL** Receive FIFO 1 Watermark Reached Interrupt Line

**Bit 4 – RF1NL** Receive FIFO 1 New Message Interrupt Line

**Bit 3 – RF0LL** Receive FIFO 0 Message Lost Interrupt Line

**Bit 2 – RF0FL** Receive FIFO 0 Full Interrupt Line

**Bit 1 – RF0WL** Receive FIFO 0 Watermark Reached Interrupt Line

**Bit 0 – RF0NL** Receive FIFO 0 New Message Interrupt Line

### 52.6.18 MCAN Interrupt Line Enable

**Name:** MCAN_ILE
**Offset:** 0x5C
**Reset:** 0x00000000
**Property:** Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | EINT1 | EINT0 |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – EINT1** Enable Interrupt Line 1

| Value | Description |
|---|---|
| 0 | Interrupt line MCAN_INT1 disabled. |
| 1 | Interrupt line MCAN_INT1 enabled. |

**Bit 0 – EINT0** Enable Interrupt Line 0

| Value | Description |
|---|---|
| 0 | Interrupt line MCAN_INT0 disabled. |
| 1 | Interrupt line MCAN_INT0 enabled. |

### 52.6.19 MCAN Global Filter Configuration

**Name:** MCAN_GFC
**Offset:** 0x80
**Reset:** 0x00000000
**Property:** Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in Standard Message ID Filter Path and Extended Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | ANFS[1:0] | | ANFE[1:0] | | RRFS | RRFE |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 5:4 – ANFS[1:0]** Accept Non-matching Frames Standard
Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

| Value | Name | Description |
|---|---|---|
| 0 | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1 | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2-3 | REJECTED | Message rejected |

**Bits 3:2 – ANFE[1:0]** Accept Non-matching Frames Extended
Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

| Value | Name | Description |
|---|---|---|
| 0 | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1 | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2-3 | REJECTED | Message rejected |

**Bit 1 – RRFS** Reject Remote Frames Standard
0 (FILTER): Filter remote frames with 11-bit standard IDs.

1 (REJECT): Reject all remote frames with 11-bit standard IDs.

**Bit 0 – RRFE** Reject Remote Frames Extended
0 (FILTER): Filter remote frames with 29-bit extended IDs.

1 (REJECT): Reject all remote frames with 29-bit extended IDs.

### 52.6.20 MCAN Standard ID Filter Configuration

**Name:** MCAN_SIDFC
**Offset:** 0x84
**Reset:** 0x00000000
**Property:** Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in Standard Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | LSS[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | FLSSA[13:6] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FLSSA[5:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

**Bits 23:16 – LSS[7:0]** List Size Standard
>128: Values greater than 128 are interpreted as 128.

| Value | Description |
|---|---|
| 0 | No standard Message ID filter. |
| 1-128 | Number of standard Message ID filter elements. |

**Bits 15:2 – FLSSA[13:0]** Filter List Standard Start Address
Start address of standard Message ID filter list (32-bit word address, see Message RAM Configuration).

Write FLSSA with the bits [15:2] of the 32-bit address.

### 52.6.21 MCAN Extended ID Filter Configuration

**Name:** MCAN_XIDFC
**Offset:** 0x88
**Reset:** 0x00000000
**Property:** Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in Extended Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | LSE[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | FLESA[13:6] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FLESA[5:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

**Bits 22:16 – LSE[6:0]** List Size Extended

| Value | Description |
|---|---|
| 0 | No extended Message ID filter. |
| 1-64 | Number of extended Message ID filter elements. |
| >64 | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – FLESA[13:0]** Filter List Extended Start Address
Start address of extended Message ID filter list (32-bit word address, see Message RAM Configuration).

Write FLESA with the bits [15:2] of the 32-bit address.

### 52.6.22 MCAN Extended ID AND Mask

**Name:** MCAN_XIDAM
**Offset:** 0x90
**Reset:** 0x1FFFFFFF
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | EIDM[28:24] | | | | |
| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 1 | 1 | 1 | 1 | 1 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | EIDM[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | EIDM[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | EIDM[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Bits 28:0 – EIDM[28:0]** Extended ID Mask
For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

### 52.6.23 MCAN High Priority Message Status

**Name:** MCAN_HPMS
**Offset:** 0x94
**Reset:** 0x00000000
**Property:** Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | FLST | FIDX[6:0] | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | MSI[1:0] | | BIDX[5:0] | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – FLST** Filter List
Indicates the filter list of the matching filter element.

| Value | Description |
|---|---|
| 0 | Standard filter list |
| 1 | Extended filter list |

**Bits 14:8 – FIDX[6:0]** Filter Index
Index of matching filter element. Range is 0 to MCAN_SIDFC.LSS - 1 resp. MCAN_XIDFC.LSE - 1.

**Bits 7:6 – MSI[1:0]** Message Storage Indicator

| Value | Name | Description |
|---|---|---|
| 0 | NO_FIFO_SEL | No FIFO selected. |
| 1 | LOST | FIFO message lost. |
| 2 | FIFO_0 | Message stored in FIFO 0. |
| 3 | FIFO_1 | Message stored in FIFO 1. |

**Bits 5:0 – BIDX[5:0]** Buffer Index
Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = ‘1’.

### 52.6.24 MCAN New Data 1

**Name:** MCAN_NDAT1
**Offset:** 0x98
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ND31 | ND30 | ND29 | ND28 | ND27 | ND26 | ND25 | ND24 |

|---|---|---|---|---|---|---|---|---|
| | ND7 | ND6 | ND5 | ND4 | ND3 | ND2 | ND1 | ND0 |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx** New Data
The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a ‘1’ to the corresponding bit position. Writing a ‘0’ has no effect. A hard reset will clear the register.

| Value | Description |
|---|---|
| 0 | Receive Buffer not updated |
| 1 | Receive Buffer updated from new message |

### 52.6.25 MCAN New Data 2

**Name:** MCAN_NDAT2
**Offset:** 0x9C
**Reset:** 0x00000000
**Property:** Read/Write

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx** New Data
The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a ‘1’ to the corresponding bit position. Writing a ‘0’ has no effect. A hard reset will clear the register.

| Value | Description |
|---|---|
| 0 | Receive Buffer not updated. |
| 1 | Receive Buffer updated from new message. |

### 52.6.26 MCAN Receive FIFO 0 Configuration

**Name:** MCAN_RXF0C
**Offset:** 0xA0
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | F0OM | F0WM[6:0] | | | | | | |

**Bit 31 – F0OM** FIFO 0 Operation Mode
FIFO 0 can be operated in Blocking or in Overwrite mode (see Rx FIFOs).

| Value | Description |
|---|---|
| 0 | FIFO 0 Blocking mode. |
| 1 | FIFO 0 Overwrite mode. |

**Bits 30:24 – F0WM[6:0]** Receive FIFO 0 Watermark

| Value | Description |
|---|---|
| 0 | Watermark interrupt disabled. |
| 1-64 | Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W). |
| >64 | Watermark interrupt disabled. |

**Bits 22:16 – F0S[6:0]** Receive FIFO 0 Size
The Receive FIFO 0 elements are indexed from 0 to F0S-1.

| Value | Description |
|---|---|
| 0 | No Receive FIFO 0 |
| 1-64 | Number of Receive FIFO 0 elements. |
| >64 | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – F0SA[13:0]** Receive FIFO 0 Start Address
Start address of Receive FIFO 0 in Message RAM (32-bit word address, see Message RAM Configuration).

Write F0SA with the bits [15:2] of the 32-bit address.

### 52.6.27 MCAN Receive FIFO 0 Status

**Name:** MCAN_RXF0S
**Offset:** 0xA4
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | RF0L | F0F |
| Access | | | | | | | R | R |

| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 25 – RF0L** Receive FIFO 0 Message Lost
This bit is a copy of interrupt flag MCAN_IR.RF0L. When MCAN_IR.RF0L is reset, this bit is also reset.

Overwriting the oldest message when MCAN_RXF0C.F0OM = ‘1’ will not set this flag.

| Value | Description |
|---|---|
| 0 | No Receive FIFO 0 message lost |
| 1 | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero |

**Bit 24 – F0F** Receive FIFO 0 Full

| Value | Description |
|---|---|
| 0 | Receive FIFO 0 not full. |
| 1 | Receive FIFO 0 full. |

**Bits 21:16 – F0PI[5:0]** Receive FIFO 0 Put Index
Receive FIFO 0 write index pointer, range 0 to 63.

**Bits 13:8 – F0GI[5:0]** Receive FIFO 0 Get Index
Receive FIFO 0 read index pointer, range 0 to 63.

**Bits 6:0 – F0FL[6:0]** Receive FIFO 0 Fill Level
Number of elements stored in Receive FIFO 0, range 0 to 64.

### 52.6.28 MCAN Receive FIFO 0 Acknowledge

**Name:** MCAN_RXF0A
**Offset:** 0xA8
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | F0AI[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 5:0 – F0AI[5:0]** Receive FIFO 0 Acknowledge Index
After the processor has read a message or a sequence of messages from Receive FIFO 0 it has to write the buffer index of the last element read from Receive FIFO 0 to F0AI. This will set the Receive FIFO 0 Get Index MCAN_RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MCAN_RXF0S.F0FL.

### 52.6.29 MCAN Receive Buffer Configuration

**Name:** MCAN_RXBC
**Offset:** 0xAC
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | F1SA[5:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

**Bit 31 – F1OM** FIFO 1 Operation Mode
FIFO 1 can be operated in Blocking or in Overwrite mode (see Rx FIFOs).

| Value | Description |
|---|---|
| 0 | FIFO 1 Blocking mode. |
| 1 | FIFO 1 Overwrite mode. |

**Bits 30:24 – F1WM[6:0]** Receive FIFO 1 Watermark

| Value | Description |
|---|---|
| 0 | Watermark interrupt disabled |
| 1-64 | Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W). |
| >64 | Watermark interrupt disabled. |

**Bits 22:16 – F1S[6:0]** Receive FIFO 1 Size
The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

| Value | Description |
|---|---|
| 0 | No Receive FIFO 1 |
| 1-64 | Number of elements in Receive FIFO 1. |
| >64 | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – F1SA[13:0]** Receive FIFO 1 Start Address
Start address of Receive FIFO 1 in Message RAM (32-bit word address, see Message RAM Configuration).

Write F1SA with the bits [15:2] of the 32-bit address.

### 52.6.31 MCAN Receive FIFO 1 Status

**Name:** MCAN_RXF1S
**Offset:** 0xB4
**Reset:** 0x00000000
**Property:** Read-only

| Access | | R | R | R | R | R | R | R |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:30 – DMS[1:0]** Debug Message Status

| Value | Name | Description |
|---|---|---|
| 0 | IDLE | Idle state, wait for reception of debug messages, DMA request is cleared. |
| 1 | MSG_A | Debug message A received. |
| 2 | MSG_AB | Debug messages A, B received. |
| 3 | MSG_ABC | Debug messages A, B, C received, DMA request is set. |

**Bit 25 – RF1L** Receive FIFO 1 Message Lost
This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset.

Overwriting the oldest message when MCAN_RXF1C.F1OM = ‘1’ will not set this flag.

| Value | Description |
|---|---|
| 0 | No Receive FIFO 1 message lost. |
| 1 | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

**Bit 24 – F1F** Receive FIFO 1 Full

| Value | Description |
|---|---|
| 0 | Receive FIFO 1 not full. |
| 1 | Receive FIFO 1 full. |

**Bits 21:16 – F1PI[5:0]** Receive FIFO 1 Put Index
Receive FIFO 1 write index pointer, range 0 to 63.

**Bits 13:8 – F1GI[5:0]** Receive FIFO 1 Get Index
Receive FIFO 1 read index pointer, range 0 to 63.

**Bits 6:0 – F1FL[6:0]** Receive FIFO 1 Fill Level
Number of elements stored in Receive FIFO 1, range 0 to 64.

### 52.6.32 MCAN Receive FIFO 1 Acknowledge

**Name:** MCAN_RXF1A
**Offset:** 0xB8
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 5:0 – F1AI[5:0]** Receive FIFO 1 Acknowledge Index
After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN_RXF1S.F1FL.

### 52.6.33 MCAN Receive Buffer / FIFO Element Size Configuration

**Name:** MCAN_RXESC
**Offset:** 0xBC
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

| Reset | | R/W | R/W | R/W | | R/W | R/W | R/W |
| | | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 10:8 – RBDS[2:0]** Receive Buffer Data Field Size

| Value | Name | Description |
|---|---|---|
| 0 | 8_BYTE | 8-byte data field |
| 1 | 12_BYTE | 12-byte data field |
| 2 | 16_BYTE | 16-byte data field |
| 3 | 20_BYTE | 20-byte data field |
| 4 | 24_BYTE | 24-byte data field |
| 5 | 32_BYTE | 32-byte data field |
| 6 | 48_BYTE | 48-byte data field |
| 7 | 64_BYTE | 64-byte data field |

**Bits 6:4 – F1DS[2:0]** Receive FIFO 1 Data Field Size

| Value | Name | Description |
|---|---|---|
| 0 | 8_BYTE | 8-byte data field |
| 1 | 12_BYTE | 12-byte data field |
| 2 | 16_BYTE | 16-byte data field |
| 3 | 20_BYTE | 20-byte data field |
| 4 | 24_BYTE | 24-byte data field |
| 5 | 32_BYTE | 32-byte data field |
| 6 | 48_BYTE | 48-byte data field |
| 7 | 64_BYTE | 64-byte data field |

**Bits 2:0 – F0DS[2:0]** Receive FIFO 0 Data Field Size

| Value | Name | Description |
|---|---|---|
| 0 | 8_BYTE | 8-byte data field |
| 1 | 12_BYTE | 12-byte data field |
| 2 | 16_BYTE | 16-byte data field |
| 3 | 20_BYTE | 20-byte data field |
| 4 | 24_BYTE | 24-byte data field |
| 5 | 32_BYTE | 32-byte data field |
| 6 | 48_BYTE | 48-byte data field |
| 7 | 64_BYTE | 64-byte data field |

### 52.6.34 MCAN Tx Buffer Configuration

**Name:** MCAN_TXBC
**Offset:** 0xC0
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | TFQM | TFQS[5:0] | | | | | |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | |

**Bit 30 – TFQM** Tx FIFO/Queue Mode

| Value | Description |
|---|---|
| 0 | Tx FIFO operation. |
| 1 | Tx Queue operation. |

**Bits 29:24 – TFQS[5:0]** Transmit FIFO/Queue Size

| Value | Description |
|---|---|
| 0 | No Tx FIFO/Queue. |
| 1-32 | Number of Tx Buffers used for Tx FIFO/Queue. |
| >32 | Values greater than 32 are interpreted as 32. |

**Bits 21:16 – NDTB[5:0]** Number of Dedicated Transmit Buffers

| Value | Description |
|---|---|
| 0 | No dedicated Tx Buffers. |
| 1-32 | Number of dedicated Tx Buffers. |
| >32 | Values greater than 32 are interpreted as 32. |

**Bits 15:2 – TBSA[13:0]** Tx Buffers Start Address
Start address of Tx Buffers section in Message RAM (32-bit word address, see Message RAM Configuration).

Write TBSA with the bits [15:2] of the 32-bit address.

### 52.6.35 MCAN Tx FIFO/Queue Status

**Name:** MCAN_TXFQS
**Offset:** 0xC4
**Reset:** 0x00000000
**Property:** Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers. Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 21 – TFQF** Tx FIFO/Queue Full

| Value | Description |
|---|---|
| 0 | Tx FIFO/Queue not full. |
| 1 | Tx FIFO/Queue full. |

**Bits 20:16 – TFQPI[4:0]** Tx FIFO/Queue Put Index
Tx FIFO/Queue write index pointer, range 0 to 31.

**Bits 12:8 – TFGI[4:0]** Tx FIFO Get Index
Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN_TXBC.TFQM = ‘1’).

**Bits 5:0 – TFFL[5:0]** Tx FIFO Free Level
Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN_TXBC.TFQM = ‘1’).

### 52.6.36 MCAN Tx Buffer Element Size Configuration

**Name:** MCAN_TXESC
**Offset:** 0xC8
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as “0xCC” (padding bytes).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

### 52.6.37 MCAN Transmit Buffer Request Pending

**Name:** MCAN_TXBRP
**Offset:** 0xCC
**Reset:** 0x00000000
**Property:** Read-only

MCAN_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN_TXBRP bit is reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx** Transmission Request Pending for Buffer x
Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN_TXBCR.

TXBRP bits are set only for those Tx Buffers configured via MCAN_TXBC. After a MCAN_TXBRP bit has been set, a Tx scan (see Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

A cancellation request resets the corresponding transmission request pending bit of register MCAN_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signalled via MCAN_TXBCF.

- after successful transmission together with the corresponding MCAN_TXBTO bit.
- when the transmission has not yet been started at the point of cancellation.

• when the transmission has been aborted due to lost arbitration.

• when an error occurred during frame transmission.

In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN_TXBCF bit is set for all unsuccessful transmissions.

| Value | Description |
|---|---|
| 0 | No transmission request pending |
| 1 | Transmission request pending |

### 52.6.38 MCAN Transmit Buffer Add Request

**Name:** MCAN_TXBAR
**Offset:** 0xD0
**Reset:** 0x00000000
**Property:** Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN_TXBRP bit already set), this Add Request is ignored.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx** Add Request for Transmit Buffer x
Each Transmit Buffer has its own Add Request bit. Writing a ‘1’ will set the corresponding Add Request bit; writing a ‘0’ has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN_TXBAR. MCAN_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

| Value | Description |
|---|---|
| 0 | No transmission request added. |
| 1 | Transmission requested added. |

**Bit 25 – TEFL** Tx Event FIFO Element Lost
This bit is a copy of interrupt flag MCAN_IR.TEFL. When MCAN_IR.TEFL is reset, this bit is also reset.

| Value | Description |
|---|---|
| 0 | No Tx Event FIFO element lost. |
| 1 | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

**Bit 24 – EFF** Event FIFO Full

| Value | Description |
|---|---|
| 0 | Tx Event FIFO not full. |
| 1 | Tx Event FIFO full. |

**Bits 20:16 – EFPI[4:0]** Event FIFO Put Index
Tx Event FIFO write index pointer, range 0 to 31.

**Bits 12:8 – EFGI[4:0]** Event FIFO Get Index
Tx Event FIFO read index pointer, range 0 to 31.

**Bits 5:0 – EFFL[5:0]** Event FIFO Fill Level
Number of elements stored in Tx Event FIFO, range 0 to 32.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | EFAI[4:0] | | | | |
| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

**Bits 4:0 – EFAI[4:0]** Event FIFO Acknowledge Index
After the processor has read an element or a sequence of elements from the Tx Event FIFO, it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCAN_TXEFS.EFGI to EFAI + 1 and update the FIFO 0 Fill Level MCAN_TXEFS.EFFL.

# 53. Timer Counter (TC)

## 53.1 Description

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC_BMR)—defines the external clock inputs for each channel, allowing them to be chained

## 53.2 Embedded Characteristics

- Total of 6 Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse Width Modulation
  - Up/down capabilities
  - Quadrature decoder
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five Internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Internal Interrupt Signal

- Read of the Capture Registers by the DMAC
- Compare Event Fault Generation for PWM
- Register Write Protection

## 53.3 Block Diagram

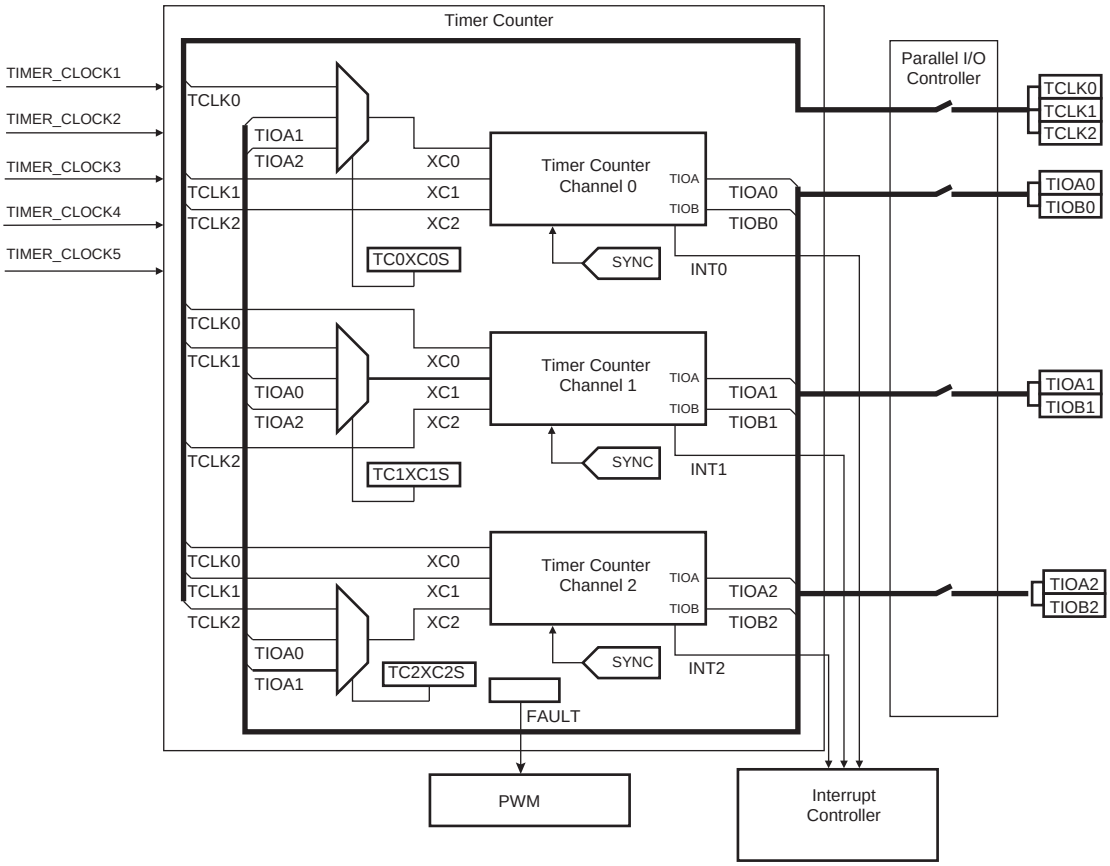
**Table 53-1. Timer Counter Clock Assignment**

| Name | Definition |
|---|---|
| TIMER_CLOCK1 | GCLK[35], GCLK[36] |
| TIMER_CLOCK2 | System bus clock divided by 8 |
| TIMER_CLOCK3 | System bus clock divided by 32 |
| TIMER_CLOCK4 | System bus clock divided by 128 |
| TIMER_CLOCK5 (See Notes) | slow_clock |

**Note:**

1. The GCLK frequency must be at least three times lower than peripheral clock frequency.

**Figure 53-1. Timer Counter Block Diagram**



**Note:**
The QDEC connections are detailed in Figure 53-17.

**Table 53-2. Channel Signal Description**

| Signal Name | Description |
|---|---|
| XC0, XC1, XC2 | External Clock Inputs |
| TIOAx | Capture Mode: Timer Counter Input<br>Waveform Mode: Timer Counter Output |
| TIOBx | Capture Mode: Timer Counter Input<br>Waveform Mode: Timer Counter Input/Output |
| INT | Interrupt Signal Output (internal signal) |
| SYNC | Synchronization Input Signal (from configuration register) |

## 53.4 Pin List

**Table 53-3. Pin List**

| Pin Name | Description | Type |
|---|---|---|
| TCLK0–TCLK2 | External Clock Input | Input |
| TIOA0–TIOA2 | I/O Line A | I/O |
| TIOB0–TIOB2 | I/O Line B | I/O |

## 53.5 Product Dependencies

### 53.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

### 53.5.2 Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

### 53.5.3 Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

### 53.5.4 Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. Refer to “Synchronization with PWM” and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 53.5.5 Fault Output

The TC has the FAULT output internally connected to the fault input of PWM. Refer to “Fault Mode” and to the implementation of the Pulse Width Modulation (PWM) in this product.

## 53.6 Functional Description

### 53.6.1 Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in 53.7 Register Summary.

### 53.6.2 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value $2^{32}$-1 and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

### 53.6.3 Clock Selection

At block level, input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining(1) by programming the Block Mode register (TC_BMR). See Clock Chaining Selection.

Each channel can independently select an internal or external clock source for its counter(2):

- External clock signals: XC0, XC1 or XC2
- Internal clock signals: GCLK[35], GCLK[36], System bus clock divided by 8, System bus clock divided by 32, System bus clock divided by 128, slow_clock

This selection is made by the TCCLKS bits in the Channel Mode register (TC_CMRx).

The selected clock can be inverted with TC_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC_CMRx defines this signal (none, XC0, XC1, XC2). See Clock Selection.

**Note:**

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
   – Configure TIOx outputs to 1 or 0 by writing the required value to TC_CMRx.ASWTRG.
   – Bit TC_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

**Figure 53-2. Clock Chaining Selection**

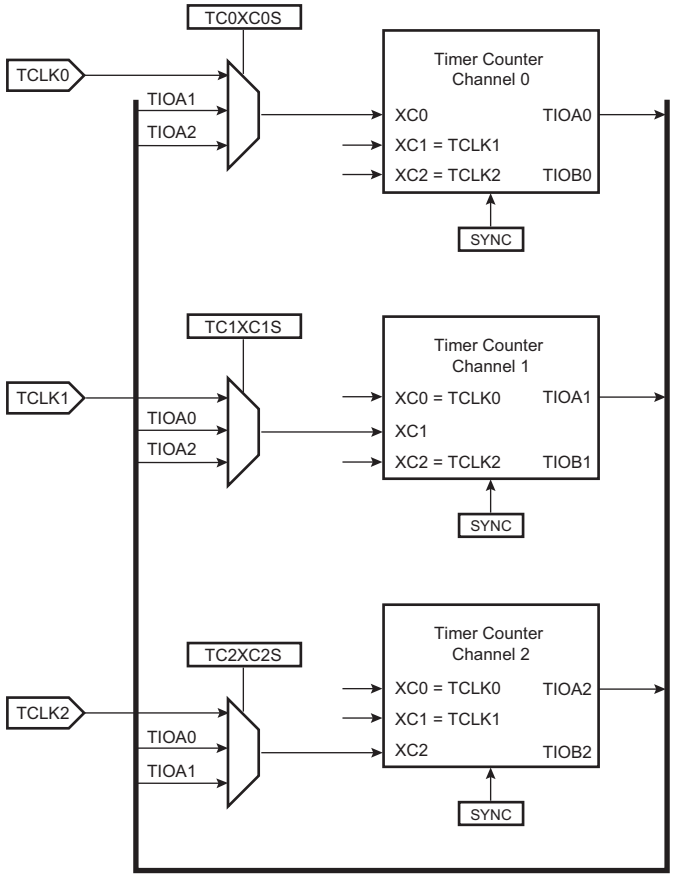


**Figure 53-3. Clock Selection**

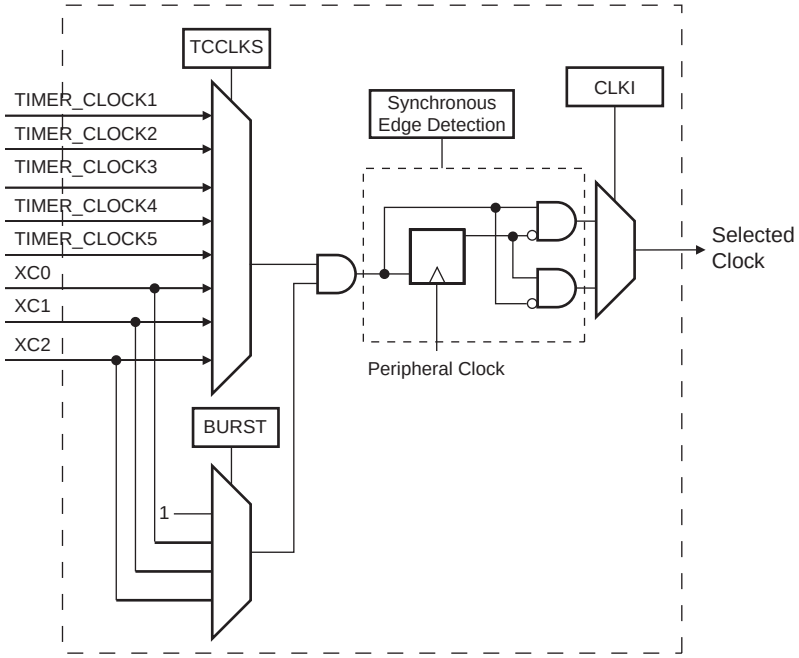
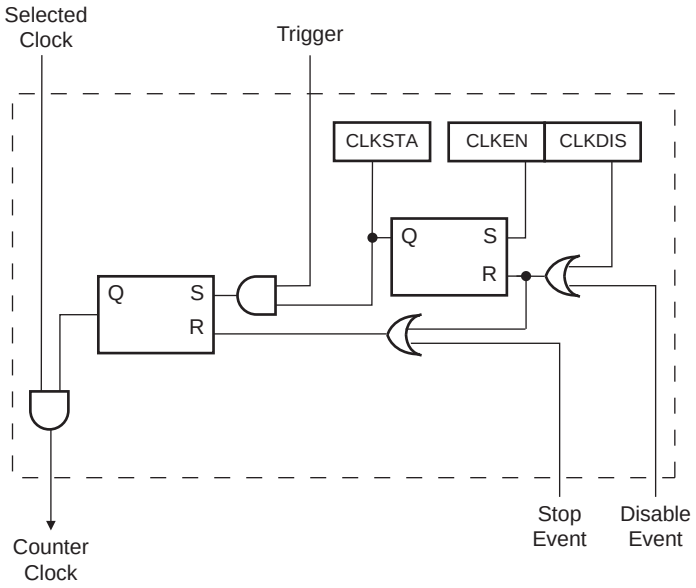


### 53.6.4 Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC_CCR). In Capture mode it can be disabled by an RB load event if TC_CMRx.LDBDIS is set to ‘1’. In Waveform mode, it can be disabled by an RC Compare event if TC_CMRx.CPCDIS is set to ‘1’. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC_CCR can reenable the clock. When the clock is enabled, TC_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

**Figure 53-4. Clock Control**



### 53.6.5 Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

### 53.6.6 Trigger

A trigger resets the counter and starts the counter clock. Three types of triggers are common to both modes, and a fourth external trigger is available to each mode.

Regardless of the trigger used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger, especially when a low frequency signal is selected as the clock.

The following triggers are common to both modes:

- Software Trigger: Each channel has a software trigger, available by setting TC_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC_BCR with SYNC set.
- Compare RC Trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC_CMRx.CPCTRG is set .

The channel can also be configured to have an external trigger. In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx. In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC_CMRx.ENETRG.

If an external trigger is used, the duration of the pulses must be longer than the peripheral clock period in order to be detected.

### 53.6.7 Capture Mode

Capture mode is entered by clearing TC_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

Figure 53-6 shows the configuration of the TC channel when programmed in Capture mode.

### 53.6.8 Capture Registers A and B

Registers A and B (TC_RA and TC_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC_CMRx.LDRA defines the TIOAx selected edge for the loading of TC_RA, and TC_CMRx.LDRB defines the TIOAx selected edge for the loading of TC_RB.

The subsampling ratio defined by TC_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC_RA is loaded only if it has not been loaded since the last trigger or if TC_RB has been loaded since the last loading of TC_RA.

TC_RB is loaded only if TC_RA has been loaded since the last trigger or the last loading of TC_RB.

Loading TC_RA or TC_RB before the read of the last value loaded sets TC_SR.LOVRS. In this case, the old value is overwritten.

When DMA is used, the Register AB (TC_RAB) address must be configured as source address of the transfer. TC_RAB provides the next unread value from TC_RA and TC_RB. It may be read by the DMA after a request has been triggered upon loading TC_RA or TC_RB.

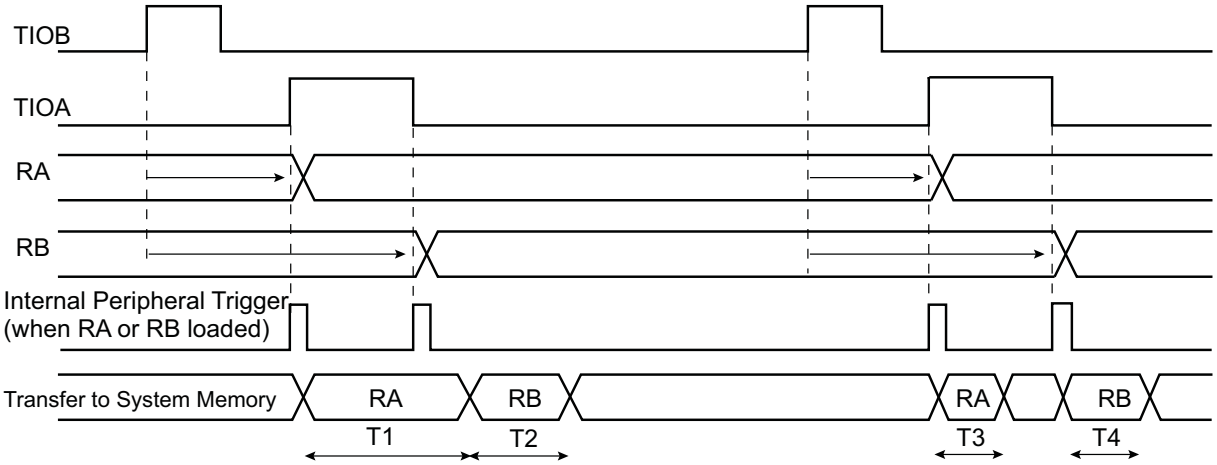
### 53.6.9 Transfer with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC_RA and TC_RB can be loaded in the system memory without processor intervention.

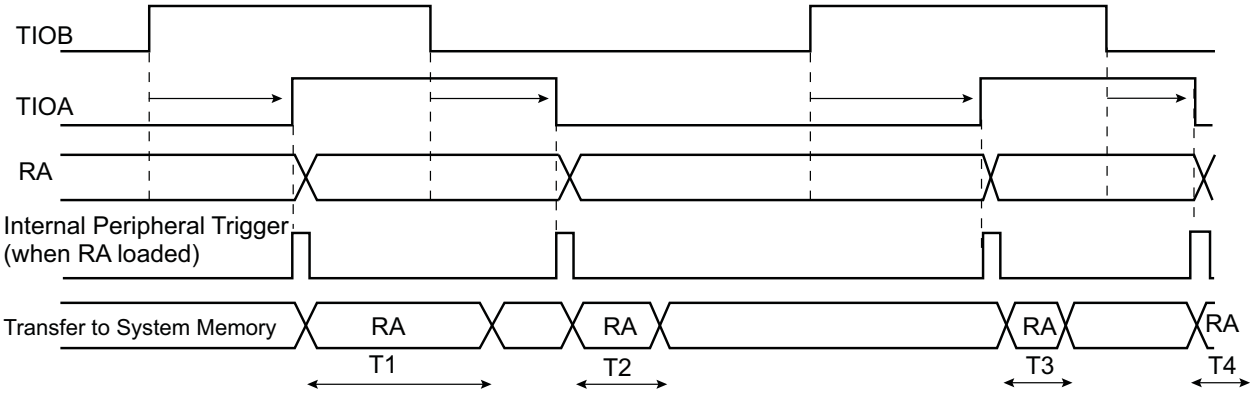
**Figure 53-5. Example of Transfer with DMAC in Capture Mode**

ETRGEDG = 1, LDRA = 1, LDRB = 2, ABETRG = 0



T1,T2,T3,T4 = System Bus load dependent ($t_{min}$ = 8 Peripheral Clocks)

ETRGEDG = 3, LDRA = 3, LDRB = 0, ABETRG = 0



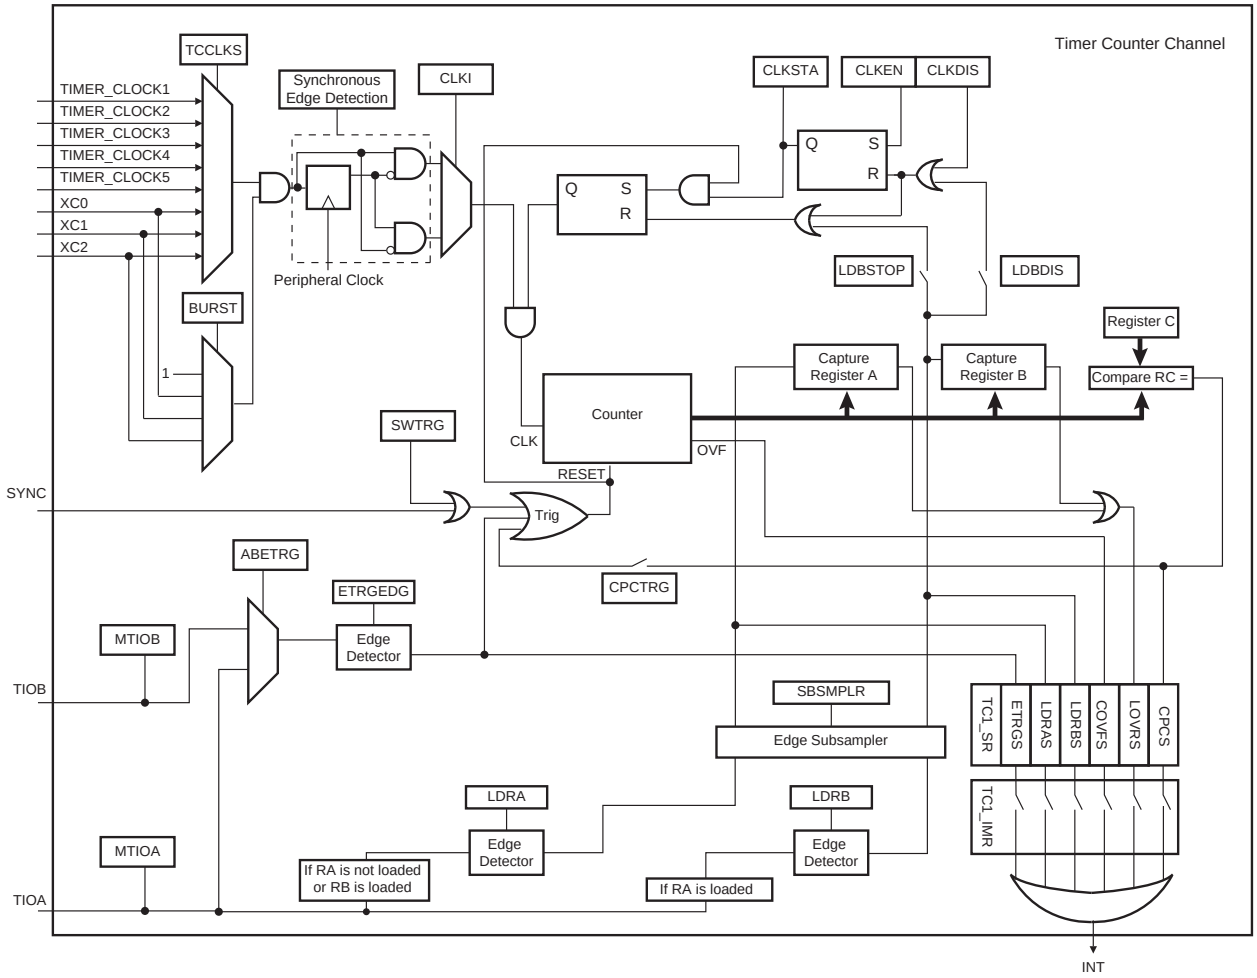
T1,T2,T3,T4 = System Bus load dependent ($t_{min}$ = 8 Peripheral Clocks)

### 53.6.10 Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC_CMR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC_CMR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

**Figure 53-6. Capture Mode**



### 53.6.11 Waveform Mode

Waveform mode is entered by setting the TC_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC_CMR).

Waveform Mode shows the configuration of the TC channel when programmed in Waveform operating mode.

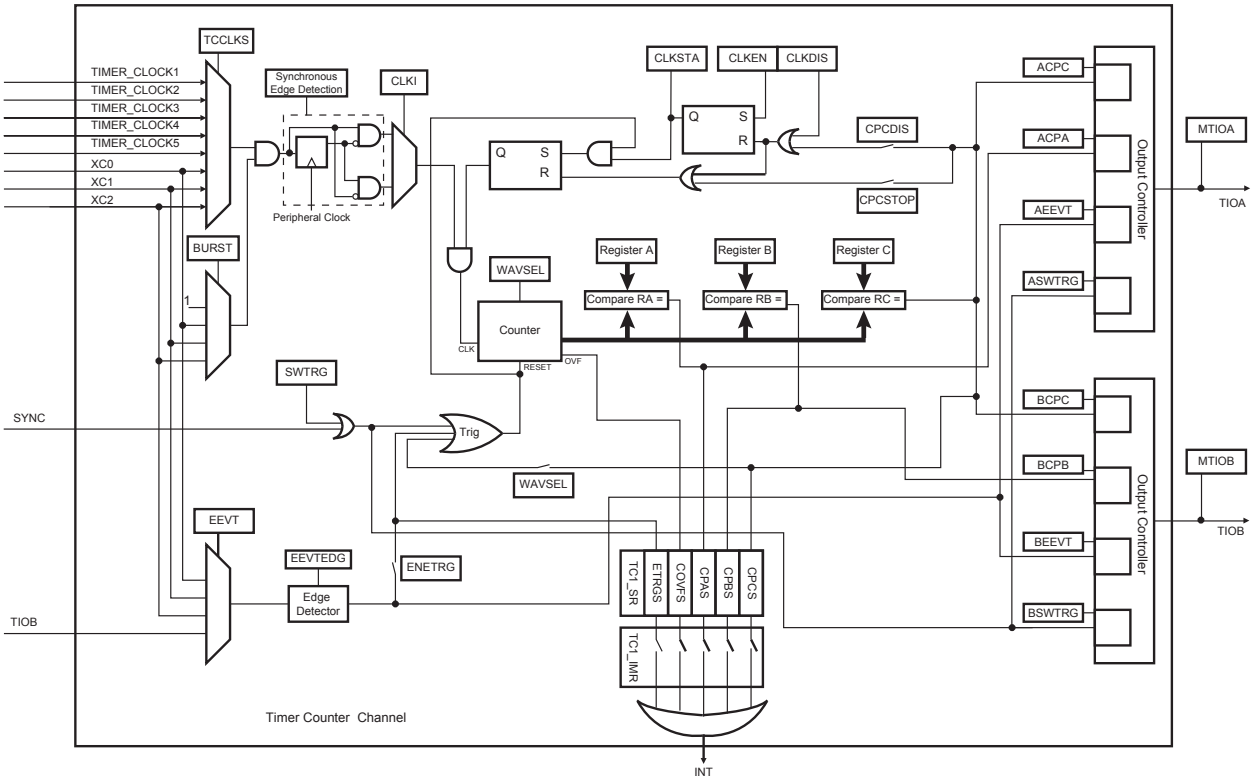
### 53.6.12 Waveform Selection

Depending on the WAVSEL parameter in TC_CMR, the behavior of TC_CV varies.

With any selection, TC_RA, TC_RB and TC_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

**Figure 53-7. Waveform Mode**



### 53.6.12.1 WAVSEL = 00

When WAVSEL = 00, the value of TC_CV is incremented from 0 to $2^{32}$-1. Once $2^{32}$-1 has been reached, the value of TC_CV is reset. Incrementation of TC_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC_CV. It is important to note that the trigger may occur at any time.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC_CMR) and/or disable the counter clock (CPCDIS = 1 in TC_CMR).

**Figure 53-8. WAVSEL = 00 without Trigger**

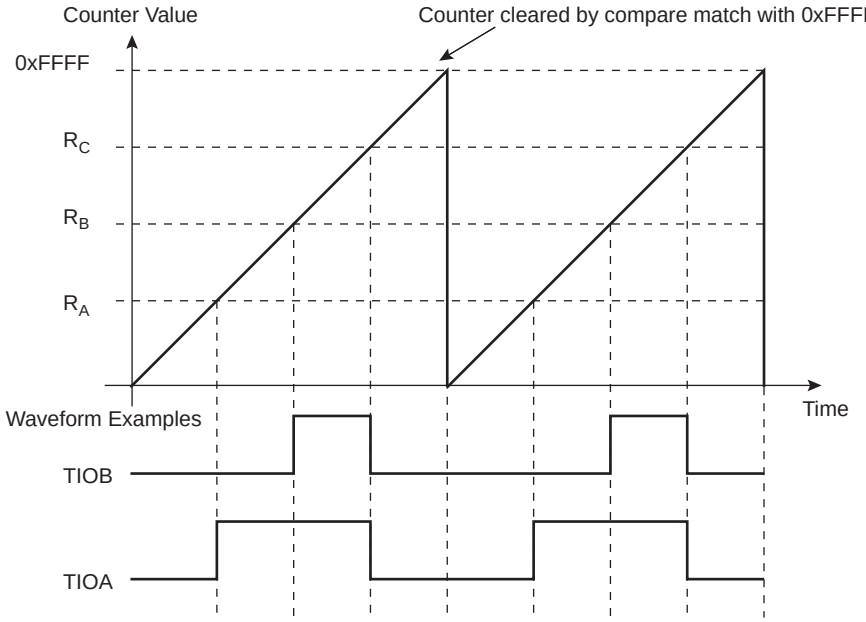


**Figure 53-9. WAVSEL = 00 with Trigger**

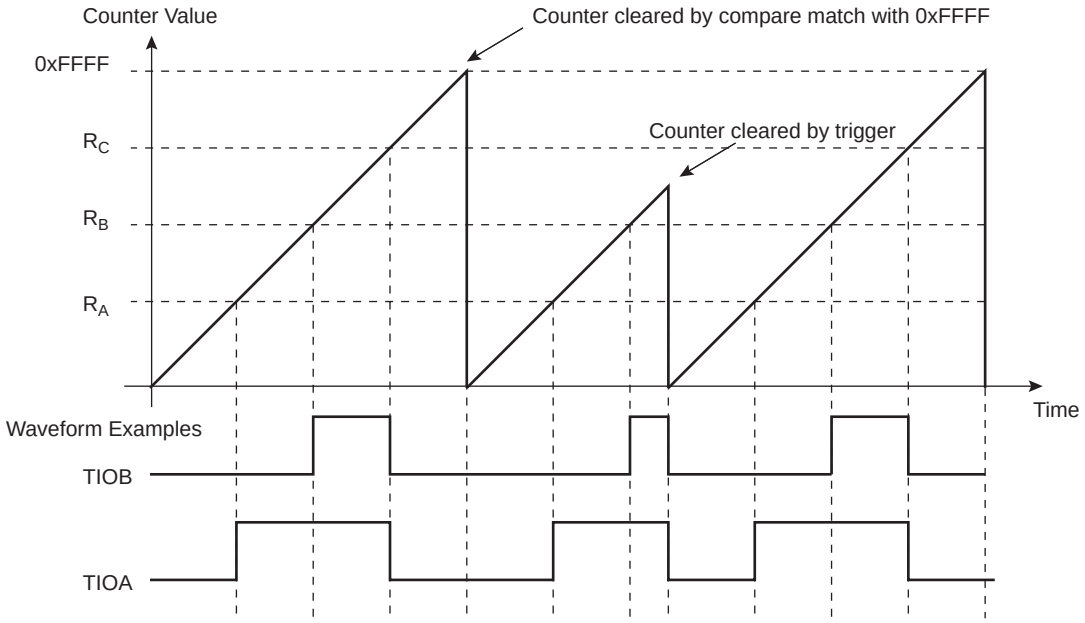

#### 53.6.12.2 WAVSEL = 10

When WAVSEL = 10, the value of TC_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC_CV has been reset, it is then incremented and so on.

It is important to note that TC_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

Refer to the figures below.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC_CMR) and/or disable the counter clock (CPCDIS = 1 in TC_CMR).

**Figure 53-10. WAVSEL = 10 without Trigger**

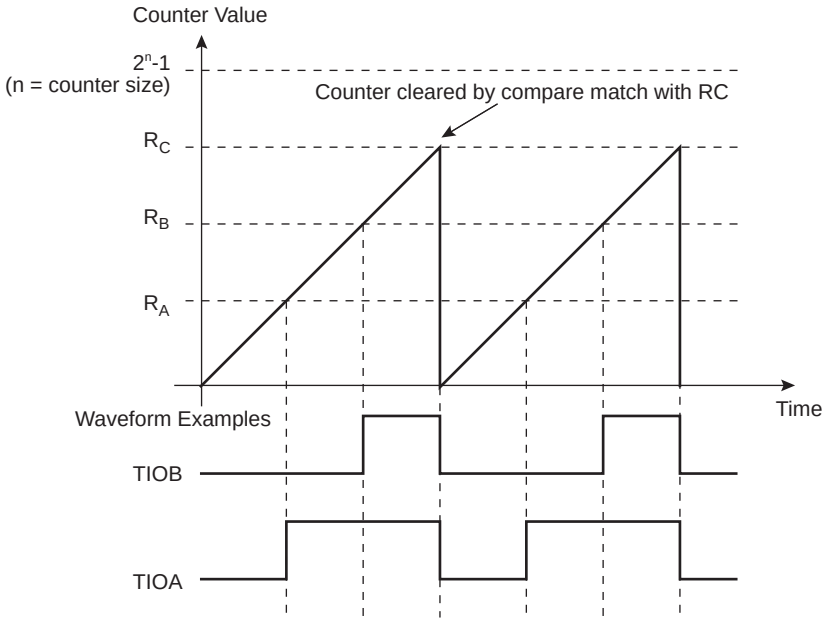

**Figure 53-11. WAVSEL = 10 with Trigger**

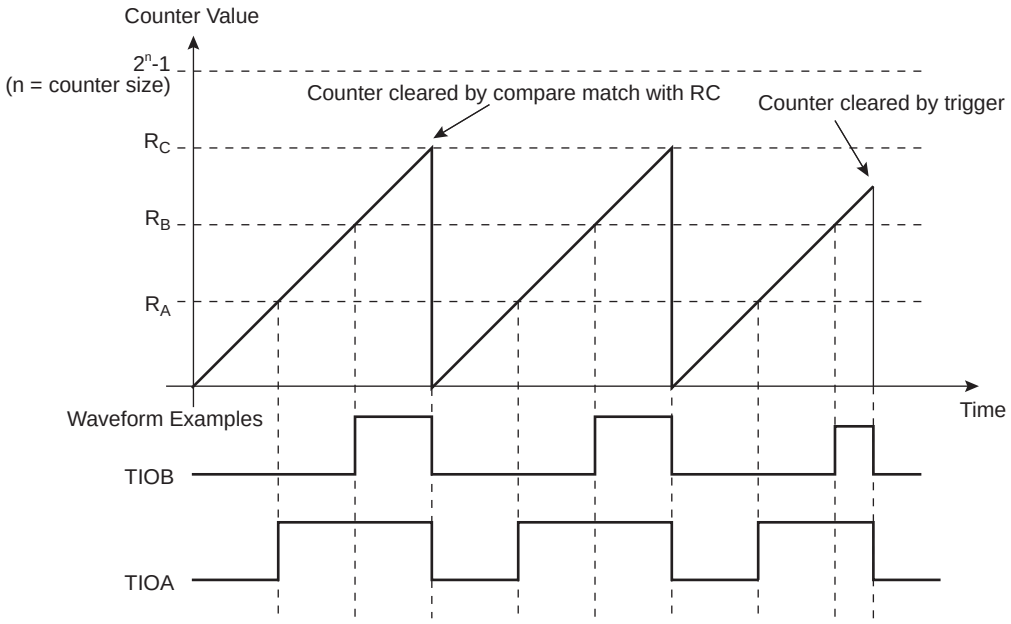

#### 53.6.12.3 WAVSEL = 01

When WAVSEL = 01, the value of TC_CV is incremented from 0 to $2^{32}$-1 . Once $2^{32}$-1 is reached, the value of TC_CV is decremented to 0, then reincremented to $2^{32}$-1 and so on.

A trigger such as an external event or a software trigger can modify TC_CV at any time. If a trigger occurs while TC_CV is incrementing, TC_CV then decrements. If a trigger is received while TC_CV is decrementing, TC_CV then increments.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-12. WAVSEL = 01 without Trigger**

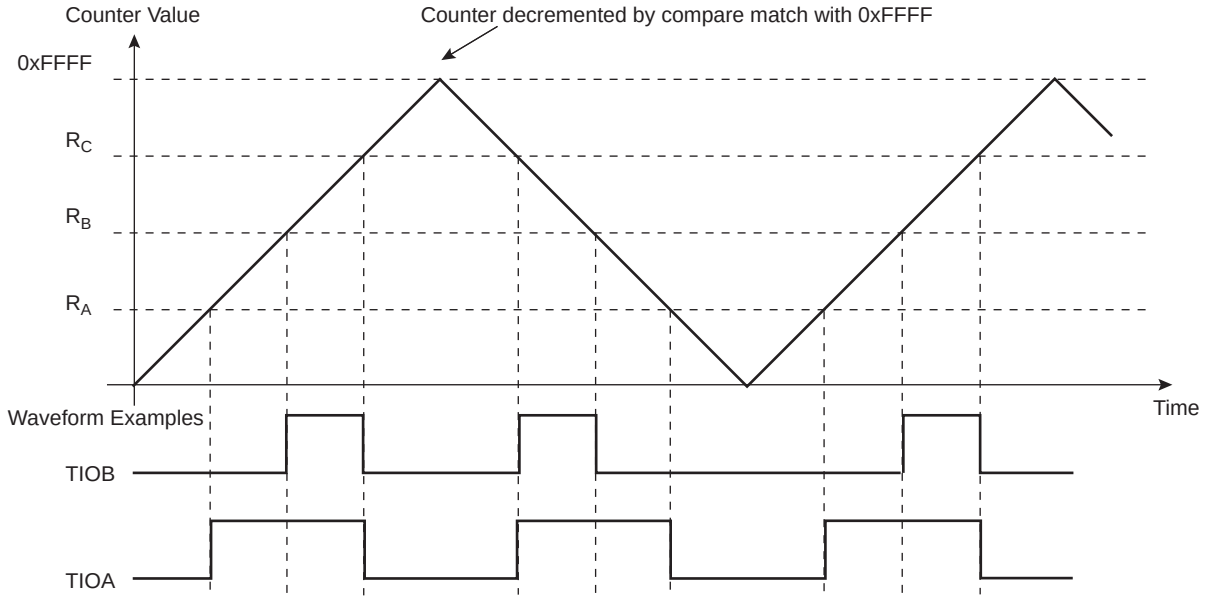

**Figure 53-13. WAVSEL = 01 with Trigger**

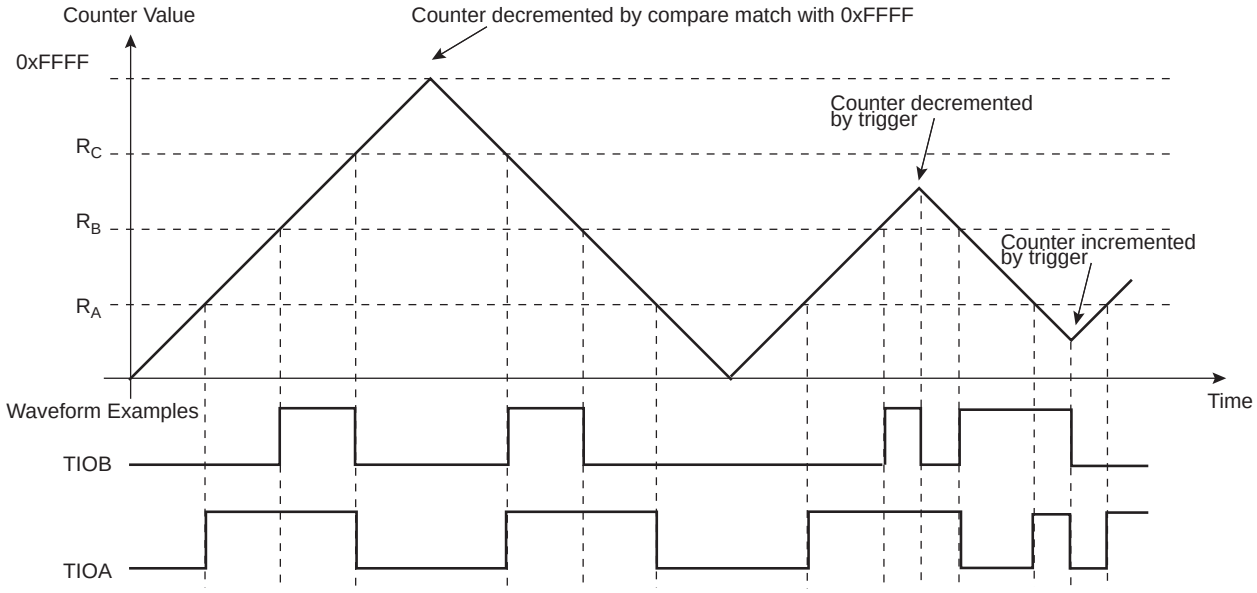

#### 53.6.12.4 WAVSEL = 11

When WAVSEL = 11, the value of TC_CV is incremented from 0 to RC. Once RC is reached, the value of TC_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC_CV at any time. If a trigger occurs while TC_CV is incrementing, TC_CV then decrements. If a trigger is received while TC_CV is decrementing, TC_CV then increments.

Refer to the figures below.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-14. WAVSEL = 11 without Trigger**

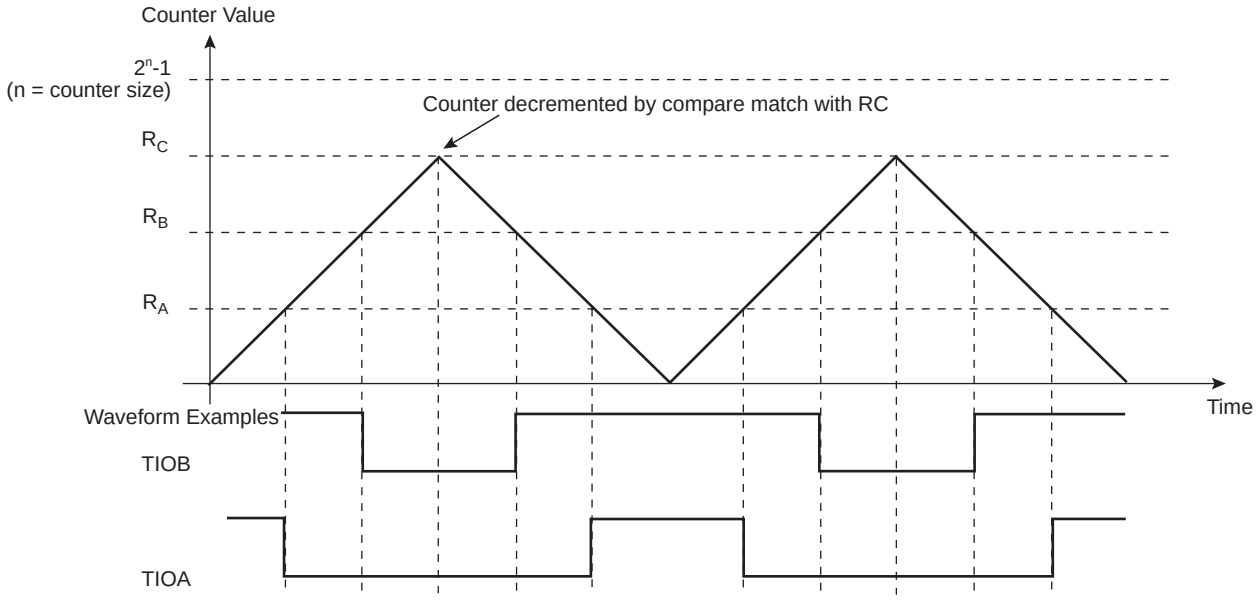

**Figure 53-15. WAVSEL = 11 with Trigger**

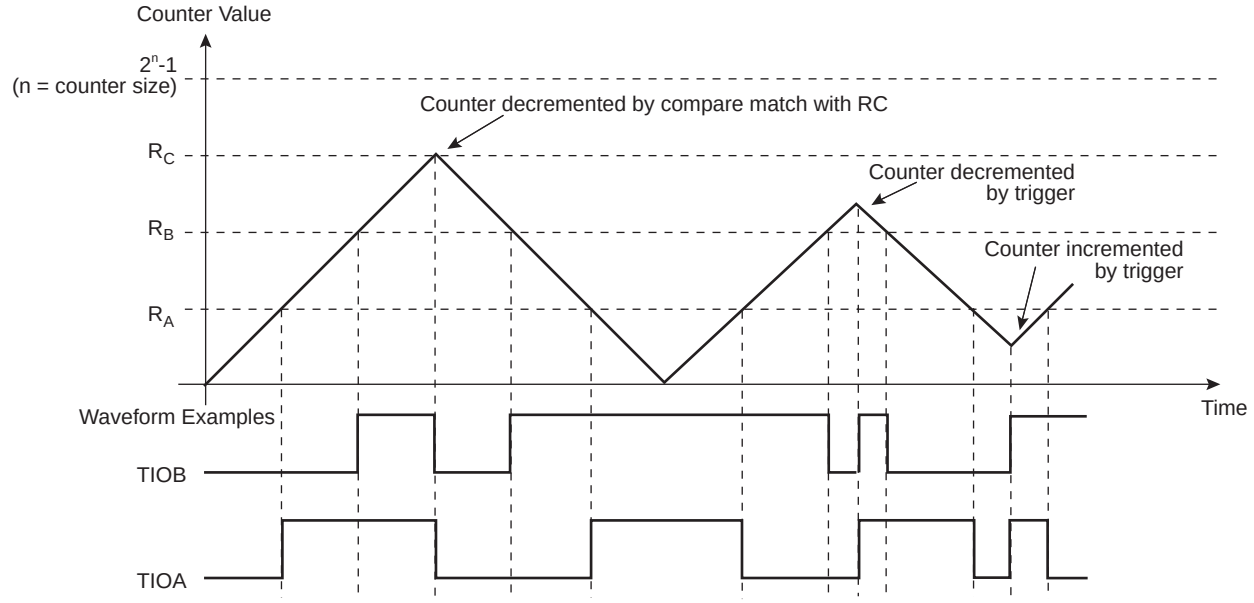


### 53.6.13 External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC_CMR.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC_CMR.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC_CMR.ENETRG.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

### 53.6.14 Synchronization with PWM

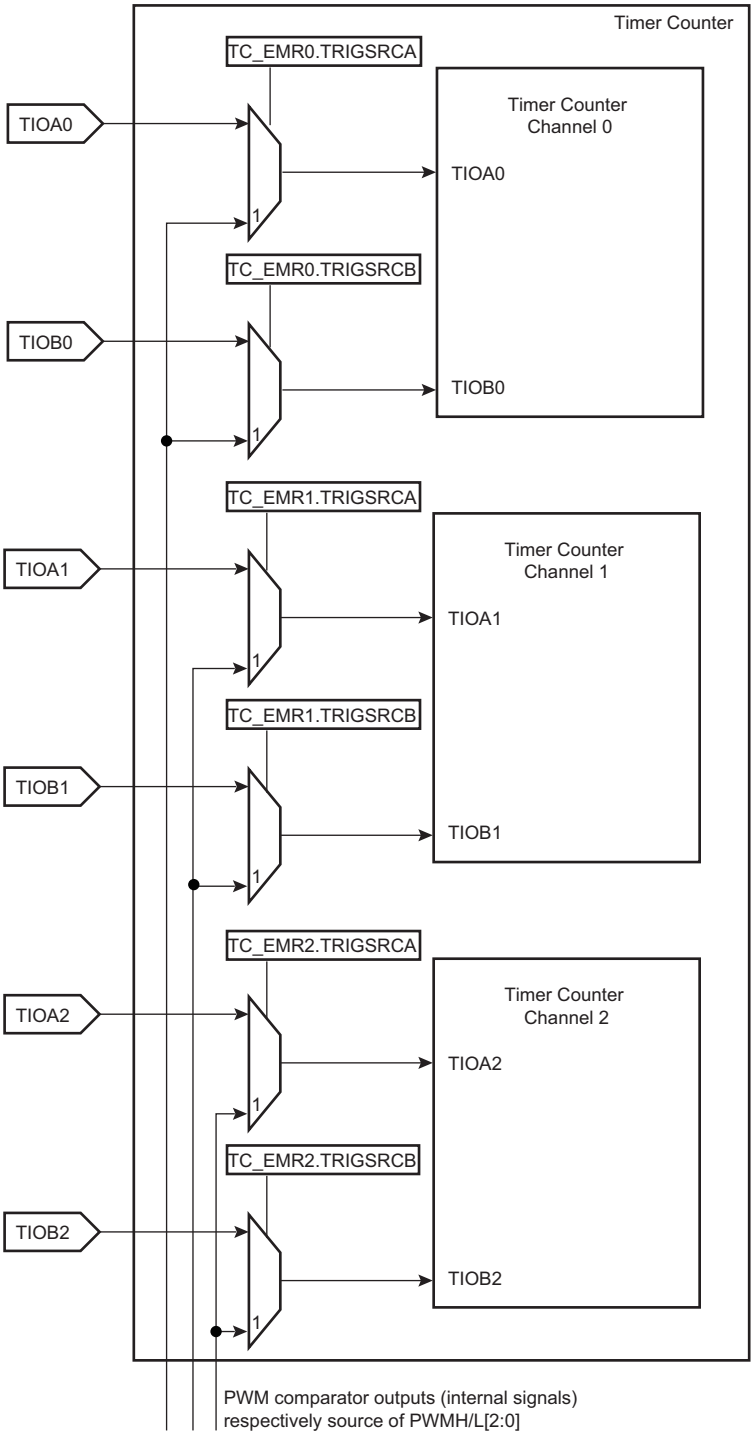
The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC_EMR) fields TRIGSRCA and TRIGSRCB (see “TC Extended Mode Register”).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

**Figure 53-16. Synchronization with PWM**



### 53.6.15 Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

The following events control TIOAx and TIOBx:

- Software trigger

- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC_CMR.

### 53.6.16 Quadrature Decoder

#### 53.6.16.1 Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (refer to Predefined Connection of the Quadrature Decoder with Timer Counters).

When writing a ‘0’ to TC_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC_CMRx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

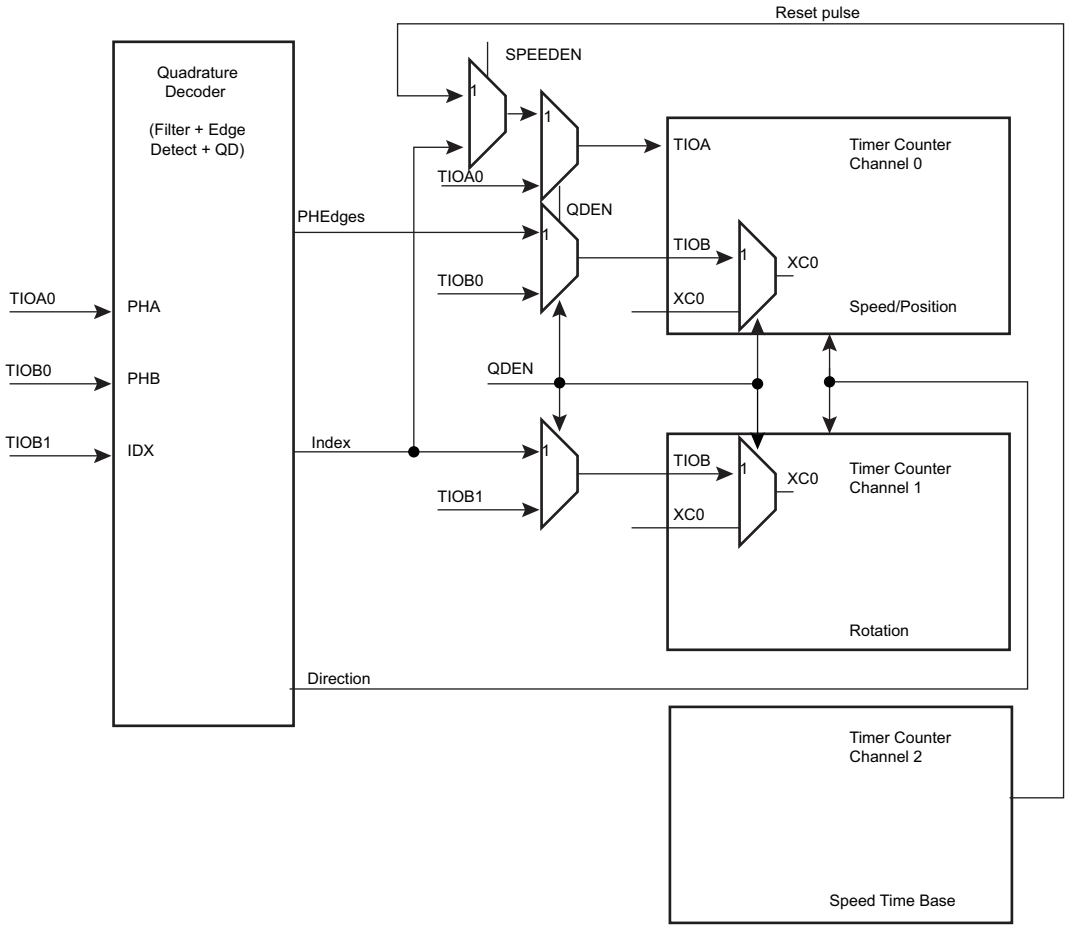
In Speed mode, position cannot be measured but revolution can be measured.

Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC_SRx.CPCS.

**Figure 53-17. Predefined Connection of the Quadrature Decoder with Timer Counters**



### 53.6.16.2 Input Preprocessing

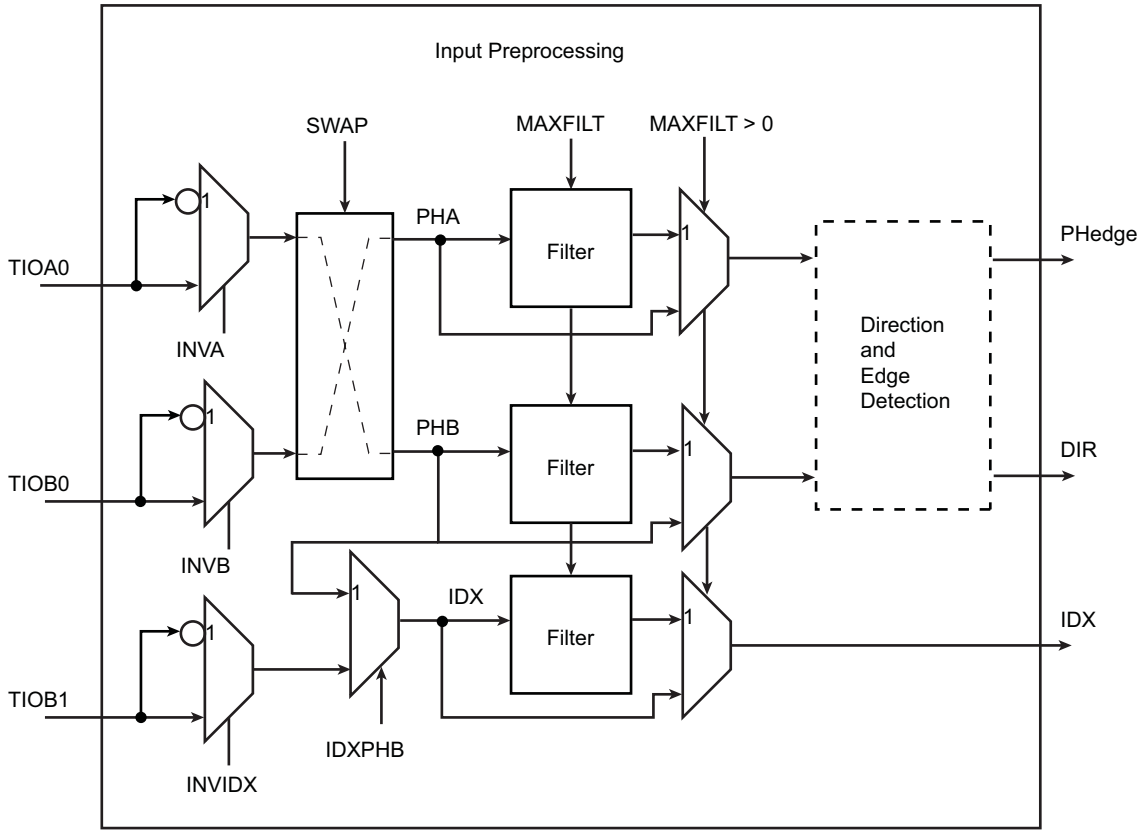
Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

Each input can be negated and swapping PHA, PHB is also configurable.

TC_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than (MAXFILT +1) × $t_{peripheral\ clock}$ are not passed to downstream logic.

The value of (MAXFILT +1) × $t_{peripheral\ clock}$ must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

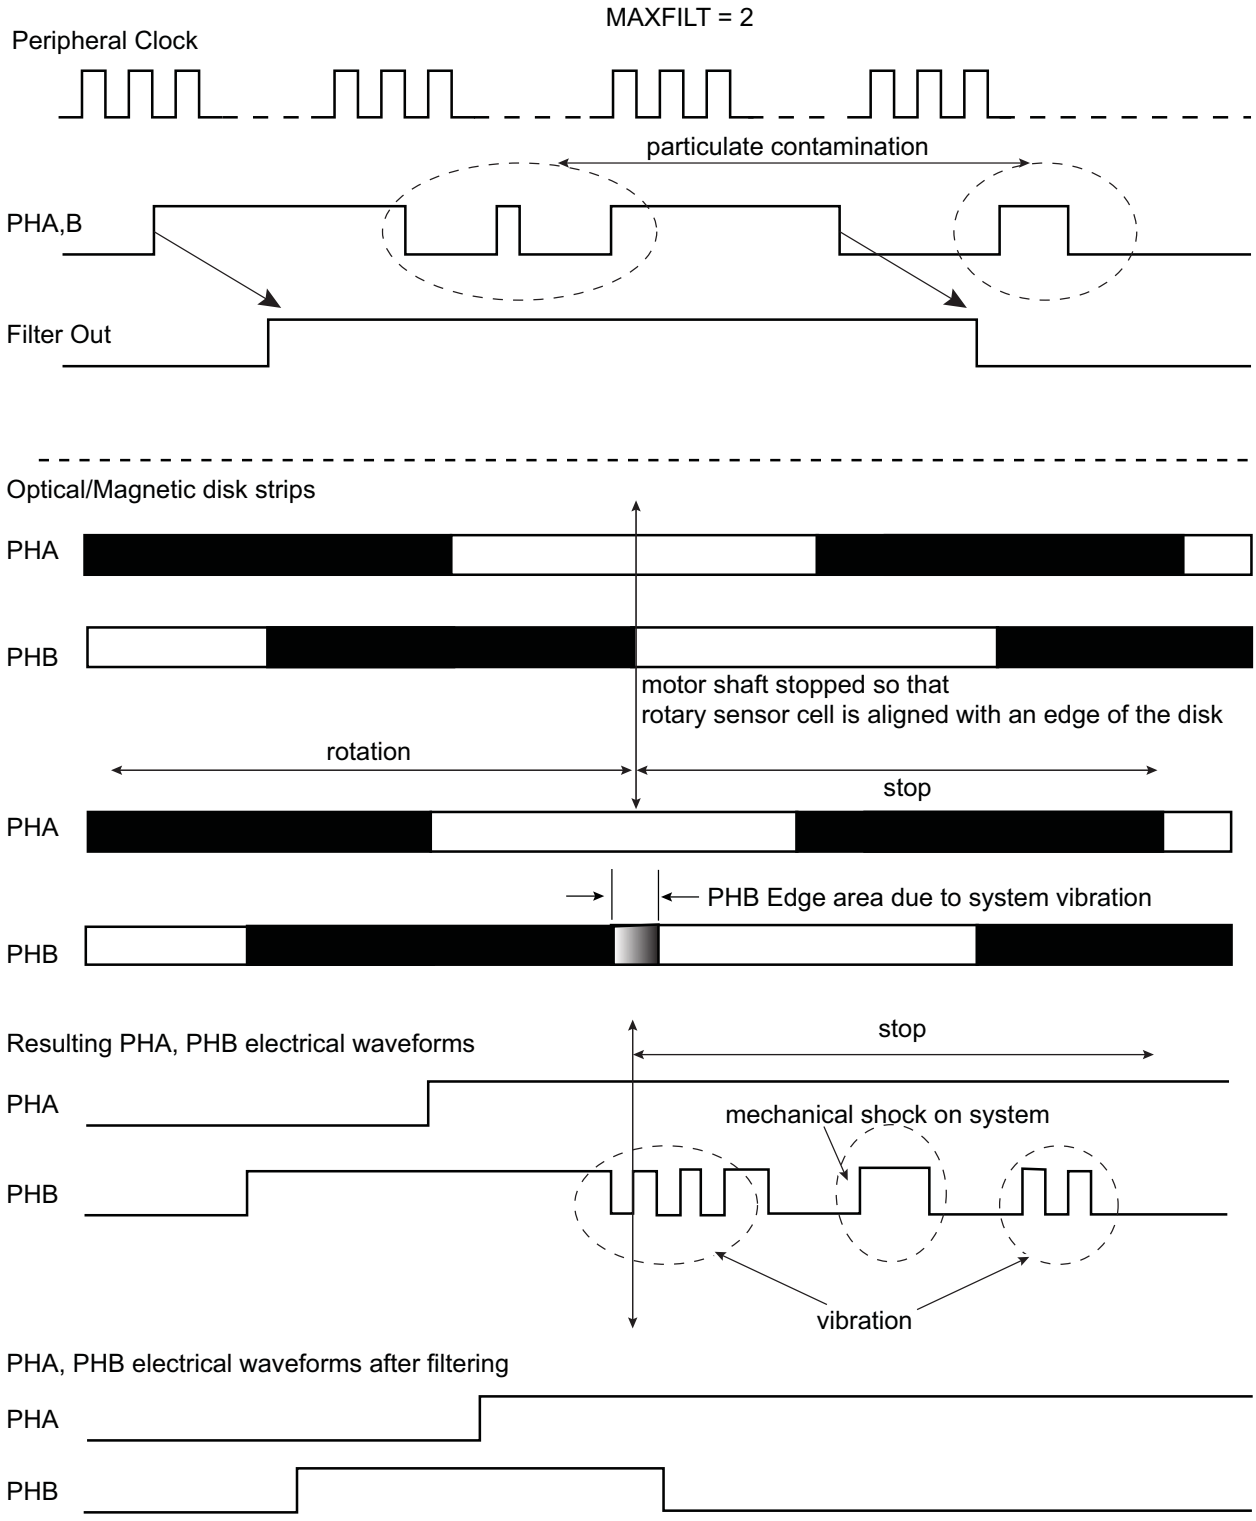
**Figure 53-18. Input Stage**



Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

**Figure 53-19. Filtering Examples**



### 53.6.16.3 Direction Status and Change Detection

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

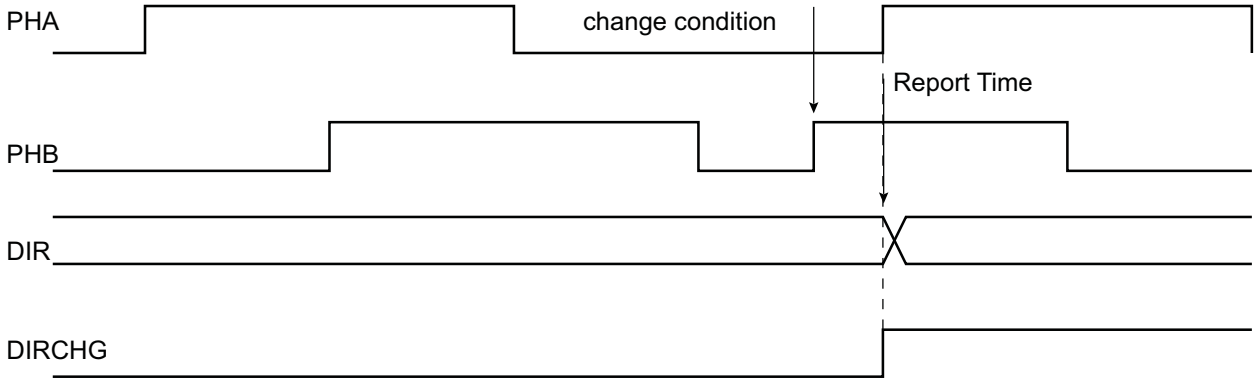
The direction status can be directly read at anytime in the TC_QISR. The polarity of the direction flag status depends on the configuration written in TC_BMR. INVA, INVB, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC_QISR and can generate an interrupt.

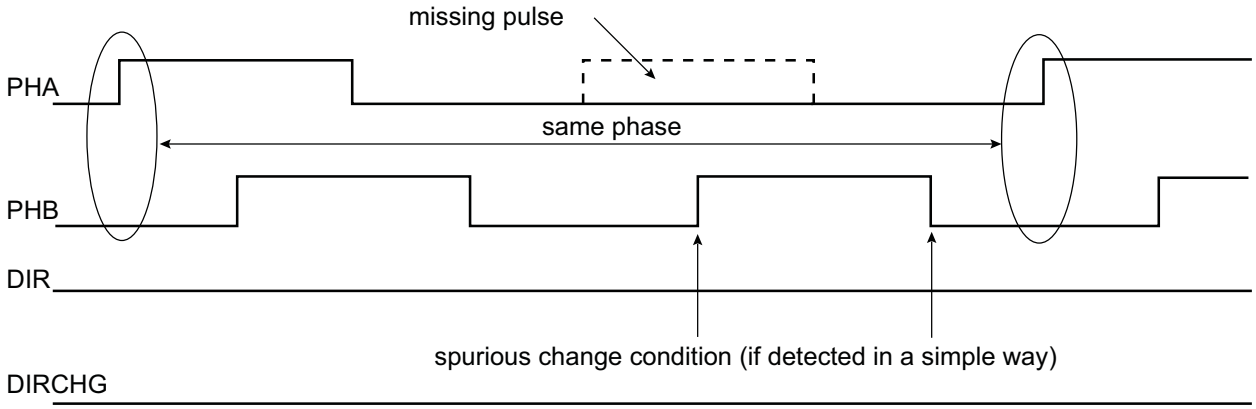
The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. Refer to the following figure for waveforms.

**Figure 53-20. Rotation Change Detection**

**Direction Change under normal conditions**



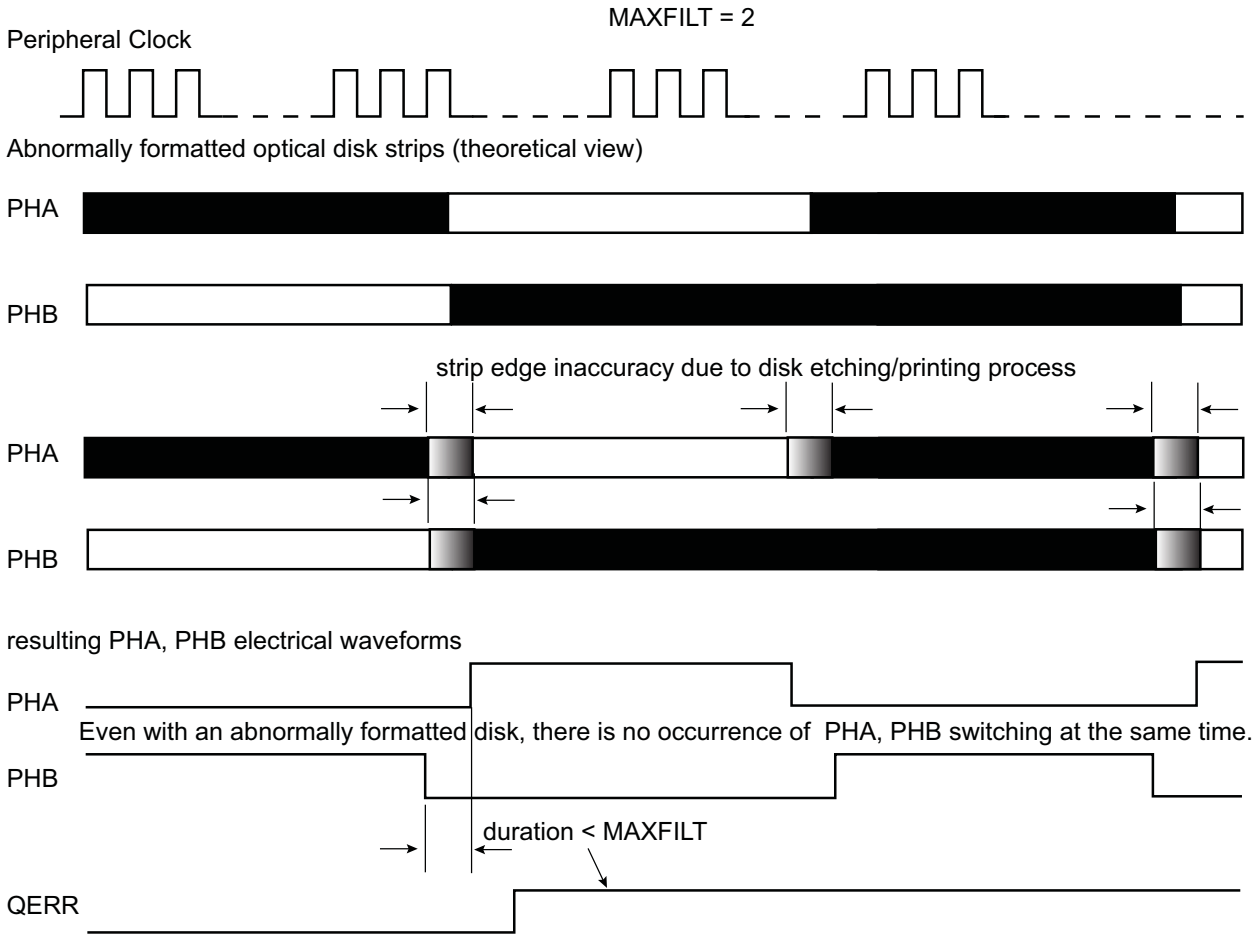
**No direction change due to particulate contamination masking a reflective bar**



The direction change detection is disabled when TC_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to (TC_BMR.MAXFILT + 1) × $t_{peripheral\ clock}$ ns. After being filtered, there is no reason to have two edges closer than (TC_BMR.MAXFILT + 1) × $t_{peripheral\ clock}$ ns under normal mode of operation.

**Figure 53-21. Quadrature Error Detection**



MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

#### 53.6.16.4 Position and Rotation Measurement

When TC_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC_RC0.RC and the TC_CMR.CPCTRG bit is written to ‘1’. The position measurement can be read in the TC_CV0 register and the rotation measurement can be read in the TC_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC_CMR0.WAVE = 0). ‘Rising edge’ must be selected as the External Trigger Edge (TC_CMR.ETRGEDG = 0x01) and ‘TIOAx’ must be selected as the External Trigger (TC_CMR.ABETRG = 0x1). The process must be started by configuring TC_CCR.CLKEN and TC_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC_CV0 register.

Therefore, the accurate position can be read on both TC_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC_QISR.

#### 53.6.16.5 Speed Measurement

When TC_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC_CMR0). TC_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC_CCR.

The speed can be read on field RA in TC_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

#### 53.6.16.6 Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC_SR0.CPCS flag is enabled as a source of the interrupt by writing a ‘1’ to TC_IER0.CPCS.

The TC_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (e.g., if nominal count per revolution is 1024, then TC_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC_SR0.CPCS=1, and the interrupt line is asserted if TC_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC_QISR.DIRCHG=0.

#### 53.6.16.7 Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsollicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

A contamination exists on a phase line if TC_SR.CPCS = 1 and TC_QISR.DIRCHG = 1 when there is no sollicited change of direction.

#### 53.6.16.8 Missing Pulse Detection and Autocorrection

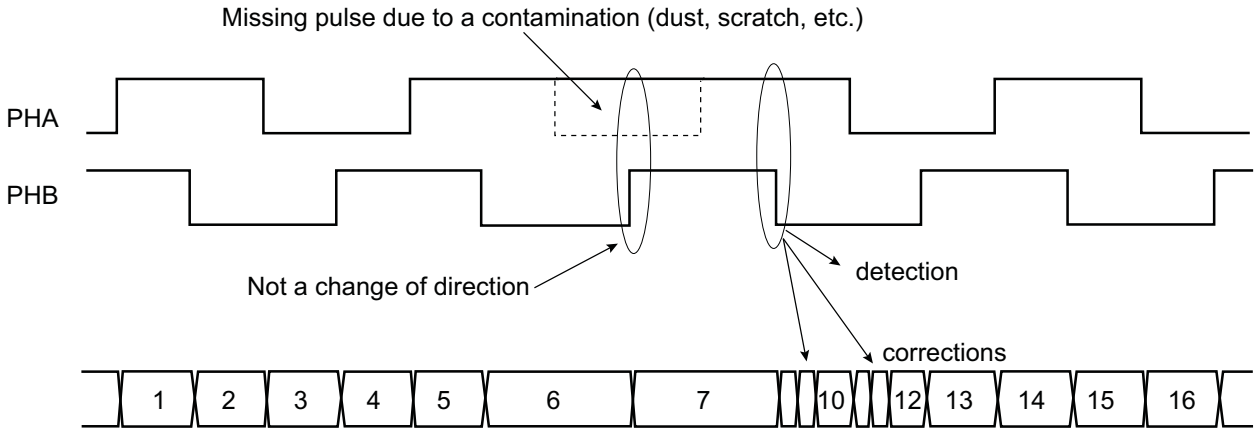
The QDEC is equipped with a circuitry which detects and corrects some errors that may result from contamination on optical disks or other materials producing the quadrature phase signals.

The detection and autocorrection only works if the Count mode is configured for both phases (EDGPHA = 1 in TC_BMR) and is enabled (AUTOC = 1 in TC_BMR).

If a pulse is missing on a phase signal, it is automatically detected and the pulse count reported in the CV field of the TC_CV0/1 is automatically corrected.

There is no detection if both phase signals are affected at the same location on the device providing the quadrature signals because the detection requires a valid phase signal to detect the contamination on the other phase signal.

**Figure 53-22. Detection and Autocorrection of Missing Pulses**



If a quadrature device is undamaged, the number of pulses counted for a predefined period of time must be the same with or without detection and autocorrection feature.

Therefore, if the measurement results differ, a contamination exists on the device producing the quadrature signals.

This does not substitute the measurements of the number of pulses between two index pulses (if available) but provides a complementary method to detect damaged quadrature devices.

When the device providing quadrature signals is severely damaged, potentially leading to a number of consecutive missing pulses greater than 1, the downstream processing may be affected. It is possible to define the maximum admissible number of consecutive missing pulses before issuing a Missing Pulse Error flag (MPE in TC_QISR). The threshold triggering an MPE flag report can be configured in TC_BMR.MAXCMP. If the field MAXCMP is cleared, MPE never rises. The flag MAXCMP can trigger an interrupt while the QDEC is operating, thus providing a real time report of a potential problem on the quadrature device.

### 53.6.17 2-bit Gray Up/Down Counter for Stepper Motor

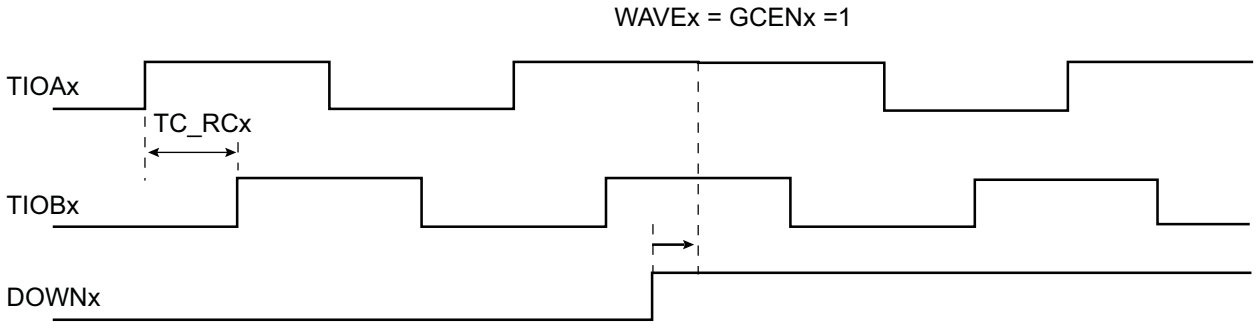
Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC_SMMRx.GCEN.

Up or Down count can be defined by writing TC_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC_CMR.

The period of the counters can be programmed in TC_RCx.

**Figure 53-23. 2-bit Gray Up/Down Counter**



### 53.6.18 Fault Mode

At any time, the TC_RCx registers can be used to perform a comparison on the respective current channel counter value (TC_CVx) with the value of TC_RCx register.

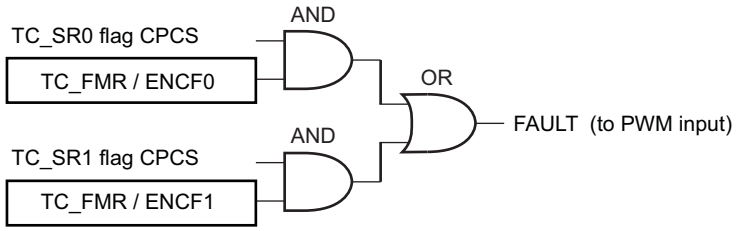
The CPCSx flags can be set accordingly and an interrupt can be generated.

This interrupt is processed but requires an unpredictable amount of time to be achieve the required action.

It is possible to trigger the FAULT output of the TIMER1 with CPCS from TC_SR0 and/or CPCS from TC_SR1. Each source can be independently enabled/disabled in the TC_FMR.

This can be useful to detect an overflow on speed and/or position when QDEC is processed and to act immediately by using the FAULT output.

**Figure 53-24. Fault Output Generation**



### 53.6.19 Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the TC Write Protection Mode Register (TC_WPMR).

The Timer Counter clock of the first channel must be enabled to access TC_WPMR.

The following registers can be write-protected when WPEN is set:

- TC Block Mode Register
- TC Channel Mode Register Capture Mode
- TC Channel Mode Register Waveform Mode
- TC Fault Mode Register
- TC Stepper Motor Mode Register
- TC Register A
- TC Register B
- TC Register C
- TC Extended Mode Register

## 53.7 Register Summary

**Note:** The register TC_CMR has two modes, Capture Mode and Waveform Mode. In this register summary, both modes are displayed

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | TC_CCR0 | 7:0 | | | | | | SWTRG | CLKDIS | CLKEN |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x04 | TC_CMR0 | 7:0 | LDBDIS | LDBSTOP | BURST[1:0] | | CLKI | TCCLKS[2:0] | | |

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | SWTRG | CLKDIS | CLKEN |
| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

**Bit 2 – SWTRG** Software Trigger Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | A software trigger is performed: the counter is reset and the clock is started. |

**Bit 1 – CLKDIS** Counter Clock Disable Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the clock. |

**Bit 0 – CLKEN** Counter Clock Enable Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the clock if CLKDIS is not 1. |

### 53.7.2 TC Channel Mode Register: Capture Mode

**Name:** TC_CMRx
**Offset:** 0x04 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read/Write

This register can be written only if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 22:20 – SBSMPLR[2:0]** Loading Edge Subsampling Ratio

| Value | Name | Description |
|---|---|---|
| 0 | ONE | Load a Capture register each selected edge. |
| 1 | HALF | Load a Capture register every 2 selected edges. |
| 2 | FOURTH | Load a Capture register every 4 selected edges. |
| 3 | EIGHTH | Load a Capture register every 8 selected edges. |
| 4 | SIXTEENTH | Load a Capture register every 16 selected edges. |

**Bits 19:18 – LDRB[1:0]** RB Loading Edge Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | RISING | Rising edge of TIOAx |
| 2 | FALLING | Falling edge of TIOAx |
| 3 | EDGE | Each edge of TIOAx |

**Bits 17:16 – LDRA[1:0]** RA Loading Edge Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |

| Value | Name | Description |
|---|---|---|
| 1 | RISING | Rising edge of TIOAx |
| 2 | FALLING | Falling edge of TIOAx |
| 3 | EDGE | Each edge of TIOAx |

**Bit 15 – WAVE** Waveform Mode

| Value | Description |
|---|---|
| 0 | Capture mode is enabled. |
| 1 | Capture mode is disabled (Waveform mode is enabled). |

**Bit 14 – CPCTRG** RC Compare Trigger Enable

| Value | Description |
|---|---|
| 0 | RC Compare has no effect on the counter and its clock. |
| 1 | RC Compare resets the counter and starts the counter clock. |

**Bit 10 – ABETRG** TIOAx or TIOBx External Trigger Selection

| Value | Description |
|---|---|
| 0 | TIOBx is used as an external trigger. |
| 1 | TIOAx is used as an external trigger. |

**Bits 9:8 – ETRGEDG[1:0]** External Trigger Edge Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | The clock is not gated by an external signal. |
| 1 | RISING | Rising edge |
| 2 | FALLING | Falling edge |
| 3 | EDGE | Each edge |

**Bit 7 – LDBDIS** Counter Clock Disable with RB Loading

| Value | Description |
|---|---|
| 0 | Counter clock is not disabled when RB loading occurs. |
| 1 | Counter clock is disabled when RB loading occurs. |

**Bit 6 – LDBSTOP** Counter Clock Stopped with RB Loading

| Value | Description |
|---|---|
| 0 | Counter clock is not stopped when RB loading occurs. |
| 1 | Counter clock is stopped when RB loading occurs. |

**Bits 5:4 – BURST[1:0]** Burst Signal Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | The clock is not gated by an external signal. |
| 1 | XC0 | XC0 is ANDed with the selected clock. |
| 2 | XC1 | XC1 is ANDed with the selected clock. |
| 3 | XC2 | XC2 is ANDed with the selected clock. |

**Bit 3 – CLKI** Clock Invert

| Value | Description |
|---|---|
| 0 | Counter is incremented on rising edge of the clock. |
| 1 | Counter is incremented on falling edge of the clock. |

**Bits 2:0 – TCCLKS[2:0]** Clock Selection
To operate at maximum peripheral clock frequency, refer to “TC Extended Mode Register”.

| Value | Name | Description |
|---|---|---|
| 0 | TIMER_CLOCK1 | Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC) |
| 1 | TIMER_CLOCK2 | Clock selected: internal System bus clock divided by 8 clock signal (from PMC) |
| 2 | TIMER_CLOCK3 | Clock selected: internal System bus clock divided by 32 clock signal (from PMC) |
| 3 | TIMER_CLOCK4 | Clock selected: internal System bus clock divided by 128 clock signal (from PMC) |
| 4 | TIMER_CLOCK5 | Clock selected: internal slow_clock clock signal (from PMC) |
| 5 | XC0 | Clock selected: XC0 |
| 6 | XC1 | Clock selected: XC1 |
| 7 | XC2 | Clock selected: XC2 |

### 53.7.3 TC Channel Mode Register: Waveform Mode

**Name:** TC_CMRx
**Offset:** 0x04 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BSWTRG[1:0] | | BEEVT[1:0] | | BCPC[1:0] | | BCPB[1:0] | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:30 – BSWTRG[1:0]** Software Trigger Effect on TIOBx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 29:28 – BEEVT[1:0]** External Event Effect on TIOBx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 27:26 – BCPC[1:0]** RC Compare Effect on TIOBx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |

| Value | Name | Description |
|---|---|---|
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 25:24 – BCPB[1:0]** RB Compare Effect on TIOBx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 23:22 – ASWTRG[1:0]** Software Trigger Effect on TIOAx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 21:20 – AEEVT[1:0]** External Event Effect on TIOAx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 19:18 – ACPC[1:0]** RC Compare Effect on TIOAx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bits 17:16 – ACPA[1:0]** RA Compare Effect on TIOAx

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | SET | Set |
| 2 | CLEAR | Clear |
| 3 | TOGGLE | Toggle |

**Bit 15 – WAVE** Waveform Mode

| Value | Description |
|---|---|
| 0 | Waveform mode is disabled (Capture mode is enabled). |
| 1 | Waveform mode is enabled. |

**Bits 14:13 – WAVSEL[1:0]** Waveform Selection

| Value | Name | Description |
|---|---|---|
| 0 | UP | UP mode without automatic trigger on RC Compare |
| 1 | UPDOWN | UPDOWN mode without automatic trigger on RC Compare |
| 2 | UP_RC | UP mode with automatic trigger on RC Compare |
| 3 | UPDOWN_RC | UPDOWN mode with automatic trigger on RC Compare |

**Bit 12 – ENETRG** External Event Trigger Enable
Whatever the value programmed in ENETRG, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

| Value | Description |
|---|---|
| 0 | The external event has no effect on the counter and its clock. |
| 1 | The external event resets the counter and starts the counter clock. |

**Bits 11:10 – EEVT[1:0]** External Event Selection
Signal selected as external event.

| Value | Name | Description | TIOB Direction |
|---|---|---|---|
| 0 | TIOB | TIOB | Input |
| 1 | XC0 | XC0 | Output |
| 2 | XC1 | XC1 | Output |
| 3 | XC2 | XC2 | Output |

**Note:** If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

**Bits 9:8 – EEVTEDG[1:0]** External Event Edge Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | None |
| 1 | RISING | Rising edge |
| 2 | FALLING | Falling edge |
| 3 | EDGE | Each edge |

**Bit 7 – CPCDIS** Counter Clock Disable with RC Compare

| Value | Description |
|---|---|
| 0 | Counter clock is not disabled when counter reaches RC. |
| 1 | Counter clock is disabled when counter reaches RC. |

**Bit 6 – CPCSTOP** Counter Clock Stopped with RC Compare

| Value | Description |
|---|---|
| 0 | Counter clock is not stopped when counter reaches RC. |
| 1 | Counter clock is stopped when counter reaches RC. |

**Bits 5:4 – BURST[1:0]** Burst Signal Selection

| Value | Name | Description |
|---|---|---|
| 0 | NONE | The clock is not gated by an external signal. |
| 1 | XC0 | XC0 is ANDed with the selected clock. |
| 2 | XC1 | XC1 is ANDed with the selected clock. |
| 3 | XC2 | XC2 is ANDed with the selected clock. |

**Bit 3 – CLKI** Clock Invert

| Value | Description |
|---|---|
| 0 | Counter is incremented on rising edge of the clock. |
| 1 | Counter is incremented on falling edge of the clock. |

**Bits 2:0 – TCCLKS[2:0]** Clock Selection
To operate at maximum peripheral clock frequency, refer to “TC Extended Mode Register”.

| Value | Name | Description |
|---|---|---|
| 0 | TIMER_CLOCK1 | Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC) |
| 1 | TIMER_CLOCK2 | Clock selected: internal System bus clock divided by 8 clock signal (from PMC) |
| 2 | TIMER_CLOCK3 | Clock selected: internal System bus clock divided by 32 clock signal (from PMC) |
| 3 | TIMER_CLOCK4 | Clock selected: internal System bus clock divided by 128 clock signal (from PMC) |
| 4 | TIMER_CLOCK5 | Clock selected: internal slow_clock clock signal (from PMC) |
| 5 | XC0 | Clock selected: XC0 |
| 6 | XC1 | Clock selected: XC1 |
| 7 | XC2 | Clock selected: XC2 |

### 53.7.4 TC Stepper Motor Mode Register

**Name:** TC_SMMRx
**Offset:** 0x08 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | DOWN | GCEN |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – DOWN** Down Count

| Value | Description |
|---|---|
| 0 | Up counter. |
| 1 | Down counter. |

**Bit 0 – GCEN** Gray Count Enable

| Value | Description |
|---|---|
| 0 | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x. |
| 1 | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter. |

### 53.7.5 TC Register AB

**Name:** TC_RABx
**Offset:** 0x0C + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RAB[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RAB[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RAB[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RAB[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – RAB[31:0]** Register A or Register B
RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.

When DMA is used, the RAB register address must be configured as source address of the transfer.

### 53.7.6 TC Counter Value Register

**Name:** TC_CVx
**Offset:** 0x10 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | CV[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CV[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | CV[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – CV[31:0]** Counter Value
CV contains the counter value in real time.

**Important:**

### 53.7.7 TC Register A

**Name:** TC_RAx
**Offset:** 0x14 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read/Write

This register has access Read-only if TC_CMRx.WAVE = 0, Read/Write if TC_CMRx.WAVE = 1.
This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RA[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RA[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RA[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RA[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – RA[31:0]** Register A
RA contains the Register A value in real time.

**Important:**

### 53.7.8 TC Register B

**Name:** TC_RBx
**Offset:** 0x18 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read/Write

This register has access Read-only if TC_CMRx.WAVE = 0, Read/Write if TC_CMRx.WAVE = 1.
This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RB[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RB[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RB[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RB[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – RB[31:0]** Register B
RB contains the Register B value in real time.

**Important:**

### 53.7.9 TC Register C

**Name:** TC_RCx
**Offset:** 0x1C + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RC[31:24] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RC[23:16] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RC[15:8] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RC[7:0] | | | | | | | |
| Access | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – RC[31:0]** Register C
RC contains the Register C value in real time.

**Important:**

### 53.7.10 TC Interrupt Status Register

**Name:** TC_SRx
**Offset:** 0x20 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | MTIOB | MTIOA | CLKSTA |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 18 – MTIOB** TIOBx Mirror

| Value | Description |
|---|---|
| 0 | TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx pin is low. If TC_CMRx.WAVE = 1, TIOBx is driven low. |
| 1 | TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx pin is high. If TC_CMRx.WAVE = 1, TIOBx is driven high. |

**Bit 17 – MTIOA** TIOAx Mirror

| Value | Description |
|---|---|
| 0 | TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx pin is low. If TC_CMRx.WAVE = 1, TIOAx is driven low. |
| 1 | TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx pin is high. If TC_CMRx.WAVE = 1, TIOAx is driven high. |

**Bit 16 – CLKSTA** Clock Enabling Status

| Value | Description |
|---|---|
| 0 | Clock is disabled. |
| 1 | Clock is enabled. |

**Bit 7 – ETRGS** External Trigger Status (cleared on read)

| Value | Description |
|---|---|
| 0 | External trigger has not occurred since the last read of the Status Register. |
| 1 | External trigger has occurred since the last read of the Status Register. |

**Bit 6 – LDRBS** RB Loading Status (cleared on read)

| Value | Description |
|---|---|
| 0 | RB Load has not occurred since the last read of the Status Register or TC_CMRx.WAVE = 1. |
| 1 | RB Load has occurred since the last read of the Status Register, if TC_CMRx.WAVE = 0. |

**Bit 5 – LDRAS** RA Loading Status (cleared on read)

| Value | Description |
|---|---|
| 0 | RA Load has not occurred since the last read of the Status Register or TC_CMRx.WAVE = 1. |
| 1 | RA Load has occurred since the last read of the Status Register, if TC_CMRx.WAVE = 0. |

**Bit 4 – CPCS** RC Compare Status (cleared on read)

| Value | Description |
|---|---|
| 0 | RC Compare has not occurred since the last read of the Status Register. |
| 1 | RC Compare has occurred since the last read of the Status Register. |

**Bit 3 – CPBS** RB Compare Status (cleared on read)

| Value | Description |
|---|---|
| 0 | RB Compare has not occurred since the last read of the Status Register or TC_CMRx.WAVE = 0. |
| 1 | RB Compare has occurred since the last read of the Status Register, if TC_CMRx.WAVE = 1. |

**Bit 2 – CPAS** RA Compare Status (cleared on read)

| Value | Description |
|---|---|
| 0 | RA Compare has not occurred since the last read of the Status Register or TC_CMRx.WAVE = 0. |
| 1 | RA Compare has occurred since the last read of the Status Register, if TC_CMRx.WAVE = 1. |

**Bit 1 – LOVRS** Load Overrun Status (cleared on read)

| Value | Description |
|---|---|
| 0 | Load overrun has not occurred since the last read of the Status Register or TC_CMRx.WAVE = 1. |
| 1 | RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status Register, if TC_CMRx.WAVE = 0. |

**Bit 0 – COVFS** Counter Overflow Status (cleared on read)

| Value | Description |
|---|---|
| 0 | No counter overflow has occurred since the last read of the Status Register. |
| 1 | A counter overflow has occurred since the last read of the Status Register. |

### 53.7.11 TC Interrupt Enable Register

**Name:** TC_IERx
**Offset:** 0x24 + x*0x40 [x=0..2]
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

### 53.7.12 TC Interrupt Disable Register

**Name:** TC_IDRx
**Offset:** 0x28 + x*0x40 [x=0..2]
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 53.7.14 TC Extended Mode Register

**Name:** TC_EMRx
**Offset:** 0x30 + x*0x40 [x=0..2]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | NODIVCLK |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TRIGSRCB[1:0] | | | | TRIGSRCA[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

**Bit 8 – NODIVCLK** No Divided Clock

| Value | Description |
|---|---|
| 0 | The selected clock is defined by field TCCLKS in TC_CMRx. |
| 1 | The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect. |

**Bits 5:4 – TRIGSRCB[1:0]** Trigger Source for Input B

| Value | Name | Description |
|---|---|---|
| 0 | EXTERNAL_TIOBx | The trigger/capture input B is driven by external pin TIOBx |
| 1 | PWMx | For TC0 to TC10: The trigger/capture input B is driven internally by the comparator output (see Synchronization with PWM) of the PWMx.<br>For TC11: The trigger/capture input B is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC). |

**Bits 1:0 – TRIGSRCA[1:0]** Trigger Source for Input A

| Value | Name | Description |
|---|---|---|
| 0 | EXTERNAL_TIOAx | The trigger/capture input A is driven by external pin TIOAx |
| 1 | PWMx | The trigger/capture input A is driven internally by PWMx |

### 53.7.15 TC Block Control Register

**Name:** TC_BCR
**Offset:** 0xC0
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SYNC |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – SYNC** Synchro Command

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels. |

### 53.7.16 TC Block Mode Register

**Name:** TC_BMR
**Offset:** 0xC4
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | MAXCMP[3:0] | | | | MAXFILT[5:4] | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | MAXFILT[3:0] | | | | | AUTOC | IDXPHB | SWAP |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | INVIDX | INVB | INVA | EDGPHA | QDTRANS | SPEEDEN | POSEN | QDEN |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TC2XC2S[1:0] | | TC1XC1S[1:0] | | TC0XC0S[1:0] | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 29:26 – MAXCMP[3:0]** Maximum Consecutive Missing Pulses

| Value | Description |
|---|---|
| 0 | The flag MPE in TC_QISR never rises. |
| 1–15 | Defines the number of consecutive missing pulses before a flag report. |

**Bits 25:20 – MAXFILT[5:0]** Maximum Filter
Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see "Input Preprocessing"

| Value | Description |
|---|---|
| 1–63 | Defines the filtering capabilities. |

**Bit 18 – AUTOC** AutoCorrection of missing pulses
0 (DISABLED): The detection and autocorrection function is disabled.

1 (ENABLED): The detection and autocorrection function is enabled.

**Bit 17 – IDXPHB** Index Pin is PHB Pin

| Value | Description |
|---|---|
| 0 | IDX pin of the rotary sensor must drive TIOA1. |

| Value | Description |
|---|---|
| 1 | IDX pin of the rotary sensor must drive TIOB0. |

**Bit 16 – SWAP** Swap PHA and PHB

| Value | Description |
|---|---|
| 0 | No swap between PHA and PHB. |
| 1 | Swap PHA and PHB internally, prior to driving the QDEC. |

**Bit 15 – INVIDX** Inverted Index

| Value | Description |
|---|---|
| 0 | IDX (TIOA1) is directly driving the QDEC. |
| 1 | IDX is inverted before driving the QDEC. |

**Bit 14 – INVB** Inverted PHB

| Value | Description |
|---|---|
| 0 | PHB (TIOB0) is directly driving the QDEC. |
| 1 | PHB is inverted before driving the QDEC. |

**Bit 13 – INVA** Inverted PHA

| Value | Description |
|---|---|
| 0 | PHA (TIOA0) is directly driving the QDEC. |
| 1 | PHA is inverted before driving the QDEC. |

**Bit 12 – EDGPHA** Edge on PHA Count Mode

| Value | Description |
|---|---|
| 0 | Edges are detected on PHA only. |
| 1 | Edges are detected on both PHA and PHB. |

**Bit 11 – QDTRANS** Quadrature Decoding Transparent

| Value | Description |
|---|---|
| 0 | Full quadrature decoding logic is active (direction change detected). |
| 1 | Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed. |

**Bit 10 – SPEEDEN** Speed Enabled

| Value | Description |
|---|---|
| 0 | Disabled. |
| 1 | Enables the speed measure on channel 0, the time base being provided by channel 2. |

**Bit 9 – POSEN** Position Enabled

| Value | Description |
|---|---|
| 0 | Disable position. |
| 1 | Enables the position measure on channel 0 and 1. |

**Bit 8 – QDEN** Quadrature Decoder Enabled
Quadrature decoding (direction change) can be disabled using QDTRANS bit.

One of the POSEN or SPEEDEN bits must be also enabled.

| Value | Description |
|---|---|
| 0 | Disabled. |
| 1 | Enables the QDEC (filter, edge detection and quadrature decoding). |

**Bits 5:4 – TC2XC2S[1:0]** External Clock Signal 2 Selection

| Value | Name | Description |
|---|---|---|
| 0 | TCLK2 | Signal connected to XC2: TCLK2 |
| 1 | – | Reserved |
| 2 | TIOA0 | Signal connected to XC2: TIOA0 |
| 3 | TIOA1 | Signal connected to XC2: TIOA1 |

**Bits 3:2 – TC1XC1S[1:0]** External Clock Signal 1 Selection

| Value | Name | Description |
|---|---|---|
| 0 | TCLK1 | Signal connected to XC1: TCLK1 |
| 1 | – | Reserved |
| 2 | TIOA0 | Signal connected to XC1: TIOA0 |
| 3 | TIOA2 | Signal connected to XC1: TIOA2 |

**Bits 1:0 – TC0XC0S[1:0]** External Clock Signal 0 Selection

| Value | Name | Description |
|---|---|---|
| 0 | TCLK0 | Signal connected to XC0: TCLK0 |
| 1 | – | Reserved |
| 2 | TIOA1 | Signal connected to XC0: TIOA1 |
| 3 | TIOA2 | Signal connected to XC0: TIOA2 |

### 53.7.17 TC QDEC Interrupt Enable Register

**Name:** TC_QIER
**Offset:** 0xC8
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | MPE | QERR | DIRCHG | IDX |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

**Bit 3 – MPE** Consecutive Missing Pulse Error

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the interrupt when an occurrence of MAXCMP consecutive missing pulses is detected. |

**Bit 2 – QERR** Quadrature Error

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the interrupt when a quadrature error occurs on PHA, PHB. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the interrupt when a change on rotation direction is detected. |

**Bit 0 – IDX** Index

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Enables the interrupt when a rising edge occurs on IDX input. |

### 53.7.18 TC QDEC Interrupt Disable Register

**Name:** TC_QIDR
**Offset:** 0xCC
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | | MPE | QERR | DIRCHG | IDX |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

**Bit 3 – MPE** Consecutive Missing Pulse Error

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the interrupt when an occurrence of MAXCMP consecutive missing pulses has been detected. |

**Bit 2 – QERR** Quadrature Error

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the interrupt when a quadrature error occurs on PHA, PHB. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the interrupt when a change on rotation direction is detected. |

**Bit 0 – IDX** Index

| Value | Description |
|---|---|
| 0 | No effect. |

| Value | Description |
|---|---|
| 1 | Disables the interrupt when a rising edge occurs on IDX input. |

### 53.7.19 TC QDEC Interrupt Mask Register

**Name:** TC_QIMR
**Offset:** 0xD0
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | MPE | QERR | DIRCHG | IDX |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 3 – MPE** Consecutive Missing Pulse Error

| Value | Description |
|---|---|
| 0 | The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is disabled. |
| 1 | The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is enabled. |

**Bit 2 – QERR** Quadrature Error

| Value | Description |
|---|---|
| 0 | The interrupt on quadrature error is disabled. |
| 1 | The interrupt on quadrature error is enabled. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description |
|---|---|
| 0 | The interrupt on rotation direction change is disabled. |
| 1 | The interrupt on rotation direction change is enabled. |

**Bit 0 – IDX** Index

| Value | Description |
|---|---|
| 0 | The interrupt on IDX input is disabled. |
| 1 | The interrupt on IDX input is enabled. |

### 53.7.20 TC QDEC Interrupt Status Register

**Name:** TC_QISR
**Offset:** 0xD4
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DIR |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | MPE | QERR | DIRCHG | IDX |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 8 – DIR** Direction
Returns an image of the current rotation direction.

**Bit 3 – MPE** Consecutive Missing Pulse Error

| Value | Description |
|---|---|
| 0 | The number of consecutive missing pulses has not reached the maximum value specified in MAXCMP since the last read of TC_QISR. |
| 1 | An occurrence of MAXCMP consecutive missing pulses has been detected since the last read of TC_QISR. |

**Bit 2 – QERR** Quadrature Error

| Value | Description |
|---|---|
| 0 | No quadrature error since the last read of TC_QISR. |
| 1 | A quadrature error occurred since the last read of TC_QISR. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description |
|---|---|
| 0 | No change on rotation direction since the last read of TC_QISR. |
| 1 | The rotation direction changed since the last read of TC_QISR. |

**Bit 0 – IDX** Index

| Value | Description |
|---|---|
| 0 | No Index input change since the last read of TC_QISR. |
| 1 | The IDX input has changed since the last read of TC_QISR. |

### 53.7.21 TC Fault Mode Register

**Name:** TC_FMR
**Offset:** 0xD8
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ENCF1 | ENCF0 |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

**Bit 1 – ENCF1** Enable Compare Fault Channel 1

| Value | Description |
|---|---|
| 0 | Disables the FAULT output source (CPCS flag) from channel 1. |
| 1 | Enables the FAULT output source (CPCS flag) from channel 1. |

**Bit 0 – ENCF0** Enable Compare Fault Channel 0

| Value | Description |
|---|---|
| 0 | Disables the FAULT output source (CPCS flag) from channel 0. |
| 1 | Enables the FAULT output source (CPCS flag) from channel 0. |

### 53.7.22 TC Write Protection Mode Register

**Name:** TC_WPMR
**Offset:** 0xE4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | WPKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x544944 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
The Timer Counter clock of the first channel must be enabled to access this register.

See “Register Write Protection” for a list of registers that can be write-protected and Timer Counter clock conditions.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII). |

# 54. Pulse Density Modulation Interface Controller (PDMIC)

## 54.1 Description

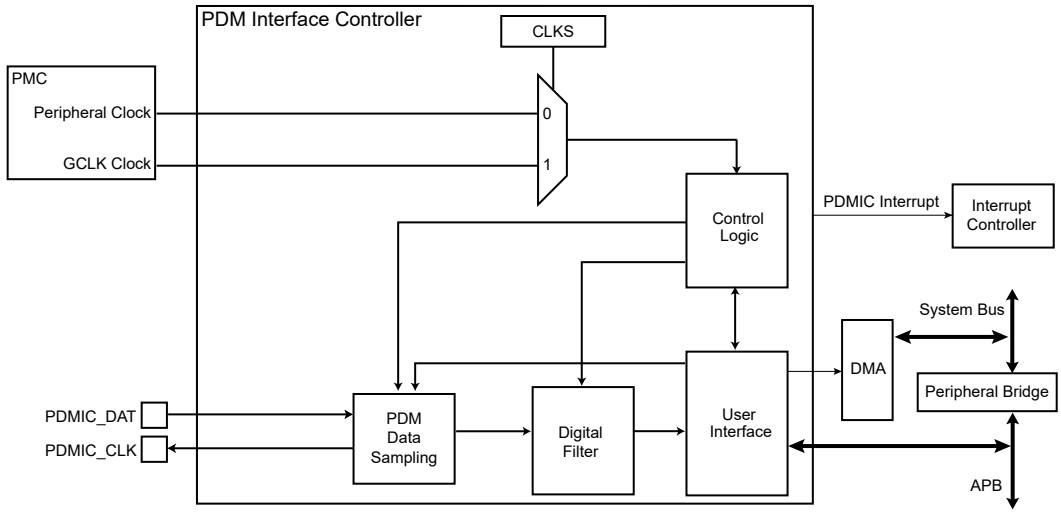
The Pulse Density Modulation Interface Controller (PDMIC) is a PDM interface controller and decoder that support mono PDM format. It integrates a clock generator driving the PDM microphone and embeds filters which decimate the incoming bitstream to obtain most common audio rates.

## 54.2 Embedded Characteristics

- 16-bit Resolution
- DMA Controller Support
- Up to 4 Conversions Stored
- PDM Clock Source can be Independent from Core Clock
- Register Write Protection

## 54.3 Block Diagram

**Figure 54-1. PDMIC Block Diagram**



## 54.4 Signal Description

**Table 54-1. PDMIC Pin Description**

| Pin Name | Description | Type |
|---|---|---|
| PDMIC_CLK | Pulse Density Modulation Bitstream Sampling Clock | Output |
| PDMIC_DAT | Pulse Density Modulation Data | Input |

## 54.5 Product Dependencies

### 54.5.1 I/O Lines

The pins used for interfacing the PDMIC are multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the peripheral functions to PDMIC pins.

### 54.5.2 Power Management

The PDMIC is not continuously clocked. The user must first enable the PDMIC peripheral clocks (PDMIC Channel 0 and PDMIC Channel 1) and the PDMIC Generic Clock in the Power Management Controller (PMC) before using the controller.

### 54.5.3 Interrupt Sources

The PDMIC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PDMIC interrupt requires the Interrupt Controller to be programmed first.

## 54.6 Functional Description

### 54.6.1 PDM Interface

#### 54.6.1.1 Description

The PDM clock (PDMIC_CLK) is used to sample the PDM bitstream.

The PDMIC_CLK frequency range is between peripheral clock/2 and peripheral clock/256 or between GCLK clock/2 and GCLK clock/256, depending on the selected clock source.

The GCLK clock frequency must always be at least three times lower than the peripheral clock frequency.

The field PRESCAL in the Mode Register (PDMIC_MR) must be programmed in order to provide a PDMIC_CLK frequency compliant with the microphone parameters.

#### 54.6.1.2 Start-up Sequence

To start processing the bitstream coming from the PDM interface, follow the steps below:

1. Clear all bits in the Control Register (PDMIC_CR) or compute a soft reset using the SWRST bit of PDMIC_CR.
2. Configure the PRESCAL field in PDMIC_MR according to the microphone specifications.
3. Enable the PDM mode and start the conversions using the ENPDM bit in PDMIC_CR.

### 54.6.2 Digital Signal Processing (Digital Filter)

#### 54.6.2.1 Description

The PDMIC includes a DSP section containing a decimation filter, a droop compensation filter, a sixth-order low pass filter, a first-order high pass filter and an offset and gain compensation stage. A block diagram of the DSP section is represented in Figure 54-2.

Data processed by the filtering section are two’s complement signals defined on 24 bits.

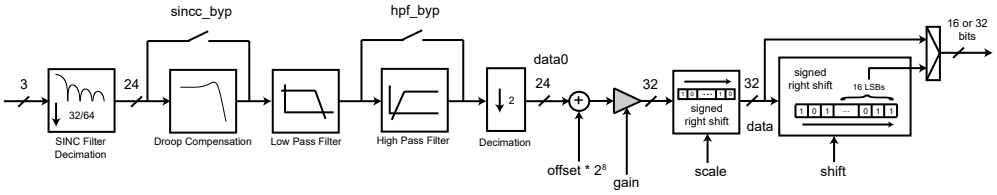
The filtering of the decimation stage is performed by a fourth-order sinc-based filter whose zeros are placed in order to minimize aliasing effects of the decimation. The decimation ratio of this filter is either 32 or 64. The droop induced by this filter can be compensated by the droop compensation stage.

The sixth-order low pass filter is used to decimate the sinc filter output by a ratio of 2.

An optional first-order high pass filter is implemented in order to eliminate the DC component of the incoming signal.

The overall decimation ratio of this DSP section is either 64 or 128. This fits an audio sampling rate of 48 kHz with a PDM microphone sampling frequency of either 3.072 or 6.144 MHz. The frequency response of the filters optimizes the gain flatness between 0 and 20 kHz (when the droop compensation filter is implemented and the high pass filter is bypassed) and highly reduces the aliasing effects of the decimation.

**Figure 54-2. DSP Block Diagram**



### 54.6.2.2 Decimation Filter

The sigma-delta architecture of the PDM microphone implies a filtering and a decimation of the bitstream at the output of the microphone bitstream. The decimation filter decimates the bitstream by either 32 or 64. To perform this operation, a fourth-order sinc filter with an Over-Sampling Ratio (OSR) of 32 or 64 is implemented with the following transfer function:

$$H(z) = \frac{1}{\mathrm{OSR}^4}\left(\sum_{i=0}^{\mathrm{OSR}-1} z^{-i}\right)^4$$

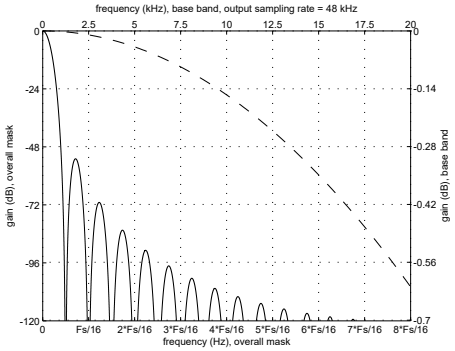
The DC gain of this filter is unity and does not depend on its OSR. However, as it generates a fourth-order zero at Fs/OSR frequency multiples (Fs being the sampling frequency of the microphone), the frequency response of the decimation filter depends on the OSR parameter. See 54.6.2.3 Droop Compensation for frequency plots.

Its non-flat frequency response can be compensated over the 0 to 20 kHz band by using the droop compensation filter when the decimated frequency is set to 48 kHz. See 54.6.2.3 Droop Compensation.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

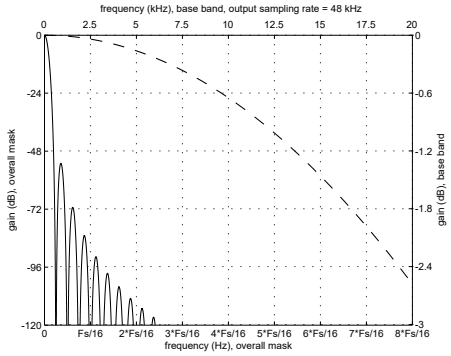
In Figure 54-3 and Figure 54-4, Fs is the sampling rate of the PDM microphone.

**Figure 54-3. Spectral mask of an OSR = 32, Fs = 6.144 MHz, Fourth-Order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**



The zeros of this filter are located at multiples of Fs/32

**Figure 54-4. Spectral Mask of an OSR = 64, Fs = 3.072 MHz, Fourth-order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**



The zeros of this filter are located at multiples of Fs/64.

### 54.6.2.3 Droop Compensation

The droop effect introduced by the sinc filter can be compensated in the 0 to 20 kHz by the droop compensation filter (see Figure 54-5). This is a second-order IIR filter which is applied on the signal output by the sinc. The default coefficients of the droop compensation filter are computed to optimize the droop of the sinc filter with the decimated frequency equal to 48 kHz.

This filter compensates the droop of the sinc filter regardless of the OSR value.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the SINBYP bit in the PDMIC DSP Configuration Register 0 (PDMIC_DSPR0).

**Figure 54-5. Droop Compensation Filter Overall Frequency Response**

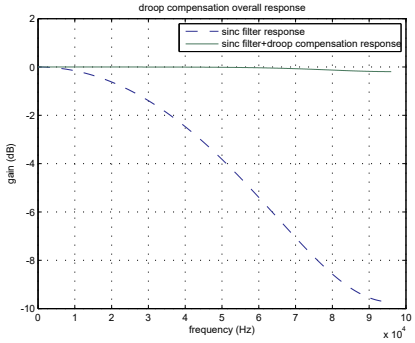


**Figure 54-6. Droop Compensation Filter 0 to 20 kHz Band Flatness**

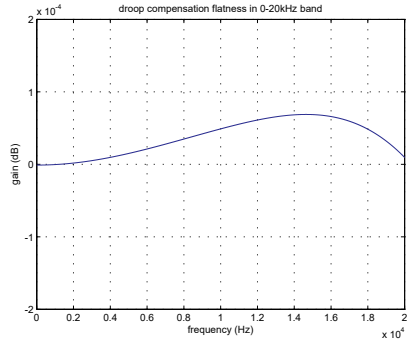

#### 54.6.2.4 Low Pass Filter

The PDMIC includes a sixth-order IIR filter that performs a low pass transfer function and decimates by 2 the output of the sinc filter. The coefficients are computed for a decimated sampling rate of 48 kHz and optimize the 0 to 20 kHz band flatness while rejecting the aliasing of the PDM microphone by at least 60 dB in the 28 to 48 kHz band.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

Figure 54-7 and Figure 54-8 are drawn for an output sampling frequency of 48 kHz.

**Figure 54-7. Low Pass Filter Spectral Mask**

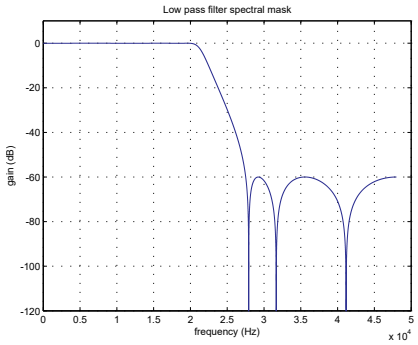

**Figure 54-8. Low Pass Filter Ripple in the 0 to 20 kHz Band**

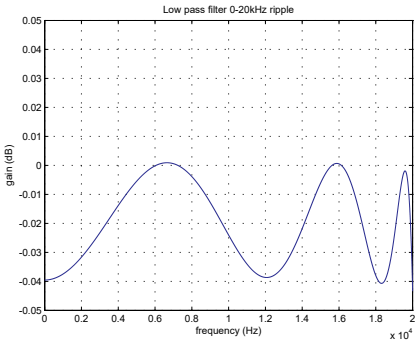


#### 54.6.2.5 High Pass Filter

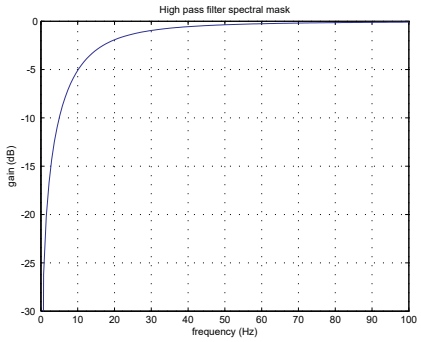
The PDMIC includes an optional first-order IIR filter performing a high pass transfer function after the low pass filter and before the decimation. The coefficients are computed for a decimated sampling rate of 48 kHz to obtain a -3dB cutoff frequency at 15 Hz.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the HPFBYP bit in PDMIC_DSPR0 (see 54.7.8 PDMIC_DSPR0).

Figure 54-9 is drawn for an output sampling frequency of 48 kHz.

**Figure 54-9. High Pass Filter Spectral Mask in the 0 to 100 Hz Band**



#### 54.6.2.6 Gain and Offset Compensation

An offset, a gain, a scaling factor and a shift can be applied to a converted PDM microphone value using the following operation:

$$\text{data} = \frac{\left(\text{data}_0 + \text{offset} \times 2^8\right) \times \text{dgain}}{2^{\text{scale} + \text{shift} + 8}}$$

where:

- $\text{data}_0$ is a signed integer defined on 24 bits. It is the output of the filtering channel.
- offset is a signed integer defined on 16 bits (see PDMIC DSP Configuration Register 1). It is multiplied by $2^8$ to have the same weight as $\text{data}_0$.
- dgain is an unsigned integer defined on 15 bits (see PDMIC DSP Configuration Register 1). Only the 32 MSBs of the multiplication operation are used for scaling and shifting operations. dgain defaults to 0 after reset, which forces CDR to 0. It must be programmed to a non-zero value to read non-zero data into the PDMIC_CDR register.
- scale is an unsigned integer defined on 4 bits (see PDMIC DSP Configuration Register 0). It shifts the multiplication operation result by scale bits to the right. Maximum allowed value is 15.
- shift is an unsigned integer defined on 4 bits (see PDMIC DSP Configuration Register 0). It shifts the multiplication operation result by shift bits to the right. Maximum allowed value is 15.

If the data transfer is configured in 32-bit mode (see PDMIC DSP Configuration Register 0), the $2^{\text{shift}}$ division is not performed and the 32-bit result of the remaining operation is sent.

If the data transfer is configured in 16-bit mode, the $2^{\text{shift}}$ division is performed. The result is then saturated to be within $\pm(2^{15}-1)$ and the 16 LSBs of this saturation operation are sent to the controller as the result of the PDM microphone conversion.

Default parameters are defined to output a 16-bit result whatever the data transfer configuration may be.

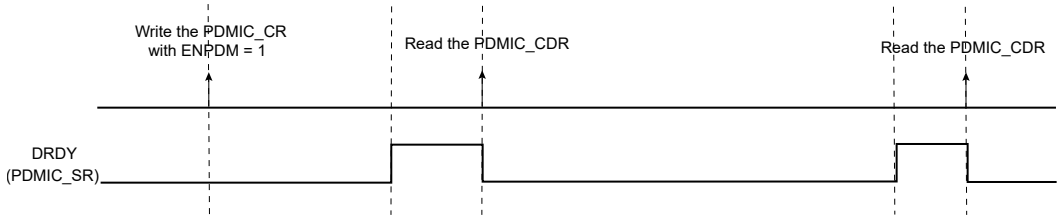
### 54.6.3 Conversion Results

When a conversion is completed, the resulting 16-bit digital value is stored in the PDMIC Converted Data Register (PDMIC_CDR).

The DRDY bit in the Interrupt Status Register (PDMIC_ISR) is set. In the case of a connected DMA Controller channel, DRDY rising triggers a data transfer request. In any case, DRDY can trigger an interrupt.

Reading PDMIC_CDR clears the DRDY flag.

**Figure 54-10. DRDY Flag Behavior**



If PDMIC_CDR is not read before further incoming data is converted, the Overrun Error (OVRE) flag is set in PDMIC_ISR. Likewise, new data converted when DRDY is high sets the OVRE bit (Overrun Error) in PDMIC_ISR. In case of overrun, the newly converted data is lost.

The OVRE flag is automatically cleared when PDMIC_ISR is read.

### 54.6.4 Register Write Protection

To prevent any single software error from corrupting PDMIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the PDMIC Write Protection Mode Register (PDMIC_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the PDMIC Write Protection Status Register (PDMIC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PDMIC_WPSR.

The following registers can be write-protected:

- PDMIC Mode Register
- PDMIC DSP Configuration Register 0
- PDMIC DSP Configuration Register 1

## 54.7 Register Summary

### 54.7.1 PDMIC Control Register

**Name:** PDMIC_CR
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | ENPDM | | | | SWRST |
| Access | | | | R/W | | | | R/W |
| Reset | | | | 0 | | | | 0 |

**Bit 4 – ENPDM** Enable PDM

| Value | Description |
|---|---|
| 0 | Disables the PDM and stops the conversions. |
| 1 | Enables the PDM and starts the conversions. |

**Bit 0 – SWRST** Software Reset
Warning: The read value of this bit is always 0.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the PDMIC, simulating a hardware reset. |

### 54.7.2 PDMIC Mode Register

**Name:** PDMIC_MR
**Offset:** 0x04
**Reset:** 0x00F00000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PDMIC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | PRESCAL[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | CLKS | | | | |
| Access | | | | R/W | | | | |
| Reset | | | | 0 | | | | |

**Bits 14:8 – PRESCAL[6:0]** Prescaler Rate Selection
PRESCAL determines the frequency of the PDM bitstream sampling clock (PDMIC_CLK):

$$\mathrm{PRESCAL} = \frac{\mathrm{SELCK}}{2 \times f_{\mathrm{PDMIC_CLK}}} - 1$$

where SELCK is either $f_{\text{peripheral clock}}$ or $f_{\text{GCLK clock}}$ depending on the value of bit CLKS ($f_{\text{peripheral clock}}$ or $f_{\text{GCLK clock}}$ is the clock frequency in Hz).

**Bit 4 – CLKS** Clock Source Selection

| Value | Description |
|---|---|
| 0 | Peripheral clock selected |
| 1 | GCLK clock selected (This clock source can be independent of the processor clock.) |

### 54.7.3 PDMIC Converted Data Register

**Name:** PDMIC_CDR
**Offset:** 0x14
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DATA[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | DATA[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – DATA[31:0]** Data Converted
The filtered output data is placed into this register at the end of a conversion and remains until it is read.

### 54.7.4 PDMIC Interrupt Enable Register

**Name:** PDMIC_IER
**Offset:** 0x18
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | OVRE | DRDY |
| Access | | | | | | | W | W |
| Reset | | | | | | | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 25 – OVRE** Overrun Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No overrun error has occurred since the last read of PDMIC_ISR. |
| 1 | At least one overrun error has occurred since the last read of PDMIC_ISR. |

**Bit 24 – DRDY** Data Ready (cleared by reading PDMIC_CDR)

| Value | Description |
|---|---|
| 0 | No data has been converted since the last read of PDMIC_CDR. |
| 1 | At least one data has been converted and is available in PDMIC_CDR. |

**Bits 23:16 – FIFOCNT[7:0]** FIFO Count
Number of conversions available in the FIFO (not a source of interrupt).

### 54.7.8 PDMIC DSP Configuration Register 0

**Name:** PDMIC_DSPR0
**Offset:** 0x58
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PDMIC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 15:12 – SHIFT[3:0]** Data Shift
Shifts the scaled result by SHIFT bits to the right.

**Bits 11:8 – SCALE[3:0]** Data Scale
Shifts the multiplication operation result by SCALE bits to the right.

**Bits 6:4 – OSR[2:0]** Global Oversampling Ratio
Values not listed are reserved.

| Value | Name | Description |
|---|---|---|
| 0 | 128 | Global Oversampling ratio is 128 (SINC filter oversampling ratio is 64) |
| 1 | 64 | Global Oversampling ratio is 64 (SINC filter oversampling ratio is 32) |

**Bit 3 – SIZE** Data Size

| Value | Description |
|---|---|
| 0 | Converted data size is 16 bits. |
| 1 | Converted data size is 32 bits. |

**Bit 2 – SINBYP** SINCC Filter Bypass

| Value | Description |
|---|---|
| 0 | Droop compensation filter enabled. |
| 1 | Bypasses the droop compensation filter. |

**Bit 1 – HPFBYP** High-Pass Filter Bypass

| Value | Description |
|---|---|
| 0 | High-pass filter enabled. |
| 1 | Bypasses the high-pass filter. |

### 54.7.9 PDMIC DSP Configuration Register 1

**Name:** PDMIC_DSPR1
**Offset:** 0x5C
**Reset:** 0x00000001
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the PDMIC Write Protection Mode Register.

DGAIN and OFFSET values can be determined using the formula in 54.6.2.6 Gain and Offset Compensation.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | OFFSET[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | OFFSET[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | DGAIN[14:8] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DGAIN[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

**Bits 31:16 – OFFSET[15:0]** Offset Correction
Offset correction to apply to the final result.

**Bits 14:0 – DGAIN[14:0]** Gain Correction
Gain correction to apply to the final result.

### 54.7.10 PDMIC Write Protection Mode Register

**Name:** PDMIC_WPMR
**Offset:** 0xE4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x414443 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0. |

**Bit 0 – WPEN** Write Protection Enable
See 54.6.4 Register Write Protection for the list of registers that can be write-protected.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY corresponds to 0x414443 (“ADC” in ASCII). |
| 1 | Enables the write protection if WPKEY corresponds to 0x414443 (“ADC” in ASCII). |

### 54.7.11 PDMIC Write Protection Status Register

**Name:** PDMIC_WPSR
**Offset:** 0xE8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of PDMIC_WPSR. |
| 1 | A write protection violation has occurred since the last read of PDMIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 55. Pulse Width Modulation Controller (PWM)

## 55.1 Description

The Pulse Width Modulation Controller (PWM) generates output pulses on 4 channels independently according to parameters defined per channel. Each channel controls two complementary square output waveforms. Characteristics of the output waveforms such as period, duty-cycle, polarity and dead-times (also called dead-bands or non-overlapping times) are configured through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock. External triggers can be managed to allow output pulses to be modified in real time.

All accesses to the PWM are made through registers mapped on the peripheral bus. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum, the duty-cycle or the dead-times.

Channels can be linked together as synchronous channels to be able to update their duty-cycle or dead-times at the same time.

The update of duty-cycles of synchronous channels can be performed by the DMA Controller channel which offers buffer transfer without processor Intervention.

The PWM includes a spread-spectrum counter to allow a constantly varying period (only for Channel 0). This counter may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

The PWM provides 1 independent comparison units capable of comparing a programmed value to the counter of the synchronous channels (counter of channel 0). These comparisons are intended to generate software interrupts, to trigger pulses on the 2 independent event lines (in order to synchronize ADC conversions with a lot of flexibility independently of the PWM outputs) and to trigger DMA Controller transfer requests.

PWM outputs can be overridden synchronously or asynchronously to their channel counter.

The PWM provides a fault protection mechanism with 6 fault inputs, capable to detect a fault condition and to override the PWM outputs asynchronously (outputs forced to ‘0’, ‘1’ or Hi-Z).

For safety usage, some configuration registers are write-protected.

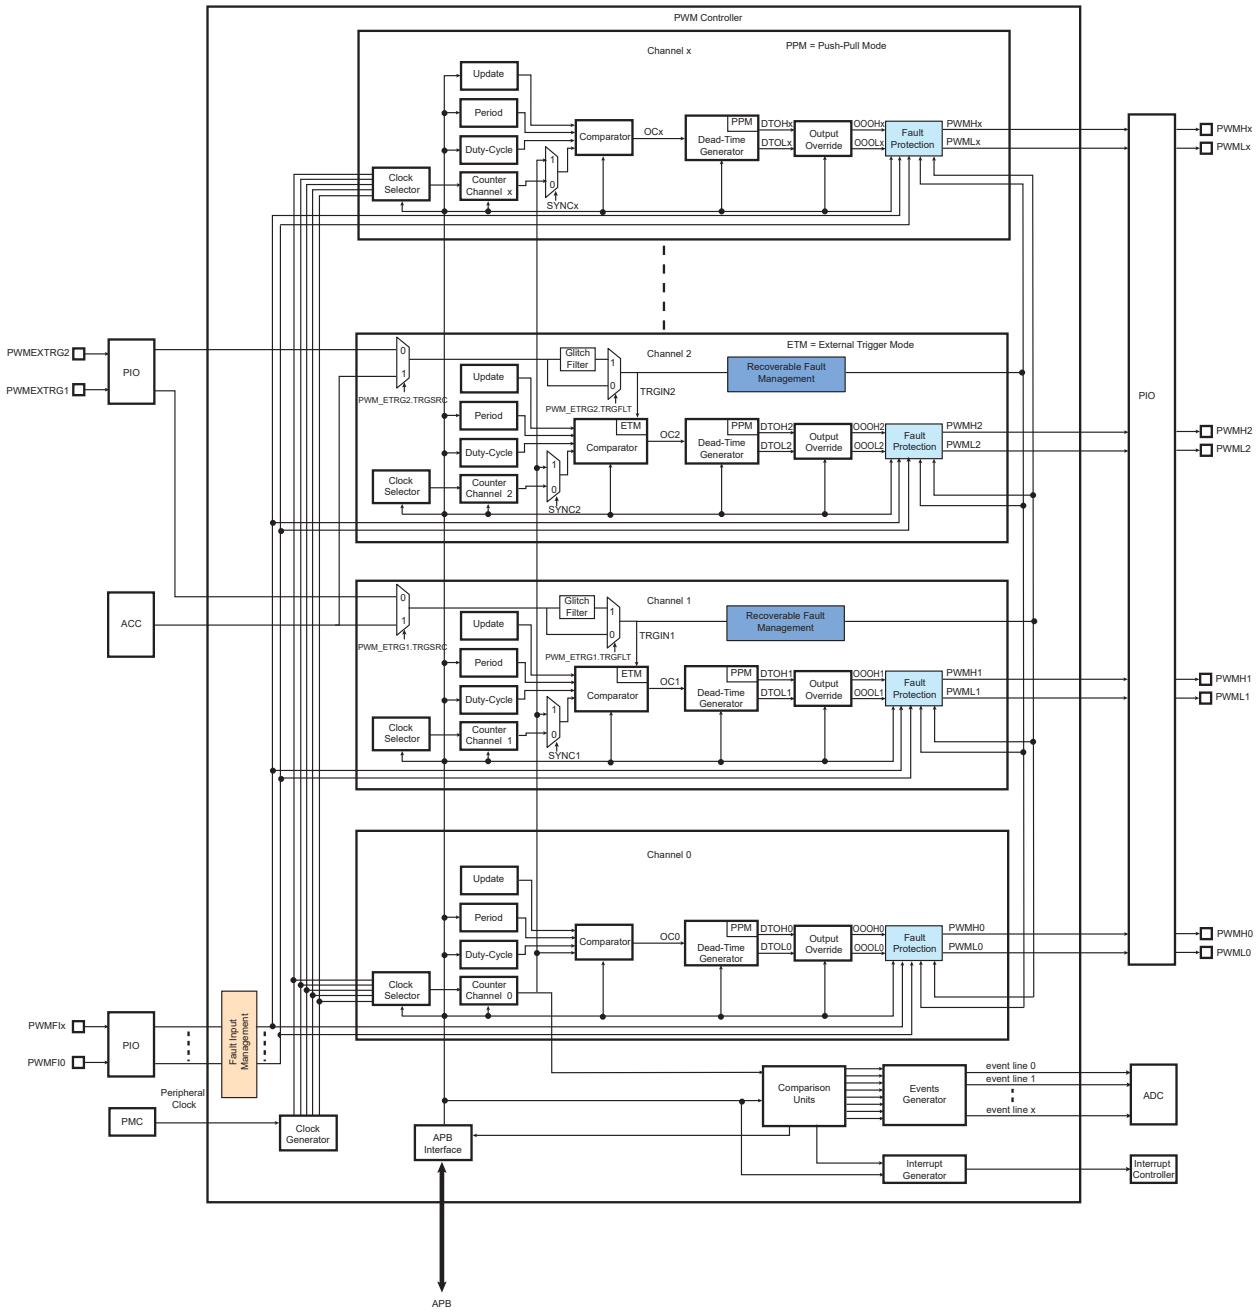
## 55.2 Embedded Characteristics

- 4 Channels
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent 16-bit Counter for Each Channel
  - Independent Complementary Outputs with 16-bit Dead-Time Generator (Also Called Dead-Band or Non-Overlapping Time) for Each Channel
  - Independent Push-Pull Mode for Each Channel
  - Independent Enable Disable Command for Each Channel

  - Independent Clock Selection for Each Channel
  - Independent Period, Duty-Cycle and Dead-Time for Each Channel
  - Independent Double Buffering of Period, Duty-Cycle and Dead-Times for Each Channel
  - Independent Programmable Selection of The Output Waveform Polarity for Each Channel, with Double Buffering
  - Independent Programmable Center- or Left-aligned Output Waveform for Each Channel
  - Independent Output Override for Each Channel
  - Independent Interrupt for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
  - Independent Update Time Selection of Double Buffering Registers (Polarity, Duty Cycle) for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- External Trigger Input Management (e.g., for DC/DC or Lighting Control)
  - External PWM Reset Mode
  - External PWM Start Mode
  - Cycle-By-Cycle Duty Cycle Mode
  - Leading-Edge Blanking
- Two 2-bit Gray Up/Down Channels for Stepper Motor Control
- Spread Spectrum Counter to Allow a Constantly Varying Duty Cycle (only for Channel 0)
- Synchronous Channel Mode
  - Synchronous Channels Share the Same Counter
  - Mode to Update the Synchronous Channels Registers after a Programmable Number of Periods
  - Synchronous Channels Supports Connection of one DMA Controller Channel Which Offers Buffer Transfer Without Processor Intervention To Update Duty-Cycle Registers
- 2 Independent Events Lines Intended to Synchronize ADC Conversions
  - Programmable delay for Events Lines to delay ADC measurements
- 1 Comparison Units Intended to Generate Interrupts, Pulses on Event Lines and DMA Controller Transfer Requests
- 6 Programmable Fault Inputs Providing an Asynchronous Protection of PWM Outputs
  - 2 User Driven through PIO Inputs
  - PMC Driven when Crystal Oscillator Clock Fails
  - ADC Controller Driven through Configurable Comparison Function
  - Timer/Counter Driven through Configurable Comparison Function
- Register Write Protection

## 55.3 Block Diagram

**Figure 55-1. Pulse Width Modulation Controller Block Diagram**



**Note:** For a more detailed illustration of the fault protection circuitry, refer to 55.6.2.7 Fault Protection.

## 55.4 I/O Lines Description

Each channel outputs two complementary external I/O lines.

**Table 55-1. I/O Line Description**

| Name | Description | Type |
|---|---|---|
| PWMHx | PWM Waveform Output High for channel x | Output |
| PWMLx | PWM Waveform Output Low for channel x | Output |
| PWMFIx | PWM Fault Input x | Input |
| PWMEXTRGy | PWM Trigger Input y | Input |

## 55.5 Product Dependencies

### 55.5.1 I/O Lines

The pins used for interfacing the PWM are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines are assigned to PWM outputs.

### 55.5.2 Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

### 55.5.3 Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first.

### 55.5.4 Fault Inputs

The PWM has the fault inputs connected to the different modules. Refer to the implementation of these modules within the product for detailed information about the fault generation procedure. The PWM receives faults from:

- PIO inputs
- the PMC
- the ADC controller
- Timer/Counters

**Table 55-2. Fault Inputs**

| Fault Generator | External PWM Fault Input Number | Polarity Level(1) | Fault Input ID |
|---|---|---|---|
| PB2 | PWMFI0 | User-defined | 0 |
| PB9 | PWMFI1 | User-defined | 1 |
| PMC | – | To be configured to 1 | 2 |

.....continued

| Fault Generator | External PWM Fault Input Number | Polarity Level(1) | Fault Input ID |
|---|---|---|---|
| ADC | – | To be configured to 1 | 3 |
| Timer0 | – | To be configured to 1 | 4 |
| Timer1 | – | To be configured to 1 | 5 |

**Note:**

1. FPOL field in PWMC_FMR.

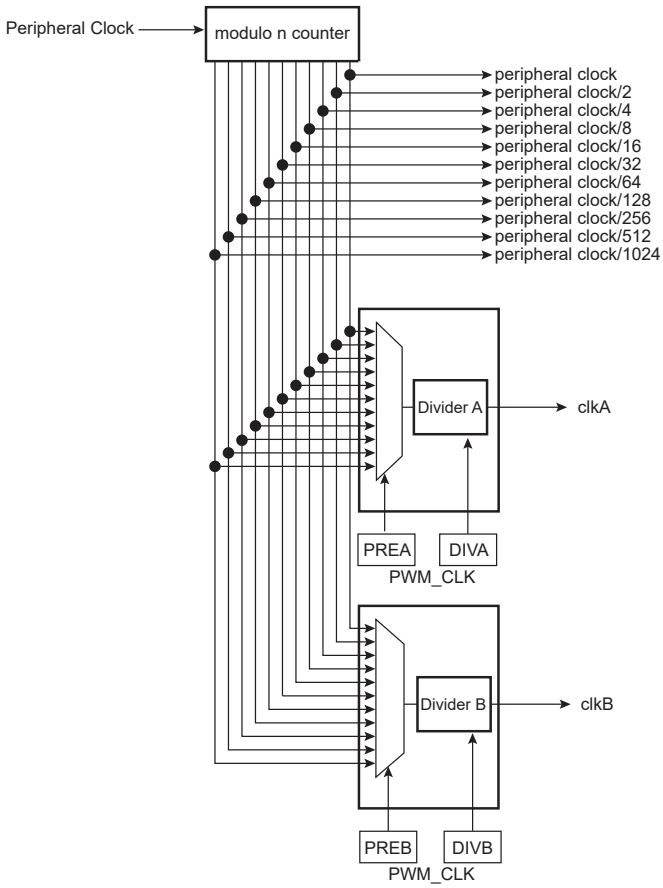
## 55.6 Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the peripheral clock, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

### 55.6.1 PWM Clock Generator

**Figure 55-2. Functional View of the Clock Generator Block Diagram**



The PWM peripheral clock is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided into different blocks:

- a modulo n counter which provides 11 clocks:
  - $f_{peripheral\ clock}$
  - $f_{peripheral\ clock}/2$
  - $f_{peripheral\ clock}/4$
  - $f_{peripheral\ clock}/8$
  - $f_{peripheral\ clock}/16$
  - $f_{peripheral\ clock}/32$
  - $f_{peripheral\ clock}/64$
  - $f_{peripheral\ clock}/128$
  - $f_{peripheral\ clock}/256$
  - $f_{peripheral\ clock}/512$
  - $f_{peripheral\ clock}/1024$
- two linear dividers (1, 1/2, 1/3, ... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Clock register (PWM_CLK). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) are set to ‘0’. This implies that after reset clkA (clkB) are turned off.

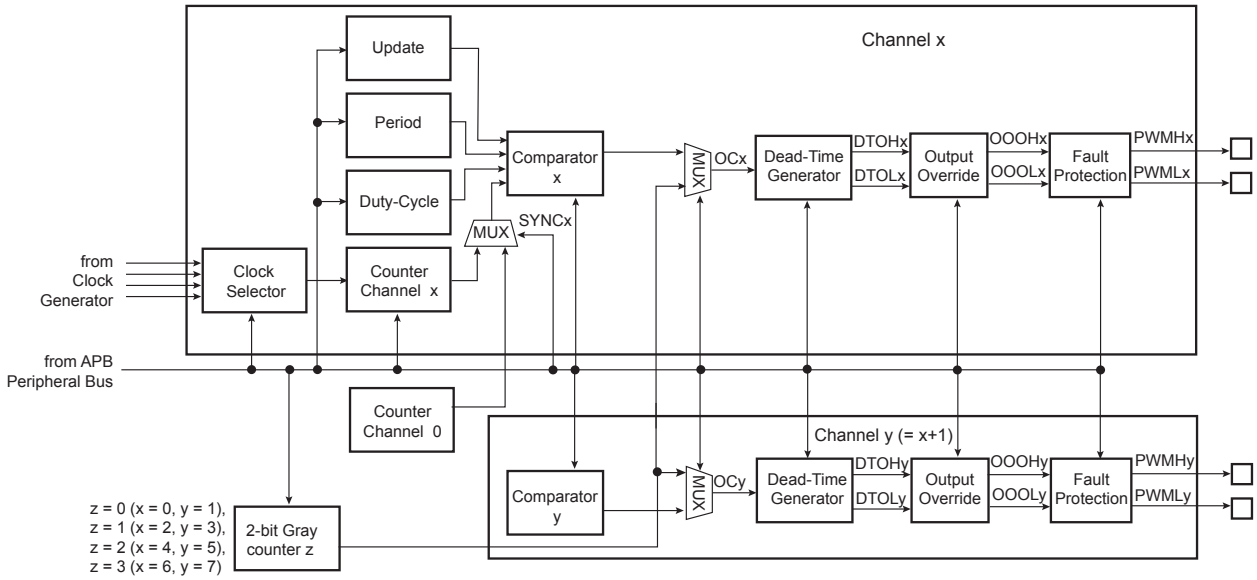
At reset, all clocks provided by the modulo n counter are turned off except the peripheral clock. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

**⚠ CAUTION** Before using the PWM controller, the programmer must first enable the peripheral clock in the Power Management Controller (PMC).

## 55.6.2 PWM Channel

### 55.6.2.1 Channel Block Diagram

**Figure 55-3. Functional View of the Channel Block Diagram**



Each of the 4 channels is composed of six blocks:

- A clock selector which selects one of the clocks provided by the clock generator (described in PWM Clock Generator ).
- A counter clocked by the output of the clock selector. This counter is incremented or decremented according to the channel configuration and comparators matches. The size of the counter is 16 bits.
- A comparator used to compute the OCx output waveform according to the counter value and the configuration. The counter value can be the one of the channel counter or the one of the channel 0 counter according to SYNCx bit in the PWM Sync Channels Mode Register (PWM_SCM).
- A 2-bit configurable Gray counter enables the stepper motor driver. One Gray counter drives 2 channels.
- A dead-time generator providing two complementary outputs (DTOHx/DTOLx) which allows to drive external power control switches safely.
- An output override block that can force the two complementary outputs to a programmed value (OOOHx/OOOLx).
- An asynchronous fault protection mechanism that has the highest priority to override the two complementary outputs (PWMHx/PWMLx) in case of fault detection (outputs forced to ‘0’, ‘1’ or Hi-Z).

### 55.6.2.2 Comparator

The comparator continuously compares its counter value with the channel period defined by CPRD in the PWM Channel Period Register (PWM_CPRDx) and the duty-cycle defined by CDTY in the PWM Channel Duty Cycle Register (PWM_CDTYx) to generate an output signal OCx accordingly.

The different properties of the waveform of the output OCx are:

- the clock selection. The channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the PWM Channel Mode Register (PWM_CMRx). This field is reset at ‘0’.

- the waveform period. This channel parameter is defined in the CPRD field of the PWM_CPRDx register.
  If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:
  By using the PWM peripheral clock divided by a given prescaler value “X” (where X = $2^{PREA}$ is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

  $$\frac{(X \times \mathrm{CPRD})}{f_{\text{peripheral clock}}}$$

  By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

  $$\frac{(X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \mathrm{CPRD} \times \mathrm{DIVB})}{f_{\text{peripheral clock}}}$$

  If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:
  By using the PWM peripheral clock divided by a given prescaler value “X” (where X = $2^{PREA}$ is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

  $$\frac{(2 \times X \times \mathrm{CPRD})}{f_{\text{peripheral clock}}}$$

  By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

  $$\frac{(2 \times X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\text{peripheral clock}}} \text{ or}$$

  $$\frac{(2 \times X \times \mathrm{CPRD} \times \mathrm{DIVB})}{f_{\text{peripheral clock}}}$$
- the waveform duty-cycle. This channel parameter is defined in the CDTY field of the PWM_CDTYx register.
  If the waveform is left-aligned, then:

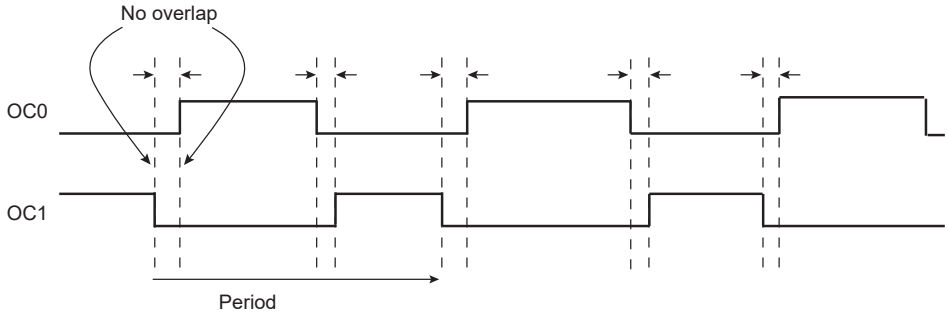
  $$\text{duty cycle} = \frac{(\text{period} - 1/\text{fchannel_x_clock} \times \mathrm{CDTY})}{\text{period}}$$

  If the waveform is center-aligned, then:

  $$\text{duty cycle} = \frac{((\text{period}/2) - 1/\text{fchannel_x_clock} \times \mathrm{CDTY}))}{(\text{period}/2)}$$
- the waveform polarity. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL bit of PWM_CMRx. By default, the signal starts by a low level. The DPOLI bit in PWM_CMRx defines the PWM polarity when the channel is disabled (CHIDx = 0 in PWM_SR). For more details, see the figure *Waveform Properties.*
  – DPOLI = 0: PWM polarity when the channel is disabled is the same as the one defined for the beginning of the PWM period.

  - DPOLI = 1: PWM polarity when the channel is disabled is inverted compared to the one defined for the beginning of the PWM period.
- the waveform alignment. The output waveform can be left- or center-aligned. Center-aligned waveforms can be used to generate non-overlapped waveforms. This property is defined in the CALG bit of PWM_CMRx. The default mode is left-aligned.

**Figure 55-4. Non-Overlapped Center-Aligned Waveforms**



**Note:** See the figure Figure 55-5 for a detailed description of center-aligned waveforms.

When center-aligned, the channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0 (Note that if TRGMODE = MODE3, the PWM waveform switches to 1 at the external trigger event (see Cycle-By-Cycle Duty Mode)).
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0
- CDTY = CPRD and CPOL = 1 (Note that if TRGMODE = MODE3, the PWM waveform switches to 0 at the external trigger event (see Cycle-By-Cycle Duty Mode)).

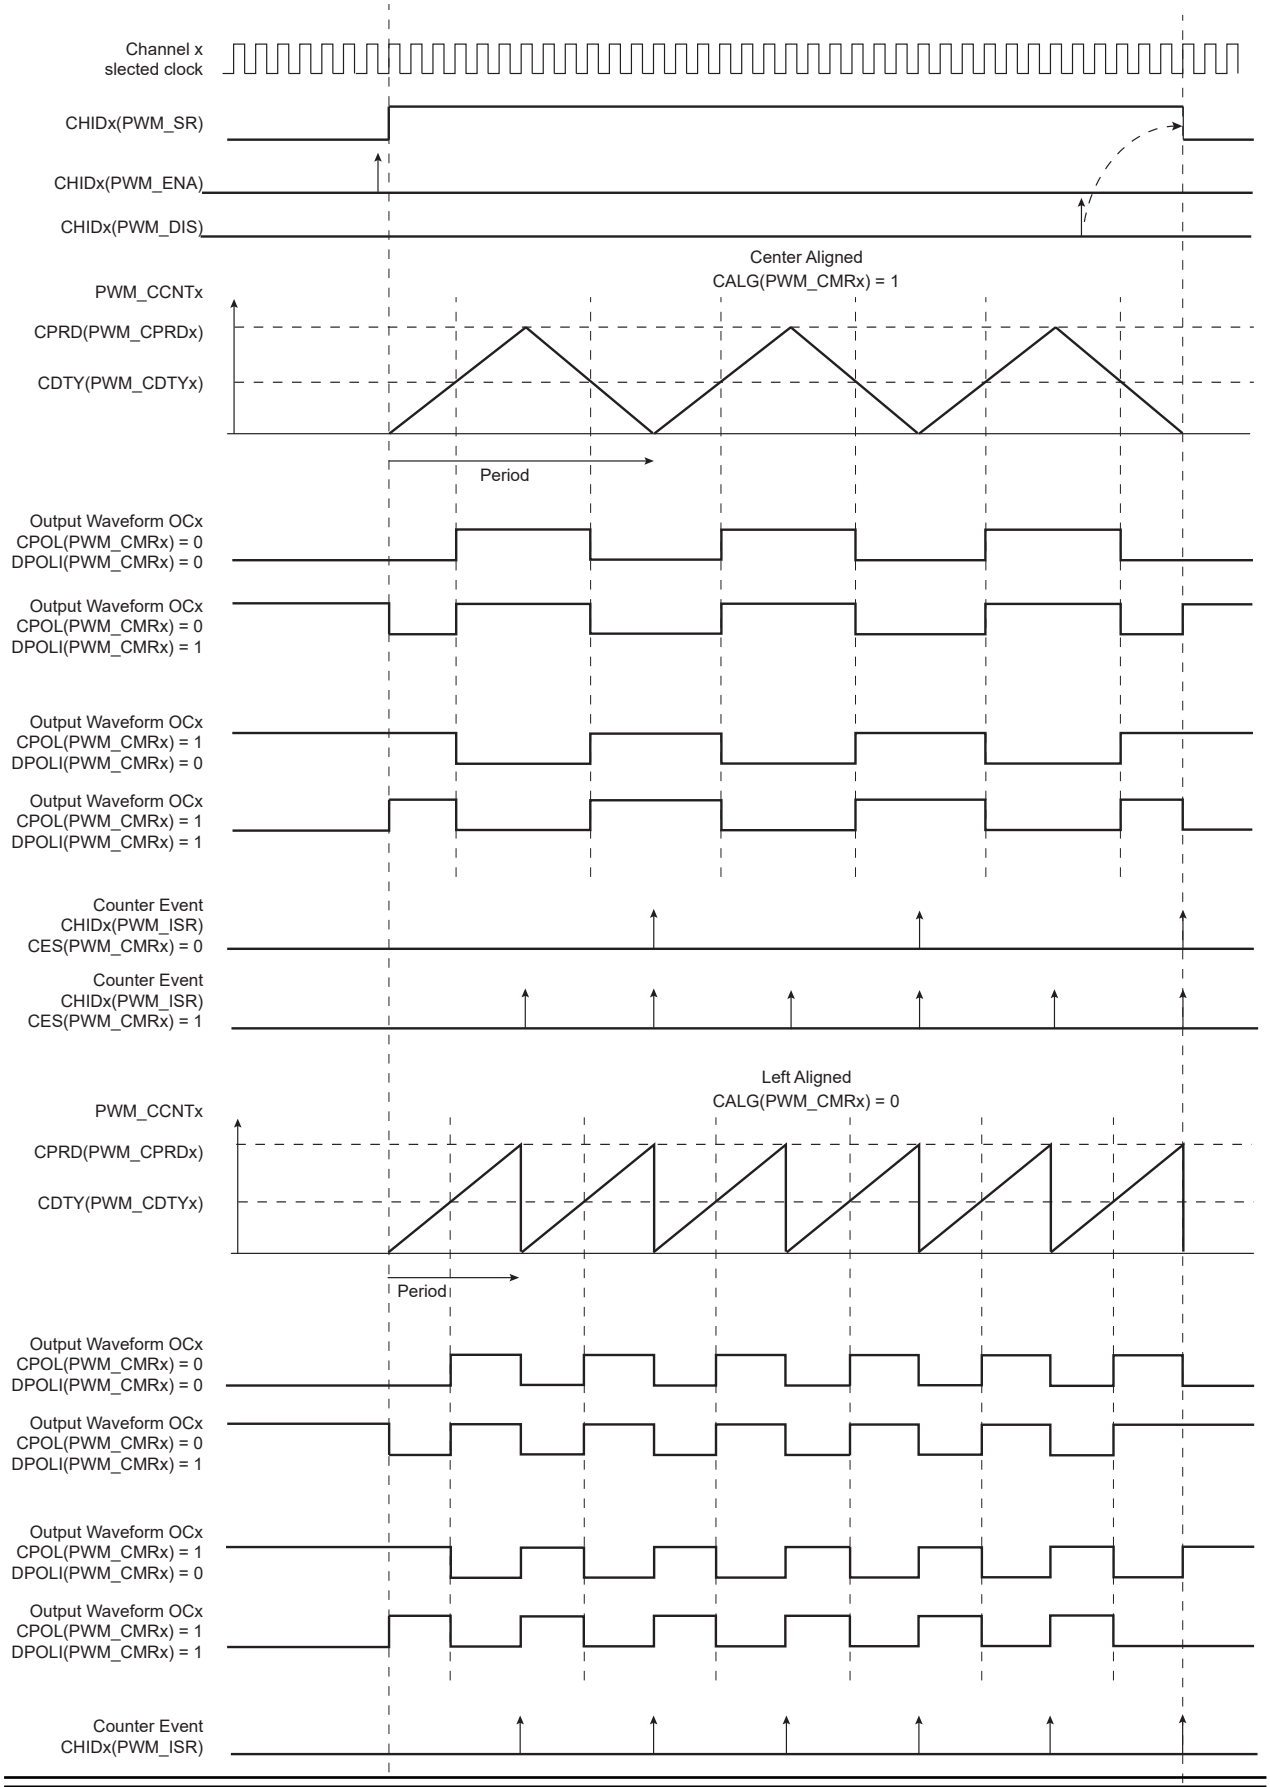
The waveform polarity must be set before enabling the channel. This immediately affects the channel output level.

Modifying CPOL in PWM Channel Mode Register while the channel is enabled can lead to an unexpected behavior of the device being driven by PWM.

In addition to generating the output signals OCx, the comparator generates interrupts depending on the counter value. When the output waveform is left-aligned, the interrupt occurs at the end of the counter period. When the output waveform is center-aligned, the bit CES of PWM_CMRx defines when the channel counter interrupt occurs. If CES is set to ‘0’, the interrupt occurs at the end of the counter period. If CES is set to ‘1’, the interrupt occurs at the end of the counter period and at half of the counter period.

The figure below illustrates the counter interrupts depending on the configuration.

**Figure 55-5. Waveform Properties**



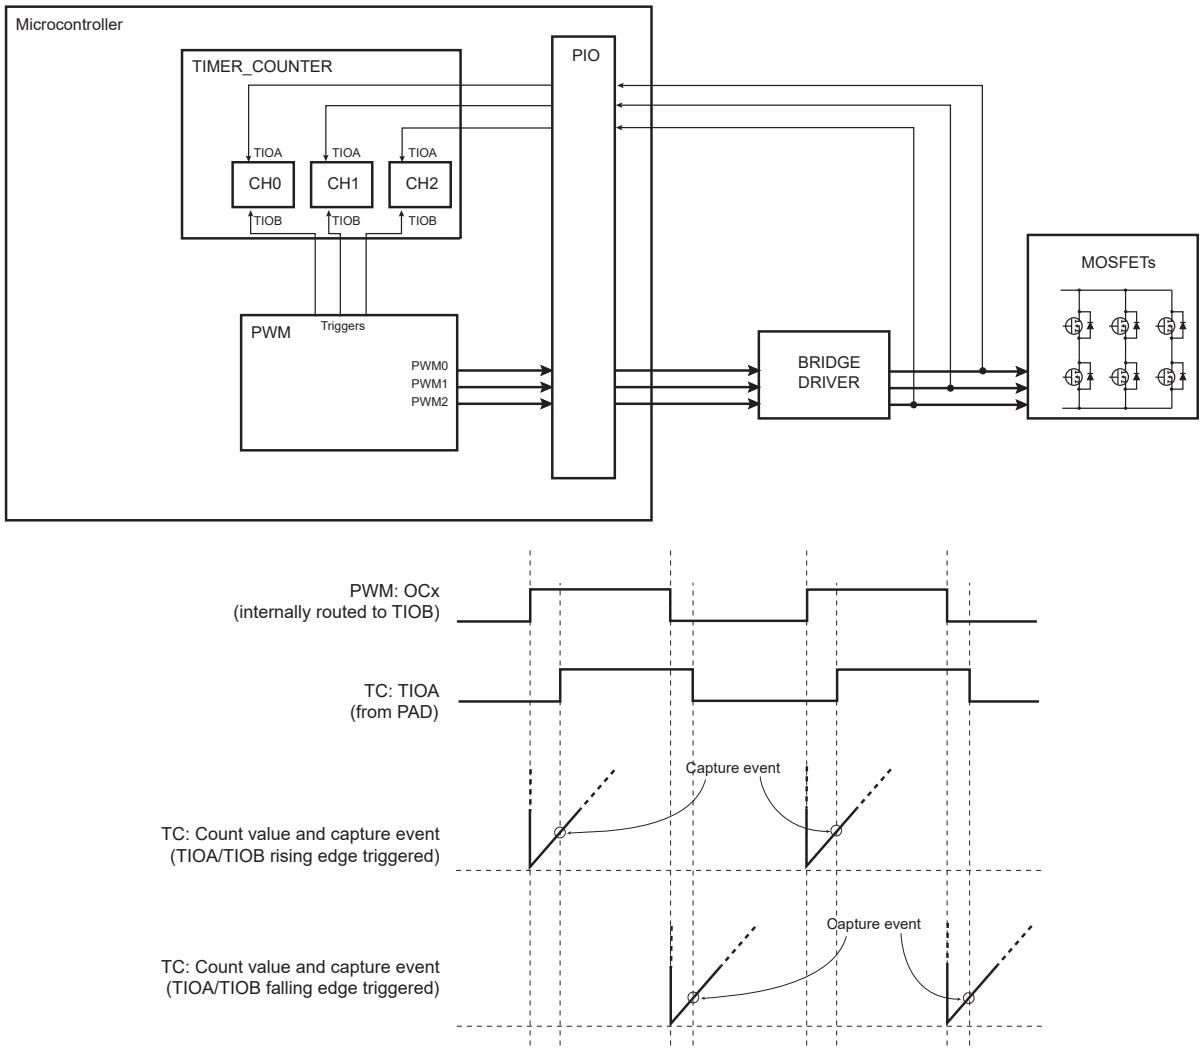
#### 55.6.2.3 Trigger Selection for Timer Counter

The PWM controller can be used as a trigger source for the Timer Counter (TC) to achieve the two application examples described below.

##### 55.6.2.3.1 Delay Measurement

To measure the delay between the channel x comparator output (OCx) and the feedback from the bridge driver of the MOSFETs (see the figure below), the bit TCTS in the PWM Channel Mode Register must be at 0. This defines the comparator output of the channel x as the TC trigger source. The TIOB trigger (TC internal input) is used to start the TC; the TIOA input (from PAD) is used to capture the delay.

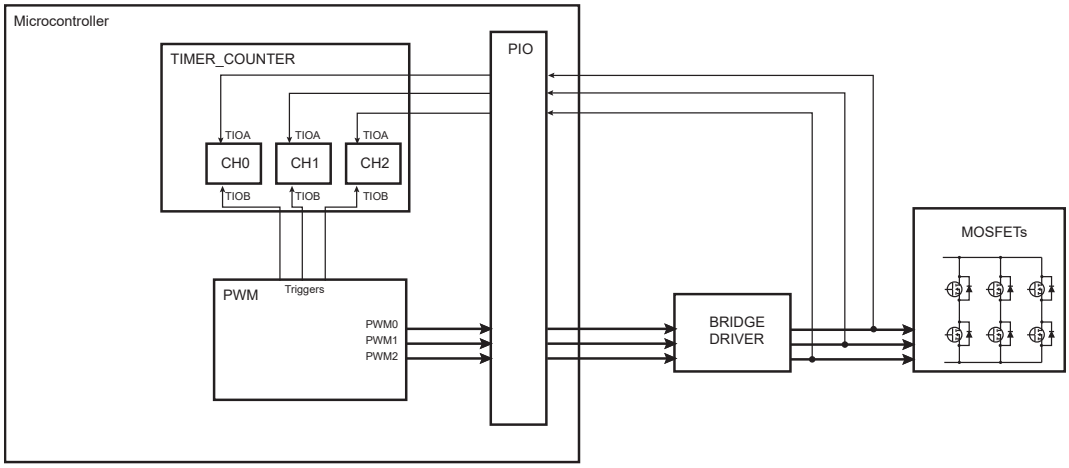
**Figure 55-6. Triggering the TC: Delay Measurement**

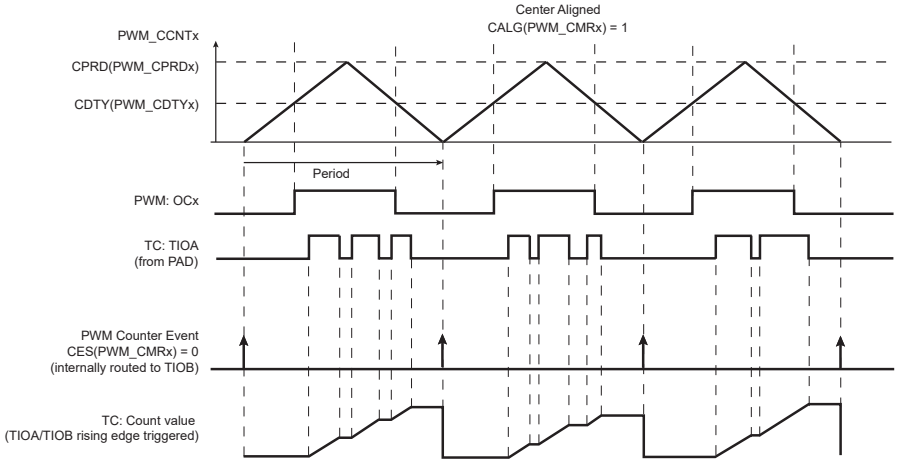


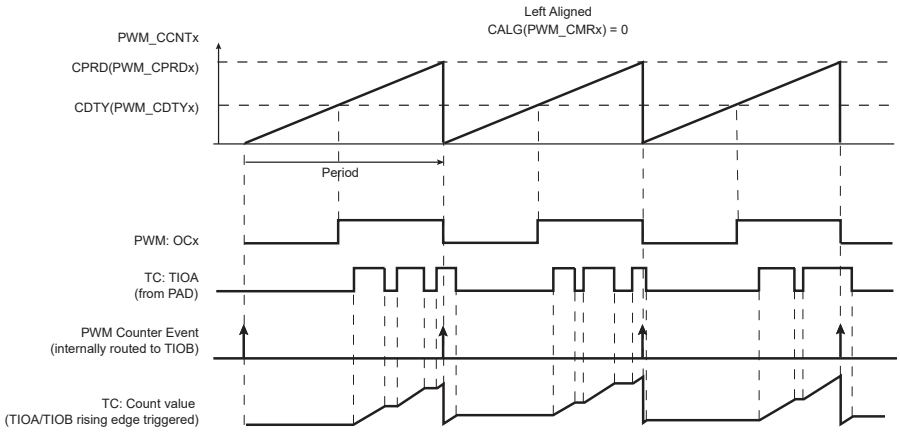
##### 55.6.2.3.2 Cumulated ON Time Measurement

To measure the cumulated “ON” time of MOSFETs (see the figure below), the bit TCTS of the PWM Channel Mode Register must be set to 1 to define the counter event (see the figure *Waveform Properties*) as the Timer Counter trigger source.

**Figure 55-7. Triggering the TC: Cumulated "ON" Time Measurement**







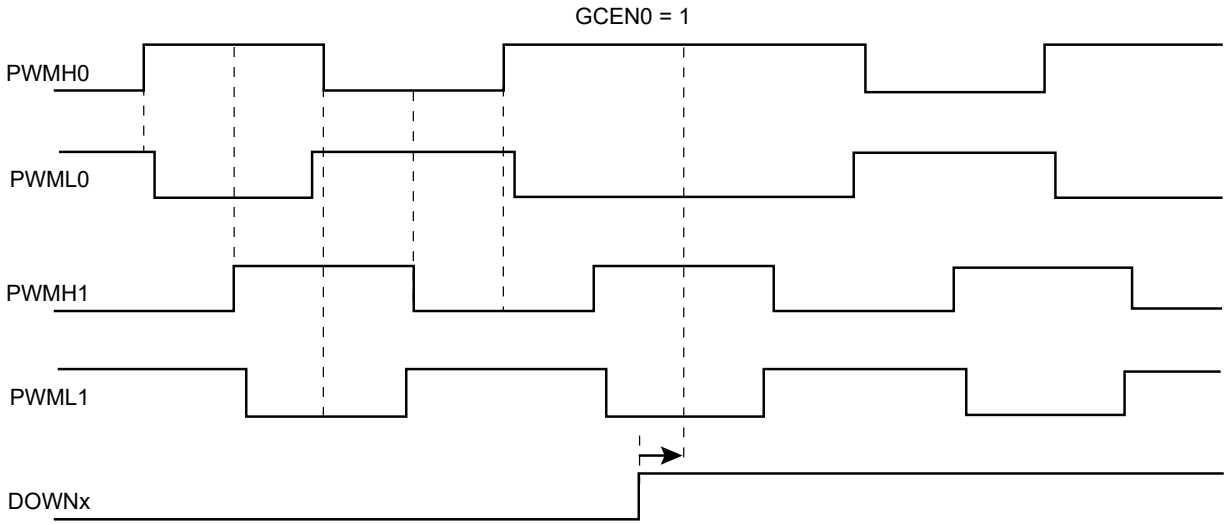
### 55.6.2.4 2-bit Gray Up/Down Counter for Stepper Motor

A pair of channels may provide a 2-bit Gray count waveform on two outputs. Dead-time generator and other downstream logic can be configured on these channels.

Up or Down Count mode can be configured on-the-fly by means of PWM_SMMR configuration registers.

When GCEN0 is set to ‘1’, channels 0 and 1 outputs are driven with a Gray counter.

**Figure 55-8. 2-bit Gray Up/Down Counter**



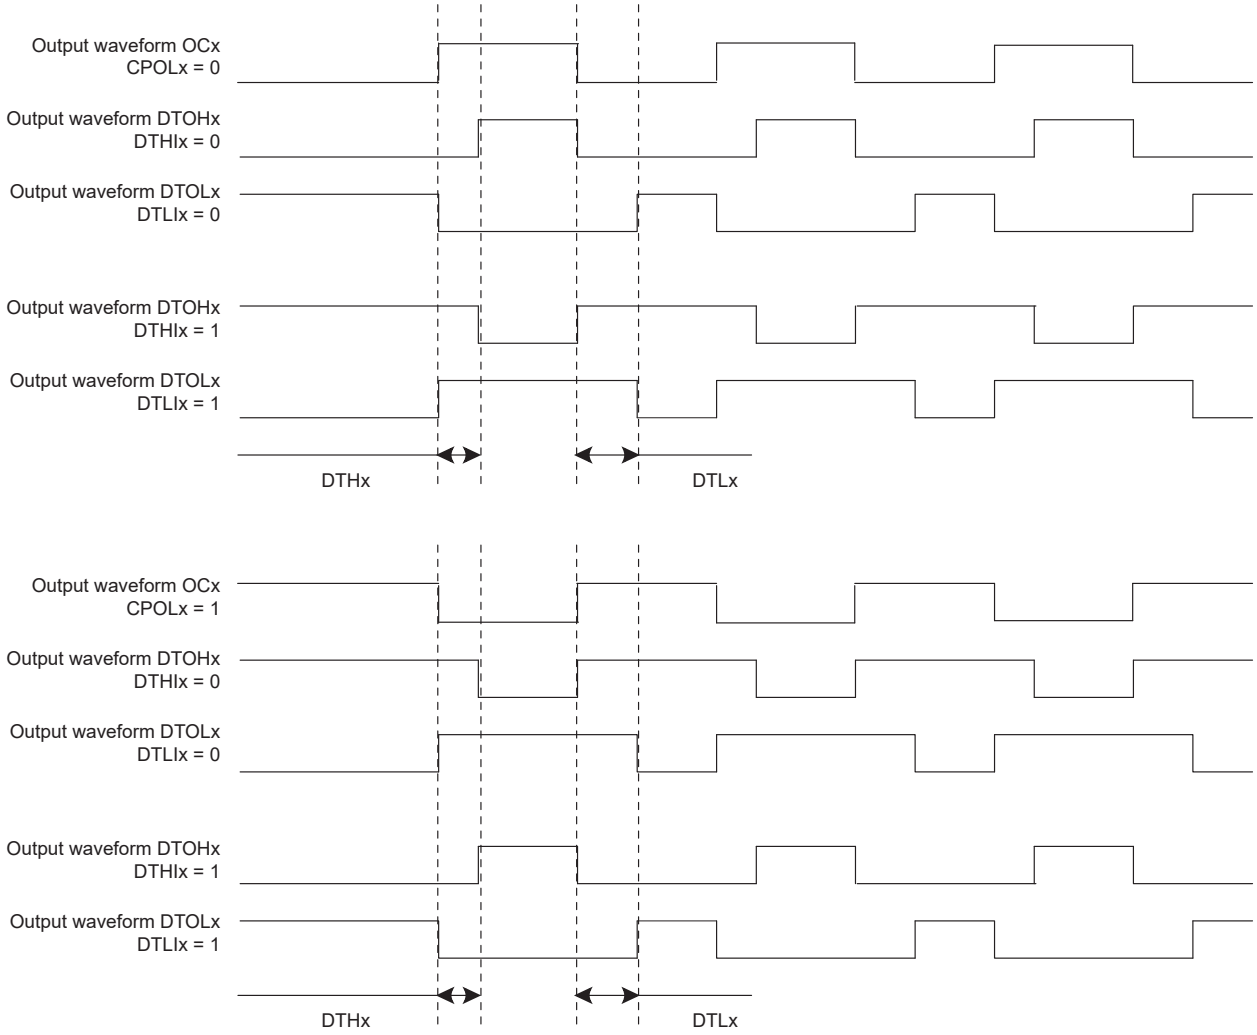
### 55.6.2.5 Dead-Time Generator

The dead-time generator uses the comparator output OCx to provide the two complementary outputs DTOHx and DTOLx, which allows the PWM macrocell to drive external power control switches safely. When the dead-time generator is enabled by setting the bit DTE to 1 or 0 in the PWM Channel Mode Register (PWM_CMRx), dead-times (also called dead-bands or non-overlapping times) are inserted between the edges of the two complementary outputs DTOHx and DTOLx. Note that enabling or disabling the dead-time generator is allowed only if the channel is disabled.

The dead-time is adjustable by the PWM Channel Dead Time Register (PWM_DTx). Each output of the dead-time generator can be adjusted separately by DTH and DTL. The dead-time values can be updated synchronously to the PWM period by using the PWM Channel Dead Time Update Register (PWM_DTUPDx).

The dead-time is based on a specific counter which uses the same selected clock that feeds the channel counter of the comparator. Depending on the edge and the configuration of the dead-time, DTOHx and DTOLx are delayed until the counter has reached the value defined by DTH or DTL. An inverted configuration bit (DTHI and DTLI bit in PWM_CMRx) is provided for each output to invert the dead-time outputs. The following figure shows the waveform of the dead-time generator.

**Figure 55-9. Complementary Output Waveforms**



#### 55.6.2.5.1 PWM Push-Pull Mode

When a PWM channel is configured in Push-Pull mode, the dead-time generator output is managed alternately on each PWM cycle. The polarity of the PWM line during the idle state of the Push-Pull mode is defined by the DPOLI bit in the PWM Channel Mode Register (PWM_CMRx). The Push-Pull mode can be enabled separately on each channel by writing a one to bit PPM in the PWM Channel Mode Register.

**Figure 55-10. PWM Push-Pull Mode**

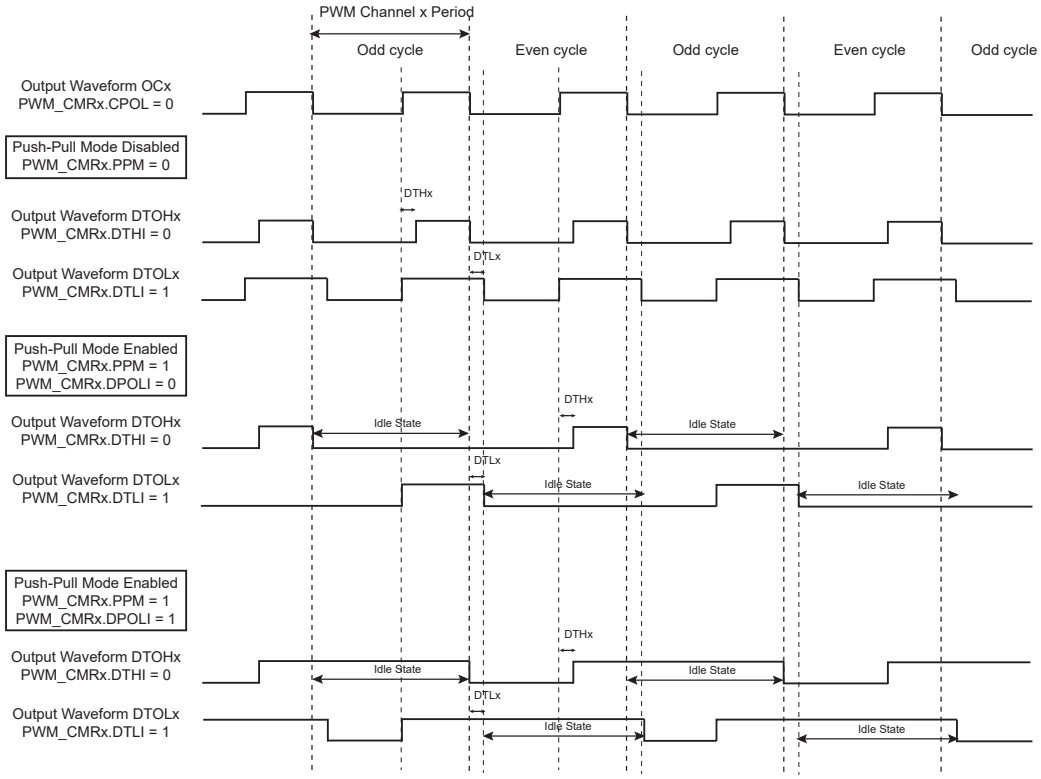


**Figure 55-11. PWM Push-Pull Waveforms: Left-Aligned Mode**

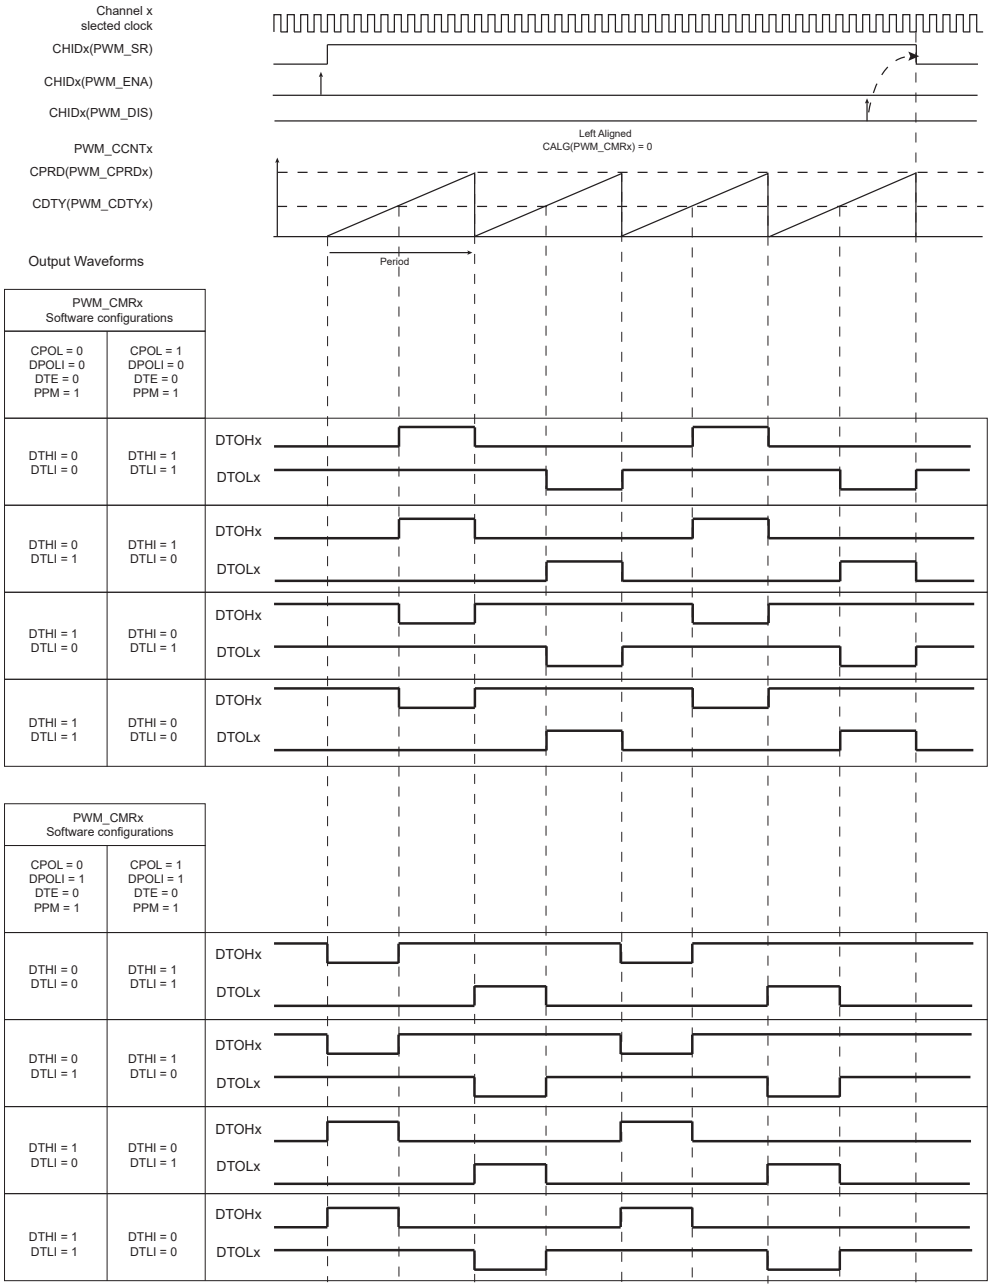

**Figure 55-12. PWM Push-Pull Waveforms: Center-Aligned Mode**

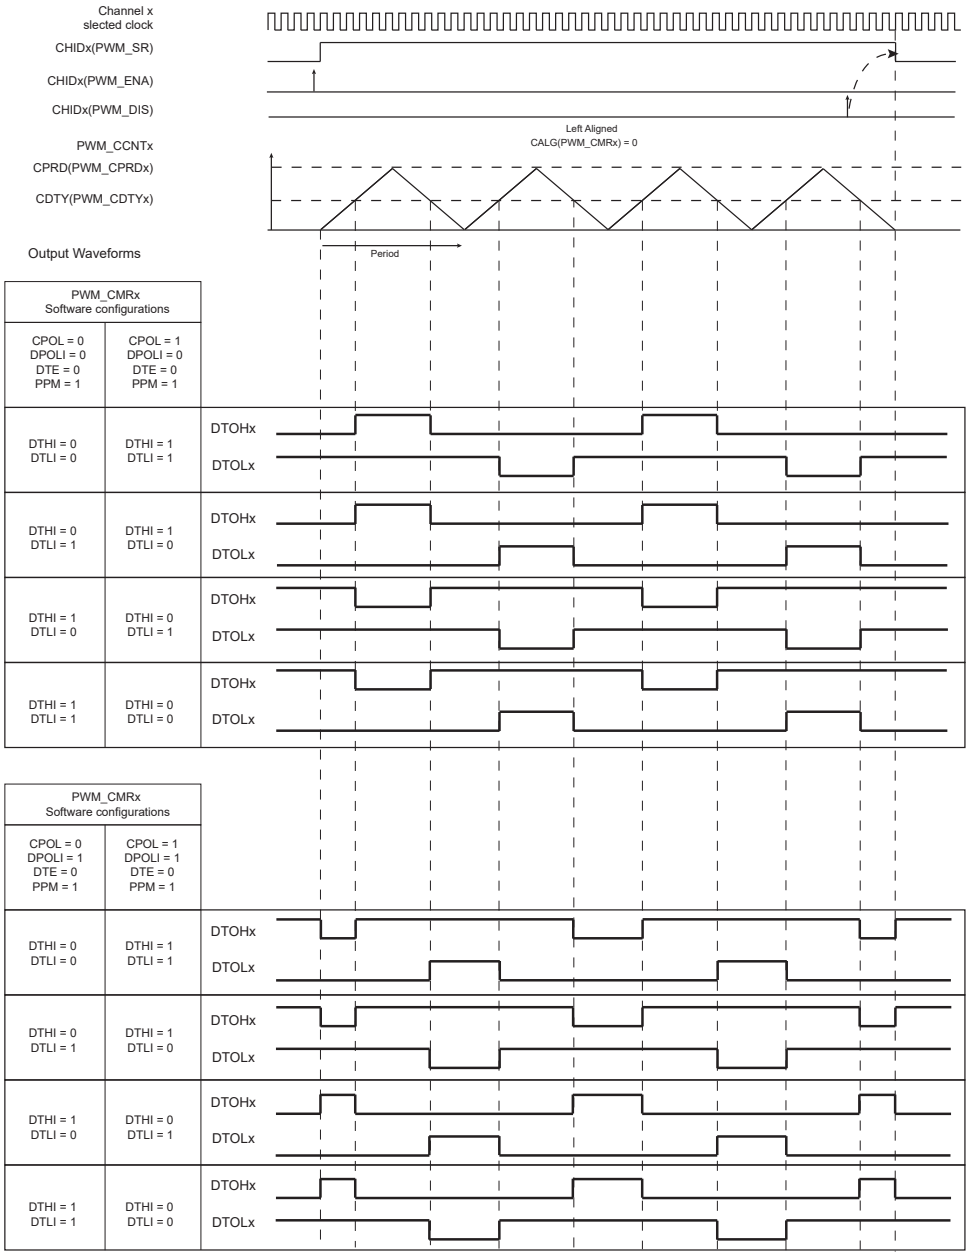

The PWM Push-Pull mode can be useful in transformer-based power converters, such as a half-bridge converter. The Push-Pull mode prevents the transformer core from being saturated by any direct current.

**Figure 55-13. Half-Bridge Converter Application: No Feedback Regulation**

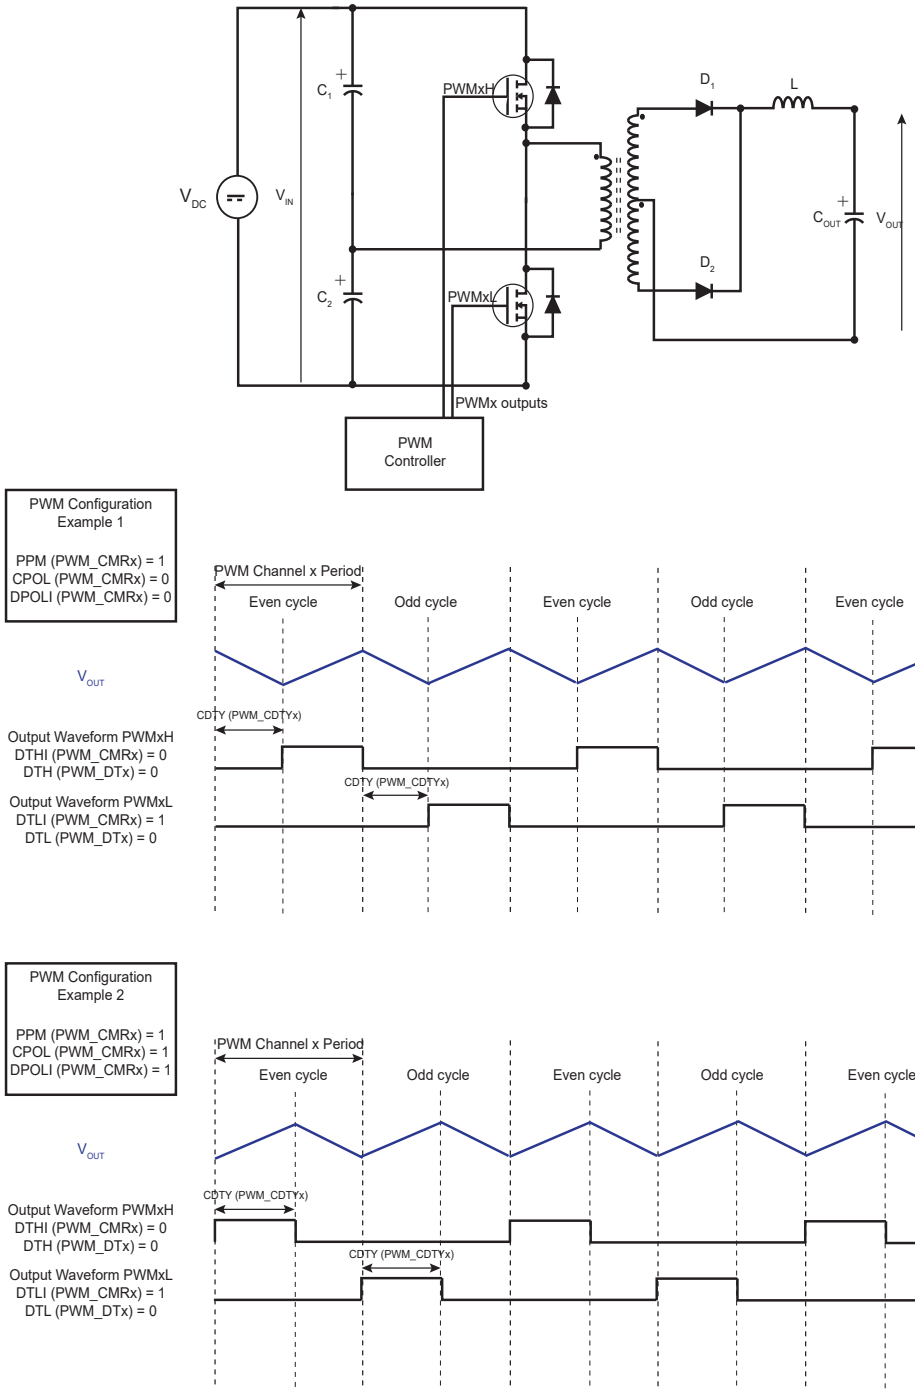

**Figure 55-14. Half-Bridge Converter Application: Feedback Regulation**

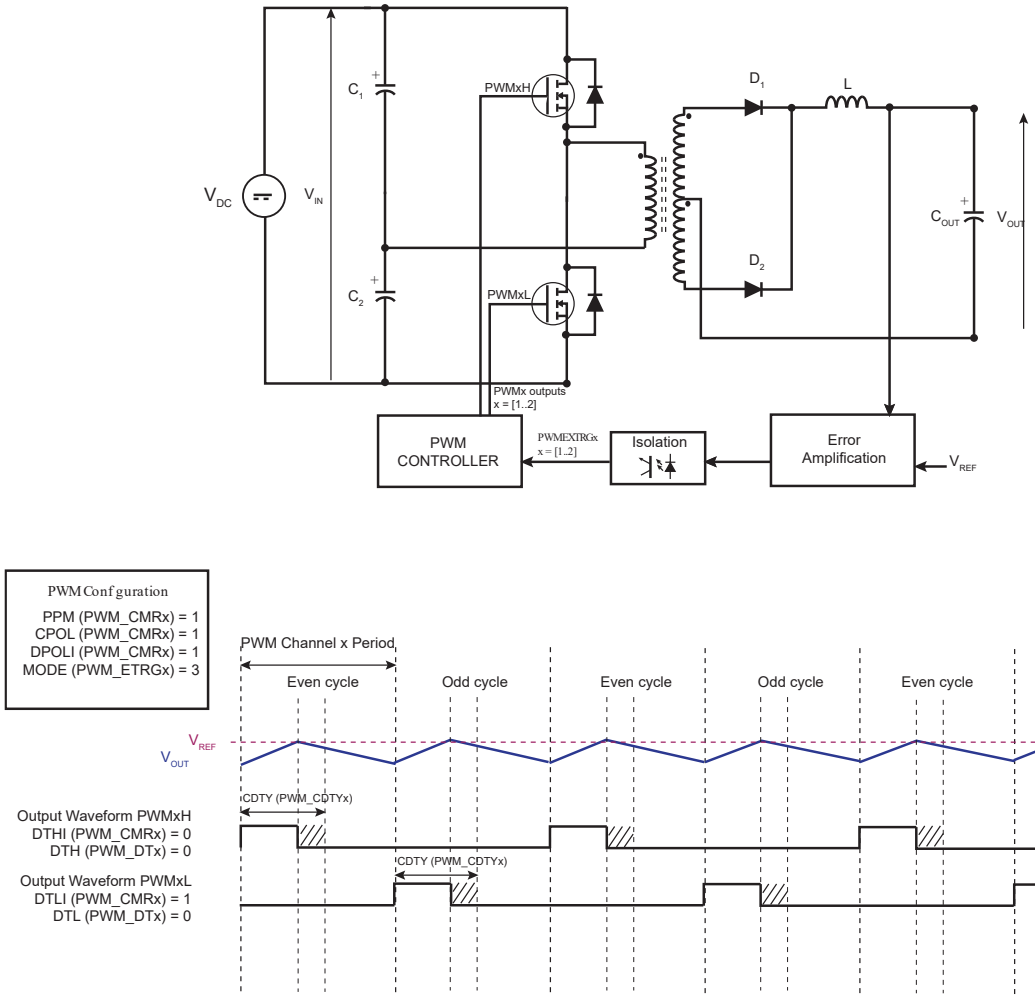
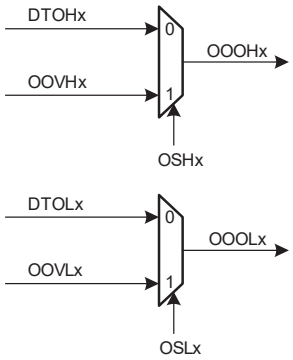


### 55.6.2.6 Output Override

The two complementary outputs DTOHx and DTOLx of the dead-time generator can be forced to a value defined by the software.

**Figure 55-15. Override Output Selection**



The fields OSHx and OSLx in the PWM Output Selection Register (PWM_OS) allow the outputs of the dead-time generator DTOHx and DTOLx to be overridden by the value defined in the fields OOVHx and OOVLx in the PWM Output Override Value Register (PWM_OOV).

The set registers PWM Output Selection Set Register (PWM_OSS) and PWM Output Selection Set Update Register (PWM_OSSUPD) enable the override of the outputs of a channel regardless of other channels. In the same way, the clear registers PWM Output Selection Clear Register (PWM_OSC) and PWM Output Selection Clear Update Register (PWM_OSCUPD) disable the override of the outputs of a channel regardless of other channels.

By using buffer registers PWM_OSSUPD and PWM_OSCUPD, the output selection of PWM outputs is done synchronously to the channel counter, at the beginning of the next PWM period.

By using registers PWM_OSS and PWM_OSC, the output selection of PWM outputs is done asynchronously to the channel counter, as soon as the register is written.

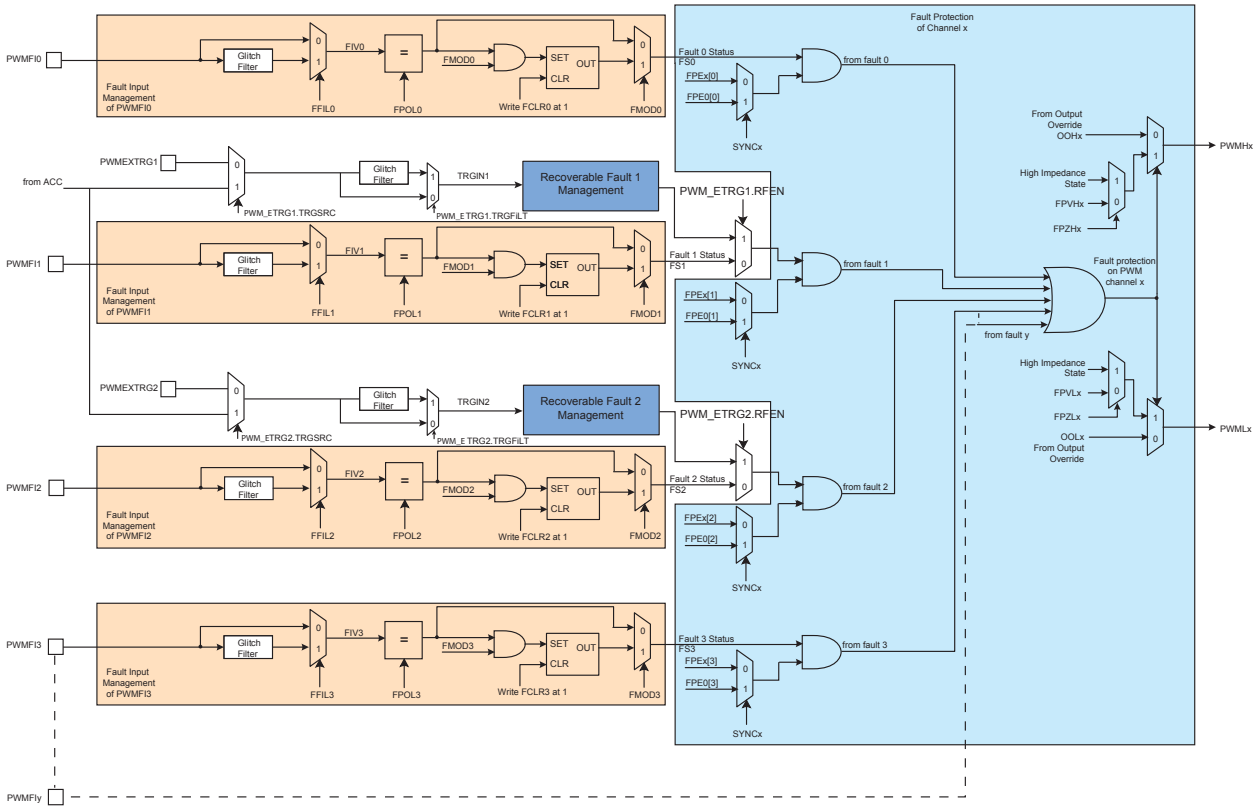
The value of the current output selection can be read in PWM_OS.

While overriding PWM outputs, the channel counters continue to run, only the PWM outputs are forced to user defined values.

### 55.6.2.7 Fault Protection

6 inputs provide fault protection which can force any of the PWM output pairs to a programmable value. This mechanism has priority over output overriding.

**Figure 55-16. Fault Protection**



The polarity level of the fault inputs is configured by the FPOL field in the PWM Fault Mode Register (PWM_FMR). For fault inputs coming from internal peripherals such as ADC or Timer Counter, the polarity level must be FPOL = 1. For fault inputs coming from external GPIO pins the polarity level depends on the user's implementation.

The configuration of the Fault Activation mode (FMOD field in PWMC_FMR) depends on the peripheral generating the fault. If the corresponding peripheral does not have “Fault Clear” management, then the

FMOD configuration to use must be FMOD = 1, to avoid spurious fault detection. Refer to the corresponding peripheral documentation for details on handling fault generation.

Fault inputs may or may not be glitch-filtered depending on the FFIL field in PWM_FMR. When the filter is activated, glitches on fault inputs with a width inferior to the PWM peripheral clock period are rejected.

A fault becomes active as soon as its corresponding fault input has a transition to the programmed polarity level. If the corresponding bit FMOD is set to '0' in PWM_FMR, the fault remains active as long as the fault input is at this polarity level. If the corresponding FMOD field is set to '1', the fault remains active until the fault input is no longer at this polarity level and until it is cleared by writing the corresponding bit FCLR in the PWM Fault Clear Register (PWM_FCR). In the PWM Fault Status Register (PWM_FSR), the field FIV indicates the current level of the fault inputs and the field FIS indicates whether a fault is currently active.

Each fault can be taken into account or not by the fault protection mechanism in each channel. To be taken into account in the channel x, the fault y must be enabled by the bit FPEx[y] in the PWM Fault Protection Enable registers (PWM_FPE1). However, synchronous channels (see Synchronous Channels) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[y]).

The fault protection on a channel is triggered when this channel is enabled and when any one of the faults that are enabled for this channel is active. It can be triggered even if the PWM peripheral clock is not running but only by a fault input that is not glitch-filtered.

When the fault protection is triggered on a channel, the fault protection mechanism resets the counter of this channel and forces the channel outputs to the values defined by the fields FPVHx and FPVLx in the PWM Fault Protection Value Register 1 (PWM_FPV) and fields FPZHx/FPZLx in the PWM Fault Protection Value Register 2, as shown in the table below. The output forcing is made asynchronously to the channel counter.

**Table 55-3. Forcing Values of PWM Outputs by Fault Protection**

| FPZH/Lx | FPVH/Lx | Forcing Value of PWMH/Lx |
|---|---|---|
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | – | High impedance state (Hi-Z) |

**⚠ CAUTION**

- To prevent any unexpected activation of the status flag FSy in PWM_FSR, the FMODy bit can be set to '1' only if the FPOLy bit has been previously configured to its final value.
- To prevent any unexpected activation of the Fault Protection on the channel x, the bit FPEx[y] can be set to '1' only if the FPOLy bit has been previously configured to its final value.

If a comparison unit is enabled (see PWM Comparison Units) and if a fault is triggered in the channel 0, then the comparison cannot match.

As soon as the fault protection is triggered on a channel, an interrupt (different from the interrupt generated at the end of the PWM period) can be generated but only if it is enabled and not masked. The interrupt is reset by reading the interrupt status register, even if the fault which has caused the trigger of the fault protection is kept active.

#### 55.6.2.7.1 Recoverable Fault

The PWM provides a Recoverable Fault mode on fault 1 and 2 (see figure *Fault Protection*).

The recoverable fault signal is an internal signal generated as soon as an external trigger event occurs (see PWM External Trigger Mode).

When the fault 1 or 2 is defined as a recoverable fault, the corresponding fault input pin is ignored and bits FFIL1/2, FMOD1/2 and FFIL1/2 are not taken into account.

The fault 1 is managed as a recoverable fault by the PWMEXTRG1 input trigger when PWM_ETRG1.RFEN = 1, PWM_ENA.CHID1 = 1, and PWM_ETRG1.TRGMODE ≠ 0.

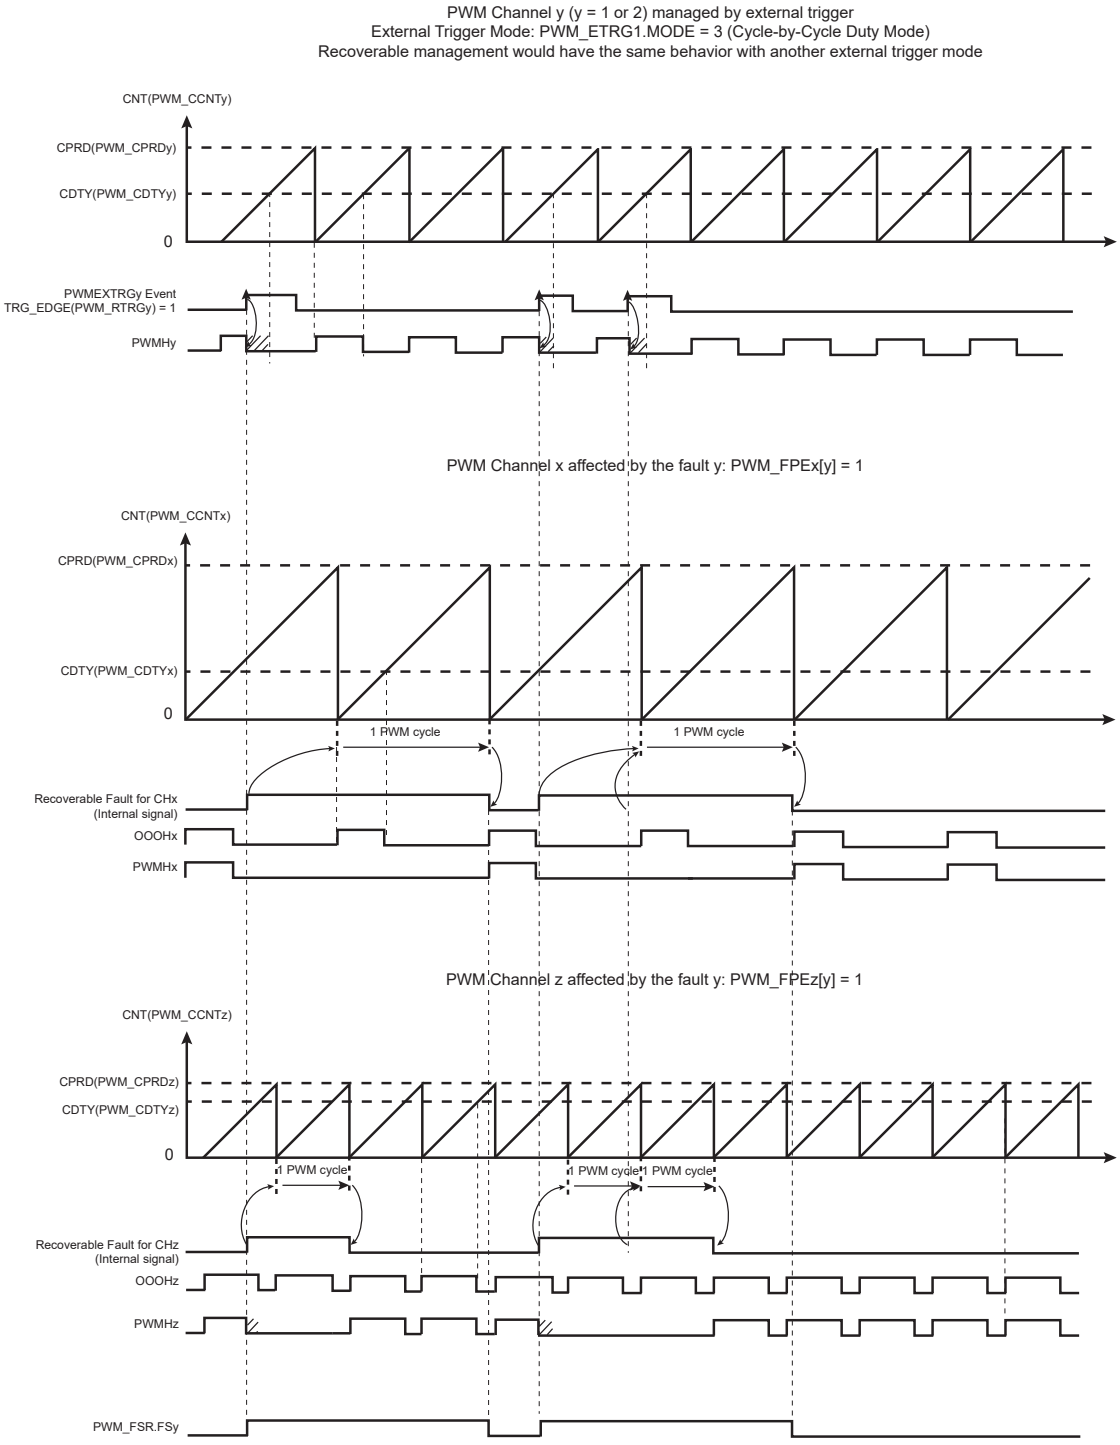
The fault 2 is managed as a recoverable fault by the PWMEXTRG2 input trigger when PWM_ETRG2.RFEN = 1, PWM_ENA.CHID2 = 1, and PWM_ETRG2.TRGMODE ≠ 0.

Recoverable fault 1 and 2 can be taken into account by all channels by enabling the bit FPEx[1/2] in the PWM Fault Protection Enable registers (PWM_FPEx). However the synchronous channels (see Synchronous Channels) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[1/2]).

When a recoverable fault is triggered (according to the PWM_ETRGx.TRGMODE setting), the PWM counter of the affected channels is not cleared (unlike in the classic fault protection mechanism) but the channel outputs are forced to the values defined by the fields FPVHx and FPVLx in the PWM Fault Protection Value Register 1 (PWM_FPV), as per table *Forcing Values of PWM Outputs by Fault Protection*. The output forcing is made asynchronously to the channel counter and lasts from the recoverable fault occurrence to the end of the next PWM cycle (if the recoverable fault is no longer present) (see the figure below).

The recoverable fault does not trigger an interrupt. The Fault Status FSy (with y = 1 or 2) is not reported in the PWM Fault Status Register when the fault y is a recoverable fault.

**Figure 55-17. Recoverable Fault Management**



### 55.6.2.8 Spread Spectrum Counter

The PWM macrocell includes a spread spectrum counter allowing the generation of a constantly varying duty cycle on the output PWM waveform (only for the channel 0). This feature may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

This is achieved by varying the effective period in a range defined by a spread spectrum value which is programmed by the field SPRD in the PWM Spread Spectrum Register (PWM_SSPR). The effective

period of the output waveform is the value of the spread spectrum counter added to the programmed waveform period CPRD in the PWM Channel Period Register (PWM_CPRD0).

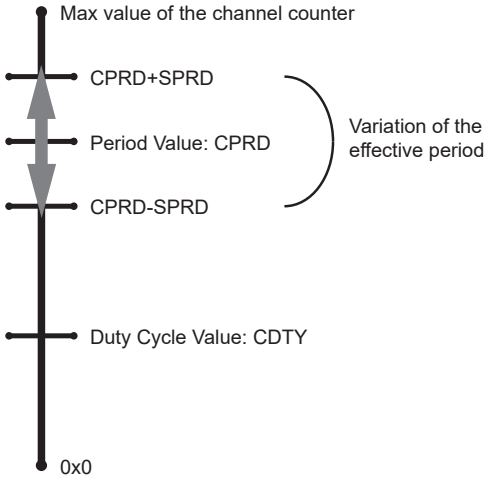
It will cause the effective period to vary from CPRD-SPRD to CPRD+SPRD. This leads to a constantly varying duty cycle on the PWM output waveform because the duty cycle value programmed is unchanged.

The value of the spread spectrum counter can change in two ways depending on the bit SPRDM in PWM_SSPR.

If SPRDM = 0, the Triangular mode is selected. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled or after reset and counts upwards at each period of the channel counter. When it reaches SPRD, it restarts to count from -SPRD again.

If SPRDM = 1, the Random mode is selected. A new random value is assigned to the spread spectrum counter at each period of the channel counter. This random value is between -SPRD and +SPRD and is uniformly distributed.

**Figure 55-18. Spread Spectrum Counter**



### 55.6.2.9 Synchronous Channels

Some channels can be linked together as synchronous channels. They have the same source clock, the same period, the same alignment and are started together. In this way, their counters are synchronized together.

The synchronous channels are defined by the SYNCx bits in the PWM Sync Channels Mode Register (PWM_SCM). Only one group of synchronous channels is allowed.

When a channel is defined as a synchronous channel, the channel 0 is also automatically defined as a synchronous channel. This is because the channel 0 counter configuration is used by all the synchronous channels.

If a channel x is defined as a synchronous channel, the fields/bits for the channel 0 are used instead of those of channel x:

- CPRE in PWM_CMR0 instead of CPRE in PWM_CMRx (same source clock)
- CPRD in PWM_CPRD0 instead of CPRD in PWM_CPRDx (same period)
- CALG in PWM_CMR0 instead of CALG in PWM_CMRx (same alignment)

Modifying the fields CPRE, CPRD and CALG of for channels with index greater than 0 has no effect on output waveforms.

Because counters of synchronous channels must start at the same time, they are all enabled together by enabling the channel 0 (by the CHID0 bit in PWM_ENA register). In the same way, they are all disabled together by disabling channel 0 (by the CHID0 bit in PWM_DIS register). However, a synchronous channel x different from channel 0 can be enabled or disabled independently from others (by the CHIDx bit in PWM_ENA and PWM_DIS registers).

Defining a channel as a synchronous channel while it is an asynchronous channel (by writing the bit SYNCx to '1' while it was at '0') is allowed only if the channel is disabled at this time (CHIDx = 0 in PWM_SR). In the same way, defining a channel as an asynchronous channel while it is a synchronous channel (by writing the SYNCx bit to '0' while it was '1') is allowed only if the channel is disabled at this time.

The UPDM field (Update Mode) in the PWM_SCM register selects one of the three methods to update the registers of the synchronous channels:

- Method 1 (UPDM = 0): The period value, the duty-cycle values and the dead-time values must be written by the processor in their respective update registers (respectively PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPDx).The update is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM Sync Channels Update Control Register (PWM_SCUC) is set to '1'.
- Method 2 (UPDM = 1): The period value, the duty-cycle values, the dead-time values and the update period value must be written by the processor in their respective update registers (respectively PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPD). The update of the period value and of the dead-time values is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM_SCUC register is set to '1'. The update of the duty-cycle values and the update period value is triggered automatically after an update period defined by the field UPR in the PWM Sync Channels Update Period Register (PWM_SCUP).
- Method 3 (UPDM = 2): Same as Method 2 apart from the fact that the duty-cycle values of ALL synchronous channels are written by the DMA Controller. The user can choose to synchronize the DMA Controller transfer request with a comparison match (see Section 7.3 "PWM Comparison Units"), by the fields PTRM and PTRCS in the PWM_SCM register. The DMA destination address must be configured to access only the PWM DMA Register (PWM_DMAR). The DMA buffer data structure must consist of sequentially repeated duty cycles. The number of duty cycles in each sequence corresponds to the number of synchronized channels. Duty cycles in each sequence must be ordered from the lowest to the highest channel index. The size of the duty cycle is 16 bits.

**Table 55-4. Summary of the Update of Registers of Synchronous Channels**

| Register | UPDM = 0 | UPDM = 1 | UPDM = 2 |
|---|---|---|---|
| Period Value (PWM_CPRDUPDx) | Write by the processor | | |
| | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' | | |
| Dead-Time Values (PWM_DTUPDx) | Write by the processor | | |
| | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' | | |

.....continued

| Register | UPDM = 0 | UPDM = 1 | UPDM = 2 |
|---|---|---|---|
| Duty-Cycle Values (PWM_CDTYUPDx) | Write by the processor | Write by the processor | Write by the DMA Controller |
| | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' | Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR | |
| Update Period Value (PWM_SCUPUPD) | Not applicable | Write by the processor | |
| | Not applicable | Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR | |

#### 55.6.2.9.1 Method 1: Manual write of duty-cycle values and manual trigger of the update

In this mode, the update of the period value, the duty-cycle values and the dead-time values must be done by writing in their respective update registers with the processor (respectively PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPDx).

To trigger the update, the user must use the bit UPDULOCK in the PWM_SCUC register which allows to update synchronously (at the same PWM period) the synchronous channels:

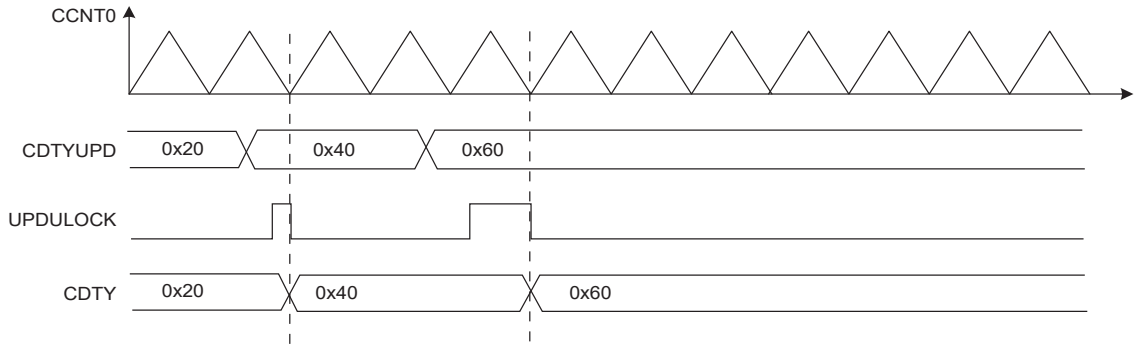
- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

Sequence for Method 1:

1. Select the manual write of duty-cycle values and the manual update by setting the UPDM field to '0' in the PWM_SCM register.
2. Define the synchronous channels by the SYNCx bits in the PWM_SCM register.
3. Enable the synchronous channels by writing CHID0 in the PWM_ENA register.
4. If an update of the period value and/or the duty-cycle values and/or the dead-time values is required, write registers that need to be updated (PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPDx).
5. Set UPDULOCK to '1' in PWM_SCUC.
6. The update of the registers will occur at the beginning of the next PWM period. When the UPDULOCK bit is reset, go to Step 4. for new values.

**Figure 55-19. Method 1 (UPDM = 0)**



#### 55.6.2.9.2 Method 2: Manual write of duty-cycle values and automatic trigger of the update

In this mode, the update of the period value, the duty-cycle values, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM_CPRDUPDx, PWM_CDTYUPDx, PWM_DTUPDx and PWM_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK in the PWM_SCUC register, which updates synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to ‘1’, the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to ‘1’, the update is locked and cannot be performed.

After writing the UPDULOCK bit to ‘1’, it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the update period by the UPR field in the PWM_SCUP register. The PWM controller waits UPR+1 period of synchronous channels before updating automatically the duty values and the update period value.

The status of the duty-cycle value write is reported in the PWM Interrupt Status Register 2 (PWM_ISR2) by the following flags:

- WRDY: this flag is set to ‘1’ when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to ‘0’ when the PWM_ISR2 register is read.

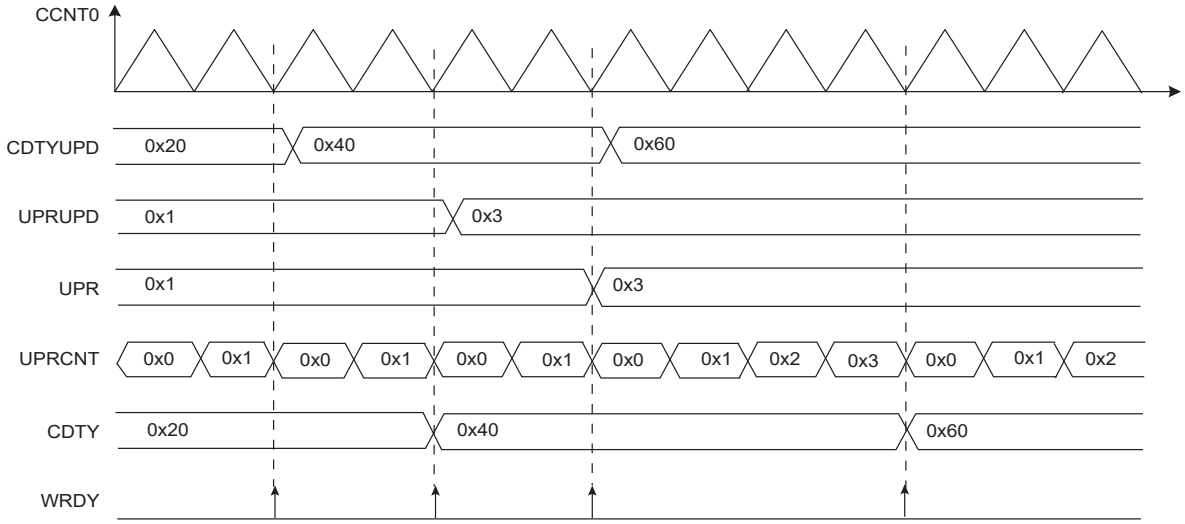
Depending on the interrupt mask in the PWM Interrupt Mask Register 2 (PWM_IMR2), an interrupt can be generated by these flags.

Sequence for Method 2:

1. Select the manual write of duty-cycle values and the automatic update by setting the field UPDM to ‘1’ in the PWM_SCM register
2. Define the synchronous channels by the bits SYNCx in the PWM_SCM register.
3. Define the update period by the field UPR in the PWM_SCUP register.
4. Enable the synchronous channels by writing CHID0 in the PWM_ENA register.
5. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM_CPRDUPDx, PWM_DTUPDx), else go to Step 8.
6. Set UPDULOCK to ‘1’ in PWM_SCUC.

7. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to Step 5. for new values.
8. If an update of the duty-cycle values and/or the update period is required, check first that write of new update values is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM_ISR2.
9. Write registers that need to be updated (PWM_CDTYUPDx, PWM_SCUPUPD).
10. The update of these registers will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to Step 8. for new values.

**Figure 55-20. Method 2 (UPDM = 1)**



#### 55.6.2.9.3 Method 3: Automatic write of duty-cycle values and automatic trigger of the update

In this mode, the update of the duty cycle values is made automatically by the DMA Controller. The update of the period value, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM_CPRDUPDx, PWM_DTUPDx and PWM_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to ‘1’, the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to ‘1’, the update is locked and cannot be performed.

After writing the UPDULOCK bit to ‘1’, it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period value is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the Update Period by the field UPR in the PWM_SCUP register. The PWM controller waits UPR+1 periods of synchronous channels before updating automatically the duty values and the update period value.

Using the DMA Controller removes processor overhead by reducing its intervention during the transfer. This significantly reduces the number of clock cycles required for a data transfer, which improves microcontroller performance.

The DMA Controller must write the duty-cycle values in the synchronous channels index order. For example if the channels 0, 1 and 3 are synchronous channels, the DMA Controller must write the duty-

cycle of the channel 0 first, then the duty-cycle of the channel 1, and finally the duty-cycle of the channel 3.

The status of the DMA Controller transfer is reported in PWM_ISR2 by the following flags:

- WRDY: this flag is set to ‘1’ when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to ‘0’ when PWM_ISR2 is read. The user can choose to synchronize the WRDY flag and the DMA Controller transfer request with a comparison match (see PWM Comparison Units), by the fields PTRM and PTRCS in the PWM_SCM register.
- UNRE: this flag is set to ‘1’ when the update period defined by the UPR field has elapsed while the whole data has not been written by the Peripheral DMA Controller. It is reset to ‘0’ when PWM_ISR2 is read.

Depending on the interrupt mask in PWM_IMR2, an interrupt can be generated by these flags.

Sequence for Method 3:

1. Select the automatic write of duty-cycle values and automatic update by setting the field UPDM to 2 in the PWM_SCM register.
2. Define the synchronous channels by the bits SYNCx in the PWM_SCM register.
3. Define the update period by the field UPR in the PWM_SCUP register.
4. Define when the WRDY flag and the corresponding DMA Controller transfer request must be set in the update period by the PTRM bit and the PTRCS field in the PWM_SCM register (at the end of the update period or when a comparison matches).
5. Define the DMA Controller transfer settings for the duty-cycle values and enable it in the DMA Controller registers
6. Enable the synchronous channels by writing CHID0 in the PWM_ENA register.
7. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM_CPRDUPDx, PWM_DTUPDx), else go to Step 10.
8. Set UPDULOCK to ‘1’ in PWM_SCUC.
9. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to Step 7. for new values.
10. If an update of the update period value is required, check first that write of a new update value is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM_ISR2, else go to Step 14.
11. Write the register that needs to be updated (PWM_SCUPUPD).
12. The update of this register will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to Step 10. for new values.
13. Wait for the DMA status flag indicating that the buffer transfer is complete. If the transfer has ended, define a new DMA transfer for new duty-cycle values. Go to Step 5.

14. **Figure 55-21. Method 3 (UPDM = 2 and PTRM = 0)**

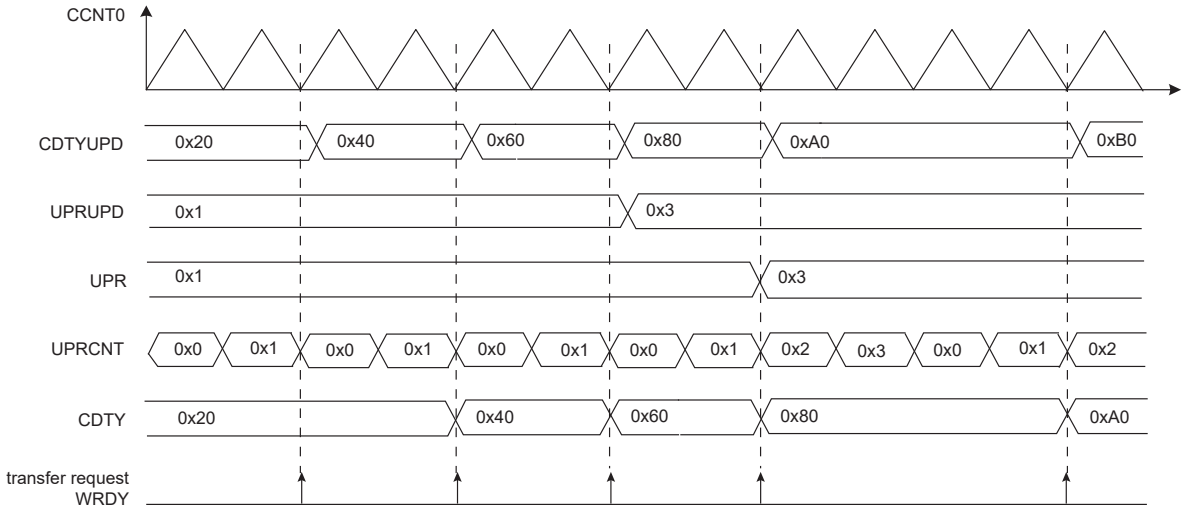


**Figure 55-22. Method 3 (UPDM = 2 and PTRM = 1 and PTRCS = 0)**

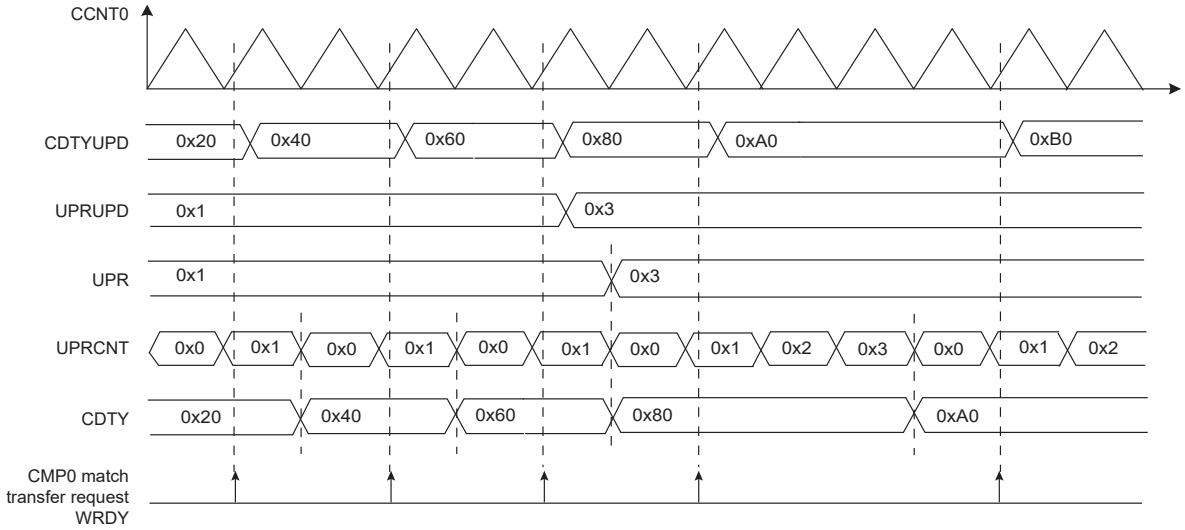


### 55.6.2.10 Update Time for Double-Buffering Registers

All channels integrate a double-buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum value, the polarity, the duty-cycle, the dead-times, the output override, and the synchronous channels update period.

This double-buffering system comprises the following update registers:

- PWM Sync Channels Update Period Update Register
- PWM Output Selection Set Update Register
- PWM Output Selection Clear Update Register
- PWM Spread Spectrum Update Register
- PWM Channel Duty Cycle Update Register
- PWM Channel Period Update Register
- PWM Channel Dead Time Update Register
- PWM Channel Mode Update Register

When one of these update registers is written to, the write is stored, but the values are updated only at the next PWM period border. In Left-aligned mode (CALG = 0), the update occurs when the channel counter reaches the period value CPRD. In Center-aligned mode, the update occurs when the channel counter value is decremented and reaches the 0 value.

In Center-aligned mode, it is possible to trigger the update of the polarity and the duty-cycle at the next half period border. This mode concerns the following update registers:

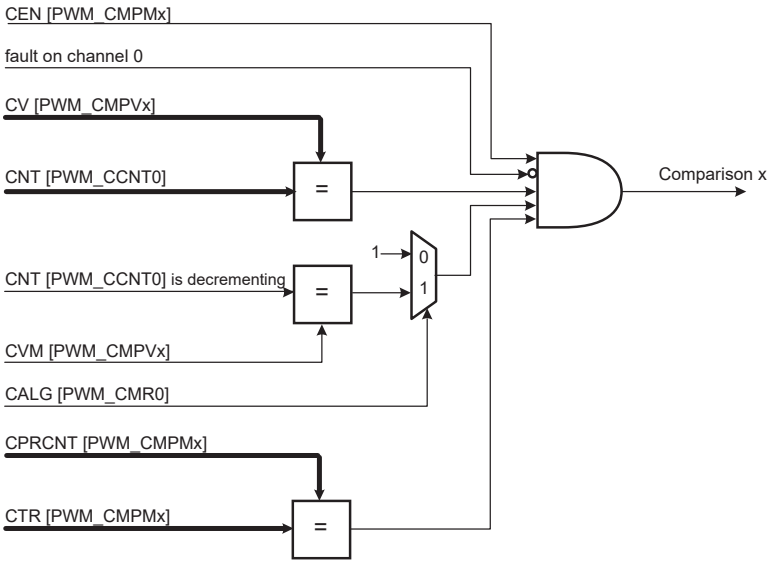
- PWM Channel Duty Cycle Update Register
- PWM Channel Mode Update Register

The update occurs at the first half period following the write of the update register (either when the channel counter value is incrementing and reaches the period value CPRD, or when the channel counter value is decrementing and reaches the 0 value). To activate this mode, the user must write a one to the bit UPDS in the PWM Channel Mode Register.

### 55.6.3 PWM Comparison Units

The PWM provides 1 independent comparison units able to compare a programmed value with the current value of the channel 0 counter (which is the channel counter of all synchronous channels, "Synchronous Channels"). These comparisons are intended to generate pulses on the event lines (used to synchronize ADC, see PWM Event Lines), to generate software interrupts and to trigger DMA Controller transfer requests for the synchronous channels (see Method 3: Automatic write of duty-cycle values and automatic trigger of the update).

**Figure 55-23. Comparison Unit Block Diagram**



The comparison x matches when it is enabled by the bit CEN in the PWM Comparison x Mode Register (PWM_CMPMx for the comparison x) and when the counter of the channel 0 reaches the comparison value defined by the field CV in PWM Comparison x Value Register (PWM_CMPVx for the comparison x). If the counter of the channel 0 is center-aligned (CALG = 1 in PWM Channel Mode Register), the bit CVM in PWM_CMPVx defines if the comparison is made when the counter is counting up or counting down (in Left-alignment mode CALG = 0, this bit is useless).

If a fault is active on the channel 0, the comparison is disabled and cannot match (see Fault Protection).

The user can define the periodicity of the comparison x by the fields CTR and CPR in PWM_CMPMx. The comparison is performed periodically once every CPR+1 periods of the counter of the channel 0, when

the value of the comparison period counter CPRCNT in PWM_CMPMx reaches the value defined by CTR. CPR is the maximum value of the comparison period counter CPRCNT. If CPR = CTR = 0, the comparison is performed at each period of the counter of the channel 0.

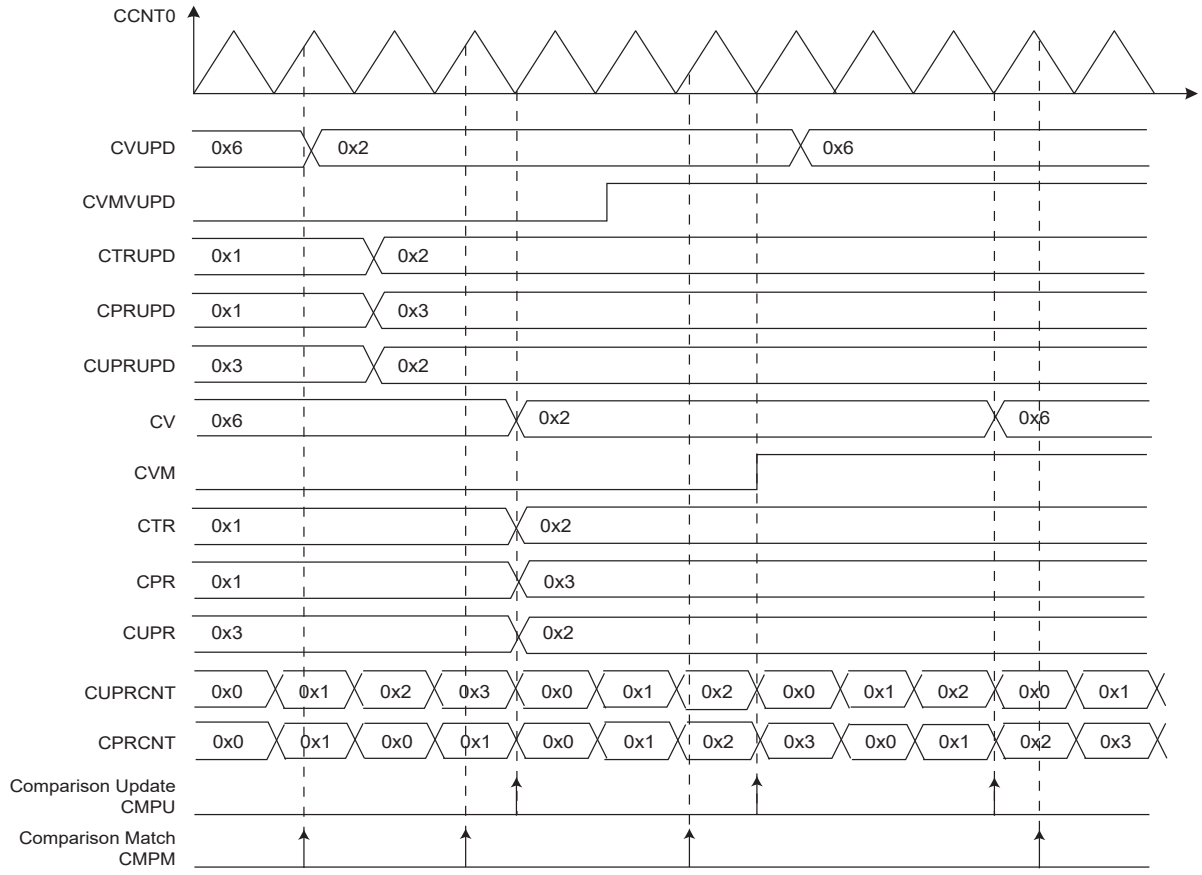
The comparison x configuration can be modified while the channel 0 is enabled by using the PWM Comparison x Mode Update Register (PWM_CMPMUPDx registers for the comparison x). In the same way, the comparison x value can be modified while the channel 0 is enabled by using the PWM Comparison x Value Update Register (PWM_CMPVUPDx registers for the comparison x).

The update of the comparison x configuration and the comparison x value is triggered periodically after the comparison x update period. It is defined by the field CUPR in PWM_CMPMx. The comparison unit has an update period counter independent from the period counter to trigger this update. When the value of the comparison update period counter CUPRCNT (in PWM_CMPMx) reaches the value defined by CUPR, the update is triggered. The comparison x update period CUPR itself can be updated while the channel 0 is enabled by using the PWM_CMPMUPDx register.

**⚠ CAUTION** The write of PWM_CMPVUPDx must be followed by a write of PWM_CMPMUPDx.

The comparison match and the comparison update can be source of an interrupt, but only if it is enabled and not masked. These interrupts can be enabled by the PWM Interrupt Enable Register 2 and disabled by the PWM Interrupt Disable Register 2. The comparison match interrupt and the comparison update interrupt are reset by reading the PWM Interrupt Status Register 2.

**Figure 55-24. Comparison Waveform**



### 55.6.4 PWM Event Lines

The PWM provides 2 independent event lines intended to trigger actions in other peripherals (e.g., for the Analog-to-Digital Converter (ADC)).

A pulse (one cycle of the peripheral clock) is generated on an event line, when at least one of the selected comparisons is matching. The comparisons can be selected or unselected independently by the CSEL bits in the PWM Event Line x Register (PWM_ELMRx for the Event Line x).

An example of event generation is provided in the figure Event Line Generation Waveform (Example).

**Figure 55-25. Event Line Block Diagram**

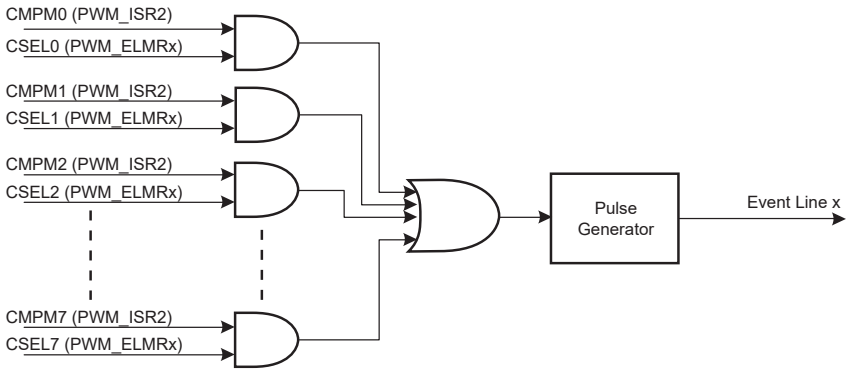


**Figure 55-26. Event Line Generation Waveform (Example)**

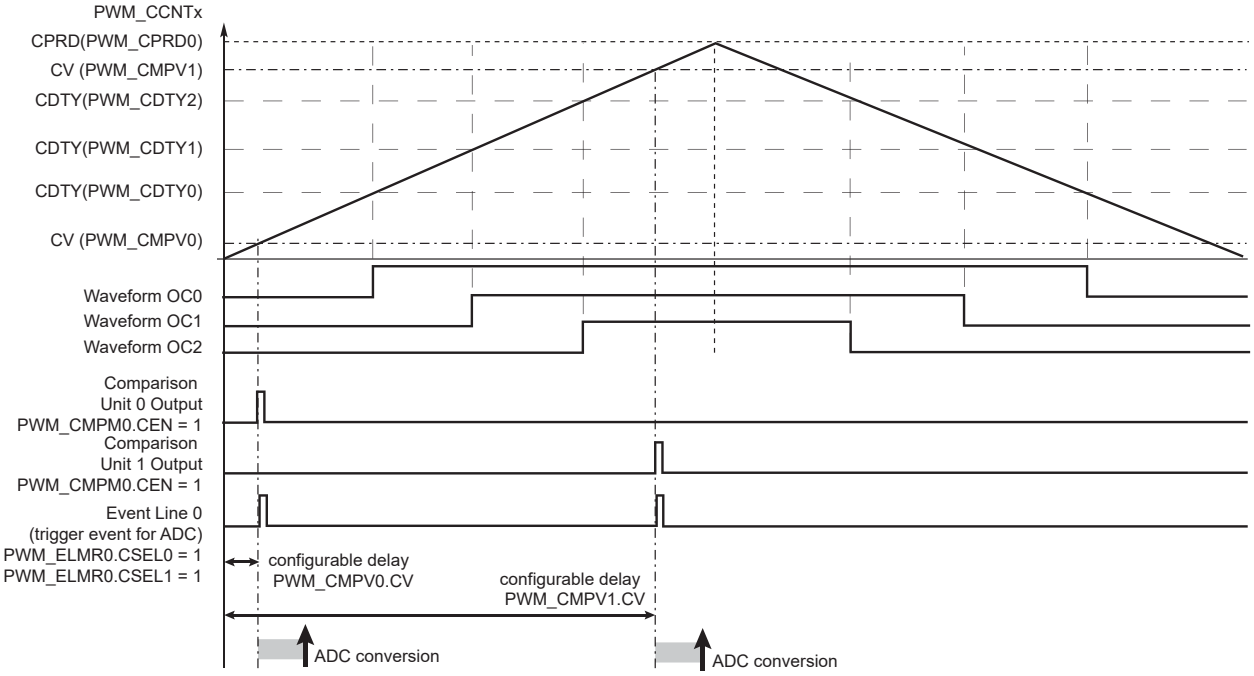


### 55.6.5 PWM External Trigger Mode

The PWM channels 1 and 2 can be configured to use an external trigger for generating specific PWM signals. The external trigger source can be selected through the bit TRGSRC of the PWM External Trigger Register (see the table below).

**Table 55-5. External Event Source Selection**

| Channel | Trigger Source Selection | Trigger Source |
|---|---|---|
| 1 | PWM_ETRG1.TRGSRC = 0 | From PWMEXTRG1 input |
| | PWM_ETRG1.TRGSRC = 1 | From Analog Comparator Controller |
| 2 | PWM_ETRG2.TRGSRC = 0 | From PWMEXTRG2 input |
| | PWM_ETRG2.TRGSRC = 1 | From Analog Comparator Controller |

Each external trigger source can be filtered by writing a one to the TRGFILT bit in the corresponding PWM External Trigger Register (PWM_ETRGx).

Each time an external trigger event is detected, the corresponding PWM channel counter value is stored in the MAXCNT field of the PWM_ETRGx register if it is greater than the previously stored value. Reading the PWM_ETRGx register will clear the MAXCNT value.

Three different modes are available for channels 1 and 2 depending on the value of the TRGMODE field of the PWM_ETRGx register:

- TRGMODE = 1: External PWM Reset Mode
- TRGMODE = 2: External PWM Start Mode
- TRGMODE = 3: Cycle-By-Cycle Duty Mode

See the following sections.

This feature is disabled when TRGMODE = 0.

This feature should only be enabled if the corresponding channel is left-aligned (CALG = 0 in PWM Channel Mode Register of channel 1 or 2) and not managed as a synchronous channel (SYNCx = 0 in PWM Sync Channels Mode Register where x = 1 or 2). Programming the channel to be center-aligned or synchronous while TRGMODE is not 0 could lead to unexpected behavior.

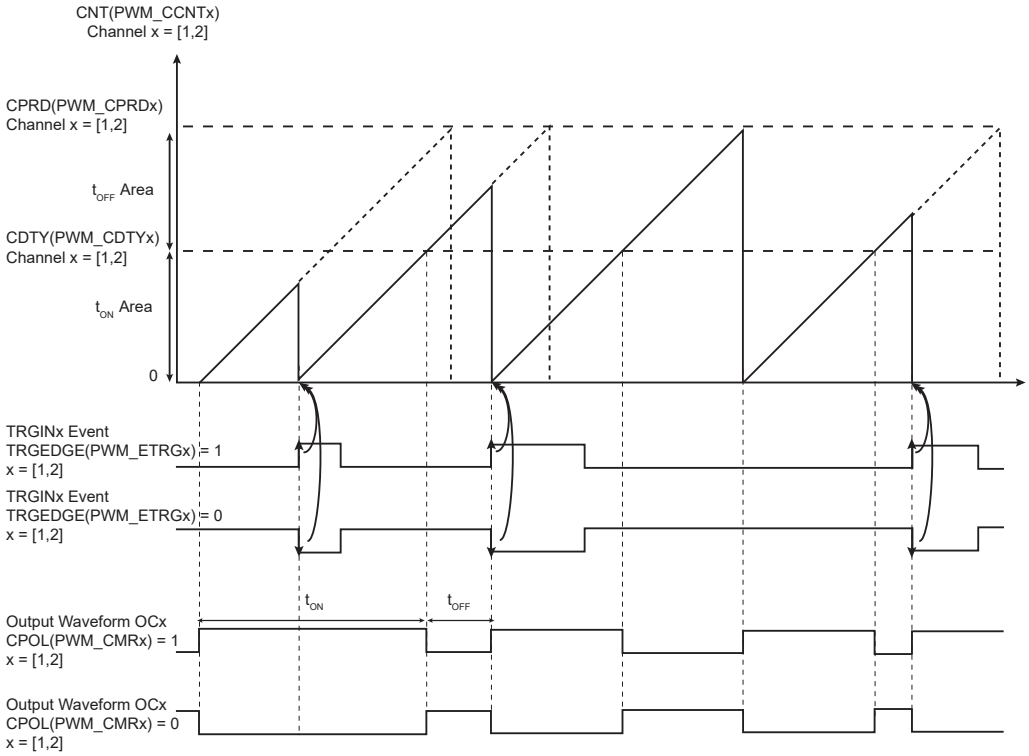
#### 55.6.5.1 External PWM Reset Mode

External PWM Reset mode is selected by programming TRGMODE = 1 in the PWM_ETRGx register.

In this mode, when an edge is detected on the PWMEXTRGx input, the internal PWM counter is cleared and a new PWM cycle is restarted. The edge polarity can be selected by programming the TRGEDGE bit in the PWM_ETRGx register. If no trigger event is detected when the internal channel counter has reached the CPRD value in the PWM Channel Period Register, the internal counter is cleared and a new PWM cycle starts.

Note that this mode does not guarantee a constant $t_{ON}$ or $t_{OFF}$ time.

**Figure 55-27. External PWM Reset Mode**



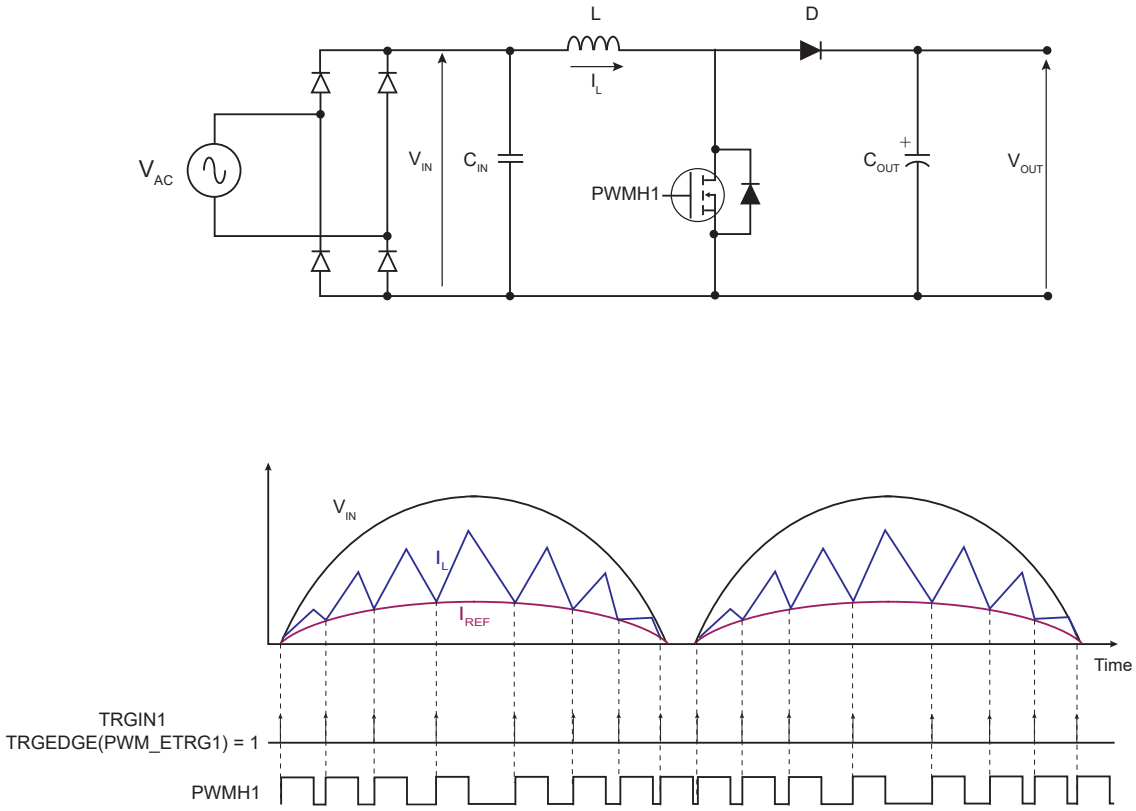
#### 55.6.5.1.1 Application Example

The external PWM Reset mode can be used in power factor correction applications.

In the example below, the external trigger input is the PWMEXTRG1 (therefore the PWM channel used for regulation is the channel 1). The PWM channel 1 period (CPRD in the PWM Channel Period Register of the channel 1) must be programmed so that the TRGIN1 event always triggers before the PWM channel 1 period elapses.

In the figure below, an external circuit (not shown) is required to sense the inductor current $I_L$. The internal PWM counter of the channel 1 is cleared when the inductor current falls below a specific threshold ($I_{REF}$). This starts a new PWM period and increases the inductor current.

**Figure 55-28. External PWM Reset Mode: Power Factor Correction Application**



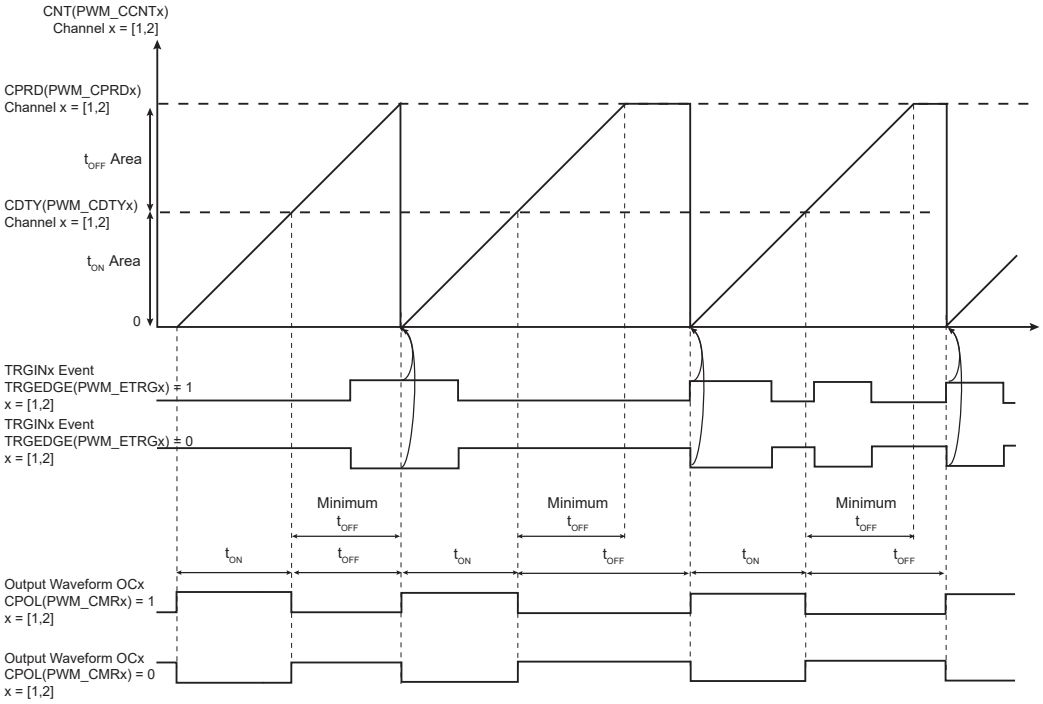
### 55.6.5.2 External PWM Start Mode

External PWM Start mode is selected by programming TRGMODE = 2 in the PWM_ETRGx register.

In this mode, the internal PWM counter can only be reset once it has reached the CPRD value in the PWM Channel Period Register and when the correct level is detected on the corresponding external trigger input. Both conditions have to be met to start a new PWM period. The active detection level is defined by the bit TRGEDGE of the PWM_ETRGx register.

Note that this mode guarantees a constant $t_{ON}$ time and a minimum $t_{OFF}$ time.

**Figure 55-29. External PWM Start Mode**



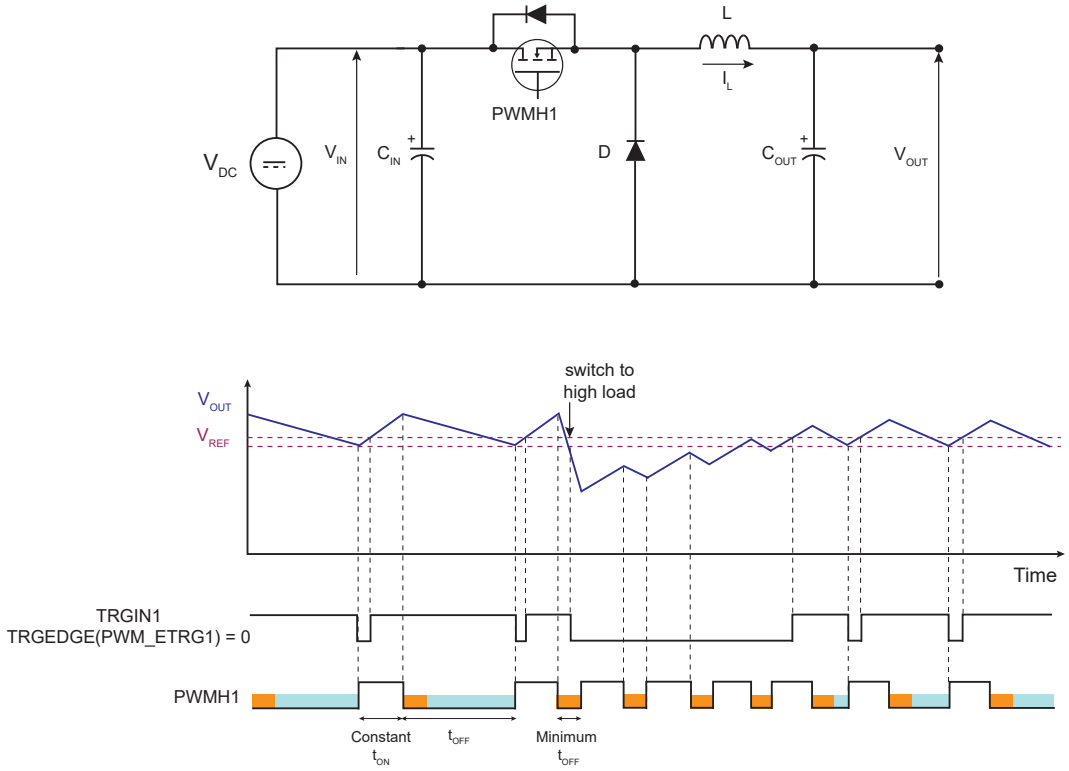
#### 55.6.5.2.1 Application Example

The external PWM Start mode generates a modulated frequency PWM signal with a constant active level duration ($t_{ON}$) and a minimum inactive level duration (minimum $t_{OFF}$).

The $t_{ON}$ time is defined by the CDTY value in the PWM Channel Duty Cycle Register. The minimum $t_{OFF}$ time is defined by CDTY - CPRD (PWM Channel Period Register). This mode can be useful in Buck DC/DC Converter applications.

When the output voltage $V_{OUT}$ is above a specific threshold (Vref), the PWM inactive level is maintained as long as $V_{OUT}$ remains above this threshold. If $V_{OUT}$ is below this specific threshold, this mode guarantees a minimum $t_{OFF}$ time required for MOSFET driving (see the figure below).

**Figure 55-30. External PWM Start Mode: Buck DC/DC Converter**



### 55.6.5.3 Cycle-By-Cycle Duty Mode

#### 55.6.5.3.1 Description

Cycle-by-cycle duty mode is selected by programming TRGMODE = 3 in PWM_ETRGx.

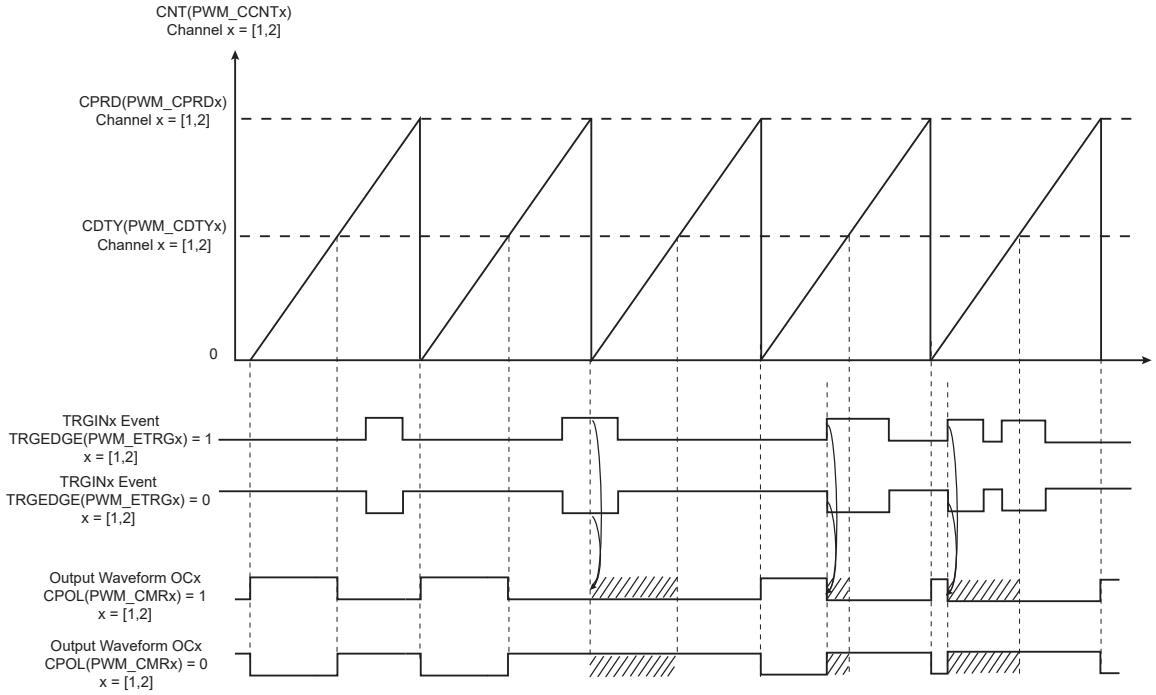
In this mode, the PWM frequency is constant and is defined by the CPRD value in the PWM Channel Period Register.

An external trigger event has no effect on the PWM output if it occurs while the internal PWM counter value is above the CDTY value of the PWM Channel Duty Cycle Register.

If the internal PWM counter value is below the value of CDTY of the PWM Channel Duty Cycle Register, an external trigger event makes the PWM output inactive.

The external trigger event can be detected on rising or falling edge according to the TRGEDGE bit in PWM_ETRGx.

**Figure 55-31. Cycle-By-Cycle Duty Mode**

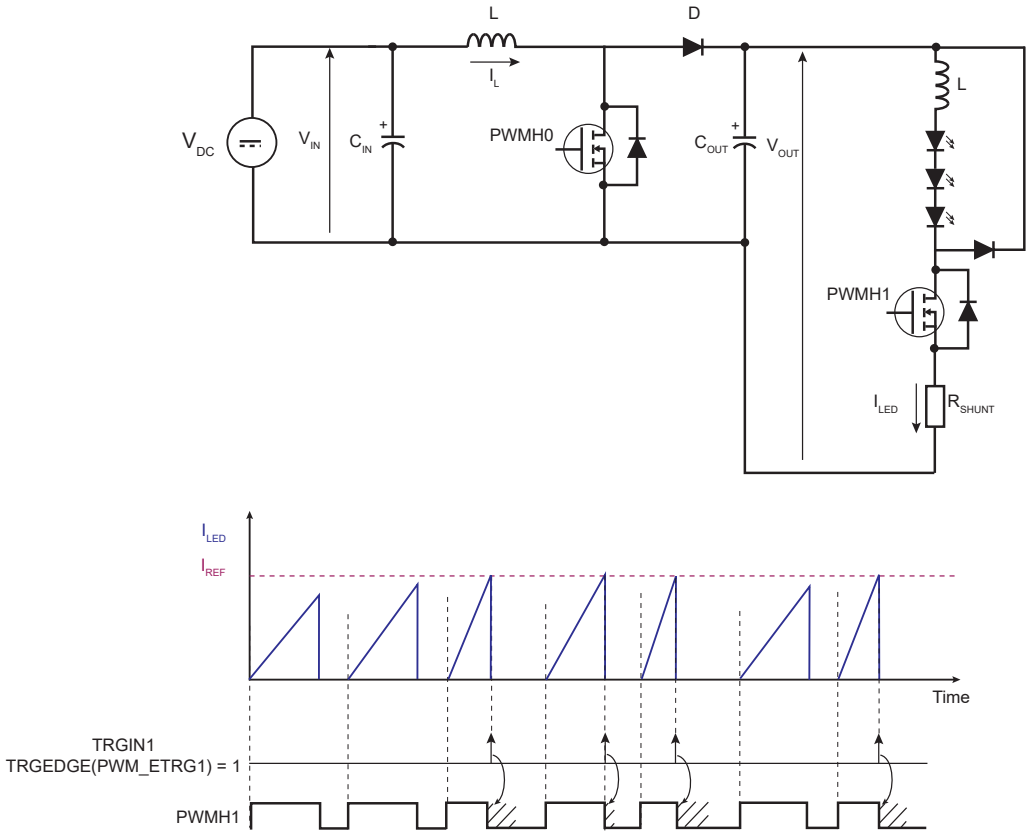


#### 55.6.5.3.2 Application Example

The figure below illustrates an application example of the Cycle-by-cycle Duty mode.

In an LED string control circuit, Cycle-by-cycle Duty mode can be used to automatically limit the current in the LED string.

**Figure 55-32. Cycle-By-Cycle Duty Mode: LED String Control**



### 55.6.5.4 Leading-Edge Blanking (LEB)

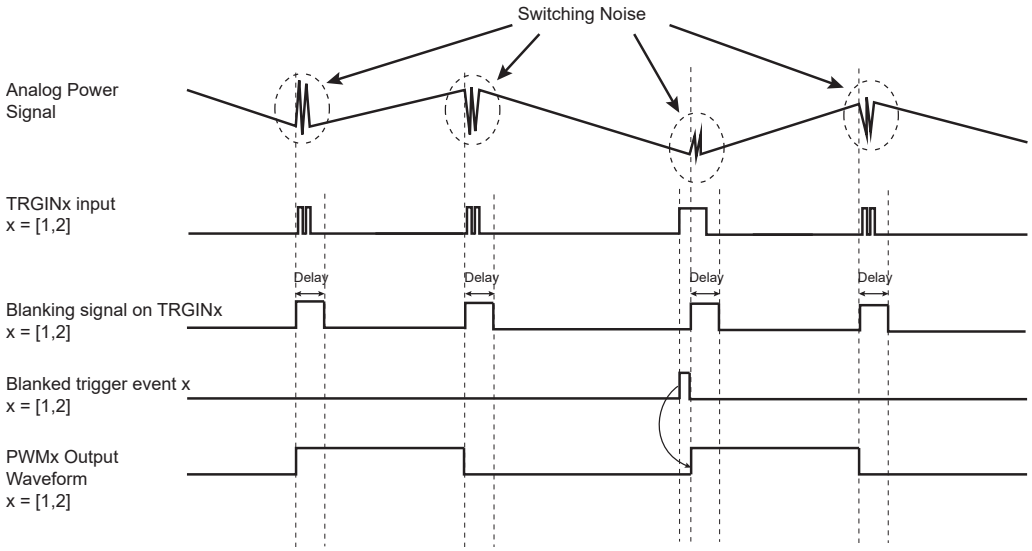
PWM channels 1 and 2 support leading-edge blanking. Leading-edge blanking masks the external trigger input when a transient occurs on the corresponding PWM output. It masks potential spurious external events due to power transistor switching.

The blanking delay on each external trigger input is configured by programming the LEBDELAYx in the PWM Leading-Edge Blanking Register.

The LEB can be enabled on both the rising and the falling edges for the PWMH and PWML outputs through the bits PWMLFEN, PWMLREN, PWMHFEN, PWMHREN.

Any event on the PWMEXTRGx input which occurs during the blanking time is ignored.

**Figure 55-33. Leading-Edge Blanking**



### 55.6.6 PWM Controller Operations

#### 55.6.6.1 Initialization

Before enabling the channels, they must be configured by the software application as described below:

- Unlock User Interface by writing the WPCMD field in PWM_WPCR.
- Configuration of the clock generator (DIVA, PREA, DIVB, PREB in the PWM_CLK register if required).
- Selection of the clock for each channel (CPRE field in PWM_CMRx)
- Configuration of the waveform alignment for each channel (CALG field in PWM_CMRx)
- Selection of the counter event selection (if CALG = 1) for each channel (CES field in PWM_CMRx)
- Configuration of the output waveform polarity for each channel (CPOL bit in PWM_CMRx)
- Configuration of the period for each channel (CPRD in the PWM_CPRDx register). Writing in PWM_CPRDx register is possible while the channel is disabled. After validation of the channel, the user must use PWM_CPRDUPDx register to update PWM_CPRDx as explained below.
- Configuration of the duty-cycle for each channel (CDTY in the PWM_CDTYx register). Writing in PWM_CDTYx register is possible while the channel is disabled. After validation of the channel, the user must use PWM_CDTYUPDx register to update PWM_CDTYx as explained below.
- Configuration of the dead-time generator for each channel (DTH and DTL in PWM_DTx) if enabled (DTE bit in PWM_CMRx). Writing in the PWM_DTx register is possible while the channel is disabled. After validation of the channel, the user must use PWM_DTUPDx register to update PWM_DTx
- Selection of the synchronous channels (SYNCx in the PWM_SCM register)
- Selection of the moment when the WRDY flag and the corresponding DMA Controller transfer request are set (PTRM and PTRCS in the PWM_SCM register)
- Configuration of the Update mode (UPDM in PWM_SCM register)
- Configuration of the update period (UPR in PWM_SCUP register) if needed
- Configuration of the comparisons (PWM_CMPVx and PWM_CMPMx)
- Configuration of the event lines (PWM_ELMRx)
- Configuration of the fault inputs polarity (FPOL in PWM_FMR)

- Configuration of the fault protection (FMOD and FFIL in PWM_FMR, PWM_FPV and PWM_FPE1)
- Enable of the interrupts (writing CHIDx and FCHIDx in PWM_IER1, and writing WRDY, UNRE, CMPMx and CMPUx in PWM_IER2)
- Enable of the PWM channels (writing CHIDx in the PWM_ENA register)

#### 55.6.6.2 Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the PWM Channel Period Register (PWM_CPRDx) and the PWM Channel Duty Cycle Register (PWM_CDTYx) helps the user select the appropriate clock. The event number written in the Period Register gives the PWM accuracy. The Duty-Cycle quantum cannot be lower than 1/CPRDx value. The higher the value of PWM_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM_CPRDx, the user is able to set a value from between 1 up to 14 in PWM_CDTYx. The resulting duty-cycle quantum cannot be lower than 1/15 of the PWM period.

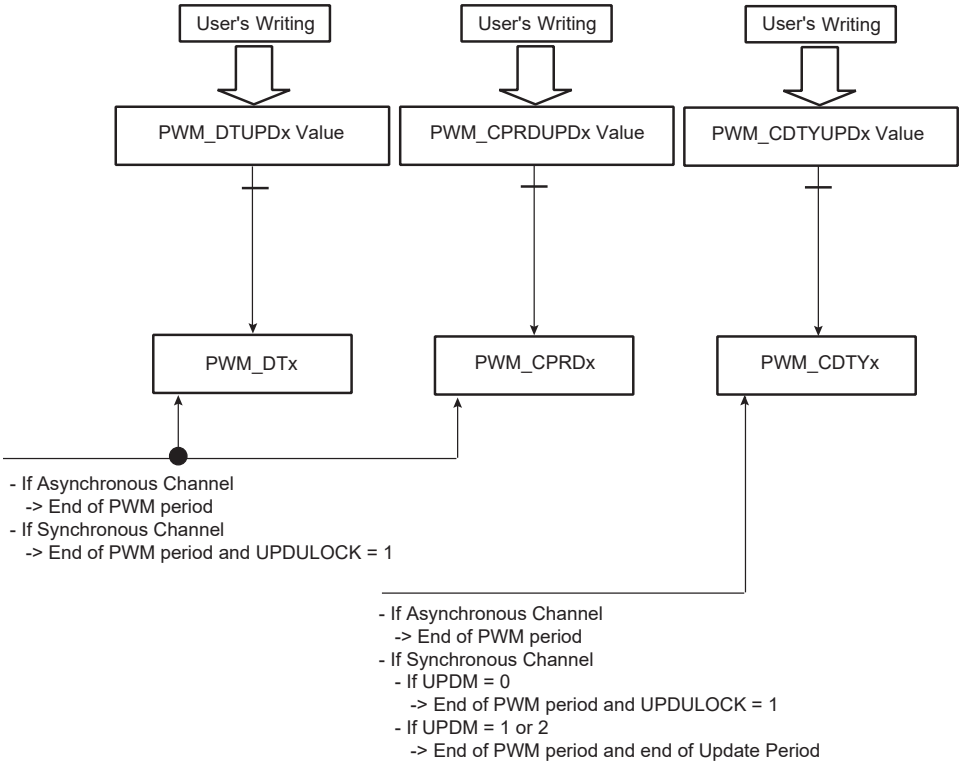
#### 55.6.6.3 Changing the Duty-Cycle, the Period and the Dead-Times

It is possible to modulate the output waveform duty-cycle, period and dead-times.

To prevent unexpected output waveform, the user must use the PWM Channel Duty Cycle Update Register (PWM_CDTYUPDx), the PWM Channel Period Update Register (PWM_CPRDUPDx) and the PWM Channel Dead Time Update Register (PWM_DTUPDx) to change waveform parameters while the channel is still enabled.

- If the channel is an asynchronous channel (SYNCx = 0 in PWM Sync Channels Mode Register (PWM_SCM)), these registers hold the new period, duty-cycle and dead-times values until the end of the current PWM period and update the values for the next period.
- If the channel is a synchronous channel and update method 0 is selected (SYNCx = 1 and UPDM = 0 in PWM_SCM register), these registers hold the new period, duty-cycle and dead-times values until the bit UPDULOCK is written at ‘1’ (in PWM Sync Channels Update Control Register (PWM_SCUC)) and the end of the current PWM period, then update the values for the next period.
- If the channel is a synchronous channel and update method 1 or 2 is selected (SYNCx = 1 and UPDM = 1 or 2 in PWM_SCM register):
  - registers PWM_CPRDUPDx and PWM_DTUPDx hold the new period and dead-times values until the bit UPDULOCK is written at ‘1’ (in PWM_SCUC) and the end of the current PWM period, then update the values for the next period.
  - register PWM_CDTYUPDx holds the new duty-cycle value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM Sync Channels Update Period Register (PWM_SCUP)) and the end of the current PWM period, then updates the value for the next period.
    **Note:** If the update registers PWM_CDTYUPDx, PWM_CPRDUPDx and PWM_DTUPDx are written several times between two updates, only the last written value is taken into account.

**Figure 55-34. Synchronized Period, Duty-Cycle and Dead-Time Update**



### 55.6.6.4 Changing the Update Period of Synchronous Channels

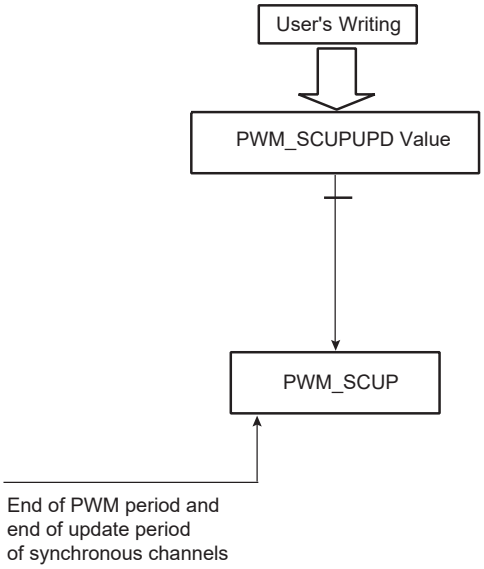
It is possible to change the update period of synchronous channels while they are enabled. See Method 2: Manual write of duty-cycle values and automatic trigger of the update and Method 3: Automatic write of duty-cycle values and automatic trigger of the update .

To prevent an unexpected update of the synchronous channels registers, the user must use the PWM Sync Channels Update Period Update Register (PWM_SCUPUPD) to change the update period of synchronous channels while they are still enabled. This register holds the new value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM_SCUP) and the end of the current PWM period, then updates the value for the next period.

**Note:**

1. If the update register PWM_SCUPUPD is written several times between two updates, only the last written value is taken into account.
2. Changing the update period does make sense only if there is one or more synchronous channels and if the update method 1 or 2 is selected (UPDM = 1 or 2 in PWM Sync Channels Mode Register).

**Figure 55-35. Synchronized Update of Update Period Value of Synchronous Channels**



### 55.6.6.5 Changing the Comparison Value and the Comparison Configuration

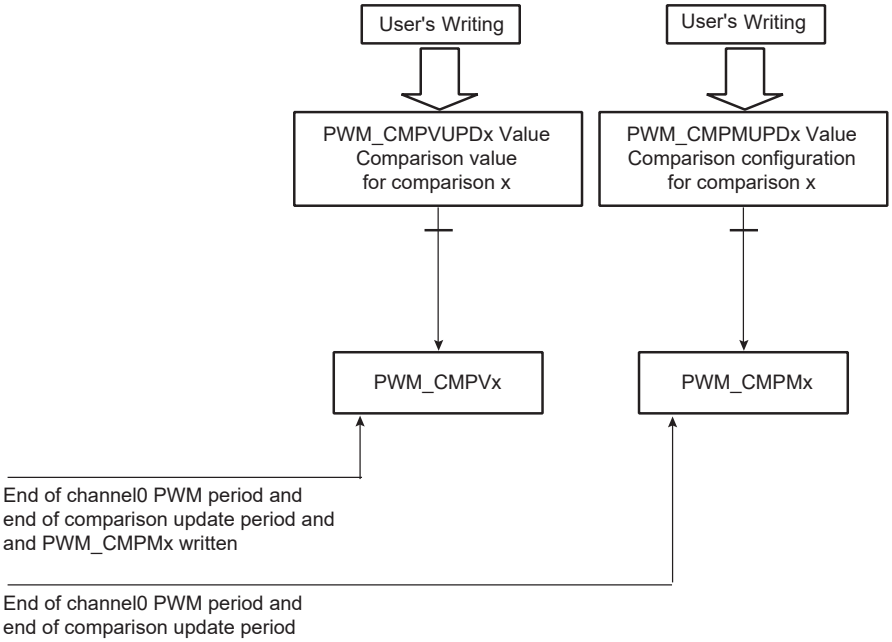
It is possible to change the comparison values and the comparison configurations while the channel 0 is enabled (see PWM Comparison Units).

To prevent unexpected comparison match, the user must use the PWM Comparison x Value Update Register (PWM_CMPVUPDx) and the PWM Comparison x Mode Update Register (PWM_CMPMUPDx) to change, respectively, the comparison values and the comparison configurations while the channel 0 is still enabled. These registers hold the new values until the end of the comparison update period (when CUPRCNT is equal to CUPR in PWM Comparison x Mode Register (PWM_CMPMx) and the end of the current PWM period, then update the values for the next period.

**⚠ CAUTION** The write of the register PWM_CMPVUPDx must be followed by a write of the register PWM_CMPMUPDx.

**Note:** If the update registers PWM_CMPVUPDx and PWM_CMPMUPDx are written several times between two updates, only the last written value are taken into account.

**Figure 55-36. Synchronized Update of Comparison Values and Configurations**



#### 55.6.6.6 Interrupt Sources

Depending on the interrupt mask in PWM_IMR1 and PWM_IMR2, an interrupt can be generated at the end of the corresponding channel period (CHIDx in the PWM Interrupt Status Register 1 (PWM_ISR1)), after a fault event (FCHIDx in PWM_ISR1), after a comparison match (CMPMx in PWM_ISR2), after a comparison update (CMPUx in PWM_ISR2) or according to the Transfer mode of the synchronous channels (WRDY and UNRE in PWM_ISR2).

If the interrupt is generated by the flags CHIDx or FCHIDx, the interrupt remains active until a read operation in PWM_ISR1 occurs.

If the interrupt is generated by the flags WRDY or UNRE or CMPMx or CMPUx, the interrupt remains active until a read operation in PWM_ISR2 occurs.

**A channel interrupt is enabled by setting the corresponding bit in PWM_IER1 and PWM_IER2. A channel interrupt is disabled by setting the corresponding bit in PWM_IDR1 and PWM_IDR2.**

### 55.6.7 Register Write Protection

To prevent any single software error that may corrupt PWM behavior, the registers listed below can be write-protected by writing the field WPCMD in the PWM Write Protection Control Register (PWM_WPCR). They are divided into six groups:

- Register group 0:
  - PWM Clock Register
- Register group 1:
  - PWM Disable Register
- Register group 2:
  - PWM Sync Channels Mode Register
  - PWM Channel Mode Register
  - PWM Stepper Motor Mode Register
  - PWM Fault Protection Value Register 2

  - PWM Leading-Edge Blanking Register
  - PWM Channel Mode Update Register
- Register group 3:
  - PWM Spread Spectrum Register
  - PWM Spread Spectrum Update Register
  - PWM Channel Period Register
  - PWM Channel Period Update Register
- Register group 4:
  - PWM Channel Dead Time Register
  - PWM Channel Dead Time Update Register
- Register group 5:
  - PWM Fault Mode Register
  - PWM Fault Protection Value Register 1

There are two types of write protection:

- SW write protection—can be enabled or disabled by software
- HW write protection—can be enabled by software but only disabled by a hardware reset of the PWM controller

Both types of write protection can be applied independently to a particular register group by means of the WPCMD and WPRGx fields in PWM_WPCR. If at least one type of write protection is active, the register group is write-protected. The value of field WPCMD defines the action to be performed:

- 0: Disables SW write protection of the register groups of which the bit WPRGx is at ‘1’
- 1: Enables SW write protection of the register groups of which the bit WPRGx is at ‘1’
- 2: Enables HW write protection of the register groups of which the bit WPRGx is at ‘1’

At any time, the user can determine whether SW or HW write protection is active in a particular register group by the fields WPSWS and WPHWS in the PWM Write Protection Status Register (PWM_WPSR).

If a write access to a write-protected register is detected, the WPVS flag in PWM_WPSR is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS and WPVSRC fields are automatically cleared after reading PWM_WPSR.

## 55.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | PWM_CLK | 7:0 | DIVA[7:0] | | | | | | | |

### 55.7.1 PWM Clock Register

**Name:** PWM_CLK
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS0 and WPHWS0 are cleared in the PWM Write Protection Status Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 27:24 – PREB[3:0]** CLKB Source Clock Selection

| Value | Name | Description |
|---|---|---|
| 0 | CLK | Peripheral clock |
| 1 | CLK_DIV2 | Peripheral clock/2 |
| 2 | CLK_DIV4 | Peripheral clock/4 |
| 3 | CLK_DIV8 | Peripheral clock/8 |
| 4 | CLK_DIV16 | Peripheral clock/16 |
| 5 | CLK_DIV32 | Peripheral clock/32 |
| 6 | CLK_DIV64 | Peripheral clock/64 |
| 7 | CLK_DIV128 | Peripheral clock/128 |
| 8 | CLK_DIV256 | Peripheral clock/256 |
| 9 | CLK_DIV512 | Peripheral clock/512 |
| 10 | CLK_DIV1024 | Peripheral clock/1024 |
| Other | – | Reserved |

**Bits 23:16 – DIVB[7:0]** CLKB Divide Factor

| Value | Name | Description |
|---|---|---|
| 0 | CLKB_POFF | CLKB clock is turned off |
| 1 | PREB | CLKB clock is clock selected by PREB |
| 2-255 | PREB_DIV | CLKB clock is clock selected by PREB divided by DIVB factor |

**Bits 11:8 – PREA[3:0]** CLKA Source Clock Selection

| Value | Name | Description |
|---|---|---|
| 0 | CLK | Peripheral clock |
| 1 | CLK_DIV2 | Peripheral clock/2 |
| 2 | CLK_DIV4 | Peripheral clock/4 |
| 3 | CLK_DIV8 | Peripheral clock/8 |
| 4 | CLK_DIV16 | Peripheral clock/16 |
| 5 | CLK_DIV32 | Peripheral clock/32 |
| 6 | CLK_DIV64 | Peripheral clock/64 |
| 7 | CLK_DIV128 | Peripheral clock/128 |
| 8 | CLK_DIV256 | Peripheral clock/256 |
| 9 | CLK_DIV512 | Peripheral clock/512 |
| 10 | CLK_DIV1024 | Peripheral clock/1024 |
| Other | – | Reserved |

**Bits 7:0 – DIVA[7:0]** CLKA Divide Factor

| Value | Name | Description |
|---|---|---|
| 0 | CLKA_POFF | CLKA clock is turned off |
| 1 | PREA | CLKA clock is clock selected by PREA |
| 2-255 | PREA_DIV | CLKA clock is clock selected by PREA divided by DIVA factor |

### 55.7.2 PWM Enable Register

**Name:** PWM_ENA
**Offset:** 0x04
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CHID3 | CHID2 | CHID1 | CHID0 |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | – |

**Bits 0, 1, 2, 3 – CHIDx** Channel ID

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enable PWM output for channel x. |

### 55.7.3 PWM Disable Register

**Name:** PWM_DIS
**Offset:** 0x08
**Reset:** –
**Property:** Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the PWM Write Protection Status Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CHID3 | CHID2 | CHID1 | CHID0 |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | – |

**Bits 0, 1, 2, 3 – CHIDx** Channel ID

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disable PWM output for channel x. |

### 55.7.4 PWM Status Register

**Name:** PWM_SR
**Offset:** 0x0C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CHID3 | CHID2 | CHID1 | CHID0 |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3 – CHIDx** Channel ID

| Value | Description |
|---|---|
| 0 | PWM output for channel x is disabled. |
| 1 | PWM output for channel x is enabled. |

### 55.7.5 PWM Interrupt Enable Register 1

**Name:** PWM_IER1
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | FCHID3 | FCHID2 | FCHID1 | FCHID0 |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CHID3 | CHID2 | CHID1 | CHID0 |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | – |

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x Interrupt Disable

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x Interrupt Disable

### 55.7.7 PWM Interrupt Mask Register 1

**Name:** PWM_IMR1
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | FCHID3 | FCHID2 | FCHID1 | FCHID0 |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CHID3 | CHID2 | CHID1 | CHID0 |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x Interrupt Mask

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x Interrupt Mask

### 55.7.8 PWM Interrupt Status Register 1

**Name:** PWM_ISR1
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

**Note:** Reading PWM_ISR1 automatically clears CHIDx and FCHIDx flags.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | FCHID3 | FCHID2 | FCHID1 | FCHID0 |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CHID3 | CHID2 | CHID1 | CHID0 |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x

| Value | Description |
|---|---|
| 0 | No new trigger of the fault protection since the last read of PWM_ISR1. |
| 1 | At least one trigger of the fault protection since the last read of PWM_ISR1. |

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x

| Value | Description |
|---|---|
| 0 | No new counter event has occurred since the last read of PWM_ISR1. |
| 1 | At least one counter event has occurred since the last read of PWM_ISR1. |

### 55.7.9 PWM Sync Channels Mode Register

**Name:** PWM_SCM
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | PTRCS[2:0] | | | PTRM | | | UPDM[1:0] | |
| Access | R/W | R/W | R/W | R/W | | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | SYNC3 | SYNC2 | SYNC1 | SYNC0 |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 23:21 – PTRCS[2:0]** DMA Controller Transfer Request Comparison Selection
Selection of the comparison used to set the flag WRDY and the corresponding DMA Controller transfer request.

**Bit 20 – PTRM** DMA Controller Transfer Request Mode

| UPDM | PTRM | WRDY Flag and DMA Controller Transfer Request |
|---|---|---|
| 0 | x | The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are never set to ‘1’. |
| 1 | x | The WRDY flag in PWM Interrupt Status Register 2 is set to ‘1’ as soon as the update period is elapsed, the DMA Controller transfer request is never set to ‘1’. |
| 2 | 0 | The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are set to ‘1’ as soon as the update period is elapsed. |
| | 1 | The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are set to ‘1’ as soon as the selected comparison matches. |

**Bits 17:16 – UPDM[1:0]** Synchronous Channels Update Mode

| Value | Name | Description |
|---|---|---|
| 0 | MODE0 | Manual write of double buffer registers and manual update of synchronous channels 1[(1)]. |
| 1 | MODE1 | Manual write of double buffer registers and automatic update of synchronous channels 2[(2)]. |
| 2 | MODE2 | The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are set to '1' as soon as the update period is elapsed. |

**Note:**

1. The update occurs at the beginning of the next PWM period, when the UPDULOCK bit in PWM Sync Channels Update Control Register is set.
2. The update occurs when the Update Period is elapsed.

**Bits 0, 1, 2, 3 – SYNCx** Synchronous Channel x

| Value | Description |
|---|---|
| 0 | Channel x is not a synchronous channel. |
| 1 | Channel x is a synchronous channel. |

### 55.7.10 PWM DMA Register

**Name:** PWM_DMAR
**Offset:** 0x24
**Reset:** –
**Property:** Write-only

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DMADUTY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | DMADUTY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DMADUTY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 23:0 – DMADUTY[23:0]** Duty-Cycle Holding Register for DMA Access
Each write access to PWM_DMAR sequentially updates PWM_CDTYUPDx.CDTYUPD with DMADUTY (only for channel configured as synchronous). See “Method 3: Automatic write of duty-cycle values and automatic trigger of the update” .

### 55.7.11 PWM Sync Channels Update Control Register

**Name:** PWM_SCUC
**Offset:** 0x28
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | UPDULOCK |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bit 0 – UPDULOCK** Synchronous Channels Update Unlock
This bit is automatically reset when the update is done.

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | If the UPDM field is set to ‘0’ in PWM Sync Channels Mode Register, writing the UPDULOCK bit to ‘1’ triggers the update of the period value, the duty-cycle and the dead-time values of synchronous channels at the beginning of the next PWM period. If the field UPDM is set to ‘1’ or ‘2’, writing the UPDULOCK bit to ‘1’ triggers only the update of the period value and of the dead-time values of synchronous channels. |

### 55.7.12 PWM Sync Channels Update Period Register

**Name:** PWM_SCUP
**Offset:** 0x2C
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | UPRCNT[3:0] | | | | UPR[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 7:4 – UPRCNT[3:0]** Update Period Counter
Reports the value of the update period counter.

**Bits 3:0 – UPR[3:0]** Update Period
Defines the time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in PWM Sync Channels Mode Register). This time is equal to UPR+1 periods of the synchronous channels.

### 55.7.13 PWM Sync Channels Update Period Update Register

**Name:** PWM_SCUPUPD
**Offset:** 0x30
**Reset:** –
**Property:** Write-only

This register acts as a double buffer for the UPR value. This prevents an unexpected automatic trigger of the update of synchronous channels.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | UPRUPD[3:0] | | | |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | – |

**Bits 3:0 – UPRUPD[3:0]** Update Period Update
Defines the wanted time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in PWM Sync Channels Mode Register). This time is equal to UPR+1 periods of the synchronous channels.

### 55.7.14 PWM Interrupt Enable Register 2

**Name:** PWM_IER2
**Offset:** 0x34
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx** Comparison x Update

| Value | Description |
|---|---|
| 0 | The comparison x has not been updated since the last read of the PWM_ISR2 register. |
| 1 | The comparison x has been updated at least one time since the last read of the PWM_ISR2 register. |

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx** Comparison x Match

| Value | Description |
|---|---|
| 0 | The comparison x has not matched since the last read of the PWM_ISR2 register. |
| 1 | The comparison x has matched at least one time since the last read of the PWM_ISR2 register. |

**Bit 3 – UNRE** Synchronous Channels Update Underrun Error

| Value | Description |
|---|---|
| 0 | No Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register. |
| 1 | At least one Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register. |

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update

| Value | Description |
|---|---|
| 0 | New duty-cycle and dead-time values for the synchronous channels cannot be written. |
| 1 | New duty-cycle and dead-time values for the synchronous channels can be written. |

### 55.7.18 PWM Output Override Value Register

**Name:** PWM_OOV
**Offset:** 0x44
**Reset:** 0x00000000
**Property:** Read/Write

| 0 | No effect. |
| 1 | Dead-time generator output DTOHx selected as PWMH output of channel x at the beginning of the next channel x PWM period. |

### 55.7.24 PWM Fault Mode Register

**Name:** PWM_FMR
**Offset:** 0x5C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

See Fault Inputs for details on fault generation.

> ⚠ **CAUTION** To prevent an unexpected activation of the status flag FSy in the PWM Fault Status Register, the bit FMODy can be set to '1' only if the FPOLy bit has been previously configured to its final value.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | FFIL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | FPOL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:16 – FFIL[7:0]** Fault Filtering
For each bit y of FFIL, where y is the fault input number:

0: The fault input y is not filtered.

1: The fault input y is filtered.

**Bits 15:8 – FMOD[7:0]** Fault Activation Mode
For each bit y of FMOD, where y is the fault input number:

0: The fault y is active until the fault condition is removed at the peripheral(1) level.

1: The fault y stays active until the fault condition is removed at the peripheral level(1)AND until it is cleared in the PWM Fault Clear Register.

**Note:**

1. The peripheral generating the fault.

**Bits 7:0 – FPOL[7:0]** Fault Polarity
For each bit y of FPOL, where y is the fault input number:

0: The fault y becomes active when the fault input y is at 0.

1: The fault y becomes active when the fault input y is at 1.

### 55.7.25 PWM Fault Status Register

**Name:** PWM_FSR
**Offset:** 0x60
**Reset:** 0x00000000
**Property:** Read-only

Refer to Fault Inputs for details on fault generation.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| | FIV[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 15:8 – FS[7:0]** Fault Status
For each bit y of FS, where y is the fault input number:

0: The fault y is not currently active.

1: The fault y is currently active.

**Bits 7:0 – FIV[7:0]** Fault Input Value
For each bit y of FIV, where y is the fault input number:

0: The current sampled value of the fault input y is 0 (after filtering if enabled).

1: The current sampled value of the fault input y is 1 (after filtering if enabled).

### 55.7.26 PWM Fault Clear Register

**Name:** PWM_FCR
**Offset:** 0x64
**Reset:** –
**Property:** Write-only

See Fault Inputs for details on fault generation.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | FCLR[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 7:0 – FCLR[7:0]** Fault Clear
For each bit y of FCLR, where y is the fault input number:

0: No effect.

1: If bit y of FMOD field is set to ‘1’ and if the fault input y is not at the level defined by the bit y of FPOL field, the fault y is cleared and becomes inactive (FMOD and FPOL fields belong to PWM Fault Mode Register), else writing this bit to ‘1’ has no effect.

### 55.7.27 PWM Fault Protection Value Register 1

**Name:** PWM_FPV1
**Offset:** 0x68
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

See Fault Inputs for details on fault generation.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 16, 17, 18, 19 – FPVLx** Fault Protection Value for PWML output on channel x
This bit is taken into account only if the bit FPZLx is set to ‘0’ in PWM Fault Protection Value Register 2.

| Value | Description |
|---|---|
| 0 | PWML output of channel x is forced to ‘0’ when fault occurs. |
| 1 | PWML output of channel x is forced to ‘1’ when fault occurs. |

**Bits 0, 1, 2, 3 – FPVHx** Fault Protection Value for PWMH output on channel x
This bit is taken into account only if the bit FPZHx is set to ‘0’ in PWM Fault Protection Value Register 2.

| Value | Description |
|---|---|
| 0 | PWMH output of channel x is forced to ‘0’ when fault occurs. |
| 1 | PWMH output of channel x is forced to ‘1’ when fault occurs. |

### 55.7.28 PWM Fault Protection Enable Register

**Name:** PWM_FPE
**Offset:** 0x6C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

Only the first 6 bits (number of fault input pins) of the register fields are significant.

Refer to Section 6.4 “Fault Inputs” for details on fault generation.

**Bits 0:7, 8:15, 16:23, 24:31 – FPEx** Fault Protection Enable for channel x
For each bit y of FPEx, where y is the fault input number:

0: Fault y is not used for the fault protection of channel x.

1: Fault y is used for the fault protection of channel x.

**⚠ CAUTION** To prevent an unexpected activation of the fault protection, the bit y of FPEx field can be set to ‘1’ only if the corresponding FPOL field has been previously configured to its final value in PWM Fault Mode Register.

### 55.7.29 PWM Event Line x Mode Register

**Name:** PWM_ELMRx
**Offset:** 0x7C + x*0x04 [x=0..1]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – CSELy** Comparison y Selection

| Value | Description |
|---|---|
| 0 | A pulse is not generated on the event line x when the comparison y matches. |
| 1 | A pulse is generated on the event line x when the comparison y match. |

### 55.7.30 PWM Spread Spectrum Register

**Name:** PWM_SSPR
**Offset:** 0xA0
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SPRDM |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | SPRD[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPRD[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 24 – SPRDM** Spread Spectrum Counter Mode

| Value | Description |
|---|---|
| 0 | Triangular mode. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled and counts upwards at each PWM period. When it reaches +SPRD, it restarts to count from -SPRD again. |
| 1 | Random mode. The spread spectrum counter is loaded with a new random value at each PWM period. This random value is uniformly distributed and is between -SPRD and +SPRD. |

**Bits 23:0 – SPRD[23:0]** Spread Spectrum Limit Value
The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying PWM period for the output waveform.

### 55.7.31 PWM Spread Spectrum Update Register

**Name:** PWM_SSPUP
**Offset:** 0xA4
**Reset:** –
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the SPRD value. This prevents an unexpected waveform when modifying the spread spectrum limit value.

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

**Bits 16, 17 – DOWNx** Down Count

| Value | Description |
|---|---|
| 0 | Up counter. |
| 1 | Down counter. |

**Bits 0, 1 – GCENx** Gray Count Enable

| Value | Description |
|---|---|
| 0 | Disable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x +1], PWMH[2*x +1] |
| 1 | Enable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x +1], PWMH[2*x +1]. |

### 55.7.33 PWM Fault Protection Value Register 2

**Name:** PWM_FPV2
**Offset:** 0xC0
**Reset:** 0x000F000F
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | FPZL3 | FPZL2 | FPZL1 | FPZL0 |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 1 | 1 | 1 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | FPZH3 | FPZH2 | FPZH1 | FPZH0 |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 1 | 1 | 1 | 1 |

**Bits 16, 17, 18, 19 – FPZLx** Fault Protection to Hi-Z for PWML output on channel x

| Value | Description |
|---|---|
| 0 | When fault occurs, PWML output of channel x is forced to value defined by the bit FPVLx in PWM Fault Protection Value Register 1. |
| 1 | When fault occurs, PWML output of channel x is forced to high-impedance state. |

**Bits 0, 1, 2, 3 – FPZHx** Fault Protection to Hi-Z for PWMH output on channel x

| Value | Description |
|---|---|
| 0 | When fault occurs, PWMH output of channel x is forced to value defined by the bit FPVHx in PWM Fault Protection Value Register 1. |
| 1 | When fault occurs, PWMH output of channel x is forced to high-impedance state. |

### 55.7.34 PWM Write Protection Control Register

**Name:** PWM_WPCR
**Offset:** 0xE4
**Reset:** –
**Property:** Write-only

See Register Write Protection for the list of registers that can be write-protected.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | WPKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WPRG5 | WPRG4 | WPRG3 | WPRG2 | WPRG1 | WPRG0 | WPCMD[1:0] | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | – | 0 | – |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x50574D | PASSWD | Writing any other value in this field aborts the write operation of the WPCMD field.<br>Always reads as 0 |

**Bits 2, 3, 4, 5, 6, 7 – WPRGx** Write Protection Register Group x

| Value | Description |
|---|---|
| 0 | The WPCMD command has no effect on the register group x. |
| 1 | The WPCMD command is applied to the register group x. |

**Bits 1:0 – WPCMD[1:0]** Write Protection Command
This command is performed only if the WPKEY corresponds to 0x50574D (“PWM” in ASCII).

| Value | Name | Description |
|---|---|---|
| 0 | DISABLE_SW_PROT | Disables the software write protection of the register groups of which the bit WPRGx is at ‘1’. |
| 1 | ENABLE_SW_PROT | Enables the software write protection of the register groups of which the bit WPRGx is at ‘1’. |

| Value | Name | Description |
|---|---|---|
| 2 | ENABLE_HW_PROT | Enables the hardware write protection of the register groups of which the bit WPRGx is at ‘1’. Only a hardware reset of the PWM controller can disable the hardware write protection. Moreover, to meet security requirements, the PIO lines associated with the PWM can not be configured through the PIO interface. |

### 55.7.35 PWM Write Protection Status Register

**Name:** PWM_WPSR
**Offset:** 0xE8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | WPVSRC[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Access | R | | R | R | R | R | R | R |
| Reset | 0 | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – WPVSRC[15:0]** Write Protect Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bits 8, 9, 10, 11, 12, 13 – WPHWSx** Write Protect HW Status

| Value | Description |
|---|---|
| 0 | The HW write protection x of the register group x is disabled. |
| 1 | The HW write protection x of the register group x is enabled. |

**Bit 7 – WPVS** Write Protect Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of PWM_WPSR. |
| 1 | At least one write protection violation has occurred since the last read of PWM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

**Bits 0, 1, 2, 3, 4, 5 – WPSWSx** Write Protect SW Status

| Value | Description |
|---|---|
| 0 | The SW write protection x of the register group x is disabled. |

| Value | Description |
|---|---|
| 1 | The SW write protection x of the register group x is enabled. |

### 55.7.36 PWM Comparison x Value Register

**Name:** PWM_CMPVx
**Offset:** 0x0130 + x*0x10 [x=0..7]
**Reset:** 0x00000000
**Property:** Read/Write

Only the first 16 bits (channel counter size) of field CV are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CVM |
| Access | | | | | | | | R/W |

**Bit 24 – CVM** Comparison x Value Mode

| Value | Description |
|---|---|
| 0 | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing. |
| 1 | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.<br>Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in PWM Channel Mode Register) |

**Bits 23:0 – CV[23:0]** Comparison x Value
Define the comparison x value to be compared with the counter of the channel 0.

### 55.7.37 PWM Comparison x Value Update Register

**Name:** PWM_CMPVUPDx
**Offset:** 0x0134 + x*0x10 [x=0..7]
**Reset:** –
**Property:** Write-only

This register acts as a double buffer for the CV and CVM values. This prevents an unexpected comparison x match.

Only the first 16 bits (channel counter size) of field CVUPD are significant.

**⚠ CAUTION** The write of the register PWM_CMPVUPDx must be followed by a write of the register PWM_CMPMUPDx.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CVMUPD |
| Access | | | | | | | | W |

| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bit 24 – CVMUPD** Comparison x Value Mode Update
**Note:** This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in PWM Channel Mode Register)

| Value | Description |
|---|---|
| 0 | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing. |
| 1 | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing. |

**Bits 23:0 – CVUPD[23:0]** Comparison x Value Update
Define the comparison x value to be compared with the counter of the channel 0.

### 55.7.38 PWM Comparison x Mode Register

**Name:** PWM_CMPMx
**Offset:** 0x0138 + x*0x10 [x=0..7]
**Reset:** 0x00000000
**Property:** R/W

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CUPRCNT[3:0] | | | | CUPR[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CPRCNT[3:0] | | | | CPR[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CTR[3:0] | | | | | | | CEN |
| Access | R/W | R/W | R/W | R/W | | | | R/W |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

**Bits 23:20 – CUPRCNT[3:0]** Comparison x Update Period Counter
Reports the value of the comparison x update period counter.

Note: The field CUPRCNT is read-only

**Bits 19:16 – CUPR[3:0]** Comparison x Update Period
Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 15:12 – CPRCNT[3:0]** Comparison x Period Counter
Reports the value of the comparison x period counter.

Note: The field CPRCNT is read-only

**Bits 11:8 – CPR[3:0]** Comparison x Period
CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTR[3:0]** Comparison x Trigger
The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CEN** Comparison x Enable

| Value | Description |
|---|---|
| 0 | The comparison x is disabled and can not match. |
| 1 | The comparison x is enabled and can match. |

### 55.7.39 PWM Comparison x Mode Update Register

**Name:** PWM_CMPMUPDx
**Offset:** 0x013C + x*0x10 [x=0..7]
**Reset:** –
**Property:** W

This register acts as a double buffer for the CEN, CTR, CPR and CUPR values. This prevents an unexpected comparison x match.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CUPRUPD[3:0] | | | |
| Access | | | | | W | W | W | W |

|---|---|---|---|---|---|---|---|---|
| | | | | | CPRUPD[3:0] | | | |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CTRUPD[3:0] | | | | | | | CENUPD |
| Access | W | W | W | W | | | | W |
| Reset | 0 | 0 | 0 | – | | | | – |

**Bits 19:16 – CUPRUPD[3:0]** Comparison x Update Period Update
Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 11:8 – CPRUPD[3:0]** Comparison x Period Update
CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTRUPD[3:0]** Comparison x Trigger Update
The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CENUPD** Comparison x Enable Update

| Value | Description |
|---|---|
| 0 | The comparison x is disabled and can not match. |
| 1 | The comparison x is enabled and can match. |

### 55.7.40 PWM Channel Mode Register

**Name:** PWM_CMRx
**Offset:** 0x0200 + x*0x20 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Access | | | | | R/W | | | |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | TCTS | DPOLI | UPDS | CES | CPOL | CALG |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CPRE[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bit 19 – PPM** Push-Pull Mode
The Push-Pull mode is enabled for channel x.

| Value | Description |
|---|---|
| 0 | The Push-Pull mode is disabled for channel x. |
| 1 | The Push-Pull mode is enabled for channel x. |

**Bit 18 – DTLI** Dead-Time PWMLx Output Inverted

| Value | Description |
|---|---|
| 0 | The dead-time PWMLx output is not inverted. |
| 1 | The dead-time PWMLx output is inverted. |

**Bit 17 – DTHI** Dead-Time PWMHx Output Inverted

| Value | Description |
|---|---|
| 0 | The dead-time PWMHx output is not inverted. |
| 1 | The dead-time PWMHx output is inverted. |

**Bit 16 – DTE** Dead-Time Generator Enable

| Value | Description |
|---|---|
| 0 | The dead-time generator is disabled. |
| 1 | The dead-time generator is enabled. |

**Bit 13 – TCTS** Timer Counter Trigger Selection

| Value | Description |
|---|---|
| 0 | The comparator of the channel x (OCx) is used as the trigger source for the Timer Counter (TC). |
| 1 | The counter events of the channel x is used as the trigger source for the Timer Counter (TC). |

**Bit 12 – DPOLI** Disabled Polarity Inverted

| Value | Description |
|---|---|
| 0 | When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is the same as the one defined by the CPOL bit. |
| 1 | When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is inverted compared to the one defined by the CPOL bit. |

**Bit 11 – UPDS** Update Selection
If the PWM period is center-aligned (CALG=1):

0: The update occurs at the next end of the PWM period after writing the update register(s).

1: The update occurs at the next end of the PWM half period after writing the update register(s).

If the PWM period is left-aligned (CALG=0), the update always occurs at the end of the PWM period after writing the update register(s).

**Bit 10 – CES** Counter Event Selection
If the PWM period is center-aligned (CALG=1):

0: The channel counter event occurs at the end of the PWM period.

1: The channel counter event occurs at the end of the PWM period and at half the PWM period.

If the PWM period is left-aligned (CALG=0), the channel counter event occurs at the end of the period and the CES bit has no effect.

**Bit 9 – CPOL** Channel Polarity

| Value | Description |
|---|---|
| 0 | The OCx output waveform (output from the comparator) starts at a low level. |
| 1 | The OCx output waveform (output from the comparator) starts at a high level. |

**Bit 8 – CALG** Channel Alignment

| Value | Description |
|---|---|
| 0 | The period is left-aligned. |
| 1 | The period is center-aligned. |

**Bits 3:0 – CPRE[3:0]** Channel Prescaler

| Value | Name | Description |
|---|---|---|
| | MCK | Peripheral clock |

| Value | Name | Description |
|---|---|---|
| 1 | MCK_DIV_2 | Peripheral clock/2 |
| 2 | MCK_DIV_4 | Peripheral clock/4 |
| 3 | MCK_DIV_8 | Peripheral clock/8 |
| 4 | MCK_DIV_16 | Peripheral clock/16 |
| 5 | MCK_DIV_32 | Peripheral clock/32 |
| 6 | MCK_DIV_64 | Peripheral clock/64 |
| 7 | MCK_DIV_128 | Peripheral clock/128 |
| 8 | MCK_DIV_256 | Peripheral clock/256 |
| 9 | MCK_DIV_512 | Peripheral clock/512 |
| 10 | MCK_DIV_1024 | Peripheral clock/1024 |
| 11 | CLKA | Clock A |
| 12 | CLKB | Clock B |

### 55.7.41 PWM Channel Duty Cycle Register

**Name:** PWM_CDTYx
**Offset:** 0x0204 + x*0x20 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CDTY[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:0 – CDTY[23:0]** Channel Duty-Cycle
Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM_CPRDx).

### 55.7.42 PWM Channel Duty Cycle Update Register

**Name:** PWM_CDTYUPDx
**Offset:** 0x0208 + x*0x20 [x=0..3]
**Reset:** –
**Property:** Write-only

This register acts as a double buffer for the CDTY value. This prevents an unexpected waveform when modifying the waveform duty-cycle.

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CDTYUPD[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CDTYUPD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 23:0 – CDTYUPD[23:0]** Channel Duty-Cycle Update
Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM_CPRDx).

### 55.7.43 PWM Channel Period Register

**Name:** PWM_CPRDx
**Offset:** 0x020C + x*0x20 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CPRD[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CPRD[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CPRD[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 23:0 – CPRD[23:0]** Channel Period
If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where X = $2^{PREA}$ is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \mathrm{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \mathrm{CPRD} \times \mathrm{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where X = $2^{PREA}$ is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \mathrm{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \mathrm{CPRD} \times \mathrm{DIVB})}{f_{\text{peripheral clock}}}$$

### 55.7.44 PWM Channel Period Update Register

**Name:** PWM_CPRDUPDx
**Offset:** 0x0210 + x*0x20 [x=0..3]
**Reset:** –
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the CPRD value. This prevents an unexpected waveform when modifying the waveform period.

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CPRDUPD[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | CPRDUPD[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |

|---|---|---|---|---|---|---|---|---|
| | CPRDUPD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 23:0 – CPRDUPD[23:0]** Channel Period Update
If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where X = $2^{PREA}$ is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \mathrm{CPRDUPD})}{f_{\mathrm{peripheral\ clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \mathrm{CPRDUPD} \times \mathrm{DIVA})}{f_{\mathrm{peripheral\ clock}}} \text{ or } \frac{(X \times \mathrm{CPRDUPD} \times \mathrm{DIVB})}{f_{\mathrm{peripheral\ clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where X = $2^{PREA}$ is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \mathrm{CPRDUPD})}{f_{\mathrm{peripheral\ clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \mathrm{CPRDUPD} \times \mathrm{DIVA})}{f_{\mathrm{peripheral\ clock}}} \text{ or } \frac{(2 \times X \times \mathrm{CPRDUPD} \times \mathrm{DIVB})}{f_{\mathrm{peripheral\ clock}}}$$

### 55.7.45 PWM Channel Counter Register

**Name:** PWM_CCNTx
**Offset:** 0x0214 + x*0x20 [x=0..3]
**Reset:** 0x00000000
**Property:** Read-only

Only the first 16 bits (channel counter size) are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

**Bits 23:0 – CNT[23:0]** Channel Counter Register
Channel counter value. This register is reset when:

• the channel is enabled (writing CHIDx in the PWM_ENA register).

• the channel counter reaches CPRD value defined in the PWM_CPRDx register if the waveform is left-aligned.

### 55.7.46 PWM Channel Dead Time Register

**Name:** PWM_DTx
**Offset:** 0x0218 + x*0x20 [x=0..3]
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the PWM Write Protection Status Register.

Only the first 16 bits (dead-time counter size) of fields DTH and DTL are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DTL[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – DTL[15:0]** Dead-Time Value for PWMLx Output
Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM_CDTYx).

**Bits 15:0 – DTH[15:0]** Dead-Time Value for PWMHx Output
Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM_CPRDx and PWM_CDTYx).

### 55.7.47 PWM Channel Dead Time Update Register

**Name:** PWM_DTUPDx
**Offset:** 0x021C + x*0x20 [x=0..3]
**Reset:** 0x00000000
**Property:** Write-only

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the DTH and DTL values. This prevents an unexpected waveform when modifying the dead-time values.

Only the first 16 bits (dead-time counter size) of fields DTHUPD and DTLUPD are significant.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DTLUPD[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DTLUPD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | DTHUPD[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DTHUPD[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:16 – DTLUPD[15:0]** Dead-Time Value Update for PWMLx Output
Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

**Bits 15:0 – DTHUPD[15:0]** Dead-Time Value Update for PWMHx Output
Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM_CPRDx and PWM_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

### 55.7.48 PWM Channel Mode Update Register

**Name:** PWM_CMUPDx
**Offset:** 0x0400 + x*0x20 [x=0..3]
**Reset:** –
**Property:** Write-only

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the CPOL value. This prevents an unexpected waveform when modifying the polarity value.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | CPOLINVUP | | | | CPOLUP | |
| Access | | | W | | | | W | |
| Reset | | | – | | | | – | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bit 13 – CPOLINVUP** Channel Polarity Inversion Update
If this bit is written at ‘1’, the write of the bit CPOLUP is not taken into account.

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The OCx output waveform (output from the comparator) is inverted. |

**Bit 9 – CPOLUP** Channel Polarity Update
The write of this bit is taken into account only if the bit CPOLINVUP is written at ‘0’ at the same time.

| Value | Description |
|---|---|
| 0 | The OCx output waveform (output from the comparator) starts at a low level. |
| 1 | The OCx output waveform (output from the comparator) starts at a high level. |

### 55.7.49 PWM External Trigger Register

**Name:** PWM_ETRGx
**Offset:** 0x042C + x*0x20 [x=0..1]
**Reset:** 0x00000000
**Property:** Read/Write

**Bit 31 – RFEN** Recoverable Fault Enable

| Value | Description |
|---|---|
| 0 | The TRGINx signal does not generate a recoverable fault. |
| 1 | The TRGINx signal generate a recoverable fault in place of the fault x input. |

**Bit 30 – TRGSRC** Trigger Source

| Value | Description |
|---|---|
| 0 | The TRGINx signal is driven by the PWMEXTRGx input. |
| 1 | The TRGINx signal is driven by the Analog Comparator Controller. |

**Bit 29 – TRGFILT** Filtered input

| Value | Description |
|---|---|
| 0 | The external trigger input x is not filtered. |
| 1 | The external trigger input x is filtered. |

**Bit 28 – TRGEDGE** Edge Selection

| Value | Name | Description |
|---|---|---|
| 0 | FALLING_ZERO | TRGMODE = 1: TRGINx event detection on falling edge.<br>TRGMODE = 2, 3: TRGINx active level is 0 |
| 1 | RISING_ONE | TRGMODE = 1: TRGINx event detection on rising edge.<br>TRGMODE = 2, 3: TRGINx active level is 1 |

**Bits 25:24 – TRGMODE[1:0]** External Trigger Mode

| Value | Name | Description |
|---|---|---|
| 0 | OFF | External trigger is not enabled. |
| 1 | MODE1 | External PWM Reset Mode |
| 2 | MODE2 | External PWM Start Mode |
| 3 | MODE3 | Cycle-by-cycle Duty Mode |

**Bits 23:0 – MAXCNT[23:0]** Maximum Counter value
Maximum channel x counter value measured at the TRGINx event since the last read of the register.

At the TRGINx event, if the channel x counter value is greater than the stored MAXCNT value, then MAXCNT is updated by the channel x counter value.

### 55.7.50 PWM Leading-Edge Blanking Register

**Name:** PWM_LEBRx
**Offset:** 0x0430 + x*0x20 [x=0..1]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | LEBDELAY[6:0] | | | | | | |
| Access | | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 19 – PWMHREN** PWMH Rising Edge Enable
Leading-edge blanking is enabled on PWMHx output rising edge.

| Value | Description |
|---|---|
| 0 | Leading-edge blanking is disabled on PWMHx output rising edge. |
| 1 | Leading-edge blanking is enabled on PWMHx output rising edge. |

**Bit 18 – PWMHFEN** PWMH Falling Edge Enable

| Value | Description |
|---|---|
| 0 | Leading-edge blanking is disabled on PWMHx output falling edge. |
| 1 | Leading-edge blanking is enabled on PWMHx output falling edge. |

**Bit 17 – PWMLREN** PWML Rising Edge Enable

| Value | Description |
|---|---|
| 0 | Leading-edge blanking is disabled on PWMLx output rising edge. |
| 1 | Leading-edge blanking is enabled on PWMLx output rising edge. |

**Bit 16 – PWMLFEN** PWML Falling Edge Enable

| Value | Description |
|---|---|
| 0 | Leading-edge blanking is disabled on PWMLx output falling edge. |

| Value | Description |
|---|---|
| 1 | Leading-edge blanking is enabled on PWMLx output falling edge. |

**Bits 6:0 – LEBDELAY[6:0]** Leading-Edge Blanking Delay for TRGINx
Leading-edge blanking duration for external trigger x input. The delay is calculated according to the following formula:

LEBDELAY = ($f_{peripheral\ clock}$ × Delay) + 1

# 56. Secure Fuse Controller (SFC)

## 56.1 Description

The Secure Fuse Controller (SFC) interfaces the system with electrical fuses in a secure way.

The default value of a fuse is logic ‘0’ (not programmed). A programmed fuse is logic ‘1’.

An electrical fuse matrix is a type of non-volatile memory. Each fuse in the matrix can be programmed only one time. They are typically used to store calibration bits for analog cells such as oscillators, configuration settings, chip identifiers or cryptographic keys.

A specific number of fuse bits are programmed during the production tests through the test interface. The remaining 544 fuse bits are programmed by the user and by software through the user interface.

The SFC automatically reads the fuse values on start-up and stores them in 32-bit registers in order to make them accessible by the software. Only fuses set to level ‘1’ are programmed.

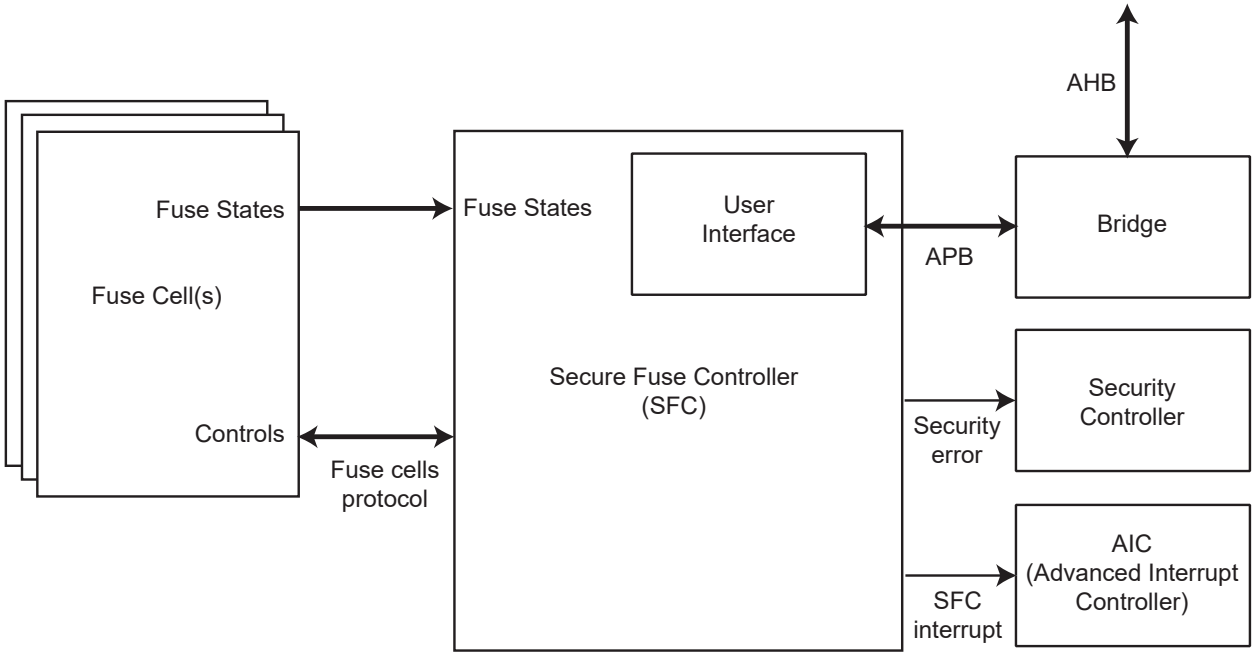
Several security mechanisms make irregular data recovery more complex to achieve.

## 56.2 Embedded Characteristics

- Fuse bits partitioned into two areas:
  - Reserved area
  - 544-bit user area
- Program and read the fuse states by software
- Automatic check of programmed fuses
- Detection of irregular alteration of the fuse states in reserved area during startup and report
- Live detection of irregular alteration of all the fuse states and report
- Part of fuse states maskable for reading

## 56.3 Block Diagram

**Figure 56-1. SFC Block Diagram**



## 56.4 Functional Description

### 56.4.1 Accessing the SFC

Setting the write-once FUSE bit in the SFR_SECURE register disables access to the Secure Fuse Controller (SFC).

### 56.4.2 Fuse Partitioning

The fuses are split into a user area of 544 bits and a reserved area.

The reserved area is typically used to store calibration bits for analog cells such as oscillators, configuration settings, chip identifiers, etc. The user area fuses are programmed later on by the user.

### 56.4.3 Fuse Integrity Checking

The SFC automatically reads the fuses values at start-up and stores them in 32-bit registers in order to make them accessible by software. At this time, the SFC checks the integrity of the fuse states in the reserved area.

If an inconsistency is detected, the CHECK error flag (named ACE for the reserved area) in the Status Register (SFC_SR) is set to ‘1’ and can trigger an interrupt. This flag is automatically cleared at ‘0’, when the Status Register (SFC_SR) is read.

### 56.4.4 Fuse Integrity Live Checking

The SFC automatically checks the integrity of all fuse states at every time after the start-up is finished. This ensures that the fuses states cannot be changed without notice.

If an inconsistency is detected, the LCHECK error flag in the Status Register (SFC_SR) is set to ‘1’ and can trigger an interrupt. This flag is automatically cleared at ‘0’, when the Status Register (SFC_SR) is read.

### 56.4.5 Fuse Access

#### 56.4.5.1 Fuse Reading

The fuse states are automatically latched at core start-up and are available for reading in the Data Registers (SFC_DRx).

The fuse states of bits 0 to 31 are available in the Data Register 0 (SFC_DR0), the fuse states of bits 32 to 63 are available in the Data Register 1 (SFC_DR1) and so on.

When fuse programming is performed, the fuse states are automatically updated in the Data Registers (SFC_DRx).

#### 56.4.5.2 Fuse Programming

All the fuses can be written by software.

The sequence of instructions to program fuses is the following:

1. Write the key code 0xFB in the Key Register (SFC_KR).
2. Write the word to program in the corresponding Data Register (SFC_DRx).
   For example, if fuses 0 to 31 must be programmed, Data Register 0 (SFC_DR0) must be written. If fuses 32 to 61 must be programmed, Data Register 1 (SFC_DR1) must be written. Only the data bits set to level ‘1’ are programmed.
3. Wait for flag PGMC to rise in the Status Register (SFC_SR) by polling or interrupt.
4. Check the value of flag PGMF: if it is set to 1, it means that the programming procedure failed. After programming, the fuses are read back in the corresponding SFC_DRx.

#### 56.4.5.3 Fuse Masking

It is possible to mask a fuse array. Once the fuse masking is enabled, the data registers from SFC_DR0 to SFC_DR7 are read at a value of ‘0’, regardless of the fuse state (the registers that are masked depend on the SFC hardware customizing).

To activate fuse masking, the MSK bit of the SFC Mode Register (SFC_MR) must be written to level ‘1’. The MSK bit is set-only. Only a hardware reset can disable fuse masking.

The MSK bit has no effect on the programming of masked fuses.

### 56.4.6 Fuse Functions

The “Fuse Box Controller” section defines the fuse bits that can be used as general purpose bits when standard boot is used.

If secure boot is used, refer to the device “Secure Boot Strategy” application note included in the Secure Package.

## 56.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SFC_KR | 7:0 | KEY[7:0] | | | | | | | |

### 56.5.1 SFC Key Register

**Name:** SFC_KR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | KEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 7:0 – KEY[7:0]** Key Code
This field must be written with the correct key code (0xFB) prior to any write in a Data Register (SFC_DRx) in order to enable the fuse programming. For each write of SFC_DRx, this field must be written immediately before.

### 56.5.2 SFC Mode Register

**Name:** SFC_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | SASEL | | | | MSK |
| Access | | | | R/W | | | | R/W |
| Reset | | | | 0 | | | | 0 |

**Bit 4 – SASEL** Sense Amplifier Selection

| Value | Description |
|---|---|
| 0 | Comparator type sense amplifier selected |
| 1 | Latch type sense amplifier selected |

**Bit 0 – MSK** Mask Data Registers
The MSK bit is set-only. Only a hardware reset can disable fuse masking.

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | The data registers from SFC_DR0 to SFC_DR7 are always read at 0x00000000. |

### 56.5.3 SFC Interrupt Enable Register

**Name:** SFC_IER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ACE | |
| Access | | | | | | | W | |
| Reset | | | | | | | – | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | LCHECK | | | PGMF | PGMC |
| Access | | | | W | | | W | W |
| Reset | | | | – | | | – | – |

**Bit 17 – ACE** Manufacturer Area Check Error Interrupt Enable

**Bit 4 – LCHECK** Live Integrity Check Error Interrupt Enable

**Bit 1 – PGMF** Programming Sequence Failed Interrupt Enable

**Bit 0 – PGMC** Programming Sequence Completed Interrupt Enable

### 56.5.4 SFC Interrupt Disable Register

**Name:** SFC_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ACE | |
| Access | | | | | | | W | |
| Reset | | | | | | | – | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

| Access | | | | W | | | W | W |
| Reset | | | | – | | | – | – |

**Bit 17 – ACE** Manufacturer Area Check Error Interrupt Disable

**Bit 4 – LCHECK** Live Integrity Check Error Interrupt Disable

**Bit 1 – PGMF** Programming Sequence Failed Interrupt Disable

**Bit 0 – PGMC** Programming Sequence Completed Interrupt Disable

### 56.5.5 SFC Interrupt Mask Register

**Name:** SFC_IMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: Corresponding interrupt is not enabled.

1: Corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | | | | R | | | R | R |
| Reset | | | | 0 | | | 0 | 0 |

**Bit 17 – ACE** Manufacturer Area Check Error Interrupt Mask

**Bit 4 – LCHECK** Live Integrity Checking Error Interrupt Mask

**Bit 1 – PGMF** Programming Sequence Failed Interrupt Mask

**Bit 0 – PGMC** Programming Sequence Completed Interrupt Mask

### 56.5.6 SFC Status Register

**Name:** SFC_SR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | ACE | APLE |
| Access | | | | | | | R | R |
| Reset | | | | | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | LCHECK | | | PGMF | PGMC |
| Access | | | | R | | | R | R |
| Reset | | | | 0 | | | 0 | 0 |

**Bit 17 – ACE** Manufacturer Area Check Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No check error in the reserved area since the last read of SFC_SR. |
| 1 | At least one check error in the reserved area since the last read of SFC_SR. |

**Bit 16 – APLE** Area Programming Lock Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No programming attempt has been made in the locked area since the last read of SFC_SR. |
| 1 | A programming attempt has been made in the locked area since the last read of SFC_SR. |

**Bit 4 – LCHECK** Live Integrity Checking Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No live integrity check error since the last read of SFC_SR. |
| 1 | At least one live integrity check error since the last read of SFC_SR. |

**Bit 1 – PGMF** Programming Sequence Failed (cleared on read)

| Value | Description |
|---|---|
| 0 | No programming failure occurred during last programming sequence since the last read of SFC_SR. |

| Value | Description |
|---|---|
| 1 | A programming failure occurred since the last read of SFC_SR. |

**Bit 0 – PGMC** Programming Sequence Completed (cleared on read)

| Value | Description |
|---|---|
| 0 | No programming sequence completion since the last read of SFC_SR. |
| 1 | At least one programming sequence completion since the last read of SFC_SR. |

### 56.5.7 SFC Data Register x

**Name:** SFC_DRx
**Offset:** 0x20 + x*0x04 [x=0..16]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | DATA[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DATA[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | DATA[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DATA[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – DATA[31:0]** Fuse Data

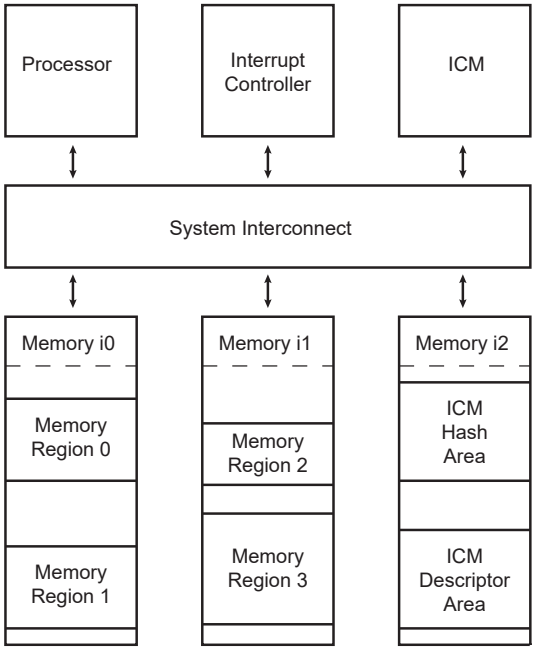
| Value | Description |
|---|---|
| READ | Reports the state of the corresponding fuses. |
| WRITE | The data to be programmed in the corresponding fuses. Only bits with a value of ‘1’ are programmed. Writing this register automatically triggers a programming sequence of the corresponding fuses. Note that a write to the Key Register (SFC_KR) with the correct key code must always precede any write to SFC_DRx. |

# 57. Integrity Check Monitor (ICM)

## 57.1 Description

The Integrity Check Monitor (ICM) is a DMA controller that performs hash calculation over multiple memory regions through the use of transfer descriptors located in memory (ICM Descriptor Area). The Hash function is based on the Secure Hash Algorithm (SHA). The ICM integrates two modes of operation. The first one is used to hash a list of memory regions and save the digests to memory (ICM Hash Area). The second mode is an active monitoring of the memory. In that mode, the hash function is evaluated and compared to the digest located at a predefined memory address (ICM Hash Area). If a mismatch occurs, an interrupt is raised. See the figure below for an example of four-region monitoring. Hash and Descriptor areas are located in Memory instance i2, and the four regions are split in memory instances i0 and i1.

**Figure 57-1. Four-region Monitoring Example**



The ICM SHA engine is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The following terms are concise definitions of the ICM concepts used throughout this document:

- Region—a partition of instruction or data memory space
- Region Descriptor—a data structure stored in memory, defining region attributes
- Region Attributes—region start address, region size, region SHA engine processing mode, Write Back or Compare function mode
- Context Registers—a set of ICM non-memory-mapped, internal registers which are automatically loaded, containing the attributes of the region being processed
- Main List—a list of region descriptors. Each element associates the start address of a region with a set of attributes.
- Secondary List—a linked list defined on a per region basis that describes the memory layout of the region (when the region is non-contiguous)

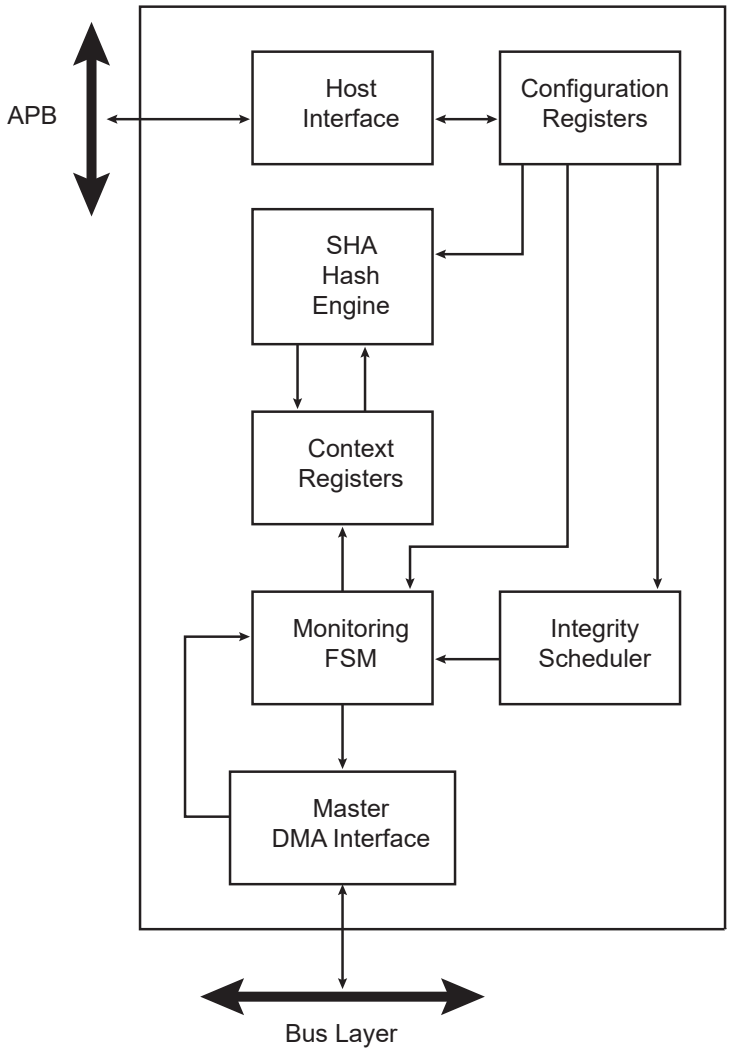
- Hash Area—predefined memory space where the region hash results (digest) are stored

## 57.2 Embedded Characteristics

- DMA AHB Master Interface
- Supports Monitoring of up to 4 Non-Contiguous Memory Regions
- Supports Block Gathering Using Linked Lists
- Supports Secure Hash Algorithm (SHA1, SHA224, SHA256)
- Compliant with FIPS Publication 180-2
- Configurable Processing Period:
  - When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.
  - When SHA256 or SHA224 algorithm is processed, the runtime period is either 72 or 194 clock cycles.
- Programmable Bus Burden

## 57.3 Block Diagram

**Figure 57-2. Integrity Check Monitor Block Diagram**



## 57.4 Product Dependencies

### 57.4.1 Power Management

The peripheral clock is not continuously provided to the ICM. The programmer must first enable the ICM clock in the Power Management Controller (PMC) before using the ICM.

### 57.4.2 Interrupt Sources

The ICM interface has an interrupt line connected to the Interrupt Controller.

Handling the ICM interrupt requires programming the interrupt controller before configuring the ICM.

## 57.5 Functional Description

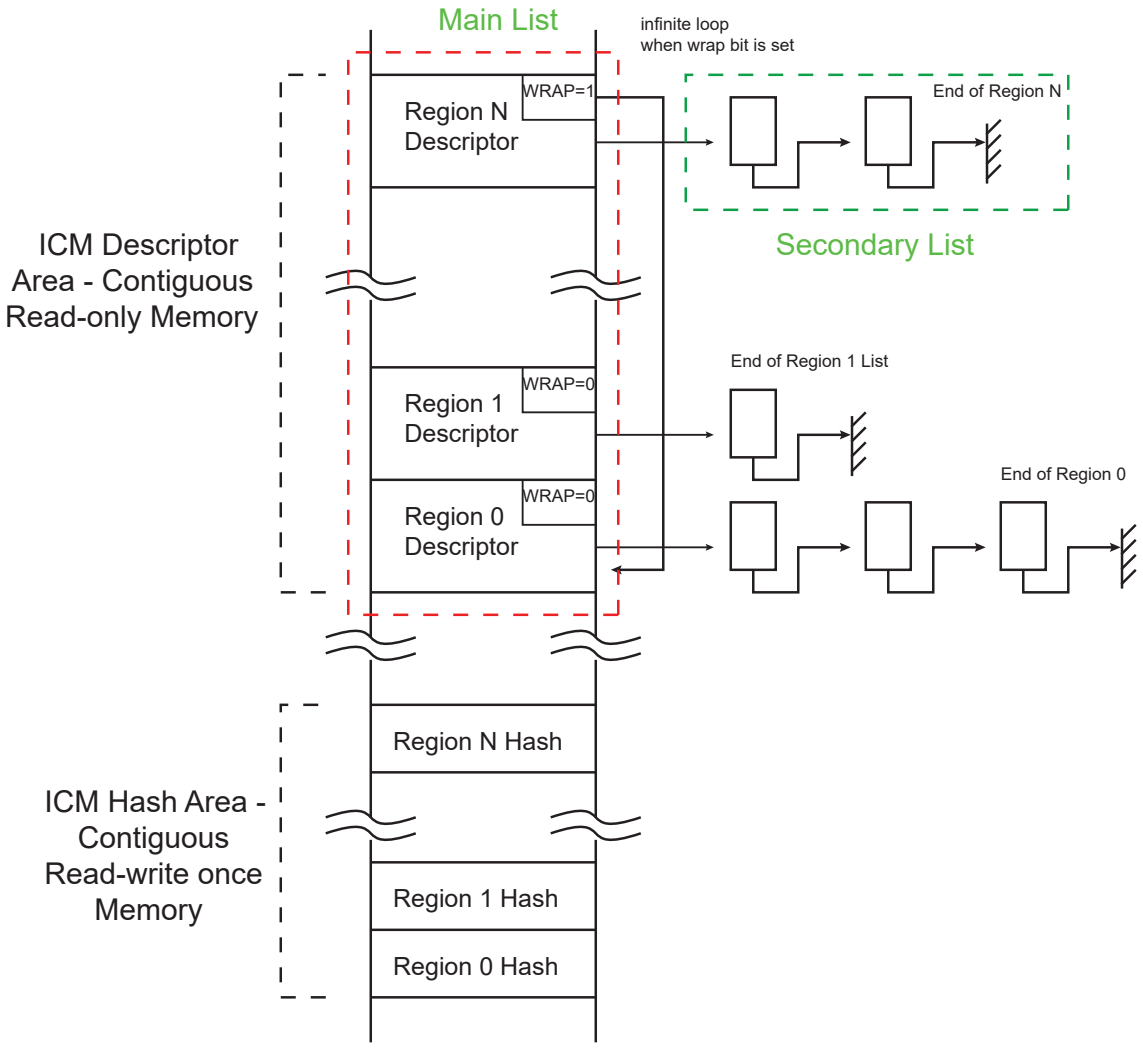
### 57.5.1 Overview

The Integrity Check Monitor (ICM) is a DMA controller that performs SHA-based memory hashing over memory regions. As shown in figure Integrity Check Monitor Block Diagram, it integrates a DMA interface, a Monitoring Finite State Machine (FSM), an integrity scheduler, a set of context registers, a SHA engine, an interface for configuration and status registers.

The ICM integrates a Secure Hash Algorithm engine (SHA). This engine requires a message padded according to FIPS180-2 specification when used as a SHA calculation unit only. Otherwise, if the ICM is used as integrated check for memory content, the padding is not mandatory. The SHA module produces an N-bit message digest each time a block is read and a processing period ends. N is 160 for SHA1, 224 for SHA224, 256 for SHA256.

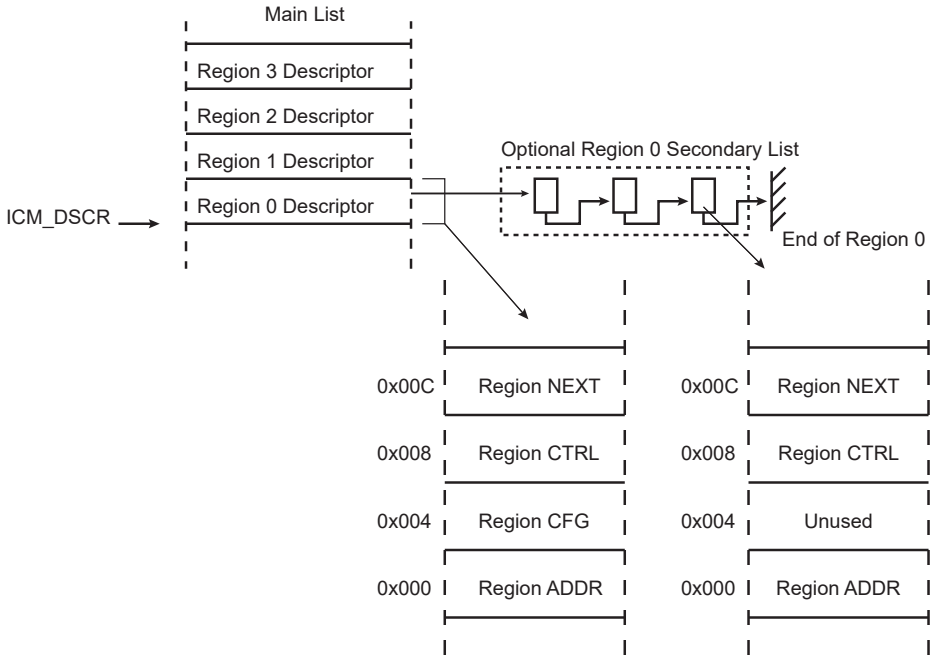
When the ICM module is enabled, it sequentially retrieves a circular list of region descriptors from the memory (Main List described in figure ICM Region Descriptor and Hash Areas). Up to four regions may be monitored. Each region descriptor is composed of four words indicating the layout of the memory region (see figure Region Descriptor ). It also contains the hashing engine configuration on a per-region basis. As soon as the descriptor is loaded from the memory and context registers are updated with the data structure, the hashing operation starts. A programmable number of blocks (see TRSIZE field of the ICM_RCTRL structure member) is transferred from the memory to the SHA engine. When the desired number of blocks have been transferred, the digest is either moved to memory (Write Back function) or compared with a digest reference located in the system memory (Compare function). If a digest mismatch occurs, an interrupt is triggered if unmasked. The ICM module passes through the region descriptor list until the end of the list marked by an end of list marker (WRAP or EOM bit in ICM_RCFG structure member set to one). To continuously monitor the list of regions, the WRAP bit must be set to one in the last data structure and EOM must be cleared.

**Figure 57-3. ICM Region Descriptor and Hash Areas**



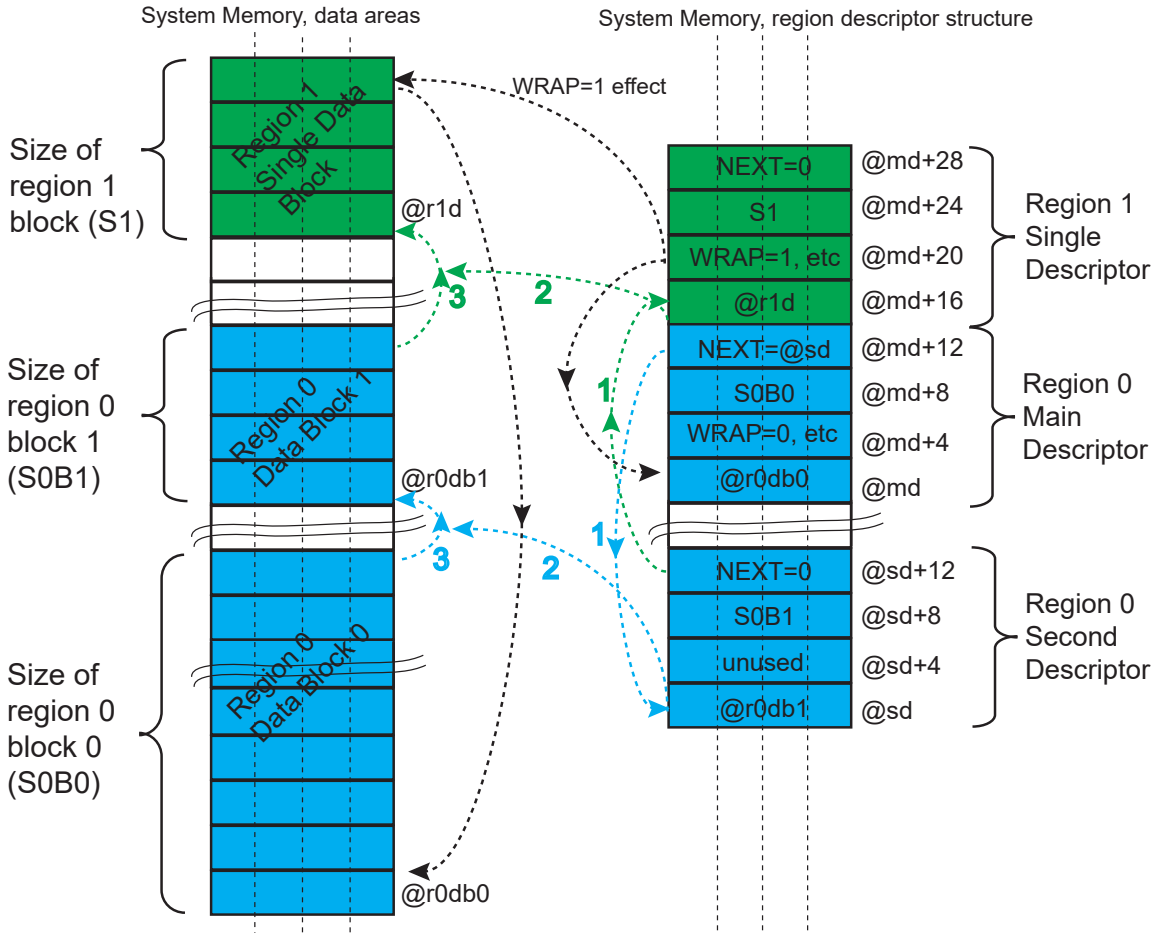
Each region descriptor supports gathering of data through the use of the Secondary List. Unlike the Main List, the Secondary List cannot modify the configuration attributes of the region. When the end of the Secondary List has been encountered, the ICM returns to the Main List. Memory integrity monitoring can be considered as a background service and the mandatory bandwidth shall be very limited. In order to limit the ICM memory bandwidth, use ICM_CFG.BBC to control the ICM memory load.

**Figure 57-4. Region Descriptor**



The figure below shows an example of the mandatory ICM settings required to monitor three memory data blocks of the system memory (defined as two regions) with one region being not contiguous (two separate areas) and one contiguous memory area. For each region, the SHA algorithm may be independently selected (different for each region). The wrap allows continuous monitoring.

**Figure 57-5. Example: Monitoring of 3 Memory Data Blocks (Defined as 2 Regions)**



### 57.5.2 ICM Region Descriptor Structure

The ICM Region Descriptor Area is a contiguous area of system memory that the controller and the processor can access. When the ICM is activated, the controller performs a descriptor fetch operation at *(ICM_DSCR) address. If the Main List contains more than one descriptor (i.e., more than one region is to be monitored), the fetch address is *(ICM_DSCR) + (RID<<4) where RID is the region identifier.

**Table 57-1. Region Descriptor Structure (Main List)**

| Offset | Structure Member | Name |
|---|---|---|
| ICM_DSCR+0x000+RID*(0x10) | ICM Region Start Address | ICM_RADDR |
| ICM_DSCR+0x004+RID*(0x10) | ICM Region Configuration | ICM_RCFG |
| ICM_DSCR+0x008+RID*(0x10) | ICM Region Control | ICM_RCTRL |
| ICM_DSCR+0x00C+RID*(0x10) | ICM Region Next Address | ICM_RNEXT |

#### 57.5.2.1 ICM Region Start Address Structure Member

**Name:** ICM_RADDR
**Property:** Read/Write

Register offset is calculated as ICM_DSCR+0x000+RID*(0x10).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | RADDR[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | RADDR[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RADDR[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RADDR[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

**Bits 31:0 – RADDR[31:0]** Region Start Address
This field indicates the first byte address of the region.

#### 57.5.2.2 ICM Region Configuration Structure Member

**Name:** ICM_RCFG
**Property:** Read/Write

Register offset is calculated as ICM_DSCR+0x004+RID*(0x10).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | ALGO[2:0] | | | | PROCDLY | SUIEN | ECIEN |
| Access | | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WCIEN | BEIEN | DMIEN | RHIEN | | EOM | WRAP | CDWBN |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | | | | | | |

**Bits 14:12 – ALGO[2:0]** SHA Algorithm
Values which are not listed in the table must be considered as “reserved”.

| Value | Name | Description |
|---|---|---|
| 0 | SHA1 | SHA1 algorithm processed |
| 1 | SHA256 | SHA256 algorithm processed |

**Bit 10 – PROCDLY** Processing Delay
When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.
When SHA256 algorithm is processed, the runtime period is either 72 or 194 clock cycles.

| Value | Name | Description |
|---|---|---|
| 0 | SHORTEST | SHA processing runtime is the shortest one. |
| 1 | LONGEST | SHA processing runtime is the longest one. |

**Bit 9 – SUIEN** Monitoring Status Updated Condition Interrupt (Default Enabled)

| Value | Name | Description |
|---|---|---|
| 0 | | The ICM_ISR.RSU[i] flag is set when the corresponding descriptor is loaded from memory to ICM. |
| 1 | | The ICM_ISR.RSU[i] flag remains cleared even if the setting condition is met. |

**Bit 8 – ECIEN** End Bit Condition Interrupt (Default Enabled)

| Value | Name | Description |
|---|---|---|
| 0 | | The ICM_ISR.REC[i] flag is set when the descriptor with the EOM bit set is processed. |
| 1 | | The ICM_ISR.REC[i] flag remains cleared even if the setting condition is met. |

**Bit 7 – WCIEN** Wrap Condition Interrupt Disable (Default Enabled)

| Value | Name | Description |
|---|---|---|
| 0 | | The ICM_ISR.RWC[i] flag is set when the WRAP bit is set in a descriptor of the main list. |
| 1 | | ICM_ISR.RWC[i] flag remains cleared even if the setting condition is met. |

**Bit 6 – BEIEN** Bus Error Interrupt Disable (Default Enabled)

| Value | Name | Description |
|---|---|---|
| 0 | | The flag is set when an error is reported on the system bus by the bus matrix. |
| 1 | | The flag remains cleared even if the setting condition is met. |

**Bit 5 – DMIEN** Digest Mismatch Interrupt Disable (Default Enabled)

| Value | Name | Description |
|---|---|---|
| 0 | | The ICM_ISR.RBE[i] flag is set when the hash value just calculated from the processed region differs from expected hash value. |
| 1 | | The ICM_ISR.RBE[i] flag remains cleared even if the setting condition is met. |

**Bit 4 – RHIEN** Region Hash Completed Interrupt Disable (Default Enabled)

| Value | Name | Description |
|---|---|---|
| 0 | | The ICM_ISR.RHC[i] flag is set when the field NEXT = 0 in a descriptor of the main or second list. |
| 1 | | The ICM_ISR.RHC[i] flag remains cleared even if the setting condition is met. |

**Bit 2 – EOM** End Of Monitoring

| Value | Name | Description |
|---|---|---|
| 0 | | The current descriptor does not terminate the monitoring. |
| 1 | | The current descriptor terminates the Main List. WRAP value has no effect. |

**Bit 1 – WRAP** Wrap Command

| Value | Name | Description |
|---|---|---|
| 0 | | The next region descriptor address loaded is the current region identifier descriptor address incremented by 0x10. |
| 1 | | The next region descriptor address loaded is ICM_DSCR. |

**Bit 0 – CDWBN** Compare Digest or Write Back Digest

| Value | Name | Description |
|---|---|---|
| 0 | | The digest is written to the Hash area. |
| 1 | | The digest value is compared to the digest stored in the Hash area. |

#### 57.5.2.3 ICM Region Control Structure Member

**Name:** ICM_RCTRL
**Property:** Read/Write

Register offset is calculated as ICM_DSCR+0x008+RID*(0x10).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | TRSIZE[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TRSIZE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

**Bits 15:0 – TRSIZE[15:0]** Transfer Size for the Current Chunk of Data

#### 57.5.2.4 ICM Region Next Address Structure Member

**Name:** ICM_RNEXT
**Property:** Read/Write

Register offset is calculated as ICM_DSCR+0x00C+RID*(0x10).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[28:21] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[20:13] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[12:5] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NEXT[4:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | | | |
| Reset | | | | | | | | |

**Bits 31:3 – NEXT[28:0]** Region Transfer Descriptor Next Address
When configured to 0, this field indicates that the current descriptor is the last descriptor of the Secondary List, otherwise it points at a new descriptor of the Secondary List.

### 57.5.3 ICM Hash Area

The ICM Hash Area is a contiguous area of system memory that the controller and the processor can access. The physical location is configured in the ICM hash area start address register. This address is a multiple of 128 bytes. If the CDWBN bit of the context register is cleared (i.e., Write Back activated), the ICM performs a digest write operation at the following starting location: *(ICM_HASH) + (RID<<5), where RID is the current region context identifier. If the CDWBN bit of the context register is set (i.e., Digest Comparison activated), the ICM performs a digest read operation at the same address.

#### 57.5.3.1 Message Digest Example

Considering the following 512-bit message (example given in FIPS 180-2):

“61626380000000000

**Table 57-2. 512 bits Message Memory Mapping**

| Memory Address | Address Offset / Byte Lane | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 0x7 / 63:56 | 0x6 / 55:48 | 0x5 / 47:40 | 0x4 / 39:32 | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x000 | 00 | 00 | 00 | 00 | 80 | 63 | 62 | 61 |
| 0x008–0x030 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | 00 |
| 0x038 | 18 | 00 | 00 | 00 | 00 | 00 | 00 | 00 |

The digest is stored at the memory location pointed at by the ICM_HASH pointer with a Region Offset.

**Table 57-3. LE Resulting SHA-160 Message Digest Memory Mapping**

| Memory Address | Address Offset / Byte Lane | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 0x7 / 63:56 | 0x6 / 55:48 | 0x5 / 47:40 | 0x4 / 39:32 | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x000 | 6a | 81 | 06 | 47 | 36 | 3e | 99 | a9 |
| 0x008 | 6c | c2 | 50 | 78 | 71 | 25 | 3e | ba |
| 0x010 | – | – | – | – | 9d | d8 | d0 | 9c |

**Table 57-4. Resulting SHA-256 Message Digest Memory Mapping**

| Memory Address | Address Offset / Byte Lane | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 0x7 / 63:56 | 0x6 / 55:48 | 0x5 / 47:40 | 0x4 / 39:32 | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x000 | ea | cf | 01 | 8f | bf | 16 | 78 | ba |
| 0x008 | 23 | 22 | ae | 5d | de | 40 | 41 | 41 |
| 0x010 | 9c | 7a | 17 | 96 | a3 | 61 | 03 | b0 |
| 0x018 | ad | 15 | 00 | f2 | 61 | ff | 10 | b4 |

Considering the following 1024-bit message (example given in FIPS 180-2):

“61626380000000000000000000000000000000000000000000000000000000000
00000000000000000000000000000000000000000000000000000000000000000
00000000000000000000000000000000000000000000000000000000000000000
00000000000000000000000000000000000000000000000000000018”

The message is written to memory in a Little Endian (LE) system architecture.

**Table 57-5. 1024 bits Message Memory Mapping**

| Memory Address | Address Offset / Byte Lane | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 0x7 / 63:56 | 0x6 / 55:48 | 0x5 / 47:40 | 0x4 / 39:32 | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x000 | 00 | 00 | 00 | 00 | 80 | 63 | 62 | 61 |

.....continued

| Memory Address | Address Offset / Byte Lane | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 0x7 / 63:56 | 0x6 / 55:48 | 0x5 / 47:40 | 0x4 / 39:32 | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x008–0x070 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | 00 |
| 0x078 | 18 | 00 | 00 | 00 | 00 | 00 | 00 | 00 |

### 57.5.4 Using ICM as SHA Engine

The ICM can be configured to only calculate a SHA1, SHA224, SHA256 digest value.

#### 57.5.4.1 Settings for Simple SHA Calculation

The start address of the system memory containing the data to hash must be configured in the transfer descriptor of the DMA embedded in the ICM.

The transfer descriptor is a system memory area integer multiple of 4 x 32-bit words and the start address of the descriptor must be configured in ICM_DSCR (the start address must be aligned on 64-bytes; six LSB must be cleared). If the data to hash is already padded according to SHA standards, only a single descriptor is required, and ICM_RCFG.EOM must be written to 1. If the data to hash does not contain a padding area, it is possible to define the padding area in another system memory location, the ICM can be configured to automatically jump from a memory area to another one by configuring the descriptor register ICM_RNEXT with a value that differs from 0. Configuring ICM_RNEXT.NEXT with the start address of the padding area forces the ICM to concatenate both areas, thus providing the SHA result from the start address of the hash area configured in ICM_HASH.

Whether the system memory is configured as a single or multiple data block area, ICM_RCFG.CDWBN and ICM_RCFG.WRAP must be cleared. The bits WBDIS, EOMDIS, SLBDIS must be cleared in ICM_CFG.

ICM_RCTRL.RHIEN and ICM_RCTRL.ECIEN must be written to 1. The flag RHC[i], i being the region index, is set (if RHIEN is set) when the hash result is available at address defined in ICM_HASH. The flag REC[i], i being the region index, is set (if ECIEN is set) when the hash result is available at the address defined in ICM_HASH.

An interrupt is generated if the bit RHC[i] is written to 1 in the ICM_IER (if RHC[i] is set in ICM_RCTRL of region i) or if the bit REC[i] is written to 1 in the ICM_IER (if REC[i] is set in ICM_RCTRL of region i).

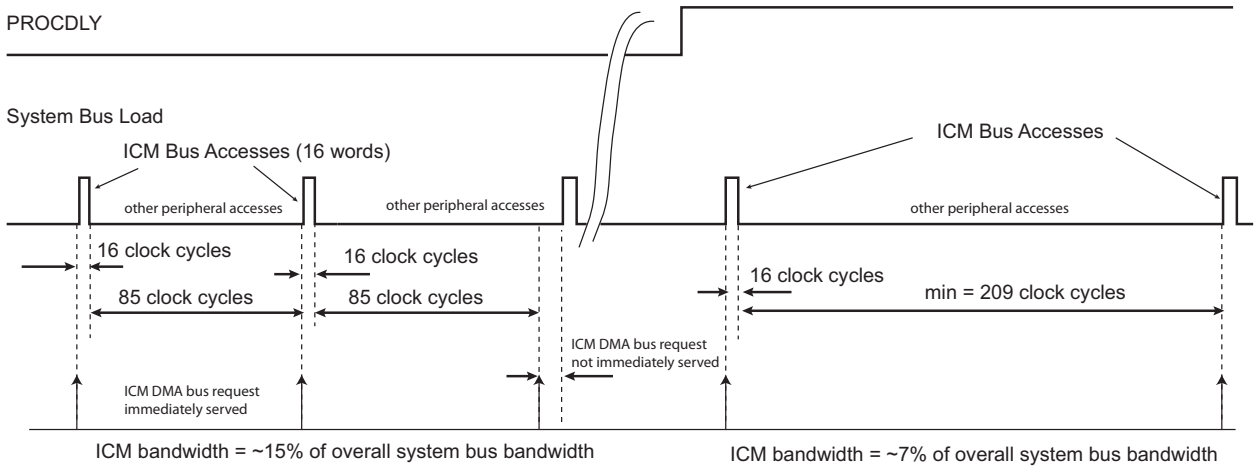
#### 57.5.4.2 Processing Period

The ICM engine has a core (SHA) inherent processing period that may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (e.g. CPU, DMA). The ICM SHA engine processing period can be configured to reduce the bandwidth required by writing ICM_RCFG.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (ICM_RCFG.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when ICM_RCFG.PROCDLY=1 (see the figure below).

In SHA256 or SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

**Figure 57-6. Bandwidth Usage in SHA1 Mode**



### 57.5.5 ICM Automatic Monitoring Mode

ICM_CFG.ASCD is used to activate the ICM Automatic Monitoring mode. When ICM_CFG.ASCD is set and bits CDWBN and EOM in ICM.RCFG equal 0, the ICM performs the following actions:

1. The ICM passes through the Main List once to calculate the message digest of the monitored area.
2. When WRAP = 1 in ICM_RCFG, the ICM begins monitoring. CDWBN in ICM_RCFG is now automatically set and EOM is cleared. These bits have no effect during the monitoring period that ends when EOM is set.

### 57.5.6 Programming the ICM

**Table 57-6. Region Attributes**

| Transfer Type | | Main List | ICM_RCFG | | | ICM_RNEXT | Comments |
|---|---|---|---|---|---|---|---|
| | | | CDWBN | WRAP | EOM | NEXT | |
| Single Region | Contiguous list of blocks Digest written to memory Monitoring disabled | 1 item | 0 | 0 | 1 | 0 | The Main List contains only one descriptor. The Secondary List is empty for that descriptor. The digest is computed and saved to memory. |
| | Non-contiguous list of blocks Digest written to memory Monitoring disabled | 1 item | 0 | 0 | 1 | Secondary List address of the current region identifier | The Main List contains only one descriptor. The Secondary List describes the layout of the non-contiguous region. |
| | Contiguous list of blocks Digest comparison enabled Monitoring enabled | 1 item | 1 | 1 | 0 | 0 | When the hash computation is terminated, the digest is compared with the one saved in memory. |

.....continued

| Transfer Type | | Main List | ICM_RCFG | | | ICM_RNEXT | Comments |
|---|---|---|---|---|---|---|---|
| | | | CDWBN | WRAP | EOM | NEXT | |
| Multiple Regions | Contiguous list of blocks Digest written to memory Monitoring disabled | More than one item | 0 | 0 | 1 for the last, 0 otherwise | 0 | ICM passes through the list once. |
| | Contiguous list of blocks Digest comparison is enabled Monitoring is enabled | More than one item | 1 | 1 for the last, 0 otherwise | 0 | 0 | ICM performs active monitoring of the regions. If a mismatch occurs, an interrupt is raised. |
| | Non-contiguous list of blocks Digest is written to memory Monitoring is disabled | More than one item | 0 | 0 | 1 | Secondary List address | ICM performs hashing and saves digests to the Hash area. |
| | Non-contiguous list of blocks Digest comparison is enabled Monitoring is enabled | More than one item | 1 | 1 | 0 | Secondary List address | ICM performs data gathering on a per region basis. |

### 57.5.7 Security Features

When an undefined register access occurs, the URAD bit in the Interrupt Status Register (ICM_ISR) is set if unmasked. Its source is then reported in the Undefined Access Status Register (ICM_UASR). Only the first undefined register access is available through the ICM_UASR.URAT field.

Several kinds of unspecified register accesses can occur:

- Unspecified structure member set to one detected when the descriptor is loaded
- Configuration register (ICM_CFG) modified during active monitoring
- Descriptor register (ICM_DSCR) modified during active monitoring
- Hash register (ICM_HASH) modified during active monitoring
- Write-only register read access

The URAD bit and the URAT field can only be reset by writing a 1 to the ICM_CTRL.SWRST bit.

## 57.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | ICM_CFG | 7:0 | BBC[3:0] | | | | | SLBDIS | EOMDIS | WBDIS |

### 57.6.1 ICM Configuration Register

**Name:** ICM_CFG
**Offset:** 0x00
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | UALGO[2:0] | | | UIHASH | | | DUALBUFF | ASCD |
| Access | R/W | R/W | R/W | R/W | | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BBC[3:0] | | | | | SLBDIS | EOMDIS | WBDIS |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 15:13 – UALGO[2:0]** User SHA Algorithm

| Value | Name | Description |
|---|---|---|
| 0 | SHA1 | SHA1 algorithm processed |
| 1 | SHA256 | SHA256 algorithm processed |
| 4 | SHA224 | SHA224 algorithm processed |

**Bit 12 – UIHASH** User Initial Hash Value

| Value | Description |
|---|---|
| 0 | The secure hash standard provides the initial hash value. |
| 1 | The initial hash value is programmable. Field UALGO provides the SHA algorithm. The ALGO field of the ICM_RCFG structure member has no effect. |

**Bit 9 – DUALBUFF** Dual Input Buffer

| Value | Description |
|---|---|
| 0 | Dual Input Buffer mode is disabled. |
| 1 | Dual Input Buffer mode is enabled (better performances, higher bandwidth required on system bus). |

**Bit 8 – ASCD** Automatic Switch To Compare Digest

| Value | Description |
|---|---|
| 0 | Automatic monitoring mode is disabled. |
| 1 | The ICM passes through the Main List once to calculate the message digest of the monitored area. When WRAP = 1 in ICM_RCFG, the ICM begins monitoring. |

**Bits 7:4 – BBC[3:0]** Bus Burden Control
This field is used to control the burden of the ICM system bus. The number of system clock cycles between the end of the current processing and the next block transfer is set to $2^{BBC}$. Up to 32,768 cycles can be inserted.

**Bit 2 – SLBDIS** Secondary List Branching Disable

| Value | Description |
|---|---|
| 0 | Branching to the Secondary List is permitted. |
| 1 | Branching to the Secondary List is forbidden. The NEXT field of the ICM_RNEXT structure member has no effect and is always considered as zero. |

**Bit 1 – EOMDIS** End of Monitoring Disable

| Value | Description |
|---|---|
| 0 | End of Monitoring is permitted. |
| 1 | End of Monitoring is forbidden. The EOM bit of the ICM_RCFG structure member has no effect. |

**Bit 0 – WBDIS** Write Back Disable
When ASCD is set, WBDIS has no effect.

| Value | Description |
|---|---|
| 0 | Write Back operations are permitted. |
| 1 | Write Back operations are forbidden. Context register CDWBN bit is internally set to one and cannot be modified by a linked list element. ICM_RCFG.CDWBN has no effect. |

### 57.6.2 ICM Control Register

**Name:** ICM_CTRL
**Offset:** 0x04
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RMEN[3:0] | | | | RMDIS[3:0] | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | – | 0 | 0 | 0 | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | REHASH[3:0] | | | | | SWRST | DISABLE | ENABLE |
| Access | W | W | W | W | | W | W | W |
| Reset | 0 | 0 | 0 | – | | – | – | – |

**Bits 15:12 – RMEN[3:0]** Region Monitoring Enable
Monitoring is activated by default.

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | When bit RMEN[i] is set to one, the monitoring of region with identifier i is activated. |

**Bits 11:8 – RMDIS[3:0]** Region Monitoring Disable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | When bit RMDIS[i] is set to one, the monitoring of region with identifier i is disabled. |

**Bits 7:4 – REHASH[3:0]** Recompute Internal Hash

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | When REHASH[i] is set to one, Region i digest is re-computed. This bit is only available when region monitoring is disabled. |

**Bit 2 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Resets the ICM. |

**Bit 1 – DISABLE** ICM Disable Register

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | The ICM is disabled. If a region is active, this region is terminated. |

**Bit 0 – ENABLE** ICM Enable

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | When set to one, the ICM is activated. |

### 57.6.3 ICM Status Register

**Name:** ICM_SR
**Offset:** 0x08
**Reset:** –
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | ENABLE |
| Access | | | | | | | | R |
| Reset | | | | | | | | – |

**Bits 15:12 – RMDIS[3:0]** Region Monitoring Disabled Status

| Value | Description |
|---|---|
| 0 | Region i is being monitored (occurs after integrity check value has been calculated and written to Hash area). |
| 1 | Region i monitoring is not being monitored. |

**Bits 11:8 – RAWRMDIS[3:0]** Region Monitoring Disabled Raw Status

| Value | Description |
|---|---|
| 0 | Region i monitoring has been activated by writing a 1 in RMEN[i] of ICM_CTRL. |
| 1 | Region i monitoring has been deactivated by writing a 1 in RMDIS[i] of ICM_CTRL. |

**Bit 0 – ENABLE** ICM Enable Register

| Value | Description |
|---|---|
| 0 | ICM is disabled. |
| 1 | ICM is activated. |

### 57.6.4 ICM Interrupt Enable Register

**Name:** ICM_IER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | – | 0 | 0 | 0 | – |

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | The Undefined Register Access interrupt is enabled. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RSU[i] is set to one, the region i Status Updated interrupt is enabled. |

**Bits 19:16 – REC[3:0]** Region End bit Condition Detected Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When REC[i] is set to one, the region i End bit Condition interrupt is enabled. |

**Bits 15:12 – RWC[3:0]** Region Wrap Condition detected Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RWC[i] is set to one, the Region i Wrap Condition interrupt is enabled. |

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RBE[i] is set to one, the Region i Bus Error interrupt is enabled. |

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RDM[i] is set to one, the Region i Digest Mismatch interrupt is enabled. |

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RHC[i] is set to one, the Region i Hash Completed interrupt is enabled. |

### 57.6.5 ICM Interrupt Disable Register

**Name:** ICM_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Reset | 0 | 0 | 0 | – | 0 | 0 | 0 | – |

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Undefined Register Access Detection interrupt is disabled. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RSU[i] is set to one, the region i Status Updated interrupt is disabled. |

**Bits 19:16 – REC[3:0]** Region End bit Condition detected Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When REC[i] is set to one, the region i End bit Condition interrupt is disabled. |

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RWC[i] is set to one, the Region i Wrap Condition interrupt is disabled. |

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RBE[i] is set to one, the Region i Bus Error interrupt is disabled. |

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RDM[i] is set to one, the Region i Digest Mismatch interrupt is disabled. |

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | When RHC[i] is set to one, the Region i Hash Completed interrupt is disabled. |

### 57.6.6 ICM Interrupt Mask Register

**Name:** ICM_IMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Mask

| Value | Description |
|---|---|
| 0 | Interrupt is disabled |
| 1 | Interrupt is enabled. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Mask

| Value | Description |
|---|---|
| 0 | When RSU[i] is set to zero, the interrupt is disabled for region i. |
| 1 | When RSU[i] is set to one, the interrupt is enabled for region i. |

**Bits 19:16 – REC[3:0]** Region End Bit Condition Detected Interrupt Mask

| Value | Description |
|---|---|
| 0 | When REC[i] is set to zero, the interrupt is disabled for region i. |
| 1 | When REC[i] is set to one, the interrupt is enabled for region i. |

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected Interrupt Mask

| Value | Description |
|---|---|
| 0 | When RWC[i] is set to zero, the interrupt is disabled for region i. |
| 1 | When RWC[i] is set to one, the interrupt is enabled for region i. |

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Mask

| Value | Description |
|---|---|
| 0 | When RBE[i] is set to zero, the interrupt is disabled for region i. |
| 1 | When RBE[i] is set to one, the interrupt is enabled for region i. |

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Mask

| Value | Description |
|---|---|
| 0 | When RDM[i] is set to zero, the interrupt is disabled for region i. |
| 1 | When RDM[i] is set to one, the interrupt is enabled for region i. |

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Mask

| Value | Description |
|---|---|
| 0 | When RHC[i] is set to zero, the interrupt is disabled for region i. |
| 1 | When RHC[i] is set to one, the interrupt is enabled for region i. |

### 57.6.7 ICM Interrupt Status Register

**Name:** ICM_ISR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | RWC[3:0] | | | | RBE[3:0] | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | RDM[3:0] | | | | RHC[3:0] | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 24 – URAD** Undefined Register Access Detection Status
The URAD bit is only reset by the SWRST bit in ICM_CTRL.

The URAT field in ICM_UASR indicates the unspecified access type.

| Value | Description |
|---|---|
| 0 | No undefined register access has been detected since the last SWRST. |
| 1 | At least one undefined register access has been detected since the last SWRST. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Detected
When RSU[i] is set, it indicates that a region status updated condition has been detected.

**Bits 19:16 – REC[3:0]** Region End Bit Condition Detected
When REC[i] is set, it indicates that an end bit condition has been detected.

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected
When RWC[i] is set, it indicates that a wrap condition has been detected.

**Bits 11:8 – RBE[3:0]** Region Bus Error
When RBE[i] is set, it indicates that a bus error has been detected while hashing memory region i.

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch
When RDM[i] is set, it indicates that there is a digest comparison mismatch between the hash value of the region with identifier i and the reference value located in the Hash Area.

**Bits 3:0 – RHC[3:0]** Region Hash Completed
When RHC[i] is set, it indicates that the ICM has completed the region with identifier i.

### 57.6.8 ICM Undefined Access Status Register

**Name:** ICM_UASR
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

**Bits 31:0 – VAL[31:0]** Initial Hash Value
When ICM_CFG.UIHASH is set, the Initial Hash Value is user-programmable.

To meet the desired standard, use the following example values.

For ICM_UIHVAL0 field:

| Example | Comment |
|---|---|
| 0x67452301 | SHA1 algorithm |
| 0xC1059ED8 | SHA224 algorithm |
| 0x6A09E667 | SHA256 algorithm |

For ICM_UIHVAL1 field:

| Example | Comment |
|---|---|
| 0xEFCDAB89 | SHA1 algorithm |
| 0x367CD507 | SHA224 algorithm |
| 0xBB67AE85 | SHA256 algorithm |

For ICM_UIHVAL2 field:

| Example | Comment |
|---|---|
| 0x98BADCFE | SHA1 algorithm |
| 0x3070DD17 | SHA224 algorithm |
| 0x3C6EF372 | SHA256 algorithm |

For ICM_UIHVAL3 field:

| Example | Comment |
|---|---|
| 0x10325476 | SHA1 algorithm |
| 0xF70E5939 | SHA224 algorithm |
| 0xA54FF53A | SHA256 algorithm |

For ICM_UIHVAL4 field:

| Example | Comment |
|---|---|
| 0xC3D2E1F0 | SHA1 algorithm |
| 0xFFC00B31 | SHA224 algorithm |
| 0x510E527F | SHA256 algorithm |

For ICM_UIHVAL5 field:

| Example | Comment |
|---|---|
| 0x68581511 | SHA224 algorithm |
| 0x9B05688C | SHA256 algorithm |

For ICM_UIHVAL6 field:

| Example | Comment |
|---|---|
| 0x64F98FA7 | SHA224 algorithm |
| 0x1F83D9AB | SHA256 algorithm |

For ICM_UIHVAL7 field:

| Example | Comment |
|---|---|
| 0xBEFA4FA4 | SHA224 algorithm |
| 0x5BE0CD19 | SHA256 algorithm |

Example of Initial Value for SHA-1 Algorithm

| Register Address | Address Offset / Byte Lane | | | |
|---|---|---|---|---|
| | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |

# 58. Advanced Encryption Standard Bridge (AESB)

## 58.1 Description

The Advanced Encryption Standard Bridge (AESB) is intended to provide on-the-fly off-chip memory encryption/decryption compliant with the American *FIPS (Federal Information Processing Standard) Publication 197* specification.

The AESB supports three confidentiality modes of operation for symmetrical key block cipher algorithms (ECB, CBC and CTR), as specified in the *NIST Special Publication 800-38A Recommendation*.

The AESB key is loaded by the software.

The 128-bit AESB key is stored in the AESB Key register made of four 32-bit write-only AESB Key Word registers (AESB_KEYWR0–3).

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit registers (AESB_IDATARx and AESB_IVRx) which are all write-only.

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data will be ready to be read out on the four 32-bit output data registers (AESB_ODATARx).

## 58.2 Embedded Characteristics

- On-The-Fly Off-Chip Memory Encryption/Decryption
- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit Cryptographic Key
- On-The-Fly Encryption/Decryption
- 10 Clock Cycles Encryption/Decryption Inherent Processing Time
- Double Input Buffer Optimizes Runtime
- Support of the Three Standard Modes of Operation Specified in *NIST Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation - Methods and Techniques*:
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Counter (CTR)
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation

## 58.3 Product Dependencies

### 58.3.1 Power Management

The AESB may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AESB clock.

### 58.3.2 Interrupt

The AESB interface has an interrupt line connected to the Interrupt Controller.

Handling the AESB interrupt requires programming the Interrupt Controller before configuring the AESB.

## 58.4 Functional Description

The Advanced Encryption Standard Bridge (AESB) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AESB algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. CIPHER in the AESB Mode register (AESB_MR) allows selection between the encryption and the decryption processes.

The AESB is capable of using cryptographic keys of 128 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit key is defined in the Key registers (AESB_KEYWRx).

The input to the encryption processes of the CBC mode includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in the Initialization Vector Registers (AESB_IVRx). The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. The Initialization Vector registers are also used by the CTR mode to set the counter value.

### 58.4.1 Operating Modes

The AESB supports the following modes of operation:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- CTR—Counter

The data pre-processing, post-processing and data chaining for the operating modes are performed automatically. Refer to *NIST Special Publication 800-38A Recommendation* for more complete information.

The modes are selected in AESB_MR.OPMOD.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 megabyte of data. If the file to be processed is greater than 1 megabyte, this file must be split into fragments of 1 megabyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AESB_IDATARx registers, the AESB_IVRx registers must be cleared. For any fragment, after the transfer is completed and prior to transferring the next fragment, AESB_IVR0 must be programmed so that the fragment number (0 for the first fragment, 1 for the second one, and so on) is written in the 16 MSB of AESB_IVR0.

If the initial value of the counter is greater than 0 and the data buffer size to be processed is greater than 1 megabyte, the size of the first fragment to be processed must be 1 megabyte minus 16x(initial value) to prevent a rollover of the internal 1-bit counter.

### 58.4.2 Double Input Buffer

The input data register can be double-buffered to reduce the runtime of large files.

This mode allows writing a new message block when the previous message block is being processed.

AESB_MR.DUALBUFF must be set to '1' to access the double buffer.

### 58.4.3 Start Modes

AESB_MR.SMOD allows selection of the Encryption or Decryption Start mode.

#### 58.4.3.1 Manual Mode

The sequence is as follows:

1. Write AESB_MR with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 128-bit key in the Key registers (AESB_KEYWRx).
3. Write the initialization vector (or counter) in the Initialization Vector registers (AESB_IVRx).
   **Note:** The Initialization Vector registers concern all modes except ECB.
4. Set DATRDY (Data Ready) in the AESB Interrupt Enable register (AESB_IER) depending on whether an interrupt is required, or not, at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized Input Data registers (see the table below).

**Table 58-1. Authorized Input Data Registers**

| Operating Mode | Input Data Registers to Write |
|---|---|
| ECB | All |
| CBC | All |
| CTR | All |

6. Set the START bit in the AESB Control register (AESB_CR) to begin the encryption or decryption process.
7. When processing is complete, DATRDY in the AESB Interrupt Status register (AESB_ISR) rises. If an interrupt has been enabled by setting AESB_IER.DATRDY, the interrupt line of the AESB is activated.
8. When the software reads one of the Output Data registers (AESB_ODATARx), AESB_ISR.DATRDY is automatically cleared.

#### 58.4.3.2 Auto Mode

In Auto mode, as soon as the correct number of Input Data registers is written, processing starts automatically without any action in AESB_CR.

### 58.4.4 Last Output Data Mode

Last Output Data mode is used to generate cryptographic checksums on data (MAC) by means of a cipher block chaining encryption algorithm (e.g., the CBC-MAC algorithm).

After each end of encryption/decryption, the output data are available on the output data registers for Manual and Auto modes.

AESB_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

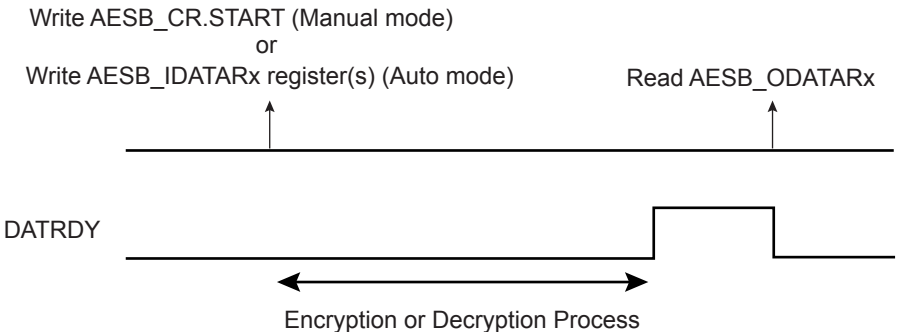
Those data are only available on the Output Data registers (AESB_ODATARx).

### 58.4.5 Manual and Auto Modes

#### 58.4.5.1 If AESB_MR.LOD = 0

AESB_ISR.DATRDY is cleared when at least one of the Output Data registers is read (see the figure below).

**Figure 58-1. Manual and Auto Modes with AESB_MR.LOD = 0**

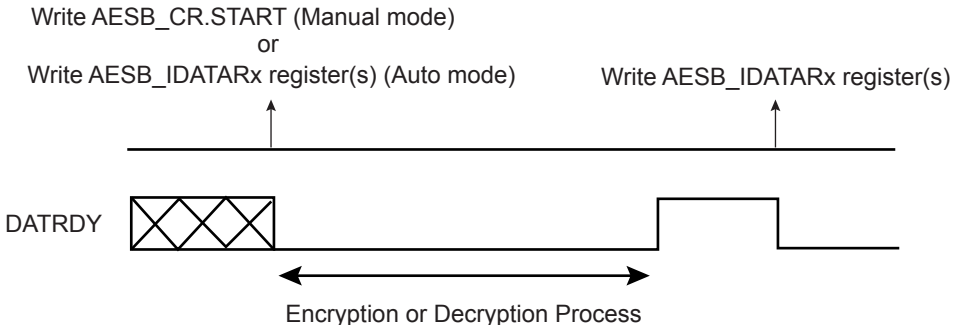


If the user does not want to read the output data registers between each encryption/decryption, AESB_ISR.DATRDY will not be cleared. If AESB_ISR.DATRDY is not cleared, the user cannot know the end of the following encryptions/decryptions.

#### 58.4.5.2 If AESB_MR.LOD = 1

AESB_ISR.DATRDY is cleared when at least one Input Data register is written, so before the start of a new transfer (see the figure below). No more Output Data register reads are necessary between consecutive encryptions/decryptions.

**Figure 58-2. Manual and Auto Modes with AESB_MR.LOD = 1**



### 58.4.6 Automatic Bridge Mode

#### 58.4.6.1 Description

The Automatic Bridge mode, when the AESB block is connected between the system bus and a DDR port and the QSPI, provides automatic encryption/decryption without any action on the part of the user. For Automatic Bridge mode, AESB_MR.OPMOD must be configured to 0x4 (see AESB Mode Register). If AESB_MR.AAHB is set and AESB_MR.OPMOD = 0x4, there is no compliance with the standard CTR mode of operation.

In case of write transfer, this mode automatically encrypts the data before writing it to the final slave destination. In case of read transfer, this mode automatically decrypts the data read from the target slave before putting it on the system bus.

Therefore, this mode does not work if the automatically encrypted data is moved at another address outside of the AESB. This means that for a given data, the encrypted value is not the same if written at different addresses.

#### 58.4.6.2 Configuration

The Automatic Bridge mode can be enabled by setting AESB_MR.AAHB.

The IV (Initialization Vector) field of the AESB Initialization Vector register x (AESB_IVRx) can be used to add a nonce in the encryption process in order to bring even more security (ignored if not filled). In this

case, any value encrypted with a given nonce can only be decrypted with this nonce. If another nonce is set for the AESB_IVRx.IV, any value encrypted with the previous nonce can no longer be decrypted (see AESB Initialization Vector Register x).

Dual buffer usage (AESB_MR.DUALBUFF='1') is recommended for improved performance.

### 58.4.7 Security Features

#### 58.4.7.1 Unspecified Register Access Detection

When an unspecified register access occurs, AESB_ISR.URAD rises. Its source is then reported in AESB_ISR.URAT. Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation
- Write-only register read access

URAD and URAT can only be reset by AESB_CR.SWRST.

## 58.5 Register Summary

This is the start of your topic.

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | AESB_CR | 7:0 | | | | | | | | START |

### 58.5.1 AESB Control Register

**Name:** AESB_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SWRST |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | START |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Resets the AESB. A software triggered hardware reset of the AESB interface is performed. |

**Bit 0 – START** Start Processing

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Starts manual encryption/decryption process |

### 58.5.2 AESB Mode Register

**Name:** AESB_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CKEY[3:0] | | | | | | | |
| Access | W | W | W | W | | | | |
| Reset | 0 | 0 | 0 | – | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | LOD | OPMOD[2:0] | | | | | SMOD[1:0] | |
| Access | R/W | R/W | R/W | R/W | | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PROCDLY[3:0] | | | | DUALBUFF | AAHB | | CIPHER |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | | 0 |

**Bits 23:20 – CKEY[3:0]** Key

| Value | Name | Description |
|---|---|---|
| 0xE | PASSWD | Must be written with 0xE the first time that AESB_MR is programmed. For subsequent programming of the AESB_MR, any value can be written, including that of 0xE.<br>Always reads as 0. |

**Bit 15 – LOD** Last Output Data Mode

| Value | Description |
|---|---|
| 0 | No effect.<br>After each end of encryption/decryption, the output data will be available either on the output data registers (Manual and Auto modes).<br>In Manual and Auto modes, AESB_ISR.DATRDY is cleared when at least one of the Output Data registers is read. |
| 1 | AESB_ISR.DATRDY is cleared when at least one of the Input Data registers is written.<br>No additional Output Data register reads are necessary between consecutive encryptions/decryptions (see Last Output Data Mode). |

**Bits 14:12 – OPMOD[2:0]** Operating Mode
Values which are not listed in the table must be considered as “reserved”.

For CBC-MAC operating mode, configure OPMOD to 0x1 (CBC) and set LOD to 1.

If OPMOD is set to 4 and AAHB = 1, there is no compliance with the standard CTR mode of operation.

| Value | Name | Description |
|---|---|---|
| 0 | ECB | Electronic Code Book mode |
| 1 | CBC | Cipher Block Chaining mode |
| 2 | – | Reserved |
| 3 | – | Reserved |
| 4 | CTR | Counter mode (16-bit internal counter) |

**Bits 9:8 – SMOD[1:0]** Start Mode

| Value | Name | Description |
|---|---|---|
| 0 | MANUAL_START | Manual mode |
| 1 | AUTO_START | Auto mode |
| 2 | IDATAR0_START | AESB_IDATAR0 access only Auto mode |

**Bits 7:4 – PROCDLY[3:0]** Processing Delay
Processing Time = 12 × (PROCDLY + 1)

The Processing Time represents the number of clock cycles that the AESB needs in order to perform one encryption/decryption .

**Note:** The best performance is achieved with PROCDLY = 0.

**Bit 3 – DUALBUFF** Dual Input Buffer

| Value | Name | Description |
|---|---|---|
| 0 | INACTIVE | AESB_IDATARx cannot be written during processing of previous block. |
| 1 | ACTIVE | AESB_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files. |

**Bit 2 – AAHB** Automatic Bridge Mode

| Value | Description |
|---|---|
| 0 | Automatic Bridge mode disabled. |
| 1 | Automatic Bridge mode enabled. |

**Bit 0 – CIPHER** Processing Mode

| Value | Description |
|---|---|
| 0 | Decrypts data. |
| 1 | Encrypts data. |

### 58.5.3 AESB Interrupt Enable Register

**Name:** AESB_IER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 58.5.4 AESB Interrupt Disable Register

**Name:** AESB_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 58.5.5 AESB Interrupt Mask Register

**Name:** AESB_IMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |

| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 58.5.6 AESB Interrupt Status Register

**Name:** AESB_ISR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | URAT[3:0] | | | | | | | URAD |
| Access | R | R | R | R | | | | R |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 15:12 – URAT[3:0]** Unspecified Register Access
Only the last Unspecified Register Access Type is available through URAT.

URAT field is reset only by AESB_CR.SWRST.

| Value | Name | Description |
|---|---|---|
| 0x0 | IDR_WR_PROCESSING | Input Data register written during the data processing when SMOD = 0x2 mode |
| 0x1 | ODR_RD_PROCESSING | Output Data register read during the data processing |
| 0x2 | MR_WR_PROCESSING | Mode register written during the data processing |
| 0x3 | ODR_RD_SUBKGEN | Output Data register read during the sub-keys generation |
| 0x4 | MR_WR_SUBKGEN | Mode register written during the sub-keys generation |
| 0x5 | WOR_RD_ACCESS | Write-only register read access |

**Bit 8 – URAD** Unspecified Register Access Detection Status
URAD is reset only by AESB_CR.SWRST.

| Value | Description |
|---|---|
| 0 | No unspecified register access has been detected since the last SWRST. |
| 1 | At least one unspecified register access has been detected since the last SWRST. |

**Bit 0 – DATRDY** Data Ready
DATRDY is cleared when a Manual encryption/decryption occurs (AESB_CR.START) or when a software triggered hardware reset of the AESB interface is performed (AESB_CR.SWRST).

AESB_MR.LOD = 0: In Manual and Auto modes, DATRDY can also be cleared when at least one of the Output Data registers is read.

AESB_MR.LOD = 1: In Manual and Auto modes, DATRDY can also be cleared when at least one of the Input Data registers is written.

| Value | Description |
|---|---|
| 0 | Output data not valid. |
| 1 | Encryption or decryption process is completed. |

### 58.5.7 AESB Key Word Register x

**Name:** AESB_KEYWRx
**Offset:** 0x20 + x*0x04 [x=0..3]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – KEYW[31:0]** Key Word
The four 32-bit Key Word registers set the 128-bit cryptographic key used for encryption/decryption.

AESB_KEYWR0 corresponds to the first word of the key, AESB_KEYWR3 to the last one.

These registers are write-only to prevent the key from being read by another application.

### 58.5.8 AESB Input Data Register x

**Name:** AESB_IDATARx
**Offset:** 0x00 + x*0x04 [x=0..3]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – IDATA[31:0]** Input Data Word
The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption.

AESB_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, AESB_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

### 58.5.9 AESB Output Data Register x

**Name:** AESB_ODATARx
**Offset:** 0x00 + x*0x04 [x=0..3]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – ODATA[31:0]** Output Data
The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.

AESB_ODATAR0 corresponds to the first word, AESB_ODATAR3 to the last one.

### 58.5.10 AESB Initialization Vector Register x

**Name:** AESB_IVRx
**Offset:** 0x00 + x*0x04 [x=0..3]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IV[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IV[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IV[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IV[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – IV[31:0]** Initialization Vector
The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AESB_IVR0 corresponds to the first word of the Initialization Vector, AESB_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC mode, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

**Note:** These registers are not used in ECB mode and must not be written. For Automatic Bridge dedicated mode, the IV input value corresponds to the initial nonce.

# 59. Advanced Encryption Standard (AES)

## 59.1 Description

The Advanced Encryption Standard (AES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 197 specification.

The AES supports the following confidentiality modes of operation for symmetrical key block cipher algorithms: ECB, CBC, OFB, CFB, CTR, and XTS), as specified in the NIST Special Publication 800-38A Recommendation, as well as Galois/Counter Mode (GCM) as specified in the NIST Special Publication 800-38D Recommendation. It is compatible with all these modes via DMA Controller channels, minimizing processor intervention for large buffer transfers.

The AES key is loaded by the software.

The 128-bit/192-bit/256-bit AES key is stored in the AES Key Register made of four/six/eight 32-bit write-only AES Key Word registers (AES_KEYWR0–7).

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit write-only AES Input Data registers (AES_IDATAR0–3) and AES Initialization Vector registers (AES_IVR0–3).

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data are ready to be read out on the four 32-bit AES Output Data registers (AES_ODATAR0–3) or through the DMA channels.

## 59.2 Embedded Characteristics

- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit/192-bit/256-bit Cryptographic Key
- 10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time with a 128-bit/192-bit/256-bit Cryptographic Key
- Double Input Buffer Optimizes Runtime
- Automatic Padding supported for IPSEC and SSL standards
- IPSEC and SSL Protocol Layers Improved Performances (Tightly coupled with SHA)
- Support of the Modes of Operation Specified in the NIST Special Publication 800-38A and NIST Special Publication 800-38D:
  - Electronic Codebook (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
  - Counter (CTR)
  - Galois/Counter Mode (GCM)
  - XEX-Based Tweaked-Codebook Mode (XTS)
- 8, 16, 32, 64 and 128-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 59.3 Product Dependencies

### 59.3.1 Power Management

The AES is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AES clock.

### 59.3.2 Interrupt Sources

The AES interface has an interrupt line connected to the Interrupt Controller.

Handling the AES interrupt requires programming the Interrupt Controller before configuring the AES.

## 59.4 Functional Description

The Advanced Encryption Standard (AES) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AES algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in the AES Mode register (AES_MR) allows selection between the encryption and the decryption processes.

The AES is capable of using cryptographic keys of 128/192/256 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit/192-bit/256-bit key is defined in the user interface AES_KEYWRx register.

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in AES_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. AES_IVRx are also used by the CTR mode to set the counter value.

### 59.4.1 AES Register Endianness

In ARM processor-based products, the system bus and processors manipulate data in little-endian form. The AES interface requires little-endian format words. However, in accordance with the protocol of the FIPS 197 specification, data is collected, processed and stored by the AES algorithm in big-endian form.

The following example illustrates how to configure the AES:

If the first 64 bits of a message (according to FIPS 197, i.e., big-endian format) to be processed is 0xcafedeca_01234567, then AES_IDATAR0 and AES_IDATAR1 registers must be written with the following pattern:

- AES_IDATAR0 = 0xcadefeca
- AES_IDATAR1 = 0x67452301

### 59.4.2 Operating Modes

The AES supports the following modes of operation:

- ECB: Electronic Codebook
- CBC: Cipher Block Chaining
  - CBC-MAC: Useful for CMAC hardware acceleration
- OFB: Output Feedback
- CFB: Cipher Feedback

  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)
  - CFB128 (CFB where the length of the data segment is 128 bits)
- CTR: Counter
- GCM: Galois/Counter Mode
- XTS: XEX-based Tweaked-codebook Mode

The data preprocessing, data postprocessing and data chaining for the concerned modes are performed automatically. Refer to the NIST Special Publication 800-38A and NIST Special Publication 800-38D for more complete information.

Mode selection is done by configuring the OPMOD field in AES_MR.

In CFB mode, five data sizes are possible (8, 16, 32, 64 or 128 bits), configurable by means of AES_MR.CFBS.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 Mbyte of data. If the file to be processed is greater than 1 Mbyte, this file must be split into fragments of 1 Mbyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AES_IDATARx, AES_IVRx must be fully programmed with the initial counter value. For any fragment, after the transfer is completed and prior to transferring the next fragment, AES_IVRx must be programmed with the appropriate counter value.

### 59.4.3 Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) by means of cipher block chaining encryption algorithm (CBC-MAC algorithm for example).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data are available either on AES_ODATARx for Manual and Auto mode, or at the address specified in the receive buffer pointer for DMA mode (see the table "Last Output Data Mode Behavior versus Start Modes").

AES_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

Therefore, there is no need to define a read buffer in DMA mode.

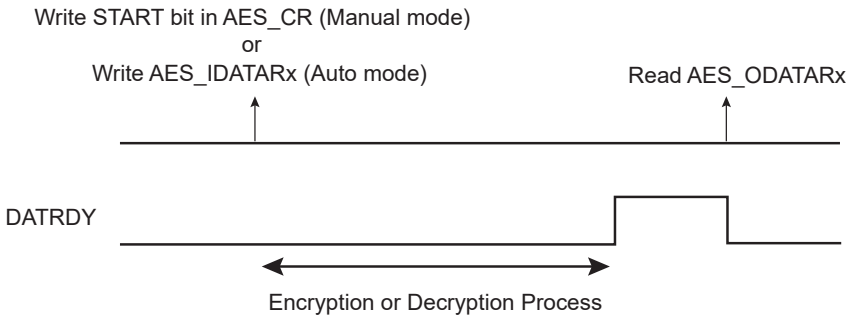
This data are only available in AES_ODATARx.

#### 59.4.3.1 Manual and Auto Modes

##### 59.4.3.1.1 If AES_MR.LOD = 0

The DATRDY flag is cleared when at least one AES_ODATARx is read (see the figure below).

**Figure 59-1. Manual and Auto Modes with AES_MR.LOD = 0**



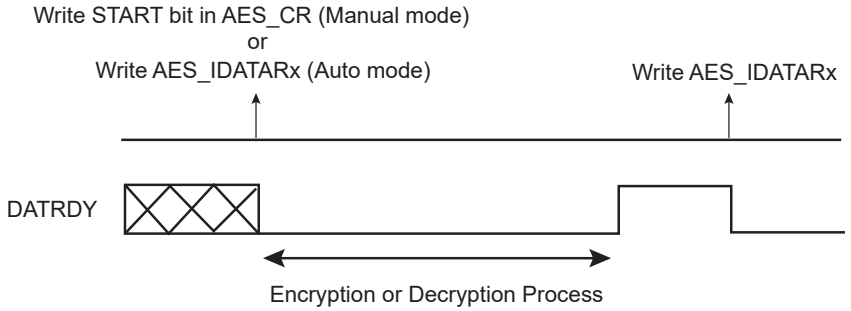
If the user does not want to read AES_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user cannot know the end of the following encryptions/decryptions.

#### 59.4.3.1.2 If AES_MR.LOD = 1

This mode is optimized to process AES CBC-MAC operating mode.

The DATRDY flag is cleared when at least one AES_IDATAR is written (see the figure below). No additional AES_ODATAR reads are necessary between consecutive encryptions/decryptions.

**Figure 59-2. Manual and Auto Modes with AES_MR.LOD = 1**



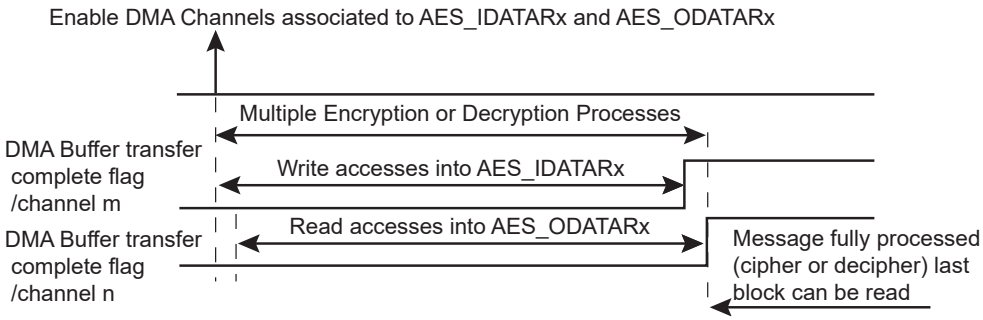
### 59.4.3.2 DMA Mode

#### 59.4.3.2.1 If AES_MR.LOD = 0

This mode may be used for all AES operating modes except CBC-MAC where AES_MR.LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to AES_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to AES_IDATARx and one to obtain the result from AES_ODATARx.

**Figure 59-3. DMA Transfer with AES_MR.LOD = 0**



#### 59.4.3.2.2 If AES_MR.LOD = 1

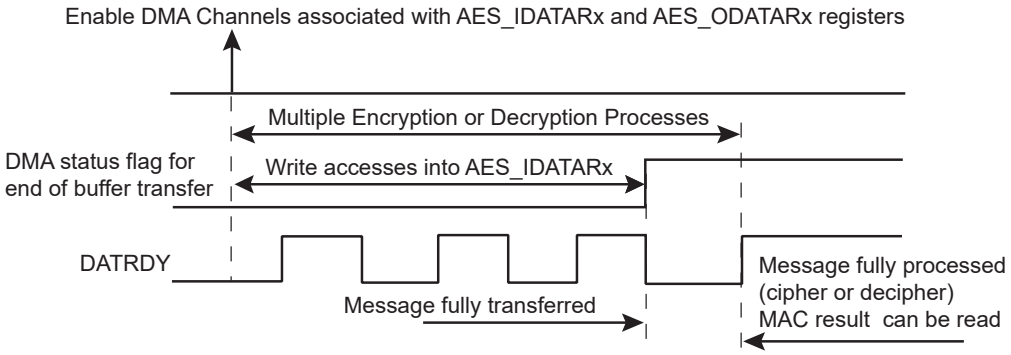
This mode is optimized to process AES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, AES_MR.SMOD must be written to ‘0’. To restart a CBC-MAC on a new buffer, AES_MR.SMOD must be written to ‘2’.

The output data are only available on AES_ODATARx.

**Figure 59-4. DMA Transfer with AES_MR.LOD = 1**



The table below summarizes the different cases.

**Table 59-1. Last Output Data Mode Behavior versus Start Modes**

| Sequence | Manual and Auto Modes | | DMA Transfer | |
|---|---|---|---|---|
| | AES_MR.LOD = 0 | AES_MR.LOD = 1 | AES_MR.LOD = 0 | AES_MR.LOD = 1 |
| DATRDY Flag Clearing Condition(1) | At least one AES_ODATAR must be read | At least one AES_IDATAR must be written | Not used | Managed by the DMA |
| End of Encryption/ Decryption Notification | DATRDY | DATRDY | 2 DMA Buffer transfer complete flags (channel m and channel n) | DMA buffer transfer complete flag, then AES DATRDY flag |
| Encrypted/ Decrypted Data Result Location | In AES_ODATARx | In AES_ODATARx | At the address specified in the Channel Buffer Transfer Descriptor | In AES_ODATARx |

**Note:**

1. Depending on the mode, there are other ways of clearing the DATRDY flag. See AES Interrupt Status Register.

**WARNING** In DMA mode, reading AES_ODATARx before the last data transfer may lead to unpredictable results.

### 59.4.4 Galois/Counter Mode (GCM)

#### 59.4.4.1 Description

GCM comprises the AES engine in CTR mode along with a universal hash function (GHASH engine) that is defined over a binary Galois field to produce a message authentication tag (the AES CTR engine and the GHASH engine are depicted in the figure below.

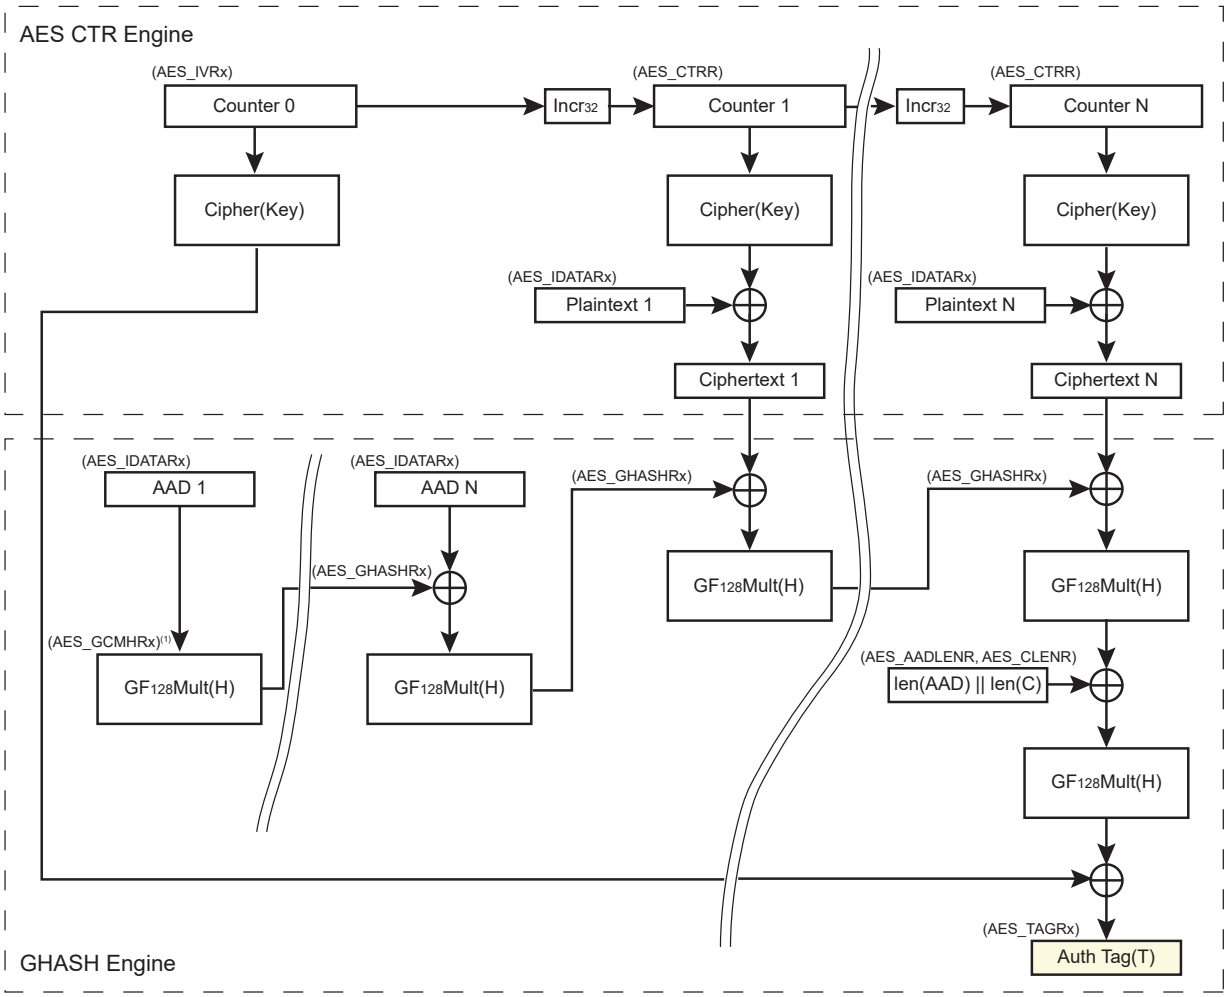
The GHASH engine processes data packets after the AES operation. GCM assures the confidentiality of data through the AES Counter mode of operation for encryption. Authenticity of the confidential data is assured through the GHASH engine. GCM can also provide assurance of data that is not encrypted. Refer to the NIST Special Publication 800-38D for more complete information.

GCM can be used with or without the DMA master. Messages may be processed as a single complete packet of data or they may be broken into multiple packets of data over time.

GCM processing is computed on 128-bit input data fields. There is no support for unaligned data. The AES key length can be whatever length is supported by the AES module.

The recommended programming procedure when using DMAPDC is described in the section GCM Processing.

**Figure 59-5. GCM Block Diagram**



Note: 1. Optional

#### 59.4.4.2 Key Writing and Automatic Hash Subkey Calculation

Whenever a new key is written to the hardware, two automatic actions are processed:

- GCM Hash Subkey *H* generation—The GCM hash subkey (*H*) is automatically generated. The GCM hash subkey generation must be complete before doing any other action. AES_ISR.DATRDY indicates when the subkey generation is complete (with interrupt if configured). The GCM hash subkey calculation is processed with the formula *H* = CIPHER(Key, <128 bits to zero>). The generated GCM *H* value is then available in AES_GCMHRx. If the application software requires a specific hash subkey, the automatically generated *H* value can be overwritten in AES_GCMHRx. AES_GCMHRx can be written after the end of the hash subkey generation (see AES_ISR.DATRDY) and prior to starting the input data feed.
- AES_GHASHRx Clear—AES_GHASHRx are automatically cleared. If a hash initial value is needed for the GHASH, it must be written to AES_GHASHRx
  - after a write to the AES Key Register, if any
  - before starting the input data feed

#### 59.4.4.3 GCM Processing

GCM processing is made up of three phases:

1. Processing the Additional Authenticated Data (*AAD*), hash computation only.
2. Processing the Ciphertext (C), hash computation + ciphering/deciphering.
3. Generating the Tag using length of *AAD*, length of C and $J_0$ (refer to NIST documentation for details).

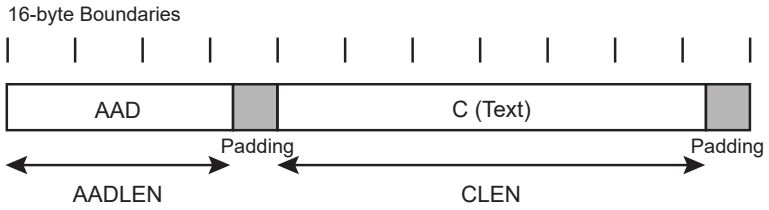
The Tag generation can be done either automatically, after the end of *AAD*/C processing if AES_MR.GTAGEN is set, or manually using AES_GHASHRx.GHASH (see subsections Processing a Complete Message with Tag Generation and Manual GCM Tag Generation for details).

##### 59.4.4.3.1 Processing a Complete Message with Tag Generation

Use this procedure only if J0 four LSB bytes ≠ 0xFFFFFFFF.

**Note:** If $J_0$ four LSB bytes = 0xFFFFFFFF or if the value is unknown, use the procedure described in Processing a Complete Message without Tag Generation followed by the procedure in Manual GCM Tag Generation.

**Figure 59-6. Full Message Alignment**



To process a complete message with Tag generation, the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '1'.
2. Set the AES Key Register and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. See Key Writing and Automatic Hash Subkey Calculation.
3. Calculate the $J_0$ value as described in NIST documentation $J_0$ = IV || $0^{31}$ || 1 when len(IV) = 96 and $J_0$ = $GHASH_H$(IV || $0^{s+64}$ || [len(IV)]64) if len(IV) ≠ 96. See Processing a Message with only AAD (GHASHH) for $J_0$ generation.
4. Set AES_IVRx.IV with inc32($J_0$) ($J_0$ + 1 on 32 bits).
5. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN.

6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Wait for TAGRDY to be set (use interrupt if needed), then read AES_TAGRx.TAG to obtain the authentication tag of the message.

#### 59.4.4.3.2 Processing a Complete Message without Tag Generation

Processing a message without generating the Tag can be used to customize the Tag generation, or to process a fragmented message. To manually generate the GCM Tag, see Manual GCM Tag Generation.

To process a complete message without Tag generation, the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Calculate the J0 value as described in NIST documentation $J_0$ = IV || $0^{31}$ || 1 when len(IV) = 96 and $J_0$ = $GHASH_H$(IV || $0^{s+64}$ || [len(IV)]64) if len(IV) ≠ 96. See Processing a Message with only AAD (GHASHH) for $J_0$ generation example when len(IV) ≠ 96.
4. Set AES_IVRx.IV with inc32($J_0$) ($J_0$ + 1 on 32 bits).
5. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Make sure the last output data have been read if AES_CLENR.CLEN ≠ 0 (or wait for DATRDY), then read AES_GHASHRx.GHASH to obtain the hash value after the last processed data.

#### 59.4.4.3.3 Processing a Fragmented Message without Tag Generation

If needed, a message can be processed by fragments, in such case automatic GCM Tag generation is not supported.

To process a message by fragments, the sequence is as follows:

- First fragment:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait for AES_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Calculate the $J_0$ value as described in NIST documentation $J_0$ = IV || $0^{31}$ || 1 when len(IV) = 96 and $J_0$ = $GHASH_H$(IV || $0^{s+64}$ || [len(IV)]64) if len(IV) ≠ 96. See Processing a Message with only AAD (GHASHH) for $J_0$ generation example when len(IV) ≠ 96.
4. Set AES_IVRx.IV with inc32($J_0$) ($J_0$ + 1 on 32 bits).
5. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN according to the length of the first fragment, or set the fields with the full message length (both configurations work).
6. Fill AES_IDATARx.IDATA with the first fragment of the message to process (aligned on 16-byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).

7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in *AAD* phase), then read AES_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).

- Next fragment (or last fragment):

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
3. Set AES_IVRx.IV as follows:
   - If the first block of the fragment is a block of Additional Authenticated data, set AES_IVRx.IV with the $J_0$ initial value
   - If the first block of the fragment is a block of Plaintext data, set AES_IVRx.IV with a value constructed as follows: 'LSB96($J_0$) || CTR' value, (96 bit LSB of $J_0$ concatenated with saved CTR value from previous fragment).
4. Configure AES_AADLENR.AADLEN and AES_CLENR.CLEN according to the length of the current fragment, or set the fields with the remaining message length, both configurations work.
5. Fill AES_GHASHRx.GHASH with the value stored after the previous fragment.
6. Fill AES_IDATARx.IDATA with the current fragment of the message to process (aligned on 16 byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing *AAD*).
7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in *AAD* phase).

**Note:** Step 1 and 2 are required only if the value of the concerned registers has been modified.

Once the last fragment has been processed, the GHASH value will allow manual generation of the GCM tag. See Manual GCM Tag Generation.

#### 59.4.4.3.4 Manual GCM Tag Generation

This section describes the last steps of the GCM Tag generation.

The Manual GCM Tag Generation is used to complete the GCM Tag Generation when the message has been processed without Tag Generation.

**Note:** The Message Processing without Tag Generation must be finished before processing the Manual GCM Tag Generation.

To generate a GCM Tag manually, the sequence is as follows:

Processing S = $GHASH_H$ (*AAD* || 0v || C || 0u || [len(*AAD*)]64 || [len(C)]64):

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait for AES_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.

3. Configure AES_AADLENR.AADLEN to 0x10 (16 bytes) and AES_CLENR.CLEN to '0'. This will allow running a single $GHASH_H$ on a 16-byte input data (see the figure below).
4. Fill AES_GHASHRx.GHASH with the state of the GHASH field stored at the end of the message processing.
5. Fill AES_IDATARx.IDATA according to the SMOD configuration used with 'len(*AAD*)64 || len(*C*)64' value as described in the NIST documentation and wait for DATRDY to be set; use interrupt if needed.
6. Read AES_GHASHRx.GHASH to obtain the current value of the hash.

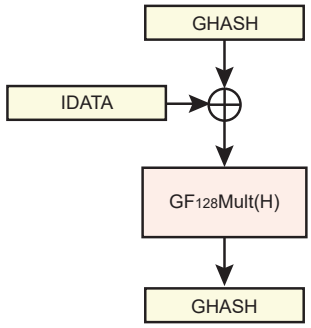
Processing $T$ = GCTRK($J_0$, S):

1. Set AES_MR.OPMOD to CTR.
2. Set AES_IVRx.IV with '$J_0$' value.
3. Fill AES_IDATARx.IDATA with the GHASH value read at step 6 and wait for DATRDY to be set (use interrupt if needed).
4. Read AES_ODATARx.ODATA to obtain the GCM Tag value.

**Note:** Step 4 is optional if the GHASH field is to be filled with value '0' (0 length packet for instance).

#### 59.4.4.3.5 Processing a Message with only AAD (GHASHH)

**Figure 59-7. Single $GHASH_H$ Block Diagram (AADLEN ≤ 0x10 and CLEN = 0)**



It is possible to process a message with only *AAD* setting the CLEN field to '0' in AES_CLENR, this can be used for J0 generation when len(*IV*) ≠ 96 for instance.

Example: Processing $J_0$ when len(*IV*) ≠ 96

To process $J_0 = GHASH_H(IV \,||\, 0^{s+64} \,||\, [len(IV)]64)$, the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.

1. Set the AES Key Register and wait until AES_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation.
2. Configure AES_AADLENR.AADLEN with 'len($IV \,||\, 0^{s+64} \,||\, [len(IV)]64$)' in and AES_CLENR.CLEN to '0'. This will allow running a $GHASH_H$ only.
3. Fill AES_IDATARx.IDATA with the message to process ($IV \,||\, 0^{s+64} \,||\, [len(IV)]64$) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a $GHASH_H$ step is over (use interrupt if needed).
4. Read AES_GHASHRx.GHASH to obtain the $J_0$ value.
   Note: The GHASH value can be overwritten at any time by writing the value of AES_GHASHRx.GHASH, used to perform a $GHASH_H$ with an initial value for GHASH (write GHASH field between step 3 and step 4 in this case).

#### 59.4.4.3.6 Processing a Single GF128 Multiplication

The AES can also be used to process a single multiplication in the Galois field on 128 bits ($GF_{128}$) using a single $GHASH_H$ with custom *H* value (see the figure above).

To run a $GF_{128}$ multiplication (A x B), the sequence is as follows:

1. Set AES_MR.OPMOD to GCM and AES_MR.GTAGEN to '0'.

1. Configure AES_AADLENR.AADLEN with 0x10 (16 bytes) and AES_CLENR.CLEN to '0'. This will allow running a single $GHASH_H$.
2. Fill AES_GCMHRx.H with B value.
3. Fill AES_IDATARx.IDATA with the A value according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a GHASHH computation is over (use interrupt if needed).
4. Read AES_GHASHRx.GHASH to obtain the result.

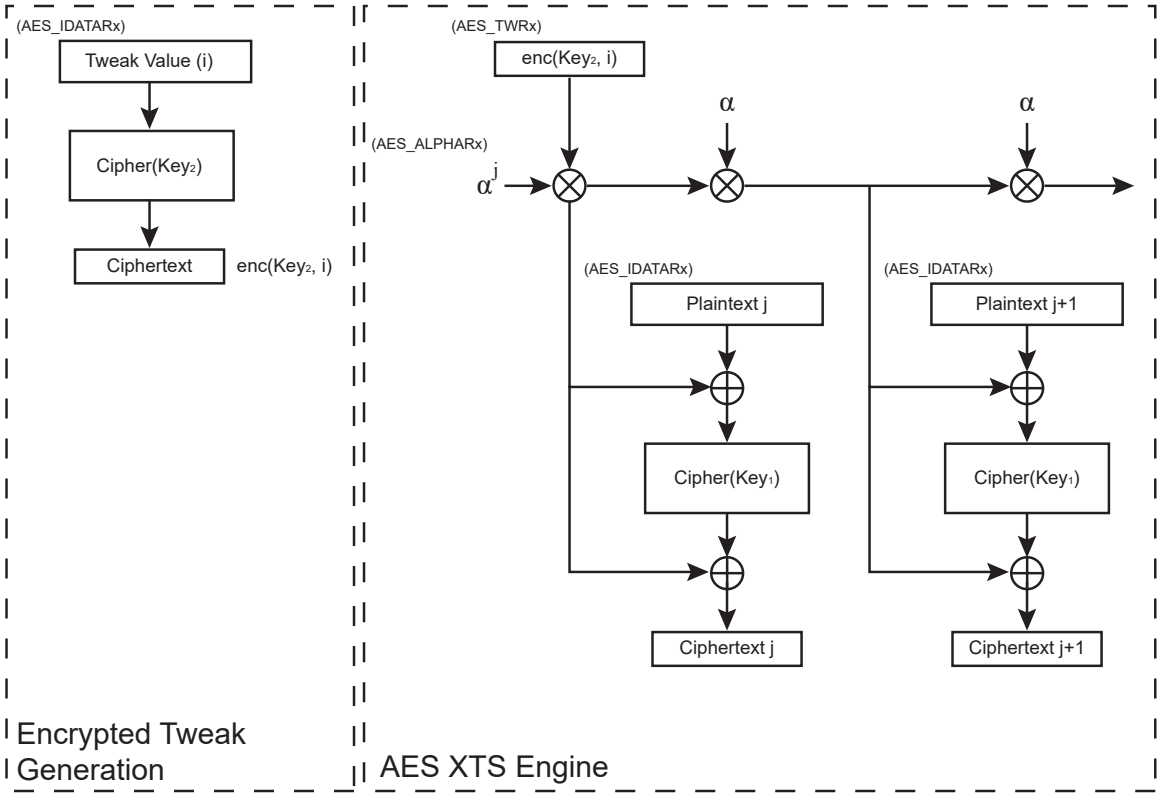
**Note:** AES_GHASHRx.GHASH can be initialized with a value C between step 3 and step 4 to run a ((A XOR C) x B) $GF_{128}$ multiplication.

### 59.4.5 XEX-based Tweaked-codebook Mode (XTS)

XTS mode comprises the AES engine with XOR on inputs and outputs. After each encryption/decryption, the value used for the XOR is multiplied by the first GF($2^{128}$) alpha primitive (0x2) and then used for the next encryption/decryption. The XTS mode uses two different keys and defines a Tweak Value (i) as additional input.

XTS processing is computed on 128-bit input data fields. There is no support for unaligned data (padding must be done manually if needed). The AES key length can be any length supported by the AES module.

**Figure 59-8. XTS Block Diagram**



#### 59.4.5.1 XTS Processing Procedure

XTS processing comprises two phases:

1. Generate encrypted tweak with Key2 (this step is only required for the first processing, further consecutive processing does not require this step).
2. Process the data giving encrypted tweak and first alpha primitive for the first encryption/decryption.

##### 59.4.5.1.1 Encrypted Tweak Generation

In the case of a new encryption/decryption, it is necessary to first encrypt the Tweak Value (i) with Key2. Here are the steps to follow to perform this step:

1. Set AES_MR.OPMODE to ECB and AES_MR.CIPHER to '1'.
2. Set the AES Key Register with Key2.
3. Fill AES_IDATARx.IDATA with the Tweak value (i) according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES_ODATARx.

##### 59.4.5.1.2 Data Processing

To process data using XTS mode, follow the steps below:

1. Set AES_MR.OPMODE to XTS.
2. Set the AES Key Register with Key1.
3. Only if the data to process is the first to be processed in the data unit, or if the data block to process is not consecutive to the previous processed data block in the same data unit, then two additional mandatory steps are required:
   a. AES_TWRx must be written with the encrypted Tweak Value (see Encrypted Tweak Generation for details) with bytes swapped as described in AES Register Endianness.

   b. Write AES_ALPHARx with the alpha primitive corresponding to the block number in the data unit.
4. Fill AES_IDATARx.IDATA with the data to process according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES_ODATARx. Repeat Step 4 as long as consecutive data blocks are processed in the same data unit.

### 59.4.6 Double Input Buffer

AES_IDATARx can be double-buffered to reduce the runtime of large files.

This mode allows a new message block to be written when the previous message block is being processed. This is only possible when DMA accesses are performed (AES_MR.SMOD = 2).

AES_MR.DUALBUFF must be set to '1' to access the double buffer.

### 59.4.7 Start Modes

AES_MR.SMOD allows selection of the encryption (or decryption) Start mode.

#### 59.4.7.1 Manual Mode

The sequence of actions is as follows:

1. Write AES_MR with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 128-bit/192-bit/256-bit AES key in AES_KEYWRx.
3. Write the initialization vector (or counter) in AES_IVRx.
   Note: AES_IVRx concerns all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the AES Interrupt Enable register (AES_IER), depending on whether an interrupt is required or not at the end of processing.

5. Write the data to be encrypted/decrypted in the authorized AES_IDATARx (see the table below).
6. Set the START bit in the AES Control register (AES_CR) to begin the encryption or the decryption process.
7. When processing completes, the DATRDY flag in the AES Interrupt Status register (AES_ISR) is raised. If an interrupt has been enabled by setting AES_IER.DATRDY, the interrupt line of the AES is activated.
8. When software reads one of AES_ODATARx, AES_IER.DATRDY is automatically cleared.

**Table 59-2. Authorized Input Data Registers**

| Operating Mode | Input Data Registers to Write |
|---|---|
| ECB | All |
| CBC | All |
| OFB | All |
| 128-bit CFB | All |
| 64-bit CFB | AES_IDATAR0 and AES_IDATAR1 |
| 32-bit CFB | AES_IDATAR0 |
| 16-bit CFB | AES_IDATAR0 |
| 8-bit CFB | AES_IDATAR0 |
| CTR | All |
| GCM | All |
| XTS | All |

**Note:**

1. In 64-bit CFB mode, writing to AES_IDATAR2 and AES_IDATAR3 is not allowed and may lead to errors in processing.
2. In 32, 16, and 8-bit CFB modes, writing to AES_IDATAR1, AES_IDATAR2 and AES_IDATAR3 is not allowed and may lead to errors in processing.

#### 59.4.7.2 Auto Mode

The Auto Mode is similar to the manual one, except that in this mode, as soon as the correct number of AES_IDATARx is written, processing is automatically started without any action in AES_CR.

#### 59.4.7.3 DMA Mode

The DMA Controller can be used in association with the AES to perform an encryption/decryption of a buffer without any action by software during processing.

AES_MR.SMOD must be configured to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (AES_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be configured with the address of AES_IDATAR0.

The DMA chunk size configuration depends on the AES mode of operation and is listed in the table below.

When writing data to AES with a first DMA channel, data are first fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the AES with the second DMA channel, the source data is the data read from AES and data destination is the memory buffer. In this case, the source data size depends on the AES mode of operation and is listed in the table below.

**Table 59-3. DMA Data Transfer Type for the Different Operating Modes**

| Operating Mode | Chunk Size | Destination/Source Data Transfer Type |
|---|---|---|
| ECB | 4 | Word |
| CBC | 4 | Word |
| OFB | 4 | Word |
| CFB 128-bit | 4 | Word |
| CFB 64-bit | 1 | Word |
| CFB 32-bit | 1 | Word |
| CFB 16-bit | 1 | Half-word |
| CFB 8-bit | 1 | Byte |
| CTR | 4 | Word |
| GCM | 4 | Word |
| XTS | 4 | Word |

### 59.4.8 Automatic Padding Mode

When Automatic Padding mode is configured, the message is automatically padded after the last block is written. Depending on the size of the message, either a padding is performed after the last part of the message and padding blocks are added, or only padding blocks are added.

IPSEC and SSL padding standards are both supported.

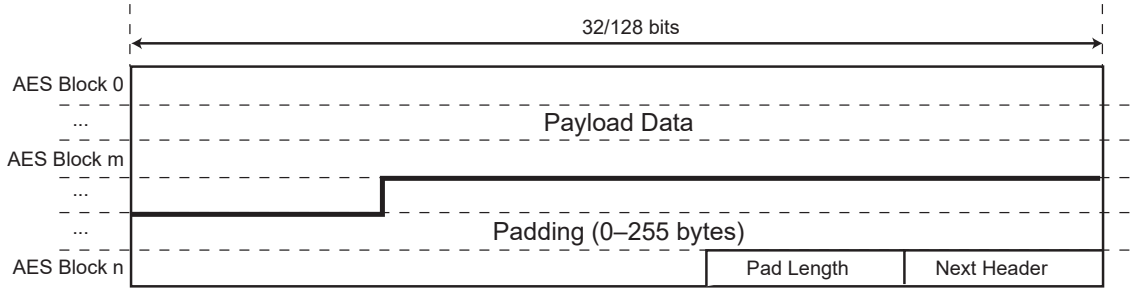
The auto padding feature only supports CBC and CTR modes.

**Note:** When automatic padding is enabled and AES_MR.SMOD=2, AES_MR.DUALBUFF must be cleared.

#### 59.4.8.1 IPSEC Padding

Automatic Padding is enabled by writing a ‘1’ to the APEN bit in the AES Extended Mode register (AES_EMR).IPSEC padding mode is selected by writing a ‘0’ to AES_EMR.APM.

**Figure 59-9. IPSEC Padding**



Each byte of the padding area contains incremental integer values.

The “Pad Length” in bytes is configured in AES_EMR.PADLEN and the “Next Header” value is configured in AES_EMR.NHEAD. AES_EMR.PADLEN must be configured with the length of the padding section, not including the length of the “Pad Length” and “Next Header” sections.

The BCNT field in the AES Byte Counter register (AES_BCNT) defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES_IDATARx access).

AES_BCNT.BCNT and AES_EMR.PADLEN must be configured so that the sum of the length of the message (Payload Data) and of the length of the Padding, Pad Length (1 byte) and Next Header (1 byte) sections is a multiple of the AES block size (128 bits).

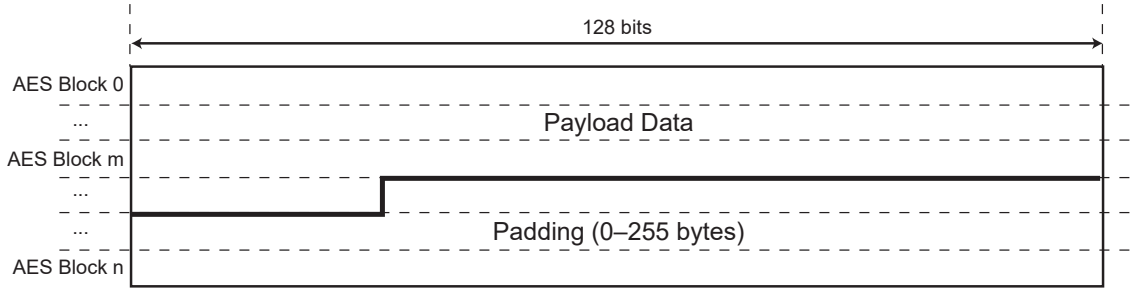
To process an IPSEC message using auto-padding, the sequence is as follows:

1. Set AES_MR.OPMOD to either CBC or CTR mode.
2. Set AES_EMR.APEN to ‘1’, AES_EMR.APM to ‘0’, AES_EMR.PADLEN to the desired padding length in byte and AES_EMR.NHEAD to the desired Next Header field value.
3. Configure AES_BCNT.BCNT with the whole message length, without padding, in byte.
4. Set the AES Key Register.
5. Set AES_IVRx.IV if needed.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block, write only what is necessary (e.g., write only AES_IDATAR0 if last block size is ≤ 32 bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 59.4.8.2 SSL Padding

Auto Padding is enabled by writing a ‘1’ to AES_EMR.APEN and SSL padding mode is selected by writing a ‘1’ to AES_EMR.APM.

**Figure 59-10. SSL Padding**



Each byte of the padding area contains the padding length.

The padding length is configured in AES_EMR.PADLEN.

AES_BCNT.BCNT defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES_IDATARx access).

AES_BCNT.BCNT and AES_EMR.PADLEN must be configured so that the length of the message plus the length of the padding section is a multiple of the AES block size (128 bits).

To process a complete SSL message, the sequence is as follows:

1. Set AES_MR.OPMOD to either CBC or CTR mode.
2. Set AES_EMR.APEN to ‘1’, AES_EMR.APM to ‘1’, AES_EMR.PADLEN to the desired padding length in bytes.
3. Set AES_BCNT.BCNT with the whole message length, without padding, in bytes.
4. Set the AES Key Register.
5. Set AES_IVRx.IV if needed.
6. Fill AES_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block write only what is necessary (e.g., write only AES_IDATAR0 if last block size is ≤ 32 bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 59.4.8.3 Flags

AES_ISR.EOPAD rises as soon as the automatic padding phase is over, meaning that all the extra padding blocks have been processed. Reading AES_ISR clears this flag.

AES_ISR.PLENERR indicates an error in the frame configuration, meaning that the whole message length including padding does not respect the standard selected. AES_ISR.PLENERR rises at the end of the frame in case of wrong message length and is cleared reading AES_ ISR.

In IPSEC/SSL standard message length including padding must be a multiple of the AES block size when CBC mode is used and multiple of 32-bit if CTR mode is used.

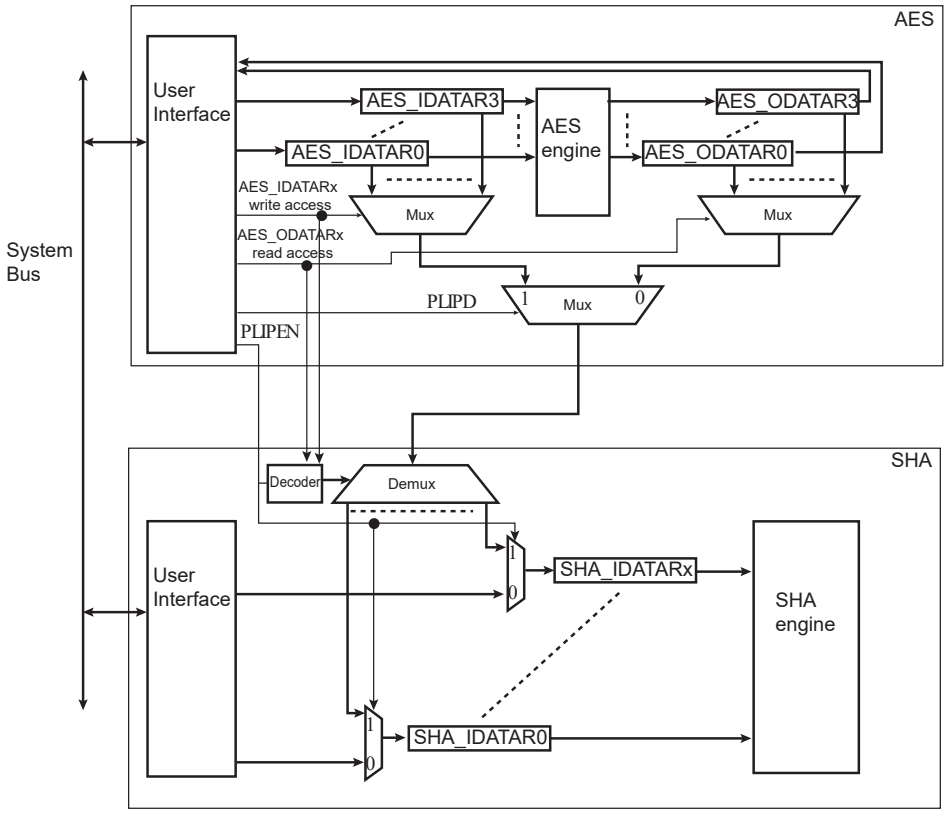
### 59.4.9 Secure Protocol Layers Improved Performances

Secure protocol layers such as IPSec require encryption and authentication. For IPSec, the authentication is based on HMAC, thus SHA is required. To optimize performance, the AES embeds a mode of operation that enables the SHA module to process the input or output data of the AES module. If this mode is enabled, write access is required only into AES_IDATARx registers, since SHA input data registers are automatically written by AES without software intervention. When the DMA is configured to transfer a buffer of data (input frame), only one transfer descriptor is required for both authentication and

encryption/decryption processes and only one buffer is transferred through the system bus (reducing the load of the system bus).

Improved performance for secure protocol layers requires AES_EMR.PLIPEN to be set.

**Figure 59-11. Secure Protocol Layers Improved Performances Block Diagram**



### 59.4.9.1 Cipher Mode

When AES_EMR.PLIPD is cleared and AES_EMR.PLIPEN=1, the message written into AES_IDATARx is first encrypted with the AES module and the encrypted message is authenticated with the SHA module. Therefore, when AES_EMR.PLIPD is cleared, AES_ODATARx are selected and sent to SHA_IDATARx as soon as AES_ODATARx are read. A read access in AES corresponds to a write access to the corresponding SHA_IDATARx. The number of SHA_IDATARx is greater than the number of AES_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES_ODATARx values into the corresponding SHA_IDATARx without software intervention.

### 59.4.9.2 Decipher Mode

When AES_EMR.PLIPD is written to ‘1’ and AES_EMR.PLIPEN=1, the message written into AES_IDATARx is decrypted with the AES module and also sent to SHA for authentication. Therefore, when AES_EMR.PLIPD=1, AES_IDATARx are selected and sent to SHA_IDATARx as soon as AES_IDATARx are written. A write access in AES corresponds to a write access to the corresponding SHA_IDATARx. The number of SHA_IDATARx is greater than the number of AES_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES_IDATARx values into the corresponding SHA_IDATARx without software intervention.

### 59.4.9.3 Encapsulating Security Payload (ESP) IPSec Examples

The following examples describe how to configure AES and SHA to optimize processing an ESP IPSec frame for maximum performance.

The cipher (or decipher) of an ESP IPSec frame requires both encryption (or decryption) and authentication.

For cipher, the input frame located in the system memory must first be padded and the resulting buffer encrypted. The encrypted frame must be written back to the system memory and sent to the authentication module.

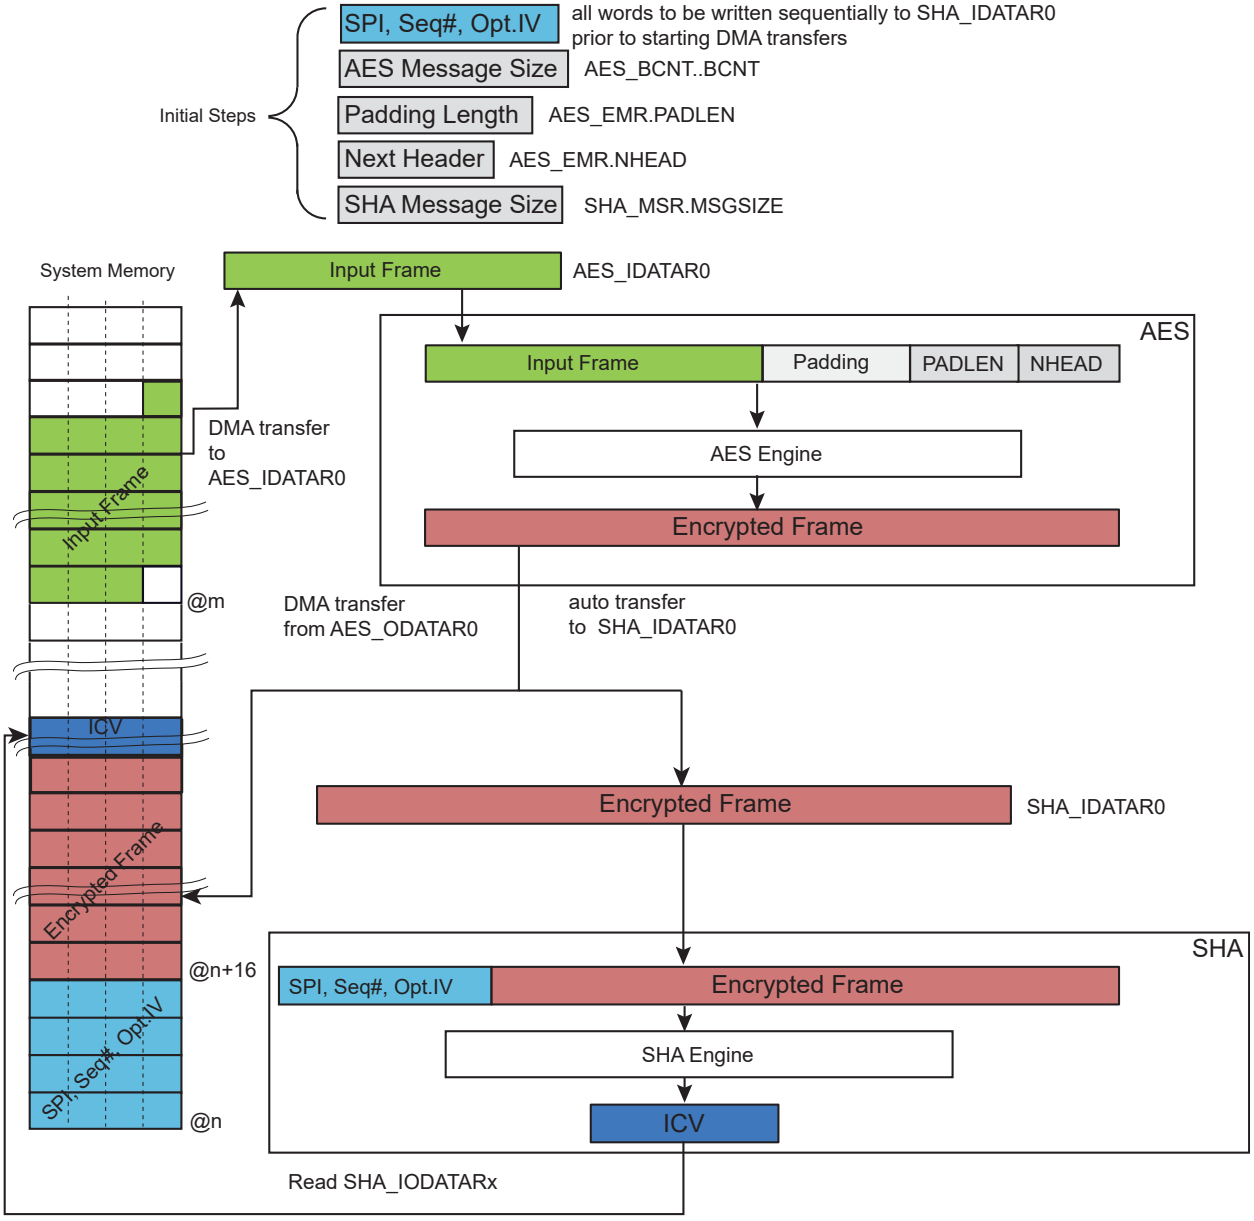
When the AES module is configured to improve the performance of the secure protocol layers (AES_EMR.PLIPEN = 1), the data transfers are simplified, limiting the bandwidth requirements on the system bus.

Before configuring the DMA to start the transfer of the data buffer (input frame) to the AES, the following actions must be taken in registers:

- AES_BCNT.BCNT must be configured with the length of the message (Input Frame).
- The padding length of the AES must be configured in AES_EMR.PADLEN. See Automatic Padding Mode for details.
- The next header value must be configured in AES_EMR.NHEAD.
- AES_MR.SMOD and SHA_MR.SMOD must be configured to 2.
  **Note:** When automatic padding is enabled and AES_MR.SMOD = 2 , AES_MR.DUALBUFF must be cleared.
- The SHA_MSR.MSGSIZE must be configured with the length of the authentication message including the optional extended sequence number (ESN) and header and trailer information required by the authentication algorithm used (HMAC, etc.). Refer to the section “Secure Hash Algorithm (SHA)” for more details on configurations for optimized processing of the header information.
- The Security Parameter Index (SPI, sequence number (SEQ#)) and the optional Initialization Vector (IV) must be configured sequentially in SHA_IDATAR0.
- A first DMA transfer descriptor must be configured to transfer the input frame from the system memory to the AES input data registers (AES_IDATARx), and a second DMA descriptor must be configured to transfer the encrypted frame from AES to the system memory.
  **Note:** If AES_EMR.PLIPEN = 1 , there is no need to define a transfer descriptor to load the encrypted frame into the SHA input data registers because the transfer is automatically performed while the second descriptor transfer is in progress.

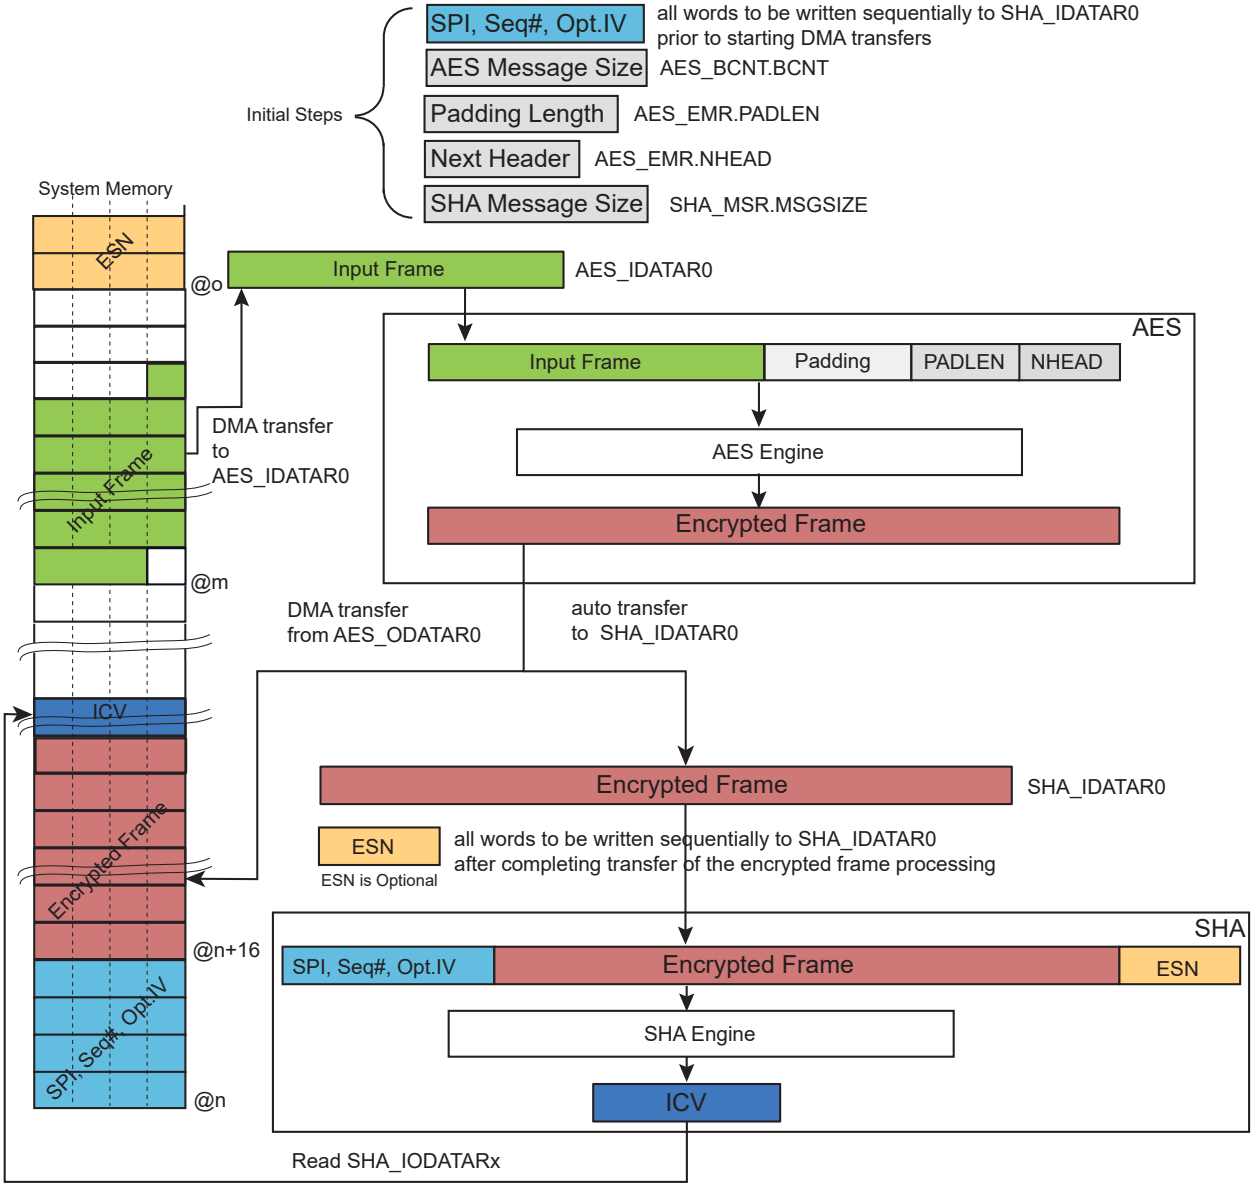
See the figures below.

**Figure 59-12. Generation of an ESP IPSec Frame without ESN**



If the optional extended sequence number is required for authentication, wait for the AES-to-system memory DMA buffer transfer to complete before configuring the ESN value. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA_IDATAR0 register. Wait for SHA_ISR.WRDY=1 before each write in the SHA_IDATAR0 register. See the figure below.

**Figure 59-13. Generation of an ESP IPSec Frame with ESN**



To decipher an ESP IPSec frame without the optional ESN trailer information, two DMA channels are required and the SHA must be configured in Automatic padding mode.

**Note:** AES automatic padding must be disabled when deciphering a frame.

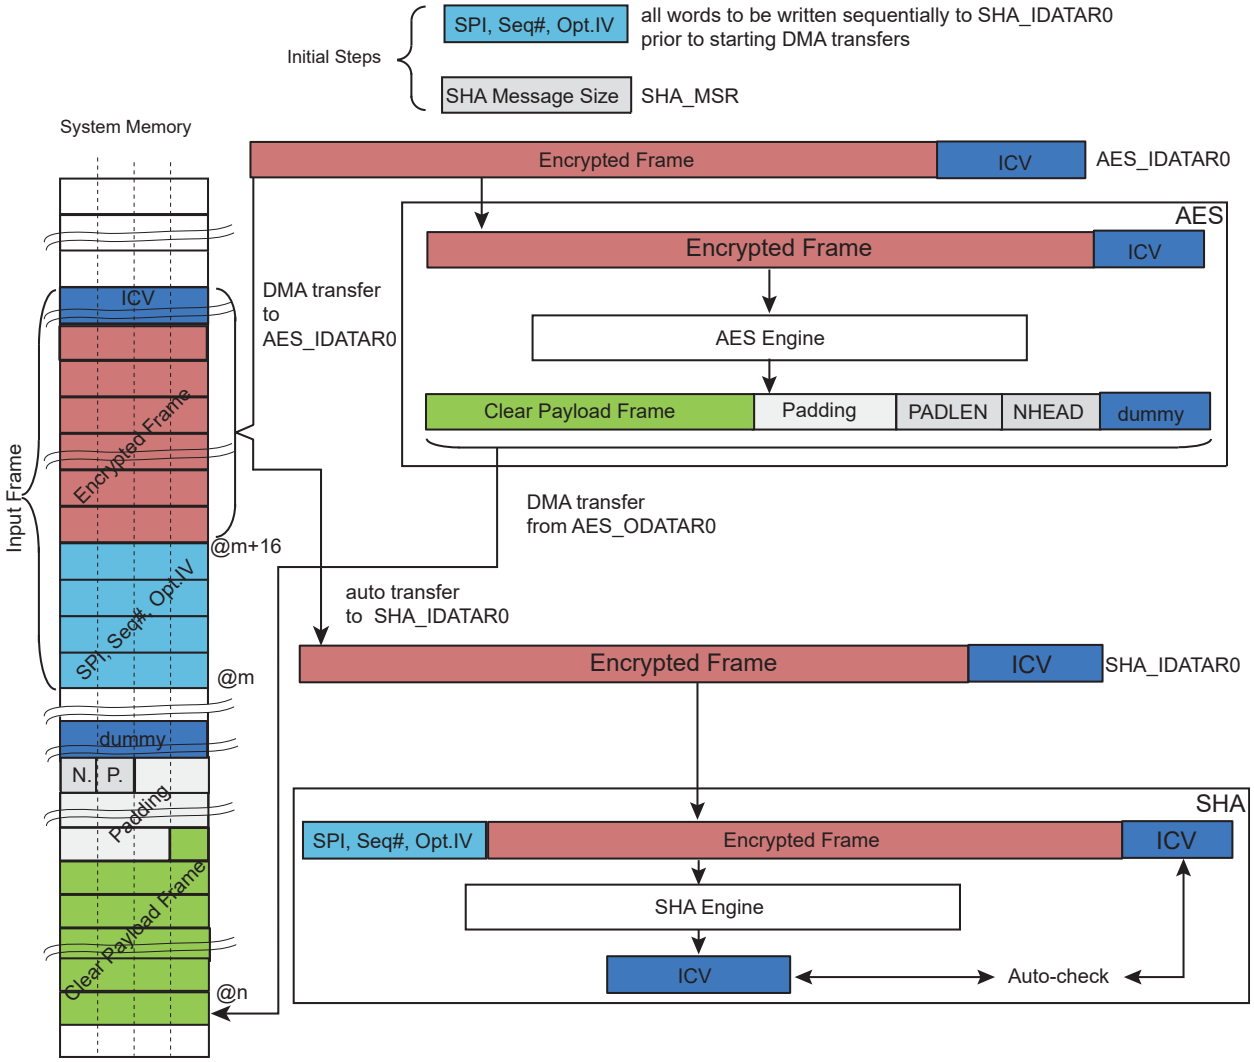
- A first DMA transfer descriptor must be configured to load the received encrypted frame from the system memory to AES_IDATARx for decryption. The start address of the first transfer descriptor must be defined after the SPI, SEQ#, and optional IV (see the figure below).
- A second DMA descriptor must be configured to transfer the decrypted frame from AES_ODATARx to the system memory.
- AES_EMR.PLIPEN and AES_EMR.PLIPD must be written to '1' so that the data buffer is written in AES_IDATARx and in SHA_IDATARx.

The SHA has the capability to perform an automatic check with an expected integrity check value if this value is appended at the end of the frame buffer (SHA_MR.CHECK=2). Thus, if the first transfer

descriptor includes the ICV for SHA, the first DMA transfer allows the decryption and authentication processes including the automatic check. The decrypted part resulting from ICV is not required for downstream processing and must be considered as dummy data.

The end of the decryption and authentication processes occur when flag SHA_ISR.CHECKF=1. The authentication status is provided by SHA_ISR.CHKST.

**Figure 59-14. Decryption of an ESP IP Sec Frame without ESN**

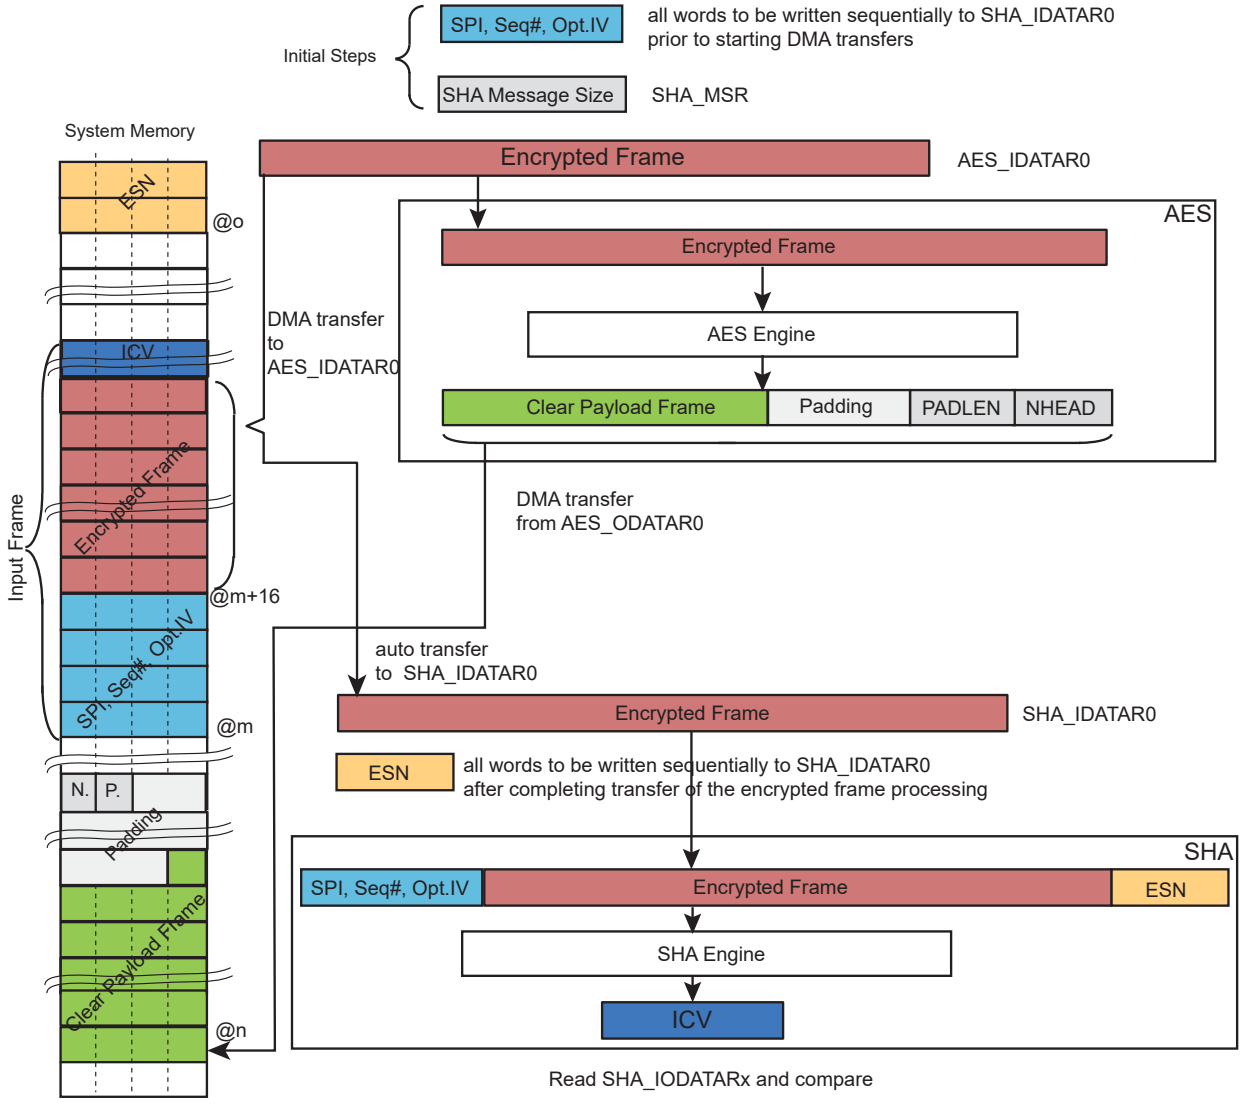


If the optional ESN trailer information is part of the ICV (see the figure below), the ESN must be manually written into SHA_IDATAR0. The ESN value must be written after completion of the system memory-to-AES DMA buffer transfer. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA_IDATAR0 register. Wait for SHA_ISR.WRDY=1 before each write in the SHA_IDATAR0 register.

When the optional ESN trailer information is part of the ICV, it is not possible to include the ICV received in the input frame to the first transfer descriptor. Moreover, if the HMAC algorithm is used for authentication, no automatic check can be performed when optimizing the processing performances of the SHA module. For more details, refer to the section “Secure Hash Algorithm (SHA)”. The result of the HMAC read in the SHA_IODATARx must be manually compared with the ICV value of the input frame.

The comparison must be performed after the end of the authentication process. The authentication process is completed when the SHA_ISR.DATRDY flag is set.

**Figure 59-15. Decryption of an ESP IPSec Frame with ESN**



## 59.4.10 Security Features

### 59.4.10.1 Unspecified Register Access Detection

When an unspecified register access occurs, AES_ISR.URAD is raised. Its source is then reported in AES_ISR.URAT. Only the last unspecified register access is available through the AES_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation

- Write-only register read access

AES_ISR.URAD and AES_ISR.URAT can only be reset by AES_CR.SWRST.

## 59.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | AES_CR | 7:0 | | | | | | | | |
| | | 15:8 | | | | | | | | SWRST |
| | | 23:16 | | | | | | | | |

| | | 31:24 | ALPHA[31:24] | | | | | | | |

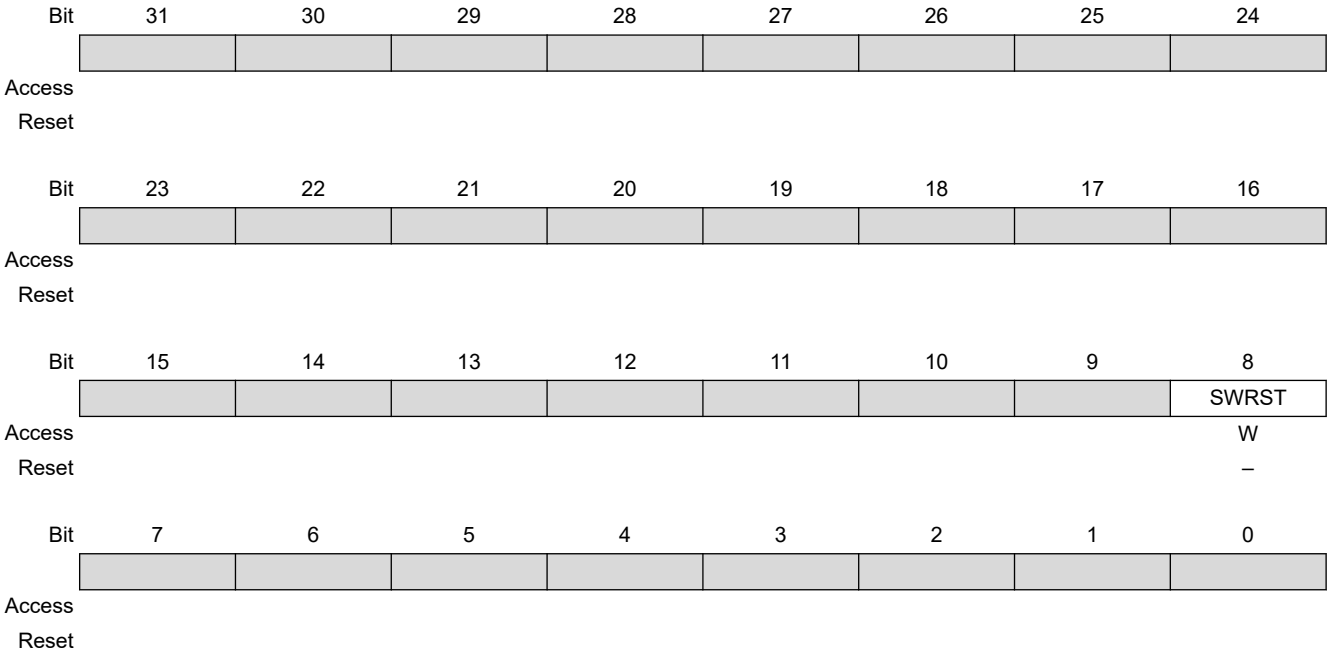
### 59.5.1 AES Control Register

**Name:** AES_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only



**Bit 8 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the AES. A software-triggered hardware reset of the AES interface is performed. |

### 59.5.2 AES Mode Register

**Name:** AES_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CKEY[3:0] | | | | | CFBS[2:0] | | |
| Access | W | W | W | W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | – | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | LOD | OPMOD[2:0] | | | KEYSIZE[1:0] | | SMOD[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PROCDLY[3:0] | | | | DUALBUFF | | GTAGEN | CIPHER |
| Access | R/W | R/W | R/W | R/W | R/W | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | | 0 | 0 |

**Bits 23:20 – CKEY[3:0]** Key

| Value | Name | Description |
|---|---|---|
| 0xE | PASSWD | This field must be written with 0xE the first time AES_MR is programmed. For subsequent programming of AES_MR, any value can be written, including that of 0xE.<br>Always reads as 0. |

**Bits 18:16 – CFBS[2:0]** Cipher Feedback Data Size

| Value | Name | Description |
|---|---|---|
| 0 | SIZE_128BIT | 128-bit |
| 1 | SIZE_64BIT | 64-bit |
| 2 | SIZE_32BIT | 32-bit |
| 3 | SIZE_16BIT | 16-bit |
| 4 | SIZE_8BIT | 8-bit |

**Bit 15 – LOD** Last Output Data Mode

**WARNING** In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable results.

| Value | Description |
|---|---|
| 0 | No effect.<br>After each end of encryption/decryption, the output data are available either on the output data registers (Manual and Auto modes) or at the address specified in the Channel Buffer Transfer Descriptor for DMA mode.<br>In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read. |
| 1 | The DATRDY flag is cleared when at least one of the Input Data Registers is written.<br>No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see Last Output Data Mode). |

**Bits 14:12 – OPMOD[2:0]** Operating Mode
For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

| Value | Name | Description |
|---|---|---|
| 0 | ECB | ECB: Electronic Codebook mode |
| 1 | CBC | CBC: Cipher Block Chaining mode |
| 2 | OFB | OFB: Output Feedback mode |
| 3 | CFB | CFB: Cipher Feedback mode |
| 4 | CTR | CTR: Counter mode (16-bit internal counter) |
| 5 | GCM | GCM: Galois/Counter mode |
| 6 | XTS | XTS: XEX-based tweaked-codebook mode |

**Bits 11:10 – KEYSIZE[1:0]** Key Size

| Value | Name | Description |
|---|---|---|
| 0 | AES128 | AES Key Size is 128 bits |
| 1 | AES192 | AES Key Size is 192 bits |
| 2 | AES256 | AES Key Size is 256 bits |

**Bits 9:8 – SMOD[1:0]** Start Mode
If a DMA transfer is used, configure SMOD to 2. See DMA Mode for more details.

| Value | Name | Description |
|---|---|---|
| 0 | MANUAL_START | Manual Mode |
| 1 | AUTO_START | Auto Mode |
| 2 | IDATAR0_START | AES_IDATAR0 access only Auto Mode (DMA) |

**Bits 7:4 – PROCDLY[3:0]** Processing Delay
Processing Time = N × (PROCDLY + 1)

where

- N = 10 when KEYSIZE = 0

- N = 12 when KEYSIZE = 1
- N = 14 when KEYSIZE = 2

The processing time represents the number of clock cycles that the AES needs in order to perform one encryption/decryption.

**Note:** The best performance is achieved with PROCDLY equal to 0.

**Bit 3 – DUALBUFF** Dual Input Buffer

| Value | Name | Description |
|---|---|---|
| 0 | INACTIVE | AES_IDATARx cannot be written during processing of previous block. |
| 1 | ACTIVE | AES_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files. |

**Bit 1 – GTAGEN** GCM Automatic Tag Generation Enable

| Value | Description |
|---|---|
| 0 | Automatic GCM Tag generation disabled. |
| 1 | Automatic GCM Tag generation enabled. |

**Bit 0 – CIPHER** Processing Mode

| Value | Description |
|---|---|
| 0 | Decrypts data. |
| 1 | Encrypts data. |

### 59.5.3 AES Interrupt Enable Register

**Name:** AES_IER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | PLENERR | EOPAD | TAGRDY |
| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 18 – PLENERR** Padding Length Error Interrupt Enable

**Bit 17 – EOPAD** End of Padding Interrupt Enable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 59.5.4 AES Interrupt Disable Register

**Name:** AES_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | PLENERR | EOPAD | TAGRDY |
| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 18 – PLENERR** Padding Length Error Interrupt Disable

**Bit 17 – EOPAD** End of Padding Interrupt Disable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 59.5.5 AES Interrupt Mask Register

**Name:** AES_IMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | PLENERR | EOPAD | TAGRDY |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 18 – PLENERR** Padding Length Error Interrupt Mask

**Bit 17 – EOPAD** End of Padding Interrupt Mask

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 59.5.6 AES Interrupt Status Register

**Name:** AES_ISR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | PLENERR | EOPAD | TAGRDY |
| Access | | | | | | R | R | R |
| Reset | | | | | | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | URAT[3:0] | | | | | | | URAD |
| Access | R | R | R | R | | | | R |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 18 – PLENERR** Padding Length Error

| Value | Description |
|---|---|
| 0 | No Padding Length Error occurred. |
| 1 | Padding Length Error detected. |

**Bit 17 – EOPAD** End of Padding

| Value | Description |
|---|---|
| 0 | Padding is not over. |
| 1 | Padding phase is over. |

**Bit 16 – TAGRDY** GCM Tag Ready

| Value | Description |
|---|---|
| 0 | GCM Tag is not valid. |
| 1 | GCM Tag generation is complete (cleared by reading GCM Tag, starting another processing or when writing a new key). |

**Bits 15:12 – URAT[3:0]** Unspecified Register Access (cleared by writing SWRST in AES_CR)
Only the last Unspecified Register Access Type is available through the URAT field.

| Value | Name | Description |
|---|---|---|
| 0 | IDR_WR_PROCESSING | Input Data register written during the data processing when SMOD = 2 mode. |
| 1 | ODR_RD_PROCESSING | Output Data register read during the data processing. |
| 2 | MR_WR_PROCESSING | Mode register written during the data processing. |
| 3 | ODR_RD_SUBKGEN | Output Data register read during the sub-keys generation. |
| 4 | MR_WR_SUBKGEN | Mode register written during the sub-keys generation. |
| 5 | WOR_RD_ACCESS | Write-only register read access. |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing SWRST in AES_CR)

| Value | Description |
|---|---|
| 0 | No unspecified register access has been detected since the last SWRST. |
| 1 | At least one unspecified register access has been detected since the last SWRST. |

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in AES_CR or by reading AES_ODATARx)

| Value | Description |
|---|---|
| 0 | Output data not valid. |
| 1 | Encryption or decryption process is completed. |

**Note:** If AES_MR.LOD = 1: In Manual and Auto mode, the DATRDY flag can also be cleared by writing at least one AES_IDATARx.

### 59.5.7 AES Key Word Register x

**Name:** AES_KEYWRx
**Offset:** 0x20 + x*0x04 [x=0..7]
**Reset:** –
**Property:** Write-only

These registers are write-only to prevent the key from being read by another application.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | KEYW[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – KEYW[31:0]** Key Word
The four/six/eight 32-bit Key Word registers set the 128-bit/192-bit/256-bit cryptographic key used for AES encryption/decryption.

AES_KEYWR0 corresponds to the first word of the key and respectively AES_KEYWR3/AES_KEYWR5/AES_KEYWR7 to the last one.

Whenever a new key (AES_KEYWRx) is written to the hardware, two automatic actions are processed:

- GCM hash subkey generation
- AES_GHASHRx Clear

See Key Writing and Automatic Hash Subkey Calculation for details.

### 59.5.8 AES Input Data Register x

**Name:** AES_IDATARx
**Offset:** 0x40 + x*0x04 [x=0..3]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – IDATA[31:0]** Input Data Word
The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption.

AES_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, and AES_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

### 59.5.9 AES Output Data Register x

**Name:** AES_ODATARx
**Offset:** 0x50 + x*0x04 [x=0..3]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ODATA[31:0]** Output Data
The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.

AES_ODATAR0 corresponds to the first word, AES_ODATAR3 to the last one.

### 59.5.10 AES Initialization Vector Register x

**Name:** AES_IVRx
**Offset:** 0x60 + x*0x04 [x=0..3]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IV[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IV[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IV[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IV[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – IV[31:0]** Initialization Vector
The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AES_IVR0 corresponds to the first word of the Initialization Vector, AES_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC, OFB and CFB modes, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

**Note:** These registers are not used in ECB mode and must not be written.

### 59.5.11 AES Additional Authenticated Data Length Register

**Name:** AES_AADLENR
**Offset:** 0x70
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | AADLEN[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | AADLEN[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | AADLEN[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | AADLEN[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – AADLEN[31:0]** Additional Authenticated Data Length
Length in bytes of the Additional Authenticated Data (AAD) that is to be processed.

**Note:** The maximum byte length of the AAD portion of a message is limited to the 32-bit counter length.

### 59.5.12 AES Plaintext/Ciphertext Length Register

**Name:** AES_CLENR
**Offset:** 0x74
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | CLEN[31:24] | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – GHASH[31:0]** Intermediate GCM Hash Word x
The four 32-bit Intermediate Hash Word registers expose the intermediate GHASH value. May be read to save the current GHASH value so processing can later be resumed, presumably on a later message fragment. Whenever a new key is written to the AES Key Register two automatic actions are processed:

- GCM hash subkey generation
- AES_GHASHRx Clear

See Key Writing and Automatic Hash Subkey Calculation for details.

If an application software-specific hash initial value is needed for the GHASH, it must be written to AES_GHASHRx:

- after a write to the AES Key Register, if any,
- before starting the input data feed.

### 59.5.14 AES GCM Authentication Tag Word Register x

**Name:** AES_TAGRx
**Offset:** 0x88 + x*0x04 [x=0..3]
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 31:0 – CTR[31:0]** GCM Encryption Counter
Reports the current value of the 32-bit GCM counter.

### 59.5.16 AES GCM H Word Register x

**Name:** AES_GCMHRx
**Offset:** 0x9C + x*0x04 [x=0..3]
**Reset:** 0x00000000
**Property:** R/W

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | H[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | H[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | H[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | H[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – H[31:0]** GCM H Word x
The four 32-bit H Word registers contain the 128-bit GCM hash subkey *H*value.

Whenever a new key is written to the AES Key Register, two automatic actions are processed:

- GCM hash subkey *H* generation
- AES_GHASHRx Clear

If the application software requires a specific hash subkey, the automatically-generated H value can be overwritten in AES_GCMHRx. See Key Writing and Automatic Hash Subkey Calculation for details.

Generating a GCM hash subkey *H* by a write in AES_GCMHRx enables to:

- select the GCM hash subkey *H* for GHASH operations,
- select one operand to process a single GF128 multiply.

### 59.5.17 AES Extended Mode Register

**Name:** AES_EMR
**Offset:** 0xB0
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| 0–255 | IPSEC Next Header field |

**Bits 15:8 – PADLEN[7:0]** Auto Padding Length

| Value | Description |
|---|---|
| 0–255 | Padding length in bytes |

**Bit 5 – PLIPD** Protocol Layer Improved Performance Decipher

| Value | Description |
|---|---|
| 0 | Protocol layer improved performance is in ciphering mode. |
| 1 | Protocol layer improved performance is in deciphering mode. |

**Bit 4 – PLIPEN** Protocol Layer Improved Performance Enable

| Value | Description |
|---|---|
| 0 | Protocol layer improved performance is disabled. |
| 1 | Protocol layer improved performance is enabled. |

**Bit 1 – APM** Auto Padding Mode

| Value | Description |
|---|---|
| 0 | Auto Padding performed according to IPSEC standard. |
| 1 | Auto Padding performed according to SSL standard. |

**Bit 0 – APEN** Auto Padding Enable

| Value | Description |
|---|---|
| 0 | Auto Padding feature is disabled. |
| 1 | Auto Padding feature is enabled. |

### 59.5.18 AES Byte Counter Register

**Name:** AES_BCNT
**Offset:** 0xB4
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

**Bits 31:0 – ALPHA[31:0]** Alpha Word x
The four 32-bit Alpha Word registers contain the 128-bit primitive of GF($2^{128}$) to use for the first processing.

# 60. Secure Hash Algorithm (SHA)

## 60.1 Description

The Secure Hash Algorithm (SHA) is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The 512/1024-bit block of message is respectively stored in 16/32 x 32-bit registers, (SHA_IDATARx/ SHA_IODATARx) which are write-only.

As soon as the input data is written, the hash processing may be started. The registers comprising the block of a padded message must be entered consecutively. Then the message digest is ready to be read out on the 5 up to 8/16 x 32-bit output data registers (SHA_IODATARx) or through the DMA channels.

## 60.2 Embedded Characteristics

- Supports Hash-based Message Authentication Code (HMAC) Algorithm (HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512, )
- Compliant with FIPS Publication 180-2
- Supports Automatic Padding of Messages
- Supports Up to 2 Sets of Initial Hash Values Registers (HMAC Acceleration or other)
- Supports Automatic Check of the Hash (HMAC Acceleration or other)
- Tightly Coupled to AES for Protocol Layers Improved Performances
- Configurable Processing Period:
  - 85 Clock Cycles to obtain a fast SHA1 runtime, 88 clock cycles for SHA384, SHA512 or 209 Clock Cycles for Maximizing Bandwidth of Other Applications
  - 72 Clock Cycles to obtain a fast SHA224, SHA256 runtime or 194 Clock Cycles for Maximizing Bandwidth of Other Applications
- Connection to DMA Channel Capabilities Optimizes Data Transfers
- Double Input Buffer Optimizes Runtime

## 60.3 Product Dependencies

### 60.3.1 Power Management

The SHA may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SHA clock.

### 60.3.2 Interrupt Sources

The SHA interface has an interrupt line connected to the Interrupt Controller.

Handling the SHA interrupt requires programming the Interrupt Controller before configuring the SHA.

## 60.4 Functional Description

The Secure Hash Algorithm (SHA) module requires a padded message according to FIPS180-2 specification. This message can be provided with the padding to the SHA module, or the padding can be

automatically computed by the SHA module if the size of the message is provided. The first block of the message must be indicated to the module by a specific command. The SHA module produces an N-bit message digest each time a block is written and processing period ends, where N is 160 for SHA1, 224 for SHA224, 256 for SHA256, 384 for SHA384, 512 for SHA512. The SHA module is also capable of computing Hash-based Message Authentication Code (HMAC) algorithm.

### 60.4.1 SHA Algorithm

The SHA can process SHA1, SHA224, SHA256, SHA384, SHA512 by configuring the ALGO field in the SHA Mode register (SHA_MR).

### 60.4.2 HMAC Algorithm

The HMAC algorithm is as follows:

$HMAC_K(m) = h((K_0 \oplus opad) || h((K_0 \oplus ipad) || m))$

where:

- h = SHA function
- $K_0$ = the key K after any necessary pre-processing to form a block size key
- m = message to authenticate
- || = concatenation operator
- $\oplus$ = XOR operator
- ipad = predefined constant (0x3636...3636)
- opad = predefined constant (0x5C5C...5C5C)

The SHA provides a fully optimized processing of the HMAC algorithm by executing the following operations:

- starting the SHA algorithm from any user predefined hash value, thus ‘$h(K_0 \oplus ipad)$’ for first HMAC hash and ‘$h(K_0 \oplus opad)$’ for second HMAC hash
- performing automatic padding
- routing automatically the first hash result ‘$h((K_0 \oplus ipad) || m)$’ to the source of the second hash processing ‘$h((K_0 \oplus opad) || (first\ hash\ result))$’ including the concatenation of the first hash result to ‘$K_0 \oplus opad$’.

To perform the HMAC operation, the ALGO field value must be greater than 7, the automatic padding feature must be enabled (MSGSIZE and BYTCNT fields differ from 0) and the SHA internal initial hash value registers 0 and 1 must be configured, respectively, with the hash results of input blocks “$K_0 \oplus ipad$” and “$K_0 \oplus opad$” (see Internal Registers for Initial Hash Value or Expected Hash Result).

The size of the message (‘m’) must be written in the MSGSIZE and BYTCNT fields.

The FIRST bit in the SHA Control register (SHA_CR) should be set before writing the first block of the message.

The SHA can process HMAC-SHA1, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512 by configuring the ALGO field in the SHA_MR.

### 60.4.3 Processing Period

The processing period can be configured.

The short processing period allocates bandwidth to the SHA module, whereas the long processing period allocates more bandwidth on the system bus to other applications. An example is DMA channels not associated with SHA.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

In SHA384, SHA512 mode, the shortest processing period is 88 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

In SHA256 and SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

### 60.4.4 Double Input Buffer

The SHA Input Data registers (SHA_IDATARx) can be double-buffered to reduce the runtime of large files.

Double-buffering allows a new message block to be written while the previous message block is being processed. This is only possible when DMA accesses are performed (SMOD = 2).

The DUALBUFF bit in the SHA_MR must be set to have double input buffer access.

### 60.4.5 Internal Registers for Initial Hash Value or Expected Hash Result

The SHA module embeds two sets of internal registers (IR0, IR1) to store different data used by the SHA or HMAC algorithms (See the figure below). These internal registers are accessed through SHA Input Data registers (SHA_IDATARx).

When the ALGO field selects SHA algorithms, IR0 can be configured with a user initial hash value. This initial hash value can be used to compute a custom hash algorithm with two sets of different initial constants, or to continue a hash computation by providing the intermediate hash value previously returned by the SHA module.

When the ALGO field selects SHA algorithms, IR1 can be configured with either a user initial hash value or an expected hash result. The expected hash result must be configured in the IR1 if the field CHECK = 1 (refer to Automatic Check). If the field CHECK = 0 or 2, IR1 can be configured with a user initial hash value that differs from IR0 value.

When the ALGO field selects HMAC algorithms, IR0 must be configured with the hash result of $K_0 \oplus$ ipad and IR1 must be configured with the hash result of $K_0 \oplus$ opad. These pre-computed first blocks speed up the HMAC computation by saving the time to compute the intermediate hash values of the first block which is constant while the secret key is constant (See HMAC Algorithm).

**Table 60-1. Configuration Values of Internal Registers**

| Register | SHA Modes (ALGO < 8) | | | HMAC Modes (ALGO > 7) |
|---|---|---|---|---|
| | CHECK = 0 | CHECK = 1 | CHECK = 2 | |
| IR0 | User Initial Hash | User Initial Hash | User Initial Hash | hash($K_0 \oplus$ ipad) |
| IR1 | User Initial Hash | Expected Hash Result | User Initial Hash | hash($K_0 \oplus$ opad) |

To calculate the initial HMAC values, follow this sequence:

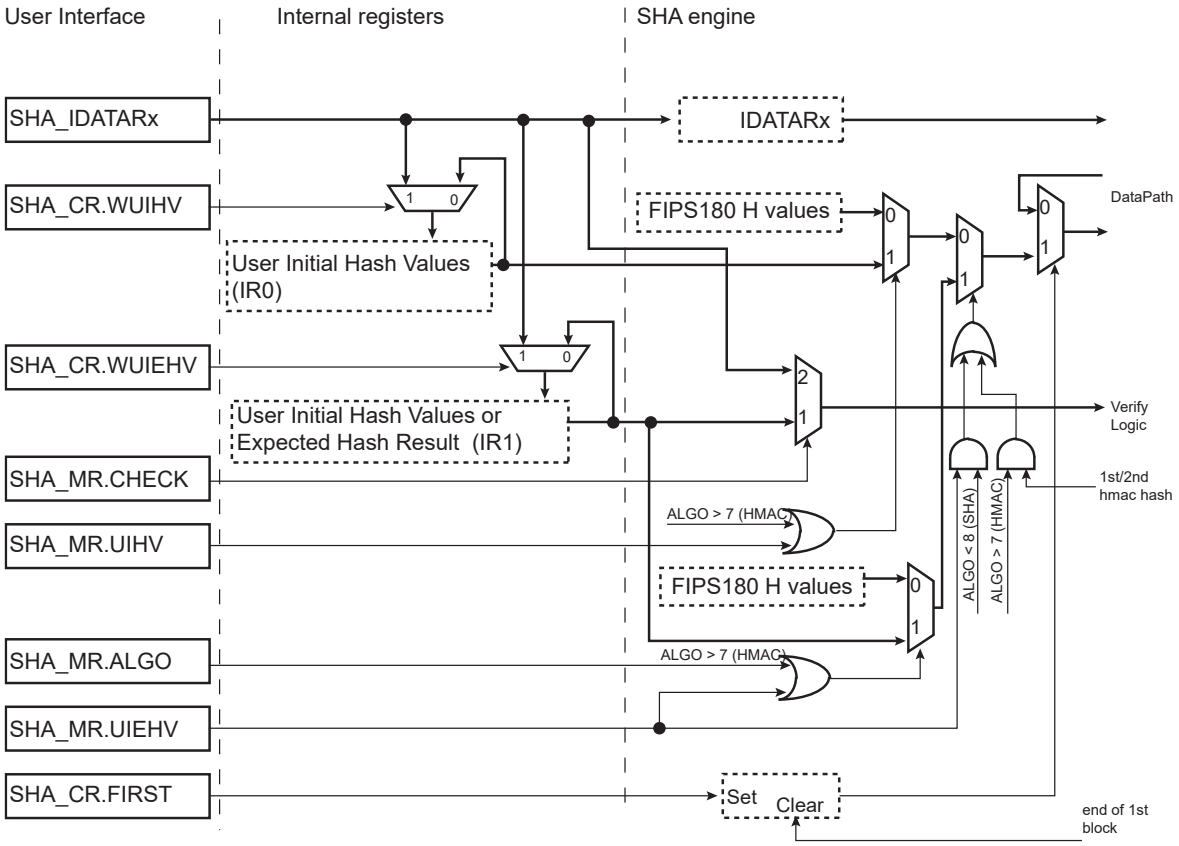
1. Calculate $K_0$.
2. Calculate $K_0 \oplus$ ipad and $K_0 \oplus$ opad.
3. Perform a hash of the result of $K_0 \oplus$ ipad and $K_0 \oplus$ opad (auto-padding must be disabled for that type of hash).
4. Write h($K_0 \oplus$ ipad) and h($K_0 \oplus$ opad) in IR0 and IR1 respectively.

To write IR0 or IR1, follow this sequence:

1. Set SHA_CR. WUIHV (IR0) or SHA_CR.WUIEHV (IR1).
2. Write the data in SHA_IDATARx. The number of registers to write depends on the type of data (user initial hash values or expected hash result) and on the type of algorithm selected:
   – SHA_IDATAR0 to SHA_IDATAR4 for data used in algorithms based on SHA1
   – SHA_IDATAR0 to SHA_IDATAR7 for data used in algorithms based on SHA256
   – SHA_IDATAR0 to SHA_IDATAR15 for data used in algorithms based on SHA512
   – SHA_IDATAR0 to SHA_IDATAR6 for expected hash result of algorithms based on SHA224
   – SHA_IDATAR0 to SHA_IDATAR11 for expected hash result of algorithms based on SHA384
3. Clear SHA_CR.WUIHV or SHA_CR.WUIEHV.

IR0 and IR1 are automatically selected for HMAC processing if the field ALGO selects HMAC algorithms. If SHA algorithms are selected, the internal registers are selected if the corresponding UIHV or UIEHV bits are set.

**Figure 60-1. User Initial Hash Value and Expected Hash Internal Register Access**



### 60.4.6 Automatic Padding

The SHA module features an automatic padding computation to speed up the execution of the algorithm.

The automatic padding function requires the following information:

- Complete message size in bytes to be written in the MSGSIZE field of the SHA Message Size register (SHA_MSR).
  The size of the message is written at the end of the last block, as required by the FIPS180-2 specification (the size is automatically converted into a bit-size).

- Number of remaining bytes (to write in the SHA_IDATARx) to be written in the BYTCNT field of the SHA Bytes Count register (SHA_BCR).
  Automatic padding occurs when the BYTCNT field reaches 0. At each write in the SHA Input registers, the BYTCNT field value is decreased by the number of bytes written.

The BYTCNT field value must be written with the same value as the MSGSIZE field value if the full message is processed. If the message is partially preprocessed and an initial hash value is used, BYTCNT must be written with the remaining bytes to hash while MSGSIZE holds the message size.

To disable the automatic padding feature, the MSGSIZE and BYTCNT fields must be configured with 0.

### 60.4.7 Automatic Check

The SHA module features an automatic check of the hash result with the expected hash. A check failure can generate an interrupt if configured in the SHA Interrupt Enable register (SHA_IER).

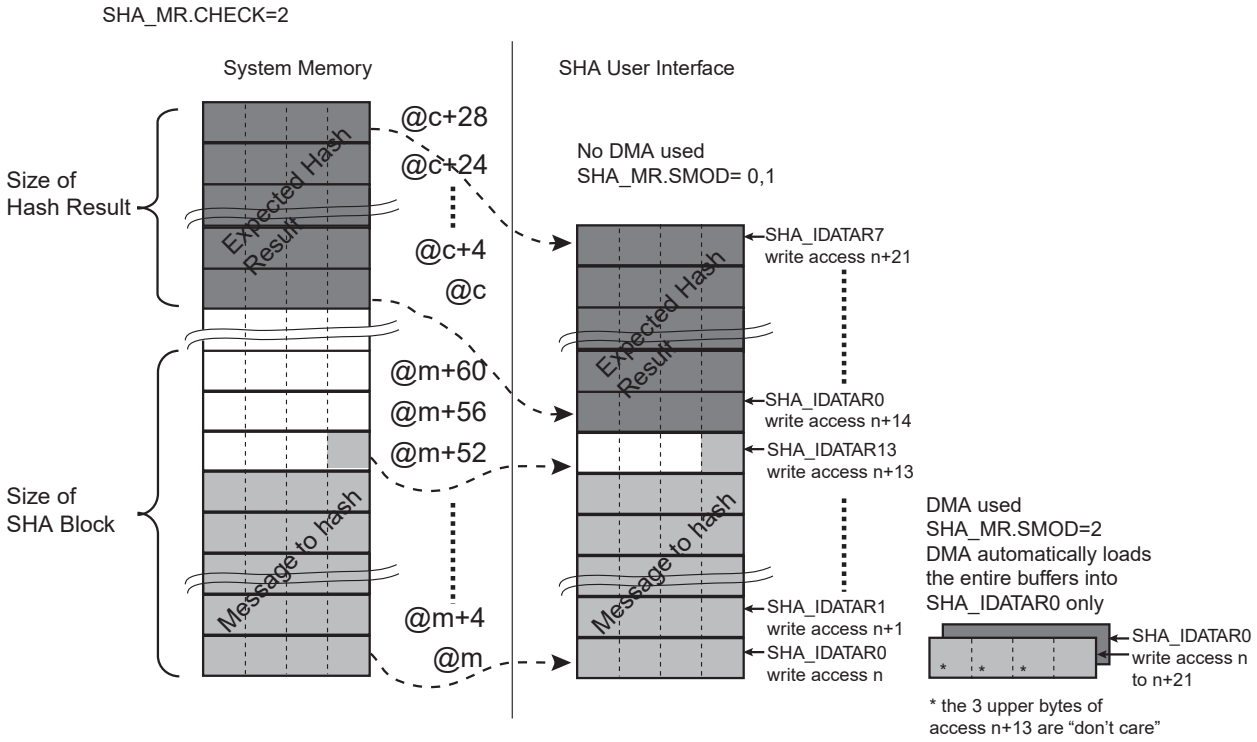
Automatic check requires the automatic padding feature to be enabled (MSGSIZE and BYTCNT fields must be greater than 0).

There are two methods to configure the expected hash result:

- if SHA_MR.CHECK = 1, the expected hash result is read from the internal register (IR1). This method cannot be used when HMAC algorithms is selected because this register is already used to store user initial hash values for the second hash processing. IR1 cannot be read by software.
- If SHA_MR.CHECK = 2, the expected hash result is written in the SHA_IDATARx after the message.

When SHA_MR.CHECK = 2, the method can provide more flexibility of use if a message is stored in system memory together with its expected hash result. A DMA with linked list can be used to ease the transfer of the message and its expected hash result.

**Figure 60-2. Message and Expected Hash Result Memory Mapping**



The number of 32-bit words of the hash result to check with the expected hash can be selected with SHA_MR.CHKCNT. The status of the check is available in the CHKST field in the SHA Interrupt Status register (SHA_ISR).

An interrupt can be generated (if enabled) when the check is completed. The check occurs several clock cycles after the computation of the requested hash, so the interrupt and the CHECKF bit are set several clock cycles after the DATRDY flag of the SHA_ISR.

### 60.4.8 Protocol Layers Improved Performances

The SHA can be tightly coupled to the AES module to improve performances when processing protocol layers such as IPsec or OpenSSL.

When the AES is configured to be tightly coupled to SHA (AES_MR), SHA must be always configured in Double Buffer mode (SHA_MR.DUALBUFF = 1).

Refer to the section “Advanced Encryption Standard (AES)” for details.

### 60.4.9 Start Modes

SHA_MR.SMOD is used to select the Hash Processing Start mode.

#### 60.4.9.1 Manual Mode

In Manual mode, the sequence is as follows:

1. Set SHA_IER.DATRDY (Data Ready) , depending on whether an interrupt is required at the end of processing.
2. If the initial hash values differ from the FIPS standard, set SHA_MR.UIHV and/or SHA_MR.UIEHV. If the initial hash values comply with the FIPS180-2 specification, clear SHA_MR.UIHV and/or SHA_MR.UIEHV.
3. If automatic padding is required, configure SHA_MSR.MSGSIZE with the number of bytes of the message, and configure SHA_BCR.BYTCNT with the remaining number of bytes to write. The BYTCNT field must be written with a value different from MSGSIZE field value if the message is preprocessed and completed by using user initial hash values.
   If automatic padding is not required, configure SHA_MSR.MSGSIZE and SHA_BCR.BYTCNT to 0.
4. For the first block of a message, the FIRST command must be set by writing a 1 into the corresponding bit of the Control register (SHA_CR). For the other blocks, there is nothing to write.
5. Write the block to be processed in the SHA_IDATARx.
6. To begin processing, set SHA_CR.START.
7. When processing is completed, the bit DATRDY in the Interrupt Status register (SHA_ISR) rises. If an interrupt has been enabled by setting SHA_IER.DATRDY, the interrupt line of the SHA is activated.
8. Repeat the write procedure for each block, start procedure and wait for the interrupt procedure up to the last block of the entire message. Each time the start procedure is complete, the DATRDY flag is cleared.
9. After the last block is processed (DATRDY flag is set, if an interrupt has been enabled by setting SHA_IER.DATRDY, the interrupt line of the SHA is activated), read the message digest in the Output Data registers. The DATRDY flag is automatically cleared when reading the SHA_IODATARx registers.

#### 60.4.9.2 Auto Mode

In Auto mode, processing starts as soon as the correct number of SHA_IDATARx is written. No action in the SHA_CR is necessary.

#### 60.4.9.3 DMA Mode

The DMA can be used in association with the SHA to perform the algorithm on a complete message without any action by the software during processing.

SHA_MR.SMOD must be configured to 2.

The DMA must be configured with non-incremental addresses.

The start address of any transfer descriptor must be set to point to the SHA_IDATAR0.

The DMA chunk size must be set to transfer, for each trigger request, 16 words of 32 bits.

The FIRST bit of the SHA_CR must be set before starting the DMA when the first block is transferred.

The DMA generates an interrupt when the end of buffer transfer is completed but the SHA processing is still in progress. The end of SHA processing is indicated by the flag DATRDY in the SHA_ISR.

If automatic padding is disabled, the end of SHA processing requires two interrupts to be verified. The DMA end of transfer interrupt must be verified first, then the SHA DATRDY interrupt must be enabled and verified.

If automatic padding is enabled, the end of SHA processing requires only one interrupt to be verified. The DMA end of transfer is not required, so the SHA DATRDY interrupt must be enabled prior to start the DMA and DATRDY interrupt is the only one to be verified. Refer to the figures below.

**Figure 60-3. Interrupts Processing with DMA**

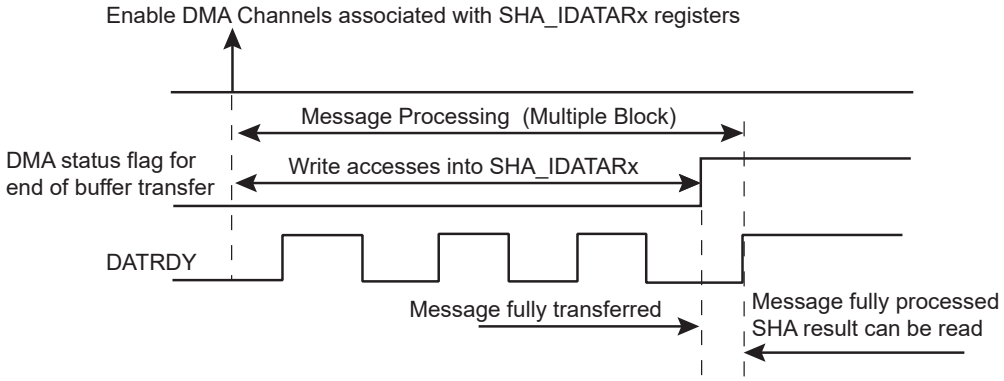


**Figure 60-4. Interrupts Processing with DMA and Automatic Padding**

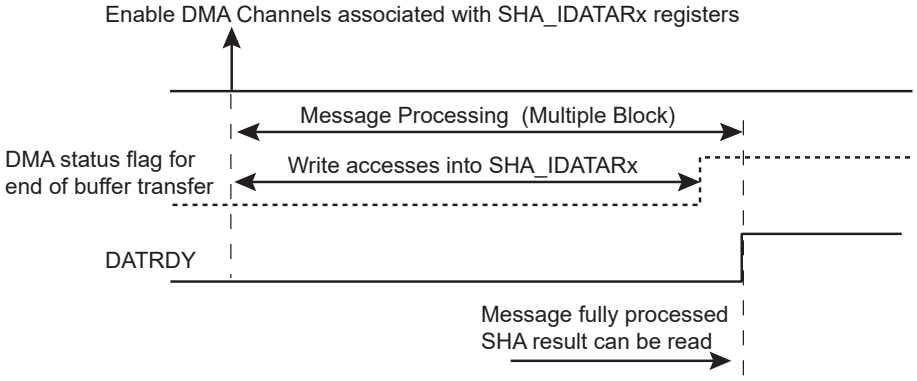

#### 60.4.9.4 SHA Register Endianness

In ARM processor-based products, the system bus and processors manipulate data in little-endian form. The SHA interface requires little-endian format words. However, in accordance with the protocol of FIPS 180-2 specification, data is collected, processed and stored by the SHA algorithm in big-endian form.

The following example illustrates how to configure the SHA:

If the first 64 bits of a message (according to FIPS 180-2, i.e., big-endian format) to be processed is 0xcafedeca_01234567, then the SHA_IDATAR0 and SHA_IDATAR1 registers must be written with the following pattern:

- SHA_IDATAR0 = 0xcadefeca
- SHA_IDATAR1 = 0x67452301

In a little-endian system, the message (according to FIPS 180-2) starting with pattern 0xcafedeca_01234567 is stored into memory as follows:

- 0xca stored at initial offset (for example 0x00),
- then 0xfe stored at initial offset + 1 (i.e., 0x01),
- 0xde stored at initial offset + 2 (i.e., 0x02),
- 0xca stored at initial offset + 3 (i.e., 0x03).

If the message is received through a serial-to-parallel communication channel, the first received character is 0xca and it is stored at the first memory location (initial offset). The second byte, 0xfe, is stored at initial offset + 1.

When reading on a 32-bit little-endian system bus, the first word read back from system memory is 0xcadefeca.

When the SHA_IODATARx registers are read, the hash result is organized in little-endian format, allowing system memory storage in the same format as the message.

Taking an example from the FIPS 180-2 specification Appendix B.1, the endian conversion can be observed.

For this example, the 512-bit message is:

0x6162638000000000

### 60.4.10 Security Features

#### 60.4.10.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in the SHA_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- SHA_IDATARx written during data processing in DMA mode
- SHA_IODATARx read during data processing
- SHA_MR written during data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in the SHA_CR.

## 60.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SHA_CR | 7:0 | | | | FIRST | | | | START |
| | | 15:8 | | | WUIEHV | WUIHV | | | | SWRST |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x04 | SHA_MR | 7:0 | | UIEHV | UIHV | PROCDLY | | | SMOD[1:0] | |
| | | 15:8 | | | | | ALGO[3:0] | | | |
| | | 23:16 | | | | | | | | DUALBUFF |
| | | 31:24 | CHKCNT[3:0] | | | | | | CHECK[1:0] | |
| 0x08 ... 0x0F | Reserved | | | | | | | | | |
| 0x10 | SHA_IER | 7:0 | | | | | | | | DATRDY |
| | | 15:8 | | | | | | | | URAD |
| | | 23:16 | | | | | | | | CHECKF |
| | | 31:24 | | | | | | | | |
| 0x14 | SHA_IDR | 7:0 | | | | | | | | DATRDY |

### 60.5.1 SHA Control Register

**Name:** SHA_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | WUIEHV | WUIHV | | | | SWRST |
| Access | | | W | W | | | | W |
| Reset | | | – | – | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | FIRST | | | | START |
| Access | | | | W | | | | W |
| Reset | | | | – | | | | – |

**Bit 13 – WUIEHV** Write User Initial or Expected Hash Values

| Value | Description |
|---|---|
| 0 | SHA_IDATARx accesses are routed to the data registers. |
| 1 | SHA_IDATARx accesses are routed to the internal registers (IR1). |

**Bit 12 – WUIHV** Write User Initial Hash Values

| Value | Description |
|---|---|
| 0 | SHA_IDATARx accesses are routed to the data registers. |
| 1 | SHA_IDATARx accesses are routed to the internal registers (IR0). |

**Bit 8 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the SHA. A software-triggered hardware reset of the SHA interface is performed. |

**Bit 4 – FIRST** First Block of a Message

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Indicates that the next block to process is the first one of a message. |

**Bit 0 – START** Start Processing

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Starts manual hash algorithm process. |

### 60.5.2 SHA Mode Register

**Name:** SHA_MR
**Offset:** 0x04
**Reset:** 0x0000100
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | CHKCNT[3:0] | | | | | | CHECK[1:0] | |
| Access | R/W | R/W | R/W | R/W | | | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DUALBUFF |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | ALGO[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | UIEHV | UIHV | PROCDLY | | | SMOD[1:0] | |
| Access | | R/W | R/W | R/W | | | R/W | R/W |
| Reset | | 0 | 0 | 0 | | | 0 | 0 |

**Bits 31:28 – CHKCNT[3:0]** Check Counter
Number of 32-bit words to check. The value 0 indicates that the number of words to compare will be based on the algorithm selected (5 words for SHA1, 7 words for SHA224, 8 words for SHA256, 12 words for SHA384, 16 words for SHA512).

**Bits 25:24 – CHECK[1:0]** Hash Check
Values not listed in table must be considered as “reserved”.

| Value | Name | Description |
|---|---|---|
| 0 | NO_CHECK | No check is performed |
| 1 | CHECK_EHV | Check is performed with expected hash stored in internal expected hash value registers. |
| 2 | CHECK_MESSAGE | Check is performed with expected hash provided after the message. |

**Bit 16 – DUALBUFF** Dual Input Buffer

| Value | Name | Description |
|---|---|---|
| 0 | INACTIVE | SHA_IDATARx and SHA_IODATARx cannot be written during processing of previous block. |
| 1 | ACTIVE | SHA_IDATARx and SHA_IODATARx can be written during processing of previous block when SMOD value = 2. It speeds up the overall runtime of large files. |

**Bits 11:8 – ALGO[3:0]** SHA Algorithm
Values not listed in the table must be considered as “reserved”.

| Value | Name | Description |
|---|---|---|
| 0 | SHA1 | SHA1 algorithm processed |
| 1 | SHA256 | SHA256 algorithm processed |
| 2 | SHA384 | SHA384 algorithm processed |
| 3 | SHA512 | SHA512 algorithm processed |
| 4 | SHA224 | SHA224 algorithm processed |
| 8 | HMAC_SHA1 | HMAC algorithm with SHA1 Hash processed |
| 9 | HMAC_SHA256 | HMAC algorithm with SHA256 Hash processed |
| 10 | HMAC_SHA384 | HMAC algorithm with SHA384 Hash processed |
| 11 | HMAC_SHA512 | HMAC algorithm with SHA512 Hash processed |
| 12 | HMAC_SHA224 | HMAC algorithm with SHA224 Hash processed |
| 13 | Reserved | – |
| 14 | Reserved | – |

**Bit 6 – UIEHV** User Initial or Expected Hash Value Registers

| Value | Description |
|---|---|
| 0 | The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification. |
| 1 | The SHA algorithm is started with the user initial hash values stored in the internal register 1 (IR1). If HMAC is configured, UIEHV has no effect (i.e. IR1 is always selected). |

**Bit 5 – UIHV** User Initial Hash Values

| Value | Description |
|---|---|
| 0 | The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification. |
| 1 | The SHA algorithm is started with the user initial hash values stored in the internal register 0 (IR0). If HMAC is configured, UIHV has no effect (i.e. IR0 is selected). |

**Bit 4 – PROCDLY** Processing Delay
When SHA1 algorithm is processed, runtime period is either 85 or 209 clock cycles.

When SHA256 or SHA224 algorithm is processed, runtime period is either 72 or 194 clock cycles.

When SHA384 or SHA512 algorithm is processed, runtime period is either 88 or 209 clock cycles.

| Value | Name | Description |
|---|---|---|
| 0 | SHORTEST | SHA processing runtime is the shortest one |
| 1 | LONGEST | SHA processing runtime is the longest one (reduces the SHA bandwidth requirement, reduces the system bus overload) |

**Bits 1:0 – SMOD[1:0]** Start Mode
Values not listed in the table must be considered as “reserved”.

If a DMA transfer is used, configure the SMOD value to 2. See DMA Mode for details.

| Value | Name | Description |
|---|---|---|
| 0 | MANUAL_START | Manual mode |

| Value | Name | Description |
|---|---|---|
| 1 | AUTO_START | Auto mode |
| 2 | IDATAR0_START | SHA_IDATAR0 access only mode (mandatory when DMA is used) |

### 60.5.3 SHA Interrupt Enable Register

**Name:** SHA_IER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CHECKF |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 16 – CHECKF** Check Done Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 60.5.4 SHA Interrupt Disable Register

**Name:** SHA_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CHECKF |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 16 – CHECKF** Check Done Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 60.5.5 SHA Interrupt Mask Register

**Name:** SHA_IMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | CHECKF |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 16 – CHECKF** Check Done Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 60.5.6 SHA Interrupt Status Register

**Name:** SHA_ISR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | CHKST[3:0] | | | | | | | CHECKF |
| Access | R | R | R | R | | | | R |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | URAT[2:0] | | | | | | URAD |
| Access | | R | R | R | | | | R |
| Reset | | 0 | 0 | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | WRDY | | | | DATRDY |
| Access | | | | R | | | | R |
| Reset | | | | 0 | | | | 0 |

**Bits 23:20 – CHKST[3:0]** Check Status (cleared by writing START or SWRST bits in SHA_CR or by reading SHA_IODATARx)
Value 5 indicates identical hash values (expected hash = hash result). Any other value indicates different hash values.

**Bit 16 – CHECKF** Check Done Status (cleared by writing START or SWRST bits in SHA_CR or by reading SHA_IODATARx)

| Value | Description |
|---|---|
| 0 | Hash check has not been computed. |
| 1 | Hash check has been computed, status is available in the CHKST bits. |

**Bits 14:12 – URAT[2:0]** Unspecified Register Access Type (cleared by writing a 1 to SWRST bit in SHA_CR)
Only the last Unspecified Register Access Type is available through the URAT field.

| Value | Name |
|---|---|
| 0 | SHA_IDATAR0 to SHA_IDATAR15 written during the data processing in DMA mode (URAD = 1 and URAT = 0 can occur only if DUALBUFF is cleared in SHA_MR). |
| 1 | Output Data Register read during the data processing. |
| 2 | SHA_MR written during the data processing. |
| 3 | Write-only register read access. |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing a 1 to SWRST bit in SHA_CR)

| Value | Description |
|---|---|
| 0 | No unspecified register access has been detected since the last SWRST. |
| 1 | At least one unspecified register access has been detected since the last SWRST. |

**Bit 4 – WRDY** Input Data Register Write Ready

| Value | Description |
|---|---|
| 0 | SHA_IDATAR0 cannot be written |
| 1 | SHA_IDATAR0 can be written |

**Bit 0 – DATRDY** Data Ready (cleared by writing a 1 to bit SWRST or START in SHA_CR, or by reading SHA_IODATARx)

| Value | Description |
|---|---|
| 0 | Output data is not valid. |
| 1 | 512/1024-bit block process is completed. DATRDY is cleared when one of the following conditions is met:<br>• Bit START in SHA_CR is set.<br>• Bit SWRST in SHA_CR is set.<br>• The hash result is read. |

### 60.5.7 SHA Message Size Register

**Name:** SHA_MSR
**Offset:** 0x20
**Reset:** 0x0
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | MSGSIZE[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | MSGSIZE[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | MSGSIZE[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | MSGSIZE[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – MSGSIZE[31:0]** Message Size
The size in bytes of the message. When MSGSIZE differs from 0, the SHA appends the corresponding value converted in bits after the padding section, as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE field must be written to 0.

### 60.5.8 SHA Bytes Count Register

**Name:** SHA_BCR
**Offset:** 0x30
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | BYTCNT[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | BYTCNT[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | BYTCNT[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BYTCNT[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – BYTCNT[31:0]** Remaining Byte Count Before Auto Padding
When the hash processing starts from the beginning of a message (without preprocessed hash part), BYTCNT must be written with the same value as the MSGSIZE. If a part of the message has been already hashed and the hash does not start from the beginning, BYTCNT must be configured with the number of bytes remaining to process before padding section.

When read, provides the size in bytes of message remaining to be written before the automatic padding starts.

BYTCNT field is automatically updated each time a write occurs in the SHA_IDATARx and SHA_IODATARx.

When BYTCNT reaches 0, the MSGSIZE is converted into bit count and appended at the end of the message after the padding as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE and BYTCNT fields must be written to 0.

### 60.5.9 SHA Input Data x Register

**Name:** SHA_IDATARx
**Offset:** 0x40 + x*0x04 [x=0..15]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | – |

**Bits 31:0 – IDATA[31:0]** Input Data
The 32-bit Input Data registers allow to load the data block used for hash processing.

These registers are write-only to prevent the input data from being read by another application.

SHA_IDATAR0 corresponds to the first word of the block, SHA_IDATAR15 to the last word of the last block in case SHA algorithm is set to SHA1, SHA224, SHA256 or SHA_IODATA15R to the last word of the block if SHA algorithm is SHA384 or SHA512 (see SHA Input/Output Data Register x).

### 60.5.10 SHA Input/Output Data Register x

**Name:** SHA_IODATARx
**Offset:** 0x80 + x*0x04 [x=0..15]
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IODATA[31:24] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IODATA[23:16] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IODATA[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IODATA[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – IODATA[31:0]** Input/Output Data
These registers can be used to read the resulting message digest and to write the second part of the message block when the SHA algorithm is SHA-384 or SHA-512.

SHA_IODATA0R to SHA_IODATA15R can be written or read but reading these offsets does not return the content of corresponding parts (words) of the message block. Only results from SHA calculation can be read through these registers.

When SHA processing is in progress, these registers return 0x0000.

SHA_IODATAR0 corresponds to the first word of the message digest; SHA_IODATAR4 to the last one in SHA1 mode, SHA_ODATAR6 in SHA224, SHA_IODATAR7 in SHA256, SHA_IODATAR11 in SHA384 or SHA_IODATAR15 in SHA512.

When SHA224 is selected, the content of SHA_ODATAR7 must be ignored.

When SHA384 is selected, the content of SHA_IODATAR12 to SHA_IODATAR15 must be ignored.

# 61. Triple Data Encryption Standard (TDES)

## 61.1 Description

The Triple Data Encryption Standard (TDES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 46-3 specification.

The TDES supports the four different confidentiality modes of operation (ECB, CBC, OFB and CFB), specified in the FIPS (Federal Information Processing Standard) Publication 81 and is compatible with the Peripheral Data Controller channels for all of these modes, minimizing processor intervention for large buffer transfers.

The TDES key is loaded by the software.

The software can write up to three 64-bit keys, each stored in two 32-bit write-only registers, i.e., Key x Word Registers TDES_KEYxWR0 and TDES_KEYxWR1.

The input data (and initialization vector for some modes) are stored in two corresponding 32-bit write-only registers:

- Input Data Registers TDES_IDATAR0 and TDES_IDATAR1
- Initialization Vector Registers TDES_IVR0 and TDES_IVR1

As soon as the initialization vector, the input data and the keys are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data is ready to be read out on the two 32-bit Output Data registers (TDES_ODATARx) or through the DMA channels.

## 61.2 Embedded Characteristics

- Supports Single Data Encryption Standard (DES) and Triple Data Encryption Standard (TDES)
- Compliant with FIPS Publication 46-3, Data Encryption Standard (DES)
- 64-bit Cryptographic Key for TDES
- Two-key or Three-key Algorithms for TDES
- 18-clock Cycles Encryption/Decryption Processing Time for DES
- 50-clock Cycles Encryption/Decryption Processing Time for TDES
- Supports eXtended Tiny Encryption Algorithm (XTEA)
- 128-bit key for XTEA and Programmable Round Number up to 64
- Supports the Four Standard Modes of Operation specified in the FIPS Publication 81, DES Modes of Operation
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC)
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
- 8-, 16-, 32- and 64-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allowing Optimized Message (Data) Authentication Code (MAC) Generation
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 61.3 Product Dependencies

### 61.3.1 Power Management

The TDES may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the TDES clock.

### 61.3.2 Interrupt Sources

The TDES interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TDES.

## 61.4 Functional Description

The Data Encryption Standard (DES) and the Triple Data Encryption Algorithm (TDES) specify FIPS-approved cryptographic algorithms that can be used to protect electronic data. The TDES bit in the TDES Mode Register (TDES_MR) is used to select either the single DES or the Triple DES mode.

Encryption (enciphering) converts data to an unintelligible form called ciphertext. Decrypting (deciphering) the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in TDES_MR is used to choose between encryption and decryption.

A DES is capable of using cryptographic keys of 64 bits to encrypt and decrypt data in blocks of 64 bits. This 64-bit key is defined in the Key 1 Registers (TDES_KEY1WRx ).

A TDES key consists of three DES keys, which is also referred to as a key bundle. These three 64-bit keys are defined, respectively, in the Key 1, 2 and 3 Registers (TDES_KEY1WRx, TDES_KEY2WRx and TDES_KEY3WRx). In Triple DES mode (TDESMOD = 1 in TDES_MR), the KEYMOD bit in TDES_MR is used to choose between a two- and a three-key algorithm, as summarized in the table below.

**Table 61-1. TDES Algorithms Summary**

| Algorithm | Mode | Data Processing Sequence Steps | | |
|---|---|---|---|---|
| | | First | Second | Third |
| Three-key | Encryption | Encryption with Key 1 | Decryption with Key 2 | Encryption with Key 3 |
| | Decryption | Decryption with Key 3 | Encryption with Key 2 | Decryption with Key 1 |
| Two-key | Encryption | Encryption with Key 1 | Decryption with Key 2 | Encryption with Key 1 |
| | Decryption | Decryption with Key 1 | Encryption with Key 2 | Decryption with Key 1 |

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 64-bit data block called the initialization vector (IV), which must be set in the Initialization Vector Registers (TDES_IVRx). The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message.

The XTEA algorithm can be used instead of DES/TDES by configuring the TDESMOD field in TDES_MR with the appropriate value 0x2. An XTEA key consists of a 128-bit key. They are defined in the Key 1 and 2 Registers.

The number of rounds of XTEA is defined in TDES_XTEA_RNDR and can be programmed up to 64 (1 round = 2 Feistel network rounds).

All the start and operating modes of the TDES algorithm can be applied to the XTEA algorithm.

### 61.4.1 Operating Modes

The TDES supports the following operating modes:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- OFB—Output Feedback
- CFB—Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)

The data pre-processing, post-processing and data chaining for each mode are automatically performed. Refer to the FIPS Publication 81 for more complete information.

These modes are selected by setting the OPMOD field in TDES_MR.

In CFB mode, four data sizes are possible (8, 16, 32 and 64 bits), configurable by means of the CFBS field in TDES_MR (see TDES Mode Register).

### 61.4.2 Start Modes

The SMOD field in TDES_MR selects the Encryption (or Decryption) start mode.

#### 61.4.2.1 Manual Mode

The sequence is as follows:

1. Write the TDES_MR register with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 64-bit key(s) in the different Key Registers (TDES_KEYxWRx), depending on whether one, two or three keys are required.
3. Write the initialization vector (or counter) in the Initialization Vector Registers (TDES_IVRx).
   **Note:** The Initialization Vector Registers concern all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the TDES Interrupt Enable register (TDES_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized Input Data Registers (see the table below).
   **Note:** In 32-, 16- and 8-bit CFB modes, writing to TDES_IDATAR1 is not allowed and may lead to processing errors.
6. Set the START bit in the TDES Control Register (TDES_CR) to begin the encryption or decryption process.
7. When the processing completes, the bit DATRDY in the TDES Interrupt Status Register (TDES_ISR) rises. If an interrupt has been enabled by setting the bit DATRDY in TDES_IER, the interrupt line of the TDES is activated.
8. When the software reads one of the Output Data Registers (TDES_ODATARx), the DATRDY bit is automatically cleared.

**Table 61-2. Authorized Input Data Registers**

| Operating Mode | Input Data Registers to Write |
|---|---|
| ECB | All |

| .....continued | |
|---|---|
| **Operating Mode** | **Input Data Registers to Write** |
| CBC | All |
| OFB | All |
| CFB 64-bit | All |
| CFB 32-bit | TDES_IDATAR0 |
| CFB 16-bit | TDES_IDATAR0 |
| CFB 8-bit | TDES_IDATAR0 |

#### 61.4.2.2 Auto Mode

The Auto Mode is similar to the Manual Mode, except that as soon as the correct number of Input Data registers is written, processing is automatically started without any action in TDES_CR.

#### 61.4.2.3 DMA Mode

The DMA Controller can be used in association with the TDES to perform an encryption/decryption of a buffer without any action by the software during processing.

The SMOD field of TDES_MR must be set to 0x2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (TDES_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be set in TDES_IDATAR0.

The DMA chunk size configuration depends on the TDES mode of operation and is listed in the table below.

When writing data to TDES with the first DMA channel, data will be fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the TDES with the second DMA channel, the source data is the data read from TDES and data destination is the memory buffer. In this case, source data size depends on the TDES mode of operation and is listed in the table below.

**Table 61-3. DMA Data Transfer Type for the Different Operating Modes**

| Operating Mode | Chunk Size | Destination/Source Data Transfer Type |
|---|---|---|
| ECB | 1 | Word |
| CBC | 1 | Word |
| OFB | 1 | Word |
| CFB 64-bit | 1 | Word |
| CFB 32-bit | 1 | Word |
| CFB 16-bit | 1 | Half-word |
| CFB 8-bit | 1 | Byte |

### 61.4.3 Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) using a CBC-MAC or a CFB encryption algorithm (refer to *FIPS Publication 81 Appendix F*).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data is available either on the output data registers for Manual and Auto modes or at the address specified in the receive buffer pointer for DMA mode (See Last Output Data Mode Behavior versus Start Modes).

The Last Output Data bit (LOD) in TDES_MR can be used to retrieve only the last data of several encryption/decryption processes.

This data is only available on the Output Data Registers (TDES_ODATARx).

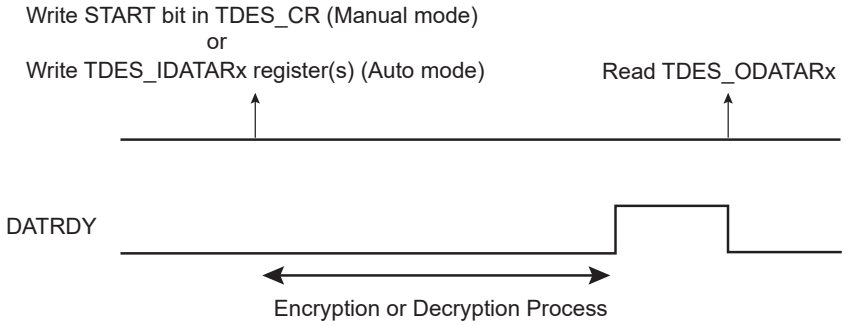
Therefore, there is no need to define a read buffer in DMA mode.

#### 61.4.3.1 Manual and Auto Modes

##### 61.4.3.1.1 TDES_MR.LOD = 0

The DATRDY flag is cleared when at least one of the Output Data Registers is read. See the figure below.

**Figure 61-1. Manual and Auto Modes with LOD = 0**

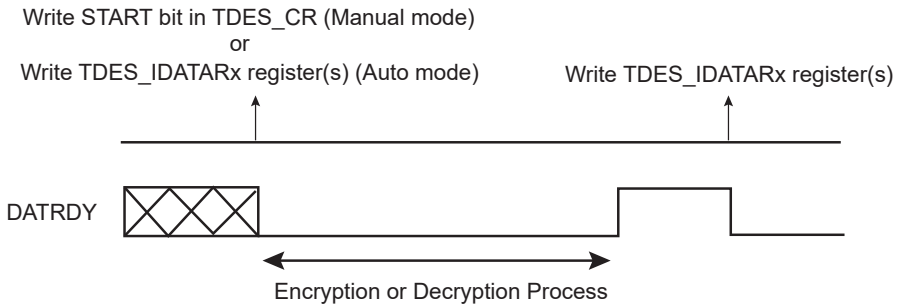


If the user does not want to read the output data registers between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user will not be informed of the end of the encryptions/decryptions that follow.

##### 61.4.3.1.2 TDES_MR.LOD = 1

The DATRDY flag is cleared when at least one Input Data Register is written, before the start of a new transfer. See the figure below. No further Output Data Register reads are necessary between consecutive encryptions/decryptions.

**Figure 61-2. Manual and Auto Modes with LOD = 1**



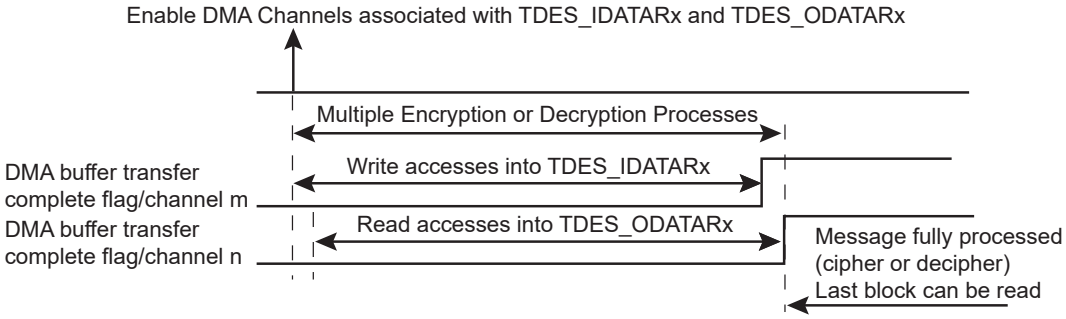
### 61.4.3.2 DMA Mode

#### 61.4.3.2.1 TDES_MR.LOD = 0

This mode may be used for all TDES operating modes except CBC-MAC where LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to TDES_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to TDES_IDATARx and one to obtain the result from TDES_ODATARx.

**Figure 61-3. DMA Transfer with LOD = 0**



#### 61.4.3.2.2 TDES_MR.LOD = 1

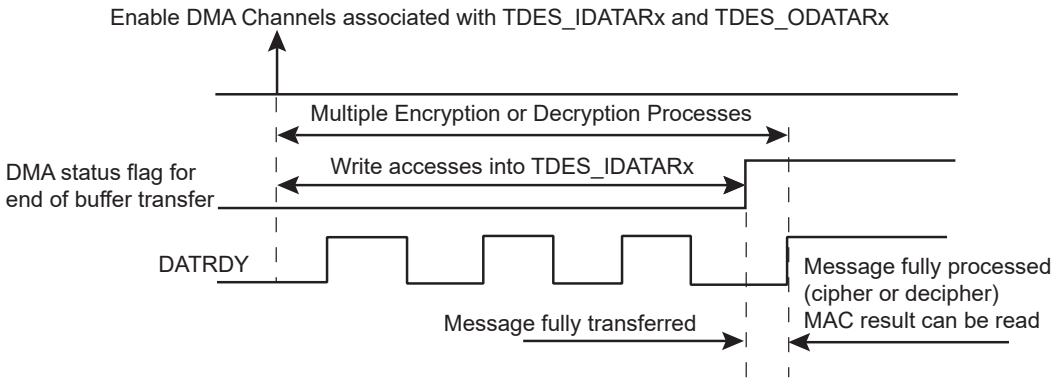
This mode is optimized to process the TDES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, TDES_MR.SMOD must be written to ‘0’. To restart a CBC-MAC on a new buffer, TDES_MR.SMOD must be written to ‘2’.

The output data is only available on TDES_ODATARx.

**Figure 61-4. DMA Transfer with LOD = 1**



The table below summarizes the different cases.

**Table 61-4. Last Output Data Mode Behavior versus Start Modes**

| Sequence | Manual and Auto Modes | | DMA Transfer | |
|---|---|---|---|---|
| | LOD = 0 | LOD = 1 | LOD = 0 | LOD = 1 |
| DATRDY Flag Clearing Condition (1) | At least one Output Data Register must be read | At least one Input Data Register must be written | Not used | Managed by the DMA |

.....continued

| Sequence | Manual and Auto Modes | | DMA Transfer | |
|---|---|---|---|---|
| | LOD = 0 | LOD = 1 | LOD = 0 | LOD = 1 |
| End of Encryption/ Decryption | DATRDY | DATRDY | 2 DMA Buffer transfer complete flags (channel m and channel n) | DMA buffer transfer complete flag, then TDES DATRDY flag |
| Encrypted/ Decrypted Data Result Location | In the Output Data Registers | In the Output Data Registers | Not available | In the Output Data Registers |

**Note:** Depending on the mode, there are other ways of clearing the DATRDY flag. See TDES Interrupt Status Register.

**WARNING** In DMA mode, reading to the Output Data registers before the last data transfer may lead to unpredictable results.

### 61.4.4 Security Features

#### 61.4.4.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in TDES_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- Input Data Register written during the data processing in DMA mode
- Output Data Register read during the data processing
- Mode Register written during the data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in TDES_CR.

## 61.5 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | TDES_CR | 7:0 | | | | | | | | START |
| | | 15:8 | | | | | | | | SWRST |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |
| 0x04 | TDES_MR | 7:0 | | | | KEYMOD | | TDESMOD[1:0] | | CIPHER |
| | | 15:8 | LOD | | OPMOD[1:0] | | | | SMOD[1:0] | |
| | | 23:16 | | | | | | | CFBS[1:0] | |
| | | 31:24 | | | | | | | | |
| 0x08 ... 0x0F | Reserved | | | | | | | | | |
| 0x10 | TDES_IER | 7:0 | | | | | | | | DATRDY |
| | | 15:8 | | | | | | | | URAD |
| | | 23:16 | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | SWRST |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | START |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Resets the TDES. A software triggered hardware reset of the TDES interface is performed. |

**Bit 0 – START** Start Processing

| Value | Description |
|---|---|
| 0 | No effect |
| 1 | Starts Manual encryption/decryption process. |

### 61.5.2 TDES Mode Register

**Name:** TDES_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | CFBS[1:0] | |
| Access | | | | | | | R/W | R/W |
| Reset | | | | | | | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | LOD | | OPMOD[1:0] | | | | SMOD[1:0] | |
| Access | R/W | | R/W | R/W | | | R/W | R/W |
| Reset | 0 | | 0 | 0 | | | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | KEYMOD | | TDESMOD[1:0] | | CIPHER |
| Access | | | | R/W | | R/W | R/W | R/W |
| Reset | | | | 0 | | 0 | 0 | 0 |

**Bits 17:16 – CFBS[1:0]** Cipher Feedback Data Size

| Value | Name | Description |
|---|---|---|
| 0 | SIZE_64BIT | 64-bit |
| 1 | SIZE_32BIT | 32-bit |
| 2 | SIZE_16BIT | 16-bit |
| 3 | SIZE_8BIT | 8-bit |

**Bit 15 – LOD** Last Output Data Mode

**WARNING** In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable result.

| Value | Description |
|---|---|
| 0 | No effect.<br>After each end of encryption/decryption, the output data is available either on the output data registers (Manual and Auto modes) .<br>In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read. |

| Value | Description |
|---|---|
| 1 | The DATRDY flag is cleared when at least one of the Input Data Registers is written.<br>No more Output Data Register reads are necessary between consecutive encryptions/ decryptions (see Last Output Data Mode). |

**Bits 13:12 – OPMOD[1:0]** Operating Mode
For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

| Value | Name | Description |
|---|---|---|
| 0 | ECB | Electronic Code Book mode |
| 1 | CBC | Cipher Block Chaining mode |
| 2 | OFB | Output Feedback mode |
| 3 | CFB | Cipher Feedback mode |

**Bits 9:8 – SMOD[1:0]** Start Mode
If a DMA transfer is used, 0x2 must be configured. See DMA Mode for more details.

| Value | Name | Description |
|---|---|---|
| 0 | MANUAL_START | Manual Mode |
| 1 | AUTO_START | Auto Mode |
| 2 | IDATAR0_START | TDES_IDATAR0 accesses only Auto Mode |

**Bit 4 – KEYMOD** Key Mode

| Value | Description |
|---|---|
| 0 | Three-key algorithm is selected. |
| 1 | Two-key algorithm is selected. There is no need to write Key 3 Registers TDES_KEY3WRx. |

**Bits 2:1 – TDESMOD[1:0]** ALGORITHM Mode
Values which are not listed in the table must be considered as “reserved”.

| Value | Name | Description |
|---|---|---|
| 0 | SINGLE_DES | Single DES processing using Key 1 Registers |
| 1 | TRIPLE_DES | Triple DES processing using Key 1, Key 2 and Key 3 Registers |
| 2 | XTEA | XTEA processing using Key 1 and Key 2 Registers |

**Bit 0 – CIPHER** Processing Mode

| Value | Name | Description |
|---|---|---|
| 0 | DECRYPT | Decrypts data. |
| 1 | ENCRYPT | Encrypts data. |

### 61.5.3 TDES Interrupt Enable Register

**Name:** TDES_IER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 61.5.4 TDES Interrupt Disable Register

**Name:** TDES_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 61.5.5 TDES Interrupt Mask Register

**Name:** TDES_IMR
**Offset:** 0x18
**Reset:** 0x000000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | URAD |
| Access | | | | | | | | W |
| Reset | | | | | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | 0 |

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 61.5.6 TDES Interrupt Status Register

**Name:** TDES_ISR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | URAT[1:0] | | | | | URAD |
| Access | | | R | R | | | | R |
| Reset | | | 0 | 0 | | | | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bits 13:12 – URAT[1:0]** Unspecified Register Access (cleared by setting bit TDES_CR.SWRST)
Only the last Unspecified Register Access Type is available through the URAT field.

| Value | Name | Description |
|---|---|---|
| 0 | IDR_WR_PROCESSING | Input Data Register written during data processing when SMOD = 0x2 mode. |
| 1 | ODR_RD_PROCESSING | Output Data Register read during data processing. |
| 2 | MR_WR_PROCESSING | Mode Register written during data processing. |
| 3 | WOR_RD_ACCESS | Write-only register read access. |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by setting bit TDES_CR.SWRST)

| Value | Description |
|---|---|
| 0 | No unspecified register access has been detected since the last write of bit TDES_CR.SWRST. |
| 1 | At least one unspecified register access has been detected since the last write of bit TDES_CR.SWRST. |

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in TDES_CR or by reading TDES_ODATARx)
If TDES_MR.LOD = 1: In Manual and Auto modes, the DATRDY flag can also be cleared by writing at least one TDES_IDATARx.

| Value | Description |
|---|---|
| 0 | Output data is not valid. |
| 1 | Encryption or decryption process is completed. |

### 61.5.7 TDES Key 1 Word Register x

**Name:** TDES_KEY1WRx
**Offset:** 0x20 + x*0x04 [x=0..1]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEY1W[31:24] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| | KEY1W[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | KEY1W[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – KEY1W[31:0]** Key 1 Word
The two 32-bit Key 1 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY1W0 refers to the first word of the key and KEY1W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 LSB bits of the encryption/decryption key.

### 61.5.8 TDES Key 2 Word Register x

**Name:** TDES_KEY2WRx
**Offset:** 0x28 + x*0x04 [x=0..1]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – KEY2W[31:0]** Key 2 Word
The two 32-bit Key 2 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY2W0 refers to the first word of the key and KEY2W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES_KEY2WRx registers are not used in DES mode.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 MSB bits of the encryption/decryption key.

### 61.5.9 TDES Key 3 Word Register x

**Name:** TDES_KEY3WRx
**Offset:** 0x30 + x*0x04 [x=0..1]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| | KEY3W[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – KEY3W[31:0]** Key 3 Word
The two 32-bit Key 3 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY3W0 refers to the first word of the key and KEY3W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES_KEY3WRx registers are not used in DES mode, TDES with two-key algorithm selected and XTEA mode.

### 61.5.10 TDES Input Data Register x

**Name:** TDES_IDATARx
**Offset:** 0x40 + x*0x04 [x=0..1]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IDATA[31:24] | | | | | | | |

| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ODATA[31:0]** Output Data
The two 32-bit Output Data registers contain the 64-bit data block which has been encrypted/decrypted.

ODATA1 refers to the first word, ODATA2 to the last one.

### 61.5.12 TDES Initialization Vector Register x

**Name:** TDES_IVRx
**Offset:** 0x60 + x*0x04 [x=0..1]
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | IV[31:24] | | | | | | | |

| Reset | – | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | IV[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | IV[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IV[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 31:0 – IV[31:0]** Initialization Vector
The two 32-bit Initialization Vector registers are used to set the 64-bit initialization vector data block, which is used by some modes of operation as an additional initial input.

IV1 refers to the first word of the Initialization Vector, IV2 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

These registers are not used for the ECB mode and must not be written.

### 61.5.13 TDES XTEA Rounds Register

**Name:** TDES_XTEA_RNDR
**Offset:** 0x70
**Reset:** 0x000000000
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | XTEA_RNDS[5:0] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 5:0 – XTEA_RNDS[5:0]** Number of Rounds
This 6-bit field is used to define the number of complete rounds (1 complete round = 2 Feistel rounds) processed in XTEA algorithm.

The value of XTEA_RNDS has no effect if the TDESMOD field in TDES_MR is set to 0x0 or 0x1.

0x00 corresponds to 1 complete round, 0x01 corresponds to 2 complete rounds, etc.

# 62. True Random Number Generator (TRNG)

## 62.1 Description

The True Random Number Generator (TRNG) passes the American *NIST Special Publication 800-22 (A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications) and the Diehard Suite of Tests.*

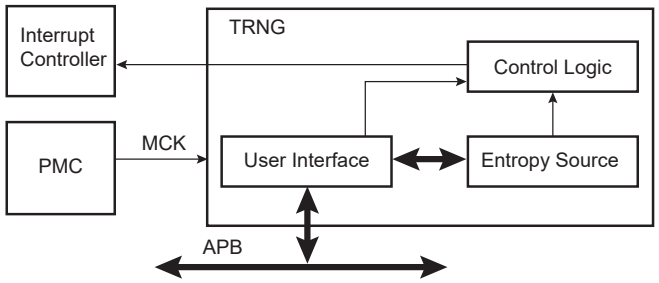
The TRNG may be used as an entropy source for seeding an NIST approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3.

## 62.2 Embedded Characteristics

- Passes *NIST Special Publication 800-22 Test Suite*
- Passes *Diehard Suite of Tests*
- May be Used as Entropy Source for seeding a NIST-approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3
- Provides a 32-bit Random Number Every 84 Clock Cycles

## 62.3 Block Diagram

**Figure 62-1. TRNG Block Diagram**



## 62.4 Product Dependencies

### 62.4.1 Power Management

The TRNG interface may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TRNG user interface clock. The user interface clock is independent from any clock that may be used in the entropy source logic circuitry. The source of entropy can be enabled before enabling the user interface clock.

### 62.4.2 Interrupt Sources

The TRNG interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TRNG.

## 62.5 Functional Description

As soon as the TRNG is enabled in the Control register (TRNG_CR), the generator provides one 32-bit random value every 84 clock cycles.

The TRNG interrupt line can be enabled in the Interrupt Enable register (TRNG_IER), and disabled in the Interrupt Disable register (TRNG_IDR). This interrupt is set when a new random value is available and is cleared when the Status register (TRNG_ISR) is read. The flag TRNG_ISR.DATRDY is set when the random data is ready to be read out on the 32-bit Output Data register (TRNG_ODATA).

## 62.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

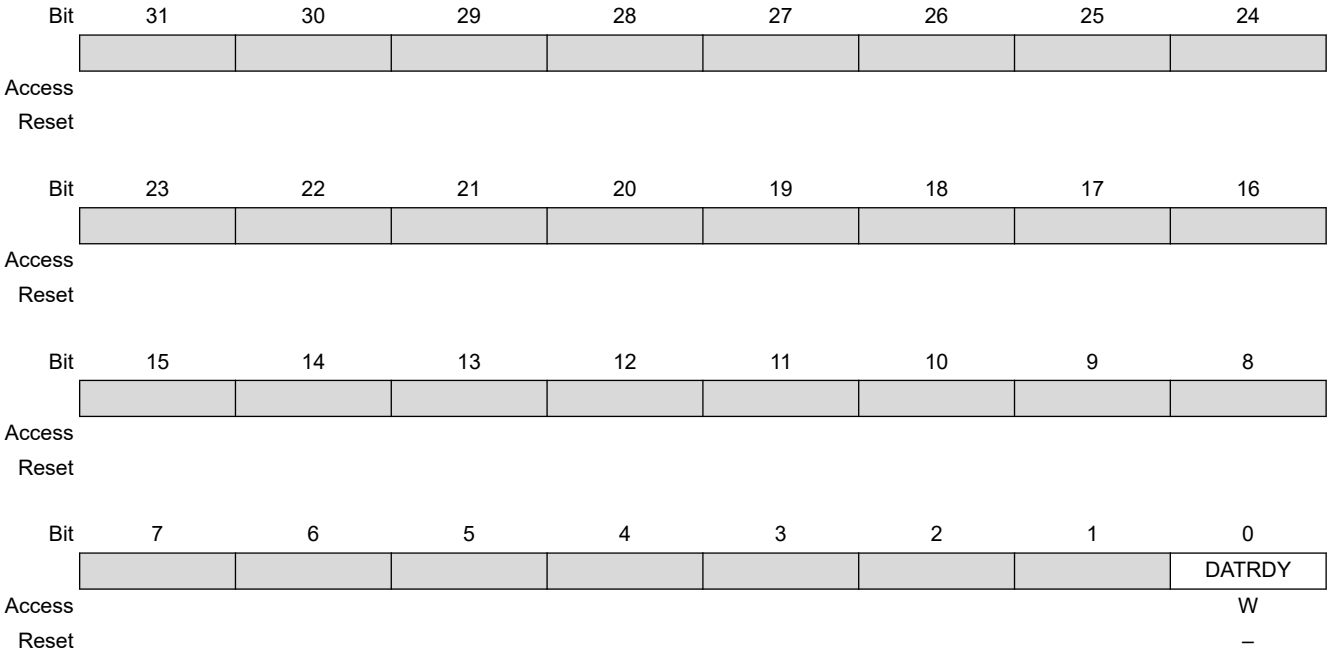
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | W |
| Reset | | | | | | | | – |

**Bit 0 – DATRDY** Data Ready Interrupt Enable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the corresponding interrupt. |

### 62.6.3 TRNG Interrupt Disable Register

**Name:** TRNG_IDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only



**Bit 0 – DATRDY** Data Ready Interrupt Disable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the corresponding interrupt. |

### 62.6.4 TRNG Interrupt Mask Register

**Name:** TRNG_IMR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 0 – DATRDY** Data Ready Interrupt Mask

| Value | Description |
|---|---|
| 0 | The corresponding interrupt is not enabled. |
| 1 | The corresponding interrupt is enabled. |

### 62.6.5 TRNG Interrupt Status Register

**Name:** TRNG_ISR
**Offset:** 0x1C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | DATRDY |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 0 – DATRDY** Data Ready (cleared on read)

| Value | Description |
|---|---|
| 0 | Output data is not valid or TRNG is disabled. |
| 1 | New random value is completed since the last read of TRNG_ODATA. |

### 62.6.6 TRNG Output Data Register

**Name:** TRNG_ODATA
**Offset:** 0x50
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[31:24] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[23:16] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ODATA[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:0 – ODATA[31:0]** Output Data
The 32-bit Output Data register contains the 32-bit random data.

# 63. Analog Comparator Controller (ACC)

## 63.1 Description

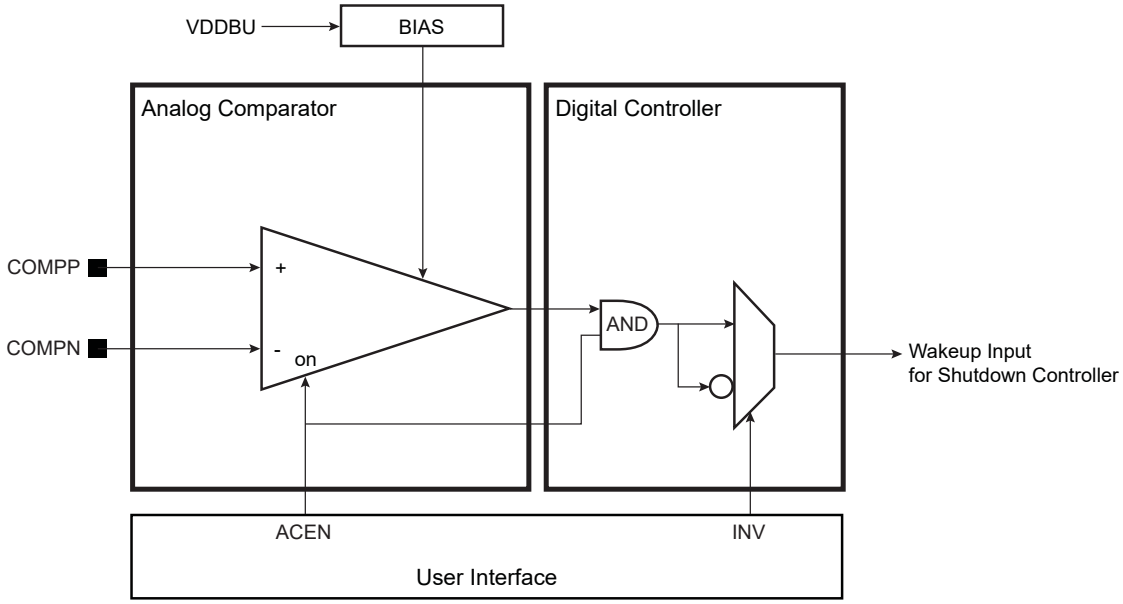
The Analog Comparator Controller (ACC) controls the analog comparator in order to provide an additional source of wakeup when the system wakes up from Wait mode.

## 63.2 Embedded Characteristics

- Source of Wakeup When System Wakes Up from Wait Mode and ULP1 Mode

## 63.3 Block Diagram

**Figure 63-1. Analog Comparator Controller Block Diagram**



## 63.4 Signal Description

**Table 63-1. ACC Signal Description**

| Pin Name | Description | Type |
|---|---|---|
| COMPP, COMPN | External analog data inputs | Input |

## 63.5 Product Dependencies

### 63.5.1 I/O Lines

The analog input pins (COMPP and COMPN) are not multiplexed with digital functions (PIO) on the I/O line.

### 63.5.2 Power Management

By clearing the ACEN bit in the ACC Mode Register (ACC_MR), the analog comparator power consumption is reduced to current leakage only.

## 63.6 Functional Description

### 63.6.1 Description

The analog comparator is enabled by writing a one to the ACEN bit in the ACC Mode Register (ACC_MR) and the polarity of the comparator output can be configured with bit ACC_MR.INV.

The ACC registers are listed in the Register Summary.

### 63.6.2 Register Write Protection

To prevent any single software error from corrupting ACC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the ACC Write Protection Mode Register (ACC_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the ACC Write Protection Status Register (ACC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the ACC_WPSR register.

The following registers can be write-protected:

- ACC Mode Register

## 63.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | ACC_CR | 7:0 | | | | | | | | SWRST |
| | | 15:8 | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | WPVS |
| Access | | | | | | | | R |
| Reset | | | | | | | | 0 |

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of ACC_WPSR. |
| 1 | A write protection violation (WPEN = 1) has occurred since the last read of ACC_WPSR. |

# 64. Security Module (SECUMOD)

## 64.1 Description

The Security Module (SECUMOD) features different levels of security depending on the device reference. This section describes the protections embedded in the SECUMOD available on all SAMA5D2 devices.

This module embeds the secure memories (5 Kbytes of SRAM and a 256-bit register bank) dedicated to the storage of sensitive data. These memories are scrambled with a programmable 32-bit key.

When a fault is detected, regardless of the source, a clear signal can be sent automatically to the secure memories and clear their contents.

For information specific to dynamic tamper protection (PIOBU), refer to the document “SAMA5D2 External Tamper Protections”(document no. 44095).

For information specific to temperature, voltage and frequency monitoring for SAMA5D23 and SAMA5D28, refer to the document “SAMA5D23 and SAMA5D28 Environmental Monitors” (document no. 44036).

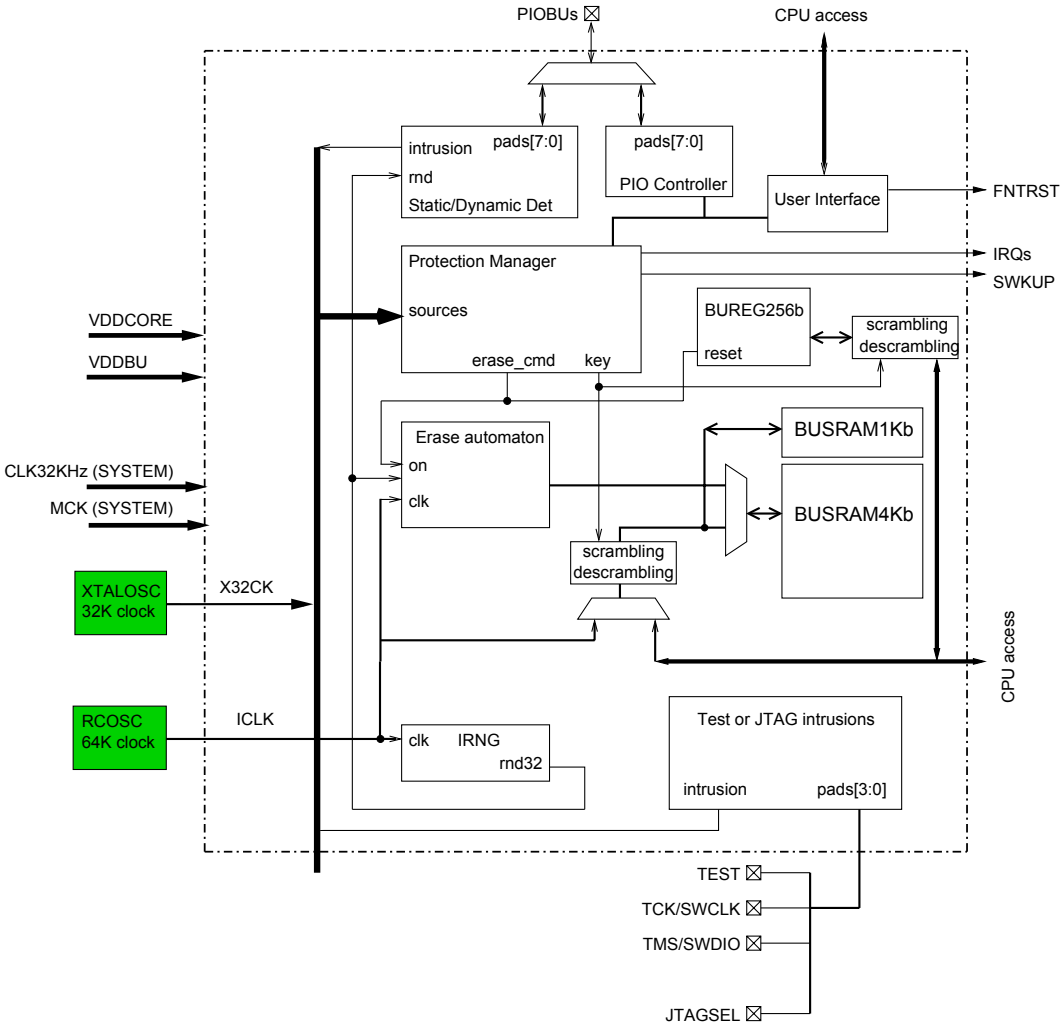
## 64.2 Embedded Characteristics

A PIO Controller managing up to eight pads (PIOBU) and offering:

- Standard I/O function powered in the backup domain
- Eight external switch state change detectors
- Memory erase and scrambling
- Backup SRAM access and Zeroisation process

## 64.3 Block Diagram

**Figure 64-1. SECUMOD Block Diagram**



The above figure represents the logic inside the SECUMOD. Analog cells are external to the IP and highlighted in green.

### 64.3.1 I/O Lines Description

**Table 64-1. I/O Lines Description**

| Name | Description | Type |
|---|---|---|
| CLK32KHZ | 32 kHz system clock from crystal or RC oscillator (SLCK) | Input |
| ICLK | 64 kHz RC Oscillator | Input |
| PIOBU[7:0] | Parallel IO backup controller, 8 pads | I/O |

| .....continued | | |
|---|---|---|
| **Name** | **Description** | **Type** |
| IRQ[1:0] | Interrupt signals going to secure AIC | Output |
| SWKUP | Wakeup signal going to system controller WKUP1 pin | Output |
| FNTRST | Force Cortex-A5 test port reset | Output |

## 64.4 Product Dependencies

### 64.4.1 Interrupt Sources

The SECUMOD provides two interrupt lines, each connected to one of the internal sources of the Advanced Interrupt Controller. Using these interrupts requires the AIC to be programmed first. Note that it is not recommended to use the interrupt lines in Edge-sensitive mode.

The first interrupt line (SECURAM ID) is dedicated to backup memories access right violations signaling, or end of erase (automatic or software erase) signaling.

The second interrupt line (SECUMOD ID) is shared by all the protection mechanisms.

See the Register Summary section for more information about interrupt acknowledgement.

The SECURAM and the SECUMOD interrupt lines are connected to the Interrupt Controller. The Interrupt Controller must be programmed before configuring the SECURAM or the SECUMOD.

## 64.5 Functional Description

### 64.5.1 Memory Mapping

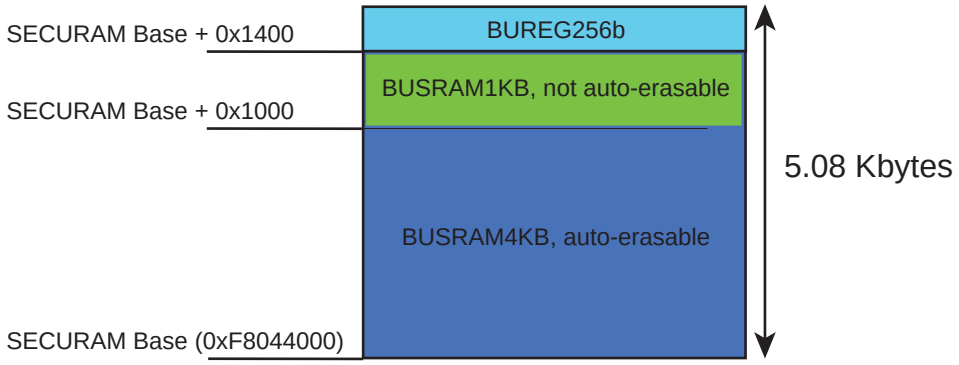
The SECUMOD embeds 5 Kbytes of SRAM split in two parts: the lower 4 Kbytes are erased in case of intrusion (BUSRAM4KB) while the upper 1 Kbyte is never erased (BUSRAM1KB). A 256-bit register bank is available as an additional memory and is totally erased in case of intrusion (BUREG256b).

All memories support 8-bit, 16-bit and 32-bit access sizes.

For power optimization, the transfers between the processor and these memories are decreased by a factor of 4.

The base address value of the SECURAM is 0xF8044000.

**Figure 64-2. SECUMOD Internal Memory Map**



### 64.5.2 Scrambling Keys

The secure memories (BUSRAM4KB, BUSRAM1KB and BUREG256b) are scrambled. The scrambling is enabled after reset and a scrambling key is automatically generated. The scrambling key can be modified through the Scrambling Key register (SECUMOD_SCRKEY).

Scrambling can be disabled using the Control register (SECUMOD_CR).

### 64.5.3 Internal Random Number Generator (IRNG)

The RNG cannot be read through the User Interface (a TrueRNG external to the SECUMOD is available for this purpose).

### 64.5.4 Protection Mechanisms

#### 64.5.4.1 PIO Backup Controller

The SECUMOD includes a PIO Controller powered by VDDBU which handles the eight PIOBU I/O pins.

Each I/O line is controlled by the PIO Controller and each pin can be configured to be driven. This is done by writing in the corresponding SECUMOD PIO Backup register (SECUMOD_PIOBUx). When SECUMOD_PIOBUx.OUTPUT is at ‘0’, the corresponding I/O line is used as an input only. When this bit is at ‘1’, the corresponding I/O line is driven by the PIO Backup Controller.

##### 64.5.4.1.1 Output Mode

When SECUMOD_PIOBUx.OUTPUT is set, the level driven on an I/O line can be determined by setting or clearing the PIO_SOD bit (Set Output Data). The value of this bit represents the data driven on the corresponding I/O line.

##### 64.5.4.1.2 Input Mode

The level on an I/O line can be read through the PIO_PDS bit (Pin Data Status) in the corresponding SECUMOD_PIOBUx. This bit indicates the level of the I/O line regardless of its configuration, whether as an input or driven by the PIO Controller.

##### 64.5.4.1.3 Static Intrusion Detectors and Programmable Internal Pullup/Pulldown

Intrusion detectors can be placed around the system to detect any intrusion attempt. This requires the corresponding I/O lines to be configured as inputs (SECUMOD_PIOBUx.OUTPUT = 0).

##### 64.5.4.1.4 Static Intrusion Detection

The detectors can be configured to detect either the rising edge or the falling edge on switches via SECUMOD_PIOBUx.SWITCH.

Example: A detector can consist of a normally-closed switch which sends a zero signal to the Protection Unit. When an intrusion attempt occurs, the switch state changes to an open position. The debounce filter waits until an intrusion has been detected for a programmable continuous period to send an alarm signal to the Protection Unit. This is to prevent erroneous intrusion detections.

##### 64.5.4.1.5 Internal Pullup/Pulldown

The user has the possibility to connect an internal pullup or pulldown (around 100 kΩ) by configuring SECUMOD_PIOBUx.PULLUP accordingly.

Configuring this field with a pullup or pulldown value activates the corresponding pullup/pulldown permanently.

**Note:** Internal pullups are connected at reset state.

##### 64.5.4.1.6 Scheduled Pullup/Pulldown

In order to reduce the power consumption on the VDDBU power supply, all activated pullups/pulldowns can be scheduled by following the steps below:

1. Activate the required pullup/pulldown.
2. Measure the level on the PIOBUx pin.
3. Deactivate the pullup/pulldown.

Scheduling is enabled by setting SECUMOD_PIOBUx.SCHEDULE.

**Note:** This feature is only effective if the PULLUP field indicates that a pullup or a pulldown is connected.

#### 64.5.4.1.7 Debouncing Time

The debouncing time is common to all I/Os. The principle is presented in the following figure. A period ($f_{ICLK}/2$) is allocated to each I/O. During that period, if SECUMOD_PIOBUx.SCHEDULE is set and if a pullup/pulldown is needed (PULLUP field different from 0), the pullup/pulldown is activated, the level is measured and the pullup/pulldown is deactivated. Otherwise, only the level is measured. Measurement is performed at the end of the allocated period.

**Figure 64-3. Schedule Principle**

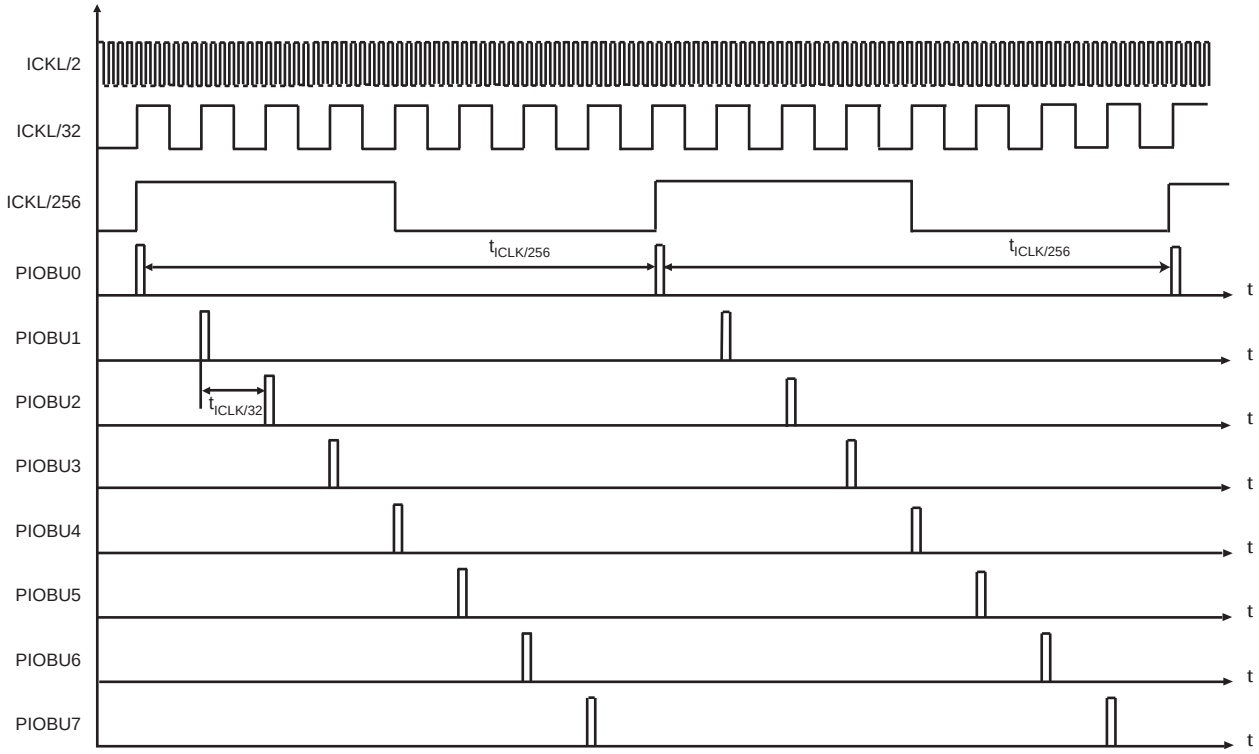


**Table 64-2. Timings vs. $f_{ICLK}$**

| Timing | $f_{ICLK}$ (kHz) | | | Units |
|---|---|---|---|---|
| | Min = 38 | Typ = 64 | Max = 90 | |
| $t_{ICLK/2}$ | 53 | 31 | 22 | µs |
| $t_{ICLK/32}$ | 842 | 500 | 356 | µs |
| $t_{ICLK/256}$ | 6.74 | 4.00 | 2.84 | ms |

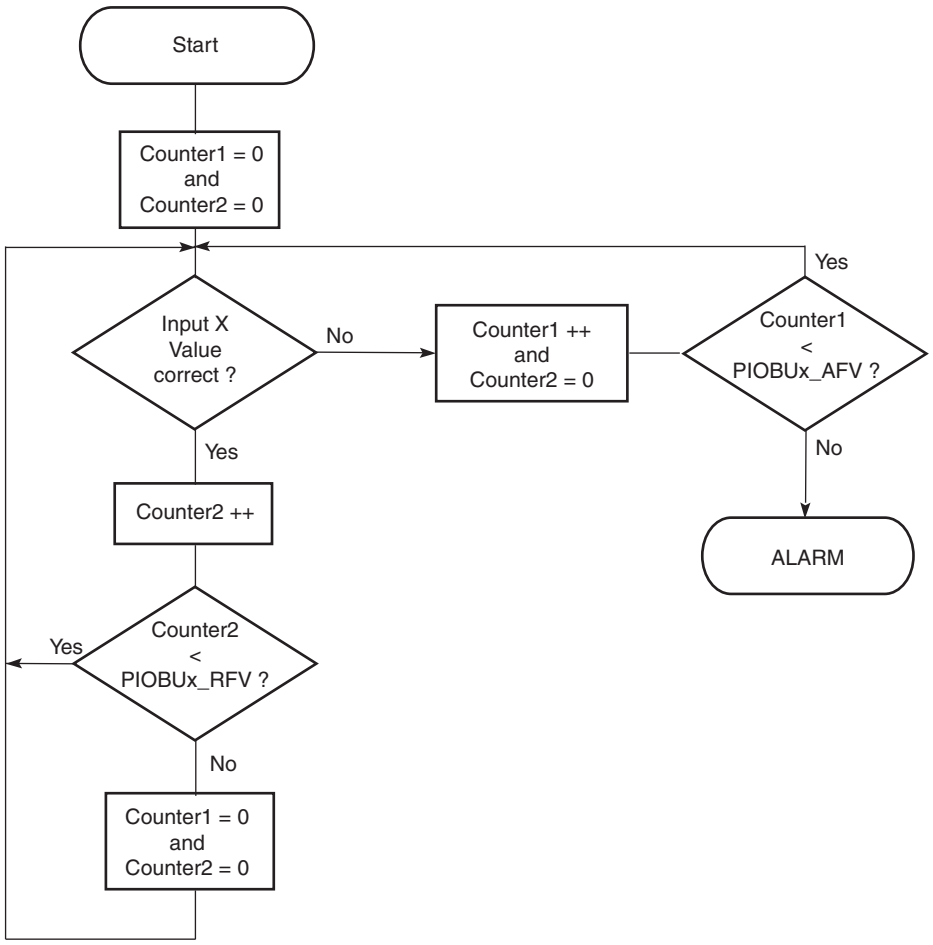
#### 64.5.4.1.8 PIOBUx Alarm Filtering in Static Mode

It is possible to filter the PIOBUx alarm detection by programming SECUMOD_PIOBUx.PIOBU_AFV. The steps are as follows:

1. A 9-bit counter is incremented each time the value present on the corresponding input is not the expected one.
2. An alarm is sent to the Protection Unit if the counter value reaches the value programmed in PIOBU_AFV.

The previous 9-bit counter is reset only if the value present on the input is correct and stable for a continuous programmable period defined by SECUMOD_PIOBUx.PIOBU_RFV (a second counter is used for that operation). See the figure below.

**Figure 64-4. PIOBUx Alarm Filtering Principle**



At reset state, the debouncers are not activated (PIOBU_AFV and PIOBU_RFV fields set to 0), which implies that no alarm can be generated.

Once both the PIOBU_AFV and the PIOBU_RFV fields have been programmed, the corresponding protection is activated and a CLR signal is generated automatically when an intrusion is detected. It is possible to generate an interrupt (or a wakeup signal) instead of clearing the secure memories content. To do so, the user must disable the protection in the Normal Mode Protection register (SECUMOD_NMPR) and configure the Normal Interrupt Enable Protection register (SECUMOD_NIEPR).

**Note:** If the Normal Mode Protection/Backup Mode Protection registers are not hidden, their configuration has priority on the debouncer activation in the PIOBUx configuration registers, which means that CLR signal generation is enabled/disabled in those two registers. Setting the PIOBU_AFV and PIOBU_RFV fields configure the debouncer sensitivity and does not generate any clear signal when an intrusion is detected.

**Table 64-3. Debouncing Time vs. $f_{ICLK}$**

| Debouncing Time | $f_{ICLK}$ (kHz) | | | Unit |
|---|---|---|---|---|
| | Min = 38 | Typ = 64 | Max = 90 | |
| Min (PIOBU_AFV = 1) | 6.74 | 4.00 | 2.84 | ms |
| Max (PIOBU_AFV = 9) | 3.45 | 2.05 | 1.46 | s |

**Note:** At reset state, the PIOBU_AFV and PIOBU_RFV fields are set to 0.

#### 64.5.4.2 JTAG Prevention

##### 64.5.4.2.1 Debug Interface Access Prevention

The SECUMOD can be used to block access to the system through the ARM processor's Debug Access Port interface. This feature is implemented via SECUMOD_JTAGCR, which enables assertion of the nDBGRESET reset input of the debug interface. Writing a ‘1’ to SECUMOD_JTAGCR.FNTRST prevents any activity on the TAP (Test Access Port) controller.

On standard devices, FNTRST resets to ‘0’ and thus does not prevent debug access.

FNTRST also locks the boundary scan when set.

##### 64.5.4.2.2 Physical Restrictions for JTAG Debug Mode

Invasive and non-invasive debug modes are controlled by four input pins of the Debug Access Port: DBGEN, SPIDEN, NIDEN and SPNIDEN.

In order to restrict the debug to nonsecure software parts only, the SEC_DEBUG_DIS fuse has to be configured in the customer fuse matrix.

Programming this fuse prevents JTAG secure debug irreversibly, but does not lock non-secure debug.

##### 64.5.4.2.3 Software Restrictions for JTAG Debug Mode

Setting SECUMOD_JTAGCR.CA5_DEBUG_MODE sets the DBGEN, SPIDEN, NIDEN and SPNIDEN Cortex inputs to the appropriate level in order to allow different debug permission levels. See 64.6.7 SECUMOD_JTAGCR for more information.

##### 64.5.4.2.4 Software Prevention for JTAG Debug

It is possible to prevent JTAG Debug accesses by forcing the reset signal of Debug Access Port by software.

While the reset signal is maintained low, the JTAG Debug interface cannot be used. To maintain the Debug Access Port in reset state, set SECUMOD_JTAGCR.FNTRST (in this case, Boundary JTAG is also disabled).

The key used for the BUREG256b scrambler/descrambler is derived from the BUSRAM4KB key and thus benefits from the same protection.

### 64.5.5 Erasing Secure Memories

#### 64.5.5.1 BUSRAM4KB Erase Sequence

##### 64.5.5.1.1 Principle

The BUSRAM4KB Erase sequence is controlled by an automaton which is activated by the CLR signal.

The following table shows the time to perform a partial erase (one erased word out of eight on the entire BUSRAM4KB), and the time to perform a full erase.

**Table 64-4. Erase Time Evaluation vs. $f_{ICLK}$**

| Erase | $f_{ICLK}$ Frequency (kHz) | | | Unit |
|---|---|---|---|---|
| | Min = 38 | Typ = 64 | Max = 90 | |
| Partial Erase | 1.68 | 1.00 | 0.71 | ms |
| Full Erase (4 Kbytes) | 13.47 | 8.00 | 5.69 | |

During the Erase sequence, the upper 1 Kbyte of memory (BUSRAM1KB) is still accessible by the system.

The erase is a write of random values instead of erase to zero.

#### 64.5.5.2 BUREG256b Erase Sequence

In parallel to the BUSRAM4KB Erase, the BUREG256b register bank is erased.

BUREG256b is always reset after a VDDBU powerup.

These registers are seen as zero after reset or after an erase.

##### 64.5.5.2.1 During and After BUSRAM4KB and BUREG256b Erase Sequence

Some flags can be read to know the real-time erase state of the memories. On completion of the Erase sequence, the SECURAM ID interrupt line is asserted.

### 64.5.6 Operating Modes

The SECUMOD is supplied by the VDDBU power supply. It is not possible to program the SECUMOD if VDDBU is not present.

The SECUMOD macrocell is able to operate in two different modes:

- When all supplies are present and can be monitored, the SECUMOD can be switched to Normal mode.
- Otherwise, the SECUMOD must be in Backup mode.

**Note:** After a powerup reset, the SECUMOD is in Backup mode.

The mode is selected by setting either SECUMOD_CR.NORMAL or SECUMOD_CR.BACKUP.

**Note:** The user must set SECUMOD_CR.BACKUP to enter Backup mode prior to shutting off the VDDCORE power supplies.

In both modes, the user can enable or disable a protection by writing in the corresponding Mode Protection register. See 64.5.7 Activation or Deactivation of Protections for more information.

#### 64.5.6.1 Protection Unit

The Protection Unit is used to centralize all alarms coming from the different monitors. When an alarm is detected, the Protection Unit sends a Clear signal to the automaton, which starts the secure memories Erase sequence if the memory is not empty.

The Protection Unit can also send:

- an IRQ interrupt signal (only in Normal mode)
- an SWKUP wakeup signal (only in Backup mode).

When an interrupt or a wakeup signal is generated, it is up to the user to detect the source of the alarm and to act accordingly, i.e., to clear the secure memories content or not.

As soon as an alarm is detected, the corresponding bit is set in the Status register (SECUMOD_SR). The only way to clear this bit is to set it in the Status Clear register (SECUMOD_SCR).

**Note:** Once a status bit is raised, it should not be cleared before the next slow clock period. If a clear does occur, the status bit rises again and the same alarm will be seen twice. To prevent this, it is recommended to wait at least one slow clock period after reading the Status register before clearing the status bits.

If a Clear of the secure memories content has been performed by the automaton, an ERASE_DONE flag is set to indicate that the secure memories content is not valid anymore. While the secure memories are erased, write accesses have no effect and read accesses return a static and invalid value (except for BUSRAM1KB).

### 64.5.7 Activation or Deactivation of Protections

It is possible to activate or deactivate each protection separately by writing in the Normal and Backup Mode Protection registers. These registers are hidden and the only way to make them appear is to write SECUMOD_CR.KEY with the correct value. This command field acts on a toggle basis: writing the correct value makes the registers appear and disappear.

At reset state, all protections are activated except the sixteen corresponding to the intrusion detectors (need to program PIOBUx).

### 64.5.8 Powerup Reset

After a powerup reset, the SECUMOD is in Backup mode, but in an unpredictable state.

The Slow Clock oscillator takes about one second to startup. It is also possible that monitors send alarms to the Protection Unit. However, a Clear command can be performed because the secure memories content is empty.

Care must be taken when writing in BUSRAM4KB or BUREG256b after reset. The user must make sure that no Erase sequence is running, otherwise the write access to BUSRAM4KB or BUREG256b is aborted. It is recommended to wait for the system to be established before accessing BUSRAM4KB or BUREG256b. This can last for at least one or two seconds. The verification is performed by reading the Status register. If there is no error for a continuous period (one second, for example), the user can access BUSRAM4KB or BUREG256b. If at least one error is detected, the user has to wait first for the ERASE_DONE flag to rise, and then wait again for at least one slow clock period after reading the Status register before writing content in the Status Clear register. At this stage, all status bits should be cleared. The user must then ensure that no error is raised in the Status register during the next second, for example.

## 64.6 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | SECUMOD_CR | 7:0 | | | | | | SWPROT | NORMAL | BACKUP |

### 64.6.1 SECUMOD Control Register

**Name:** SECUMOD_CR
**Offset:** 0x0000
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | KEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | KEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | SCRAMB[1:0] | | |
| Access | | | | | | W | W | |
| Reset | | | | | | – | – | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | SWPROT | NORMAL | BACKUP |
| Access | | | | | | W | W | W |
| Reset | | | | | | – | – | – |

**Bits 31:16 – KEY[15:0]** Password
This command field acts on a toggle basis: writing the value 0x89CA alternatively makes the Normal or Backup Protection Registers appear and disappear.

Writing any other value in this field has no effect.

**Bits 10:9 – SCRAMB[1:0]** Memory Scrambling Enable

| Value | Description |
|---|---|
| 10 | Memories are not scrambled. |
| 01 | Memories are scrambled (default). |
| 00 | No effect |
| 11 | No effect |

**Bit 2 – SWPROT** Software Protection

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Starts the BUSRAM4KB and BUREG256b Clear content. |

**Bit 1 – NORMAL** Normal Mode

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Switches to Normal mode. |

**Bit 0 – BACKUP** Backup Mode

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Switches to Backup mode. |

### 64.6.2 SECUMOD System Status Register

**Name:** SECUMOD_SYSR
**Offset:** 0x0004
**Reset:** 0x000000D4
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SCRAMB | AUTOBKP | | | SWKUP | BACKUP | ERASE_ON | ERASE_DONE |
| Access | R | R | | | R | R | R | R/W |
| Reset | 1 | 1 | | | 0 | 1 | 0 | 0 |

**Bit 7 – SCRAMB** Scrambling Enabled

| Value | Description |
|---|---|
| 0 | Disabled. |
| 1 | Enabled. |

**Bit 6 – AUTOBKP** Automatic Backup Mode Enabled

| Value | Description |
|---|---|
| 0 | Disabled. |
| 1 | Enabled. |

**Bit 3 – SWKUP** SWKUP State

| Value | Description |
|---|---|
| 0 | No SWKUP signal sent since the last clear. |
| 1 | SWKUP signal has been sent since the last clear. |

**Bit 2 – BACKUP** Backup Mode

| Value | Description |
|---|---|
| 0 | Normal mode active. |
| 1 | Backup mode active. |

**Bit 1 – ERASE_ON** Erase Process Ongoing
When ERASE_ON returns to 0, ERASE_DONE is set after half a period of ICLK.

| ERASE_ON | ERASE_DONE | Status | Action |
|---|---|---|---|
| 0 | 0 | No Erase ongoing or since the last Erase. | Nothing. |
| 1 | 0 | An Erase process is running. | Wait until the ERASE_ON flag is reset.<br>ERASE_DONE will rise, see line below. |
| 0 | 1 | An Erase occurred and is finished. | Clear the ERASE_DONE flag. |
| 1 | 1 | An Erase process is running.<br>The ERASE_DONE flag refers to a previous Erase process, but was not cleared. | Wait until the ERASE_ON flag is reset, then clear the ERASE_DONE flag. |

| Value | Description |
|---|---|
| 0 | Erase automaton is not running. |
| 1 | Erase automaton is currently running, memories are not accessible. |

**Bit 0 – ERASE_DONE** Erasable Memories State

| Value | Description |
|---|---|
| 0 | Secure memories content has not been erased since the last clear. |
| 1 | Secure memories content has been erased since the last clear. The user must write 1 into this bit to clear this flag. Note that not clearing this flag does not prevent the next erase processes. This flag also activates the SECURAM interrupt line as long as it is not cleared. |

### 64.6.3 SECUMOD Status Register

**Name:** SECUMOD_SR
**Offset:** 0x0008
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No alarm generated since the last clear.

1: An alarm has been generated by the corresponding monitor since the last clear.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DET7 | DET6 | DET5 | DET4 | DET3 | DET2 | DET1 | DET0 |
| Access | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx** PIOBU Intrusion Detector

### 64.6.4 SECUMOD Status Clear Register

**Name:** SECUMOD_SCR
**Offset:** 0x0010
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Clears the corresponding alarm flag bit.

If the corresponding alarm was programmed to generate a SWKUP signal, clearing the alarm also clears the SWKUP status bit in the SECUMOD Status register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | DET7 | DET6 | DET5 | DET4 | DET3 | DET2 | DET1 | DET0 |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

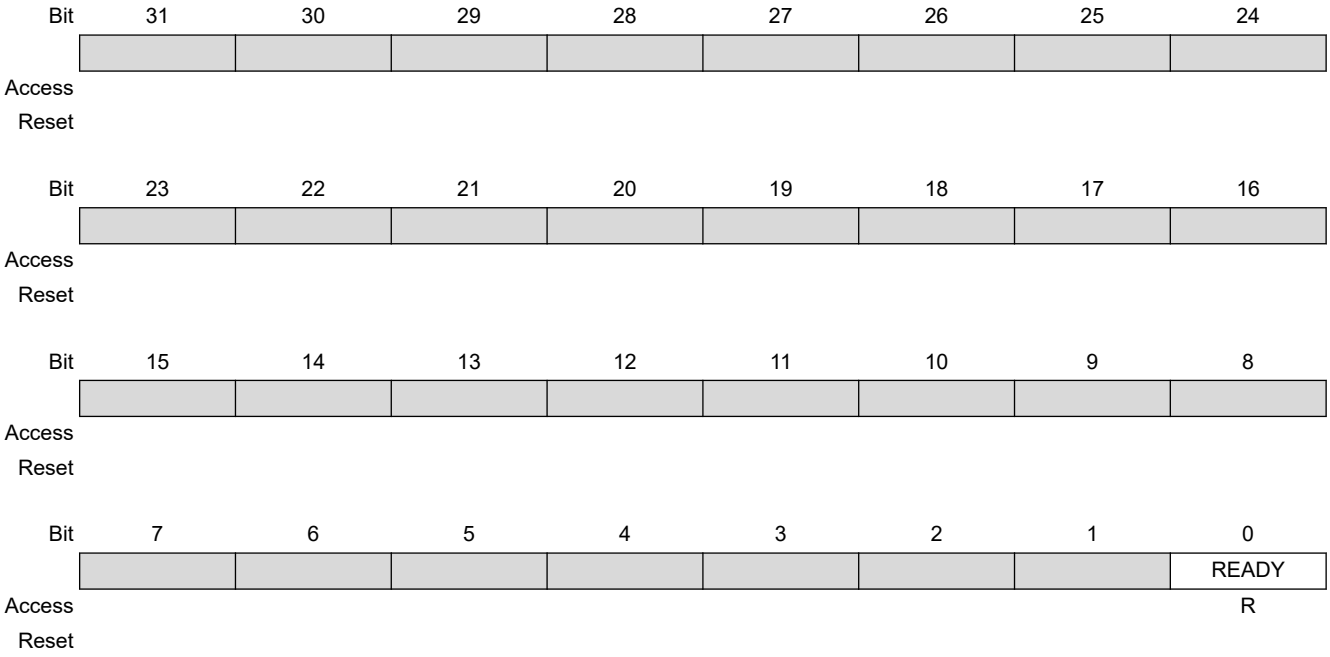
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx** PIOBU Intrusion Detector

### 64.6.5 SECUMOD RAM Access Ready Register

**Name:** SECUMOD_RAMRDY
**Offset:** 0x0014
**Reset:** Undefined
**Property:** Read-only



**Bit 0 – READY** Ready for System Access Flag
When exiting Idle, System Reset or Backup mode, this flag must be read high before accessing the secure memories. The flag remains low until any ongoing process stops. Refer to the section “Real-time Clock (RTC) Register Summary” for more information.

### 64.6.6 SECUMOD PIO Backup Register x

**Name:** SECUMOD_PIOBUx
**Offset:** 0x18 + x*0x04 [x=0..7]
**Reset:** 0x00001000
**Property:** Read/Write

**Note:** The FILTER3_5 and DYNSTAT fields only exist for even PIOBUs.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | SWITCH | SCHEDULE | PULLUP[1:0] | | | PIO_PDS | PIO_SOD | OUTPUT |
| Access | R/W | R/W | R/W | R/W | | R | R/W | R/W |
| Reset | 0 | 0 | 0 | 1 | | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PIOBU_RFV[3:0] | | | | PIOBU_AFV[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 15 – SWITCH** Switch State for Intrusion Detection

| Value | Description |
|---|---|
| 0 | Input default state is low level. |
| 1 | Input default state is high level. |

**Bit 14 – SCHEDULE** Pullup/Down Scheduled

| Value | Description |
|---|---|
| 0 | Pullup/pulldown is not scheduled. |
| 1 | Pullup/pulldown is scheduled. |

**Bits 13:12 – PULLUP[1:0]** Programmable Pullup State
This field is used to control the internal pullup or pulldown.

| PULLUP0 | | Status |
|---|---|---|
| 0 | 0 | No pullup/pulldown connected |
| 0 | 1 | Pullup connected |
| 1 | 0 | Pulldown connected |

| .....continued | | |
|---|---|---|
| **PULLUP0** | | **Status** |
| 1 | 1 | Reserved |

**Bit 10 – PIO_PDS** Level on the Pin in Input Mode (OUTPUT = 0)

| Value | Description |
|---|---|
| 0 | The I/O line is at level 0. |
| 1 | The I/O line is at level 1. |

**Bit 9 – PIO_SOD** Set/Clear the I/O Line when configured in Output Mode (OUTPUT =1)

| Value | Description |
|---|---|
| 0 | Clears the data to be driven on the I/O line. |
| 1 | Sets the data to be driven on the I/O line. |

**Bit 8 – OUTPUT** Configure I/O Line in Input/Output

| Value | Description |
|---|---|
| 0 | The I/O line is a pure input. |
| 1 | The I/O line is enabled in output. |

**Bits 7:4 – PIOBU_RFV[3:0]** PIOBUx Reset Filter Value
This field is used to define the number of consecutive valid states to be reached before resetting the AFV counter.

| PIOBU_RFV | Maximum Counter Value |
|---|---|
| 0 | 0 (No static protection) |
| 1 | 2 |
| 2 | 4 |
| 3 | 8 |
| 4 | 16 |
| 5 | 32 |
| 6 | 64 |
| 7 | 128 |
| 8 | 256 |
| 9 | 512 |

This field must be set to 0 when Dynamic Intrusion is selected.

**Bits 3:0 – PIOBU_AFV[3:0]** PIOBU Alarm Filter Value
This field is used to define the filter value prior to generating an alarm.

| PIOBU_AFV | Maximum Counter Value |
|---|---|
| 0 | 0 (No static protection) |
| 1 | 2 |
| 2 | 4 |
| 3 | 8 |
| 4 | 16 |
| 5 | 32 |
| 6 | 64 |
| 7 | 128 |
| 8 | 256 |
| 9 | 512 |

This field must be set to 0 when Dynamic Intrusion is selected.

### 64.6.7 SECUMOD JTAG Protection Control Register

**Name:** SECUMOD_JTAGCR
**Offset:** 0x0068
**Reset:** 0x00000008
**Property:** Read/Write

**Note:** Reset values are all 0 when fuse DEFDBG is programmed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | WZO | CA5_DEBUG_MODE[2:0] | | | FNTRST |
| Access | | | | R/W | R/W | R/W | R/W | R/W |
| Reset | | | | 0 | 1 | 0 | 0 | 0 |

**Bit 4 – WZO** Write ZERO
Must be written with 0.

**Bits 3:1 – CA5_DEBUG_MODE[2:0]** Cortex-A5 Invasive/Non-Invasive Secure/Non-Secure Debug Permissions
This field is used to set different debug permission levels. For instance, it can be used to prevent debug on secure parts of the code. The table below shows the effect of the field value on the Cortex-A5 pins (SPIDEN, DBGEN, SPNIDEN and NIDEN).

| CA5_DEBUG_MODE Value | Cortex-A5 Debug Permissions | SPIDEN | DBGEN | SPNIDEN | NIDEN |
|---|---|---|---|---|---|
| b000 | No Debug | 0 | 0 | 0 | 0 |
| b001 | Non-Invasive, Non-Secure | 0 | 0 | 0 | 1 |
| b010 | Full Non-Secure (Invasive and Non-Invasive) | 0 | 1 | 0 | 0 |
| b011 | Full Non-Secure + Non-Invasive Secure | 0 | 1 | 1 | 1 |
| b100 | Full Debug allowed | 1 | 1 | 1 | 1 |

**Bit 0 – FNTRST** Force NTRST

| Value | Description |
|---|---|
| 0 | The ARM processor's TAP controller access and Boundary JTAG are not blocked by the SECUMOD. |
| 1 | nDBGRESET of the ARM processor's TAP controller and Boundary JTAG reset are held low, preventing the processor to switch to debug state and Boundary JTAG to work. |

### 64.6.8 SECUMOD Scrambling Key Register

**Name:** SECUMOD_SCRKEY
**Offset:** 0x0070
**Reset:** Undefined
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | SCRKEY[31:24] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | SCRKEY[23:16] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | SCRKEY[15:8] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SCRKEY[7:0] | | | | | | | |
| Access | W | W | W | W | W | W | W | W |
| Reset | | | | | | | | |

**Bits 31:0 – SCRKEY[31:0]** Scrambling Key Value
This 32-bit key is used by the secure memories scrambler/descrambler logics. When changed, the readable content of the memories is made unintelligible instantaneously.

### 64.6.9 SECUMOD RAM Access Rights Register

**Name:** SECUMOD_RAMACC
**Offset:** 0x0074
**Reset:** 0x00003FFFF
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

00: No access allowed

01: Only write access allowed

10: Only read access allowed

11: Read and write accesses allowed

Accessing a forbidden area causes an interrupt (SECURAM ID).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | RW5[1:0] | | RW4[1:0] | |
| Access | | | | | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|
| | RW3[1:0] | | RW2[1:0] | | RW1[1:0] | | RW0[1:0] | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

**Bits 11:10 – RW5[1:0]** Access right for RAM region [5 Kbytes; 6 Kbytes] (register bank BUREG256b)

**Bits 9:8 – RW4[1:0]** Access right for RAM region [4 Kbytes; 5 Kbytes]

**Bits 7:6 – RW3[1:0]** Access right for RAM region [3 Kbytes; 4 Kbytes]

**Bits 5:4 – RW2[1:0]** Access right for RAM region [2 Kbytes; 3 Kbytes]

**Bits 3:2 – RW1[1:0]** Access right for RAM region [1 Kbyte; 2 Kbytes]

**Bits 1:0 – RW0[1:0]** Access right for RAM region [0; 1 Kbyte]

### 64.6.10 SECUMOD RAM Access Rights Status Register

**Name:** SECUMOD_RAMACCSR
**Offset:** 0x0078
**Reset:** 0x00000000
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

00: No access violation occurred

01: Write access violation occurred

10: Read access violation occurred

11: Read and write access violation occurred

Writing any value to this register resets the register and the associated interrupt line (SECURAM ID).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |

# 65. Analog-to-Digital Controller (ADC)

## 65.1 Description

The ADC is based on a 12-bit Analog-to-Digital Converter (ADC) managed by an ADC Controller providing enhanced resolution up to 14 bits. See 65.3 Block Diagram. It also integrates a 12-to-1 analog multiplexer, making possible the analog-to-digital conversions of 12 analog lines. The conversions extend from 0V to the voltage carried on pin ADVREF.

Conversion results are reported in a common register for all channels, as well as in a channel-dedicated register.

The 13-bit and 14-bit resolution modes are obtained by averaging multiple samples to decrease quantization noise. For the 13-bit mode, 4 samples are used, which gives a real sample rate of 1/4 of the actual sample frequency. For the 14-bit mode, 16 samples are used, giving a real sample rate of 1/16 of the actual sample frequency. This arrangement allows conversion speed to be traded off against for better accuracy.

The software trigger, external trigger on rising edge of the ADTRG pin or internal triggers from Timer Counter output(s) are configurable.

The comparison circuitry allows automatic detection of values below a threshold, higher than a threshold, in a given range or outside the range, thresholds and ranges being fully configurable.

The ADC Controller internal fault output is directly connected to the PWM fault input. This input can be asserted by means of comparison circuitry to immediately put the PWM output in a safe state (pure combinational path).

The ADC also integrates a Sleep mode and a conversion sequencer and connects with a DMA channel. These features reduce both power consumption and processor intervention.

This ADC has a selectable single-ended or fully differential input.

This ADC Controller includes a Resistive Touchscreen Controller. It supports 4-wire and 5-wire technologies.

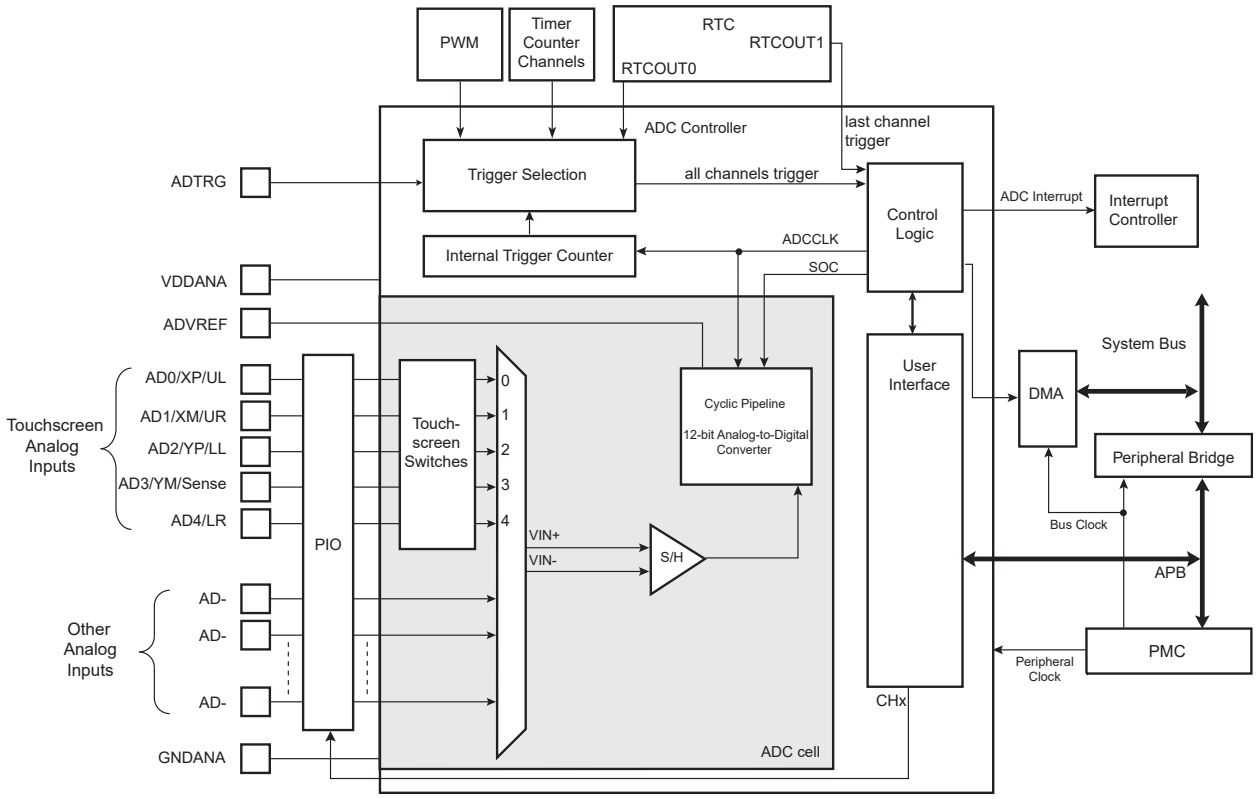
## 65.2 Embedded Characteristics

- 12-bit Resolution with Enhanced Mode up to 14 bits
- 1 Msps Conversion Rate
- Digital Averaging Function providing Enhanced Resolution Mode up to 14 bits
- Wide Range of Power Supply Operation
- Selectable Single-Ended or Differential Input Voltage
- Digital correction of offset and gain errors
- Resistive 4-wire and 5-wire Touchscreen Controller
  - Position and Pressure Measurement for 4-wire Screens
  - Position Measurement for 5-wire Screens
  - Average of Up to 8 Measures for Noise Filtering
- Programmable Pen Detection Sensitivity
- Integrated Multiplexer Offering Up to 12 Independent Analog Inputs

- Individual Enable and Disable of Each Channel
- Hardware or Software Trigger from:
  - External Trigger Pin
  - Timer Counter Outputs (Corresponding TIOA Trigger)
  - ADC Internal Trigger Counter
  - Trigger on Pen Contact Detection
  - PWM Event Line
- Drive of PWM Fault Input
- DMA Support
- Two Sleep Modes (Automatic Wakeup on Trigger)
  - Lowest Power Consumption (Voltage Reference OFF Between Conversions)
  - Fast Wakeup Time Response on Trigger Event (Voltage Reference ON Between Conversions)
- Channel Sequence Customizing
- Automatic Window Comparison of Converted Values
- Asynchronous Partial Wakeup (SleepWalking) on External Trigger
- Register Write Protection

## 65.3 Block Diagram

**Figure 65-1. Analog-to-Digital Converter Block Diagram**



## 65.4 Signal Description

**Table 65-1. ADC Pin Description**

| Pin Name | Description |
|---|---|
| VDDANA | Analog power supply |
| ADVREF | Reference voltage |
| AD0–AD11 | Analog input channels |
| ADTRG | External trigger |

## 65.5 Product Dependencies

### 65.5.1 Power Management

The ADC Controller is not continuously clocked. The programmer must first enable the ADC Controller peripheral clock in the Power Management Controller (PMC) before using the ADC Controller. However, if the application does not require ADC operations, the ADC Controller clock can be stopped when not needed and restarted when necessary. Configuring the ADC Controller does not require the ADC Controller clock to be enabled.

### 65.5.2 Interrupt Sources

The ADC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ADC interrupt requires the interrupt controller to be programmed first.

### 65.5.3 I/O Lines

The digital input ADTRG is multiplexed with digital functions on the I/O line and the selection of ADTRG is made using the PIO controller.

The ADC_ADx analog inputs are multiplexed with digital functions on the I/O lines. ADC_ADx inputs are selected as inputs of the ADCC when writing a one in the corresponding ADC_CHER.CHx bit and the digital functions are not selected.

### 65.5.4 Hardware Triggers

The ADC can use internal signals to start conversions. See the ADC_MR.TRGSEL field description in 65.7.2 ADC_MR for exact wiring of internal triggers.

### 65.5.5 Fault Output

The ADC Controller has the FAULT output connected to the FAULT input of PWM. See 65.6.18 Fault Event and section “Pulse Width Modulation Controller (PWM)”.

## 65.6 Functional Description

### 65.6.1 Analog-to-Digital Conversion

Once the programmed startup time (ADC_MR.STARTUP) has elapsed, ADC conversions are sequenced by three operating times:

- Tracking time—the time for the ADC to charge its input sampling capacitor to the input voltage. When several channels are converted consecutively, the inherent tracking time is 6 ADC clock

cycles. However, the tracking time can be increased using the TRACKTIM field in the Mode register (ADC_MR).

- ADC inherent conversion time—the time for the ADC to convert the sampled analog voltage. This time is constant and is defined from start of conversion to end of conversion.
- Channel conversion period—the effective time between the end of the current channel conversion and the end of the next channel conversion.

**Figure 65-2. Sequence of Consecutive ADC Conversions with TRACKTIM = 0**

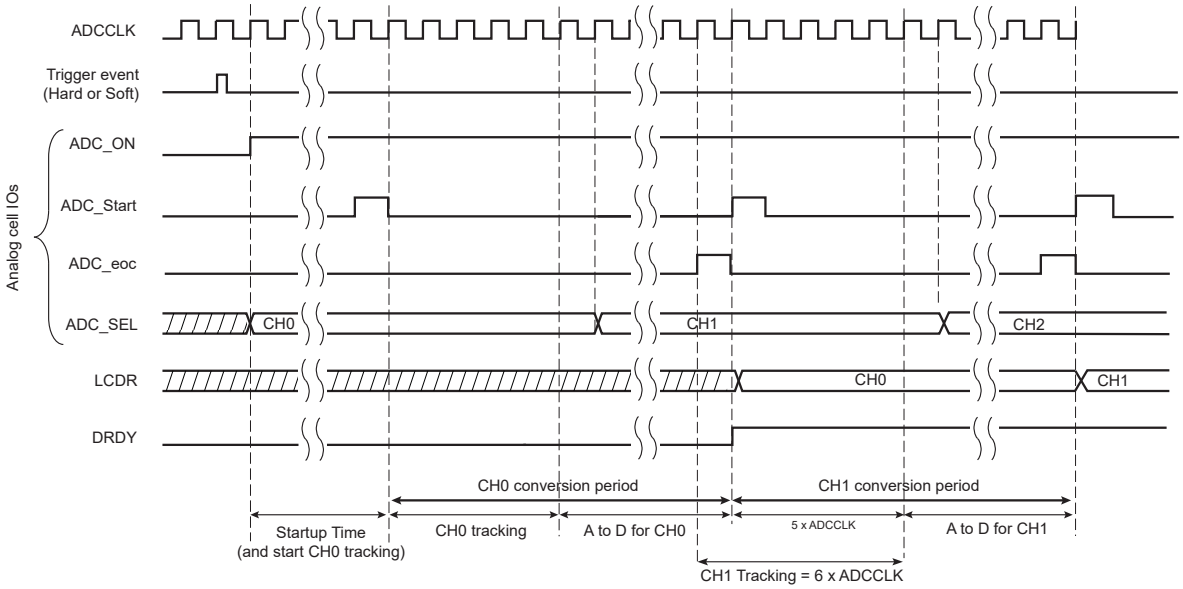


**Figure 65-3. Sequence of Consecutive ADC Conversions with TRACKTIM = 15**

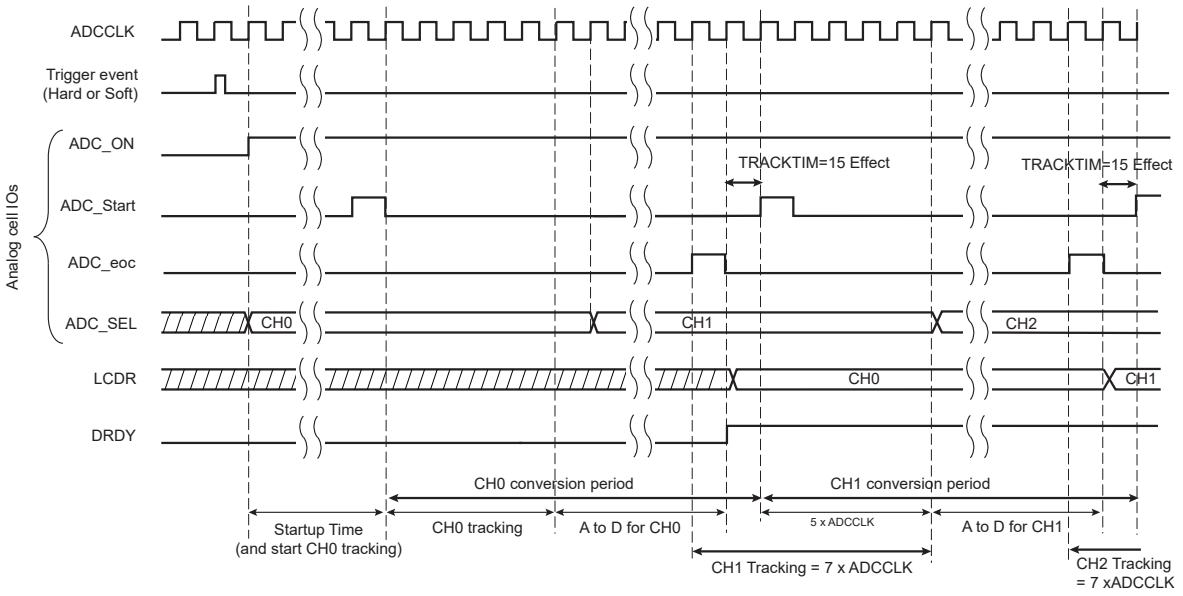


### 65.6.2 ADC Clock

The ADC uses the ADC clock (ADCCLK) to perform conversions. The ADC clock frequency is selected in the ADC_MR.PRESCAL.

To generate the ADC clock, the prescaler has two clock sources: the peripheral clock and the GCLK clock. This clock source is selected using the SRCCLK bit in the Extended Mode register (ADC_EMR).

If GCLK is selected as a source clock, the ADC clock frequency is independent of the processor/bus clock. At reset, the peripheral clock is selected.

If the ADC_EMR.SRCCLK bit is cleared, the prescaler clock (presc_clk) is driven by peripheral_clock. If the ADC_EMR.SRCCLK bit is set, the prescaler clock is driven by GCLK. The ADC clock frequency is between fpresc_clk/2, if PRESCAL is 0, and fpresc_clk/512, if PRESCAL is set to 255 (0xFF).

PRESCAL must be programmed to provide the ADC clock frequency parameter provided in the “Electrical Characteristics” section.

### 65.6.3 ADC Reference Voltage

The voltage reference input of the ADC is the ADVREF pin. Refer to the “Electrical Characteristics” section for further details.

### 65.6.4 Conversion Resolution

The ADC has a native resolution of 12 bits.

The ADC Controller provides enhanced resolution up to 14 bits by means of digital averaging.

If ADTRG is asynchronous to the ADC peripheral clock, the internal resynchronization introduces a jitter of 1 peripheral clock. This jitter may reduce the resolution of the converted signal.

The same applies when using the independent clock (ADC_MR.SRCCLK = 1), if the provided clock is asynchronous to ADC peripheral clock.

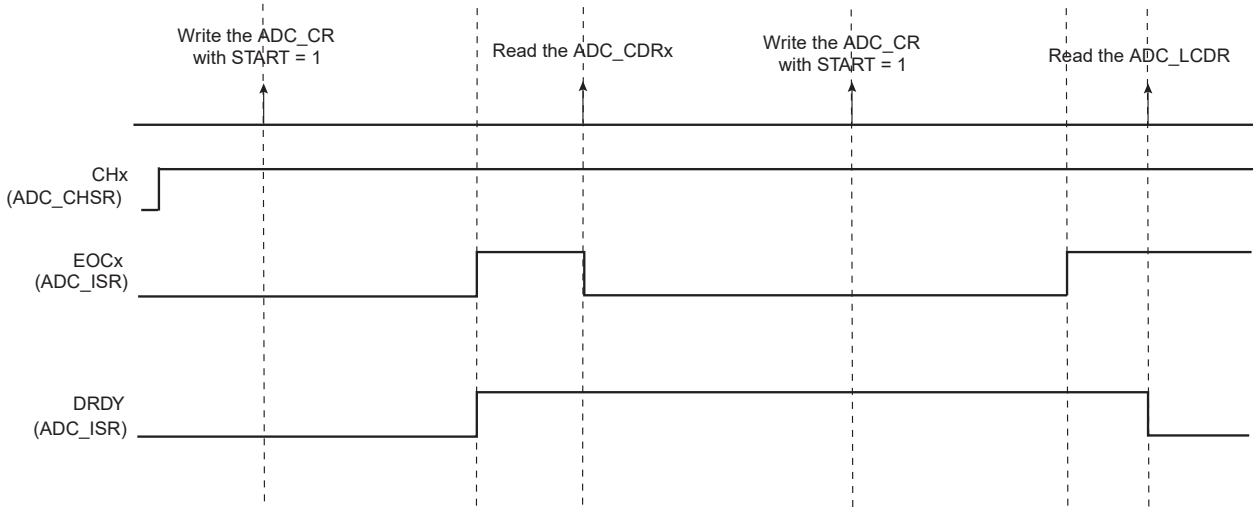
### 65.6.5 Conversion Results

When a conversion is completed, the resulting digital value is stored in the Channel Data register (ADC_CDRx) of the current channel and in the Last Converted Data register (ADC_LCDR). By setting the TAG option in ADC_EMR, ADC_LCDR presents the channel number associated with the last converted data in the CHNB field.

When a conversion is completed, the channel EOC bit and the DRDY bit in the Interrupt Status register (ADC_ISR) are set. In the case of a connected DMA channel, DRDY rising triggers a data request. In any case, either EOC and DRDY can trigger an interrupt.

Reading one of the ADC_CDRx clears the corresponding EOC bit. Reading ADC_LCDR clears the DRDY bit.

**Figure 65-4. EOCx and DRDY Flag Behavior**

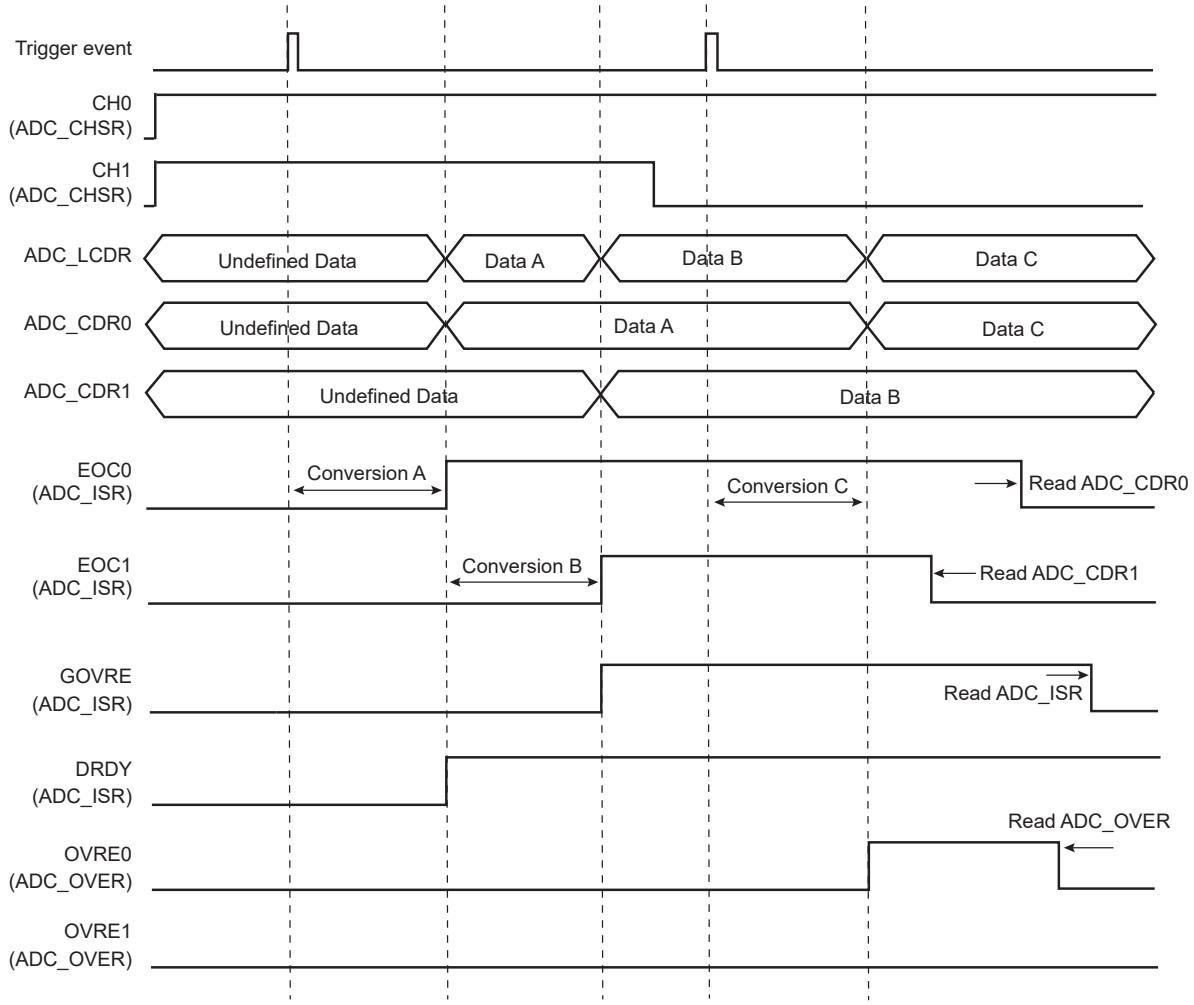


If ADC_CDR is not read before further incoming data is converted, the corresponding OVREx flag is set in the Overrun Status register (ADC_OVER).

If new data is converted when DRDY is high, the ADC_ISR.GOVRE bit is set.

The OVREx flag is automatically cleared when ADC_OVER is read, and the GOVRE flag is automatically cleared when ADC_ISR is read.

**Figure 65-5. EOCx, OVREx and GOVREx Flag Behavior**



**WARNING** If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC_ISR and OVREx flags in ADC_OVER are unpredictable.

### 65.6.6 Conversion Results Format

The conversion results can be signed (2's complement) or unsigned depending on the value of the ADC_EMR.SIGNMODE field.

If conversion results are signed and resolution is less than 16 bits, the sign is extended up to the bit 15 (e.g., 0xF43 for 12-bit resolution is read as 0xFF43, and 0x467 is read as 0x0467).

### 65.6.7 Conversion Triggers

Conversions of the active analog channels are started with a software or hardware trigger. The software trigger is provided by writing the Control register (ADC_CR) with the START bit at 1.

The list of external/internal events is provided in 65.7.2 ADC_MR. The hardware trigger is selected using the ADC_MR.TRGSEL field. The selected hardware trigger is enabled if TRGMOD = 1, 2 or 3 in the Trigger register (ADC_TRGR).

The ADC also provides a dual trigger mode (ADC_LCTMR.DUALTRIG = 1) in which the higher index channel can be sampled at a rhythm different from the other channels. The trigger of the last channel is generated by the RTC. See 65.6.12 Last Channel Specific Measurement Trigger.

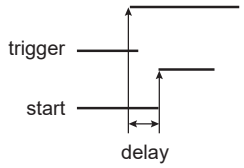
The ADC_TRGR.TRGMOD field selects the hardware trigger from the following:

- any edge, either rising or falling or both, detected on the external trigger pin ADTRG
- the Pen Detect, depending on how the PENDET bit is set in the Touchscreen Mode register (ADC_TSMR)
- a continuous trigger, meaning the ADC Controller restarts the next sequence as soon as it finishes the current one
- a periodic trigger, which is defined by programming the ADC_TRGR.TRGPER field

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence according to configuration of registers ADC_MR, ADC_CHSR, ADC_SEQRx, and ADC_TSMR.

If a hardware trigger is selected, the start of a conversion is triggered after a delay starting at each rising edge of the selected signal. Due to asynchronous handling, the delay may vary in a range of two peripheral clock periods to one ADC clock period. This delay introduces sampling jitter in the A/D conversion process and may therefore degrade the conversion performance (e.g., SNR, THD).

**Figure 65-6. Hardware Trigger Delay**



If one of the TIOA outputs is selected, the corresponding Timer Counter channel must be programmed in Waveform mode.

Only one start command is necessary to initiate a conversion sequence on all the channels. The ADC hardware logic automatically performs the conversions on the active channels, then waits for a new request. The Channel Enable (ADC_CHER) and Channel Disable (ADC_CHDR) registers enable the analog channels to be enabled or disabled independently.

If the ADC is used with a DMA, only the transfers of converted data from enabled channels are performed and the resulting data buffers should be interpreted accordingly.

### 65.6.8 Sleep Mode and Conversion Sequencer

The ADC Sleep mode maximizes power saving by automatically deactivating the ADC when it is not being used for conversions. Sleep mode is selected by setting the ADC_MR.SLEEP bit.

Sleep mode is managed by a conversion sequencer, which automatically processes the conversions of all channels at lowest power consumption.

This mode can be used when the minimum period of time between two successive trigger events is greater than the startup period of the ADC. Refer to section “Electrical Characteristics”.

When a start conversion request occurs, the ADC is automatically activated. As the analog cell requires a startup time, the logic waits during this time and starts the conversion on the enabled channels. When all conversions are complete, the ADC is deactivated until the next trigger. Events triggered during the sequence are ignored.

The conversion sequencer allows automatic processing with minimum processor intervention and optimized power consumption. Conversion sequences can be performed periodically using the internal timer (ADC_TRGR) or the PWM event line. The periodic acquisition of several samples can be processed automatically without any intervention of the processor via the DMA.

The sequence can be customized by programming the Sequence Channel registers ADC_SEQR1 and ADC_SEQR2 and setting the USEQ bit of the Mode register (ADC_MR). The user can choose a specific order of channels and can program up to 12 conversions by sequence. The user is free to create a personal sequence by writing channel numbers in ADC_SEQR1 and ADC_SEQR2. Not only can channel numbers be written in any sequence, channel numbers can be repeated several times. When the ADC_MR.USEQ bit is set, the ADC_SEQR1.USCHx and ADC_SEQR2.USCHx fields are used to define the sequence. Only enabled USCHx fields will be part of the sequence. Each USCHx field has a corresponding enable, CHx-1, in ADC_CHER.

If all ADC channels (i.e., 12) are used on an application board, there is no restriction of usage of the user sequence. However, if some ADC channels are not enabled for conversion but rather used as pure digital inputs, the respective indexes of these channels cannot be used in the user sequence fields (see ADC_SEQRx). For example, if channel 4 is disabled (ADC_CHSR[4] = 0), ADC_SEQRx fields USCH1 up to USCH12 must not contain the value 4. Thus the length of the user sequence may be limited by this behavior.

As an example, if only four channels over 12 (CH0 up to CH3) are selected for ADC conversions, the user sequence length cannot exceed four channels. Each trigger event may launch up to four successive conversions of any combination of channels 0 up to 3 but no more (i.e., in this case the sequence CH0, CH0, CH1, CH1, CH1 is impossible).

A sequence that repeats the same channel several times requires more enabled channels than channels actually used for conversion. For example, the sequence CH0, CH0, CH1, CH1 requires four enabled channels (four free channels on application boards) whereas only CH0, CH1 are really converted.

**Note:** The reference voltage pins always remain connected in Normal mode as in Sleep mode.

### 65.6.9 Comparison Window

The ADC Controller features automatic comparison functions. It compares converted values to a low threshold, a high threshold or both, depending on the value of the ADC_EMR.CMPMODE field. The comparison can be done on all channels or only on the channel specified in the ADC_EMR.CMPSEL field. To compare all channels, the ADC_EMR.CMPALL bit must be set.

If set, the ADC_EMR.CMPTYPE bit can be used to discard all conversion results that do not match the comparison conditions. Once a conversion result matches the comparison conditions, all the subsequent conversion results are stored in ADC_LCDR (even if these results do not meet the comparison conditions). Setting the ADC_CR.CMPRST bit immediately stops the conversion result storage until the next comparison match.

If the ADC_EMR.CMPTYPE bit is cleared, all conversions are stored in ADC_LCDR. Only the conversions that match the comparison conditions trigger the ADC_ISR.COMPE flag.

Moreover, a filtering option can be set by writing the number of consecutive comparison matches needed to raise the flag. This number can be written and read in the ADC_EMR.CMPFILTER field. The filtering option is dedicated to reinforcing the detection of an analog signal overpassing a predefined threshold. The filter is cleared as soon as ADC_ISR is read, so this filtering function must be used with peripheral DMA controller and works only when using Interrupt mode (no polling).

The flag can be read on the ADC_ISR.COMPE bit and can trigger an interrupt.

The high threshold and the low threshold can be read/write in the Compare Window register (ADC_CWR).

Depending on the sign of the conversion, chosen with the ADC_EMR.SIGNMODE field, the high threshold and low threshold values must be signed or unsigned to maintain consistency during the comparison. If the conversion is signed, both thresholds must also be signed; if the conversion is unsigned, both thresholds must be unsigned. If comparison occurs on all channels, the ADC_EMR.SIGNMODE field must be set to ALL_UNSIGNED or ALL_SIGNED and the thresholds must be set accordingly.

### 65.6.10 Differential and Single-ended Input Modes

#### 65.6.10.1 Input-output Transfer Functions

The ADC can be configured to operate in the following input voltage modes:

- Single-ended—ADC_COR.DIFFx = 0. This is the default mode after a reset.
- Differential—ADC_COR.DIFFx = 1 (see figure below). In Differential mode, the ADC requires differential input signals having a VDD/2 common mode voltage (refer to section “Electrical Characteristics”).
- The following equations give the unsigned ADC input-output transfer function in each mode(1). With signed conversions (see field ADC_EMR.SIGNMODE), subtract 2047 from the ADC_LCDR.DATA value given below.

Single-ended mode:

$$\text{ADC_LCDR.LDATA} = \frac{\text{ADx} - \text{GNDANA}}{\text{ADVREF} - \text{GNDANA}} \times 2^{12}$$

Differential mode:

$$\text{ADC_LCDR.LDATA} = \left(1 + \frac{\text{ADx} - \text{ADx+1}}{\text{ADVREF} - \text{GNDANA}}\right) \times 2^{11}$$

Note: 1. Equations assume ADC_EMR.OSR = 1

If the ADC_MR.ANACH bit is set, the ADC can manage both differential channels and single-ended channels. If the ADC_MR.ANACH bit is cleared, the parameters defined in ADC_COR are applied to all channels.

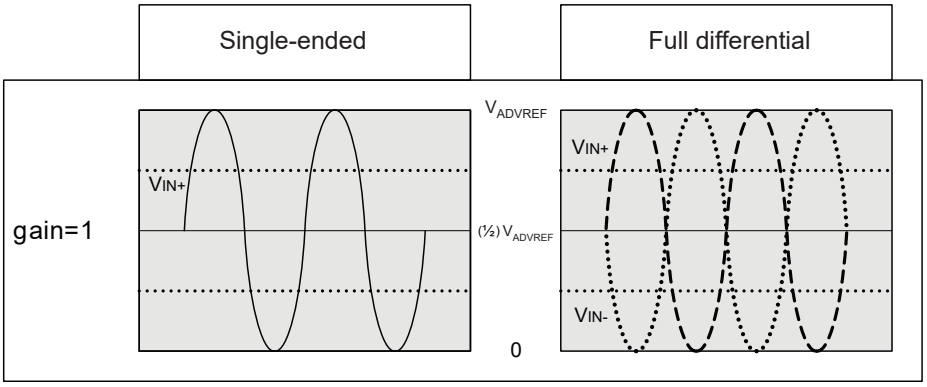
The following table gives s the internal positive and negative ADC inputs assignment with respect to the programmed mode (ADC_COR.DIFFx).

For example, if Differential mode is required on channel 0, input pins AD0 and AD1 are used. In this case, only channel 0 must be enabled by writing a 1 to ADC_CHER.CH0.

**Table 65-2. Input Pins and Channel Numbers**

| Input Pin | Channel Number | |
|---|---|---|
| | Single-ended Mode | Differential Mode |
| AD0 | CH0 | CH0 |
| AD1 | CH1 | |
| AD2 | CH2 | CH2 |
| AD3 | CH3 | |
| AD4 | CH4 | CH4 |
| AD5 | CH5 | |
| AD6 | CH6 | CH6 |
| AD7 | CH7 | |
| AD8 | CH8 | CH8 |
| AD9 | CH9 | |
| AD10 | CH10 | CH10 |
| AD11 | CH11 | |

**Figure 65-7. Analog Full Scale Ranges in Single-Ended/Differential Applications**



### 65.6.11 ADC Timings

The ADC startup time is programmed through the ADC_MR.STARTUP field. Refer to the “Electrical Characteristics” section.

The ADC Controller provides an inherent tracking time of six ADC clock cycles.

A minimal tracking time is necessary for the ADC to guarantee the best converted final value between two conversions. The tracking time can be adjusted to accommodate a range of source impedances. If more than six ADC clock cycles are required, the tracking time can be increased using the ADC_MR.TRACKTIM field.

**WARNING** No input buffer amplifier to isolate the source is included in the ADC. Refer to the “Electrical Characteristics” section.

### 65.6.12 Last Channel Specific Measurement Trigger

The last channel (higher index available) embeds a specific mode allowing a measurement trigger period which differs from other active channels. This allows efficient management of the conversions especially if the channel is driven by a device with a variation of a different frequency from other converted channels (for example, but not limited to, temperature sensor).

The last channel can be sampled in different ways through the ADC Controller. The different methods of sampling depend on the ADC_TRGR.TRGMOD configuration field and on the ADC_CHSR.CH11 bit.

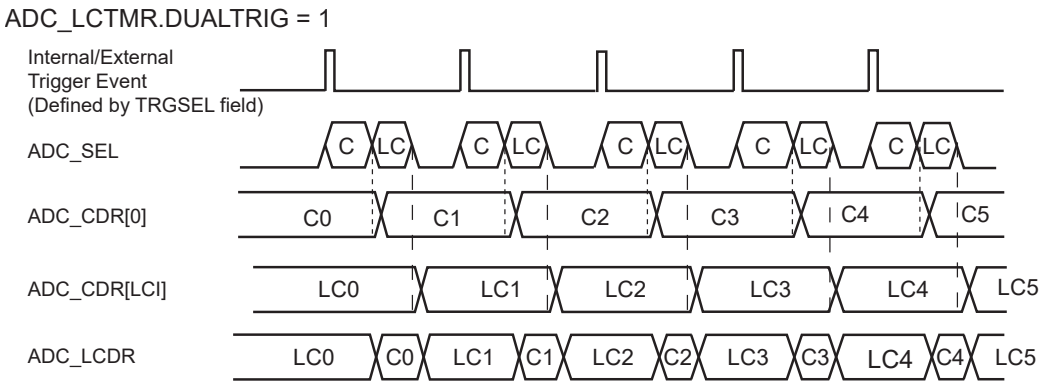
The last channel conversion can be triggered like the other channels by enabling the ADC_CHER.CH11 bit.

The manual start can only be performed if field TRGMOD = 0. When the ADC_CR.START bit is set, the last channel conversion is scheduled together with the other enabled channels (if any). The result of the conversion is placed in the ADC_CDR11 register, and the associated ADC_ISR.EOC11 flag is set.

If the last channel is enabled in the Channel Status register (ADC_CHSR), ADC_LCTMR.DUALTRIG is cleared and field TRGMOD = 1, 2, 3, 5, the last channel is periodically converted together with the other enabled channels and the result is placed in the ADC_LCDR and ADC_CDR11 registers. Thus the last channel conversion result is part of the DMA Controller buffer (see the following figure).

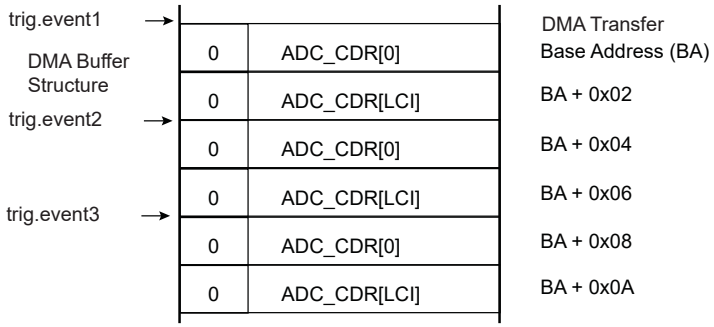
When the conversion result matches the conditions defined in ADC_LCTMR and ADC_LCCWR, the ADC_ISR.LCCHG flag is set.

**Figure 65-8. Same Trigger for All Channels (ADC_CHSR[LCI] = 1 and ADC_TRGR.TRGMOD = 1, 2, 3, 5)**



Notes: ADC_SEL: Command to the ADC analog cell
Cx: All ADC channel values except the last channel (highest index)
LCx: Last channel value
LCI: Last channel index

Assuming ADC_CHSR[0] = 1 and ADC_CHSR[LCI] = 1



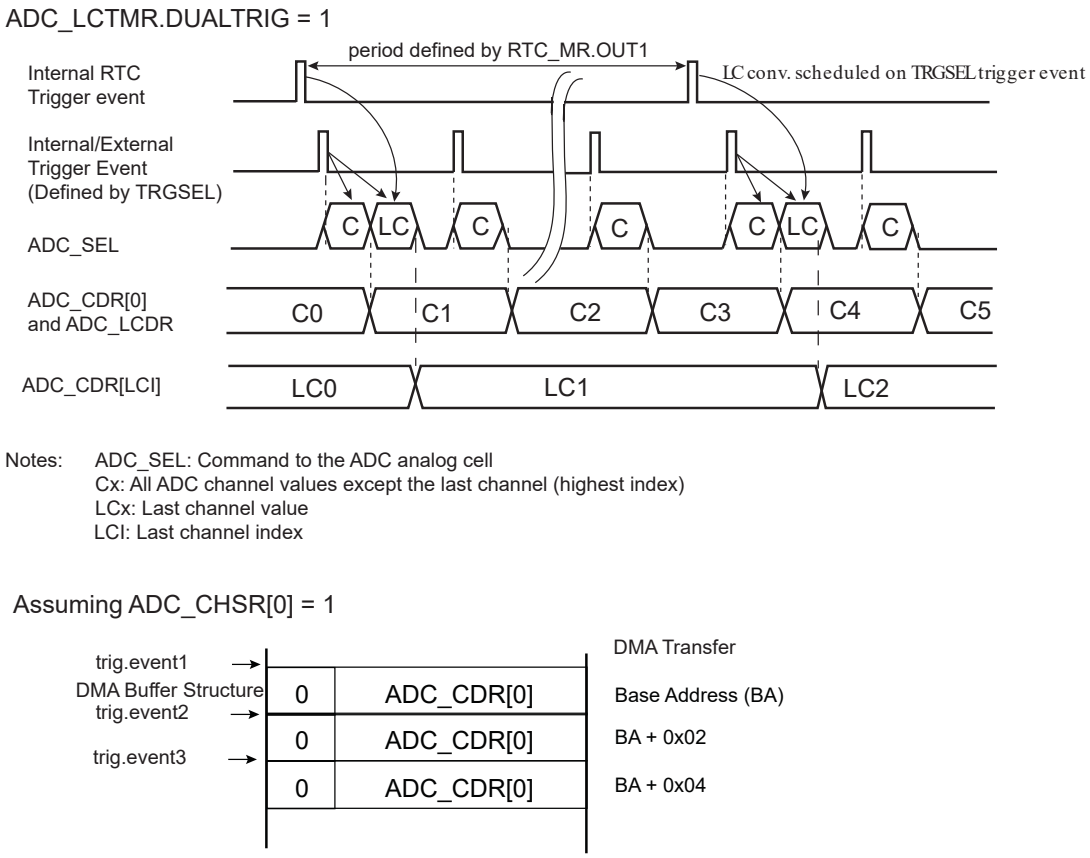
If the last channel is driven by a device with a slower variation compared to other channels (temperature sensor for example), the channel can be enabled/disabled at any time. However, this may not be optimal for downstream processing.

The ADC Controller allows a different way of triggering the measurement when DUALTRIG is set in the Last Channel Trigger Mode register (ADC_LCTMR) but CH11 is not set in ADC_CHSR.

Under these conditions, the last channel conversion is triggered with a period defined by the OUT1 field in the RTC_MR (Real-time Clock Mode register) while other channels are still active. OUT1 configures an internal trigger generated by the RTC, totally independent of the internal/external triggers. The RTC event will be processed on the next internal/external trigger event as shown in the following figure. The internal/external trigger for other channels is selected through the ADC_MR.TRGSEL field.

When DUALTRIG = 1, the result of each conversion of channel 11 is only uploaded in the ADC_CDR11 register and not in ADC_LCDR (see the following figure). Therefore, there is no change in the structure of the peripheral DMA controller buffer due to the conversion of the last channel: only the enabled channels are kept in the buffer. The end of conversion of the last channel is reported by the ADC_ISR.EOC11 flag.

**Figure 65-9. Independent Trigger Measurement for Last Channel (ADC_CHSR[LCI] = 0 and ADC_TRGR.TRGMOD = 1, 2, 3, 5)**

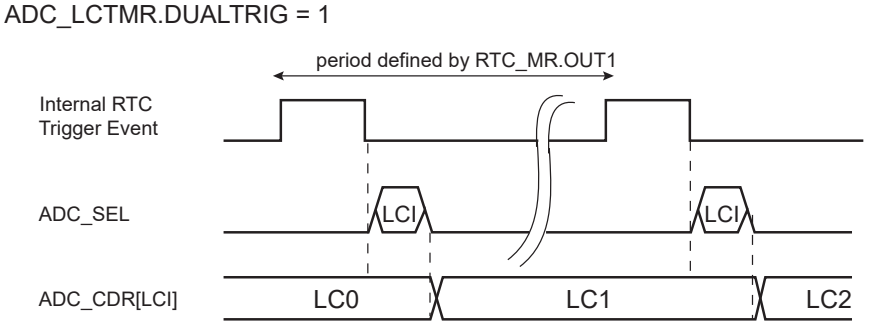


Notes: ADC_SEL: Command to the ADC analog cell
Cx: All ADC channel values except the last channel (highest index)
LCx: Last channel value
LCI: Last channel index

If DUALTRIG = 1 and field ADC_TRGR.TRGMOD = 0 and none of the channels are enabled in ADC_CHSR (ADC_CHSR = 0), then only channel 11 is converted at a rate defined by the trigger event signal that can be configured in RTC_MR.OUT1 (see the following figure).

This mode of operation, when combined with the Sleep mode operation of the ADC Controller, provides a low-power mode for last channel measure. This assumes there is no other ADC conversion to schedule at a high sampling rate or no other channel to convert.

**Figure 65-10. Only Last Channel Measurement Triggered at Low Speed (ADC_CHSR[LCI] = 0 and ADC_TRGR.TRGMOD = 0)**



Notes: ADC_SEL: Command to the ADC analog cell
LCx: Last channel value
LCI: Last channel index

### 65.6.13 Enhanced Resolution Mode and Digital Averaging Function

#### 65.6.13.1 Enhanced Resolution Mode

The Enhanced Resolution mode is enabled if the OSR field is configured to 1 or 2 in ADC_EMR. The enhancement is based on a digital averaging function.

There is no averaging on the last index channel if the measure is triggered by an RTC event.

In this mode, the ADC Controller will trade off conversion speed against accuracy by averaging multiple samples, thus providing a digital low-pass filter function.

The selected oversampling ratio applies to all enabled channels when triggered by an RTC event.

$$\text{ADC_LCDR.LDATA} = \frac{1}{M} \times \sum_{k=0}^{k=N-1} \text{ADC}(k)$$

where N and M are given in the table below.

**Table 65-3. Digital Averaging Function Configuration versus OSR Values**

| ADC_EMR.OSR Value | ADC_LCDR.LDATA Length | N Value | M Value | Full Scale Value | Maximum Value |
|---|---|---|---|---|---|
| 0 | 12 bits | 1 | 1 | 4095 | 4095 |
| 1 | 13 bits | 4 | 2 | 8191 | 8190 |
| 2 | 14 bits | 16 | 4 | 16383 | 16381 |

The average result is valid in ADC_CDRx (x corresponds to the index of the channel) only if the ADC_ISR.EOCn flag is set and if the ADC_OVER.OVREn flag is cleared. The average result for all channels is valid in ADC_LCDR only if the ADC_ISR.DRDY bit is set and the ADC_ISR.GOVRE bit is cleared.

Note that ADC_CDRs are not buffered. Therefore, when an averaging sequence is ongoing, the value in these registers changes after each averaging sample. However, overrun flags in ADC_OVER rise as soon as the first sample of an averaging sequence is received. Thus the previous averaged value is not read, even if the new averaged value is not ready.

Consequently, when an overrun flag rises in ADC_OVER, it means that the previous unread data is lost but it does not mean that this data has been overwritten by the new averaged value as the averaging sequence concerning this channel can still be ongoing.

When an oversampling is performed, the maximum value that can be read on ADC_CDRx or ADC_LCDR is not the full-scale value, even if the maximum voltage is supplied on the analog input. See table above.

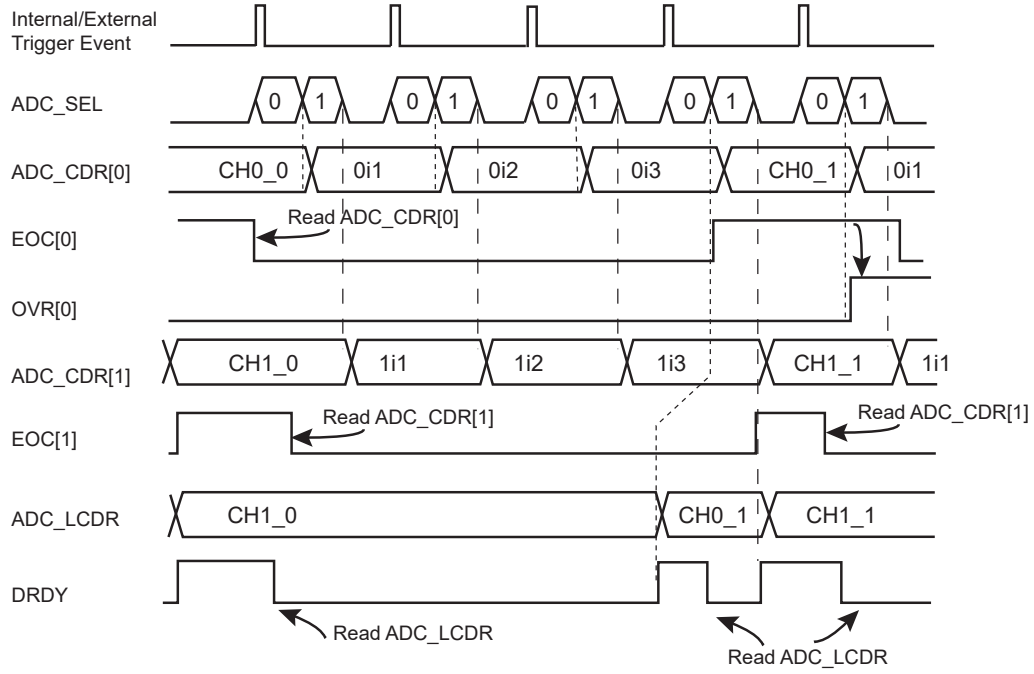
#### 65.6.13.2 Averaging Function versus Trigger Events

The samples can be defined in different ways for the averaging function depending on the configuration of the ADC_EMR.ASTE bit and the ADC_MR.USEQ bit.

When USEQ = 0, there are two possible ways to generate the averaging through the trigger event. If ADC_EMR.ASTE = 0, every trigger event generates one sample for each enabled channel, as described in the following figure. Therefore, four trigger events are required to obtain the result of averaging if OSR = 1.

**Figure 65-11. Digital Averaging Function Waveforms Over Multiple Trigger Events**

ADC_EMR.OSR = 1, ASTE = 0, ADC_CHSR[1:0] = 0x3 and ADC_MR.USEQ = 0

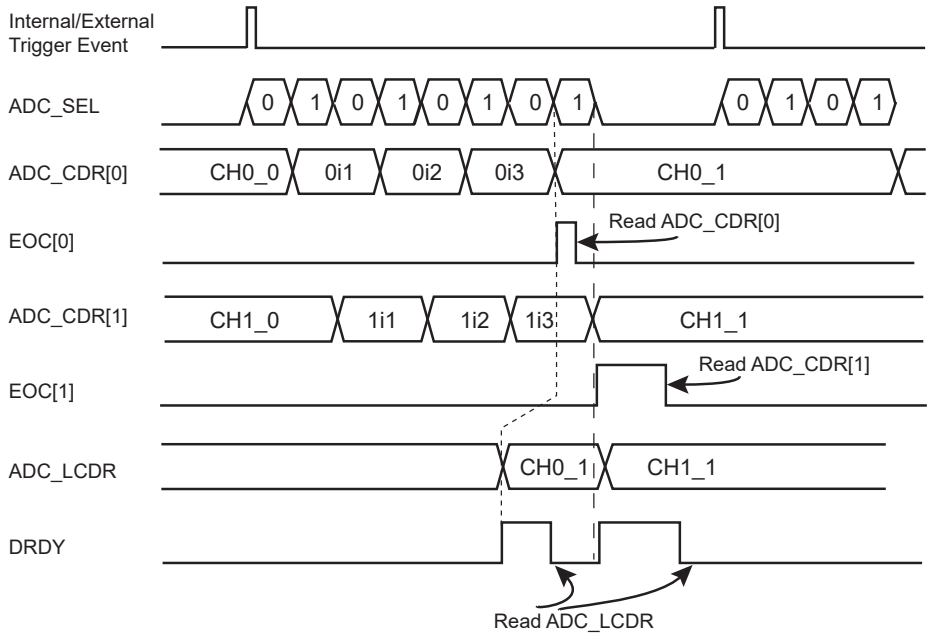


Note: ADC_SEL: Command to the ADC analog cell
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0_0, CH0_1, CH1_0 and CH1_1 are final results of average function.

If ADC_EMR.ASTE = 1 and ADC_MR.USEQ = 0, the sequence to be converted, defined in ADC_CHSR, is automatically repeated n times (where n corresponds to the oversampling ratio defined in the ADC_EMR.OSR field). As a result, only one trigger is required to obtain the result of the averaging function as described in the following figure.

**Figure 65-12. Digital Averaging Function Waveforms on a Single Trigger Event**

ADC_EMR.OSR = 1, ASTE = 1, ADC_CHSR[1:0] = 0x3 and ADC_MR.USEQ = 0



Note: ADC_SEL: Command to the ADC analog cell
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0_0, CH0_1, CH1_0 and CH1_1 are final results of average function.

When USEQ = 1, the user can define the channel sequence to be converted by configuring ADC_SEQRx and ADC_CHER so that channels are not interleaved during the averaging period. Under these conditions, a sample is defined for each end of conversion as described in the figure below.

When USEQ = 1 and ASTE = 1, OSR can be only configured to 1. Up to three channels can be converted in this mode. The averaging result will be placed in the corresponding ADC_CDRx and in ADC_LCDR for each trigger event. The ADC real sample rate remains the maximum ADC sample rate divided by 4.

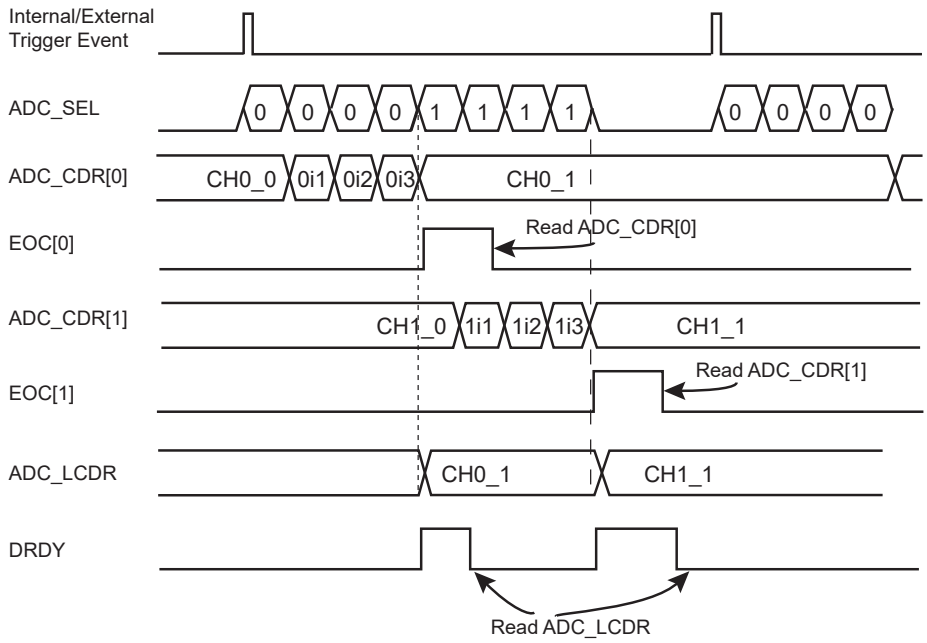
It is important that the user sequence follows a specific pattern. The user sequence must be programmed in such a way that it generates a stream of conversion, where a same channel is successively converted.

**Table 65-4. Example Sequence Configurations (USEQ = 1, ASTE = 1, OSR = 1)**

| Register | Number of Channels Non-interleaved Averaging - Register Value | | |
|---|---|---|---|
| | 1 (e.g., CH0) | 2 (e.g., CH0, CH1) | 3 (e.g., CH0, CH1, CH2) |
| ADC_CHSR | 0x0000_000F | 0x0000_00FF | 0x0000_0FFF |
| ADC_SEQR1 | 0x0000_0000 | 0x1111_0000 | 0x1111_0000 |
| ADC_SEQR2 | 0x0000_0000 | 0x0000_0000 | 0x0000_2222 |

**Figure 65-13. Digital Averaging Function Waveforms on a Single Trigger Event, Non-interleaved**

ADC_EMR.OSR = 1, ASTE = 1, ADC_CHSR[7:0] = 0xFF and ADC_MR.USEQ = 1
ADC_SEQR1 = 0x1111_0000



Note: ADC_SEL: Command to the ADC analog cell
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0_0, CH0_1, CH1_0 and CH1_1 are final results of average function.

### 65.6.14 Automatic Error Correction

The ADC features automatic error correction of conversion results. Offset and gain error corrections are available. The correction can be enabled for each channel and correction values (offset and gain) are the same for all channels.

To enable error correction, the corresponding ECORRx bit must be set in the Channel Error Correction register (ADC_CECR). The offset and gain values used to compensate the results are the same for all correction-enabled channels and programmed in the Correction Values register (ADC_CVR).

The error correction for channels used with the touchscreen is available in the ADC Touchscreen Correction Values register (ADC_TSCVR).

The ADC_EMR.ADCMODE field is used to configure a running mode of the ADC Normal mode, Offset Error mode, or Gain Error mode (see 65.7.16 ADC_EMR). ADCMODE uses 3 internal references to be measured and to extract the offset and gain error from 3 point-measurement codes. If some references already exist on the final application connected to some input channel ADx, they can be used as a replacement of the ADCMODE to generate the 2 or 3 points of calibration and used to extract the GAINCORR and OFFSETCORR.

After a reset, the running mode of the ADC is Normal mode. Offset Error mode and Gain Error mode are used to determine values of offset compensation and gain compensation, respectively, to apply to conversion results. The table below provides formulas to obtain the compensation values, with:

- OFFSETCORR—the Offset Correction value. OFFSETCORR is a signed value.
- GAINCORR—the Gain Correction value
- GCi—the intermediate Gain Compensation value

- Gs—the value 13
- ConvValue—the value converted by the ADC (as returned in ADC_LCDR or ADC_CDR)
- Resolution—the resolution used to process the conversion (either RESOLUTION, RESOLUTION+1 or RESOLUTION+2).

**Table 65-5. ADC Running Modes**

| ADC_EMR.ADCMODE | Mode | Description |
|---|---|---|
| 0 | Normal | Normal mode of operation to perform conversions |
| 1 | Offset Error | For unsigned conversions: OFFSETCORR = ConvValue – $2^{(\text{Resolution}} - 1)$ |
| | | For signed conversions: OFFSETCORR = ConvValue |
| 2 | Gain Error | GCi = ConvValue |
| 3 | | $\text{GAINCORR} = \frac{3584}{\text{GCi} - \text{ConvValue}} \times 2^{(\text{Gs})}$ |

The final conversion result after error correction is obtained using the following formula:

$$\text{Corrected Data} = (\text{Converted Data} + \text{OFFSETCORR}) \times \frac{\text{GAINCORR}}{2^{(\text{Gs})}}$$

### 65.6.15 Touchscreen

#### 65.6.15.1 Touchscreen Mode

The ADC_TSMR.TSMODE parameter is used to enable/disable the touchscreen functionality, to select the type of screen (4-wire or 5-wire) and, in the case of a 4-wire screen, to activate (or not) the pressure measurement.

In 4-wire mode, channels 0, 1, 2 and 3 must not be used for classic ADC conversions. Likewise, in 5-wire mode, channels 0, 1, 2, 3, and 4 must not be used for classic ADC conversions.

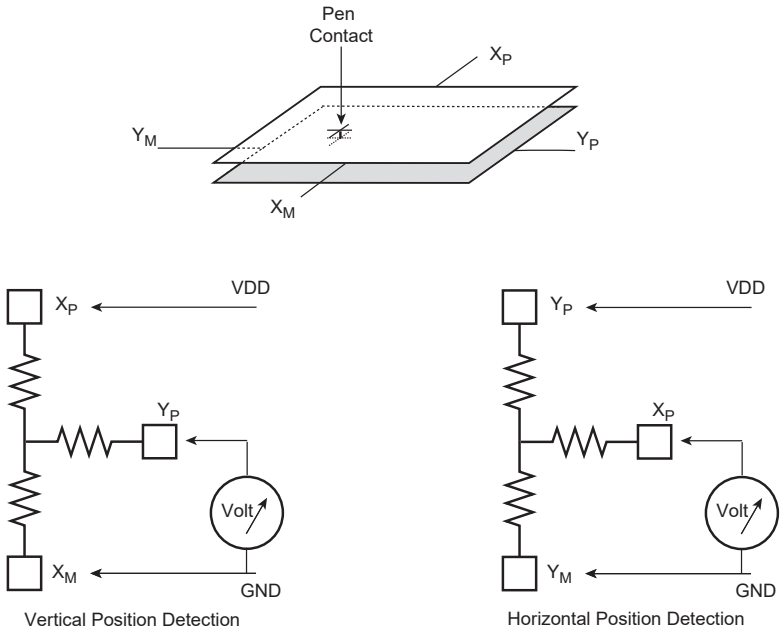
#### 65.6.15.2 4-wire Resistive Touchscreen Principles

A resistive touchscreen is based on two resistive films, each one being fitted with a pair of electrodes, placed at the top and bottom on one film, and on the right and left on the other. In between, there is a layer acting as an insulator, but also enables contact when you press the screen. This is illustrated in the following figure.

The ADC Controller can perform the following tasks without external components:

- position measurement
- pressure measurement
- pen detection

**Figure 65-14. Touchscreen Position Measurement**



#### 65.6.15.3 4-wire Position Measurement Method

As shown in the above figure, to detect the position of a contact, a supply is first applied from top to bottom. Due to the linear resistance of the film, there is a voltage gradient from top to bottom. When a contact is performed on the screen, the voltage propagates at the point the two surfaces come into contact. If the input impedance on the right and left electrodes is high enough, the film intrinsic resistor does not affect this voltage.

For the horizontal direction, the same method is used, but by applying supply from left to right. The range depends on the supply voltage and on the loss in the switches that connect to the top and bottom electrodes.

In an ideal world (linear, with no loss through switches), the horizontal position is equal to:

$VY_M$ / VDD or $VY_P$ / VDD.

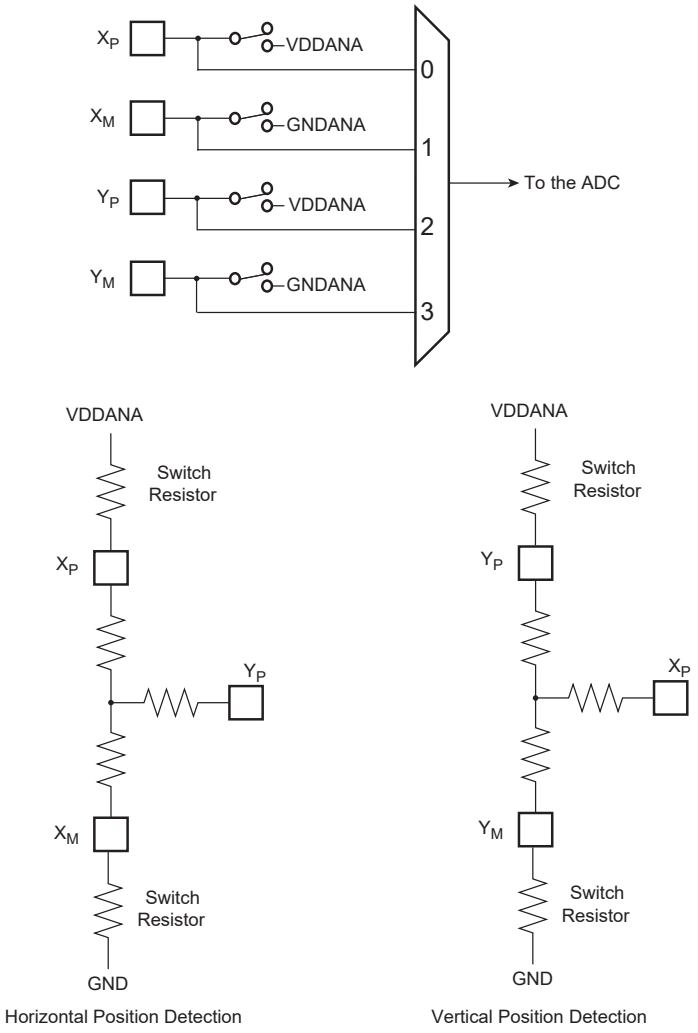
The implementation with on-chip power switches is shown in the figure below. The voltage measurement at the output of the switch compensates for the switches loss.

It is possible to correct for switch loss by performing the operation:

[$VY_P$ - $VX_M$] / [$VX_P$ - $VX_M$].

This requires additional measurements, as shown in the figure below.

**Figure 65-15. Touchscreen Switches Implementation**



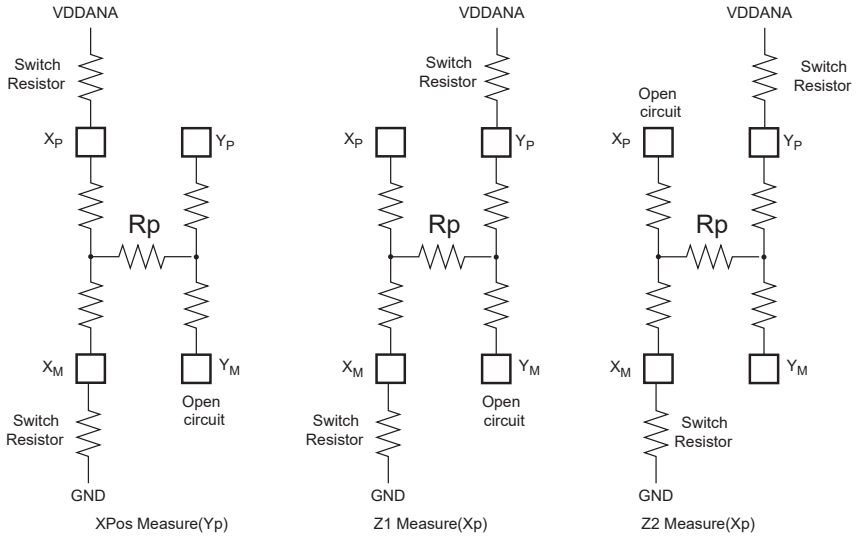
#### 65.6.15.4 4-wire Pressure Measurement Method

The method to measure the pressure (Rp) applied to the touchscreen is based on the known resistance of the X-Panel resistance (Rxp).

Three conversions (Xpos,Z1,Z2) are necessary to determine the value of Rp (Zaxis resistance).

$Rp = Rxp \times (Xpos/1024) \times [(Z2/Z1)-1]$

**Figure 65-16. Pressure Measurement**



### 65.6.15.5 5-wire Resistive Touchscreen Principles

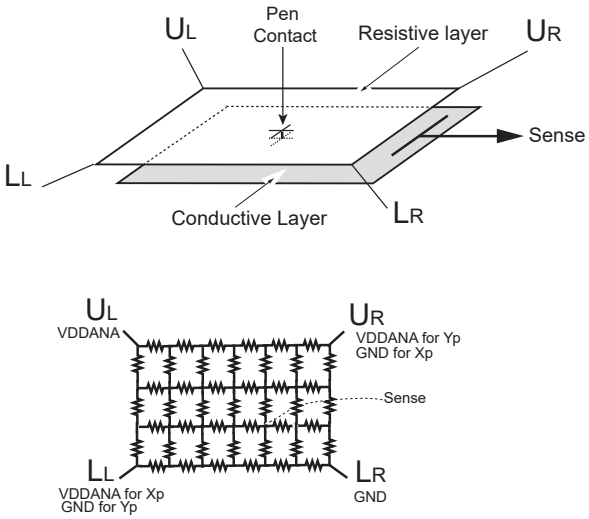
To make a 5-wire touchscreen, a resistive layer with a contact point at each corner and a conductive layer are used.

The 5-wire touchscreen differs from the 4-wire type mainly in that the voltage gradient is applied only to one layer, the resistive layer, while the other layer is the sense layer for both measurements.

The measurement of the X position is obtained by biasing the upper left corner and lower left corner to VDDANA and the upper right corner and lower right to ground.

To measure along the Y axis, bias the upper left corner and upper right corner to VDDANA and bias the lower left corner and lower right corner to ground.

**Figure 65-17. 5-Wire Principle**



### 65.6.15.6 5-wire Position Measurement Method

In an application only monitoring clicks, 100 points per second is typically needed. For handwriting or motion detection, the number of measurements to consider is approximately 200 points per second. This must take into account that multiple measurements are included (over sampling, filtering) to compute the correct point.

The 5-wire touchscreen panel works by applying a voltage at the corners of the resistive layer and measuring the vertical or horizontal resistive network with the sense input. The ADC converts the voltage measured at the point the panel is touched.

A measurement of the Y position of the pointing device is made by:

- Connecting Upper left (UL) and upper right (UR) corners to VDDANA
- Connecting Lower left (LL) and lower right (LR) corners to ground.

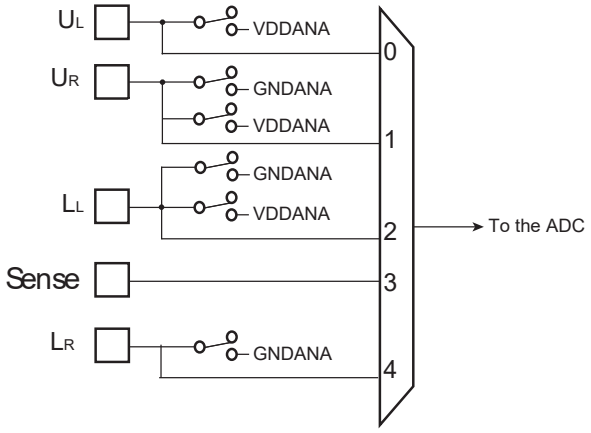
The voltage measured is determined by the voltage divider developed at the point of touch (Y position) and the SENSE input is converted by ADC.

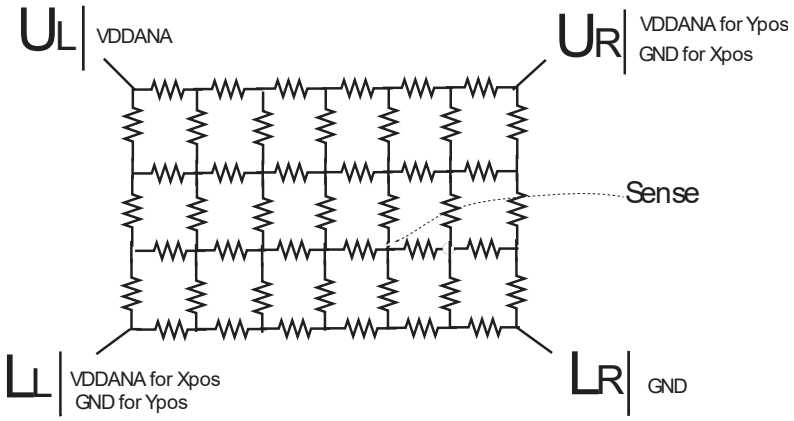
A measurement of the X position of the pointing device is made by:

- Connecting the upper left (UL) and lower left (LL) corners to ground
- Connecting the upper right and lower right corners to VDDANA.

The voltage measured is determined by the voltage divider developed at the point of touch (X position) and the SENSE input is converted by ADC.

**Figure 65-18. Touchscreen Switches Implementation**





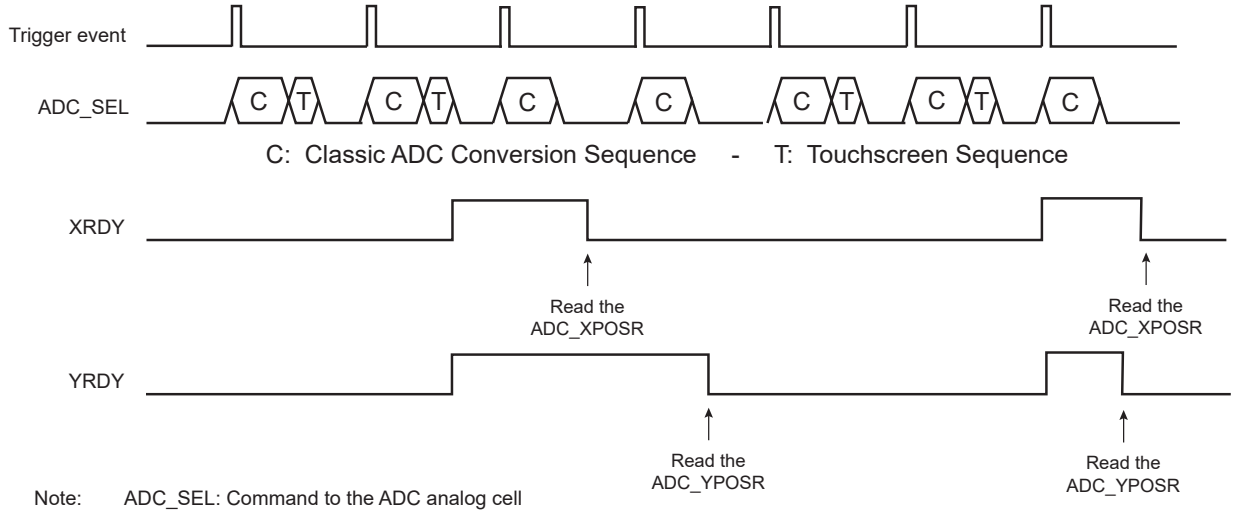
### 65.6.15.7 Sequence and Noise Filtering

The ADC Controller can manage ADC conversions and touchscreen measurement. On each trigger event the sequence of ADC conversions is performed as described in 65.6.8 Sleep Mode and Conversion Sequencer. The touchscreen measure frequency can be specified in number of trigger events

by writing the ADC_TSMR.TSFREQ parameter. An internal counter counts triggers up to TSFREQ, and every time it rolls out, a touchscreen sequence is appended to the classic ADC conversion sequence (see figure below).

Additionally the user can average multiple touchscreen measures by writing the ADC_TSMR.TSAV parameter. This can be 1, 2, 4 or 8 measures performed on consecutive triggers as illustrated in the figure below. Consequently, the ADC_TSMR.TSFREQ parameter must be greater than or equal to the ADC_TSMR.TSAV parameter.

**Figure 65-19. Insertion of Touchscreen Sequences (TSFREQ = 2; TSAV = 1)**



### 65.6.15.8 Measured Values, Registers and Flags

As soon as the controller finishes the Touchscreen sequence, XRDY, YRDY and PRDY are set and can generate an interrupt. These flags can be read in the Interrupt Status register (ADC_ISR). They are reset independently by reading in the ADC Touchscreen X Position register (ADC_XPOSR), the ADC Touchscreen Y Position register (ADC_YPOSR) and the ADC Touchscreen Pressure register (ADC_PRESSR).

ADC_XPOSR presents XPOS (VX - VXmin) on its LSB and XSCALE (VXMAX - VXmin) aligned on the 16th bit.

ADC_YPOSR presents YPOS (VY - VYmin) on its LSB and YSCALE (VYMAX - VYmin) aligned on the 16th bit.

To improve the quality of the measure, the user must calculate XPOS/XSCALE and YPOS/YSCALE.

VXMAX, VXmin, VYMAX, and VYmin are measured at the first startup of the controller. These values can change during use, so it can be necessary to refresh them. Refresh can be done by writing ‘1’ in the ADC_CR.TSCALIB field.

ADC_PRESSR presents Z1 on its LSB and Z2 aligned on the 16th bit. See 65.6.15.4 4-wire Pressure Measurement Method.

### 65.6.15.9 Pen Detect Method

When there is no contact, it is not necessary to perform a conversion. However, it is important to detect a contact by keeping the power consumption as low as possible.

The implementation polarizes one panel by closing the switch on ($X_P$/$U_L$) and ties the horizontal panel by an embedded resistor connected to $Y_M$ / Sense. This resistor is enabled by a fifth switch. Since there is

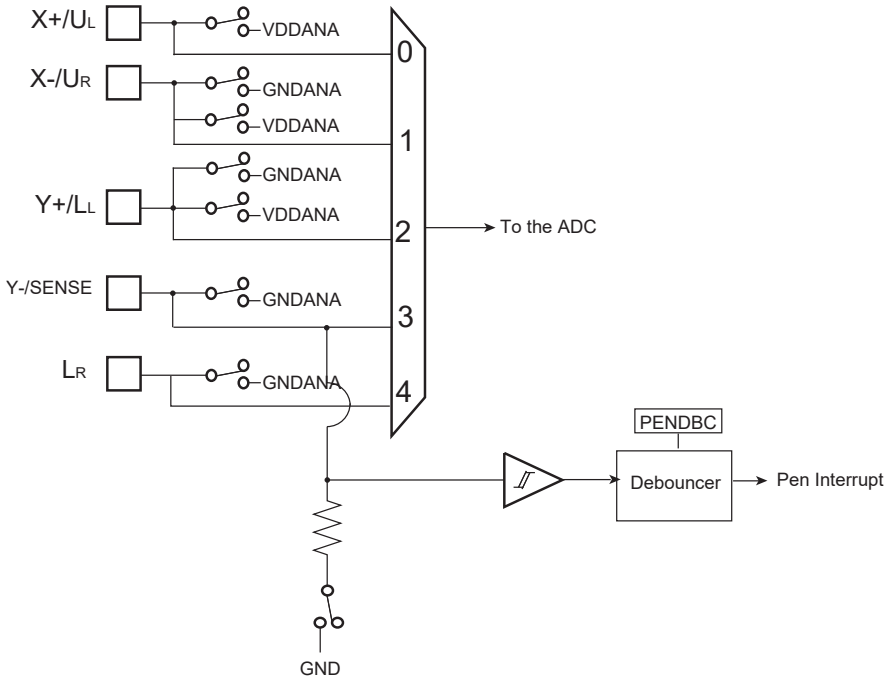
no contact, no current is flowing and there is no related power consumption. As soon as a contact occurs, a current is flowing in the Touchscreen and a Schmitt trigger detects the voltage in the resistor.

The Touchscreen Interrupt configuration is entered by programming the ADC_TSMR.PENDET bit. If this bit is written at 1, the controller samples the pen contact state when it is not converting and waiting for a trigger.

To complete the circuit, a programmable debouncer is placed at the output of the Schmitt trigger. This debouncer is programmable up to $2^{15}$ ADC clock periods. The debouncer length can be selected by programming the ADC_TSMR.PENDBC field.

Due to the analog switch's structure, the debouncer circuitry is only active when no conversion (touchscreen or classic ADC channels) is in progress. Thus, if the time between the end of a conversion sequence and the arrival of the next trigger event is lower than the debouncing time configured on ADC_TSMR.PENDBC, the debouncer will not detect any contact.

**Figure 65-20. Touchscreen Pen Detect**



The touchscreen pen detect can be used to generate an ADC interrupt to wake up the system. The pen detect generates two types of status, reported in ADC_ISR:

- the ADC_ISR.PEN bit is set as soon as a contact exceeds the debouncing time as defined by the ADC_TSMR.PENDBC field and remains set until ADC_ISR is read.
- the ADC_ISR.NOPEN bit is set as soon as no current flows for a time over the debouncing time as defined by PENDBC and remains set until ADC_ISR is read.

Both bits are automatically cleared as soon as ADC_ISR is read, and can generate an interrupt by writing ADC_IER.

Moreover, the rising of either one of them clears the other, they cannot be set at the same time.

The ADC_ISR.PENS bit shows the current status of the pen contact.

### 65.6.16 Asynchronous and Partial Wakeup (SleepWalking)

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the ADC to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the Power Management Controller (PMC) section for further details). It can also be enabled when the system is fully running.

Once the Asynchronous and partial wakeup mode is enabled, no access must be performed in the ADC before a wakeup is performed by the ADC.

When the Asynchronous and partial wakeup mode is enabled for the ADC (refer to the Power Management Controller (PMC) section), the PMC decodes a clock request from the ADC. The clock request is generated as soon as a trigger event occurs. Only a trigger from RTC or ADTRG pin can be used in partial wakeup mode. The selection between RTC or ADTRG pin is performed through the ADC_MR.TRGSEL field.

If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the ADC.

To perform a conversion at regular intervals with RTC trigger, the RTC must be configured with the following settings: RTC_MR.OUT0=7 and RTC_MR.THIGH=7. The period of the trigger can be defined in RTC_MR.TPERIOD.

To trigger a conversion using the ADTRG pin, the minimum high level duration of the ADTRG signal must be greater than 2 clock periods of the fast RC oscillator. The maximum duration of the high level must be limited to the amount of startup and conversion time.

As soon as the clock is provided by the PMC, the ADC processes the conversions and compares the converted values with the ADC_CWR.LOWTHRES and ADC_CWR.HIGHTHRES field values.

The ADC instructs the PMC to disable the clock if the converted value does not meet the conditions defined by the ADC_CWR.LOWTHRES and ADC_CWR.HIGHTHRES field values.

If the converted value meets the conditions, the ADC instructs the PMC to exit the full system from Wait mode.

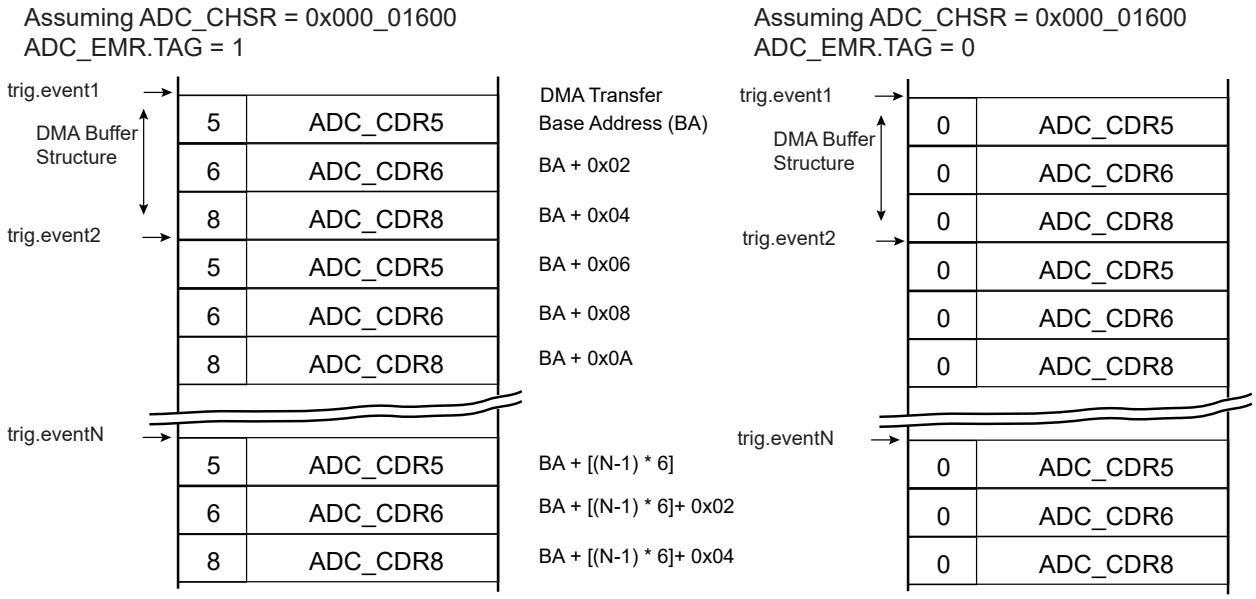
If the processor and peripherals are running, the ADC can be configured in Asynchronous and partial wakeup mode by enabling PMC_SLPWK_ER (refer to the Power Management Controller (PMC) section). When a trigger event occurs, the ADC requests the clock from the PMC and the comparison is performed. If there is a comparison match, the ADC continues to request the clock. If there is no match, the clock is switched off for the ADC only, until a new trigger event is detected.

It is recommended to write a ‘1’ to the ADC_MR.SLEEP bit to reduce the power consumption of the ADC analog part when the system is waiting for a trigger event.

### 65.6.17 Buffer Structure

The DMA read channel is triggered each time a new data is stored in ADC_LCDR. The same data structure is repeatedly stored in ADC_LCDR each time a trigger event occurs. Depending on user mode of operation (ADC_MR, ADC_CHSR, ADC_SEQR1, ADC_SEQR2, ADC_TSMR) the structure differs. Each data read to DMA buffer, carried on a half-word (16-bit), consists of last converted data right-aligned and when the ADC_EMR.TAG is set, the four most significant bits are carrying the channel number thus allowing an easier postprocessing in the DMA buffer or better checking the DMA buffer integrity.

**Figure 65-21. Buffer Structure**



As soon as touchscreen conversions are required, the pen detection function can help the postprocessing of the buffer. See 65.6.17.4 Pen Detection Status.

### 65.6.17.1 Classic ADC Channels Only (Touchscreen Disabled)

When no touchscreen conversion is required (i.e., ADC_TSMR.TSMODE = 0), the data structure within the buffer is defined by ADC_MR, ADC_CHSR, ADC_SEQRx. See figure Buffer Structure.

If the user sequence is not used (i.e., ADC_MR.USEQ is cleared) then only the value of ADC_CHSR defines the data structure. For each trigger event, enabled channels will be consecutively stored in ADC_LCDR and automatically read to the buffer.

When the user sequence is configured (i.e., ADC_MR.USEQ is set) not only does ADC_CHSR modify the data structure of the buffer, but ADC_SEQRx registers may modify the data structure of the buffer as well.

### 65.6.17.2 Touchscreen Channels Only

When only touchscreen conversions are required (i.e., TSMODE ≠ 0 in ADC_TSMR and ADC_CHSR equals 0), the structure of data within the buffer is defined by ADC_TSMR.

When TSMODE = 1 or 3, each trigger event adds two half-words in the buffer (assuming TSAV = 0), first half-word being ADC_XPOSR.XPOS, then ADC_YPOSR.YPOS. If TSAV/TSFREQ ≠ 0, the data structure remains unchanged. Not all trigger events add data to the buffer.

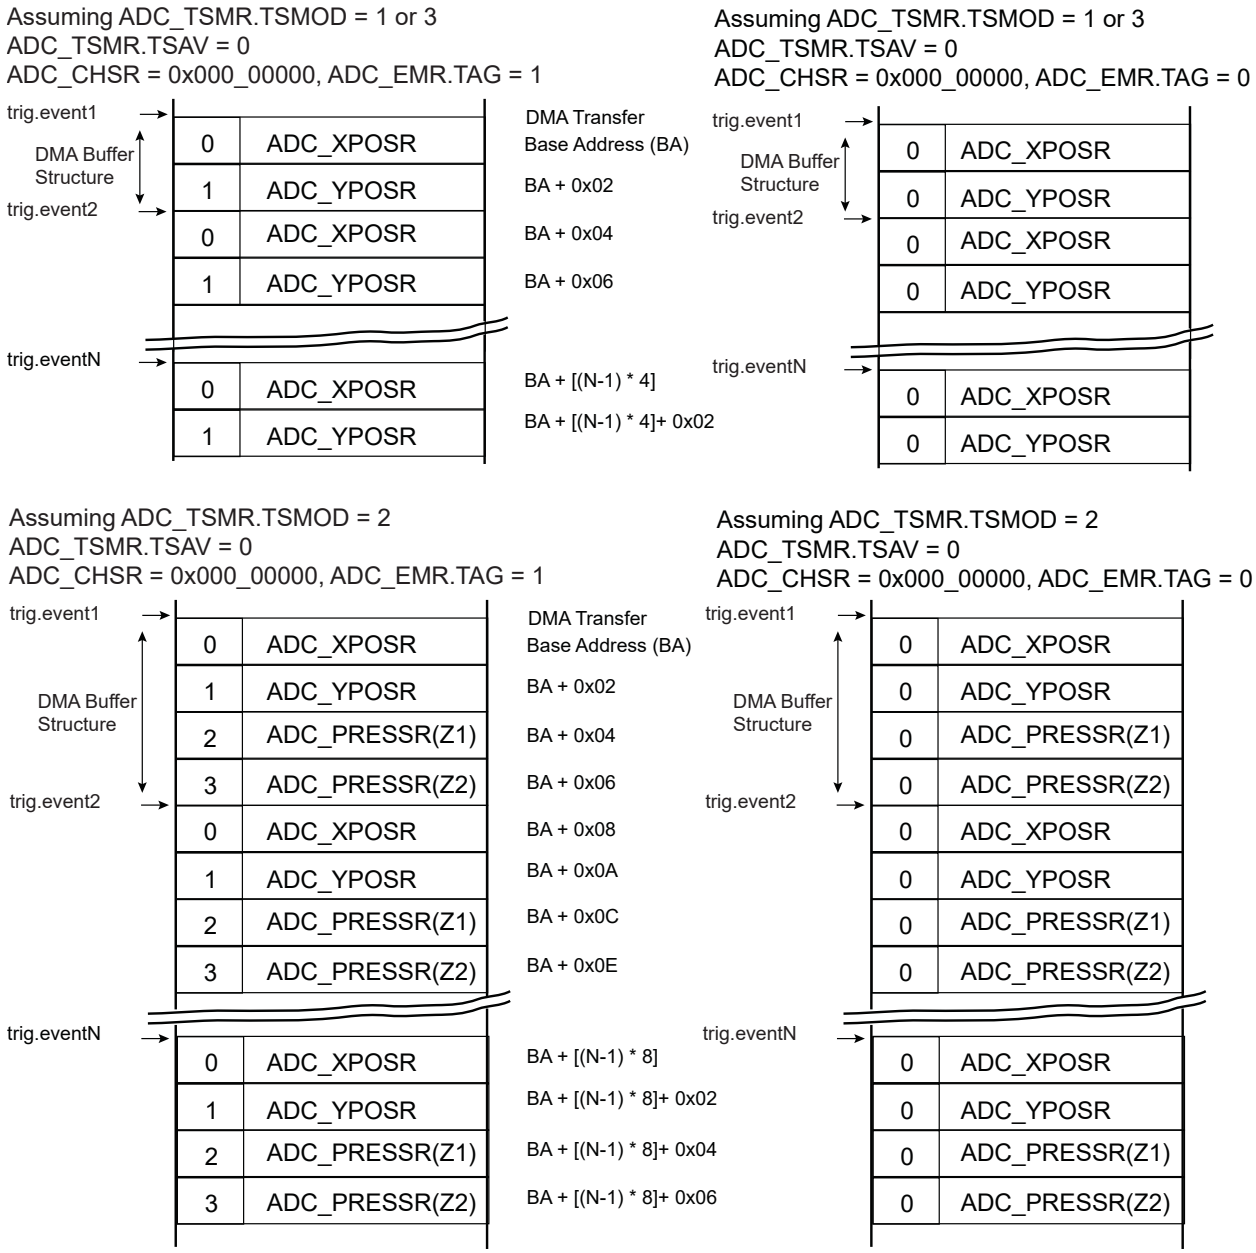
When TSMODE = 2, each trigger event adds four half-words to the buffer (assuming TSAV = 0), first half-word being ADC_XPOSR.XPOS, followed by ADC_YPOSR.YPOS and finally ADC_PRESSR.Z1, followed by ADC_PRESSR.Z2.

When ADC_EMR.TAG is set, the CHNB field (four most significant bits of ADC_LCDR) is cleared when ADC_XPOSR.XPOS is transmitted and set when ADC_YPOSR.YPOS is transmitted, allowing an easier post-processing of the buffer or a better checking of the buffer integrity. In case 4-wire with Pressure mode is selected, the Z1 value is transmitted to the buffer along with tag set to 2 and Z2 is tagged with value 3.

XSCALE and YSCALE (calibration values) are not transmitted to the buffer because they are supposed to be constant and moreover only measured at the very first startup of the controller or upon user request.

There is no change in buffer structure whatever the value of the PENDET.ADC_TSMR bit configuration, but it is recommended to use the pen detection function for buffer postprocessing (see 65.6.17.4 Pen Detection Status).

**Figure 65-22. Buffer Structure When Only Touchscreen Channels are Enabled**



### 65.6.17.3 Interleaved Channels

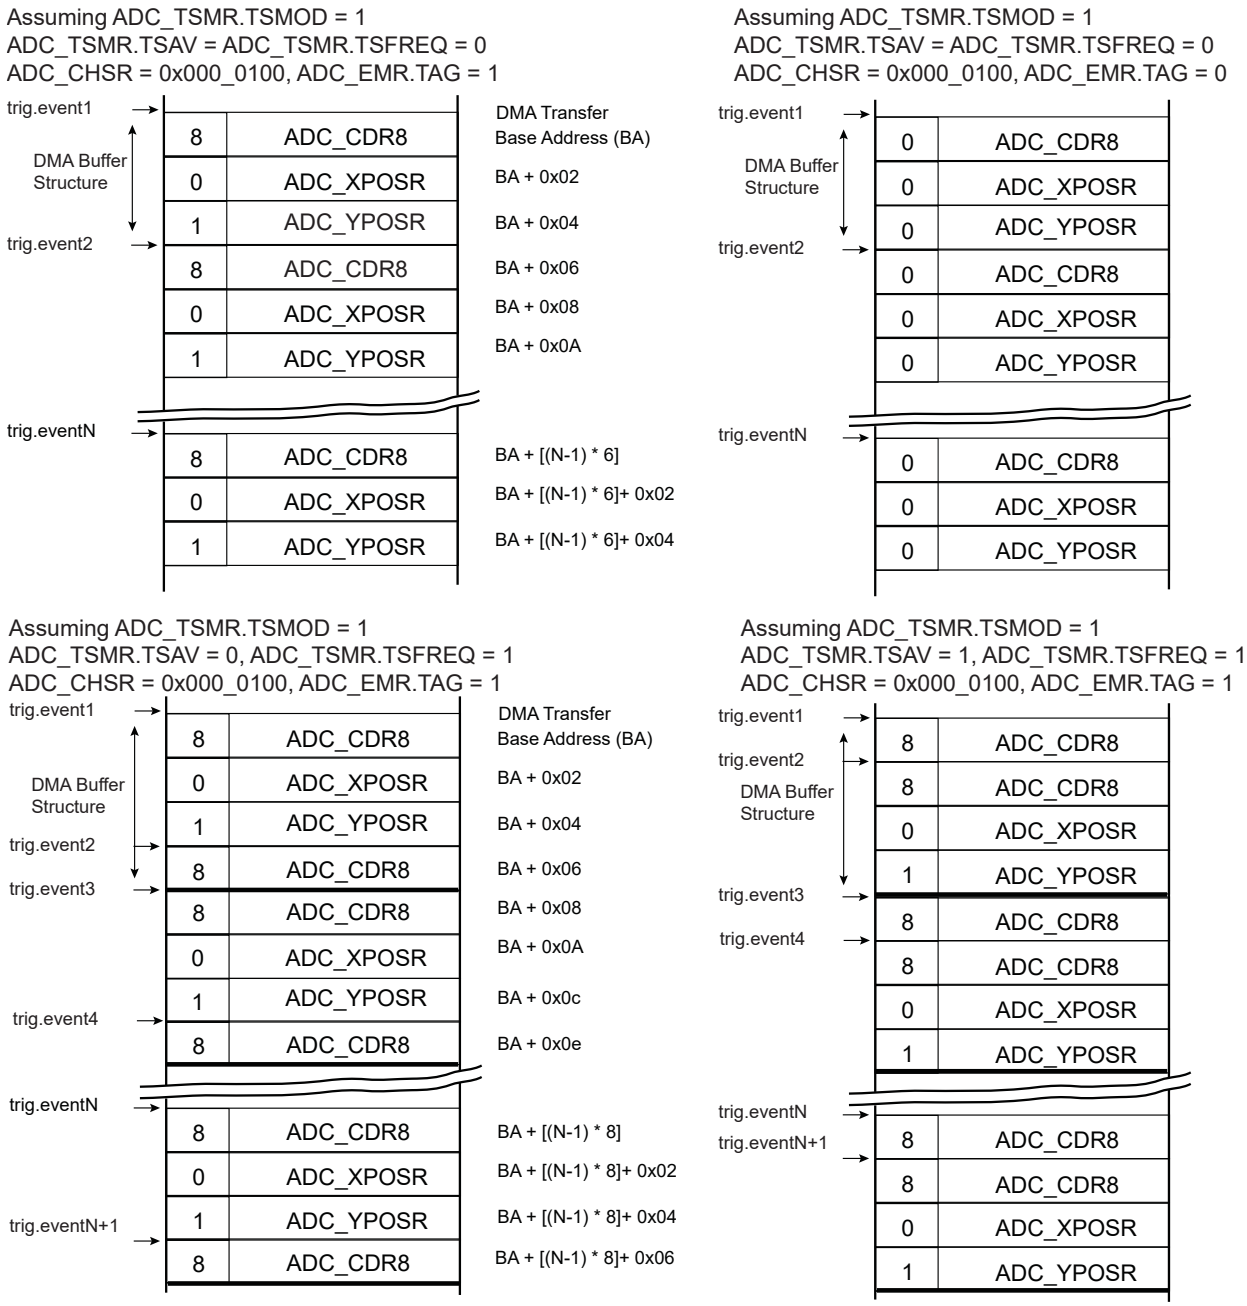
When both classic ADC channels (CH4/CH5 up to CH12 are set in ADC_CHSR) and touchscreen conversions are required (TSMODE ≠ 0 in ADC_TSMR), the structure of the buffer differs according to the ADC_TSMR.TSAV and ADC_TSMR.TSFREQ values.

If TSFREQ ≠ 0, not all events generate touchscreen conversions, therefore the buffer structure is based on $2^{TSFREQ}$ trigger events. Given a TSFREQ value, the location of touchscreen conversion results depends on TSAV value.

When TSFREQ = 0, TSAV must equal 0.

There is no change in buffer structure whatever the value of the ADC_TSMR.PENDET bit configuration, but it is recommended to use the pen detection function for buffer post-processing (see 65.6.17.4 Pen Detection Status).

**Figure 65-23. Buffer Structure When Classic ADC and Touchscreen Channels are Interleaved**



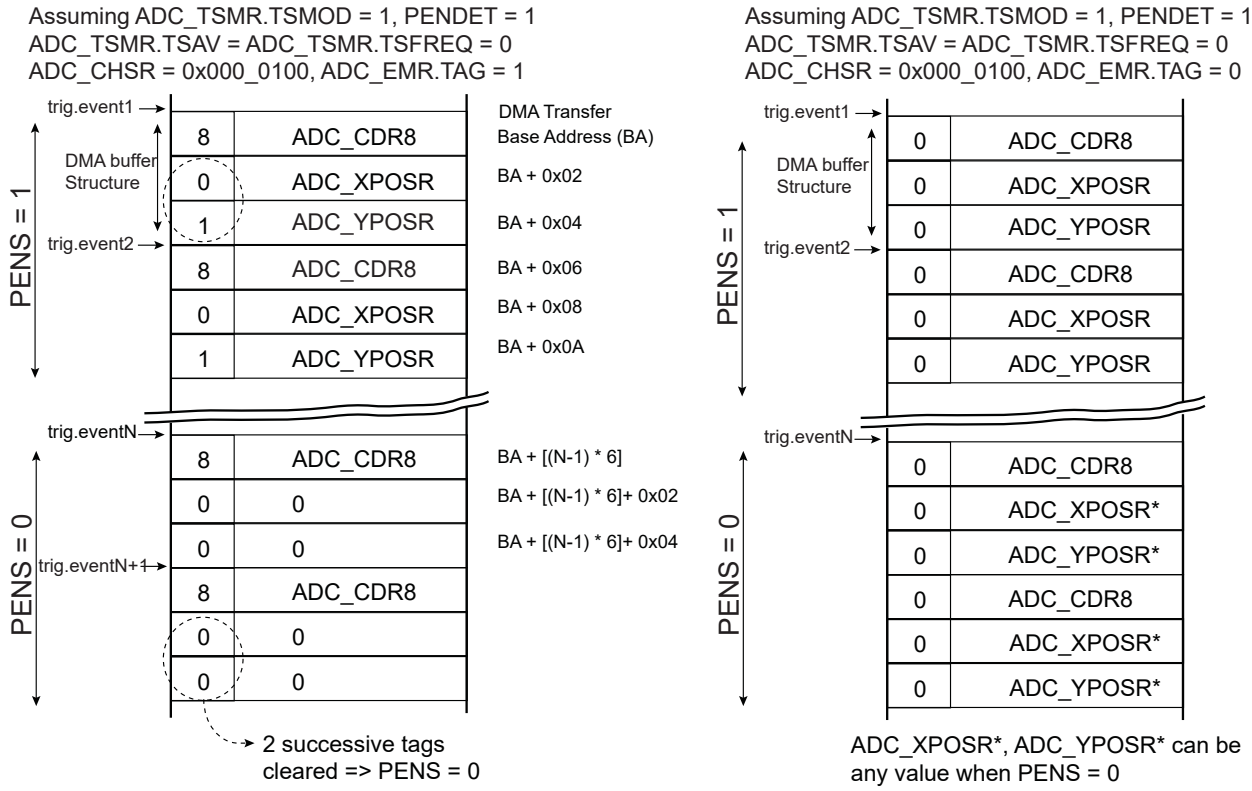
### 65.6.17.4 Pen Detection Status

If the pen detection measure is enabled (ADC_TSMR.PENDET is set), the XPOS, YPOS, Z1, Z2 values transmitted to the buffer through ADC_LCDR are cleared (including the CHNB field), if the ADC_ISR.PENS flag is 0. When the ADC_ISR.PENS flag is set, XPOS, YPOS, Z1, Z2 are normally transmitted.

Therefore, using pen detection together with tag function eases the post-processing of the buffer, especially to determine which touchscreen converted values correspond to a period of time when the pen was in contact with the screen.

When the pen detection is disabled or the tag function is disabled, XPOS, YPOS, Z1, Z2 are normally transmitted without tag and no relationship can be found with pen status, thus post-processing may not be easy.

**Figure 65-24. Buffer Structure With and Without Pen Detection Enabled**



### 65.6.18 Fault Event

The ADC Controller internal fault output is directly connected to the PWM fault input. The fault event may be asserted depending on the configuration of ADC_EMR, ADC_CWR, ADC_LCMR and ADC_LCCWR and converted values.

Two types of comparison can trigger a comparison event (fault output pulse):

- The first comparison type is based on ADC_LCCWR settings, i.e., on all converted channels except the last one;
- The second comparison type is linked to the last channel.

As an example, overcurrent and temperature exceeding limits can trigger a fault to PWM.

When the comparison event occurs, the ADC fault output generates a pulse of one peripheral clock cycle to the PWM fault input. This fault line can be enabled or disabled within PWM. Should it be activated and asserted by the ADC Controller, the PWM outputs are immediately placed in a safe state (pure combinational path). Note that the ADC fault output connected to the PWM is not the COMPE bit. Thus the Fault mode (FMOD) within the PWM configuration must be FMOD = 1.

### 65.6.19 Register Write Protection

To prevent any single software error from corrupting ADC behavior, certain registers in the address space can be write-protected by setting the bit WPEN in the "ADC Write Protection Mode Register" (ADC_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the "ADC Write Protection Status Register" (ADC_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically reset by reading ADC_WPSR.

The following registers are write-protected when ADC_WPMR.WPEN is set:

- ADC Mode Register
- ADC Channel Sequence 1 Register
- ADC Channel Sequence 2 Register
- ADC Channel Enable Register
- ADC Channel Disable Register
- ADC Last Channel Trigger Mode Register
- ADC Last Channel Compare Window Register
- ADC Extended Mode Register
- ADC Compare Window Register
- ADC Channel Offset Register
- ADC Analog Control Register
- ADC_Touchscreen Mode Register
- ADC Trigger Register
- ADC Correction Values Register
- ADC Channel Error Correction Register
- ADC Touchscreen Correction Values Register

## 65.7 Register Summary

| Offset | Name | Bit Pos. | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 0x00 | ADC_CR | 7:0 | | | | CMPRST | | TSCALIB | START | SWRST |
| | | 15:8 | | | | | | | | |
| | | 23:16 | | | | | | | | |
| | | 31:24 | | | | | | | | |

### 65.7.1 ADC Control Register

**Name:** ADC_CR
**Offset:** 0x00
**Reset:** –
**Property:** Write-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | CMPRST | | TSCALIB | START | SWRST |
| Access | | | | W | | W | W | W |
| Reset | | | | – | | – | – | – |

**Bit 4 – CMPRST** Comparison Restart

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Stops the conversion result storage until the next comparison match. |

**Bit 2 – TSCALIB** Touchscreen Calibration
If conversion is in progress, the calibration sequence starts at the beginning of a new conversion sequence. If no conversion is in progress, the calibration sequence starts at the second conversion sequence located after the TSCALIB command (Sleep mode, waiting for a trigger event).

TSCALIB measurement sequence does not affect the Last Converted Data register (ADC_LCDR).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Programs screen calibration (VDD/GND measurement) |

**Bit 1 – START** Start Conversion

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Begins analog-to-digital conversion. |

**Bit 0 – SWRST** Software Reset

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Resets the ADC, simulating a hardware reset. |

### 65.7.2 ADC Mode Register

**Name:** ADC_MR
**Offset:** 0x04
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | USEQ | MAXSPEED | TRANSFER[1:0] | | TRACKTIM[3:0] | | | |

| | PRESCAL[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | FWUP | SLEEP | | TRGSEL[2:0] | | | |
| Access | | R/W | R/W | | R/W | R/W | R/W | |
| Reset | | 0 | 0 | | 0 | 0 | 0 | |

**Bit 31 – USEQ** User Sequence Enable

| Value | Name | Description |
|---|---|---|
| 0 | NUM_ORDER | Normal mode: The controller converts channels in a simple numeric order depending only on the channel index. |
| 1 | REG_ORDER | User Sequence mode: The sequence respects what is defined in ADC_SEQR1 and ADC_SEQR2 registers and can be used to convert the same channel several times. |

**Bit 30 – MAXSPEED** Maximum Sampling Rate Enable in Freerun Mode
This bit should always be set to 0.

**Bits 29:28 – TRANSFER[1:0]** Transfer Time
The TRANSFER field must be set to 2 to guarantee the optimal transfer time.

**Bits 27:24 – TRACKTIM[3:0]** Tracking Time

| Value | Name | Description |
|---|---|---|
| 0 | ADCCLK6 | The tracking time is 6 ADC clock cycles. |
| 1-14 | – | The tracking time is 6 ADC clock cycles. |
| 15 | ADCCLK7 | The tracking time is 7 ADC clock cycles. |

**Bit 23 – ANACH** Analog Change

| Value | Name | Description |
|---|---|---|
| 0 | NONE | No analog change on channel switching: DIFF0 is used for all channels. |
| 1 | ALLOWED | Allows different analog settings for each channel. See ADC_COR. |

**Bits 19:16 – STARTUP[3:0]** Startup Time

| Value | Name | Description |
|---|---|---|
| 0 | SUT0 | 0 periods of ADCCLK |
| 1 | SUT8 | 8 periods of ADCCLK |
| 2 | SUT16 | 16 periods of ADCCLK |
| 3 | SUT24 | 24 periods of ADCCLK |
| 4 | SUT64 | 64 periods of ADCCLK |
| 5 | SUT80 | 80 periods of ADCCLK |
| 6 | SUT96 | 96 periods of ADCCLK |
| 7 | SUT112 | 112 periods of ADCCLK |
| 8 | SUT512 | 512 periods of ADCCLK |
| 9 | SUT576 | 576 periods of ADCCLK |
| 10 | SUT640 | 640 periods of ADCCLK |
| 11 | SUT704 | 704 periods of ADCCLK |
| 12 | SUT768 | 768 periods of ADCCLK |
| 13 | SUT832 | 832 periods of ADCCLK |
| 14 | SUT896 | 896 periods of ADCCLK |
| 15 | SUT960 | 960 periods of ADCCLK |

**Bits 15:8 – PRESCAL[7:0]** Prescaler Rate Selection
PRESCAL = ($f_{peripheral\ clock}$ / (2 × $f_{ADCCLK}$)) – 1.

**Bit 6 – FWUP** Fast Wakeup

| Value | Name | Description |
|---|---|---|
| 0 | OFF | If SLEEP is 1, then both ADC core and reference voltage circuitry are OFF between conversions |
| 1 | ON | If SLEEP is 1, then Fast Wakeup Sleep mode: The voltage reference is ON between conversions and ADC core is OFF |

**Bit 5 – SLEEP** Sleep Mode

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Normal Mode: The ADC core and reference voltage circuitry are kept ON between conversions. |
| 1 | SLEEP | Sleep Mode: The wakeup time can be modified by programming the FWUP bit. |

**Bits 3:1 – TRGSEL[2:0]** Trigger Selection
The trigger selection can be performed only if ADC_TRGR.TRGMOD = 1, 2 or 3.

| Value | Name | Description |
|---|---|---|
| 0 | ADC_TRIG0 | ADTRG |
| 1 | ADC_TRIG1 | TIOA0 |
| 2 | ADC_TRIG2 | TIOA1 |

| Value | Name | Description |
|---|---|---|
| 3 | ADC_TRIG3 | TIOA2 |
| 4 | ADC_TRIG4 | PWM event line 0 |
| 5 | ADC_TRIG5 | PWM event line 1 |
| 6 | ADC_TRIG6 | TIOA3 |
| 7 | ADC_TRIG7 | RTCOUT0 |

### 65.7.3 ADC Channel Sequence 1 Register

**Name:** ADC_SEQR1
**Offset:** 0x08
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | USCH8[3:0] | | | | USCH7[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | USCH6[3:0] | | | | USCH5[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | USCH4[3:0] | | | | USCH3[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | USCH2[3:0] | | | | USCH1[3:0] | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – USCHx** User Sequence Number x
This register can be used only if the ADC_MR.USEQ field is set to ‘1’.

Any USCHx field is processed only if the ADC_CHSR.CHx-1 bit reads logical ‘1’, else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

Example: for each trigger event, to obtain the “CH3 CH1 CH0 CH4 CH4” conversion sequence, use the following settings:

ADC_SEQR1.USCH1=3, ADC_CHSR.CH0=1

ADC_SEQR1.USCH2=1, ADC_CHSR.CH1=1

ADC_SEQR1.USCH3=0, ADC_CHSR.CH2=1

ADC_SEQR1.USCH4=4, ADC_CHSR.CH3=1

ADC_SEQR1.USCH5=4, ADC_CHSR.CH4=1

### 65.7.4 ADC Channel Sequence 2 Register

**Name:** ADC_SEQR2
**Offset:** 0x0C
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | USCHx[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

**Bits 3:0 – USCHx[3:0]** User Sequence Number x
This register can be used only if the ADC_MR.USEQ field is set to ‘1’.

Any USCHx field is processed only if the ADC_CHSR.CHx-1 bit reads logical ‘1’, else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

### 65.7.5 ADC Channel Enable Register

**Name:** ADC_CHER
**Offset:** 0x10
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CH11 | CH10 | CH9 | CH8 |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CH7 | CH6 | CH5 | CH4 | CH3 | CH2 | CH1 | CH0 |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx** Channel x Enable
If ADC_MR.USEQ = 1, CHx corresponds to the enable of sequence number x+1 described in ADC_SEQR1 and ADC_SEQR2 (e.g. CH0 enables sequence number USCH1).

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Enables the corresponding channel. |

### 65.7.6 ADC Channel Disable Register

**Name:** ADC_CHDR
**Offset:** 0x14
**Reset:** –
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CH11 | CH10 | CH9 | CH8 |
| Access | | | | | W | W | W | W |
| Reset | | | | | – | – | – | – |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CH7 | CH6 | CH5 | CH4 | CH3 | CH2 | CH1 | CH0 |
| Access | W | W | W | W | W | W | W | W |
| Reset | – | – | – | – | – | – | – | – |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx** Channel x Disable

**WARNING** If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC_ISR and OVREx flags in ADC_OVER are unpredictable

| Value | Description |
|---|---|
| 0 | No effect. |
| 1 | Disables the corresponding channel. |

### 65.7.7 ADC Channel Status Register

**Name:** ADC_CHSR
**Offset:** 0x18
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | CH11 | CH10 | CH9 | CH8 |
| Access | | | | | W | W | W | W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CH7 | CH6 | CH5 | CH4 | CH3 | CH2 | CH1 | CH0 |
| Access | W | W | W | W | W | W | W | W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx** Channel x Status

| Value | Description |
|---|---|
| 0 | The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is disabled. |
| 1 | The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is enabled.<br>Note: As an example, when ADC_MR.USEQ=1 and a 1 is written to CH2, the channel defined in ADC_SEQ0R.USCH3 is part of the sequence of conversions. |

### 65.7.8 ADC Last Converted Data Register

**Name:** ADC_LCDR
**Offset:** 0x20
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | CHNBOSR[4:0] | | | | |
| Access | | | | R | R | R | R | R |
| Reset | | | | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | LDATA[15:8] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LDATA[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 28:24 – CHNBOSR[4:0]** Channel Number in Oversampling Mode
Indicates the last converted channel when the ADC_EMR.TAG bit is set and the ADC_EMR0.OSR field is not equal to 0. If the ADC_EMR.TAG bit is not set, CHNBOSR = 0.

**Bits 15:0 – LDATA[15:0]** Last Data Converted
The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed.

If OSR = 0 and TAG = 1 in ADC_EMR, the 4 MSBs of LDATA carry the channel number to obtain a packed system memory buffer made of 1 converted data stored in a halfword (16-bit) instead of 1 converted data in a 32-bit word, thus dividing by 2 the size of the memory buffer.

### 65.7.9 ADC Interrupt Enable Register

**Name:** ADC_IER
**Offset:** 0x24
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

**Bit 25 – GOVRE** General Overrun Error Interrupt Enable

**Bit 24 – DRDY** Data Ready Interrupt Enable

**Bit 22 – PRDY** Touchscreen Measure Pressure Ready Interrupt Enable

**Bit 21 – YRDY** Touchscreen Measure YPOS Ready Interrupt Enable

**Bit 20 – XRDY** Touchscreen Measure XPOS Ready Interrupt Enable

**Bit 19 – LCCHG** Last Channel Change Interrupt Enable

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion Interrupt Enable x

### 65.7.10 ADC Interrupt Disable Register

**Name:** ADC_IDR
**Offset:** 0x28
**Reset:** –
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bit 26 – COMPE** Comparison Event Interrupt Disable

**Bit 25 – GOVRE** General Overrun Error Interrupt Disable

**Bit 24 – DRDY** Data Ready Interrupt Disable

**Bit 22 – PRDY** Touchscreen Measure Pressure Ready Interrupt Disable

**Bit 21 – YRDY** Touchscreen Measure YPOS Ready Interrupt Disable

**Bit 20 – XRDY** Touchscreen Measure XPOS Ready Interrupt Disable

**Bit 19 – LCCHG** Last Channel Change Interrupt Disable

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion Interrupt Disable x

### 65.7.11 ADC Interrupt Mask Register

**Name:** ADC_IMR
**Offset:** 0x2C
**Reset:** 0x00000000
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | NOPEN | PEN | | | COMPE | GOVRE | DRDY |
| Access | | R | R | | | R | R | R |

| | EOC7 | EOC6 | EOC5 | EOC4 | EOC3 | EOC2 | EOC1 | EOC0 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bit 31 – PENS** Pen Detect Status

| Value | Description |
|---|---|
| 0 | The pen does not press the screen. |
| 1 | The pen presses the screen.<br><br>Note: PENS is not a source of interruption. |

**Bit 30 – NOPEN** No Pen Contact (cleared on read)

| Value | Description |
|---|---|
| 0 | No loss of pen contact since the last read of ADC_ISR. |
| 1 | At least one loss of pen contact since the last read of ADC_ISR. |

**Bit 29 – PEN** Pen contact (cleared on read)

| Value | Description |
|---|---|
| 0 | No pen contact since the last read of ADC_ISR. |
| 1 | At least one pen contact since the last read of ADC_ISR. |

**Bit 26 – COMPE** Comparison Event (cleared on read)

| Value | Description |
|---|---|
| 0 | No comparison event since the last read of ADC_ISR. |
| 1 | At least one comparison event (defined in ADC_EMR and ADC_CWR) has occurred since the last read of ADC_ISR. |

**Bit 25 – GOVRE** General Overrun Error (cleared on read)

| Value | Description |
|---|---|
| 0 | No general overrun error occurred since the last read of ADC_ISR. |
| 1 | At least one general overrun error has occurred since the last read of ADC_ISR. |

**Bit 24 – DRDY** Data Ready (automatically set / cleared)

| Value | Description |
|---|---|
| 0 | No data has been converted since the last read of ADC_LCDR. |
| 1 | At least one data has been converted and is available in ADC_LCDR. |

**Bit 22 – PRDY** Touchscreen Pressure Measure Ready (cleared on read)

| Value | Description |
|---|---|
| 0 | No measure has been performed since the last read of ADC_PRESSR. |
| 1 | At least one measure has been performed since the last read of ADC_ISR. |

**Bit 21 – YRDY** Touchscreen YPOS Measure Ready (cleared on read)

| Value | Description |
|---|---|
| 0 | No measure has been performed since the last read of ADC_YPOSR. |
| 1 | At least one measure has been performed since the last read of ADC_ISR. |

**Bit 20 – XRDY** Touchscreen XPOS Measure Ready (cleared on read)

| Value | Description |
|---|---|
| 0 | No measure has been performed since the last read of ADC_XPOSR. |
| 1 | At least one measure has been performed since the last read of ADC_ISR. |

**Bit 19 – LCCHG** Last Channel Change (cleared on read)

| Value | Description |
|---|---|
| 0 | There is no comparison match (defined in the Last Channel Compare Window register (ADC_LCCWR) since the last read of ADC_ISR. |
| 1 | The converted value reported on ADC_CDR11 has changed since the last read of ADC_ISR, according to what is defined in ADC_LCTMR and ADC_LCCWR. |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion x (automatically set / cleared)

| Value | Description |
|---|---|
| 0 | The corresponding analog channel is disabled, or the conversion is not finished. This flag is cleared when reading the corresponding ADC_CDRx registers. |
| 1 | The corresponding analog channel is enabled and conversion is complete. |

### 65.7.13 ADC Last Channel Trigger Mode Register

**Name:** ADC_LCTMR
**Offset:** 0x34
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | CMPMOD[1:0] | | | | | DUALTRIG |
| Access | | | R/W | R/W | | | | R/W |
| Reset | | | 0 | 0 | | | | 0 |

**Bits 5:4 – CMPMOD[1:0]** Last Channel Comparison Mode

| Value | Name | Description |
|---|---|---|
| 0 | LOW | Generates the ADC_ISR.LCCHG flag when the converted data is lower than the low threshold of the window. |
| 1 | HIGH | Generates the ADC_ISR.LCCHG flag when the converted data is higher than the high threshold of the window. |
| 2 | IN | Generates the ADC_ISR.LCCHG flag when the converted data is in the comparison window. |
| 3 | OUT | Generates the ADC_ISR.LCCHG flag when the converted data is out of the comparison window. |

**Bit 0 – DUALTRIG** Dual Trigger ON

| Value | Description |
|---|---|
| 0 | All channels are triggered by event defined by ADC_MR.TRGSEL. |
| 1 | Last channel (higher index) trigger period is defined by RTC_MR.OUT1. |

### 65.7.14 ADC Last Channel Compare Window Register

**Name:** ADC_LCCWR
**Offset:** 0x38
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | HIGHTHRES[11:8] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | HIGHTHRES[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | LOWTHRES[11:8] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LOWTHRES[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 27:16 – HIGHTHRES[11:0]** High Threshold
High threshold associated to compare settings of ADC_LCTMR.

**Bits 11:0 – LOWTHRES[11:0]** Low Threshold
Low threshold associated to compare settings of ADC_LCTMR.

### 65.7.15 ADC Overrun Status Register

**Name:** ADC_OVER
**Offset:** 0x3C
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | OVRE11 | OVRE10 | OVRE9 | OVRE8 |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | OVRE7 | OVRE6 | OVRE5 | OVRE4 | OVRE3 | OVRE2 | OVRE1 | OVRE0 |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – OVREx** Overrun Error x

| Value | Description |
|---|---|
| 0 | No overrun error on the corresponding channel since the last read of ADC_OVER. |
| 1 | An overrun error has occurred on the corresponding channel since the last read of ADC_OVER. |

### 65.7.16 ADC Extended Mode Register

**Name:** ADC_EMR
**Offset:** 0x40
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | ADCMODE[1:0] | | | SIGNMODE[1:0] | | TAG |
| Access | | | R/W | R/W | | R/W | R/W | R/W |
| Reset | | | 0 | 0 | | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|
| | | | SRCCLK | ASTE | | | OSR[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | CMPFILTER[1:0] | | | | CMPALL | |
| Access | | | R/W | R/W | | | R/W | |
| Reset | | | 0 | 0 | | | 0 | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CMPSEL[3:0] | | | | | CMPTYPE | CMPMODE[1:0] | |
| Access | R/W | R/W | R/W | R/W | | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | | 0 | 0 | 0 |

**Bits 29:28 – ADCMODE[1:0]** ADC Running Mode
See 65.6.14 Automatic Error Correction for details on ADC running mode.

| Value | Name | Description |
|---|---|---|
| 0 | NORMAL | Normal mode of operation. |
| 1 | OFFSET_ERROR | Offset Error mode to measure the offset error. See table ADC Running Modes. |
| 2 | GAIN_ERROR_HIGH | Gain Error mode to measure the gain error. See table ADC Running Modes. |
| 3 | GAIN_ERROR_LOW | Gain Error mode to measure the gain error. See table ADC Running Modes. |

**Bits 26:25 – SIGNMODE[1:0]** Sign Mode
If conversion results are signed and resolution is below 16 bits, the sign is extended up to the bit 15 (for example, 0xF43 for 12-bit resolution will be read as 0xFF43 and 0x467 will be read as 0x0467). See 65.6.6 Conversion Results Format.

| Value | Name | Description |
|---|---|---|
| 0 | SE_UNSG_DF_SIGN | Single-Ended channels: Unsigned conversions.<br>Differential channels: Signed conversions. |

| Value | Name | Description |
|---|---|---|
| 1 | SE_SIGN_DF_UNSG | Single-Ended channels: Signed conversions.<br>Differential channels: Unsigned conversions. |
| 2 | ALL_UNSIGNED | All channels: Unsigned conversions. |
| 3 | ALL_SIGNED | All channels: Signed conversions. |

**Bit 24 – TAG** Tag of ADC_LCDR

| Value | Description |
|---|---|
| 0 | Sets ADC_LCDR.CHNB field to zero. |
| 1 | Appends the channel number to the conversion result in ADC_LCDR. |

**Bit 21 – SRCCLK** External Clock Selection
0 (PERIPH_CLK): The peripheral clock is the source for the ADC prescaler.

1 (GCLK): GCLK is the source clock for the ADC prescaler, thus the ADC clock can be independent of the core/peripheral clock.

**Bit 20 – ASTE** Averaging on Single Trigger Event

| Value | Name | Description |
|---|---|---|
| 0 | MULTI_TRIG_AVERAGE | The average requests several trigger events. |
| 1 | SINGLE_TRIG_AVERAGE | The average requests only one trigger event. |

**Bits 17:16 – OSR[1:0]** Over Sampling Rate

| Value | Name | Description |
|---|---|---|
| 0 | NO_AVERAGE | No averaging. ADC sample rate is maximum. |
| 1 | OSR4 | 1-bit enhanced resolution by averaging. ADC sample rate divided by 4. |
| 2 | OSR16 | 2-bit enhanced resolution by averaging. ADC sample rate divided by 16. |
| 3 | OSR64 | 3-bit enhanced resolution by averaging. ADC sample rate divided by 64. |
| 4 | OSR256 | 4-bit enhanced resolution by averaging. ADC sample rate divided by 256. |

**Bits 13:12 – CMPFILTER[1:0]** Compare Event Filtering
Number of consecutive compare events necessary to raise the flag = CMPFILTER+1

When programmed to 0, the flag rises as soon as an event occurs.

See 65.6.9 Comparison Window when using the filtering option (CMPFILTER > 0).

**Bit 9 – CMPALL** Compare All Channels

| Value | Description |
|---|---|
| 0 | Only channel indicated in CMPSEL field is compared. |
| 1 | All channels are compared. |

**Bits 7:4 – CMPSEL[3:0]** Comparison Selected Channel
If CMPALL = 0: CMPSEL indicates which channel has to be compared.

If CMPALL = 1: No effect.

**Bit 2 – CMPTYPE** Comparison Type

| Value | Name | Description |
|---|---|---|
| 0 | FLAG_ONLY | Any conversion is performed and comparison function drives the ADC_ISR.COMPE flag. |
| 1 | START_CONDITION | Comparison conditions must be met to start the storage of all conversions until the ADC_CR.CMPRST bit is set. |

**Bits 1:0 – CMPMODE[1:0]** Comparison Mode

| Value | Name | Description |
|---|---|---|
| 0 | LOW | When the converted data is lower than the low threshold of the window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode. |
| 1 | HIGH | When the converted data is higher than the high threshold of the window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode. |
| 2 | IN | When the converted data is in the comparison window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode. |
| 3 | OUT | When the converted data is out of the comparison window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode. |

© 2018 Microchip Technology Inc.

### 65.7.17 ADC Compare Window Register

**Name:** ADC_CWR
**Offset:** 0x44
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | HIGHTHRES[13:8] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | HIGHTHRES[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | LOWTHRES[13:8] | | | | | |
| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | LOWTHRES[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 29:16 – HIGHTHRES[13:0]** High Threshold
High threshold associated to compare settings of ADC_EMR.

**Bits 13:0 – LOWTHRES[13:0]** Low Threshold
Low threshold associated to compare settings of ADC_EMR.

### 65.7.18 Channel Offset Register

**Name:** ADC_COR
**Offset:** 0x4C
**Reset:** 0
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27 – DIFFx** Differential Inputs for Channel x

| Value | Description |
|---|---|
| 0 | Corresponding channel is set in Single-ended mode. |
| 1 | Corresponding channel is set in Differential mode. |

### 65.7.19 ADC Channel Data Register

**Name:** ADC_CDRx
**Offset:** 0x50 + x*0x04 [x=0..11]
**Reset:** 0
**Property:** Read/Write

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Access | | | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | | | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | DATA[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 13:0 – DATA[13:0]** Converted Data
The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed. ADC_CDRx is only loaded if the corresponding analog channel is enabled.

### 65.7.20 ADC Analog Control Register

**Name:** ADC_ACR
**Offset:** 0x94
**Reset:** 0x00000101
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

By default, bits 12 and 13 are set to 1 and 0, respectively, and must not be modified.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | IBCTL[1:0] | |
| Reset | | | | | | | 0 | 1 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Access | | | | | | | PENDETSENS[1:0] | |
| Reset | | | | | | | 0 | 1 |

**Bits 9:8 – IBCTL[1:0]** ADC Bias Current Control
Adapts performance versus power consumption. Refer to the “Electrical Characteristics” section for further details.

**Bits 1:0 – PENDETSENS[1:0]** Pen Detection Sensitivity
Modifies the pen detection input pull-up resistor value. Refer to the “Electrical Characteristics” section for further details.

### 65.7.21 ADC Touchscreen Mode Register

**Name:** ADC_TSMR
**Offset:** 0xB0
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | PENDBC[3:0] | | | | | | | PENDET |
| Access | R/W | R/W | R/W | R/W | | | | R/W |
| Reset | 0 | 0 | 0 | 0 | | | | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | | NOTSDMA | | | TSSCTIM[3:0] | | | |
| Access | | R/W | | | R/W | R/W | R/W | R/W |
| Reset | | 0 | | | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | TSFREQ[3:0] | | | |
| Access | | | | | R/W | R/W | R/W | R/W |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | TSAV[1:0] | | | | TSMODE[1:0] | |
| Access | | | R/W | R/W | | | R/W | R/W |
| Reset | | | 0 | 0 | | | 0 | 0 |

**Bits 31:28 – PENDBC[3:0]** Pen Detect Debouncing Period
Debouncing period = $2^{PENDBC}$ ADCCLK periods.

**Bit 24 – PENDET** Pen Contact Detection Enable
When PENDET = 1, XPOS, YPOS, Z1, Z2 values of ADC_XPOSR, ADC_YPOSR, ADC_PRESSR are automatically cleared when ADC_ISR.PENS = 0.

| Value | Description |
|---|---|
| 0 | Pen contact detection disabled. |
| 1 | Pen contact detection enabled. |

**Bit 22 – NOTSDMA** No TouchScreen DMA

| Value | Description |
|---|---|
| 0 | XPOS, YPOS, Z1, Z2 are transmitted in ADC_LCDR. |
| 1 | XPOS, YPOS, Z1, Z2 are never transmitted in ADC_LCDR, therefore the buffer does not contains touchscreen values. |

**Bits 19:16 – TSSCTIM[3:0]** Touchscreen Switches Closure Time
Defines closure time of analog switches necessary to establish the measurement conditions.

The closure time is:

Switch Closure Time = (TSSCTIM × 4) ADCCLK periods.

**Bits 11:8 – TSFREQ[3:0]** Touchscreen Frequency
Defines the touchscreen frequency compared to the trigger frequency.

TSFREQ must be greater or equal to TSAV.

The touchscreen frequency is:

Touchscreen Frequency = Trigger Frequency / $2^{TSFREQ}$

**Bits 5:4 – TSAV[1:0]** Touchscreen Average

| Value | Name | Description |
|---|---|---|
| 0 | NO_FILTER | No Filtering. Only one ADC conversion per measure |
| 1 | AVG2CONV | Averages 2 ADC conversions |
| 2 | AVG4CONV | Averages 4 ADC conversions |
| 3 | AVG8CONV | Averages 8 ADC conversions |

**Bits 1:0 – TSMODE[1:0]** Touchscreen Mode
When TSMOD equals 01 or 10 (i.e., 4-wire mode), channels 0, 1, 2 and 3 must not be used for classic ADC conversions. When TSMOD equals 11 (i.e., 5-wire mode), channels 0, 1, 2, 3, and 4 must not be used.

| Value | Name | Description |
|---|---|---|
| 0 | NONE | No Touchscreen |
| 1 | 4_WIRE_NO_PM | 4-wire Touchscreen without pressure measurement |
| 2 | 4_WIRE | 4-wire Touchscreen with pressure measurement |
| 3 | 5_WIRE | 5-wire Touchscreen |

### 65.7.22 ADC Touchscreen X Position Register

**Name:** ADC_XPOSR
**Offset:** 0xB4
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | XSCALE[11:8] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | XSCALE[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | XPOS[11:8] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | XPOS[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 27:16 – XSCALE[11:0]** Scale of XPOS
Indicates the max value that XPOS can reach. This value should be close to $2^{12}$.

**Bits 11:0 – XPOS[11:0]** X Position
The position measured is stored here. If XPOS = 0 or XPOS = XSIZE, the pen is on the border.

When pen detection is enabled (ADC_TSMR.PENDET set to ‘1’), XPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC_ISR.PENS bit is cleared).

### 65.7.23 ADC Touchscreen Y Position Register

**Name:** ADC_YPOSR
**Offset:** 0xB8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | YSCALE[11:8] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | YSCALE[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | YPOS[11:8] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | YPOS[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 27:16 – YSCALE[11:0]** Scale of YPOS
Indicates the max value that YPOS can reach. This value should be close to $2^{12}$.

**Bits 11:0 – YPOS[11:0]** Y Position
The position measured is stored here. If YPOS = 0 or YPOS = YSIZE, the pen is on the border.

When pen detection is enabled (ADC_TSMR.PENDET set to ‘1’), YPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC_ISR.PENS bit is cleared).

### 65.7.24 ADC Touchscreen Pressure Register

**Name:** ADC_PRESSR
**Offset:** 0xBC
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | | | | | Z2[11:8] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | Z2[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | Z1[11:8] | | | |
| Access | | | | | R | R | R | R |
| Reset | | | | | 0 | 0 | 0 | 0 |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | Z1[7:0] | | | | | | | |
| Access | R | R | R | R | R | R | R | R |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 27:16 – Z2[11:0]** Data of Z2 Measurement
Data Z2 necessary to calculate pen pressure.

When pen detection is enabled (ADC_TSMR.PENDET set to ‘1’), Z2 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC_ISR.PENS bit is cleared).

**Note:** These two values are unavailable if ADC_TSMR.TSMODE is not set to 2.

**Bits 11:0 – Z1[11:0]** Data of Z1 Measurement
Data Z1 necessary to calculate pen pressure.

When pen detection is enabled (ADC_TSMR.PENDET set to ‘1’), Z1 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC_ISR.PENS bit is cleared).

### 65.7.25 ADC Trigger Register

**Name:** ADC_TRGR
**Offset:** 0xC0
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | TRGPER[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| | TRGPER[7:0] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Access | | | | | | | | |
| Reset | | | | | | | | |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | TRGMOD[2:0] | | |
| Access | | | | | | R/W | R/W | R/W |
| Reset | | | | | | 0 | 0 | 0 |

**Bits 31:16 – TRGPER[15:0]** Trigger Period
Effective only if TRGMOD defines a periodic trigger.

Defines the periodic trigger period, with the following equation:

Trigger Period = (TRGPER + 1) / ADCCLK

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence depending on the configuration of registers ADC_MR, ADC_CHSR, ADC_SEQRx, ADC_TSMR.

When TRGMOD is set to pen detect trigger (i.e., 100) and averaging is used (i.e., field TSAV ≠ 0 in ADC_TSMR) only one measure is performed. Thus, XRDY, YRDY, PRDY, DRDY will not rise on pen contact trigger. To achieve measurement, several triggers must be provided either by software or by setting the TRGMOD on continuous trigger (i.e., 110) until flags rise.

**Bits 2:0 – TRGMOD[2:0]** Trigger Mode

| Value | Name | Description |
|---|---|---|
| 0 | NO_TRIGGER | No trigger, only software trigger can start conversions |
| 1 | EXT_TRIG_RISE | Rising edge of the selected trigger event, defined in ADC_MR.TRGSEL |
| 2 | EXT_TRIG_FALL | Falling edge of the selected trigger event |
| 3 | EXT_TRIG_ANY | Any edge of the selected trigger event |

| Value | Name | Description |
|---|---|---|
| 4 | PEN_TRIG | Pen Detect Trigger (shall be selected only if PENDET is set and TSMODE > 0) |
| 5 | PERIOD_TRIG | ADC internal periodic trigger (see field TRGPER) |
| 6 | CONTINUOUS | Continuous mode |

### 65.7.26 ADC Correction Values Register

**Name:** ADC_CVR
**Offset:** 0xD4
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| | GAINCORR[15:8] | | | | | | | |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 31:16 – GAINCORR[15:0]** Gain Correction
Gain correction to apply on converted data. Only bits 0 to 13 are relevant (other bits are ignored and read as 0).

**Bits 15:0 – OFFSETCORR[15:0]** Offset Correction
Offset correction to apply on converted data. The offset is signed (2's complement), only bits 0 to 11 are relevant (other bits are ignored and read as 0).

### 65.7.27 ADC Channel Error Correction Register

**Name:** ADC_CECR
**Offset:** 0xD8
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – ECORRx** Error Correction Enable for channel x

| Value | Description |
|---|---|
| 0 | Automatic error correction is disabled for channel x. |
| 1 | Automatic error correction is enabled for channel x. |

### 65.7.28 ADC Touchscreen Correction Values Register

**Name:** ADC_TSCVR
**Offset:** 0xDC
**Reset:** 0x00000000
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

| | | | | | | | | WPEN |
| Access | | | | | | | | R/W |
| Reset | | | | | | | | 0 |

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

| Value | Name | Description |
|---|---|---|
| 0x414443 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0 |

**Bit 0 – WPEN** Write Protection Enable
See 65.6.19 Register Write Protection for the list of write-protected registers.

| Value | Description |
|---|---|
| 0 | Disables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII). |
| 1 | Enables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII). |

### 65.7.30 ADC Write Protection Status Register

**Name:** ADC_WPSR
**Offset:** 0xE8
**Reset:** 0x00000000
**Property:** Read-only

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|

**Bits 23:8 – WPVSRC[15:0]** Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description |
|---|---|
| 0 | No write protection violation has occurred since the last read of ADC_WPSR. |
| 1 | A write protection violation has occurred since the last read of ADC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC. |

# 66. Electrical Characteristics

## 66.1 Absolute Maximum Ratings

**Table 66-1. Absolute Maximum Ratings***

| | | |
|---|---|---|
| **Storage Temperature** | -60°C to + 150°C | **Note:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. |
| **Voltage on Input Pins with Respect to Ground** | -0.3V to +4.0V | |
| **Maximum Voltage on Power Input Pins with Respect to Ground** | | |
| VDDCORE, VDDPLLA, VDDUTMIC and VDDHSIC | 1.5V | |
| VDDIODDR | 2.0V | |
| VDDBU | 4.0V | |
| VDDIOPx, VDDUTMII, VDDISC, VDDSDMMC, VDDOSC, VDDANA, VDDAUDIOPLL | 4.0V | |
| VDDFUSE | 3.0V | |
| **Total DC Output Current on all I/O lines** | 350 mA | |

## 66.2 DC Characteristics

The following characteristics are applicable to the ambient operating temperature range $T_A$ = -40°C to +105°C for -CN devices, and -40°C to +85°C for -CU devices, unless otherwise specified.

**Table 66-2. Recommended Thermal Operating Conditions**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $T_A$ | Ambient Temperature | – | -40 | – | +105 | °C |
| $T_J$ | Junction Temperature | – | -40 | – | +125 | °C |
| $R_{thJA}$ | Junction-to-ambient thermal resistance | LFBGA289 | – | 34.8 | – | °C/W |
| | | TFBGA256 | – | 27.4 | – | |
| | | TFBGA196 | – | 44.6 | – | |
| $R_{thJC}$ | Junction-to-case thermal resistance | LFBGA289 | – | 10.9 | – | °C/W |
| | | TFBGA256 | – | 9.3 | – | |
| | | TFBGA196 | – | 11.2 | – | |
| $P_D$ | Allowable Power Dissipation | At $T_A$ = 85°C, LFBGA289 | – | – | 1149 | mW |
| | | At $T_A$ = 105°C, LFBGA289 | – | – | 575 | mW |
| $P_D$ | Allowable Power Dissipation | At $T_A$ = 85°C, TFBGA256 | – | – | 1460 | mW |
| | | At $T_A$ = 105°C, TFBGA256 | – | – | 730 | mW |

.....continued

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $P_D$ | Allowable Power Dissipation | At $T_A$ = 85°C, TFBGA196 | – | – | 897 | mW |
| | | At $T_A$ = 105°C, TFBGA196 | – | – | 448 | mW |
| $V_{DDCORE}$ | DC Supply Core | – | 1.1 | 1.2 | 1.32 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 20 MHz | – | – | 15 | mV |
| | Slope | – | 1.3 | – | – | V/ms |
| $V_{DDBU}$ | DC Supply I/Os, Backup | Must be established first | 1.65 | | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 30 | mV |
| | Slope | – | 2.4 | – | – | V/ms |
| $V_{DDANA}$ | DC Supply I/Os, Backup | The ADC is not functional below 2.0V | 1.65 | | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 20 MHz | – | – | 20 | mV |
| | Slope | – | 2.4 | – | – | V/ms |
| $V_{DDIOP0}$ | DC Supply LCD I/Os | | 1.65 | – | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 20 MHz | – | – | 20 | mV |
| $V_{DDIOP1}$ | DC Supply Peripheral I/Os | Peripheral I/O Lines | 1.65 | – | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 20 MHz | – | – | 20 | mV |
| $V_{DDIOP2}$ | DC Supply Peripheral I/Os | Peripheral I/O Lines | 1.65 | – | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 20 MHz | – | – | 20 | mV |
| $V_{DDPLLA}$ | PLL A and Main Oscillator Supply | – | 1.1 | 1.2 | 1.32 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| | | rms value > 10 MHz | – | – | 20 | |
| $V_{DDUTMIC}$ | DC Supply UDPHS and UHPHS UTMI+ Core | – | 1.1 | 1.2 | 1.32 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| $V_{DDUTMII}$ | DC Supply UDPHS and UHPHS UTMI+ Interface | – | 3.0 | 3.3 | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| $V_{DDHSIC}$ | DC Supply HSIC Phy | – | 1.1 | 1.2 | 1.3 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| $V_{DDAUDIOPLL}$ | DC Supply AUDIO PLL | – | 3.0 | 3.3 | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| $V_{DDFUSE}$ | DC Supply Fuse Box | For fuse programming only | 2.25 | 2.5 | 2.75 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| $V_{DDSDMMC}$ | DC Supply Peripheral I/Os | SDMMC I/Os Lines | 1.65 | – | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |
| $V_{DDISC}$ | DC Supply Peripheral I/Os | ISC I/Os Lines | 1.65 | – | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 20 | mV |

.....continued

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{DDOSC}$ | DC Supply Oscillator | – | 1.65 | – | 3.6 | V |
| | Allowable Voltage Ripple | rms value 10 kHz to 10 MHz | – | – | 15 | mV |
| $V_{DDIODDR}$ | DC Supply SDRAM I/Os | - LPDDR1-DDR2 Interface I/O lines | 1.7 | 1.8 | 1.9 | V |

| | High | 50 | 60 | 70 | |

**Table 66-4. QSPI I/O Switching Frequency**

| GPIO Type | Description | Name | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|---|
| GPIO_QSPI | Maximum output frequency | $f_{max}$ | Load = 30 pF | – | 133 | MHz |
| | Output duty cycle | – | Load = 30 pF | 45 | 55 | % |

## 66.3 Power Consumption

This section provides information about the current consumption on different power supply rails of the device. It gives current consumption in:

- Active mode when running a CoreMark and in predefined use cases
- Low-power modes: Backup mode, Idle mode and Ultra Low-power mode

- By peripheral with representative activity

## 66.4 Active Mode

Active mode is the normal running mode with the Arm core clock running off a PLL. The power management controller is used to adapt the frequency and to disable the peripheral clocks.

### 66.4.1 Active Mode Power Consumption Versus Modes

The power consumption values are measured under the following operating conditions:

- Parts are from typical process
- $V_{DDIOPx}$ = 3.3V
- $V_{DDSDMMC0}$ and $V_{DDSDMMC1}$ = 1.8V to 3.3V (high frequency)
- $V_{DDCORE}$ = 1.2V +/-2%
- $V_{DDBU}$ = 1.6V to 3.6V
- $T_A$ = as specified in tables "Typical Peripheral Power Consumption by Peripheral in Active Mode" and "Power Consumption in Active Mode: AMP2"
- There is no consumption on the device I/Os.
- All peripheral clocks are disabled.

**Figure 66-1. Measurement Schematics**

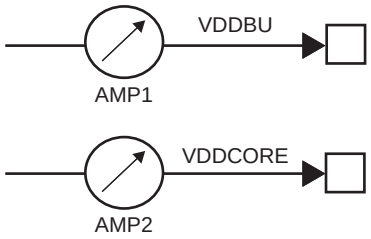

**Table 66-5. Typical Peripheral Power Consumption by Peripheral in Active Mode**

Measurements made at $T_A$ = 25°C and with peripheral clock enabled.

| Peripheral | Clock | Consumption on VDDCORE | Conditions | Consumption (typ) | Unit |
|---|---|---|---|---|---|
| GMAC | MCK/2 | – | See Note 1. | 12 *MCK + 1840*DR (Data rate in Mbits/s) | µA |
| XDMAC0 | MCK | – | See Note 2. | 17.6 * MCK + 4.92 * DR (MCK in MHz, Data rate in Mbytes/s) | |
| XDMAC1 | MCK | – | | | |
| ICM | MCK/2 | 3.52 | – | – | µA/MHz |
| AES | MCK | 8.79 | | | |
| AESB | MCK | 7.49 | | | |
| TDES | MCK/2 | 0.85 | | | |
| SHA | MCK | 3.88 | | | |
| MPDDRC | MCK | 45.21 | See Note 3. | 67 * MCK + 3.11 * DR + 1609 (MCK in MHz, Data rate in Mbytes/s) | µA |

.....continued

| Peripheral | Clock | Consumption on VDDCORE | Conditions | Consumption (typ) | Unit |
|---|---|---|---|---|---|
| HSMC | MCK/2 | 20.12 | – | – | µA/MHz |
| PIOA | MCK/2 | 11.39 | | | |
| FLEXCOM0 | MCK/2 | - | | | |
| FLEX0_USART | | 5.21 | | | |
| FLEX0_SPI | | 7.39 | | | |
| FLEX0_TWI | | 3.88 | | | |
| FLEXCOM1 | MCK/2 | See FLEXCOM0 | | | |
| FLEXCOM2 | MCK/2 | See FLEXCOM0 | | | |
| FLEXCOM3 | MCK/2 | See FLEXCOM0 | | | |

| UART3 | MCK/2 | 0.85 | | | |
| UART4 | MCK/2 | 0.85 | | | |
| TWIHS0 | MCK/2 | 3.27 | | | |
| TWIHS1 | MCK/2 | 3.39 | | | |
| SDMMC0 | MCK | 8.61 | | | |
| SDMMC1 | MCK | 8.61 | | | |
| SPI0 | MCK/2 | 4.61 | | | |
| SPI1 | MCK/2 | 4.48 | | | |
| TC0 | MCK/2 | 3.03 | | | |
| TC1 | MCK/2 | 4 | | | |
| PWM | MCK/2 | 7.03 | | | |
| ADC | MCK/2 | 2.3 | | | |
| UHPHS | MCK/2 | – | See Note 4. | 12 *MCK + 490*DR (MCK in MHz, Data rate in Mbytes/s) | µA |
| UDPHS | MCK/2 | | See Note 5. | 10 *MCK + 206*DR (MCK in MHz, Data rate in Mbytes/s) | |
| SSC0 | MCK/2 | 1.58 | – | – | µA/MHz |
| SSC1 | MCK/2 | 1.58 | | | |
| LCDC | MCK | – | See Note 6. | 9.8 *MCK + 32 *Pix_CLK + 15.7*DR_Baselayer +30.1*DR_Overlayer (MCK & Pixelclock in MHz, Data rate in Mbytes/s); | µA |
| ISC | MCK | | See Note 7. | 10.9*MCK + 22.4*ISPCK + 12.38*DR_sensor (MCK & ISPCK in MHz, Data rate in Mbytes/s) | |
| TRNG | MCK/2 | 760 | – | – | |

.....continued

| Peripheral | Clock | Consumption on VDDCORE | Conditions | Consumption (typ) | Unit |
|---|---|---|---|---|---|
| PDMIC | MCK/2 | 8.24 | – | – | µA/MHz |
| QSPI0 | MCK | 1.94 | | | |
| QSPI1 | MCK | 1.94 | | | |
| I2SC0 | MCK/2 | 0.61 | | | |
| I2SC1 | MCK/2 | 0.61 | | | |
| CAN0 | MCK/2 | 9.7 | | | |
| CAN1 | MCK/2 | 7.27 | | | |

**Note:**

1. In Linux OS, use the ‘iperf’ command to perform bidirectional data transfers. Measure GMAC consumption at different transfer speeds.
2. XDMAC is initialized and one channel performs a memory-to-memory transfer. During test, the data rate is adjusted by changing the DMA setting and the burst size.
3. DDR3 devices are initialized (fully functional). XDMAC performs a memory-to-memory transfer inside the DDR area. Total consumption of MPDDRC and XDMAC is measured. MPDDRC consumption is calculated by discounting XDMAC consumption.
4. In Linux OS, measure UHPHS consumption at different transfer speeds.
5. In Linux OS, build a mass storage using UDPHS. Measure UDPHS consumption at different transfer speeds.
6. The LCD timing engine and each display layer are switched on in sequence. The static image (using random data) is displayed under various resolutions. The 24-bpp RGB888 color space is set for all layers. Auxiliary functions such as rotation, scaling, color space conversion, color look-up table, and chroma upsampling are disabled.
7. ISC performs image sensor preview.

In order to maximize performance, each Peripheral Clock has been timed to H32MX clock frequency. The peripheral frequency can be reduced with the help of a divider in PMC_PCR.

**Table 66-6. Power Consumption in Active Mode: AMP2**

| Conditions $T_A$ = 25°C | | Consumption | |
|---|---|---|---|
| | | Dhrystone (mA) | CoreMark (mA) |
| PLL clock is 1000 MHz, Arm Core clock is 500 MHz, MCK is 166 MHz.<br>– Caches L1 and L2 enabled<br>– Code running off of internal SRAM<br>– Code speed optimization<br>– Run Dhrystone / CoreMark benchmark<br>– Peripheral clock disabled | MRL C<br>MRL B | 114.4 | 108.8 |
| | MRL A | 237.2 | 233.7 |

## 66.5 Low-power Modes

Low-power modes provide a way to balance device power consumption against wake-up time. The modes are described below, in the order of lowest to highest power consumption.

### 66.5.1 Backup Mode

Backup mode achieves the lowest power consumption in the system with limited functionality.

In this mode, only the backup area is powered, maintaining the RTC, the back-up registers, the back-up SRAM and the security module running. This mode is entered by shutting down all the power rails except the VDDBU (refer to the section Shutdown Controller (SHDWC)). To exit Backup mode, the SHDN pin (connected to the enable of the external Power Management IC) must be driven high by an internal event (RTC) or by one of the external events listed below:

- WKUP0 to WKUP9 pins (level transition, configurable debouncing)
- Character received on a serial com receiver (RXLP)
- Analog comparison

Backup mode functionality has been extended with the possibility to keep the DDR memory in Self-refresh state.

### 66.5.2 Backup Mode with DDR in Self-Refresh

Backup mode with DDR in Self-refresh is used to keep the DDR contents when the system is powered off. This mode is achieved by maintaining the backup area and the VDDIODDR powered. To enter Backup Self-refresh mode, follow the sequence below:

- Software saves all the context information to resume (application-dependent).
- Put the DDR in Self-refresh mode and wait until the Self-refresh status is OK (refer to the section Multiport DDR-SDRAM Controller (MPDDRC)).
- Set SFRBU_DDRBUMCR.BUMEN (see SFRBU DDR BU Mode Control Register).
- Enter Backup mode as described above.

To exit this mode, follow the sequence below:

- Once the system is restarted, the software checks the state of SFRBU_DDRBUMCR.BUMEN.
- Restore all the context information.
- Check that the Self-refresh status is OK (refer to the section Multiport DDR-SDRAM Controller (MPDDRC)).
- Disable SFRBU_DDRBUMCR.BUMEN (see SFRBU DDR BU Mode Control Register).
- The DDR memory exits Self-refresh mode when a memory access in the DDR memory space is performed.

### 66.5.3 Ultra Low-power (ULP) Mode

Ultra Low-power mode achieves the lowest power consumption with the system in Retention mode and able to resume on wake-up events (any interrupt or hardware event). This mode is a combination of the Wait for Interrupt mode of the Arm core and a reduced frequency or shut-off of the system clocks.

To obtain the best results, care must be taken that the I/Os (pull-up/pull-down, etc.), USB transceivers, etc., are set to the appropriate state.

The Ultra Low-power mode features two submodes:

- ULP0 mode
- ULP1 mode

#### 66.5.3.1 ULP0 Mode

ULP0 mode maintains a very low frequency clock to wake up on any interrupt.

The selection of the clock depends on the current consumption target versus wake-up time. The higher the frequency, the higher the power consumption.

The sequence to enter ULP0 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM.

1. Set the DDR to Self-Refresh mode.
2. Set the interrupts to wake up the system.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers (refer to the section Special Function Registers (SFR)).
5. Switch the system clock to the selected clock (RC12MHZ, 32 KHz Slow Clock.) according to the power consumption and wake-up time awaited (see table VDDCORE Power Consumption in Ultra Low-power Mode: AMP2).
6. Disable the PLLs and all unused clocks (main oscillator, 12 MHz RC oscillator or 32 KHz oscillator).
7. Enter the Wait for Interrupt mode and disable the PCK clock in the PMC_SCDR.

The wake-up from ULP0 mode is triggered by any enabled interrupt. When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before WFI.

#### 66.5.3.2 ULP1 Mode

Unlike ULP0 mode, all the clocks are off in ULP1 mode, but the number of wake-up sources is limited to the list below:

- WKUP0 pin (level transition, configurable debouncing)
- WKUP1 Secumod wake-up signal
- WKUP2 pin to WKUP9 pin (shared with PIOBU0 to PIOBU7)
- RTC alarm
- USB Resume from Suspend mode
- SDMMC card detect
- RXLP event
- ACC event
- Any SleepWalking event coming from TWI, FLEXCOMx, SPI, or ADC

The sequence to enter the ULP1 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM.

1. Set the DDR to Self-Refresh mode.
2. Set the events to enable a system wake-up.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers (refer to the section Special Function Registers (SFR)).
5. Switch the system clock to the 12 MHz RC oscillator.
6. Disable the PLLs and the main oscillator.
7. Enter the ULP1 mode by either:
   7.1. setting the WAITMODE bit in CKGR_MOR, or
   7.2. setting the LPM bit in PMC_FSMR and executing the processor WaitForEvent (WFE) instruction.
8. After setting the WAITMODE bit or using the WFE instruction, wait for the PMC_SR.MCKRDY bit to be set.

### 66.5.4 Idle Mode

In Idle mode, power consumption of the device versus response time is optimized. In this mode, only the core clock is stopped. The peripheral clocks, including the DDR controller clock, can be enabled. The current consumption in this mode is application-dependent and can be reduced by enabling Dynamic Clock Gating (L2CC_POWCR.DCKGATEN = 1).

This mode is entered via the Wait for Interrupt (WFI) instruction and PCK disabling.

The processor can be awakened from an interrupt. The system resumes where it was before entering WFI mode.

### 66.5.5 Low-power Mode Summary Table

The modes detailed above are the main low-power modes. Each part can be set to on or off separately and wake-up sources can be configured individually. The table below gives a summary of the low-power mode configurations.

**Table 66-7. Low-power Mode Configuration Summary**

| Submode | Low-power Mode | | | | |
|---|---|---|---|---|---|
| | Backup | | Ultra-low-power | | Idle |
| | – | Self-refresh | ULP0 | ULP1 | |
| 64 kHz RC Oscillator, 32 kHz Oscillator, RTC, Backup Memory and Registers, POR | ON | | | | |
| 12 MHz RC Oscillator | OFF | | | | ON |
| VDDCORE Regulator | OFF | | ON | | |
| Core | OFF (not powered) | | Powered (not clocked) | | |
| Memory, Peripherals | OFF (not powered) | | Powered (512 Hz) | Powered (not clocked) | Powered (clocked) |
| Mode Entry | Shutdown Controller, FLEXCOM SleepWalking | DDR in Self-refresh, Shutdown Controller | DDR in Self-refresh, Frequency reduced in PMC, WFI | DDR in Self-refresh, CKGR_MOR.WAIT-MODE=1 | DDR in Self-refresh, WFI |
| Potential Wake-up Sources | WKUP0 pin, any PIOBU configured as WKUP pin, RTC alarm, any level above comparator source or character received | Backup mode sources | Any interrupt | Wake-up pins, WOL | Any interrupt |
| Core at Wake-up | Reset | | Clocked back at 512 Hz | Clocked back at 12 MHz | Clocked back at full speed |
| PIO State While in Low-power Mode | Reset | | Previous state saved | | |
| PIO State at Wake-up | Inputs with pull-ups | Unchanged | | | |
| Consumption(2) | $I_{VDDBU}$= 4.5 µA typ(3) at 25°C/3.0V | $I_{VDDBU}$= 4.5 µA typ(3) at 25°C/3.0V $I_{VDDIODDR}$ = 40 µA | 0.21 mA at 25°C/1.1V 0.27 mA at 25°C/1.2V | 0.17 mA at 25°C/1.1V 0.27 mA at 25°C/1.2V | 28 mA at 25°C/ 1.2V(4) |
| Wake-up Time(1) | Start-up time | Start-up time | 300 ms | 15 µs | 800 ns at 498 MHz |

**Note:**

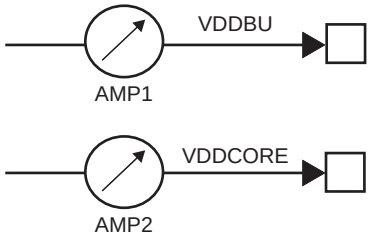
1. When considering wake-up time, the time required to start the PLL is not taken into account. Once started, the device works with the main oscillator. The user has to add the PLL start-up time if it is needed in the system. The wake-up time is defined as the time taken for wake-up until the first instruction is fetched.
2. The external loads on PIOs are not taken into account in the calculation.
3. Total current consumption.
4. Dynamic Clock Gating enabled (L2CC_POWCR.DCKGATEN = 1).

### 66.5.6 Low-power Consumption Versus Modes

The low-power consumption values are measured under the following operating conditions:

- Parts are from typical process
- $V_{DDIOPx}$ = 3.3V
- $V_{DDSDMMC0}$ and $V_{DDSDMMC1}$ = 1.8V to 3.3V (high frequency)
- $V_{DDCORE}$ = 1.2V ±2%
- $V_{DDBU}$ = 1.6V to 3.6V
- $T_A$ = as specified in the tables below
- There is no consumption on the device I/Os.
- All peripheral clocks are disabled.

**Figure 66-2. Measurement Schematics**



In order to maximize performances, each Peripheral Clock has been timed to H32MX clock frequency. The peripheral frequency can be reduced with the help of a divider in PMC_PCR.

**Table 66-8. Typical Power Consumption in Idle Mode: AMP2**

| Conditions | Consumption | | | | |
|---|---|---|---|---|---|
| | $T_A$ 25°C | $T_A$ 70°C | $T_A$ 85°C | $T_A$ 105°C | Unit |
| PLL clock is 1000 MHz, Arm Core clock is 500 MHz, MCK is 166 MHz.<br>– Core clock is stopped<br>– Peripheral clocks, including the DDR Controller clock, can be enabled<br>– Mode is entered via Wait for Interrupt (WFI) instruction and PCK disabling<br>– Measure IDDCORE + IDDBU<br>– Peripheral clock disabled | 28.2 | 29.6 | 30.8 | 33.4 | mA |

**Table 66-9. VDDCORE Power Consumption in Ultra-Low-Power Mode: AMP2**

| Mode | Conditions | Consumption (mA) | | | | Wake-up Time (µs) |
|---|---|---|---|---|---|---|
| | | $T_A$ 25°C | $T_A$ 70°C | $T_A$ 85°C | $T_A$ 105°C | |
| ULP1 Fast Wakeup | Arm Core clock is disabled. MCK is 0. | 0.3 | 1.4 | 2.4 | 4.6 | 15 |
| ULP0 12 MHz | Arm Core clock is disabled. MCK is 12 MHz. | 3.2 | 4.2 | 5.3 | 7.7 | 13 |

.....continued

| Mode | Conditions | Consumption (mA) | | | | Wake-up Time (µs) |
|---|---|---|---|---|---|---|
| | | $T_A$ 25°C | $T_A$ 70°C | $T_A$ 85°C | $T_A$ 105°C | |
| ULP0 750 kHz | Arm Core clock is disabled. MCK is 750 kHz. | 1.6 | 2.6 | 3.7 | 6.1 | 205 |
| ULP0 187 kHz | Arm Core clock is disabled. MCK is 187.5 kHz. | 1.5 | 2.5 | 3.6 | 6.0 | 820 |
| ULP0 32 kHz | Arm Core clock is disabled. MCK is 32 kHz. | 0.3 | 1.5 | 2.6 | 5.0 | 4690 |

**Table 66-10. Typical Power Consumption for Backup Mode**

Measurements made when powered by VDDBU only.

| VDDBU (V) | Conditions | Consumption (µA) | | | | Unit |
|---|---|---|---|---|---|---|
| | | $T_A$ = 25°C | $T_A$ = 70°C | $T_A$ = 85°C | $T_A$ = 105°C | |
| 1.6 | VDDBU Only | 4.2 | 12.1 | 19.3 | 36.8 | µA |
| 1.7 | | 4.2 | 12.1 | 19.3 | 36.9 | |
| 1.8 | | 4.3 | 12.1 | 19.4 | 36.9 | |
| 1.9 | | 4.3 | 12.1 | 19.4 | 36.9 | |
| 2 | | 4.3 | 12.1 | 19.4 | 37 | |
| 2.1 | | 4.3 | 12.2 | 19.4 | 37 | |
| 2.2 | | 4.3 | 12.2 | 19.5 | 37 | |
| 2.3 | | 4.4 | 12.2 | 19.5 | 37 | |
| 2.4 | | 4.4 | 12.2 | 19.5 | 37 | |
| 2.5 | | 4.4 | 12.3 | 19.5 | 37.1 | |
| 2.6 | | 4.4 | 12.3 | 19.6 | 37.1 | |
| 2.7 | | 4.4 | 12.3 | 19.6 | 37.1 | |
| 2.8 | | 4.4 | 12.3 | 19.6 | 37.2 | |
| 2.9 | | 4.5 | 12.4 | 19.6 | 37.2 | |
| 3 | | 4.5 | 12.4 | 19.7 | 37.3 | |
| 3.1 | | 4.5 | 12.5 | 19.8 | 37.7 | |
| 3.2 | | 4.6 | 12.8 | 20.3 | 38.3 | |
| 3.3 | | 4.9 | 13.4 | 20.9 | 38.9 | |
| 3.4 | | 5.5 | 14.1 | 21.6 | 39.7 | |
| 3.5 | | 6.2 | 14.9 | 22.4 | 40.5 | |
| 3.6 | | 7 | 15.7 | 23.3 | 41.4 | |

## 66.6 Clock Characteristics

The following characteristics are applicable to the ambient operating temperature range $T_A$ = -40°C to +105°C for -CN devices, and $T_A$ = -40°C to +85°C for -CU devices, unless otherwise specified.

### 66.6.1 Processor Clock Characteristics

**Table 66-11. Processor Clock Waveform Parameters**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| 1/($t_{CPPCK}$) | Processor Clock Frequency | VDDCORE[1.1V, 1.32V] | 250(1) | 400 | MHz |
| | | VDDCORE[1.2V, 1.32V] | 250(1) | 500 | |

**Note:**

1. Limitation for DDR2 (125 MHz) usage only. There are no limitations to DDR3, DDR3L, LPDDR1, LPDDR2 and LPDDR3.

### 66.6.2 Master Clock Characteristics

The master clock is the maximum clock at which the system is able to run. It is given by the smallest value of the internal bus clock and EBI clock.

**Table 66-12. Master Clock Waveform Parameters**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| 1/($t_{CPMCK}$) | Master Clock Frequency | VDDCORE[1.1V, 1.32V] | 125(1) | 133 | MHz |
| | | VDDCORE[1.2V, 1.32V], in DDR2 or LPDDR1 mode, VDDIODDR[1.8V, 1.9V]<br>in LPDDR2 or LPDDR3 mode, VDDIODDR[1.2V, 1.30V]<br>in DDR3 mode, VDDIODDR[1.5V, 1.575V]<br>in DDR3L mode, VDDIODDR[1.35V, 1.45V]<br>Security disabled | 125(1) | 166(2) | |

**Note:**

1. Limitation for DDR2 usage only. There are no limitations to DDR3, DDR3L, LPDDR1, LPDDR2 and LPDDR3.
2. The JEDEC standard specifies a maximum clock frequency of 125 MHz for DDR3 and DDR3L in DLL Off mode. However, check with memory suppliers for higher frequencies.

## 66.7 Oscillator Characteristics

### 66.7.1 Main Oscillator Characteristics

**Table 66-13. 8 to 24 MHz Crystal Oscillator Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{OSC}$ | Operating Frequency | FREQ(2) = 00, 11 | 8 | – | 12 | MHz |
| | | FREQ = 01 | 12 | | 16 | |
| | | FREQ = 10 | 16 | | 24 | |
| – | Duty Cycle | – | 40 | 50 | 60 | % |

.....continued

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $t_{START}$ | Startup Time | FREQ[2] = 00, 11<br>FREQ = 01<br>FREQ = 10 | – | – | 18.5<br>10.5<br>6 | ms |
| $I_{DDON}$ | Current Consumption (on VDDIO) | @ 12 MHz<br>@ 24 MHz | – | 1.2<br>1.7 | 3.5<br>4 | mA |
| $I_{DD_STDBY}$ | Standby Current | – | – | 0.02 | 0.1 | µA |
| $C_{PARA}$ | Internal Parasitic Capacitance[1] | From XIN to XOUT | 1.4 | 1.6 | 1.8 | pF |
| $P_{ON}$ | Drive level | FREQ = 00<br>FREQ = 01, 11<br>FREQ = 10 | – | – | 150<br>300<br>400 | µW |

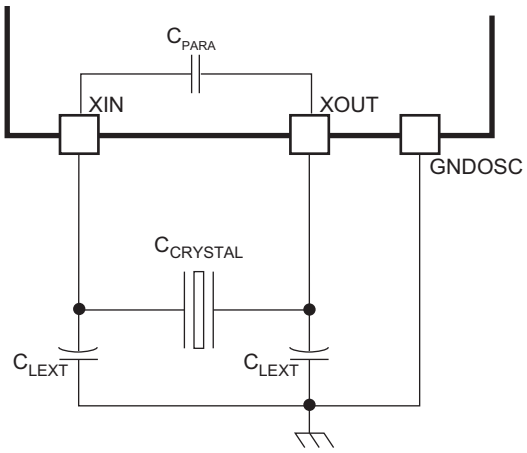
**Note:**

1. The values of external capacitors can be determined by using the following formula:
   $C_{LEXT} = (2 \times C_{CRYSTAL}) - C_{BOARD} - (C_{PARA} \times 2)$

   where:

   - $C_{LEXT}$ is the external capacitor value which must be soldered from XIN to GND and XOUT to GND
   - $C_{CRYSTAL}$ is crystal targeted load
   - $C_{BOARD}$ is the external board parasitic capacitance (from XIN to GND or XOUT to GND)
   - $C_{PARA}$ is the internal parasitic capacitance
2. The SFR_UTMICKTRIM.FREQ field defines the input frequency for the UTMI and the main oscillator. It is important to select the correct FREQ value because this has a direct influence on USB frequency.

**Figure 66-3. Main Oscillator Schematics**



#### 66.7.1.1 Recommended Crystal Characteristics

**Table 66-14. Recommended Crystal Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| ESR | Equivalent Series Resistance | FREQ = 00, 11 | – | – | 100 | Ω |
| | | FREQ = 10, 01 | – | – | 80 | |
| $C_M$ | Motional Capacitance | FREQ = 00 | 5 | – | 9 | fF |
| | | FREQ = 01, 10, 11 | 1.3 | – | 3.2 | |
| $C_S$ | Shunt Capacitance | FREQ = 00, 01, 10 | – | – | 3 | pF |
| | | FREQ = 11 | – | – | 1.3 | |
| $C_{CRYSTAL}$ | Allowed crystal capacitive load | From crystal specification | | | | pF |
| | | FREQ = 00, 01, 11 | 12.5 | – | 18 | |
| | | FREQ = 10 | 8 | – | 12.5 | |

#### 66.7.1.2 XIN Clock Characteristics

These characteristics apply only when the Main Oscillator is in Bypass mode (i.e., when MOSCRCEN = 0 and MOSCXTBY = 1 in CKGR_MOR). Refer to PMC Clock Generator Main Oscillator Register.

**Table 66-15. XIN Clock Electrical Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $1/(t_{CPXIN})$ | XIN Clock Frequency | – | – | – | 50 | MHz |
| $t_{CPXIN}$ | XIN Clock Period | – | 20 | – | – | ns |
| $t_{CHXIN}$ | XIN Clock High Half-period | – | 0.4 x $t_{CPXIN}$ | – | 0.6 x $t_{CPXIN}$ | ns |
| $t_{CLXIN}$ | XIN Clock Low Half-period | – | 0.4 x $t_{CPXIN}$ | – | 0.6 x $t_{CPXIN}$ | ns |
| $C_{IN}$ | XIN Input Capacitance | – | – | – | 25 | pF |
| $R_{IN}$ | XIN Pull-down Resistor | – | – | – | 500 | kΩ |
| $V_{IL_XIN}$ | XIN Low-level Input Voltage | – | – | – | 0.3 x $V_{DDOSC}$ | V |
| $V_{IH_XIN}$ | XIN High-level Input Voltage | – | 0.7 x $V_{DDOSC}$ | – | – | V |

### 66.7.2 12 MHz RC Oscillator Characteristics

**Table 66-16. 12 MHz RC Oscillator Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{OSC}$ | RC Oscillator Frequency | – | 11.4 | – | 12.6 | MHz |
| $t_{START}$ | Startup Time | – | – | – | 15 | µs |
| Duty | Duty Cycle | – | 45 | 50 | 55 | % |
| $I_{DDON}$ | Current Consumption | After startup time | – | 160 | 350 | µA |

### 66.7.3 32.768 kHz Crystal Oscillator Characteristics

**Table 66-17. 32.768 kHz Crystal Oscillator Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{OSC}$ | Operating Frequency | Normal mode with crystal | – | 32.768 | – | kHz |
| $t_{START}$ | Startup Time | Cm> 3fF | – | – | 1200 | ms |

.....continued

| Symbol | Parameter | Conditions | | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|---|
| $I_{DDON}$ | Current Consumption | ESR < 50k ohm | $C_{CRYSTAL32}$ = 12.5 pF | – | 440 | 900 | nA |
| | | | $C_{CRYSTAL32}$ = 6 pF | | 600 | 900 | |
| | | ESR < 100k ohm | $C_{CRYSTAL32}$ = 12.5 pF | | 800 | 1200 | |
| | | | $C_{CRYSTAL32}$ = 6 pF | | 700 | 1200 | |
| $C_{PARA32}$ | Internal Parasitic Capacitance | Between XIN32 and XOUT32 | | 1.4 | 1.6 | 1.8 | pF |

**Figure 66-4. 32 kHz Oscillator Schematics**

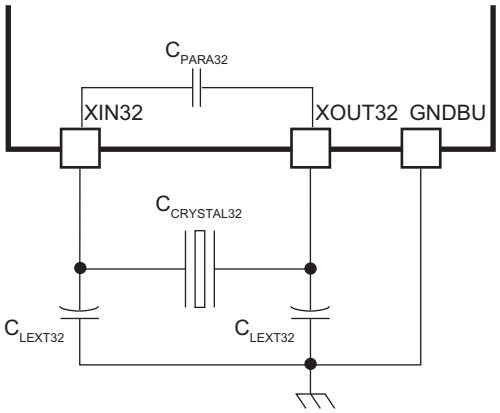


**Table 66-18. Recommended 32.768 kHz Crystal Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| ESR | Equivalent Series Resistor | Crystal at 32.768 kHz | – | – | 100 | kΩ |
| – | Duty Cycle | – | 40 | 50 | 60 | % |
| $C_m$ | Motional Capacitance | Crystal at 32.768 kHz | 3 | – | 8 | fF |
| $C_{SHUNT}$ | Shunt Capacitance | Crystal at 32.768 kHz | 0.6 | – | 2 | pF |
| $C_{CRYSTAL32}$ | Allowed Crystal Capacitance Load(1) | From crystal specification | 6 | – | 12.5 | pF |
| $P_{ON}$ | Drive Level | – | – | – | 0.2 | µW |

**Note:** The value of the external capacitors can be determined by using the following formula:
$C_{LEXT32} = (2 \times C_{CRYSTAL32}) - C_{BOARD} - (C_{PARA32} \times 2)$

where:

- $C_{LEXT32}$ is the external capacitor value which must be soldered from XIN to GND and XOUT to GND
- $C_{CRYSTAL32}$ is crystal targeted load
- $C_{BOARD}$ is the external board parasitic capacitance (from XIN to GND or XOUT to GND)
- $C_{PARA32}$ is the internal parasitic capacitance

### 66.7.4 64 kHz RC Oscillator Characteristics

**Table 66-19. 64 kHz RC Oscillator Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{OSC}$ | RC Oscillator Frequency | – | 40 | – | 90 | kHz |

.....continued

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $t_{START}$ | Startup Time | – | 11 | 17 | 30 | µs |
| $I_{DDON}$ | Current Consumption | After startup time | – | 93 | 140 | nA |

## 66.8 PLL Characteristics

**Table 66-20. PLLA Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{IN}$ | Input Frequency | – | 12 | – | 24 | MHz |
| $f_{OUT}$ | Output Frequency | – | 600 | – | 1200 | MHz |
| $I_{PLL}$ | Current Consumption | Active mode | – | – | 14.5 | mA |
| | | Standby mode | – | – | 2 | µA |
| $t_{START}$ | Startup Time | – | – | – | 60 | µs |

**Table 66-21. UTMI PLL Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{IN}$ | Input Frequency | – | 12 | – | 24 | MHz |
| $f_{OUT}$ | Output Frequency | – | | 480 | | MHz |
| $I_{VDDUTMII}$ | Current Consumption | In Active mode, on VDDUTMII, @480 MHz | – | 6.3 | 7.0 | mA |
| $t_{START}$ | Startup Time | – | – | – | 60 | µs |

**Table 66-22. Audio PLL Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{IN}$ | Input Frequency | – | 12 | – | 24 | MHz |
| $f_{AUDIOCORECLK}$ | AUDIOCORECLK frequency range | – | 620 | – | 700 | MHz |
| $f_{AUDIOPINCLK}$ | AUDIOPINCLK frequency range | – | 8 | 12.288 | 48 | MHz |
| $f_{AUDIOPLLCLK}$ | AUDIOPLLCLK frequency range | – | – | – | 150 | MHz |
| $I_{PLL}$ | Current Consumption | On VDDAUDIOPLL | 6 | – | 20 | mA |
| $t_{START}$ | Startup Time | From OFF to stable AUDIOCORECLK frequency | – | – | 100 | µs |
| $t_{SET}$ | Settling Time(1) | When changing FRACR or NR in PMC_AUDIO_PLL0 or PMC_AUDIO_PLL1 | – | – | 100 | µs |

**Note:** Loop filter is set as recommended in fields BIAS_FILTER and DCO_FILTER of PMC_AUDIO_PLL0.

## 66.9 USB HS Characteristics

### 66.9.1 Electrical Characteristics

The device conforms to all voltage, power, and timing characteristics and specifications set forth in the USB 2.0 Specification. Refer to the USB 2.0 Specification for more information.

### 66.9.2 Dynamic Power Consumption

**Table 66-23. USB Transceiver Dynamic Power Consumption**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $I_{BIAS}$ | Bias Generator Current Consumption | – | – | 0.7 | 0.8 | mA |
| $I_{VDDUTMII}$ | HS Transceiver Current Consumption | HS transmission | – | 47 | 60 | mA |
| | HS Transceiver Current Consumption | HS reception | – | 18 | 27 | mA |
| | LS / FS Transceiver Current Consumption | FS transmission 0m cable(1) | – | 4 | 6 | mA |
| | LS / FS Transceiver Current Consumption | FS transmission 5m cable(1) | – | 26 | 30 | mA |
| | LS / FS Transceiver Current Consumption | FS reception(1) | – | 3 | 4.5 | mA |
| $I_{VDDUTMIC}$ | Core | – | – | 5.5 | 9 | mA |

**Note:** Including 1 mA due to pull-up/pull-down current consumption.

## 66.10 PTC Characteristics

**Table 66-24. PTC Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $C_C$ | Compensation Capacitance | Programmable max code 0x3FFF | 30 | – | – | pF |
| $E_{RS}$ | Error on Serial Filtering Resistance | 20, 50, 100 kOhm | -20 | – | 20 | % |
| $I_{PTCT}$ | PTC Current Consumption | – | – | – | 500 | µA |

## 66.11 ADC Characteristics

The following characteristics are applicable to the ambient operating temperature range TA = -40°C to +105°C for -CN devices, and -40°C to +85°C for -CU devices, unless otherwise specified.

ADVREF is the positive reference of the ADC.

### 66.11.1 ADC Power Supply

#### 66.11.1.1 Power Supply Characteristics

**Table 66-25. Power Supply Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $I_{VDDIN}$ | Analog Current Consumption | Sleep mode(1) | – | 2 | 4 | µA |
| | | Fast Wake-up mode | | 0.4 | 0.6 | mA |
| | | Normal mode, single sampling | | 2.2 | 3.0 | mA |

.....continued

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $I_{VDDCORE}$ | Digital Current Consumption | Sleep mode(1) | – | 1 | 2 | µA |
| | | Normal mode | | 80 | 100 | µA |

**Note:** In Sleep mode, the ADC core, the Sample and Hold and the internal reference operational amplifier are off.

#### 66.11.1.2 ADC Bias Current

The field IBCTL in ADC_ACR controls the ADC biasing current.

The table below gives the IBCTL settings according to the ADC sample rate value.

| IBCTL | Max Data Rate (Ksps) |
|---|---|
| 00 | 250 |
| 01 | 500 |
| 10 | 1000 |
| 11 | 1000 |

### 66.11.2 External Reference Voltage

$V_{ADVREF}$ is an external reference voltage applied on the pin ADVREF. The quality of the reference voltage $V_{ADVREF}$ is critical to the performance of the ADC. A DC variation of the reference voltage $V_{ADVREF}$ is converted to a gain error by the ADC. The noise generated by $V_{ADVREF}$ is converted by the ADC to count noise.

**Table 66-26. ADVREF Electrical Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{ADVREF}$ | Voltage Range | Full operational | 2 | – | VDDANA | V |
| | RMS Noise | Bandwidth 10 kHz to 1 MHz | – | – | 100 | µV |
| $R_{ADVREF}$ | Input DC Impedance | ADC reference resistance bridge(1) | 6 | 8 | 10 | kΩ |
| $I_{ADVREF}$ | Current | $V_{ADVREF}$ = 3.3V | – | – | 460 | µA |

**Note:**

1. When the ADC is off, the ADVREF impedance has a minimum of 1 MΩ.

### 66.11.3 ADC Timings

**Table 66-27. ADC Timing Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $f_{ADC_Clock}$ | Clock Frequency | – | 0.2 | – | 20 | MHz |
| $f_S$ | Sampling Frequency(1) | – | – | – | 1 | MHz |
| $t_{START}$ | ADC Start-up Time | Sleep mode to Normal mode | – | – | 4 | µs |
| | | Fast Wake-up mode to Normal mode | | | 2 | |

**Note:** $t_{ADC_Clock} = 1/f_{ADC_Clock}$ ADC conversion time = 21 $t_{ADC_Clock}$. The Tracking time of the ADC has a minimal value of $t_{TRACKTIM}$ = 15 $t_{ADC_Clock}$.

### 66.11.4 ADC Transfer Function

The DATA code in ADC_CDR is up to 12-bit positive integer or two's complement (signed integer).

#### 66.11.4.1 Differential Mode (12-bit mode)

A differential input voltage $V_{IN} = V_{INP} - V_{INN}$ can be applied between two selected differential pins, e.g. ADC0_AD0 and ADC0_AD1. The ideal code $C_i$ is calculated by using the following formula and rounding the result to the nearest positive integer.

$$C_i = \frac{2047}{V_{\mathrm{ADVREF}}} \times V_{\mathrm{IN}}$$

For the other resolution defined by RES, the code $C_i$ is extended to the corresponding resolution.

The table below is a computation example for the above formula, where $V_{ADVREF}$ = 3V.

**Table 66-28. Input Voltage Values in Differential Mode, Non-signed Output**

| Signed $C_i$ | $V_{IN}$ |
|---|---|
| -2048 | -3 |
| 0 | 0 |
| 2047 | 3 |

#### 66.11.4.2 Single-ended Mode (12-bit mode)

A single input voltage $V_{IN}$ can be applied to selected pins, e.g., ADC0_AD0 or ADC0_AD1. The ideal code $C_i$ is calculated using the following formula and rounding the result to the nearest positive integer.

The single-ended ideal code conversion formula is:

$$C_i = \frac{4095}{V_{\mathrm{ADVREF}}} \times V_{\mathrm{IN}}$$

For the other resolution defined by RES, the code $C_i$ is extended to the corresponding resolution.

The table below is a computation example for the above formula, where $V_{ADVREF}$ = 3V:

**Table 66-29. Input Voltage Values in Single-ended Mode**

| Non-signed $C_i$ | $V_{IN}$ |
|---|---|
| 0 | 0 |
| 2047 | 1.5 |
| 4095 | 3 |

#### 66.11.4.3 Example of LSB Computation

The LSB is relative to the analog scale $V_{ADVREF}$.

The term LSB expresses the quantization step in volts, also used for one ADC code variation.

- Single-ended (SE) (ex: $V_{ADVREF}$ = 3.0V)
  - Gain = 1, LSB = (3.0V / 4096) = 732 µV
- Differential (DIFF) (ex: $V_{ADVREF}$ = 3.0V)
  - Gain = 0.5, LSB = (6.0V / 4096) = 1465 µV

The data include the ADC performances, as the PGA and ADC core cannot be separated. The temperature and voltage dependencies are given as separate parameters.

#### 66.11.4.4 Gain and Offset Errors

For:

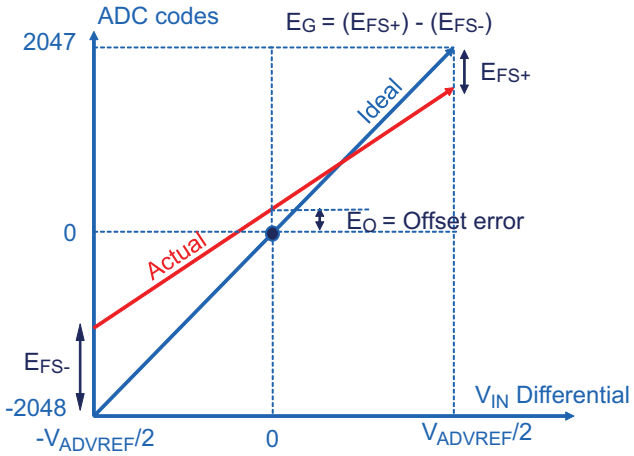
- a given gain error: $E_G$ (%)
- a given ideal code ($C_i$)
- a given offset error: $E_O$ (LSB of 12 bits)
  in 12-bit mode, the actual code ($C_A$) is calculated using the following formula

$$C_A = \left(1 + \frac{E_G}{100}\right) \times (C_i - 2047) + 2047 + E_O$$

**Differential Mode**

In Differential mode, the offset is defined when the differential input voltage is zero.

**Figure 66-5. Gain and Offset Errors in Differential Mode**



where:

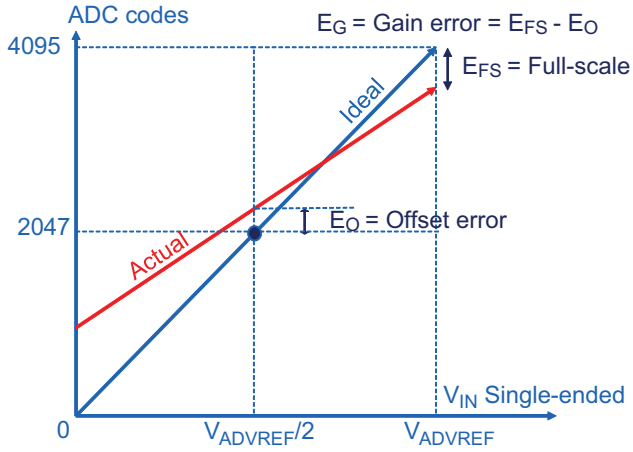
- Full-scale error $E_{FS} = (E_{FS+}) - (E_{FS-})$, unit is LSB code
- Offset error $E_O$ is the offset error measured for $V_{IN}$ = 0V
- Gain error $E_G = 100 \times E_{FS} / 4096$, unit in %

The error values in "ADC Offset and Gain Error, VADVREF = 3.3V" include the sample-and-hold error as well as the PGA gain error.

**Single-ended Mode**

The figure below illustrates the ADC output code relative to an input voltage $V_{IN}$ between 0V (Ground) and $V_{ADVREF}$. The ADC is configured in Single-ended mode by connecting internally the negative differential input to $V_{ADVREF}$ / 2. As the ADC continues to work internally in Differential mode, the offset is measured at $V_{ADVREF}$ / 2. The offset at $V_{INP}$ = 0 can be computed using the transfer function and the corresponding $E_G$ and $E_O$.

**Figure 66-6. Gain and Offset Errors in Single-ended Mode**



where:

- Full-scale error $E_{FS} = (E_{FS+}) - (E_{FS-})$, unit is LSB² code
- Offset error $E_O$ is the offset error measured for $V_{INP} = 0V$
- Gain error $E_G = 100 \times E_{FS} / 2048$, unit in %

The error values in the table "ADC Offset and Gain Error, VADVREF = 3.3V" include the DAC, the sample-and-hold error as well as the PGA gain error.

### 66.11.5 ADC Electrical Characteristics

**Table 66-30. ADC INL and DNL, $V_{ADVREF}$ = 3.3V**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| **Differential Mode** | | | | | | |
| INL | Integral Non-Linearity | – | 1 | – | 1 | LSB |
| DNL | Differential Non-Linearity | – | 1 | – | 1 | LSB |
| **Single-Ended Mode** | | | | | | |
| INL | Integral Non-Linearity | – | 1.5 | – | 1.5 | LSB |
| DNL | Differential Non-Linearity | – | 1 | – | 1 | LSB |

**Table 66-31. ADC Offset and Gain Error, $V_{ADVREF}$ = 3.3V**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| **Differential Mode** | | | | | | |
| $E_O$ | Differential Offset Error | – | -2.0 | – | 2.0 | LSB |
| $E_G$ | Differential Gain Error | – | -0.2 | – | 0.2 | % |
| **Single-Ended Mode** | | | | | | |
| $E_O$ | Single-ended Offset Error | – | -2.0 | – | 2.0 | LSB |
| $E_G$ | Single-ended Gain Error | – | -0.2 | – | 0.2 | % |

**Table 66-32. ADC Analog Input Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{FS}$ | Analog Input Full Scale Range(1) | ADC_COR.DIFFx = 0 | 0 | – | $V_{ADVREF}$ | V |
| | | ADC_COR.DIFFx = 1 | $-V_{ADVREF}$ | – | $V_{ADVREF}$ | |
| $V_{INCM}$ | Common Mode input range(2) | ADC_COR.DIFFx = 1 | 0.4 × $V_{DDANA}$ | – | 0.6 × $V_{DDANA}$ | V |
| $C_{IN}$ | ADC sampling capacitance | – | – | – | 3 | pF |
| $C_{P_ADx}$ | Analog input parasitic capacitance(4) | ADx pin configured as analog input | – | – | 10 | |
| $Z_{IN}$ | Common Mode Input impedance(3) | On ADx pin | 1 / ($f_S$ × $C_{P_ADx}$) | – | – | Ω |

**Note:**

1. $V_{FS} = V_{ADx}$ in Single-ended mode, $V_{FS} = (V_{ADx} - V_{ADx}+1)$ in Differential mode.
2. $V_{INCM} = (V_{ADx} + V_{ADx}+1) / 2$.
3. See the figure "Input Channel Model". When converting one single channel, most of the input parasitic capacitance in not switched, therefore the common mode input impedance reduces to $Z_{IN} = 1 / (f_S \times C_{IN})$.
4. Includes $C_{IN}$.

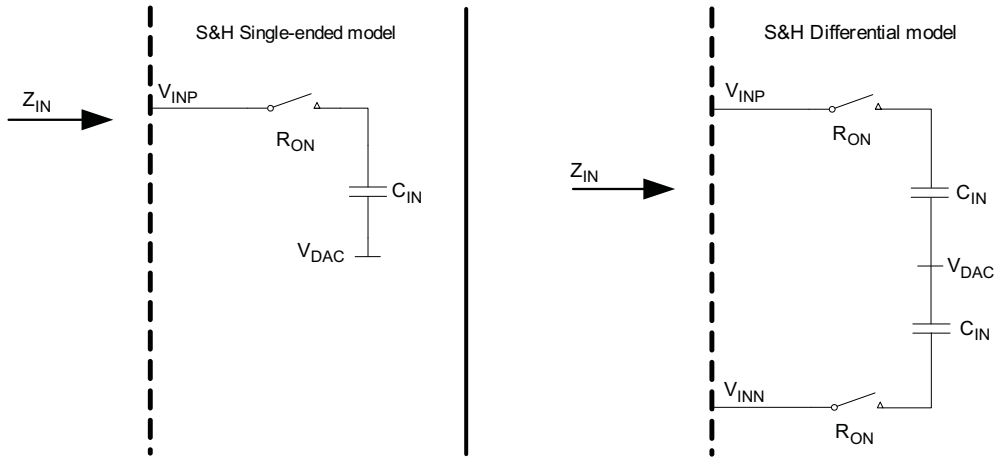
### 66.11.6 Pen Detect Characteristics

The pen detection sensibility is based on a programmable pull-down controlled by the field PENDETSENS of the ADC_ACR register.

| PENDETSENS | Detection Resistor (KOhm) |
|---|---|
| 00 | 200 |
| 01 | 150 |
| 10 | 100 |
| 11 | 50 |

### 66.11.7 ADC Channel Input Impedance

**Figure 66-7. Input Channel Model**



where:

- $Z_{IN}$ is the input impedance in Single-ended or Differential mode

- $C_{IN}$ = 2 pF ±20% depending on the gain value and mode (SE or DIFF); temperature dependency is negligible
- $R_{ON}$ is typical 2 kΩ and 8 kΩ max (worst case process and high temperature)

The following formula is used to calculate input impedance:

$$Z_{\mathrm{IN}} = \frac{1}{f_S \times C_{\mathrm{IN}}}$$

where:

- $f_S$ is the sampling frequency of the ADC channel
- Typ values are used to compute ADC input impedance $Z_{IN}$

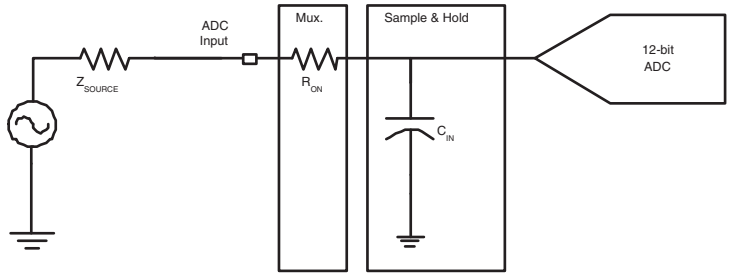
**Table 66-33. $Z_{IN}$ Input Impedance**

| $f_S$ (MHz) | 1 | 0.5 | 0.25 | 0.125 | 0.0625 | 0.03125 | 0.015625 | 0.007813 |
|---|---|---|---|---|---|---|---|---|
| $C_{IN}$ = 2 pF | | | | | | | | |
| $Z_{IN}$ (MΩ) | 0.5 | 1 | 2 | 4 | 8 | 16 | 32 | 64 |

**Track and Hold Time versus Source Output Impedance**

The figure below shows a simplified acquisition path.

**Figure 66-8. Simplified Acquisition Path**



During the tracking phase, the ADC tracks the input signal during the tracking time shown below:

$t_{TRACK} = n \times C_{IN} \times (R_{ON} + Z_{SOURCE}) / 1000$

where

- Tracking time expressed in ns and $Z_{SOURCE}$ expressed in Ω
- n = 8 for 12-bit accuracy
- $R_{ON}$ = 2 kΩ

**Table 66-34. Number of Tau:n**

| Resolution (bits) | 12 |
|---|---|
| RES | 0 |
| n | 8 |

The ADC already includes a tracking time of 15 $t_{ADC\ Clock}$.

## 66.12 Analog Comparator Characteristics

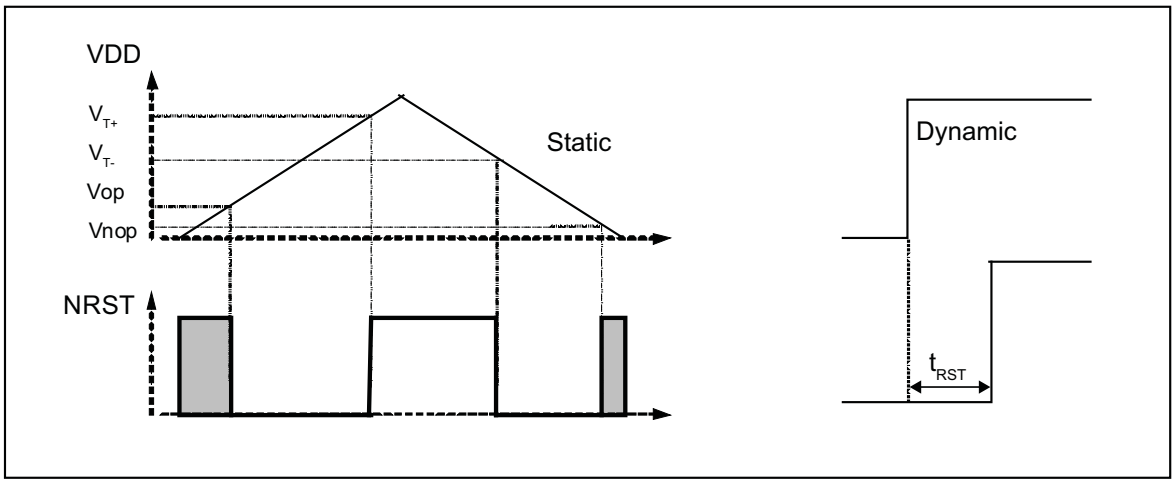
**Table 66-35. Analog Comparator Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{DDBU}$ | Power Supply Voltage Range (VDDBU) | – | 1.65 | 3.3 | 3.6 | V |
| $V_{COMPx}$ | Input Voltage Range | On COMPP or COMPN input | 0 | – | VDDBU | V |
| $V_{hys}$ | Hysteresis | – | 35 | – | 70 | mV |
| TPD | Propagation Delay | 100mV Overdrive | – | – | 350 | µs |
| $f_{in}$ | COMPx Input Signal Frequency | Common mode and differential | – | – | 1 | kHz |
| $I_{VDDBU}$ | Current Consumption (VDDBU) | OFF Mode (ACC_MR.ACEN = 0) | – | – | 50 | nA |
| | | ON Mode (ACC_MR.ACEN = 1) | – | 100 | 200 | |
| $t_{START}$ | Startup Time | – | – | – | 300 | µs |

## 66.13 POR Characteristics

The figure below provides a general presentation of Power-On-Reset (POR) characteristics.

**Figure 66-9. General Presentation of POR Behavior**



When a very slow (versus $t_{RST}$) supply rising slope is applied on the POR VDD pin, the reset time becomes negligible and the reset signal is released when VDD raises higher than $V_{T+}$.

When a very fast (versus $t_{RST}$) supply rising slope is applied on the POR VDD pin, the voltage threshold becomes negligible and the reset signal is released after $t_{RST}$. It is the smallest possible reset time.

**Table 66-36. VDDBU Power-On Reset Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{T+}$ | Threshold Voltage Rising | – | 1.3 | – | 1.5 | V |
| $V_{T-}$ | Threshold Voltage Falling | – | 1.22 | – | 1.4 | V |
| $V_{hys}$ | Hysteresis Voltage | – | 50 | – | 160 | mV |
| $t_{RST}$ | Reset Timeout Period | – | 890 | – | 5100 | µs |

**Table 66-37. VDDCORE Power-On Reset Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{T+}$ | Threshold Voltage Rising | – | 0.927 | – | 1.075 | V |
| $V_{T-}$ | Threshold Voltage Falling | – | 0.848 | – | 1.025 | V |
| $V_{hys}$ | Hysteresis Voltage | – | 38 | – | 109 | mV |
| $t_{RST}$ | Reset Timeout Period | – | 150 | – | 650 | µs |

**Table 66-38. VDDANA Power-On Reset Characteristics**

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---|---|---|---|---|---|---|
| $V_{T+}$ | Threshold Voltage Rising | – | 1.3 | – | 1.5 | V |
| $V_{T-}$ | Threshold Voltage Falling | – | 1.22 | – | 1.4 | V |
| $V_{hys}$ | Hysteresis Voltage | – | 50 | – | 160 | mV |
| $t_{RST}$ | Reset Timeout Period | – | 130 | – | 650 | µs |

## 66.14 SMC Timings

### 66.14.1 Timing Conditions

SMC timings are given in max corners.

Timings assuming a capacitance load on data, control and address pads are given in the table below.

**Table 66-39. Capacitance Load**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 50 pF | 5 pF |
| 1.8V | 30 pF | 5 pF |

In the tables that follow, $t_{CPMCK}$ is the MCK period.

### 66.14.2 SMC IOSET1 Timing Extraction

#### 66.14.2.1 SMC IOSET1 Read Timings

**Table 66-40. SMC IOSET1 Read Signals - NRD Controlled (READ_MODE = 1)**

| Symbol | Parameter | Min | | Unit |
|---|---|---|---|---|
| | Power supply | 1.8V | 3.3V | |
| NO HOLD SETTINGS (nrd hold = 0) | | | | |
| $SMC_1$ | Data Setup before NRD High | 16.4 | 15 | ns |
| $SMC_2$ | Data Hold after NRD High | 0 | 0 | ns |
| HOLD SETTINGS (nrd hold ≠ 0) | | | | |
| $SMC_3$ | Data Setup before NRD High | 14.4 | 13 | ns |
| $SMC_4$ | Data Hold after NRD High | 0 | 0 | ns |
| HOLD or NO HOLD SETTINGS (nrd hold ≠ 0, nrd hold =0) | | | | |

.....continued

| Symbol | Parameter | Min | | Unit |
|---|---|---|---|---|
| | Power supply | 1.8V | 3.3V | |
| $SMC_5$ | NBS0/A0, NBS1, NBS2/A1, NBS3, A2–A25 Valid before NRD High | (nrd setup + nrd pulse) × $t_{CPMCK}$ | (nrd setup + nrd pulse) × $t_{CPMCK}$ | ns |
| $SMC_6$ | NCS low before NRD High | (nrd setup + nrd pulse - ncs rd setup) × $t_{CPMCK}$ | (nrd setup + nrd pulse - ncs rd setup) × $t_{CPMCK}$ | ns |
| $SMC_7$ | NRD Pulse Width | nrd pulse × $t_{CPMCK}$ | nrd pulse × $t_{CPMCK}$ | ns |

**Table 66-41. SMC IOSET1 Read Signals - NCS Controlled (READ_MODE = 0)**

| Symbol | Parameter | Min | | Unit |
|---|---|---|---|---|
| | Power supply | 1.8V | 3.3V | |
| NO HOLD SETTINGS (ncs rd hold = 0) | | | | |
| $SMC_8$ | Data Setup before NCS High | 17.9 | 15.7 | ns |
| $SMC_9$ | Data Hold after NCS High | 0 | 0 | ns |
| HOLD SETTINGS (ncs rd hold ≠ 0) | | | | |
| $SMC_{10}$ | Data Setup before NCS High | 15.9 | 13.7 | ns |
| $SMC_{11}$ | Data Hold after NCS High | 0 | 0 | ns |
| HOLD or NO HOLD SETTINGS (ncs rd hold ≠ 0, ncs rd hold = 0) | | | | |
| $SMC_{12}$ | NBS0/A0, NBS1, NBS2/A1, NBS3, A2–A25 valid before NCS High | (ncs rd setup + ncs rd pulse) × $t_{CPMCK}$ | (ncs rd setup + ncs rd pulse) × $t_{CPMCK}$ | ns |
| $SMC_{13}$ | NRD low before NCS High | (ncs rd setup + ncs rd pulse - nrd setup) × $t_{CPMCK}$ | (ncs rd setup + ncs rd pulse - nrd setup) × $t_{CPMCK}$ | ns |

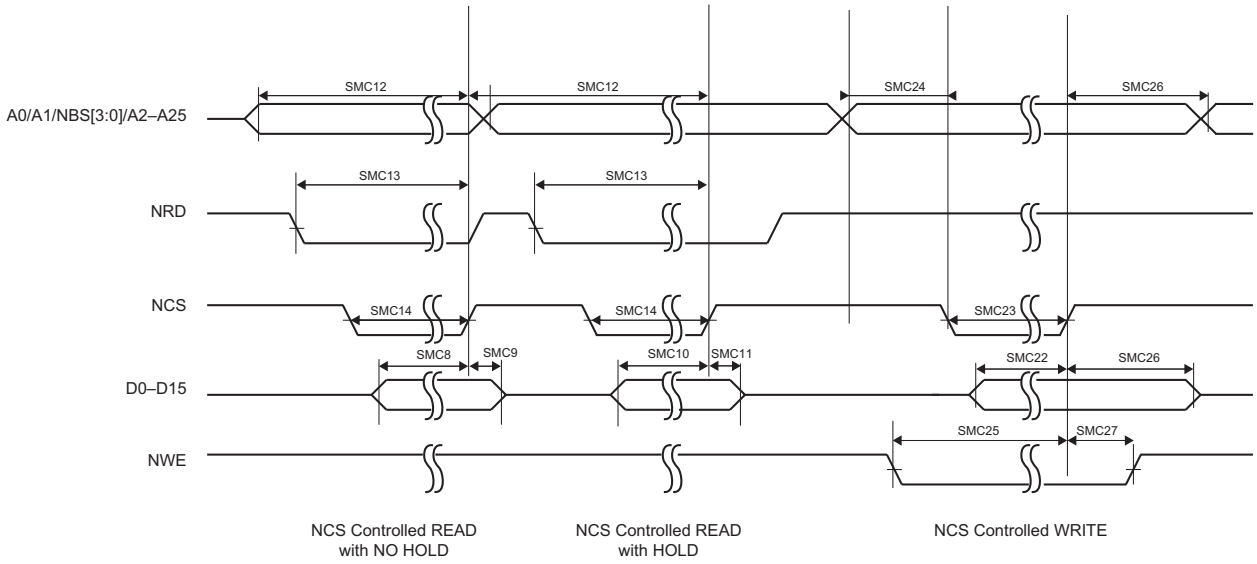

**Figure 66-11. SMC Timings - NRD Controlled Read and NWE Controlled Write**

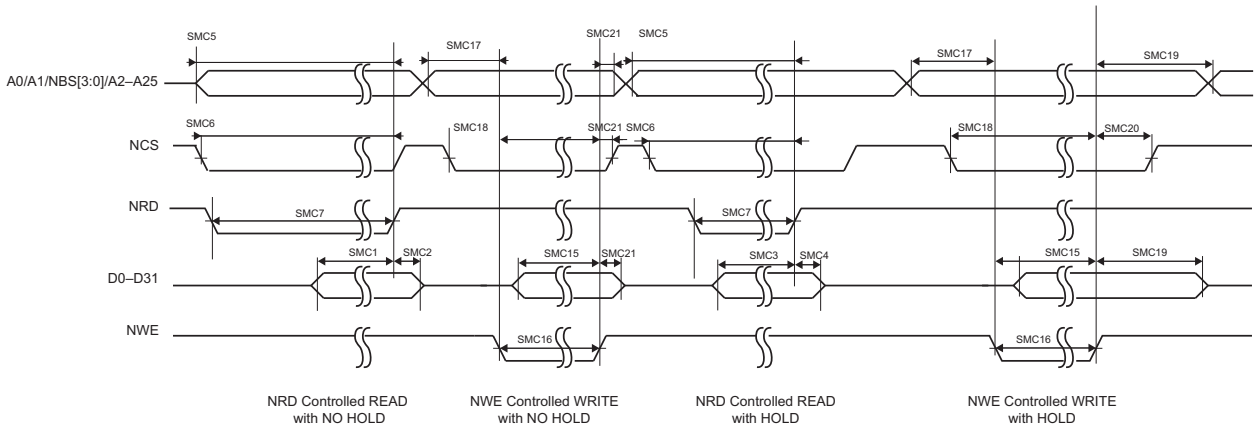

## 66.15 FLEXCOM Timings

### 66.15.1 FLEXCOM USART in Asynchronous Modes

Refer to the section USART in Asynchronous Modes.

### 66.15.2 FLEXCOM SPI Timings

#### 66.15.2.1 Timing Conditions

Timings assuming a capacitance load on MISO, SPCK and MOSI are given in the table "Capacitance Load for MISO, SPCK and MOSI (SPI0 and SPI1)".

**Table 66-48. Capacitance Load for MISO, SPCK and MOSI (FLEXCOM 0, 1, 2, 3, 4)**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 40 pF | 5 pF |
| 1.8V | 20 pF | 5 pF |

#### 66.15.2.2 Timing Extraction

**Figure 66-12. FLEXCOM in SPI Master Modes 1 and 2**

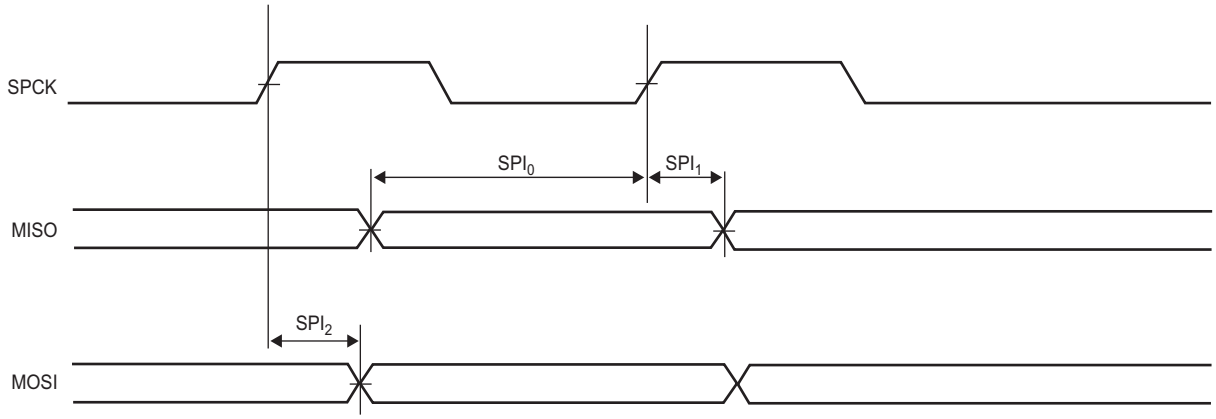

**Figure 66-13. FLEXCOM in SPI Master Modes 0 and 3**

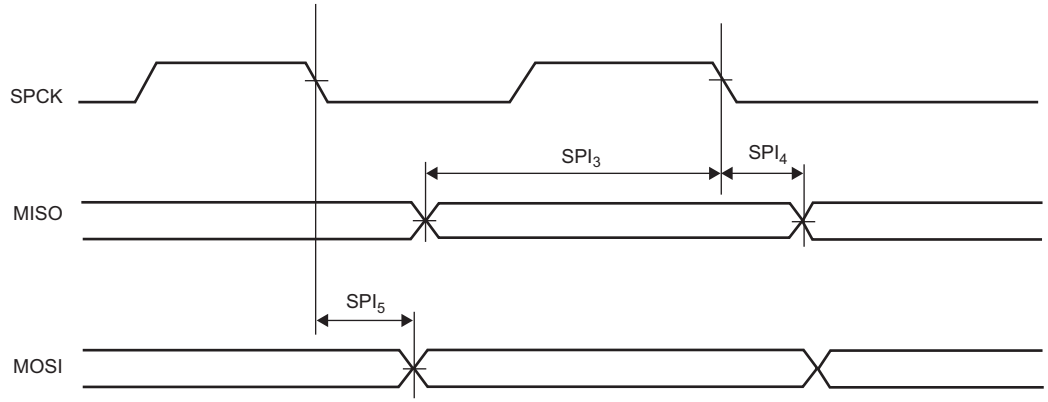

**Figure 66-14. FLEXCOM in SPI Slave Modes 0 and 3**

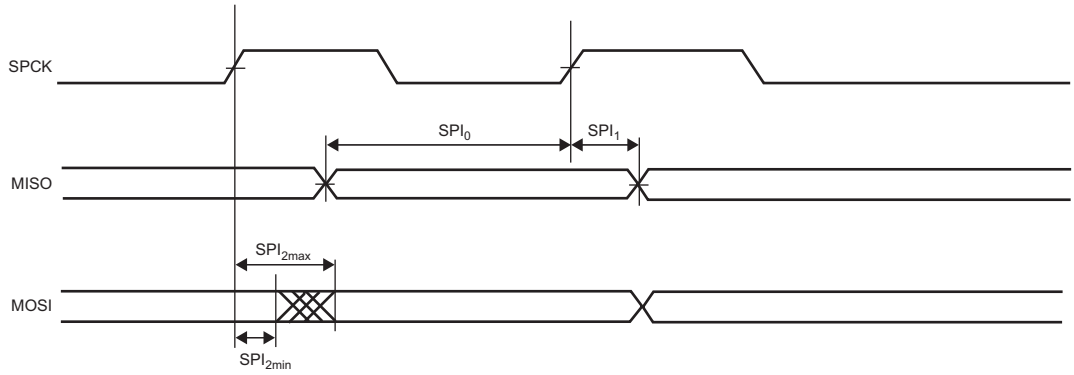
**Figure 66-17. Minimum and Maximum Access Time for SPI Output Signal**



### 66.15.3 FLEXCOM TWI Timings

Refer to the section TWI Timings.

## 66.16 USART in Asynchronous Modes

In Asynchronous modes, the maximum baud rate that can be achieved is MCK2 / 8, if the bit USART_MR.OVER=1.

Example: if MCK2 = 83 MHz, the baud rate is 10.375 Mbit/s.

## 66.17 SPI Timings

### 66.17.1 Maximum SPI Frequency

The following formulas give maximum SPI frequency in Master Read and Write modes and in Slave Read and Write modes.

- Master Write Mode
  The SPI sends data to a slave device only, e.g. an LCD. The limit is given by $SPI_2$ (or $SPI_5$) timing.

- Master Read Mode

$$f_{SPCK}\max = \frac{1}{SPI_0(\text{or } SPI_3) + t_{VALID}}$$

$t_{VALID}$ is the slave time response to output data after deleting an SPCK edge.

The $f_{SPCK}$ max is given between the maximum frequency given by the above formula and the pad I/O limitation.

- Slave Read Mode
In Slave mode, SPCK is the input clock for the SPI. The max SPCK frequency is given by setup and hold timings $SPI_7$/$SPI_8$ (or $SPI_{10}$/$SPI_{11}$). Since this gives a frequency well above the pad limit, the limit in Slave Read mode is given by the SPCK pad.
- Slave Write Mode

$$f_{SPCK}\max = \frac{1}{SPI_6(\text{or } SPI_9) + t_{SETUP}}$$

$t_{SETUP}$ is the setup time from the master before sampling data (6 ns).

The $f_{SPCK}$ max is given between the maximum frequency given by the above formula and the pad I/O limitation.

### 66.17.2 Timing Conditions

Timings assuming a capacitance load on MISO, SPCK and MOSI are given in the table below.

**Table 66-59. Capacitance Load for MISO, SPCK and MOSI (SPI0 and SPI1)**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 40 pF | 5 pF |
| 1.8V | 20 pF | 5 pF |

### 66.17.3 Timing Extraction

In the first two figures below, “SPI Master Modes 1 and 2” and “SPI Master Modes 0 and 3”, the MOSI line shifting edge is represented with a hold time = 0. However, it is important to note that for this device, the MISO line is sampled prior to the MOSI line shifting edge. As shown in “MISO Capture in Master Mode”, the device sampling point extends the propagation delay ($t_p$) for slave and routing delays to more than half the SPI clock period, whereas the common sampling point allows only less than half the SPI clock period.

As an example, an SPI Slave working in Mode 0 is safely driven if the SPI Master is configured in Mode 0.

**Figure 66-18. MISO Capture in Master Mode**

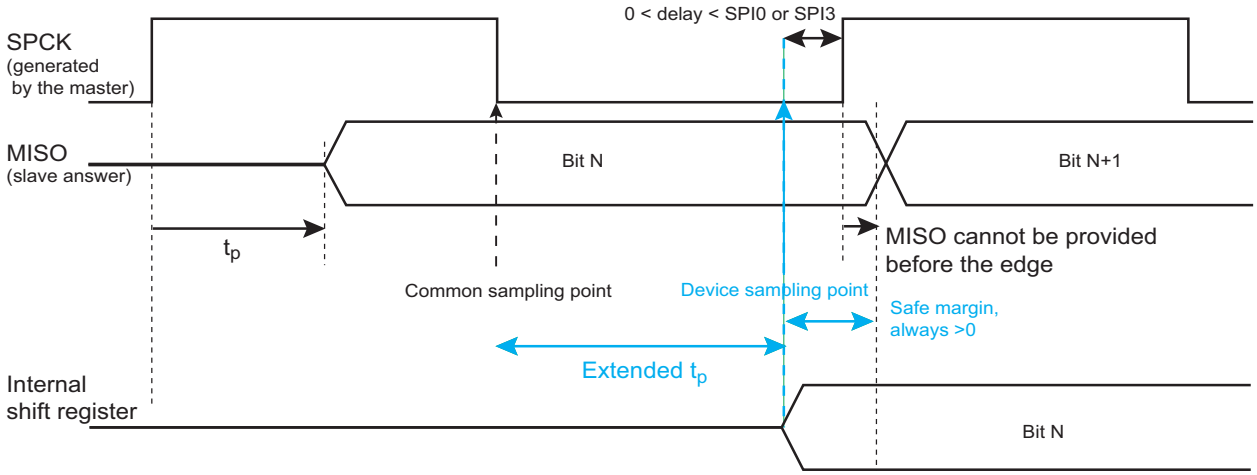


**Figure 66-19. SPI Master Modes 1 and 2**

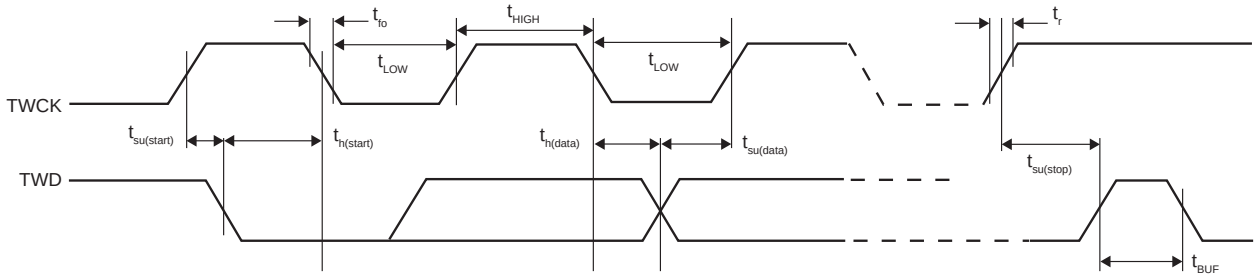
## 66.18 TWI Timings

**Figure 66-25. Two-wire Serial Bus Timing**



The table below describes the requirements for devices connected to the Two-wire Serial Bus.

**Table 66-65. Two-wire Serial Bus Requirements**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $V_{IL}$ | Input Low-voltage | – | -0.3 | 0.3 × $V_{DDIO}$ | V |
| $V_{IH}$ | Input High-voltage | – | 0.7 × $V_{DDIO}$ | $V_{CC}$ + 0.3 | V |
| $V_{hys}$ | Hysteresis of Schmitt Trigger Inputs | – | 0.150 | – | V |
| $V_{OL}$ | Output Low-voltage | 3 mA sink current | – | 0.4 | V |
| $t_r$ | Rise Time for both TWD and TWCK | – | 20 + 0.1$C_b$ (2) | 300 | ns |
| $t_{fo}$ | Output Fall Time from $V_{IHmin}$ to $V_{ILmax}$ | 10 pF < $C_b$ < 400 pF (see the figure above) | 20 + 0.1$C_b$ (2) | 250 | ns |
| $C_i$ (1) | Capacitance for each I/O Pin | – | – | 10 | pF |
| $f_{TWCK}$ | TWCK Clock Frequency | – | 0 | 400 | kHz |

.....continued

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| Rp | Value of Pull-up Resistor | $f_{TWCK}$≤ 100 kHz | ($V_{DDIO}$ - 0.4V) ÷ 3mA | 1000ns ÷ $C_b$ | Ω |
| | | $f_{TWCK}$ > 100 kHz | ($V_{DDIO}$ - 0.4V) ÷ 3mA | 300ns ÷ $C_b$ | Ω |
| $t_{LOW}$ | Low Period of the TWCK Clock | $f_{TWCK}$≤ 100 kHz | (3) | – | µs |
| | | $f_{TWCK}$ > 100 kHz | (3) | – | µs |
| $t_{HIGH}$ | High Period of the TWCK Clock | $f_{TWCK}$≤ 100 kHz | (4) | – | µs |
| | | $f_{TWCK}$ > 100 kHz | (4) | – | µs |
| $t_{h(start)}$ | Hold Time (repeated) START condition | $f_{TWCK}$≤ 100 kHz | $t_{HIGH}$ | – | µs |
| | | $f_{TWCK}$ > 100 kHz | $t_{HIGH}$ | – | µs |
| $t_{su(start)}$ | Setup Time for a Repeated START condition | $f_{TWCK}$≤ 100 kHz | $t_{HIGH}$ | – | µs |
| | | $f_{TWCK}$ > 100 kHz | $t_{HIGH}$ | – | µs |
| $t_{h(data)}$ | Data Hold Time | $f_{TWCK}$≤ 100 kHz | 0 | (HOLD + 3) × $t_{peripheral\ clock}$ | µs |
| | | $f_{TWCK}$ > 100 kHz | 0 | (HOLD + 3) × $t_{peripheral\ clock}$ | µs |
| $t_{su(data)}$ | Data Setup Time | $f_{TWCK}$≤ 100 kHz | $t_{LOW}$ - (HOLD + 3) × $t_{peripheral\ clock}$ | – | ns |
| | | $f_{TWCK}$ > 100 kHz | $t_{LOW}$ - (HOLD + 3) × $t_{peripheral\ clock}$ | – | ns |
| $t_{su(stop)}$ | Setup time for STOP condition | $f_{TWCK}$≤ 100 kHz | $t_{HIGH}$ | – | µs |
| | | $f_{TWCK}$ > 100 kHz | $t_{HIGH}$ | – | µs |
| $t_{BUF}$ | Bus free time between a STOP and START condition | $f_{TWCK}$≤ 100 kHz | $t_{LOW}$ | – | µs |
| | | $f_{TWCK}$ > 100 kHz | $t_{LOW}$ | – | µs |

**Note:**

1. Required only for $f_{TWCK}$ > 100 kHz.
2. $C_B$ = capacitance of one bus line in pF. Per I2C Standard, $C_b$ Max = 400 pF
3. The TWCK low period is defined as follows: $t_{LOW} = ((CLDIV \times 2^{CKDIV}) + 3) \times t_{MCK}$
4. The TWCK high period is defined as follows: $t_{HIGH} = ((CHDIV \times 2^{CKDIV}) + 3) \times t_{MCK}$

## 66.19 QSPI Timings

### 66.19.1 Maximum QSPI Frequency

The following formulas give maximum QSPI frequency in Master Read and Write modes.

- Master Write Mode
  The QSPI sends data to a slave device only, e.g. an LCD. The limit is given by $QSPI_2$ (or $QSPI_5$) timing.
- Master Read Mode

$$f_{QSCK}\max = \frac{1}{\mathrm{QSPI}_0(\text{or } \mathrm{QSPI}_3) + t_{VALID}}$$

$t_{VALID}$ is the slave time response to output data after detecting a QSCK edge.

The $f_{QSCK}$ max is given between the maximum frequency given by the above formula and the pad I/O limitation.

### 66.19.2 Timing Conditions

Timings assuming a capacitance load are given in the table below.

**Table 66-66. Capacitance Load (QSPI 0 and QSPI1)**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 30 pF | 5 pF |
| 1.8V | 20 pF | 5 pF |

| $QSPI_{11}$ | SCK falling to QIOx valid | 0 | 1.1 | 0 | 1.7 | ns |

## 66.20 MPDDRC Timings

The following characteristics are applicable to the ambient operating temperature range $T_A$ = -40°C to +105°C for -CN devices, and -40°C to +85°C for -CU devices, unless otherwise specified.

### 66.20.1 Board Design Constraints

As the SAMA5D2 series embeds impedance calibrated pads, there are no capacitive constraints on DDR signals. However, a board must be designed and equipped in order to respect propagation time and intrinsic delay in the SDRAM device. In all cases, line length to memory device must not exceed 5 cm.

### 66.20.2 DDR2-SDRAM

**Note:** For DDR2 memory, the SHIFT_SAMPLING field value in the MPRDDRC_RD_DATA_PATH register must be configured to 1.

**Table 66-73. System Clock Waveform Parameters**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V] | 7.5 | 8.0 | ns |
| | | VDDCORE[1.2V, 1.32V], VDDIODDR[1.8V, 1.9V] | 6.0 | 8.0 | ns |

### 66.20.3 LPDDR1-SDRAM

**Note:** For LPDDR1 memory, the SHIFT_SAMPLING field value in the MPRDDRC_RD_DATA_PATH register must be configured as follows:

SHIFT_SAMPLING = 0 for 0 < DDR_CLK < 94 MHz

SHIFT_SAMPLING = 1 for 94 MHz < DDR_CLK < 166 MHz

**Table 66-74. System Clock Waveform Parameters**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V] | 7.5 | – | ns |
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.2V, 1.32V], VDDIODDR[1.8V, 1.9V] | 6 | – | ns |

### 66.20.4 LPDDR2/LPDDR3-SDRAM

**Note:** For LPDDR2/LPDDR3 memory, the SHIFT_SAMPLING field value in the MPRDDRC_RD_DATA_PATH register must be configured as follows:

SHIFT_SAMPLING = 0 for 0 < DDR_CLK < 80 MHz

SHIFT_SAMPLING = 1 for 80 MHz < DDR_CLK < 166 MHz

**Table 66-75. System Clock Waveform Parameters**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V] | 7.5 | – | ns |
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V], VDDIODDR[1.18V, 1.3V] | 6 | – | ns |

### 66.20.5 DDR3/DDR3L-SDRAM

**Note:** For DDR3/DDR3L memory, the SHIFT_SAMPLING field value in the MPRDDRC_RD_DATA_PATH register must be configured to 2.

**Table 66-76. System Clock Waveform Parameters**

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|---|---|---|---|---|
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V] | 8.0 | – | ns |
| $t_{DDRCK}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V], VDDIODDR[1.18V, 1.3V] | 8.0 | – | ns |

## 66.21 SSC Timings

### 66.21.1 Timing Conditions

Timings assuming a capacitance load are given in the table below.

**Table 66-77. Capacitance Load (SSC0 and SSC1)**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 30 pF | 5 pF |
| 1.8V | 20 pF | 5 pF |

### 66.21.2 Timing Extraction

| $I2SC_4$ | SDI Input setup time before SCK rises | | 1.1 | – | 1 | – | ns |
| $I2SC_5$ | SDI Input hold time after SCK rises | | 1.2 | – | 1 | – | ns |
| $I2SC_6$ | WS Input setup time before SCK rises | | 2.2 | – | 2 | – | ns |
| $I2SC_7$ | WS Input hold time after SCK rises | | 0.9 | – | 0.7 | – | ns |
| $I2SC_8$ | SCK falling to SDO valid | | 4.3 | 14 | 3.7 | 12 | ns |

## 66.24 ISC Timings

### 66.24.1 Timing Conditions

Timings assuming capacitance loads are given in the table below.

**Table 66-90. Capacitance Load**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 30 pF | 5 pF |
| 1.8V | 20 pF | 5 pF |

### 66.24.2 Timing Extraction

**Figure 66-39. ISC Timing Diagram**

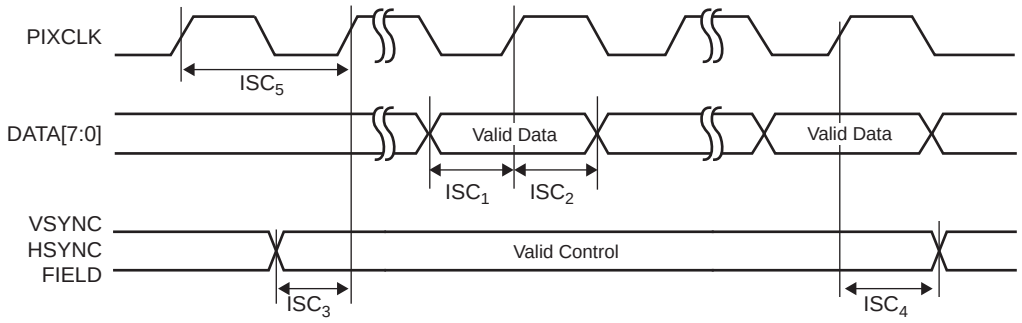

**Table 66-91. ISC IOSET1 Timings**

| Symbol | Parameter | Power Supply | 1.8V | | 3.3V | | Unit |
|---|---|---|---|---|---|---|---|
| | | | Min | Max | Min | Max | |
| $ISC_1$ | DATA setup time before PIXCLK rises | | 3.9 | – | 3.6 | – | ns |
| $ISC_2$ | DATA hold time after PIXCLK rises | | 0.7 | – | 0.6 | – | ns |
| $ISC_3$ | VSYNC/HSYNC/FIELD setup time before PIXCLK rises | | 4.4 | – | 4.2 | – | ns |
| $ISC_4$ | CONTROL VSYNC/HSYNC/FIELD hold time after PIXCLK rises | | 0.4 | – | 0.3 | – | ns |
| $ISC_5$ | PIXCLK frequency | | – | 96 | – | 96 | MHz |

**Table 66-92. ISC IOSET2 Timings**

| Symbol | Power Supply / Parameter | 1.8V Min | 1.8V Max | 3.3V Min | 3.3V Max | Unit |
|---|---|---|---|---|---|---|
| $ISC_1$ | DATA setup time before PIXCLK rises | 4.3 | – | 4.2 | – | ns |
| $ISC_2$ | DATA hold time after PIXCLK rises | 0.5 | – | 0.3 | – | ns |
| $ISC_3$ | VSYNC/HSYNC/FIELD setup time before PIXCLK rises | 4.6 | – | 4.4 | – | ns |
| $ISC_4$ | CONTROL VSYNC/HSYNC/FIELD hold time after PIXCLK rises | 0.2 | – | 0 | – | ns |
| $ISC_5$ | PIXCLK frequency | – | 96 | – | 96 | MHz |

**Table 66-93. ISC IOSET3 Timings**

| Symbol | Power Supply / Parameter | 1.8V Min | 1.8V Max | 3.3V Min | 3.3V Max | Unit |
|---|---|---|---|---|---|---|
| $ISC_1$ | DATA setup time before PIXCLK rises | 4.6 | – | 4.2 | – | ns |
| $ISC_2$ | DATA hold time after PIXCLK rises | 0.5 | – | 0.4 | – | ns |
| $ISC_3$ | VSYNC/HSYNC/FIELD setup time before PIXCLK rises | 4.3 | – | 4 | – | ns |
| $ISC_4$ | CONTROL VSYNC/HSYNC/FIELD hold time after PIXCLK rises | 1.5 | – | 0.4 | – | ns |
| $ISC_5$ | PIXCLK frequency | – | 96 | – | 96 | MHz |

**Table 66-94. ISC IOSET4 Timings**

| Symbol | Power Supply / Parameter | 1.8V Min | 1.8V Max | 3.3V Min | 3.3V Max | Unit |
|---|---|---|---|---|---|---|
| $ISC_1$ | DATA setup time before PIXCLK rises | 4.3 | – | 4 | – | ns |
| $ISC_2$ | DATA hold time after PIXCLK rises | 0.5 | – | 0.4 | – | ns |
| $ISC_3$ | VSYNC/HSYNC/FIELD setup time before PIXCLK rises | 4.2 | – | 4 | – | ns |
| $ISC_4$ | CONTROL VSYNC/HSYNC/FIELD hold time after PIXCLK rises | 0.5 | – | 0.3 | – | ns |
| $ISC_5$ | PIXCLK frequency | – | 96 | – | 96 | MHz |

## 66.25 SDMMC Timings

The Secure Digital Multimedia Card (SDMMC) Controller supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

Features are different for the two instances of SDMMC:

SDMMC0: SD 3.0, eMMC 4.51, 8 bits

SDMMC1: SD 2.0, eMMC 4.41, 4 bits only

In SDR104 mode (SD 3.0), SDMMC0 is limited to 120 MHz (instead of 208 MHz). In HS200 mode (eMMC 4.51), SDMMC0 is limited to 120 MHz (instead of 200 MHz).

## 66.26 GMAC Timings

### 66.26.1 Timing Conditions

Timings assuming a capacitance load on data and clock are given in the table below.

**Table 66-95. Capacitance Load on Data, Clock Pads**

| Supply | Corner | |
|---|---|---|
| | Max | Min |
| 3.3V | 20 pF | 0 pF |

### 66.26.2 Timing Constraints

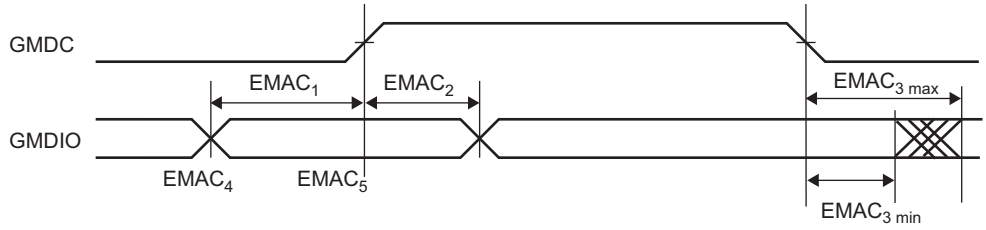
**Table 66-96. Ethernet MAC Signals Relative to GMDC**

| Symbol | Parameter | Min | Max | Unit |
|---|---|---|---|---|
| $EMAC_1$ | Setup for GMDIO from GMDC rising | 10 | – | ns |
| $EMAC_2$ | Hold for GMDIO from GMDC rising | 10 | – | ns |
| $EMAC_3$ | GMDIO toggling from GMDC rising(1) | 0 | 300 | ns |

**Note:**

1. For Ethernet MAC output signals, minimum and maximum access times are defined. The minimum access time is the time between the GMDC rising edge and the signal change. The maximum access time is the time between the GMDC rising edge and the signal stabilizes. The figure below illustrates minimum and maximum accesses for $EMAC_3$.

**Figure 66-40. Minimum and Maximum Access Times of Ethernet MAC Output Signals**



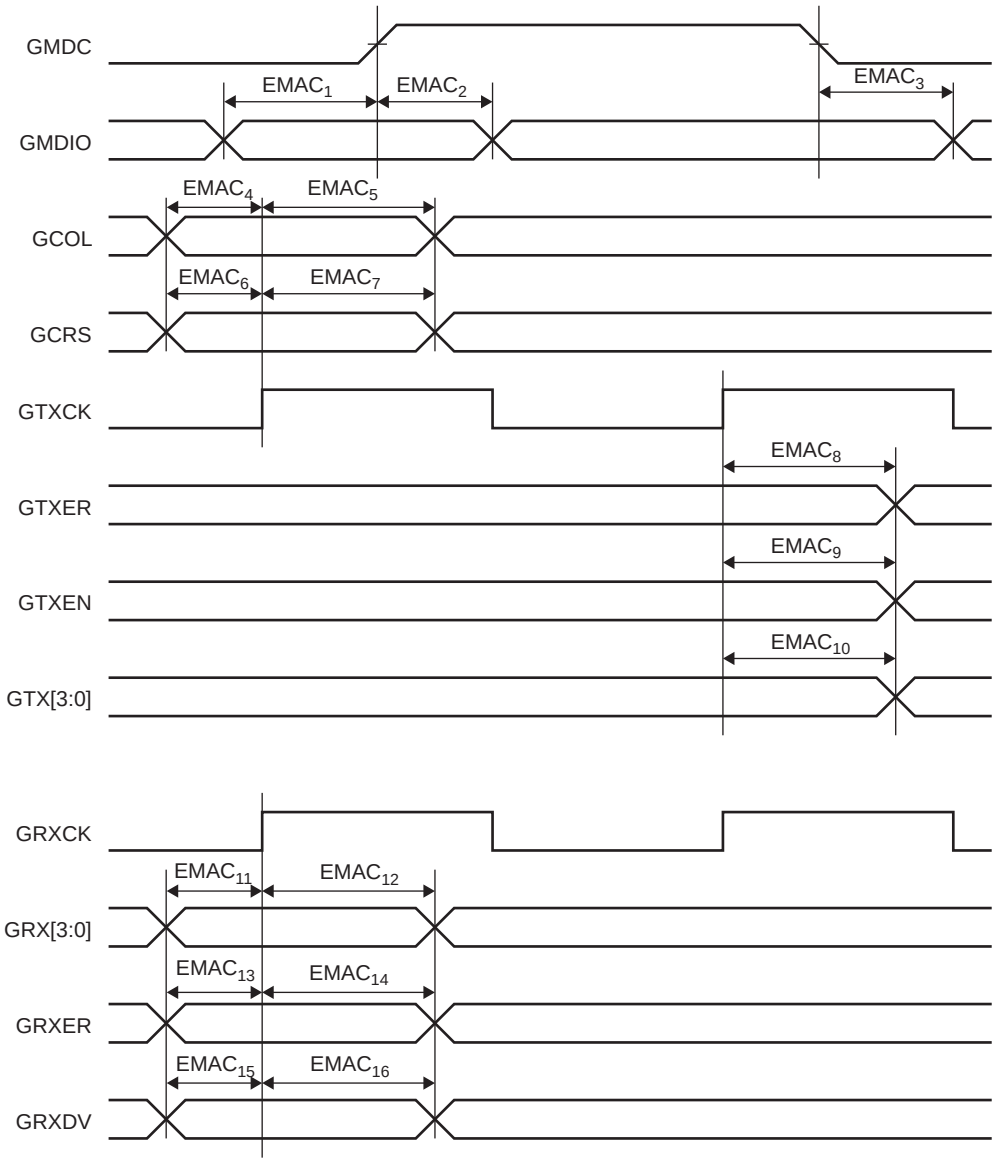
#### 66.26.2.1 Ethernet MAC MII Mode

**Table 66-97. Ethernet MAC MII Specific Signals**

| Symbol | Parameter | Min | Max | Unit |
|---|---|---|---|---|
| $EMAC_4$ | Setup for GCOL from GTXCK rising | 10 | – | ns |
| $EMAC_5$ | Hold for GCOL from GTXCK rising | 10 | – | ns |
| $EMAC_6$ | Setup for GCRS from GTXCK rising | 10 | – | ns |
| $EMAC_7$ | Hold for GCRS from GTXCK rising | 10 | – | ns |
| $EMAC_8$ | GTXER toggling from GTXCK rising | 10 | 25 | ns |
| $EMAC_9$ | GTXEN toggling from GTXCK rising | 10 | 25 | ns |

| .....continued | | | | |
|---|---|---|---|---|
| **Symbol** | **Parameter** | **Min** | **Max** | **Unit** |
| $EMAC_{10}$ | GTX toggling from GTXCK rising | 10 | 25 | ns |
| $EMAC_{11}$ | Setup for GRX from GRXCK | 10 | – | ns |
| $EMAC_{12}$ | Hold for GRX from GRXCK | 10 | – | ns |
| $EMAC_{13}$ | Setup for GRXER from GRXCK | 10 | – | ns |
| $EMAC_{14}$ | Hold for GRXER from GRXCK | 10 | – | ns |
| $EMAC_{15}$ | Setup for GRXDV from GRXCK | 10 | – | ns |
| $EMAC_{16}$ | Hold for GRXDV from GRXCK | 10 | – | ns |

**Figure 66-41. Ethernet MAC MII Mode**



#### 66.26.2.2 Ethernet MAC RMII Mode

**Table 66-98. Ethernet MAC RMII Mode**

| Symbol | Parameter | Min | Max | Unit |
|---|---|---|---|---|
| $EMAC_{21}$ | GTXEN toggling from GREFCK rising | 2 | 16 | ns |
| $EMAC_{22}$ | GTX toggling from GREFCK rising | 2 | 16 | ns |
| $EMAC_{23}$ | Setup for GRX from GREFCK rising | 4 | – | ns |
| $EMAC_{24}$ | Hold for GRX from GREFCK rising | 2 | – | ns |
| $EMAC_{25}$ | Setup for GRXER from GREFCK rising | 4 | – | ns |
| $EMAC_{26}$ | Hold for GRXER from GREFCK rising | 2 | – | ns |
| $EMAC_{27}$ | Setup for GCRSDV from GREFCK rising | 4 | – | ns |
| $EMAC_{28}$ | Hold for GCRSDV from GREFCK rising | 2 | – | ns |

# 68. Schematic Checklist

The schematic checklist provides the user with the requirements regarding the different pin connections that must be considered before starting any new board design as well as information on the minimum hardware resources required to quickly develop an application with the SAMA5D2. It does not consider PCB layout constraints.

It also provides recommendations regarding low-power design constraints to minimize power consumption.

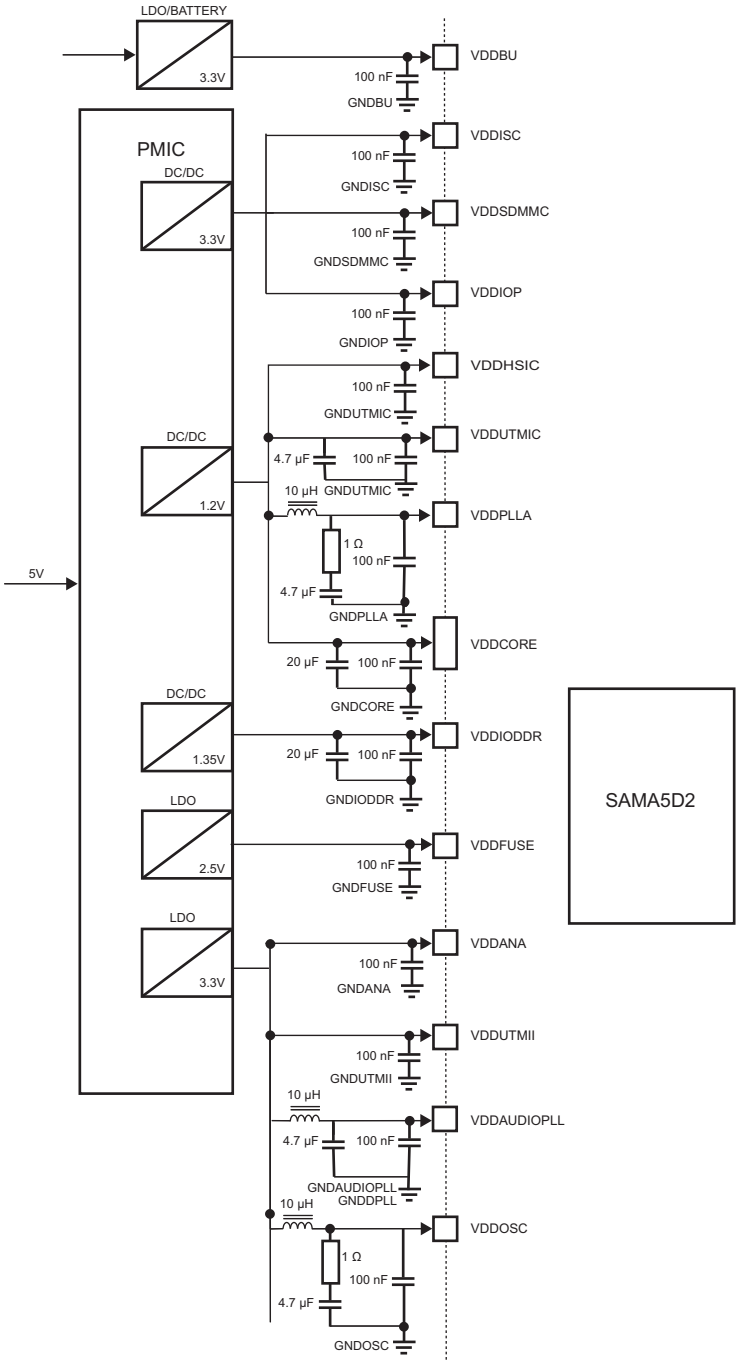
This information is not intended to be exhaustive. Its objective is to cover as many configurations of use as possible.

The checklist contains a column for use by designers, making it easy to track and verify each line item.

## 68.1 Power Supply

**⚠ CAUTION** The board design must comply with the power-up and power-down sequence guidelines provided in the data sheet to ensure reliable operation of the device.

**Figure 68-1. 1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)**



**Note:**

1. These values are given only as typical examples.

**Table 68-1. Power Supply Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | VDDCORE | 1.1V to 1.32V<br>Decoupling/Filtering capacitors (10 µF and 100 nF)(1)(2) | Powers the core<br>Supply ripple must not exceed 15 mVrms. |
| | VDDPLLA | 1.1V to 1.32V<br>Decoupling/Filtering capacitor (100 nF)(1)(2) | Powers the PLLA cell.<br>The VDDPLLA power supply pin draws small current, but it is noise-sensitive. Care must be taken in VDDPLLA power supply routing, decoupling and also on bypass capacitors.<br>Supply ripple must not exceed 20 mVrms. |
| | VDDIODDR | 1.14V to 1.30V<br>1.283V to 1.45V<br>1.425V to 1.575V<br>1.7V to 1.9V<br>Decoupling/Filtering capacitors (10 µF and 100 nF)(1)(2) | Powers LPDDR2-LPDDR3 interface<br>Powers DDR3L interface<br>Powers DDR3 interface<br>Powers LPDDR1-DDR2 interface<br>Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop. |
| | VDDISC | 1.65V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the ISC Interface I/O lines. |
| | VDDIOP0,1,2 | 1.65V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the peripherals I/O lines.<br>Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop. |
| | VDDBU | 1.65V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the Slow Clock oscillator, the internal 64 kHz RC and a part of the System Controller.<br>Must be established first.<br>Supply ripple must not exceed 30 mVrms. |
| | VDDUTMIC | 1.1V to 1.32V<br>Decoupling capacitor (100 nF) (1)(2) | DC Supply UTMI Phy (Core) and PLL UTMI<br>Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop. |

.....continued

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | VDDUTMII | 3.0V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | DC Supply UTMI Phy (Interface)<br>Decoupling/filtering capacitors must be added to improve startup stability and reduce source voltage drop. |
| | VDDHSIC | 1.1V to 1.3V<br>Decoupling capacitors (100 nF) (1)(2) | DC Supply HSIC Phy |
| | VDDOSC | 1.65V to 3.6V<br>Decoupling/Filtering RLC circuit(1) | Powers the main oscillator cell.<br>The VDDOSC power supply pin is noise-sensitive. Care must be taken in VDDOSC power supply routing, decoupling and also on bypass capacitors.<br>Supply ripple must not exceed 30 mVrms. |
| | VDDSDMMC | 1.65V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the SDMMC I/O lines. |
| | VDDANA | 1.65V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the analog parts. |
| | VDDFUSE | 2.25V to 2.75V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the fuse box for programming.<br>VDDFUSE must not be left floating. |
| | VDDAUDIOPLL | 3.0V to 3.6V<br>Decoupling capacitor (100 nF) (1)(2) | Powers the Audio PLL. |
| | GNDCORE | Core Chip ground | GNDCORE pins are common to VDDCORE pins.<br>GNDCORE pins should be connected as shortly as possible to the system ground plane. |

.....continued

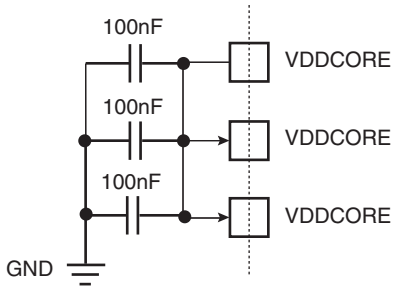
| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | GNDPLLA | PLLA cell ground | GNDPLL pin is provided for VDDPLLA pins.<br>GNDPLL pin should be connected as shortly as possible to the system ground plane. |
| | GNDIODDR | DDR2/LPDDR1/LPDDR2/ DDR3/LPDDR3 interface I/O lines ground | GNDIODDR pins should be connected as shortly as possible to the system ground plane. |
| | GNDISC | VDDISC ground | GNDISC pins are common to VDDISC pins.<br>GNDISC pins should be connected as shortly as possible to the system ground plane. |
| | GNDIOP0,1,2 | Peripherals and ISC I/O lines ground | GNDIOPx pins are common to VDDIOPx pins.<br>GNDIOP pins should be connected as shortly as possible to the system ground plane. |
| | GNDBU | Backup ground | GNDBU pin is provided for VDDBU pins.<br>GNDBU pin should be connected as shortly as possible to the system ground plane. |
| | GNDUTMIC | VDDUTMIC and VDDHSIC ground | GNDUTMIC pins are common to VDDUTMIC and VDDHSIC pins.<br>GNDUTMIC pins should be connected as shortly as possible to the system ground plane. |
| | GNDUTMII | UDPHS and UHPHS UTMI+ Core and Interface, and PLL UTMI ground | GNDUTMII pins are common to VDDUTMII and VDDUTMIC pins.<br>GNDUTMII pins should be connected as shortly as possible to the system ground plane. |
| | GNDOSC | Oscillator ground | GNDOSC pin is provided for VDDOSC pins.<br>GNDOSC pin should be connected as shortly as possible to the system ground plane. |

.....continued

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | GNDSDMMC | SDMMC ground | SDMMC pins are common to VDDSDMMC pins.<br>GNDSDMMC pins should be connected as shortly as possible to the system ground plane. |
| | GNDANA | Analog ground | GNDANA pins are common to VDDANA pins.<br>GNDANA pins should be connected as shortly as possible to the system ground plane. |
| | GNDFUSE | Fuse box ground | GNDFUSE pins are common to VDDFUSE pins.<br>GNDFUSE pins should be connected as shortly as possible to the system ground plane. |
| | GNDAUDIOPLL<br>GNDDPLL | Audio PLL ground | GNDAUDIOPLL and GNDDPLL pins are common to VDDAUDIOPLL.<br>GNDAUDIOPLL and GNDDPLL pins should be connected as shortly as possible to the system ground plane. |

**Note:**

1. These values are given only as typical examples.
2. Decoupling capacitors must be connected as close as possible to the microprocessor and on each relevant pin



For more information, see the table “VDDCORE Power-On Reset Characteristics” in the section "Electrical Characteristics".

## 68.2 Power-On Reset

The SAMA5D2 embeds several Power-On Resets (PORs) to ensure the power supply is established when the reset is released. These PORs are dedicated to VDDBU, VDDANA and VDDCORE respectively.

## 68.3 Clock, Oscillator and PLL

**Table 68-2. Clock, Oscillator and PLL Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | XIN<br>XOUT<br>Main Oscillator in Normal Mode | Crystals between 8 and 24 MHz<br>USB High Speed (not Full Speed) Host and Device peripherals need a 12 MHz clock.<br>Capacitors on XIN and XOUT (Crystal Load Capacitance dependent) | Crystal Load Capacitance to check ($C_{CRYSTAL}$)<br>  <br>Refer to the section Electrical Characteristics. |
| | XIN<br>XOUT<br>Main Oscillator in Bypass Mode | XIN: external clock source<br>XOUT: can be left unconnected<br>USB High speed (not Full Speed) Host and Device peripherals need a 12 MHz clock. | Square wave signal, high level = VDDOSC<br>External clock source up to 50 MHz<br>Duty Cycle: 40 to 60%<br>Refer to the section Electrical Characteristics. |

## 68.4 ICE and JTAG

**Note:** It is recommended to establish accessibility to a JTAG connector for debug in any case.

**Note:** The boundary scan is only available on JTAG IO Set 1 signals.

**Table 68-3. ICE and JTAG Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | TCK | Pull-up (100 kΩ)(1)<br>If Debug mode is not required, this pin can be used as GPIO. | This pin is a Schmitt trigger input.<br>Internal pull-up resistor to $V_{DDIOP}$ (100 kΩ). |
| | TMS | Pull-up (100 kΩ)(1)<br>If Debug mode is not required, this pin can be used as GPIO. | This pin is a Schmitt trigger input.<br>Internal pull-up resistor to $V_{DDIOP}$ (100 kΩ). |
| | TDI | Pull-up (100 kΩ)(1)<br>If Debug mode is not required, this pin can be used as GPIO. | This pin is a Schmitt trigger input.<br>Internal pull-up resistor to $V_{DDIOP}$ (100 kΩ). |

.....continued

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | TDO | Floating<br>If Debug mode is not required, this pin can be used as GPIO. | Output driven at up to $V_{DDIOP}$. |
| | NTRST | Refer to the section Pin Description.<br>If Debug mode is not required, this pin can be used as GPIO. | This pin is a Schmitt trigger input.<br>Internal pull-up resistor to $V_{DDIOP}$ (100 kΩ). |
| | JTAGSEL | In harsh environments(2), it is strongly recommended to tie this pin to GNDBU if not used or to add an external low-value resistor (such as 1 kΩ). | Internal pull-down resistor to GNDBU (15 kΩ).<br>Must be tied to $V_{DDBU}$ to enter JTAG Boundary Scan. |

**Note:**

1. These values are given only as typical examples.
2. In a well-shielded environment subject to low magnetic and electric field interference, the pin may be left unconnected. In noisy environments, a connection to ground is recommended.

## 68.5 Reset and Test

**Table 68-4. Reset and Test Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | NRST | Application-dependent<br>Can be connected to a push button for hardware reset.<br>In applications with a storage element on VDDBU (battery, supercapacitor, etc.), NRST must be tied to an non-permanent supply (satisfying VIH conditions on NRST) and not to VDDBU. Typically, this may be the application's primary 3.3V supply (VDDIOP0, VDDIOP1 or any other). The recommended pull-up value is 10 kOhms minimum. Doing so, the NRST level is 'L' when the non-permanent supply is removed. On the contrary, if this pin is tied to VDDBU:<br>• the circuit driving this pin low may not be operational when the input power of the application is removed. Therefore the processor may not be properly reset during power-up or power-down phases,<br>• a leakage path from VDDBU to the application's input power may be created when this input power is removed. (This may be for example through a clamping diode that may be present on an external integrated circuit driving NRST.) | NRST pin is a Schmitt trigger input.<br>No internal pull-up resistor. |
| | TST | In harsh environments(1), it is strongly recommended to tie this pin to GNDBU to add an external low-value resistor (such as 10 kΩ). | This pin is a Schmitt trigger input.<br>Internal pull-down resistor to GNDBU (15 kΩ). |

**Note:**

1. In a well-shielded environment subject to low magnetic and electric field interference, the pin may be left unconnected. In noisy environments, a connection to ground is recommended.

## 68.6 Shutdown/Wake-up Logic

**Table 68-5. Shutdown/Wake-up Logic Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | SHDN | Application-dependent<br>A typical application connects pin SHDN to the shutdown input of the DC/DC Converter providing the main power supplies. | Push-pull output. |
| | WKUP | 0V to $V_{DDBU}$ | Input only. WKUP behavior can be configured through the Shutdown Controller (SHDWC). |

## 68.7 Parallel Input/Output (PIO)

**Table 68-6. PIO Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | PAx<br>PBx<br>PCx<br>PDx | Application-dependent | All PIOs are pulled up inputs (100 kW) at reset except those which are multiplexed with the Address Bus signals that require to be enabled as peripherals:<br>In the section Package and Pinout, refer to the column ‘Reset State’ of the Pin Description table.<br>Schmitt trigger on all inputs.<br>To reduce power consumption if not used, the relevant PIO can be configured as an output, driven at ‘0’ with internal pull-up disabled. |

## 68.8 Analog-to-Digital Converter (ADC)

**Table 68-7. ADC Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | ADVREF | 3.3 V to VDDANA<br>Decoupling/filtering capacitors<br>Application-dependent | ADVREF is a pure analog input.<br>To reduce power consumption if the ADC is not used, connect ADVREF to GNDANA. |

## 68.9 External Bus Interface (EBI)

**Table 68-8. EBI Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| | D0–D15 | Application-dependent | Data Bus (D0 to D15)<br>All data lines are pulled up inputs at reset. |
| | A0–A25 | Application-dependent | Address Bus (A0 to A25)<br>All address lines are pulled up inputs at reset. |

The tables below detail the connections to be applied between the EBI pins and the external devices for each memory controller.

**Table 68-9. EBI Pins and External Static Devices Connections**

| Signals: EBI_ | Pins of the Interfaced Device | | |
|---|---|---|---|
| | 8-bit Static Devices | 2 x 8-bit Static Devices | 16-bit Static Devices |
| Controller | SMC (Static Memory Controller) | | |
| D0–D7 | D0–D7 | D0–D7 | D0–D7 |
| D8–D15 | – | D8–D15 | D8–D15 |
| A0/NBS0 | A0 | – | NLB |
| A1 | A1 | A0 | A0 |
| A2–A22 | A[2:22] | A[1:21] | A[1:21] |
| A23–A25 | A[23:25] | A[22:24] | A[22:24] |
| NCS0 | CS | CS | CS |
| NCS1 | CS | CS | CS |
| NCS2 | CS | CS | CS |
| NCS3/NANDCS | CS | CS | CS |
| NRD/NANDOE | OE | OE | OE |
| NWE/NWR0/NANDWE | WE | WE(1) | WE |
| NWR1/NBS1 | – | WE(1) | NUB |

**Note:**

1. NWR0 enables lower byte writes. NWR1 enables upper byte writes.

**Table 68-10. EBI Pins and NAND Flash Device Connections**

| Signals: EBI_ | Pins of the Interfaced Device | |
|---|---|---|
| | 8-bit NAND Flash | 16-bit NAND Flash |
| Controller | NFC (NAND Flash Controller) | |
| D0–D7 | NFD0–NFD7 | NFD0–NFD7 |
| D8–D15 | – | NFD8–NFD15 |
| A21/NANDALE | ALE | ALE |
| A22/NANDCLE | CLE | CLE |
| NRD/NANDOE | RE | RE |
| NWE/NWR0/NANDWE | WE | WE |
| NCS3/NANDCS | CE | CE |
| NANDRDY | R/B | R/B |
| A0/NBS0 | – | – |
| A1–A20 | – | – |
| A23–A25 | – | – |
| NWR1/NBS1 | – | – |
| NCS0 | – | – |
| NCS1 | – | – |
| NCS2 | – | – |
| NWAIT | – | – |

## 68.10 USB High-Speed Host Port (UHPHS) / USB High-Speed Device Port (UDPHS)

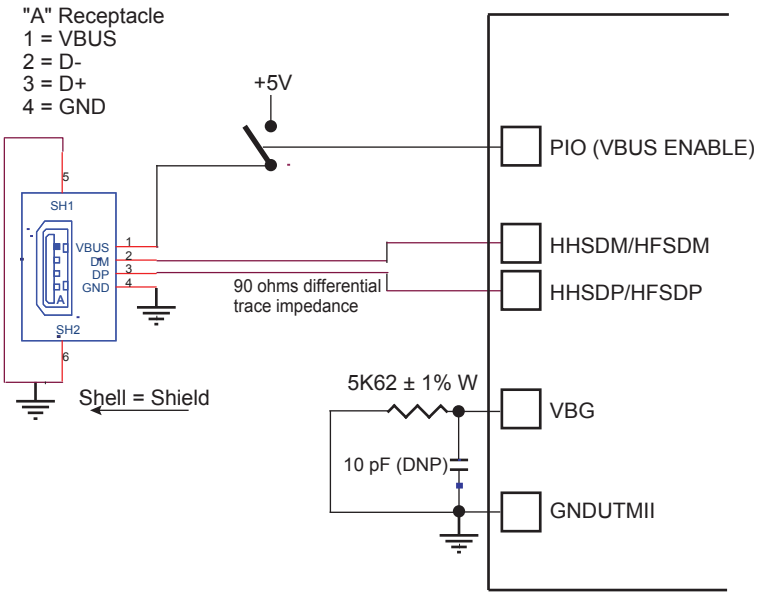
**Table 68-11. UHPHS/UDPHS Connections**

| | Signal Name | Recommended Pin Connection | Description |
|---|---|---|---|
| UHPHS | HHSDPA/DHSDPB(1)<br>HHSDMA/ DHSDMB(1) | Application-dependent(2)(3) | Pull-down output at reset |
| UDPHS | HHSDP/HHSDM | Application-dependent(2) | Pull-down output at reset |
| HSIC | HHSTROBE/ HHDATA | Application-dependent(2) | Pull-down output at reset |

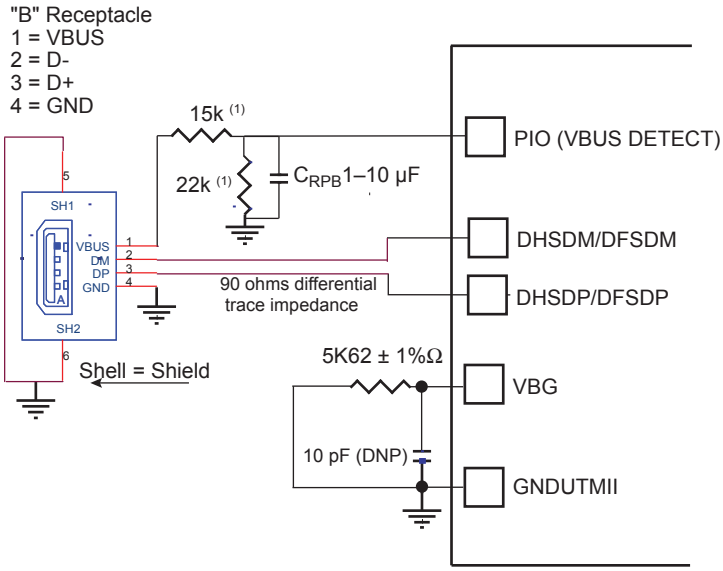
**Note:**

1. UDPHS shares Port A with UHPHS.

2. Example of a USB High Speed Host connection, refer to the section USB Host High Speed Port (UHPHS).



3. Typical USB High Speed Device connection, refer to the section USB Host High Speed Port (UHPHS).



**Note:** The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3.3V supplied PIOs.

## 68.11 Boot Program Hardware Constraints

Refer to the section Standard Boot Strategies for more details on the boot program.

## 68.12 Layout and Design Constraints

**Note:** All PIOs shared, multiplexed, connected to various components and connectors must be connected through serial resistors 22R and 39R for clock signals. The resistors must be populated as close as possible to the SAMA5D2.

### 68.12.1 General Considerations

This chapter provides routing guidelines for layout and design of a printed circuit board using high-speed interfaces, Serial, Ethernet and USB 2.0. The signal integrity rules for high-speed interfaces need to be considered. In fact, it is highly recommended that the board design be simulated to determine optimum layout for signal integrity and quality. Keep in mind that this document can only highlight the most important issues that should be considered when designing the SAMA5D2 board. The designer has to take into account the corresponding information (specification, design guidelines, etc.) contained in the documentation of all other devices that are to be implemented on board.

### 68.12.2 Considerations for High-Speed Differential Interfaces

The following recommendations for designing with high-speed differential signals are useful to maintain maximum SAMA5D2 board performance when implementing these interfaces.

- Use controlled impedance PCB traces that match the specified differential impedance.
- Keep the trace lengths of the differential signal pairs as short as possible.
- The differential signal pair traces should be trace-length matched.
- Maintain parallelism and symmetry between differential signals with the trace spacing needed to achieve the specified differential impedance.
- Maintain maximum possible separation between the differential pairs and any high-speed clocks/ periodic signals (CMOS/TTL) and any connector leaving the PCB (such as I/O connectors, control and signal headers, or power connectors).
- Route differential signals on the signal layer nearest to the ground plane using a minimum of vias and corners. This will reduce signal reflections and impedance changes. Use GND stitching vias when changing layers.
- It is best to put CMOS/TTL and differential signals on different layers which should be isolated by the power and ground planes.
- Avoid tight bends. When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn.
- Do not route traces under crystals, crystal oscillators, clock synthetizers, magnetic devices or ICs that use, and/or generate, clocks.
- Stubs on differential signals should be avoided due to the fact that stubs cause signal reflections and affect signal quality.
- Keep the length of high-speed clock and periodic signal traces that run parallel to high-speed signal lines at a minimum to avoid crosstalk. Based on EMI testing experience, the minimum suggested spacing to clock signals is 50 mil.
- Use a minimum of 20 mil spacing between the differential signal pairs and other signal traces for optimal signal quality. This helps to prevent crosstalk.
- Route all traces over continuous planes (VCC or GND) with no interruptions.
- Avoid crossing over anti-etch if at all possible. Crossing over anti-etch (split planes) increases inductance and radiation levels by forcing a greater loop area.

### 68.12.3 DDR Layout and Design Considerations

Refer to the document “SAMA5D2 Layout Recommendations”, document no. 44041.

### 68.12.4 e.MMC Routing

Refer to the Micron Technical Note TN-FC-35: *e.MMC PCB Design Guide*. This document is intended as guide for PCB designers using Micron e.MMC devices and discusses the primary issues affecting design and layout.

### 68.12.5 USB Trace Routing Guidelines

- Maintain parallelism between USB differential signals with the trace spacing needed to achieve 90-ohm differential impedance. Deviations will normally occur due to package breakout and routing to connector pins. Just ensure the amount and lengths of the deviations are kept to the minimum possible.
- Use an impedance calculator to determine the trace width and spacing required for the specific board stack-up being used. Example: Layer Stacking, 7.5-mil traces with 7.5-mil spacing results in approximately 90-ohm differential trace impedance.
- Minimize the length of high-speed clock and periodic signal traces that run parallel to high-speed USB signal lines, to minimize crosstalk.
- Based on EMI testing experience, the minimum suggested spacing to clock signals is 50 mils. Based on simulation data, use 20-mil minimum spacing between high-speed USB signal pairs and other signal traces for optimal signal quality. This helps to prevent crosstalk.

**Table 68-12. USB Trace Routing Guidelines**

| Parameter | Trace Routing |
|---|---|
| Signal length allowance for the SAMA5D2 | 14.0 inches<br>Valid for a damping value of the PCB trace of 0.11 dB/inch @ 0.4 GHz (common value for FR-4 based material) |
| Differential impedance | 90 ohms ±15% |
| Single-ended impedance | 45 ohms ±10% |
| Trace width (W) | 5 mils (microstrip routing) |
| Spacing between differential pairs (intra-pair) | 6 mils (microstrip routing) |
| Spacing between pairs (inter-pair) | Min. 20 mils |
| Spacing between differential pairs and high-speed periodic signals | Min. 50 mils |
| Spacing between differential pairs and low-speed non-periodic signals | Min. 20 mils |
| Length matching between differential pairs (intra-pair) | 150 mils |
| Reference plane | GND referenced preferred |
| Spacing from edge of plane | Min. 40 mils |
| Vias usage | Try to minimize the number of vias |

### 68.12.6 QSPI Pull-up Resistors

The ROM code **removes** the internal pull-up resistors when it configures PIO controller to mux the QSPI controller I/O lines. Therefore the probing step may fail if the Quad I/O mode of the memory has not been enabled yet and if this memory does not embed internal pull-up resistor on #HOLD or #RESET pin.

For this reason, it is recommended to add external pull-up resistors if needed on the four I/O data lines MOSI/IO0, MISO/IO1, #WP/IO2 and #HOLD/IO3.

Another solution is to update the Quad Enable non-volatile bit in the relevant register to reassign #WP and #HOLD/#RESET pins to functions IO2 and IO3.

### 68.12.7 Considerations for PTC Interface

Particular care must be taken during the layout of the PTC interface for the signals PTC_Xm and PTC_Yn. The PTC Debug Port (PTC_PORT_x) can be routed normally.

**X-Lines (PTC_Xm)**

- Must be routed on TOP and BOTTOM side as often as possible.
- Can be routed in inner layer when necessary.
- A maximum of 4 vias per line is allowed.
- Is possible to cross the lines if necessary.
- X-lines must be as short as possible with a maximum intrinsic capacitance of 15pF.

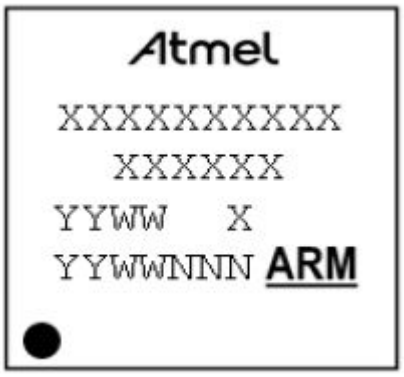
**Y-Lines (PTC_Yn)**

- Must be routed on TOP side only.
- Only one via per line is allowed.
- Never cross the Y-lines.
- Y-lines must be as short as possible with a maximum intrinsic capacitance of 15pF.

Respect an absolute clearance in PTC routing area. No ground path or plane, no power path or plane, and no signals except other PTC lines respecting the recommendations above should overlay the PTC signals in another PCB layer.

# 69. Marking

Top marking follows the scheme below:



with possible values:

| Line | Description | Values |
|---|---|---|
| 1 | Company Logo | Atmel |
| 2 | Device Name | ATSAMA5D21<br>ATSAMA5D22<br>ATSAMA5D23<br>ATSAMA5D24<br>ATSAMA5D26<br>ATSAMA5D27<br>ATSAMA5D28 |
| 3 | Device Information | CN<br>CU |
| 4 | Date Code, Design Revision | YYWW C<br>YYWW B<br>YYWW A |
| 5 | Lot Traceability, ARM logo | YYWWNNN ARM |

# 70. Ordering Information

| Ordering Code | MRL | Package | Carrier Type | Operating Temperature Range |
|---|---|---|---|---|
| ATSAMA5D21C-CU | C | TFBGA196 | Tray | -40°C to 85°C |
| ATSAMA5D21C-CUR | C | | Tape and reel | |
| ATSAMA5D22C-CN | C | | Tray | -40°C to 105°C |
| ATSAMA5D22C-CNR | C | | Tape and reel | |
| ATSAMA5D22C-CU | C | | Tray | -40°C to 85°C |
| ATSAMA5D22C-CUR | C | | Tape and reel | |
| ATSAMA5D23C-CN | C | | Tray | -40°C to 105°C |
| ATSAMA5D23C-CNR | C | | Tape and reel | |
| ATSAMA5D23C-CU | C | | Tray | -40°C to 85°C |
| ATSAMA5D23C-CUR | C | | Tape and reel | |
| ATSAMA5D24C-CU | C | TFBGA256 | Tray | -40°C to 85°C |
| ATSAMA5D24C-CUF01(1) | C | | | |
| ATSAMA5D24C-CUR | C | | Tape and reel | |
| ATSAMA5D26C-CN | C | LFBGA289 | Tray | -40°C to 105°C |
| ATSAMA5D26C-CNR | C | | Tape and reel | |
| ATSAMA5D26C-CU | C | | Tray | -40°C to 85°C |
| ATSAMA5D26C-CUR | C | | Tape and reel | |
| ATSAMA5D27C-CN | C | | Tray | -40°C to 105°C |
| ATSAMA5D27C-CNR | C | | Tape and reel | |
| ATSAMA5D27C-CU | C | | Tray | -40°C to 85°C |
| ATSAMA5D27C-CUR | C | | Tape and reel | |
| ATSAMA5D28C-CN | C | | Tray | -40°C to 105°C |
| ATSAMA5D28C-CNR | C | | Tape and reel | |
| ATSAMA5D28C-CU | C | | Tray | -40°C to 85°C |
| ATSAMA5D28C-CUR | C | | Tape and reel | |

**Note:**

1. The Boot Configuration Word reset value for ATSAMA5D24C-CUF01 is 0x00000C00, meaning that the boot on SDMMC1 and SDMMC0 are disabled. Refer to Boot Configuration Word.

# 71. Revision History

## 71.1 Revision DS60001476C

| Changes |
|---|
| **Global format change**<br>In peripheral sections:<br>- User Interface table is now called Register Summary and features new information.<br>- Details for registers have changed. The details are now Name, Offset, Reset and Property **(Note)**.<br>- Each bitfield now displays its Access and Reset value.<br>**Note**: Absolute register addresses are available in Memories. |
| Updated Block Diagram. |
| Updated Signal Description List for PTC signals. |
| Table Pin Description (all packages): added note on JTAG boundary scan. |
| **Memory Mapping** |
| In Figure 8-1, updated SYSCWP, PMC, RTC and RSTC. |
| **Debug and Test Features** |
| Updated Figure 15-2. |
| Deleted section *Chip Access Using JTAG Connection*. |
| Updated Product part number and JTAG ID Code value in Boundary JTAG ID Register. |
| Updated Product Version Number and Debug Port JTAG IDCODE in JTAG-DP Device ID Code Register. |
| **Standard Boot Strategies** |
| Updated Boot Configuration. |
| **Matrix (H64MX/H32MX)** |
| Updated table Peripheral Identifiers. |
| Master to Slave Access on H32MX: connection between ICM and H32MX removed. |
| Added note on AESB after table Master to Slave Access on H64MX. |
| Section "TrustZone Extension to AHB and APB" renamed to 18.12 TrustZone Technology and reorganized content. |
| In Principles, renamed ‘Always Non-secure’ to ‘Never Secure’ |
| **Special Function Registers (SFR)** |
| Section 19.3.2 SFR_OHCIICR: updated SUSPEND_A, SUSPEND_B and SUSPEND_C definitions |
| **Advanced Interrupt Controller (AIC)** |
| Updated Figure 21-8. |
| Updated Figure in Section 21.3 Block Diagram; updated Section 21.7.3 Interrupt Sources. |
| **Shutdown Controller (SHDWC)** |
| Added information on Write Protection. |
| **Periodic Interval Timer (PIT)** |
| Added information on Write Protection. |

| .....continued |
|---|
| **Changes** |
| **Real-time Clock (RTC)** |
| Updated content of section Waveform Generation. |
| Added information about how to clear bits/fields. |
| **System Controller Write Protection** |
| Section 27.1.2 Register Write Protection: updated list of write-protected registers. |
| **Slow Clock Controller (SCKC)** |
| Updated:<br>• Section 28.1 Description<br>• Section 28.3 Block Diagram<br>• Section 28.4 Functional Description<br>• Section 28.4.1 Switching from Embedded 64 kHz RC Oscillator to 32.768 kHz Crystal Oscillator<br>• Section 28.4.2 Switching from 32.768 kHz Crystal Oscillator to Embedded 64 kHz RC Oscillator<br>• Section 28.5.1 SCKC_CR |
| **Power Management Controller (PMC)** |
| Clock Assignments: removed LCDC row. |
| Removed content related to the CKGR_UCKR.BIASEN bit in Section 32.19 Programming Sequence and Section 32.22.7 CKGR_UCKR |
| Updated Section 32.9 Peripheral and Generic Clock Controller. |
| **Parallel Input/Output Controller (PIO)** |
| Updated Figure 33-2. |
| **External Memories** |
| Table 34-2: Added note on connecting DDR_DQSN. |
| **AHB Multiport DDR-SDRAM Controller (MPDDRC)** |
| Embedded Characteristics: added “Write Leveling not supported” and added “Low-cost LPDDR1with 2 internal banks” and “Arbitration policies” characteristics |
| Updated Block Diagram. |
| DDR2-SDRAM Initialization: added Step 2. |
| Low-power DDR2-SDRAM Initialization: added Step 2. |
| DDR3-SDRAM/DDR3L-SDRAM Initialization: added Step 2. |
| Restored title of Refresh (Autorefresh Command). |
| Scrambling/Unscrambling Function: MPDDRC_KEY1/2 replaced with KEY1/2. |
| Added Monitor. |
| Updated Sequential Mapping DDR-SDRAM Configuration Mapping: 8K Rows, 512/1024 Columns, 8 banks and Interleaved Mapping DDR-SDRAM Configuration Mapping: 8K Rows, 512/1024 Columns, 8 banks. |
| MPDDRC Mode Register: updated DAI bit description. |
| MPDDRC Configuration Register: updated UNAL bit description. |
| MPDDRC Memory Device Register: updated WL, RL3, MANU_ID, REV_ID, TYPE, DENSITY and IO_WIDTH bit descriptions. |
| MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register: updated RZQI bit description. |
| MPDDRC I/O Calibration Register: updated CALCODEP and CALCODEN field descriptions. |
| MPDDRC Read Data Path Register: updated SHIFT_SAMPLING field description. |

| .....continued |
|---|
| **Changes** |
| MPDDRC Monitor Configuration Register: updated REFR_CALIB bit description. |
| **DMA Controller (XDMAC)** |
| Section 37.5.1 Basic Definitions: added "Stride" definition; added 37.5.2 Data Striding Diagram. |
| Updated Section 37.8 XDMAC Software Requirements;Section 37.9.28 XDMAC_CC: updated PROT bit description. |
| **Ethernet MAC (GMAC)** |
| MAC Transmit Block: removed reference to non-existing bit HDFC. |
| GMAC Network Status Register: updated reset value for GMAC_NSR. |
| **USB High Speed Device Port (UDPHS)** |
| Updated Endpoint Configuration and DPRAM Management. |
| Removed figure Example of DPRAM Allocation and Reorganization. |
| **USB Host High Speed Port (UHPHS)** |
| Updated Section 41.3 Block Diagram, Section 41.5.1 I/O Lines, Section 41.6.2 EHCI, and Section 41.6.3 OHCI. |
| Power Management: removed reference to bit BIASEN (UTMI BIAS Enable). |
| Updated Figure 41-2. |
| Added Section 41.6.1 UTMI Transceivers Sharing. |
| Section 41.7.4 UHPHS_USBCMD: USBCMD reset value set to 0x00080B00 (instead of "0x00080000 or 0x00080B00"). |
| Section 41.7.11 UHPHS_PORTSCx: UHPHS_PORTSCx reset value set to 0x00002000 (instead of "0x00002000 or 0x00003000"). |
| Deleted registers UHPHS_INSNREG00 to UHPHS_INSNREG05. |
| **Two-wire Interface (TWIHS)** |
| Table 45-1: START byte support now available. Updated Note 2. |
| Replaced sections "Master Mode FIFOs" and "Slave Mode FIFOs" by a single Section “FIFOs”. |
| Section FIFOs, sub-section Overview, the description for FIFO disable/enable has been changed. |
| **Flexible Serial Communication Controller (FLEXCOM)** |
| Section 46.10.7 FLEX_US_MR (SPI_MODE): restored CHMODE field and updated CHMODE description. |
| Section 46.7.3.1 Transmitter Operations: updated Figure Transmitter Status |
| Section 46.10.55 FLEX_SPI_FMR: updated RXRDYM field description |
| Updated 46.7.4.1 ISO7816 Mode Overview |
| Section 46.7.6 RS485 Mode: updated Figure Example of RTS Drive with Timeguard |
| TWI Clock Waveform Generator Register: deleted CKSRC description. |
| **Universal Asynchronous Receiver Transmitter (UART)** |
| Section47.3 Block Diagram: RXD/TXD pins were renamed to URXD/UTXD. |
| Section47.5.7 Register Write Protection: added UART Receiver Time-out Register to the list. |
| **Quad Serial Peripheral Interface (QSPI)** |
| QSPI Bus Clock Modes: updated column “Capture QSCK Edge”. |
| **Secure Digital MultiMedia Card Controller (SDMMC)** |
| SDMMC Preset Value Register: deleted Note from SDMMC_PVRx register description. |

| .....continued |
|---|
| **Changes** |
| SDMMC Maximum Current Capabilities Register: corrected access to Read/Write. Added note on CAPWREN below register table. |
| SDMMC Capabilities Control Register: updated CAPWREN bit description. |
| **Image Sensor Controller (ISC)** |
| Section51.6.1 ISC_CTRLEN: added bit FUPPRO at index 9 and bit description. |
| Section51.6.30 ISC_GAM_CTRL: added bit BIPART at index 4 and bit description. |
| **Controller Area Network (MCAN)** |
| Description, Section 52.2 Embedded Characteristics: added information on ISO non-compliance |
| **Pulse Width Modulation Controller (PWM)** |
| PWM Clock Generator: updated figure. |
| **Secure Fuse Controller (SFC)** |
| Number of maskable Data Registers modified to 8. Number of Data Registers modified to 17. |
| Modified ACE bit name in Section 56.5.3 SFC_IER, Section 56.5.4 SFC_IDR, Section 56.5.5 SFC_IMR and Section 56.5.6 SFC_SR. |
| **Integrity Check Monitor (ICM)** |
| Updated Section 57.5.4.2 Processing Period. |
| **Advanced Encryption Standard (AES)** |
| Section 59.1 Description: added XTS to supported modes. |
| Section 59.4.2 Operating Modes: added bullet for XTS mode; added bullet for CBC-MAC. |
| Last Output Data Mode: Added (CBC-MAC) to section title. Added details on CMAC algorithm. |
| Section59.4.7.1 Manual Mode: table "Authorized Input Data Registers": updated for XTS algorithm. |
| Section 59.4.7.3 DMA Mode: table "DMA Data Transfer Type for the Different Operating Modes": updated for XTS algorithm. |
| IPSEC Padding: added detail on padding length. |
| SSL Padding: added detail on incremental integer values. |
| Updated DMA Mode. |
| Updated If AES_MR.LOD = 1. |
| **Triple Data Encryption Standard (TDES)** |
| Last Output Data Mode (CBC-MAC): added “CBC-MAC” in section title and added second paragraph. |
| Updated Section 61.4.2.3 DMA Mode and Section 61.4.3.2.2 TDES_MR.LOD = 1. |
| **Analog-to-Digital Controller (ADC)** |
| ADC Channel Status Register: updated CHx bit description |
| Updated USCHx field description in ADC Channel Sequence 1 Register and ADC Channel Sequence 2 Register |
| **Electrical Characteristics** |
| In DC Characteristics updated:<br>- Vhyst parameter<br>- VDDIODDR<br>- conditions for VOL and VOH |
| Updated Section 66.5.2 Backup Mode with DDR in Self-Refresh. |
| Master Clock Waveform Parameters: changed VDDIODDR range. |

| .....continued |
|---|
| **Changes** |
| Corrected references to CKGR_MOR bits and added VIL_XIN and VIH_XIN parameters in XIN Clock Electrical Characteristics. |
| Updated 12 MHz RC Oscillator Characteristics. |
| Updated PLLA Characteristics. |
| Added ADC Bias Current. |
| Added Pen Detect Characteristics. |
| Updated Analog Comparator Characteristics. |
| Two Wire Serial Bus Requirements: corrected definition of TWCK high and low periods. |
| DDR2-SDRAM System Clock Waveform Parameters: VDDIODDR range changed. |
| LPDDR1-SDRAM System Clock Waveform Parameters: VDDIODDR range changed. |
| Section 66.21 SSC Timings: added SSC14 and SSC15 timings |
| **Schematic Checklist** |
| ICE and JTAG: added note on JTAG boundary scan. |
| **Errata** |
| Removed from data sheet to create separate document, *SAMA5D2 Family Silicon Errata and Data Sheet Clarification*, document number DS80000803. |

## 71.2 Revision DS60001476B

| Changes |
|---|
| **Section 6. “Package and Pinout”** |
| Table 6-2 Pin Description: added notes (2) and (3). |
| Table 6-3 Pin Description (SAMA5D23 pins different from those in Table 6-2 “Pin Description”): added note (2). |
| Table 6-4 Pin Description (SAMA5D28B/C pins different from those in Table 6-2 “Pin Description”): added note (2). |
| **Section 7. “Power Considerations”** |
| Updated Figure 7-1 “Recommended Powerup Sequence” and Table 7-2 “Powerup Timing Specification”. |
| **Section 16. “Standard Boot Strategies”** |
| Updated Section 16.4.7.3 “SDCard / e.MMC Boot”. |
| Reworked Section 16.4.7.6 “QSPI NOR Flash Boot for MRL C”. |
| **Section 29. “Peripheral Touch Controller (PTC)”** |
| - Replaced "Peripheral Touch Controller" with "Peripheral Touch Controller Subsystem". |
| - Changed "PTC_IRQ_EVT" to "PTC_IRQ". |
| - Replaced "PIO" and "IO" with "GPIO". |
| Updated: |
| - Figure 29-1. "PTC Block Diagram" |
| - Section 29.2 “Embedded Characteristics” |
| - Section 29.5.2 “I/O Lines” |
| - Section 29.5.3 “Interrupt Sources” |

| .....continued |
|---|
| **Changes** |
| - Section 29.6.2.3 “Firmware in SRAM Code Area” |
| Section 29.5.1 “Power Management”: updated description of “SLCK”. |
| Section 29.6.3.1 “PTC Digital Controller Operations”: modified Sensing mode description. |
| Renamed and reworked Section 29.7.1 “PTC Command Register” and Section 29.7.2 “PTC Interrupt Status Register”. |
| Section 29.7.3 “PTC Enable Register”: removed field CLR_IRQEN, and replaced field SET_IRQEN with bits IER0, IER1, IER2, IER3. |
| Renamed the following registers: |
| - “Mode 1: Write Access” to “PTC Command Register” |
| - “Host Flags” to “PTC Interrupt Status Register” |
| - “Host Flags Control” to “PTC Enable Register” |
| Section 39. “LCD Controller (LCDC)” |
| Corrected Figure 39-1. Block Diagram (added “PP Layer” block). |
| **Section 66. “Electrical Characteristics”** |
| Added Section 66.10 ”PTC Characteristics”. |
| Section 66.5.3.1 “ULP0 Mode”: updated steps (5) and (6). |
| Table 66-9 “Typical Peripheral Power Consumption by Peripheral in Active Mode”: corrected UHPHS consumption value from "12 *MCK + 4900*DR" to "12 *MCK + 490*DR" and UDPHS consumption value from “10 *MCK + 2060*DR” to “10 *MCK + 206*DR” |
| Table 66-13 “VDDCORE Power Consumption in Ultra Low-power Mode: AMP2”: removed ULP0 512 Hz row. |
| **Section 68. “Schematic Checklist”** |
| Removed Section 68.3 “Shutdown Considerations” and Section 68.4 “Wakeup Considerations” (redundant with content in Section 7. “Power Considerations”). |
| Table 68-1 “Power Supply Connections”: updated VDDCORE recommended pin connection from “1.08V to 1.32V” to “1.1V to 1.32V”. |
| Table 68-2 “Clock, Oscillator and PLL Connections”: updated main oscillator recommended pin connection from "Crystals between 8 and 16 MHz" to "Crystals between 8 and 24 MHz". |
| Table 68-6 “Reset and Test Connections”: updated NRST recommended pin connection. |
| **Section 69. “Marking”** |
| Updated marking information. |
| **Section 71. “Errata”** |
| Added the following issues in Section 71.1 “Errata - SAMA5D2 MRL C Parts”: |
| Section 71.1.9 “Master CAN-FD Controller (MCAN)” to Section 71.1.18 “MCAN High Priority Message (HPM)” and Section 71.1.19 “ROM Code: Using JTAG IOSET 4”. |
| Added the following issues in Section 71.2 “Errata - SAMA5D2 MRL B Parts”: |
| Section 71.2.10 “Master CAN-FD Controller (MCAN)” to Section 71.2.19 “MCAN High Priority Message (HPM)” and Section 71.2.20 “ROM Code: Using JTAG IOSET 4”. |
| Added the following issues in Section 71.3 “Errata - SAMA5D2 MRL A Parts”: |
| Section 71.3.26 “Master CAN-FD Controller (MCAN)” to Section 71.3.35 “MCAN High Priority Message (HPM)” and Section 71.3.36 “ROM Code: Using JTAG IOSET 4”. |

## 71.3 Revision DS60001476A

| Changes |
|---|
| General |
| - Template update: Moved from Atmel to Microchip template. |
| - The datasheet is assigned a new document number (DS60001476) and revision letter is reset to A. |
| --- Document number DS60001476 revision A corresponds to what would have been 11267 revision F. |
| - ISBN number assigned. |
| **“Features”**: added PTC. |
| **Table 2. “Configuration Summary”**: added PTC. Corrected number of Timers. |
| **Section 3. “Block Diagram”** |
| Figure 3-1 “SAMA5D2 Series Block Diagram”: corrected SDMMC signals. Updated peripheral bridge naming. Added PTC. Removed signal names. |
| **Section 4. “Signal Description”** |
| Table 4-1 “Signal Description List”: renamed SDMMCx_VDDSEL to SDMMCx_1V8SEL. Added PTC pins on PD0 to PD18. |
| Added **Section 5. “Safety and Security Features”**. |
| **Section 6. “Package and Pinout”** |
| Added Note on IO sets. |
| Table 6-2 “Pin Description”: for P15/R14 renamed SDMMC0_VDDSEL to SDMMC0_1V8SEL. |
| **Section 7. “Power Considerations”** |
| Table 7-1 “SAMA5D2 Power Supplies”: in VDDBU row, corrected RC Oscillator frequency to 64 kHz. |
| **Section 8. “Memories”** |
| Figure 8-1 “Memory Mapping”: renamed MATRIXx blocks. Added PTC. Renamed TC blocks. Added SYSCWP block. |
| **Section 11. “Peripherals”** |
| Table 11-1 “Peripheral Identifiers”: corrected reference to SDMMC. Assigned ID 58 to Peripheral Touch Controller (PTC). |
| Section 11.4 “Peripheral Clock Types”: removed clock type HCLOCK and PCLOCK from table. |
| **Section 12. “Chip Identifier (CHIPID)”** |
| Table 12-1 “SAMA5D2 Chip ID Registers”: added chip ids for MRL C revision. |
| **Section 13. “ARM Cortex-A5”** |
| Section 13.4.7.3 “Debug”: updated Note. |
| **Section 16. “Standard Boot Strategies”** |
| Replaced all occurrences of “Spansion” by “Cypress”. |
| Updated Section 16.3 “Chip Setup”. |
| Updated Section 16.4.1 “Boot Configuration Word”. |
| Section 16.4.2 “Boot Sequence Controller Configuration Register”: updated BUREG_VALID bit description. |
| Added Note to descriptions of SDMMC_0 and SDMMC_1 in Section 16.4.4 “Boot Configuration Word”. |
| Updated Section 16.4.5 “NVM Boot Sequence” and figures. |
| Renamed Section 16.4.7.5 “QSPI Flash Boot for MRL A and MRL B”. |

| .....continued |
|---|
| **Changes** |
| Added Section 16.4.7.6 “QSPI Flash Boot for MRL C”. |
| Updated Section 16.4.8 “Hardware and Software Constraints”: |
| -- added Table 16-5 “Clock Frequencies during External Memory Boot Sequence”. |
| -- Table 16-6 “PIO Driven during Boot Program Execution”: renamed SDMMC_VDDSEL to SDMMC0_1V8SEL. Added column “Drive Strength (MRL C only)”. |
| Section 16.5 “SAM-BA Monitor”: deleted sentence on Main Clock; updated 3rd paragraph. |
| Updated Section 16.6.1 “Fuse Bit Mapping”. |
| **Section 18. “Matrix (H64MX/H32MX)”** |
| Table 18-5 “List of H32MX Slaves”: added Peripheral Touch Controller (PTC) at Slave 6. |
| Table 18-6 “Master to Slave Access on H32MX”: added Peripheral Touch Controller (PTC) at Slave 6. |
| Table 18-9 “Peripheral Identifiers”: added PTC at ID 58. |
| **Section 19. “Special Function Registers (SFR)”** |
| Section 19.3.5 “UTMI Clock Trimming Register”: VBG now 2 bits wide at index [17:16] (was [19:16]). |
| **Section 20. “Special Function Registers Backup (SFRBU)”** |
| Section 20.3.3 “SFRBU DDR BU Mode Control Register” changed occurrences of VCCCORE to VDDCORE. |
| **Section 26. “Real-time Clock (RTC)”** |
| Table 26-1 “Register Mapping”: updated offsets as of 0xCC. Deleted RTC_WPMR at offset 0xE4. |
| Deleted “Section 25.6.23 RTC Write Protection Mode Register”. |
| Added **Section 27. “System Controller Write Protection (SYSCWP)”.** |
| Added **Section 29. “Peripheral Touch Controller (PTC)”.** |
| **Section 33. “Power Management Controller (PMC)”** |
| Reorganized order of sub-sections within the chapter. |
| Updated Figure 33-2 “H32MX 32-bit Matrix Clock Configuration”. |
| Figure 33-1 “General Clock Block Diagram”: updated PMC_PCR block. |
| Added Section 33.8 “Core and Bus Independent Clocks for Peripherals”. |
| Added Section 33.9 “Peripheral and Generic Clock Controller”. |
| Deleted section “Peripheral Clock Controller”. |
| Deleted section “Generic Clock Controller”. |
| Figure 33-10 “Clock Failure Detection (Example)”: corrected CDFEV to CFDEV and CDFS to CFDS. |
| Section 33.19 “Programming Sequence”: deleted paragraph on DIVA from Step 6. |
| Section 33.22.10 “PMC Clock Generator PLLA Register”: changed DIVA description for value ‘0’. |
| **Section 35. “External Memories”** |
| Updated Figure 35-2 “MPDDRC Block Diagram”. |
| Table 35-1 “DDR/LPDDR I/O Lines Description”: DDR_DQS[3:0] and DDR_DQSN[3:0] now type I/O. |
| Aligned signal names in schematics of Section 35.1 “Multiport DDR-SDRAM Controller (MPDDRC)” with signal names in Table 35-2 “I/O Lines Usage vs Operating Modes”. |
| **Section 36. “Multiport DDR-SDRAM Controller (MPDDRC)”** |

| .....continued |
|---|
| **Changes** |
| Section 36.1 “Description”: corrected supported CAS latency. |
| Section 36.4.1 “Low-power DDR1-SDRAM Initialization”: updated Step 12. |
| Section 36.4.2 “DDR2-SDRAM Initialization”: updated Step 22. |
| Section 36.4.3 “Low-power DDR2-SDRAM Initialization”: updated Step 22. |
| Section 36.4.4 “DDR3-SDRAM/DDR3L-SDRAM Initialization”: updated Step 13. |
| Section 36.4.5 “Low-power DDR3-SDRAM Initialization”: updated Step 22. |
| Table 36-1 “CAS Write Latency”: added row for Low-power DDR3-SDRAM. Corrected typo in note. |
| Table 36-2 “CAS Read Latency”: added row for Low-power DDR3-SDRAM. Corrected typo in note. |
| Section 36.7.2 “MPDDRC Refresh Timer Register”: updated the method to compute COUNT. |
| Section 36.7.3 “MPDDRC Configuration Register”: updated NC field description table. |
| Section 36.7.6 “MPDDRC Timing Parameter 2 Register”: in TRPA description, added “In the case of LPDDR2-SDRAM, this field is equivalent to tRPAB.” |
| Section 36.7.10 “MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register”: in COUNT_CAL field description, added ‘One ZQCS command can effectively correct at least 1.5% of output impedance errors within Tzqcs.’ and ‘TSens and VSens are given by the manufacturer (Output Driver Sensitivity definition). Tdriftrate and Vdriftrate are defined by the end user.’ |
| **Section 38. “DMA Controller (XDMAC)”** |
| Added information regarding XDMAC_CC.INITD in Section 38.8 “XDMAC Software Requirements” and Section 38.9.28 “XDMAC Channel x [x = 0..15] Configuration Register”. |
| Section 38.9.3 “XDMAC Global Weighted Arbiter Configuration Register”: replaced “XDMAC scheduler” with “DMAC scheduler” throughout. |
| **Section 39. “LCD Controller (LCDC)”** |
| Standardized signal names from ‘LCD_XXX’ to ‘LCDXXX’ (‘underscore’ character removed) |
| Section 39.2 “Embedded Characteristics”: removed “(at synthesis time)” from characteristic “Asynchronous Output Mode Supported”. |
| **Section 40. “Ethernet MAC (GMAC)”** |
| Section 40.2 “Embedded Characteristics”: deleted queue sizes (now found in Table 40-6 “Queue Size”). |
| Table 40.6.3.9 “Priority Queueing in the DMA”: added Table 40-6 “Queue Size” and updated queue sizes. |
| Section 40.6.15 “Timestamp Unit”: changed pin reference from “TIOB11/PD22” to “TIOA11/PD21”. |
| Added Section 40.6.18 “Energy-efficient Ethernet Support” |
| Updated Section 40.6.19 “802.1Qav Support - Credit-based Shaping”: added definitions of portTransmitRate and IdleSlope; updated content on queue priority management. |
| Added Section 40.6.20 “LPI Operation in the GMAC”. |
| Table 40-18 “Register Mapping”: added registers at offsets 0x270 to 0x27C. |
| Section 40.8.1 “GMAC Network Control Register”: added bit 19: TXLPIEN: Enable LPI Transmission (was ‘reserved’). Added bit description. Changed description of SRTSM bit. |
| Section 40.8.3 “GMAC Network Status Register”: added bit 7: RXLPIS: LPI Indication (was ‘reserved’). Added bit description. |
| Added bit 27: RXLPISBC: Receive LPI indication Status Bit Change and bit description and added bit 29: TSUTIMCOMP: TSU timer comparison interrupt and bit description in: |
| - Section 40.8.10 “GMAC Interrupt Status Register” |
| - Section 40.8.11 “GMAC Interrupt Enable Register” |
| - Section 40.8.12 “GMAC Interrupt Disable Register” |

| .....continued |
|---|
| **Changes** |
| - Section 40.8.13 “GMAC Interrupt Mask Register” |
| Section 40.8.13 “GMAC Interrupt Mask Register”: added bit 26, SRI, and bit 28, WOL, and bit descriptions. |
| Added following sections: |
| - Section 40.8.106 “GMAC Received LPI Transitions” |
| - Section 40.8.107 “GMAC Received LPI Time” |
| - Section 40.8.108 “GMAC Transmit LPI Transitions” |
| - Section 40.8.109 “GMAC Transmit LPI Time” |
| Section 40.8.115 “GMAC Credit-Based Shaping IdleSlope Register for Queue A” and Section 40.8.116 “GMAC Credit-Based Shaping IdleSlope Register for Queue B”: updated example for calculation of IdleSlope. |
| **Section 41. “USB High Speed Device Port (UDPHS)”** |
| Table 41-6 “Register Mapping”: offsets 0xD0 to 0xDC now ‘reserved’. |
| Deleted internal registers: |
| - UDPHS Test SOF Counter Register |
| - UDPHS Test A Counter Register |
| - UDPHS Test B Counter Register |
| - UDPHS Test Mode Register |
| **Section 43. “Audio Class D Amplifier (CLASSD)”** |
| Section 43.6.6 “Application Schematics For Use Case Examples”: for Use Case 1, added information on external MOSFET selection. |
| Section 44. “Inter-IC Sound Controller (I2SC)” |
| In text, tables and figures, pin names changed to: |
| - I2SC_MCK |
| - I2SC_CK |
| - I2SC_WS |
| - I2SC_DI |
| - I2SC_DO |
| Updated Figure 44-1 “I2SC Block Diagram”. |
| Section 44.6.1 “Initialization”: added detail on configuring SFR_I2SCLKSEL. |
| Section 44.6.5 “Serial Clock and Word Select Generation”: updated paragraph on I2SC input clock selection in Master mode. |
| Updated Figure 44-3 “I2SC Clock Generation”. |
| Updated figures in Section 44.7 “I2SC Application Examples”. |
| Section 44.8.2 “I2SC Mode Register”: updated MODE bit description for value ‘1’. Updated IMCKDIV and IMCKMODE field descriptions. |
| **Section 46. “Two-wire Interface (TWIHS)”** |
| Added Section 46.7.2 “TWIHS Control Register (FIFO_ENABLED)”. |
| Added Section 46.7.8 “TWIHS Status Register (FIFO_ENABLED)”. |
| **Section 47. “Flexible Serial Communication Controller (FLEXCOM)”** |
| Corrected Figure 47-27 “RTS Line Software Control when FLEX_US_MR.USART_MODE = 2”. |
| Reworked Section 47.7.11 “USART FIFOs”. |

| .....continued |
|---|
| **Changes** |
| Updated Section 47.8.3.5 “Peripheral Selection”. |
| Reworked Section 47.8.7 “SPI FIFOs”. |
| Section 47.9.3.9 “SMBus Mode”: corrected typo in SMBEN bit name (was ‘SMEN’). |
| Created Section 47.9.6 “TWI FIFOs” by merging Section 10.3.15 “TWI Master Mode FIFOs” and Section 10.5.9 “TWI Slave Mode FIFOs” |
| Section 47.10.43 “SPI Control Register”: updated TXFCLR and RXFCLR bit descriptions. |
| Section 47.10.50 “SPI Status Register”: updated RDRF and TDRE bit descriptions. |
| Section 47.10.55 “SPI FIFO Mode Register”: updated TXRDYM description for value ‘1’. Deleted row for value ‘2’. Updated RXRDYM description for value ‘1’ and for value ‘2’. |
| Added Section 47.10.61 “TWI Control Register (FIFO_ENABLED)”. |
| Added Section 47.10.67 “TWI Status Register (FIFO ENABLED)”. |
| **Section 49. “Serial Peripheral Interface (SPI)”** |
| Section 49.7.3.5 “Peripheral Selection”: modified sub-section “Variable Peripheral Select Mode”. |
| Section 49.7.5 “SPI Comparison Function on Received Character”: replace ‘When the CMPMODE bit is cleared in SPI_CMPR’ with ‘When SPI_MR.CMPMODE is cleared’ |
| In Section 49.7.7 “FIFOs” updated: |
| - Section 49.7.7.1 “Overview” |
| - Section 49.7.7.2 “Sending Data with FIFO Enabled” |
| - Section 49.7.7.3 “Receiving Data with FIFO Enabled” |
| - Section 49.7.7.5 “TXEMPTY, TDRE and RDRF Behavior” |
| - Section 49.7.7.6 “Single Data Mode” |
| - Section 49.7.7.7 “Multiple Data Mode” |
| - “TDRE and RDRF Configuration” |
| Section 49.8.1 “SPI Control Register”: updated TXFCLR and RXFCLR bit descriptions. |
| Section 49.8.8 “SPI Status Register”: updated RDRF and TDRE bit descriptions. |
| Section 49.8.13 “SPI FIFO Mode Register”: updated TXRDYM description for value ‘1’. Deleted row for value ‘2’. Updated RXRDYM description for value ‘1’ and for value ‘2’. |
| Updated “DMAC” in Section 49.7.7.7 “Multiple Data Mode”. |
| **Section 50. “Quad Serial Peripheral Interface (QSPI)”** |
| Section 50.1 “Description”: added Note on device support. |
| Removed references to Double Data Rate (DDR) in Section 50.2 “Embedded Characteristics” and Section 50.6.5.2 “Instruction Frame Transmission”. |
| Section 50.6.5 “QSPI Serial Memory Mode”: updated text on data transfer constraint. |
| Updated Figure 50-8 “Instruction Frame”. |
| Figure 50-9 “Instruction Transmission Flow Diagram”: |
| - Corrected typos: |
| --- “Wait for flag QSPI_SR.INSTRE ... “ (was “QSPI_CR“) |
| --- “Wait for flag QSPI_SR.CSR ... “ (was “QSPI_CR“) |
| - Added new instruction: “Read QSPI_SR (dummy read) to clear QSPI_SR.INSTRE and QSPI_SR.CSR“ |

| .....continued |
|---|
| **Changes** |
| Updated Figure 50-10 “Continuous Read Mode”, Figure 50-16 “Instruction Transmission Waveform 6”, Figure 50-17 “Instruction Transmission Waveform 7” and Figure 50-18 “Instruction Transmission Waveform 8”. |
| **Section 51. “Secure Digital MultiMedia Card Controller (SDMMC)”** |
| Section 51.2 “Embedded Characteristics”: updated bullets on support for MMC at default speed and at high speed. |
| Section 51.3 “Embedded Features for SDMMC0 and SDMMC1”: updated information on SDMMC1. |
| Section 51.10.1.3 “Boot Procedure, ADMA Mode”: removed note after step j. |
| Section 51.13.2 “SDMMC Block Size Register” updated BLKSIZE field description. |
| Section 51.13.9 “SDMMC Present State Register”: updated BUFWREN field description. |
| Section 51.13.16 “SDMMC Clock Control Register”: updated SDCLKFSEL field description. |
| Section 51.13.17 “SDMMC Timeout Control Register”: updated equation in DTCVAL field description. |
| Section 51.13.18 “SDMMC Software Reset Register”: in SWRSTALL field description, updated list of registers cleared to 0 . |
| Section 51.13.21 “SDMMC Error Interrupt Status Register (SD_SDIO)”: in CURLIM bit description, corrected reference to SDMMC_PCR (was SDMMC_PSR). |
| Section 51.13.22 “SDMMC Error Interrupt Status Register (e.MMC)”: updated ACMD bit description. |
| Section 51.13.31 “SDMMC Auto CMD Error Status Register”: changed register access to Read-only. |
| Section 51.13.32 “SDMMC Host Control 2 Register (SD_SDIO)”: corrected typo in bit 7 name (is SCLKSEL; was SLCKSEL). Updated VS18EN bit description. |
| Section 51.13.33 “SDMMC Host Control 2 Register (e.MMC)”: corrected typo in bit 7 name (is SCLKSEL; was SLCKSEL). |
| Section 51.13.41 “SDMMC Preset Value Register”: in Table 51-8 “Preset Value Register Select Condition”: corrected HSEN value in row for High Speed. |
| Section 51.13.45 “SDMMC e.MMC Control 1 Register”: in DDR bit description Note, replaced ‘HSEN’ with ‘DDR’. |
| Section 51.13.51 “SDMMC Retuning Counter Value Register”: updated description for TCVAL. |
| **Section 53. “Controller Area Network (MCAN)”** |
| Section 53.1 “Description”: updated information on compliance. |
| Section 53.4.4 “Address Configuration”: added cross-reference for clarity. |
| Section 53.5.1.4 “Transmitter Delay Compensation”: changed NTSEG1 to TSEG1. |
| **Section 54. “Timer Counter (TC)”** |
| Table 54-1 “Timer Counter Clock Assignment”: added Note below table. |
| Section 54.6.16.2 “Input Preprocessing”: removed unit following equation in 3rd paragraph. Added limitation on maximum pulse duration. |
| Section 54.6.16.4 “Position and Rotation Measurement”: in 3rd paragraph, added “The process must be started by configuring TC_CCR.CLKEN and TC_CCR.SWTRG.” |
| Section 54.6.16.6 “Detecting a Missing Index Pulse”: corrected value of TC_RC0.RC in example in 2nd paragraph. |
| Added Section 54.6.16.7 “Detecting Contamination/Dust at Rotary Encoder Low Speed”. |
| Section 54.7.16 “TC Block Mode Register”: updated MAXFILT field description. |
| In Section 54.7.17 “TC QDEC Interrupt Enable Register”, Section 54.7.18 “TC QDEC Interrupt Disable Register” and Section 54.7.19 “TC QDEC Interrupt Mask Register”: at index 3, added bit MPE and bit description. |
| Corrected occurrences of ‘MAXMP’ to ‘MAXCMP’ in Section 54.7.19 “TC QDEC Interrupt Mask Register” and in Section 54.7.20 “TC QDEC Interrupt Status Register” |
| **Section 56. “Pulse Width Modulation Controller (PWM)”** |

| .....continued |
|---|
| **Changes** |
| Section 56.6.2.2 “Comparator”: corrected ‘CRPD’ to ‘CPRD’ in formulae. |
| Table 56-8 “Register Mapping”: modfied offsets for “PWM External Trigger Register 1”, “PWM Leading-Edge Blanking Register 1”, “PWM External Trigger Register 2” and “PWM Leading-Edge Blanking Register 2”. |
| Section 56.7.43 “PWM Channel Period Register”: corrected ‘CRPD’ to ‘CPRD’ in CPRD description. |
| Section 56.7.44 “PWM Channel Period Update Register”: corrected ‘CRPDUPD’ to ‘CPRDUPD’ in CPRDUDP description. |
| **Section 57. “Secure Fuse Controller (SFC)”** |
| Removed all occurrences of ‘Atmel reserved area’ ( now just ‘reserved area’). |
| Modified bit names for APLE and ACE in: |
| - Section 57.5.3 “SFC Interrupt Enable Register” |
| - Section 57.5.4 “SFC Interrupt Disable Register” |
| - Section 57.5.5 “SFC Interrupt Mask Register” |
| - Section 57.5.6 “SFC Status Register” |
| **Section 58. “Integrity Check Monitor (ICM)”** |
| Updated Section 58.5.5 “ICM Automatic Monitoring Mode”. |
| Section 58.6.1 “ICM Configuration Register”: updated ASCD description. |
| **Section 59. “Advanced Encryption Standard Bridge (AESB)”** |
| Section 59.1 “Embedded Characteristics”: replaced "12 clock cycles encryption/decryption processing time with a 128-bit cryptographic key" with "10 clock cycles encryption/decryptioninherent processing time". |
| In Section 59.3.6 “Automatic Bridge Mode”, updated Section 59.3.6.1 “Description”. |
| **Section 60. “Advanced Encryption Standard (AES)”** |
| Replaced references to “keys” and to “AES_KEYWRx registers” with “AES Key Registers”. |
| Section 60.1 “Description”: corrected index of AES_KEYWR0 registers from 3 to 7. |
| Section 60.2 “Embedded Characteristics” replaced “12/14/16 Clock Cycles Encryption/Decryption Processing Time” with “10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time” |
| **Section 61. “Secure Hash Algorithm (SHA)”** |
| Corrected typos in some figures. |
| Section 61.4.9.1 “Manual Mode”: updated Step 2. |
| Section 61.5.2 “SHA Mode Register”: updated SMOD bit description. |
| **Section 62. “Triple Data Encryption Standard (TDES)”** |
| Replaced references to “TDES_KEYxWRx registers” with “Key Registers”. |
| **Section 63. “True Random Number Generator (TRNG)”** |
| Section 63.6.1 “TRNG Control Register”: changed field name to WAKEY (was KEY). |
| Added **Section 64. “Security Module (SECUMOD)”.** |
| **Section 65. “Analog-to-Digital Converter (ADC)”** |
| Section 65.5.3 “I/O Lines”: “ADC_ADTRG” corrected to “ADTRG”. |
| Section 65.6.14 “Automatic Error Correction”: added information about ADCMODE field. |
| Table 65-7 “ADC Running Modes”: updated Offset Error row. |

| .....continued |
|---|
| **Changes** |
| Section 65.6.18 “Fault Event”: reworked and renamed section (was previously “Fault Output”). |
| Section 65.7.2 “ADC Mode Register”: at index 30, added bit MAXSPEED and bit description |
| Section 65.7.12 “ADC Interrupt Status Register”: updated LCCHG bit description. |
| Section 65.7.20 “ADC Analog Control Register”: added Note (1). |
| **Section 66. “Electrical Characteristics”** |
| Table 66-3 “DC Characteristics”: updated min and max valued for low-level and high-level input currents (all pads). Changed ISI_MCK to ISC_MCK. |
| Updated Table 66-8 “Typical Peripheral Power Consumption by Peripheral in Active Mode” with new column “Clock”. |
| Table 66-10 “Power Consumption in Active Mode: AMP2”: Removed columns DMIPS and CoreMark. |
| In Section 66.14 “FLEXCOM Timings”, added Section 66.14.1 “FLEXCOM USART in Asynchronous Modes” and Section 66.14.3 “FLEXCOM TWI Timings”. |
| In Section 66.14.2 “FLEXCOM SPI Timings”, removed note below all tables from Table 66-52 “FLEXCOM0 in SPI Mode IOSET1 Timings” to Table 66-61 “FLEXCOM4 in SPI Mode IOSET3 Timings”. |
| Added Section 66.15 “USART in Asynchronous Modes”. |
| Section 66.16 “SPI Timings”: updated limitation on fSPCK in “Master Read Mode” and “Slave Write Mode”. Removed note below Table 66-63 “SPI0 IOSET1 Timings”, Table 66-64 “SPI0 IOSET2 Timings”, Table 66-65 “SPI1 IOSET1 Timings”, Table 66-66 “SPI1 IOSET2 Timings” and Table 66-67 “SPI1 IOSET3 Timings”. |
| Section 66.18 “QSPI Timings”: updated limitation on fQSCK in “Master Read Mode”. |
| Section 66.19.3 “LPDDR1-SDRAM”, Table 66-76 “System Clock Waveform Parameters”: updated min value of tDDRCK for VDDCORE[1.2V, 1.32V]. |
| Section 66.19.4 “LPDDR2/LPDDR3-SDRAM”, Table 66-77 “System Clock Waveform Parameters”: updated min value of tDDRCK for VDDCORE[1.2V, 1.32V]. |
| Section 66.19.5 “DDR3/DDR3L-SDRAM”: updated min values in Table 66-78 “System Clock Waveform Parameters”. |
| Section 66.23 “ISC Timings”: updated Figure 66-40 “ISC Timing Diagram” and Timings tables. |
| **Section 68. “Schematic Checklist”** |
| Table 68-1 “Power Supply Connections”: removed reference to VCCCORE. |
| Added Section 68.14.7 “Considerations for PTC Interface”. |
| **Section 70. “Ordering Information”** |
| Updated Table 70-1 “SAMA5D2 Ordering Information” with MRL C ordering codes. |
| **Section 71. “Errata”** |
| Added Section 71.1 “Errata - SAMA5D2 MRL C Parts”. |
| Section 71.2 “Errata - SAMA5D2 MRL B Parts”: added Section 71.1.1 “GMAC Timestamps and PTP packets”. |
| Section 71.3 “Errata - SAMA5D2 MRL A Parts”: added |
| - Section 71.1.1 “GMAC Timestamps and PTP packets” |
| - Section 71.3.4 “ROM Code: SPI Bootup Frequency”. |

## 71.4 Revision 11267E

| Changes |
|---|
| Deleted Section 61. “Security Module”. |

## 71.5 Revision 11267D

| Changes |
|---|
| Minor formatting and editorial changes throughout |
| **“Introduction”** |
| Updated listed DDR memories |
| **“Features”** |
| Frequency of digital fractional PLL for audio “11.289 MHz” corrected to “11.2896 MHz” |
| “Two 64-bit, 16-channel DMA controllers” changed to “51 DMA Channels including two 16-channel 64-bit Central DMA Controllers” |
| **Section 1. “Description”** |
| Updated description of Low-power modes |
| **Section 2. “Configuration Summary”** |
| “Class D amplifier” changed to “stereo Class D amplifier” |
| Updated text at end of section |
| **Section 3. “Block Diagram”** |
| Figure 3-1 “SAMA5D2 Series Block Diagram”: added ISC_MSK input; updated description of crystal oscillators; “PWMEXTRIG0-1” renumbered to “PWMEXTRG1–2” |
| Added note “See Section 35. “DMA Controller (XDMAC)” for peripheral connections to DMA.” |
| **Section 4. “Signal Description”** |
| Table 4-1 “Signal Description List”: NRST signal function “Microcontroller Reset” changed to “Microprocessor Reset”; “PWMEXTRG0-1” renumbered to “PWMEXTRG1–2”; “Self-refresh mode” changed to “Backup Self-refresh mode” in DDR_CKE comments |
| **Section 5. “Package and Pinout”** |
| Separated content into Section 5.1 “Packages” and Section 5.2 “Pinouts” |
| Table 5-2 “Pin Description (SAMA5D21, SAMA5D22, SAMA5D24, SAMA5D26, SAMA5D27, SAMA5D28A)”: “ADVREFP” corrected to “ADVREF”; “PWMEXTRG0” and “PWMEXTRG1” renumbered to “PWMEXTRG1” and “PWMEXTRG2”; removed empty function cells for primary signals PA30, PA31, and PB0–PB7; removed “SEC, FILTER” from “Reset State” column header; added footnote on reset states |
| Added Table 5-3 “Pin Description (SAMA5D23 pins different from those in SAMA5D21/SAMA5D2)” and Table 5-4 “Pin Description (SAMA5D28B pins different from those in SAMA5D28A)” |
| **Section 6. “Power Considerations”** |
| Table 6-1 “SAMA5D2 Power Supplies”: updated rows VDDUTMIC, VDDHSIC and VDDOSC |
| Section 6.4.1 “VDDBU Power Architecture”: reworded second paragraph and deleted “typically less than 2 µA” |
| **Section 7. “Memories”** |
| Section 7.2.1 “External Bus Interface”: “The slew rates are determined by programming the SFR_EBICFG bit in SFR registers” changed to “The drive levels are configured with the DRIVEx field in the EBI Configuration Register (SFR_EBICFG)” |
| **Section 8. “Event System”** |
| Section 8-1 “Real-time Event Mapping List”: instance of “ADC_ADTRG” corrected to “ADTRG” |

.....continued

| Changes |
|---|
| **Section 9. “System Controller”** |
| Section 9.1 “Power-On Reset”: “dedicated to VDDBU, VDDIOP and VDDCORE” changed to “dedicated to monitoring VDDBU, VDDIOP and VDDCORE” |
| **Section 10. “Peripherals”** |
| Table 10-1 “Peripheral identifiers”: in ‘Instance Name’ column, renamed CAN0 and CAN1 to MCAN0 and MCAN1 |
| Section 10.4 “Peripheral Clock Types”: in SLOW_CLOCK description, “32768-Hz crystal oscillator or by the on-chip 32-kHz RC oscillator” changed to “32.768 kHz crystal oscillator or by the on-chip 64 kHz RC oscillator” |
| **Section 11. “Chip Identifier (CHIPID)”** |
| Updated Table 11-1 “SAMA5D2 Chip ID Registers” |
| **Section 13. “L2 Cache Controller (L2CC)”** |
| Table 13-2 “Register Mapping”: reset value 0x0000_0000 changed to 0x0000_0111 for L2CC_TRCR and L2CC_DRCR |
| **Section 14. “Debug and Test Features”** |
| Table 14-1 “Debug and Test Pin List”: NRST pin function “Microcontroller Reset” changed to “Microprocessor Reset” |
| **Section 15. “Standard Boot Strategies”** |
| “Boot Sequence Control Register (BSCR)” renamed to “Boot Sequence Controller Configuration Register” |
| Section 15.1 “Description”: “This microcontroller can be configured” changed to “This microprocessor can be configured” |
| Figure 15-10 “Galois Field Table Mapping”: modified Galois field table offsets |
| Section 15.4.2 “Boot Sequence Controller Configuration Register”: added address |
| Section 15.4.3 “Boot Configuration Word”: added reference to “Customer Fuse Matrix” |
| Added Section 15.4.6.5 “QSPI Flash Boot” |
| Table 15-3 “PIO Driven during Boot Program Execution”: NAND Flash PIO line PIOC17 changed to PIOB0 |
| **Section 18. “Special Function Registers (SFR)”** |
| Table 18-1 “Register Mapping”: removed EBI Configuration Register / SFR_EBICFG (offset 0x40 now reserved) |
| Section 18.3.1 “DDR Configuration Register”: added note |
| Removed section “EBI Configuration Register” |
| **Section 21. “Watchdog Timer (WDT)”** |
| Section 21.4 “Functional Description”: in eighth paragraph, “To prevent a software deadlock that continuously triggers the watchdog, the reload of the watchdog must occur...” changed to “The reload of the watchdog must occur...” |
| **Section 25. “Real-time Clock (RTC)”** |
| Reworked Section 25.5.6 “Updating Time/Calendar” |
| Reworked Figure 25-7 “Calibration Circuitry Waveforms” |
| AD index ‘7’ replaced with generic ‘n’ in Section 25.5.8 “Waveform Generation” |
| Updated Figure 25-8 “Waveform Generation for ADC Trigger Event” |
| Section 25.6.2 “RTC Mode Register”: |
| - updated descriptions of fields OUT0 and OUT1<br>- added fields TPERIOD and THIGH |
| **Section 27. “Low Power Asynchronous Receiver (RXLP)”** |

.....continued

| Changes |
|---|
| Pin/signal name “LPRXD” changed to “RXD” |
| **Section 29. “Clock Generator”** |
| Section 29.2 “Embedded Characteristics”: AUDIOPLLCK changed to AUDIOPLLCLK |
| Figure 29-1 “Clock Generator Block Diagram”: lines changed to arrows for OSCSEL to multiplexer, for MOSCSEL to multiplexer, and for PLLADIV2 to “PLLA and Divider” block |
| Figure 29-5 “Divider and PLLA Block Diagram”: added PLLADIV2 divider |
| Updated Section 29.8 “Audio PLL” |
| **Section 30. “Power Management Controller (PMC)”** |
| AUDIOPLLCK changed to AUDIOPLLCLK in Section 30.15 “Programmable Clock Controller” and Section 30.16 “Generic Clock Controller” |
| Figure 30-1 “General Clock Block Diagram”: added PLLA block; repositioned PLLACK signal; at bottom of diagram “PCKx” changed to “PCKx (to pads)” |
| Table 30-3 “Register Mapping”: PMC_AUDIO_PLL0 reset value ‘0x0000_0000’ changed to ‘0x0000_00D0’ |
| Section 30.22.11 “PMC Master Clock Register”: updated CSS field description |
| Section 30.22.13 “PMC Programmable Clock Register”: added addresses 0xF0014044 and 0xF0014048; updated CSS field description |
| Section 30.22.39 “PMC Audio PLL Control Register 0”: added fields DCO_FILTER (bits 29:28), DCO_GAIN (bits 27:24) and PLLFLT (bits 7:4) |
| Section 30.22.40 “PMC Audio PLL Control Register 1”: updated DIV field description |
| **Section 31. “Parallel Input/Output Controller (PIO)”** |
| Section 31.4.2 “External Interrupt Lines”: “are generally multiplexed” changed to “are multiplexed” |
| Section 31.5 “Functional Description”: removed entire section “Peripheral Muxing Example” |
| Table 31-4 “Register Mapping”: |
| - added reset value for PIO_CFGR, PIO_ODSR, PIO_IMR, S_PIO_CFGR, S_PIO_ODSR and S_PIO_IMR<br>- “PIO I/O Freeze Register” corrected to “PIO I/O Freeze Configuration Register” |
| - defined offset range 0x400–0x4FC as reserved |
| - reserved offset range 0x5E8–0x5F8 changed to 0x5E8–0x5FC |
| - “Secure PIO I/O Freeze Register” corrected to “Secure PIO I/O Freeze Configuration Register” |
| Removed duplicated or invalid addresses in Section 31.7.1 “PIO Mask Register”, Section 31.7.2 “PIO Configuration Register”, Section 31.7.3 “PIO Pin Data Status Register”, Section 31.7.4 “PIO Lock Status Register”, Section 31.7.5 “PIO Set Output Data Register”, and Section 31.7.6 “PIO Clear Output Data Register” |
| Section 31.7.7 “PIO Output Data Status Register”: removed duplicated or invalid addresses; access “Read-only or Read/Write” corrected to “Read/Write” |
| Removed duplicated or invalid addresses in Section 31.7.8 “PIO Interrupt Enable Register”, Section 31.7.9 “PIO Interrupt Disable Register”, Section 31.7.10 “PIO Interrupt Mask Register”, and Section 31.7.11 “PIO Interrupt Status Register” |
| Section 31.7.12 “PIO I/O Freeze Configuration Register”: corrected title (was “PIO Freeze Configuration Register”); removed duplicated or invalid addresses; access “Read/Write” corrected to “Write-only” |
| Removed duplicated or invalid addresses in Section 31.7.15 “Secure PIO Mask Register”, Section 31.7.16 “Secure PIO Configuration Register”, Section 31.7.17 “Secure PIO Pin Data Status Register”, Section 31.7.18 “Secure PIO Lock Status Register”, Section 31.7.19 “Secure PIO Set Output Data Register” and Section 31.7.20 “Secure PIO Clear Output Data Register” |
| Section 31.7.21 “Secure PIO Output Data Status Register”: removed duplicated or invalid addresses; access “Read-only or Read/Write” corrected to “Read/Write” |

.....continued

| Changes |
|---|
| Removed duplicated or invalid addresses in Section 31.7.22 “Secure PIO Interrupt Enable Register”, Section 31.7.23 “Secure PIO Interrupt Disable Register”, Section 31.7.24 “Secure PIO Interrupt Mask Register”, and Section 31.7.25 “Secure PIO Interrupt Status Register” |
| Section 31.7.29 “Secure PIO I/O Freeze Configuration Register”: corrected title (was “Secure PIO Freeze Configuration Register”); removed duplicated or invalid addresses; access “Read/Write” corrected to “Write-only” |
| Section 31.7.30 “Secure PIO Slow Clock Divider Debouncing Register”: added sentence about register write protection |
| **Section 32. “External Memories”** |
| Table 32-1 “DDR/LPDDR I/O Lines Description”: updated DDR_VREF function description |
| **Section 33. “Multiport DDR-SDRAM Controller (MPDDRC)”** |
| Section 33.4.1 “Low-power DDR1-SDRAM Initialization”: in first paragraph, removed content about configuring register SFR_DDRCFG |
| Section 33.6 “Software Interface/SDRAM Organization, Address Mapping”: modified description of Interleaved mode (“at each SDRAM end page” corrected to “at each DDRSDRAM end of page”) |
| Harmonized register naming throughout Section 33.7 “AHB Multiport DDR-SDRAM Controller (MPDDRC) User Interface” |
| Removed all MPDDRC DLL registers (offset range 0x100–0x158 now reserved) |
| Section 33.7.3 “MPDDRC Configuration Register”: modified description of DECOD bit value ‘1’ (“at each SDRAM end page” corrected to “at each DDR-SDRAM end of page”) |
| Section 33.7.12 “MPDDRC I/O Calibration Register”: updated RZQ values in RDIV field description |
| **Section 34. “Static Memory Controller (SMC)”** |
| Section 34.17.3 “NFC Initialization”: instances of “rbn” changed to “Ready/Busy” |
| Section 34.20.3 “NFC Status Register”: bit RB_EDGE3 (bit 27) replaced by RB_EDGE0 (bit 24); updated RB_RISE and RB_FALL bit descriptions |
| Bit RB_EDGE3 (bit 27) replaced by RB_EDGE0 (bit 24) in Section 34.20.4 “NFC Interrupt Enable Register”, Section 34.20.5 “NFC Interrupt Disable Register” and Section 34.20.6 “NFC Interrupt Mask Register” |
| Deleted invalid addresses in Section 34.20.30 “PMECC Error Location SIGMA0 Register” and Section 34.20.31 “PMECC Error Location SIGMAx Register” |
| Section 34.20.32 “PMECC Error Location x Register”: register index “x=0..23” corrected to “x=0..31” |
| Section 34.20.36 “Timings Register”: removed RBNSEL field |
| **Section 35. “DMA Controller (XDMAC)”** |
| Added XDMAC_CCx.CSIZE configuration to Table 35-2 “DMA Channels Definition (XDMAC0)” and Table 35-3 “DMA Channels Definition (XDMAC1)” |
| Table 35-5 “Register Mapping”: |
| - XDMAC_GCFG access Read-only corrected to Read/Write |
| - XDMAC_GWAC access Read-only corrected to Read/Write |
| Section 35.9.2 “XDMAC Global Configuration Register”: access Read-only corrected to Read/Write |
| Section 35.9.3 “XDMAC Global Weighted Arbiter Configuration Register”: access Read-only corrected to Read/Write |
| **Section 36. “LCD Controller (LCDC)”** |
| Updated ”Section 36.2 “Embedded Characteristics” |
| Updated Section 36.6.1.1 “Pixel Clock Period Configuration” |
| **Section 37. “Ethernet MAC (GMAC)”** |
| Table 37-1 “GMAC Connections in Different Modes”: added table Note on GTXCK |

| .....continued |
|---|
| **Changes** |
| Updated Section 37.5.3 “Interrupt Sources” |
| Section 37.7.1.2 “Receive Buffer List” and Section 37.7.1.3 “Transmit Buffer List”: added note at end of sections on queue pointer intilaization |
| Section 37.8.107 “GMAC Transmit Buffer Queue Base Address Register Priority Queue x” and Section 37.8.108 “GMAC Receive Buffer Queue Base Address Register Priority Queue x”: changed sentence on register initialization |
| **Section 39. “USB Host High Speed Port (UHPHS)”** |
| Section 39.2 “Embedded Characteristics”: “X Hosts (A and B) High Speed (EHCI)” corrected to “2 Hosts (A and B) High Speed (EHCI)” |
| Table 39-2 “Register Mapping”: inserted reserved offset 0x0C |
| Section 39.7.19 “EHCI: REG06 - AHB Error Status”: instances of “INSNREG[8:4]” changed to “INSNREG06[8:4]” |
| **Section 40. “Audio Class D Amplifier (CLASSD)”** |
| Section 40.2 “Embedded Characteristics”: DSP clock frequency “11.289 MHz” corrected to “11.2896 MHz” |
| Section 40.5.2 “Power Management”: field name “NOVRLAP” corrected to “NOVRVAL” |
| Figure 40-21 “Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs”: changed title (was “Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Differential Outputs”) |
| **Section 42. “Synchronous Serial Controller (SSC)”** |
| Figure 42-19 “Interrupt Block Diagram”: “RXSYNC” renamed to “RXSYN”; “TXSYNC” renamed to “TXSYN” |
| Section 42.8.10 “Register Write Protection”: in first sentence, “AIC behavior” corrected to “SSC behavior” |
| **Section 43. “Two-wire Interface (TWIHS)”** |
| Section 43.6.3.10 “SMBus Mode”: Deleted “A dedicated bus line, SMBALERT, allows a slave to get a master attention” from listed exceptions |
| Section 43.6.5.6 “SMBus Mode”: Deleted “A dedicated bus line, SMBALERT, allows a slave to get a master attention” from listed exceptions |
| Deleted note about debugger read access in Section 43.7.6 “TWIHS Status Register”, Section 43.7.13 “TWIHS Receive Holding Register” and Section 43.7.25 “TWIHS Write Protection Status Register” |
| **Section 44. “Flexible Serial Communication Controller (FLEXCOM)”** |
| Section 44.7.1.2 “Fractional Baud Rate in Asynchronous Mode”: in first paragraph, deleted sentence “This feature is only available when using USART Normal mode.” |
| Figure 44-8 “Preamble Patterns, Default Polarity Assumed”: instances of “8 bit width” changed to “8-bit” |
| Figure 44-11 “Asynchronous Start Detection”: added missing arrowheads |
| Section 44.7.3.11 “Receiver Timeout”: removed redundant paragraphs on STTTO and RETTO; reworded two bullets |
| Section 44.7.4 “ISO7816 Mode”: at end of second paragraph, “value 0x5 for protocol T = 1” changed to “value 0x6 for protocol T = 1” |
| Section 44.7.4.2 “Protocol T = 0”: reworded content under “Receive NACK Inhibit” |
| Section 44.7.7 “USART Comparison Function on Received Character”: modified information about the CMPMODE bit |
| Table 44-18 “Register Mapping”: added TWI SleepWalking Matching Register (FLEX_TWI_SWMR) |
| Section 44.10.41 “USART Write Protection Mode Register”: rephrased WPEN bit description |
| Corrected order of all sections from Section 44.10.66 “TWI Interrupt Enable Register” to Section 44.10.76 “TWI SleepWalking Matching Register” |
| Section 44.10.76 “TWI SleepWalking Matching Register”: added addresses |
| **Section 46. “Serial Peripheral Interface (SPI)”** |
| Figure 46-1 “Block Diagram”: added GCLK output from PMC to SPI |
| Modified transmission condition description in Section 46.7.3 “Master Mode Operations” |

| .....continued |
|---|
| **Changes** |
| Section 46.7.4 “SPI Slave Mode”: added sentence about NSS rising between characters |
| Section 46.7.5 “SPI Comparison Function on Received Character”: in seventh paragraph, added “if SleepWalking mode is disabled” to sentence “The comparison trigger event is...” |
| Updated Section 46.7.8 “Register Write Protection” |
| Section 46.8.2 “SPI Mode Register”: added bits BRSRCCLK (Bit Rate Source Clock) and LSBHALF (LSB Timing Selection); updated description of field DLYBCS |
| Section 46.8.12 “SPI Chip Select Register”: updated description of fields CSNAAT, SCBR, DLYBS and DLYBCT |
| **Section 47. “Quad Serial Peripheral Interface (QSPI)”** |
| Section 47.2 “Embedded Characteristics”: added bullet “Interface to Serial Flash Memories Operating in Single Data Rate or Double Data Rate Modes” |
| **Section 47. “Quad Serial Peripheral Interface (QSPI)” (cont’d)** |
| NSS renamed to QCS in Figure 47-2 “QSPI Transfer Format (QSPI_SCR.CPHA = 0, 8 bits per transfer)” and Figure 47-3 “QSPI Transfer Format (QSPI_SCR.CPHA = 1, 8 bits per transfer)” |
| Section 47.7.2 “QSPI Mode Register”: added note “This field is forced to LASTXFER when SMM is written to ‘1’ to CSMODE field description; modified equation in description of fields DLYBCT and DLYCS |
| Section 47.7.5 “QSPI Status Register”: updated descriptions of bits CSR and INSTRE |
| Section 47.7.9 “QSPI Serial Clock Register”: modified equation in description of fields SCBR and DLYBS |
| **Section 48. “Secure Digital Multimedia Card Controller (SDMMC)”** |
| Added Section 48.3 “Embedded Features for SDMMC0 and SDMMC1” |
| Figure 48-1 “Block Diagram”: added two notes |
| Table 48-3 “Register Mapping”: updated SDMMC_APSR reset value (SDMMC0 different from SDMMC1) |
| Section 48.13.18 “SDMMC Software Reset Register”: updated SWRSTCMD bit description |
| Section 48.13.58 “SDMMC Calibration Control Register”: in CNTVAL field description, “tSTARTUP = ...” corrected to “tSTARTUP = 2 µs” |
| **Section 49. “Image Sensor Controller (ISC)”** |
| Added Section 49.4 “Product Dependencies” |
| Table 49-18 “Register Mapping”: defined offset range 0x404–0x40C as reserved |
| **Section 50. “Controller Area Network (MCAN)”** |
| “GCLK3” changed to “GCLK” in Section 50.3 “Block Diagram” and Section 50.4.2 “Power Management” |
| Added Table 50-2 “Peripheral IDs” |
| Updated Section 50.5.1.3 “CAN FD Operation” |
| Section 50.5.1.4 “Transmitter Delay Compensation”: modified title (was “Transceiver Delay Compensation”); revised content |
| Section 50.5.1.5 “Restricted Operation Mode”: added ‘Note’ |
| Section 50.5.3 “Timeout Counter”: “baud rate” changed to “bit rate” in ‘Note’ |
| Section 50.5.4.1 “Acceptance Filtering”: “described in Section” corrected to “described in “Rx FIFO Overwrite Mode” |
| Updated Figure 50-5 “Standard Message ID Filter Path”and Figure 50-6 “Extended Message ID Filter Path” |
| Updated register names in Figure 50-7 “Rx FIFO Status” and Figure 50-8 “Rx FIFO Overflow Handling” |
| Section 50.5.7.2 “Rx Buffer and FIFO Element”: “R1 Bit 21 FDF: Extended Data Length” renamed to “R1 Bit 21 FDF: FD Format” |
| Section 50.5.7.4 “Tx Event FIFO Element”: “E1 Bit 21 FDF: Extended Data Length” renamed to “E1 Bit 21 FDF: FD Format” |

| .....continued |
|---|
| **Changes** |
| Table 50-14 “Register Mapping”: |
| - deleted row “0x00–0x04 / Reserved” |
| - “Fast Bit Timing and Prescaler Register” renamed to “Data Bit Timing and Prescaler Register” |
| #NAME? |
| Section 50.6.4 “MCAN Data Bit Timing and Prescaler Register”: changed name (was “MCAN Fast Bit Timing and Prescaler Register”); field FBRP replaced by field DBRP |
| Section 50.6.7 “MCAN CC Control Register”: updated descriptions of fields FDOE, BRSE, PXHD and EFB; removed NISO bit |
| Section 50.6.8 “MCAN Nominal Bit Timing and Prescaler Register”: “NBRP: Nominal Baud Rate Prescaler” changed to “NBRP: Nominal Bit Rate Prescaler” |
| Section 50.6.9 “MCAN Timestamp Counter Configuration Register”: updated TSS field description |
| Section 50.6.10 “MCAN Timestamp Counter Value Register”: updated TSC field description |
| Section 50. “Controller Area Network (MCAN)” (cont’d) |
| Section 50.6.20 “MCAN Global Filter Configuration”: added details on register description; updated ANFE and ANFS field descriptions. |
| Added details on register description in Section 50.6.21 “MCAN Standard ID Filter Configuration” and Section 50.6.22 “MCAN Extended ID Filter Configuration” |
| Section 50.6.24 “MCAN High Priority Message Status”: updated description of MSI field value ‘1’ |
| **Section 51. “Timer Counter (TC)”** |
| Replaced TIOA, TIOB, TCLK with TIOAx, TIOBx, TCLKx |
| Table 51-1 “Timer Counter Clock Assignment”: updated definitions |
| Section 51.6.3 “Clock Selection”: updated bullet “Internal clock signals”, updated notes 1 and 2 |
| Section 51.6.9 “Transfer with DMAC in Capture Mode”: updated title (added “in Capture Mode”) |
| Updated Figure 51-5 “Example of Transfer with DMAC in Capture Mode” |
| Section 51.6.16.4 “Position and Rotation Measurement”: updated text in first paragraph |
| Added Section 51.6.16.6 “Detecting a Missing Index Pulse” |
| Updated TCCLKS field description in Section 51.7.2 “TC Channel Mode Register: Capture Mode” and Section 51.7.3 “TC Channel Mode Register: Waveform Mode” |
| **Section 53. “Pulse Width Modulation Controller (PWM)”** |
| Throughout, “PWMTRG” and “EXTTRG” renamed to “PWMEXTRG” |
| Table 53-2 “I/O Lines”: “PWMEXTRG0” and “PWMEXTRG1” renumbered to “PWMEXTRG1” and “PWMEXTRG2” |
| Updated Section “Recoverable Fault” |
| Updated Figure 53-1 “Pulse Width Modulation Controller Block Diagram” and added note below figure |
| Updated Figure 53-16 “Fault Protection” |
| **Section 54. “Secure Fuse Controller (SFC)”** |
| Table 54-1 “Register Mapping”: removed reset value from SFC_IER and SFC_IDR (both registers are write-only) |
| **Section 55. “Integrity Check Monitor (ICM)”** |
| Table 55-8 “Register Mapping”: ICM_SR access “Write-only” corrected to “Read-only” |
| **Section 57. “Advanced Encryption Standard (AES)”** |
| Table 57-5 “Register Mapping”: AES_ALPHAR[0..3] access “Write” corrected to “Write-only” |

| .....continued |
|---|
| **Changes** |
| Section 57.5.20 “AES Alpha Word Register x”: access “Write” corrected to “Write-only” |
| **Section 59. “Triple Data Encryption Standard (TDES)”** |
| Section 59.4.1 “Operating Modes”: deleted sentence “The OFB and CFB modes of operation are only available if 2-key mode is selected (KEYMOD = 1 in TDES_MR).” |
| Section 59.4.3 “Last Output Data Mode”: deleted sentence “No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see Section 59.4.3 “Last Output Data Mode”).” |
| Section 59.5.2 “TDES Mode Register”: in OPMOD field description, deleted sentence “The OFB and CFB modes of operation are only available if 2-key mode is selected (KEYMOD = 1).” |
| **Section 61. “Security Module”** |
| Updated Figure 61-2 “Security Module Internal Memory Map” |
| **Section 62. “Analog-to-Digital Converter (ADC)”** |
| Section 62.1 “Description”: |
| - deleted sentence “A digital error correction circuit based on the multi-bit redundant signed digit (RSD) algorithm is implemented to reduce INL and DNL errors.” |
| - deleted sentence “Finally, the user can configure ADC timings, such as startup time and tracking time.” |
| Updated Section 62.2 “Embedded Characteristics” |
| Updated Figure 62-1 “Analog-to-Digital Converter Block Diagram” |
| Revised Section 62.5 “Product Dependencies” |
| Revised Section 62.6.1 “Analog-to-Digital Conversion” |
| Updated Section 62.6.3 “ADC Reference Voltage” and Section 62.6.4 “Conversion Resolution” |
| Updated Section 62.6.7 “Conversion Triggers” |
| Section 62.6.9 “Comparison Window”: in fourth paragraph, instance of “ADC_SR” corrected to “ADC_ISR” |
| Section 62.6.10 “Differential and Single-ended Input Modes”: changed title (was “Differential Inputs”) and revised content |
| Updated Section 62.6.11 “ADC Timings”, Section 62.6.12 “Last Channel Specific Measurement Trigger”, Section 62.6.13 “Enhanced Resolution Mode and Digital Averaging Function” and Section 62.6.14 “Automatic Error Correction” |
| Instances of GND renamed to GNDANA in Figure 62-15 “Touchscreen Switches Implementation”, Figure 62-18 “Touchscreen Switches Implementation” and Figure 62-20 “Touchscreen Pen Detect” |
| Updated Section 62.6.16 “Asynchronous and Partial Wakeup (SleepWalking)” |
| Section 62.6.17.1 “Classic ADC Channels Only (Touchscreen Disabled)”: changed title (was “Classical ADC Channels Only”) |
| Section 62.6.19 “Register Write Protection”: updated list of protectable registers |
| Table 62-8 “Register Mapping”: |

| .....continued |
|---|
| **Changes** |
| - defined 0x48 as reserved<br>- added row 0x4C / Channel Offset Register / ADC_COR<br>- added offset 0x7C for ADC_CDR11<br>- defined offset range 0x80–0x90 as reserved<br>- added row 0x94 / Analog Control Register / ADC_ACR<br>- defined offset range 0xC4–0xD0 as reserved<br>- added row 0xD4 / Correction Values Register / ADC_CVR<br>- added row 0xD8 / Channel Error Correction Register / ADC_CECR<br>- added row 0xDC / Touchscreen Correction Values Register / ADC_TSCVR<br>- defined offset 0xE0 as reserved |
| Section 62.7.2 “ADC Mode Register”: updated TRACKIM field description |
| Added LCCHG (Last Channel Change) bit in Section 62.7.9 “ADC Interrupt Enable Register”, Section 62.7.10 “ADC Interrupt Disable Register”, Section 62.7.11 “ADC Interrupt Mask Register” and Section 62.7.12 “ADC Interrupt Status Register” |
| Section 62.7.13 “ADC Last Channel Trigger Mode Register”: updated CMPMOD field description |
| Section 62.7.16 “ADC Extended Mode Register”: updated CMPMODE field description; added descriptions for fields OSR ASTE |
| Section 62.7.18 “ADC Channel Offset Register”: added address; removed bits OFF11:OFF0 from bitmap; modified DIFFx field description |
| Section 62.7.20 “ADC Analog Control Register”: added address; added IBCTL field |
| Section 62.7.25 “ADC Trigger Register”: added sentence about write protection |
| Removed Section “Correction Select Register” |
| Added sentence about write protection in Section 62.7.26 “ADC Correction Values Register” and Section 62.7.27 “ADC Channel Error Correction Register” |
| Added Section 62.7.28 “ADC Touchscreen Correction Values Register” |
| **Section 63. “Electrical Characteristics”** |
| “ADVREFP” corrected to “ADVREF” |
| Section 63.2 “DC Characteristics”: in first sentence, “TA = -40°C to +85°C” changed to “TA = -40°C to +105°C” |
| Added Table 63-2 “Recommended Thermal Operating Conditions” |
| Updated Section 63.4 “Active Mode” |
| Table 63-8 “Low-power Mode Configuration Summary”: updated values for ‘Consumption’ and ‘Wakeup Time’ |
| Updated Section 63.5.6 “Low-power Consumption Versus Modes” |
| Table 63-9 “Typical Power Consumption in Idle Mode: AMP2”: updated consumption values |
| Table 63-10 “VDDCORE Power Consumption in Ultra Low-power Mode: AMP2”: updated consumption values; updated wakeup time for ULP1 Fast Wakeup mode |
| Table 63-11 “Typical Power Consumption for Backup Mode”: updated consumption values |
| Updated Table 63-12 “Processor Clock Waveform Parameters” and Table 63-13 “Master Clock Waveform Parameters” |
| Updated Section 63.7.1 “Main Oscillator Characteristics” |
| Table 63-17 “12 MHz RC Oscillator Characteristics”: updated startup time values |
| Updated Section 63.7.3 “32.768 kHz Crystal Oscillator Characteristics” |
| Updated Table 63-23 “Audio PLL Characteristics” |

| .....continued |
|---|
| **Changes** |
| Section 63.10 “ADC Characteristics”: deleted sentence “The VREFN pin must be connected to ground.” |
| Table 63-25 “Power Supply Characteristics”: updated Analog Current Consumption value for Fast Wakeup mode |
| Table 63-26 “ADVREF Electrical Characteristics”: “VREFP” corrected to “ADVREF”; updated Current value |
| Section 63.10.4.1 “Differential Mode (12-bit mode)” and Section 63.10.4.2 “Single-ended Mode (12-bit mode)”: in equation, “VVREFP” corrected to “VADVREF” |
| Section 63.10.4.4 “Gain and Offset Errors”: “VVREFP” corrected to “VADVREF” |
| Table 63-27 “ADC Timing Characteristics”: updated footnote |
| Added Table 63-32 “ADC Analog Input Characteristics” |
| Table 63-37 “VDDCORE Power-On Reset Characteristics”: updated Hysteresis Voltage values |
| Section 63.14.1 “Maximum SPI Frequency”: updated values in “Master Read Mode” and “Slave Write Mode” |
| Revised Section 63.18 “MPDDRC Timings” |
| Corrected CKI values in Figure 63-33 “SSC Transmitter, TK and TF in Input”, Figure 63-35 “SSC Receiver, RK in Input and RF in Output”, Figure 63-36 “SSC Receiver, RK and RF in Output” and Figure 63-38 “Minimum and Maximum Access Time of Output Signals” |
| **Section 65. “Schematic Checklist”** |
| Figure 65-1 “1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)”: GNDHSIC changed to GNDUTMIC |
| Table 65-1 “Power Supply Connections”: updated GNDUTMIC row; removed GNDHSIC row; in second footnote, “microcontroller” changed to “microprocessor” |
| Table 65-2 “Clock, Oscillator and PLL Connections”: “(internal 32-kHz RC oscillator) changed to “(internal 64 kHz RC oscillator)” |
| Section 65.5.1 “How to Define the Oscillator Load Capacitance”: instances of “32-KHz Oscillator” changed to “32.768 kHz Oscillator” |
| Added Section 65.14.6 “QSPI Pull-up Resistors” |
| Updated **Section 67. “Ordering Information”** |
| **Section 68. “Errata”** |
| Updated and reorganized content (errata now collected in Section 68.1 “Errata - SAMA5D2 MRL-B Parts” and Section 68.2 “Errata - SAMA5D2 MRL-A Parts”) |

## 71.6 Revision 11267C

| Changes |
|---|
| Changed datasheet status from ‘Preliminary’ to ‘Complete’. |
| Added “Introduction” and transferred Description to Section 1. |
| **Section 2. “Configuration Summary”** |
| Added device compatibility information |
| **Section 4. “Signal Description”** |
| Table 4-1 “Signal Description List”: modified rows PIOBU 0-7 and DDR_RESETN |
| **Section 6. “Power Considerations”** |
| Added Section 6.4.1 “VDDBU Power Architecture” |
| Updated Section 6.2 “Power-Up Considerations” and Section 6.3 “Power-Down Considerations” |
| **Section 7. “Memories”** |

| .....continued |
|---|
| **Changes** |
| Updated Section 7.1.2 “Internal ROM” |
| **Section 10. “Peripherals”** |
| Updated Table 10-1 “Peripheral identifiers” and Section 10.4 “Peripheral Clock Types” |
| **Section 16. “AXI Matrix (AXIMX)”** |
| Table 16-1 “Register Mapping”: removed 0x00000000 reset value from all rows |
| **Section 17. “Matrix (H64MX/H32MX)”** |
| Section 17.2 “Embedded Characteristics”: removed "Master number forwarding to slaves" characteristic |
| Updated Table 17-1 “List of H64MX Masters”, Table 17-2 “List of H64MX Slaves”, Table 17-4 “List of H32MX Masters”, Table 17-5 “List of H32MX Slaves” |
| Table 17-3 “Master to Slave Access on H64MX”: updated ‘SDMMC0-SDMMC1’ row |
| Table 17-6 “Master to Slave Access on H32MX”: updated ‘Slave 5’ rows |
| Section 17.12.2 “Security of APB Slaves”: added introduction and bulleted list introduced by “As a general rule” |
| Added Section 17.12.3 “Security Types of AHB Master Peripherals” and Section 17.12.4 “Security Types of AHB Slave Peripherals” |
| Section 17-9 “Peripheral Identifiers”: corrected some security type names |
| Section 17.13 “AHB Matrix (MATRIX) User Interface”: added introduction and modified reset value of Updated Security Areas Split Slave x Registers in Table 17-10 “Register Mapping” |
| **Section 21. “Watchdog Timer (WDT)”** |
| Replaced “Idle mode” with “Sleep mode (Idle mode)” in Section 21.1 “Description” and with “Sleep mode” in Section 21.4 “Functional Description” |
| **Section 22. “Reset Controller (RSTC)”** |
| Renamed 'proc_nreset' to 'Processor Reset', 'periph_nreset' to 'Peripheral Reset', 'backup_neset' to 'Backup Reset', 'rstc_irq' to 'Reset Controller Interrupt', 'wd_fault' to 'Watchdog Fault', ‘user_reset’ to User Reset. |
| Updated text and figures to show that Processor Reset and Peripheral Reset signals are merged. |
| **Section 23. “Shutdown Controller (SHDWC)”** |
| Updated Figure 23-1 “Shutdown Controller Block Diagram” and Table 23-1 “I/O Lines Description” |
| Section 23.7.3 “Shutdown Status Register”: corrected register table (added WKUPIS9) |
| Section 23.7.4 “Shutdown Wake-up Inputs Register”: corrected register table (added WKUPT9 and WKUPEN9) |
| **Section 25. “Real-time Clock (RTC)”** |
| Removed RTC Milliseconds Register (RTC_MSR) and all related information in Section 25.1 “Description”, Section 25.2 “Embedded Characteristics”, Section 25.5 “Functional Description” and Section 25.6 “Real-time Clock (RTC) User Interface”. |
| Table 25-1 “Register Mapping”: modified RTC_CALR reset value |
| Section 25.6.1 “RTC Control Register”: updated CALEVSEL field description |
| Updated Section 25.6.22 “RTC TimeStamp Source Register” |
| **Section 29. “Clock Generator”** |
| Section 29.2 “Embedded Characteristics”: replaced "400 to 1000 MHz programmable PLL" with "600 to 1200 MHz programmable PLL" and replaced “HCLOCK” with “HCLOCK_LS/HS” and “PCLOCK” with “PCLOCK_LS/HS” |
| Section 29.4 “Slow Clock”: removed “This allows the slow clock to be valid in a short time (about 100 µs)” |
| Section 29.8 “Audio PLL”: updated all equations and added “in the 700 MHz range” after “The PLL core operates at 700 MHz (AUDIOCORECLOCK)” |

| .....continued |
|---|
| **Changes** |
| Updated Figure 29-3. Main Clock Block Diagram and Figure 29-4. Main Clock Source Selection |
| **Section 30. “Power Management Controller (PMC)”** |
| Updated Section 30.6 “Matrix Clock Controller” |
| Updated Section 30-1 “General Clock Block Diagram” |
| Section 30.19 “Programming Sequence”, sub-section “Selecting Master Clock and Processor Clock”: updated sequence following "If a new value for CSS field corresponds to PLL Clock" |
| Section 30.22.11 “PMC Master Clock Register”: updated H32MXDIV field description |
| **Section 33. “Multi-port DDR-SDRAM Controller (MPDDRC)”** |
| Section 33-2 “Single Write Access, Row Closed, DDR-SDRAM Devices” to Section 33-8 “SINGLE Write Access Followed by a Read Access, DDR2-SDRAM Devices”: replaced “D[15:0]” with “DATA” |
| Updated Section 33.7.9 “MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register” |
| Section 33.7.10 “MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register”: updated MR4_READ field description |
| **Section 34. “Static Memory Controller (SMC)”** |
| Removed NFCCMD field and modified Section 34.17.2.1 “Building NFC Address Command Example” and Section 34.17.2.2 “NFC Address Command” accordingly |
| Table 34-20 “Register Mapping”: corrected offset values of PMECC Error Location 31 Register and of subsequent reserved range; removed reset value from HSMC_CTRL (register is write-only) |
| **Section 35. “DMA Controller (XDMAC)”** |
| Section 35.5.4.1 “Single Block With Single Microblock Transfer”: added text on memory-to-memory transfer |
| Section 35.8 “XDMAC Software Requirements”: added bullet on memory-to-memory transfer |
| Table 35-5 “Register Mapping”: corrected access of XDMAC_GTYPE, XDMAC_GWAC, XDMAC_CIM |
| Section 35.9.6 “XDMAC Global Interrupt Mask Register”: corrected access to Read-only |
| Section 35.9.28 “XDMAC Channel x [x = 0..15] Configuration Register”: corrected INITD and PERID field descriptions |
| **Section 36. “LCD Controller (LCDC)”** |
| Modified width of fields in Section 36.7.2 “LCD Controller Configuration Register 1” and Section 36.7.3 “LCD Controller Configuration Register 2” |
| **Section 40. “Audio Class D Amplifier (CLASSD)”** |
| Replaced ‘audio clock’ with ‘generic clock’ and ‘ACLK’ with ‘GCLK’ throughout the section |
| **Section 41. “Inter-IC Sound Controller (I2SC)”** |
| Section 41.6.3 “Master, Controller and Slave Modes”: removed text fragment: ‘in order to avoid unwanted glitches on the I2SWS and I2SCK pins.’ |
| Section 41.8.2 “Inter-IC Sound Controller Mode Register”: removed text fragment: ‘in order to avoid unexpected behavior on the I2SWS, I2SCK and I2SDO outputs.’ and added note (2) below IMCKDIV field description. |
| **Section 44. “Flexible Serial Communication Controller (FLEXCOM)”** |
| Restored all references to ISO7816 specification |
| Updated Figure 44-3 “Fractional Baud Rate Generator” |
| Added Figure 44-27 “RTS line software control when FLEX_US_MR.USART_MODE = 2” |
| Section 44.10.6 “USART Mode Register”: updated USART_MODE field description (SPI_MASTER item) |

| .....continued |
|---|
| **Changes** |
| Section 44.10.44 “SPI Mode Register”: added LBHPC bit |
| **Section 45. “Universal Asynchronous Receiver Transmitter (UART)”** |
| Section 45.6.9 “UART Baud Rate Generator Register”: in CD field description, corrected equation after “If BRSRCCK = 1” |
| **Section 47. “Quad SPI Interface (QSPI)”** |
| Section 47.7.5 “QSPI Status Register”: updated RDRF, TDRE, TXEMPTY, and OVRES field descriptions |
| **Section 48. “Secure Digital Multimedia Card (SDMMC)”** |
| Section 48.12.41 “SDMMC Preset Value Register”: updated CLKGSEL field description |
| **Section 49. “Image Sensor Controller (ISC)”** |
| Section 49.1 “Description”: removed "serial csi-2 based CMOS/CCD sensor" (not supported). |
| **Section 50. “Controller Area Network (MCAN)”** |
| Changed MCAN interrupt line names to MCAN_INT0 and MCAN_INT1 thoughout the section |
| Section 50.6.7 “MCAN CC Control Register”: added bit NISO |
| **Section 51. “Timer Counter (TC)”** |
| Reformatted and renamed Table 51-2 “Channel Signal Description” |
| Section 51.6.3 “Clock Selection”: updated notes (1) and (2) |
| **Section 52. “Pulse Density Modulation Interface Controller (PDMIC)”** |
| Replaced all instances of “PCK” with “GCLK” |
| Section 52.2 “Embedded Characteristics”: removed ‘Multiplexed PDM Input Support’ characteristic |
| Updated Section 52.5.2 “Power Management” and Section 52.6.2.1 “Description” |
| Section 52.6.2.6 “Gain and Offset Compensation”: updated dgain bullet |
| Section 52.7.3 “PDMIC Converted Data Register”: updated DATA field description |
| Section 52.7.8 “PDMIC DSP Configuration Register 0”: updated OSR field description |
| **Section 61. “Security Module”** |
| Section 61.5.5 “SECUMOD Status Clear Register”: removed MCKM field description |
| Section 61.5.18 “SECUMOD Wake Up Register”: removed TPML field description |
| **Section 62. “Analog-to-Digital Converter (ADC)”** |
| Section 62.7.2 “ADC Mode Register”: updated TRACKTIM and TRANSFER field descriptions. |
| **Section 63. “Electrical Characteristics”** |
| Updated tables from Table 63-2 “DC Characteristics” to Table 63-33 “Analog Comparator Characteristics” |
| Updated Figure 63-2 “Main Oscillator Schematics” |
| Corrected Gain Error formula under Figure 63-5 “Gain and Offset Errors in Single-ended Mode” |
| Removed Figure 63-4 “Single-ended Mode ADC” and Figure 63-5 “Differential Mode ADC” |
| Updated wake-up pin numbers in Section 63.5.1 “Backup Mode” and Section 63.5.3.2 “ULP1 Mode” |
| Updated Section 63.5.4 “Idle Mode” and Section 63.23 “SDMMC Timings” |
| Section 63.14.3 “Timing Extraction”: added introduction and Figure 63-11 “MISO Capture in Master Mode” |
| **Section 65. “Schematic Checklist”** |

| .....continued |
|---|
| **Changes** |
| Removed Table 65-12. “EBI Pins and NAND Flash Device Connections” and Table 65-13. “DDR2 I/O Lines Usage vs Operating Modes” |
| Reorganized **Section 67. “Ordering Information”** |
| **Updated Section 68. “Errata”** |

## 71.7 Revision 11267B

| **Changes** |
|---|
| “Features” |
| Updated Security features |
| **Section 2. “Block Diagram”** |
| Updated Figure 2-1 “SAMA5D2 Series Block Diagram”. |
| **Section 4. “Package and Pinout”** |
| Updated Table 4-2 “Pin Description” |
| Removed Section 4.2 “Input/Output Description” and Section 4-3 “SAMA5D2 I/O Type Description” |
| **Section 5. “Power Considerations”** |
| Updated Table 5-1 “SAMA5D2 Power Supplies” |
| Updated Figure 5-1 “Recommended Power-Up Sequence”, Figure 5-2 “Recommended Power-Down Sequence”, Figure 5-3 “Recommended Backup Mode Entry”, Figure 5-4 “Recommended Power Supply Sequencing at Wake-Up” |
| **Section 7. “Event System”** |
| Updated Table 7-1 “Real-time Event Mapping List” |
| **Section 14. “Standard Boot Strategies”** |
| Replaced all instances of "GPBR" with "BUREG". |
| **Section 17. “Special Function Registers (SFR)”** |
| Updated Section 17.3.15 “I2S Register” |
| **Section 19. “Advanced Interrupt Controller (AIC)”** |
| Removed Sections “Interrupt Vectoring” and “Fast Interrupt Vectoring” |
| Updated Section 19.8.3.3 “Interrupt Handlers”and Section 19.8.4.3 “Fast Interrupt Handlers” |
| **Section 29. “Power Management Controller (PMC)”** |
| Replaced “generated clock” with “generic clock”, and “GCK” with “GCLK” |
| Updated Section 29.22.8 “PMC Clock Generator Main Oscillator Register” |
| **Section 30. “Parallel Input/Output Controller (PIO)”** |
| Removed all references to programmable I/O delay |
| Added **Section 31. “External Memories”** |
| **Section 32. “Multi-port DDR-SDRAM Controller (MPDDRC)”** |
| Section 32.4.3 “Low-power DDR2-SDRAM Initialization”: added Step 14., Step 15. and Step 21. |
| Section 32.4.5 “Low-power DDR3-SDRAM Initialization”: added Step 14., Step 15. and Step 21. |
| Section 32.7.8 “MPDDRC Memory Device Register”: updated DBW field description; corrected location of fields RL3 and WL |

| .....continued |
|---|
| **Changes** |
| **Section 36. “Ethernet MAC (GMAC)”** |
| Updated Section 36.1 “Description” |
| Section 36.5.2 “Power Management”: deleted reference to PMC_PCER |
| Section 36.5.3 “Interrupt Sources”: deleted reference to ‘Advanced Interrupt Controller’. Replaced by ‘Interrupt Controller’. |
| Section 36.6.14 “IEEE 1588 Support”: deleted reference to GMAC_TSSx. Removed reference to ‘output pins’ in 2nd paragraph. |
| Section 36.6.15 “Time Stamp Unit”: added information on GTSUCOMP signal in last paragraph |
| **Section 39. “Audio Class D Amplifier (CLASSD)”** |
| Updated Figure 39-1. CLASSD Block Diagram |
| **Section 40. “Inter-IC Sound Controller (I2SC)”** |
| Replaced all instances of “PCKx” with “GCLK” |
| Removed all references to Time Division Multiplexed (TDM) format (not supported) |
| Section 40.1 “Description”: replaced “The I2SC can use either a single DMA Controller channel for both audio channels or one DMA Controller channel per audio channel.” with “The I2SC uses a single DMA Controller channel for both audio channels.”, and updated Section 40.2 “Embedded Characteristics” and Section 40.6.8 “DMA Controller Operation” accordingly |
| Section 40.8.2 “Inter-IC Sound Controller Mode Register”: removed fields RXDMA and TXDMA |
| **Section 43. “Flexible Serial Communication Controller (FLEXCOM)”** |
| Added SPI mode in UART/USART |
| Replaced all instances of ‘PCK’ with ‘GCLK’ |
| Replaced all instances of ‘DMAC/PDC’ with ‘DMAC’ |
| Removed SleepWalking characteristic from UART/USART mode |
| Removed all references to ISO7816 specification |
| Section 43.10.6 “USART Mode Register” updated USCLKS field description |
| Section 43.10.42 “SPI Mode Register”: updated BRSRCCLK and DLYBCS field descriptions |
| Section 43.10.52 “SPI Chip Select Register”: updated CSNAAT, SCBR, DLYBS and DLYBCT field descriptions |
| Section 43.10.62 “TWI Clock Waveform Generator Register”: updated BRSRCCLK and CKSRC field descriptions |
| Updated Figure 43-1 “FLEXCOM Block Diagram” and Figure 43-63 “Master Mode Block Diagram” |
| **Section 42. “Two-wire Interface (TWIHS)”** |
| Replaced all instances of “PMC_PCK” with “GCLK” |
| **Section 44. “Universal Asynchronous Receiver Transmitter (UART)”** |
| Replaced "Processor-Independent Source Clock" with "Processor-Independent Generic Source Clock" and "PCK" with "GCLK" |
| **Section 47. “Secure Digital Multimedia Card (SDMMC)”** |
| Updated revision of supported e.MMC specification (from V4.41 to V4.51) |
| **Section 51. “Pulse Density Modulation Interface Controller (PDMIC)”** |
| Removed all references to PDC |
| Removed Section 1.6.4 “Buffer Structure” |
| **Section 53. “Secure Fuse Controller (SFC)”** |
| Removed all references to lock fuse (not supported) |

| .....continued |
|---|
| **Changes** |
| Section 53.4.5.3 “Fuse Masking”: corrected data register names |
| Section 53.5.2 “SFC Mode Register”: updated MSK field description |
| Table 53-1 “Register Mapping”: modified SFC_IER and SFC_IDR access type from “Read/Write” to “Write-only” |
| **Section 56. “Advanced Encryption Standard (AES)”** |
| Updated Figure 56-12 “Generation of an ESP IPSec Frame without ESN” and Figure 56-13 “Generation of an ESP IPSec Frame with ESN” |
| Added **Section 60. “Security Module”** |
| **Section 61. “Analog-to-Digital Converter (ADC)”** |
| Updated enhanced resolution value from 12 bits to 14 bits |
| Renamed “Hold time” to “Transfer time” |
| Replaced all instances of “PMC PCK” with “GCLK” |
| Added Section 61.6.6 “Conversion Results Format”, Section 61.7.13 “ADC Last Channel Trigger Mode Register”, Section 61.7.14 “ADC Last Channel Compare Window Register” |
| Section 61.2 “Embedded Characteristics”: corrected conversion rate |
| Section 61.6.9 “Comparison Window”: added paragraph about bit SIGNMODE |
| Section 61.6.14 “Automatic Error Correction”: replaced “GAIN_ERROR_SIZE-1” with appropriate value; replaced “Gs-1” with “Gs” in formulas |
| Section 61.6.14 “Automatic Error Correction”, Section 61.7.27 “Correction Values Register”: replaced “GAIN_ERROR_SIZE-1” and “OFFSET_ERROR_SIZE-1” with appropriate values |
| Section 61.7.2 “ADC Mode Register”: updated TRGSEL and TRACKTIM field descriptions |
| Updated Section 61.7.8 “ADC Last Converted Data Register” |
| Section 61.7.16 “ADC Extended Mode Register”: added bit SIGNMODE |
| Updated Section 61.7.18 “ADC Channel Offset Register” |
| Updated Figure 61-1 “Analog-to-Digital Converter Block Diagram” and Figure 61-7 “Analog Full Scale Ranges in Single-Ended/Differential Applications” |
| Updated Table 61-5 “Oversampling Digital Output Range Values” |
| **Section 62. “Electrical Characteristics”** |
| Added: |
| - Section 62.11 “Analog Comparator Characteristics” |
| - Section 62.14.1 “Maximum SPI Frequency” |
| - Section 62.16.1 “Maximum QSPI Frequency” |
| - Table 62-3 “I/O Switching Frequency” |
| - Table 62-4 “QSPI I/O Switching Frequency” |
| - Table 62-21 “PLL UTMI Characteristics” |
| - Table 62-22 “PLLAUDIO Characteristics” |
| Updated: |
| - Table 62-1 “Absolute Maximum Ratings*” |
| - Table 62-2 “DC Characteristics” |
| - Table 62-6 “Typical Peripheral Power Consumption by Peripheral in Active Mode” to Table 62-10 “Typical Power Consumption for Backup Mode” |

| .....continued |
|---|
| **Changes** |
| - Table 62-13 “8 to 24 MHz Crystal Oscillator Characteristics” |
| - Table 62-16 “12-MHz RC Oscillator Characteristics” to Table 62-21 “PLL UTMI Characteristics” |
| - Table 62-34 “VDDBU Power-On Reset Characteristics” to Table 62-36 “VDDANA Power-On Reset Characteristics” |
| Reworked Section 62.9 “USB HS Characteristics” |
| **Section 64. “Schematic Checklist”** |
| Updated: |
| - Section 64.16.3 “DDR Layout and Design Considerations” |
| - Figure 64-1 “1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)” |
| - Table 64-1 “Power Supply Connections” |

## 71.8 Revision 11267A

| Issue Date | Changes |
|---|---|
| 10-Sep-15 | Preliminary Datasheet - First issue |
| 25-Feb-15 | Advance Information Datasheet. |

# Table of Contents

Introduction....1

Features....1

1. Description....5

2. Configuration Summary....6

3. Block Diagram....7

4. Signal Description....8

5. Safety and Security Features....15

5.1. Design for Safety and IEC60730 Class B Certification....15
5.2. Design for Security....15
5.3. Safety and IEC 60730 Features....15
5.4. Security Features....17

6. Package and Pinout....20

6.1. Packages....20
6.2. Pinouts....20

7. Power Considerations....51

7.1. Power Supplies....51
7.2. Power-up Considerations....51
7.3. Power-down Considerations....53
7.4. Power Supply Sequencing at Backup Mode Entry and Exit....54

8. Memories....57

8.1. Embedded Memories....58
8.2. External Memory....58

9. Event System....62

9.1. Real-time Event List....62
9.2. Real-time Event Mapping....62

10. System Controller....64

10.1. Power-On Reset....66

11. Peripherals....67

11.1. Peripheral Mapping....67
11.2. Peripheral Identifiers....67
11.3. Peripheral Signal Multiplexing on I/O Lines....67
11.4. Peripheral Clock Types....67

12. Chip Identifier (CHIPID)....69
12.1. Description....69
12.2. Embedded Characteristics....69
12.3. Register Summary....71

13. Cortex-A5 Processor (ARM)....76
13.1. Reference Documents....76
13.2. Description....76
13.3. Embedded Characteristics....77
13.4. Block Diagram....77
13.5. Programmer Model....78
13.6. Memory Management Unit (MMU)....86

14. L2 Cache Controller (L2CC)....92
14.1. Description....92
14.2. Embedded Characteristics....92
14.3. Product Dependencies....92
14.4. Functional Description....92
14.5. Register Summary....94

15. Debug and Test Features....132
15.1. Description....132
15.2. Embedded Characteristics....132
15.3. Debug and Test Block Diagrams....133
15.4. Application Examples....134
15.5. Debug and Test Pin Description....136
15.6. Functional Description....136
15.7. Boundary JTAG ID Register....138
15.8. Cortex-A5 DP Identification Code Register IDCODE....138

16. Standard Boot Strategies....141
16.1. Description....141
16.2. Chip Access Using JTAG Connection....141
16.3. Flow Diagram....141
16.4. Chip Setup....142
16.5. Boot Configuration....142
16.6. SAM-BA Monitor....172
16.7. Fuse Box Controller....176

17. AXI Matrix (AXIMX)....178
17.1. Description....178
17.2. Embedded Characteristics....178
17.3. Operation....178
17.4. Register Summary....180

18. Matrix (H64MX/H32MX)....182
18.1. Description....182

18.2. Embedded Characteristics ..... 182
18.3. 64-bit Matrix (H64MX) ..... 182
18.4. 32-bit Matrix (H32MX) ..... 185
18.5. Memory Mapping ..... 187
18.6. Special Bus Granting Mechanism ..... 187
18.7. No Default Master ..... 188
18.8. Last Access Master ..... 188
18.9. Fixed Default Master ..... 188
18.10. Arbitration ..... 189
18.11. Register Write Protection ..... 191
18.12. TrustZone Technology ..... 192
18.13. Register Summary ..... 208

19. Special Function Registers (SFR) ..... 235
19.1. Description ..... 235
19.2. Embedded Characteristics ..... 235
19.3. Register Summary ..... 236

20. Special Function Registers Backup (SFRBU) ..... 254
20.1. Description ..... 254
20.2. Embedded Characteristics ..... 254
20.3. Register Summary ..... 255

21. Advanced Interrupt Controller (AIC) ..... 261
21.1. Description ..... 261
21.2. Embedded Characteristics ..... 261
21.3. Block Diagram ..... 262
21.4. Application Block Diagram ..... 262
21.5. AIC Detailed Block Diagram ..... 263
21.6. I/O Line Description ..... 263
21.7. Product Dependencies ..... 263
21.8. Functional Description ..... 264
21.9. Register Summary ..... 273

22. Watchdog Timer (WDT) ..... 297
22.1. Description ..... 297
22.2. Embedded Characteristics ..... 297
22.3. Block Diagram ..... 297
22.4. Functional Description ..... 298
22.5. Register Summary ..... 300

23. Reset Controller (RSTC) ..... 305
23.1. Description ..... 305
23.2. Embedded Characteristics ..... 305
23.3. Block Diagram ..... 305
23.4. Functional Description ..... 306
23.5. Register Summary ..... 311

24. Shutdown Controller (SHDWC)....316
24.1. Description....316
24.2. Embedded Characteristics....316
24.3. Block Diagram....316
24.4. I/O Lines Description....317
24.5. Product Dependencies....317
24.6. Functional Description....317
24.7. Register Summary....319

25. Periodic Interval Timer (PIT)....326
25.1. Description....326
25.2. Embedded Characteristics....326
25.3. Block Diagram....326
25.4. Functional Description....326
25.5. Register Summary....328

26. Real-time Clock (RTC)....333
26.1. Description....333
26.2. Embedded Characteristics....333
26.3. Block Diagram....334
26.4. Product Dependencies....334
26.5. Functional Description....334
26.6. Register Summary....346

27. System Controller Write Protection (SYSCWP)....379
27.1. Functional Description....379
27.2. Register Summary....380

28. Slow Clock Controller (SCKC)....382
28.1. Description....382
28.2. Embedded Characteristics....382
28.3. Block Diagram....382
28.4. Functional Description....382
28.5. Register Summary....384

29. Peripheral Touch Controller (PTC)....386
29.1. Description....386
29.2. Embedded Characteristics....386
29.3. Block Diagram....387
29.4. Signal Description....387
29.5. Product Dependencies....388
29.6. Functional Description....390
29.7. Register Summary....395

30. Low Power Asynchronous Receiver (RXLP)....399
30.1. Description....399
30.2. Embedded Characteristics....399

30.3. Block Diagram....399
30.4. Product Dependencies....400
30.5. Functional Description....400
30.6. Register Summary....403

31. Clock Generator....410
31.1. Description....410
31.2. Embedded Characteristics....410
31.3. Block Diagram....411
31.4. Slow Clock....411
31.5. Main Clock....412
31.6. Divider and PLLA Block....416
31.7. UTMI PLL Clock....417
31.8. Audio PLL....418

32. Power Management Controller (PMC)....420
32.1. Description....420
32.2. Embedded Characteristics....420
32.3. Block Diagram....421
32.4. Master Clock Controller....422
32.5. Processor Clock Controller....422
32.6. Matrix Clock Controller....423
32.7. Programmable Clock Controller....423
32.8. Core and Bus Independent Clocks for Peripherals....423
32.9. Peripheral and Generic Clock Controller....424
32.10. LCDC Clock Controller....425
32.11. ISC Clock Controller....425
32.12. USB Device and Host Clocks....425
32.13. DDR2/LPDDR/LPDDR2 Clock Controller....426
32.14. Fast Start-up from Ultra-Low-Power (ULP) Mode 0....426
32.15. Fast Start-up from Ultra-Low-Power (ULP) Mode 1....427
32.16. Asynchronous Partial Wake-up (SleepWalking)....429
32.17. Main Crystal Oscillator Failure Detection....431
32.18. 32.768 kHz Crystal Oscillator Frequency Monitor....432
32.19. Programming Sequence....433
32.20. Clock Switching Details....435
32.21. Register Write Protection....438
32.22. Register Summary....440

33. Parallel Input/Output Controller (PIO)....498
33.1. Description....498
33.2. Embedded Characteristics....498
33.3. Block Diagram....499
33.4. Product Dependencies....500
33.5. Functional Description....500
33.6. I/O Lines Programming Example....512
33.7. Register Summary....515

34. External Memories....565
34.1. Multiport DDR-SDRAM Controller (MPDDRC)....565
34.2. External Bus Interface (EBI)....573

35. AHB Multiport DDR-SDRAM Controller (MPDDRC)....576
35.1. Description....576
35.2. Embedded Characteristics....576
35.3. Block Diagram....577
35.4. Product Dependencies, Initialization Sequence....578
35.5. Functional Description....587
35.6. Software Interface/SDRAM Organization, Address Mapping....602
35.7. Register Summary....610

36. Static Memory Controller (SMC)....663
36.1. Description....663
36.2. Embedded Characteristics....663
36.3. Block Diagram....664
36.4. I/O Lines Description....664
36.5. Multiplexed Signals....665
36.6. Application Example....666
36.7. Product Dependencies....666
36.8. External Memory Mapping....666
36.9. Connection to External Devices....667
36.10. Standard Read and Write Protocols....669
36.11. Scrambling/Unscrambling Function....675
36.12. Automatic Wait States....676
36.13. Data Float Wait States....679
36.14. External Wait....683
36.15. Slow Clock Mode....687
36.16. Register Write Protection....689
36.17. NFC Operations....690
36.18. PMECC Controller Functional Description....700
36.19. Software Implementation....707
36.20. Register Summary....712

37. DMA Controller (XDMAC)....768
37.1. Description....768
37.2. Embedded Characteristics....768
37.3. Block Diagram....769
37.4. DMA Controller Peripheral Connections....769
37.5. Functional Description....773
37.6. Linked List Descriptor Operation....779
37.7. XDMAC Maintenance Software Operations....781
37.8. XDMAC Software Requirements....782
37.9. Register Summary....783

38. LCD Controller (LCDC)....845

38.1. Description ... 845
38.2. Embedded Characteristics ... 845
38.3. Block Diagram ... 846
38.4. I/O Lines Description ... 846
38.5. Product Dependencies ... 847
38.6. Functional Description ... 847
38.7. Register Summary ... 880

39. Ethernet MAC (GMAC) ... 1090
39.1. Description ... 1090
39.2. Embedded Characteristics ... 1090
39.3. Block Diagram ... 1091
39.4. Signal Interfaces ... 1091
39.5. Product Dependencies ... 1092
39.6. Functional Description ... 1092
39.7. Programming Interface ... 1123
39.8. Register Summary ... 1128

40. USB High Speed Device Port (UDPHS) ... 1285
40.1. Description ... 1285
40.2. Embedded Characteristics ... 1285
40.3. Block Diagram ... 1286
40.4. Typical Connection ... 1287
40.5. Product Dependencies ... 1287
40.6. Functional Description ... 1287
40.7. Register Summary ... 1312

41. USB Host High Speed Port (UHPHS) ... 1400
41.1. Description ... 1400
41.2. Embedded Characteristics ... 1400
41.3. Block Diagram ... 1401
41.4. Typical Connection ... 1402
41.5. Product Dependencies ... 1402
41.6. Functional Description ... 1404
41.7. Register Summary ... 1406

42. Audio Class D Amplifier (CLASSD) ... 1435
42.1. Description ... 1435
42.2. Embedded Characteristics ... 1435
42.3. Block Diagram ... 1436
42.4. Pin Name List ... 1436
42.5. Product Dependencies ... 1437
42.6. Functional Description ... 1437
42.7. Register Summary ... 1451

43. Inter-IC Sound Controller (I2SC) ... 1466
43.1. Description ... 1466
43.2. Embedded Characteristics ... 1466

43.3. Block Diagram....1467
43.4. I/O Lines Description....1467
43.5. Product Dependencies....1467
43.6. Functional Description....1468
43.7. I2SC Application Examples....1473
43.8. Register Summary....1476

44. Synchronous Serial Controller (SSC)....1492
44.1. Description....1492
44.2. Embedded Characteristics....1492
44.3. Block Diagram....1493
44.4. Application Block Diagram....1493
44.5. SSC Application Examples....1493
44.6. Pin Name List....1495
44.7. Product Dependencies....1495
44.8. Functional Description....1496
44.9. Register Summary....1507

45. Two-wire Interface (TWIHS)....1536
45.1. Description....1536
45.2. Embedded Characteristics....1536
45.3. List of Abbreviations....1537
45.4. Block Diagram....1537
45.5. Product Dependencies....1538
45.6. Functional Description....1538
45.7. Register Summary....1587

46. Flexible Serial Communication Controller (FLEXCOM)....1641
46.1. Description....1641
46.2. Embedded Characteristics....1642
46.3. Block Diagram....1645
46.4. I/O Lines Description....1645
46.5. Product Dependencies....1645
46.6. Register Accesses....1646
46.7. USART Functional Description....1646
46.8. SPI Functional Description....1696
46.9. TWI Functional Description....1717
46.10. Register Summary....1764

47. Universal Asynchronous Receiver Transmitter (UART)....1924
47.1. Description....1924
47.2. Embedded Characteristics....1924
47.3. Block Diagram....1924
47.4. Product Dependencies....1925
47.5. Functional Description....1925
47.6. Register Summary....1936

48. Serial Peripheral Interface (SPI)....1954

48.1. Description.... 1954
48.2. Embedded Characteristics.... 1954
48.3. Block Diagram.... 1955
48.4. Application Block Diagram.... 1955
48.5. Signal Description.... 1956
48.6. Product Dependencies.... 1956
48.7. Functional Description.... 1956
48.8. Register Summary.... 1978

49. Quad Serial Peripheral Interface (QSPI).... 2010
49.1. Description.... 2010
49.2. Embedded Characteristics.... 2010
49.3. Block Diagram.... 2011
49.4. Signal Description.... 2011
49.5. Product Dependencies.... 2011
49.6. Functional Description.... 2012
49.7. Register Summary.... 2028

50. Secure Digital MultiMedia Card Controller (SDMMC).... 2052
50.1. Description.... 2052
50.2. Embedded Characteristics.... 2052
50.3. Reference Documents.... 2053
50.4. Block Diagram.... 2054
50.5. Application Block Diagram.... 2055
50.6. Pin Name List.... 2055
50.7. Product Dependencies.... 2056
50.8. SD/SDIO Operating Mode.... 2056
50.9. e.MMC Operating Mode.... 2056
50.10. SDR104 / HS200 Tuning.... 2058
50.11. I/O Calibration.... 2061
50.12. Register Summary.... 2062

51. Image Sensor Controller (ISC).... 2171
51.1. Description.... 2171
51.2. Embedded Characteristics.... 2171
51.3. Block Diagram and Use Cases.... 2172
51.4. Product Dependencies.... 2174
51.5. Functional Description.... 2174
51.6. Register Summary.... 2196

52. Controller Area Network (MCAN).... 2275
52.1. Description.... 2275
52.2. Embedded Characteristics.... 2275
52.3. Block Diagram.... 2276
52.4. Product Dependencies.... 2276
52.5. Functional Description.... 2277
52.6. Register Summary.... 2305

53. Timer Counter (TC)....2379
53.1. Description....2379
53.2. Embedded Characteristics....2379
53.3. Block Diagram....2380
53.4. Pin List....2381
53.5. Product Dependencies....2381
53.6. Functional Description....2382
53.7. Register Summary....2404
54. Pulse Density Modulation Interface Controller (PDMIC)....2444
54.1. Description....2444
54.2. Embedded Characteristics....2444
54.3. Block Diagram....2444
54.4. Signal Description....2444
54.5. Product Dependencies....2445
54.6. Functional Description....2445
54.7. Register Summary....2451
55. Pulse Width Modulation Controller (PWM)....2465
55.1. Description....2465
55.2. Embedded Characteristics....2465
55.3. Block Diagram....2467
55.4. I/O Lines Description....2467
55.5. Product Dependencies....2468
55.6. Functional Description....2469
55.7. Register Summary....2511
56. Secure Fuse Controller (SFC)....2585
56.1. Description....2585
56.2. Embedded Characteristics....2585
56.3. Block Diagram....2586
56.4. Functional Description....2586
56.5. Register Summary....2588
57. Integrity Check Monitor (ICM)....2597
57.1. Description....2597
57.2. Embedded Characteristics....2598
57.3. Block Diagram....2599
57.4. Product Dependencies....2599
57.5. Functional Description....2600
57.6. Register Summary....2614
58. Advanced Encryption Standard Bridge (AESB)....2635
58.1. Description....2635
58.2. Embedded Characteristics....2635
58.3. Product Dependencies....2635
58.4. Functional Description....2636

58.5. Register Summary....2640

59. Advanced Encryption Standard (AES).... 2655
59.1. Description.... 2655
59.2. Embedded Characteristics.... 2655
59.3. Product Dependencies....2656
59.4. Functional Description....2656
59.5. Register Summary....2678

60. Secure Hash Algorithm (SHA)....2707
60.1. Description.... 2707
60.2. Embedded Characteristics.... 2707
60.3. Product Dependencies....2707
60.4. Functional Description....2707
60.5. Register Summary....2716

61. Triple Data Encryption Standard (TDES)....2732
61.1. Description.... 2732
61.2. Embedded Characteristics.... 2732
61.3. Product Dependencies....2733
61.4. Functional Description....2733
61.5. Register Summary....2739

62. True Random Number Generator (TRNG).... 2757
62.1. Description.... 2757
62.2. Embedded Characteristics.... 2757
62.3. Block Diagram....2757
62.4. Product Dependencies....2757
62.5. Functional Description....2758
62.6. Register Summary....2759

63. Analog Comparator Controller (ACC)....2766
63.1. Description.... 2766
63.2. Embedded Characteristics.... 2766
63.3. Block Diagram....2766
63.4. Signal Description.... 2766
63.5. Product Dependencies....2766
63.6. Functional Description....2767
63.7. Register Summary....2768

64. Security Module (SECUMOD)....2773
64.1. Description.... 2773
64.2. Embedded Characteristics.... 2773
64.3. Block Diagram....2774
64.4. Product Dependencies....2775
64.5. Functional Description....2775
64.6. Register Summary....2782

65. Analog-to-Digital Controller (ADC)..... 2806
65.1. Description..... 2806
65.2. Embedded Characteristics..... 2806
65.3. Block Diagram..... 2807
65.4. Signal Description..... 2808
65.5. Product Dependencies..... 2808
65.6. Functional Description..... 2808
65.7. Register Summary..... 2836

66. Electrical Characteristics..... 2881
66.1. Absolute Maximum Ratings..... 2881
66.2. DC Characteristics..... 2881
66.3. Power Consumption..... 2884
66.4. Active Mode..... 2885
66.5. Low-power Modes..... 2887
66.6. Clock Characteristics..... 2892
66.7. Oscillator Characteristics..... 2893
66.8. PLL Characteristics..... 2897
66.9. USB HS Characteristics..... 2898
66.10. PTC Characteristics..... 2898
66.11. ADC Characteristics..... 2898
66.12. Analog Comparator Characteristics..... 2905
66.13. POR Characteristics..... 2905
66.14. SMC Timings..... 2906
66.15. FLEXCOM Timings..... 2911
66.16. USART in Asynchronous Modes..... 2919
66.17. SPI Timings..... 2919
66.18. TWI Timings..... 2926
66.19. QSPI Timings..... 2927
66.20. MPDDRC Timings..... 2932
66.21. SSC Timings..... 2933
66.22. PDMIC Timings..... 2940
66.23. I2SC Timings..... 2941
66.24. ISC Timings..... 2943
66.25. SDMMC Timings..... 2944
66.26. GMAC Timings..... 2945

67. Mechanical Characteristics..... 2948
67.1. 289-Ball Low Profile Fine Pitch Ball Grid Array (AMB) - 14x14x1.4 mm Body [LFBGA] Atmel Legacy Global Package Code CCZ..... 2948
67.2. 256-Ball Thin Fine Pitch Ball Grid Array (AYB) - 8x8x1.05 mm Body [TFBGA]..... 2952
67.3. 196-Ball Thin Fine Pitch Ball Grid Array (BAB) - 11x11 mm Body [TFBGA]..... 2956

68. Schematic Checklist..... 2960
68.1. Power Supply..... 2960
68.2. Power-On Reset..... 2966
68.3. Clock, Oscillator and PLL..... 2966

© 2018 Microchip Technology Inc.

68.4. ICE and JTAG.... 2968
68.5. Reset and Test.... 2970
68.6. Shutdown/Wake-up Logic.... 2971
68.7. Parallel Input/Output (PIO).... 2971
68.8. Analog-to-Digital Converter (ADC).... 2971
68.9. External Bus Interface (EBI).... 2972

## The Microchip Web Site

Microchip provides online support via our web site at http://www.microchip.com/. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## Customer Change Notification Service

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at http://www.microchip.com/. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## Customer Support

Users of Microchip products can receive assistance through several channels:

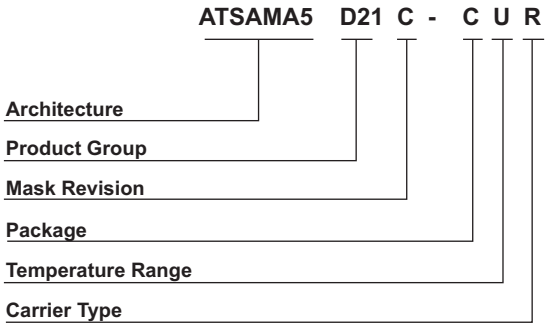
- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://www.microchip.com/support

## Product Identification System

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



| | | |
|---|---|---|
| Architecture: | ATSAMA5 | = Arm Cortex-A5 CPU |
| Product Group: | D21, D22, D23 | = 196-ball general-purpose microprocessors |
| | D24 | = 256-ball general-purpose microprocessors |
| | D28 | = 289-ball general-purpose microprocessors |
| Mask Revision: | C | |
| Package: | C | = BGA |
| Temperature Range: | U | = -40°C to +85°C (Industrial) |
| | N | = -40°C to +105°C (Extended Industrial) |
| Carrier Type: | Blank | = Standard packaging (tray) |
| | R | = Tape and Reel |

Examples:

- ATSAMA5D21C-CUR = ARM Cortex-A5 general- purpose microprocessor, 196-ball, Industrial temperature, BGA Package.

**Note:** Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package

## Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the

operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

## Legal Notice

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

## Trademarks

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, Kleer, LANCheck, LINK MD, maXStylus, maXTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prochip Designer, QTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, INICnet, Inter-Chip Connectivity, JitterBlocker, KleerNet, KleerNet logo, memBrain, Mindi, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

AMBA, Arm, Arm7, Arm7TDMI, Arm9, Arm11, Artisan, big.LITTLE, Cordio, CoreLink, CoreSight, Cortex, DesignStart, DynamIQ, Jazelle, Keil, Mali, Mbed, Mbed Enabled, NEON, POP, RealView, SecurCore, Socrates, Thumb, TrustZone, ULINK, ULINK2, ULINK-ME, ULINK-PLUS, ULINKpro, µVision, Versatile are trademarks or registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

## Quality Management System Certified by DNV

**ISO/TS 16949**

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001
Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

**Данный компонент на территории Российской Федерации**

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
