## ■ NOTES

It is necessary to adjust  $R_D$  to 10k $\Omega$  for the overcurrent protection.

The input coupling capacitors( $C_{IN}$ ) and the input resistance( $R_{IN}=20k\Omega$ ) form a high-pass filter with the corner frequency determined in  $[fc=1/(2\pi R_{IN}C_{IN})]$ .

The  $R_{bias}$  affects the Volume(Att.) linearity characteristic. When  $R_{bias}$  value is too small, the amount of attenuation increases, so that the output amplitude becomes small and THD deteriorates by an internal analog switch. On the other hand, when  $R_{bias}$  is too large, it may be affected at the noise from the outside. Please decide resistance value after it verifies it enough by an actual application.

Separate for REF terminals for High and Middle voltage(AC) and REF terminals for Low voltage(AC) in the pattern design.

Note.) This product starts up by MUTE setting in power "ON". Use it after removing MUTE of each setting.

If any audio signal is inputted in input signal terminal before power "ON", it may cause initial condition abnormality.

In conditions of use such as the above, it prevents that abnormality by setting MUTE before power "OFF"
