

### FEATURES

2.25 V to 5.5 V operating voltage range

Low power consumption (4  $\mu$ A)

High voltage (22 V) tolerance on inputs

Output stages

ADCMP370: open-drain, high voltage (22 V tolerance)

ADCMP371: push-pull

50 nA input bias current

150 nA input offset current

9 mV input offset voltage

Rail-to-rail, common-mode input range

Specified over  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  temperature range

5-lead SC70 packaging

### APPLICATIONS

Voltage detectors

Battery management systems

Analog-to-digital converters

Low voltage applications

Battery-powered electronics

Portable equipment

### GENERAL DESCRIPTION

The ADCMP370/ADCMP371 are general-purpose comparators with input offset voltages of 9 mV (maximum) and low power consumption, which make them ideal for battery-powered, portable equipment.

The ADCMP371 has a push-pull output stage, while the ADCMP370 has an open-drain output. The inputs on both parts and the output on the ADCMP370 can tolerate voltages up to 22 V, making them suitable for use as voltage detectors in portable equipment.

The devices are available in space-efficient, 5-lead SC70 packaging.

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 2.

Parameter	Rating
$V_{CC}$	-0.3 V to +6 V
IN+, IN-	-0.3 V to +25 V
OUT (ADCMP370)	-0.3 V to +25 V
OUT (ADCMP371)	-0.3 V to $V_{CC} + 0.3$ V
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C
$\theta_{JA}$ Thermal Impedance, SC70	146°C/W
Lead Temperature	
Soldering (10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## APPLICATIONS

### BASIC COMPARATOR

In its most basic configuration, a comparator can be used to convert an analog input signal to a digital output signal. The analog signal on IN+ is compared to the voltage on IN–, and the voltage at OUT is either high or low, depending on whether IN+ is at a higher or lower potential than IN–, respectively.

The ADCMP370 and ADCMP371 have different digital output structures. The ADCMP370 has an open-drain output stage that requires an external resistor to pull OUT to the logic high voltage level when the output transistor is switched off. This voltage level can be as high as 22 V. The same 22 V tolerance also applies to the inputs of the comparators. The pull-up resistor should be large enough to avoid excessive power dissipation but small enough to switch logic levels reasonably quickly when the comparator output is connected to other digital circuitry. A suitable value is between 1 kΩ and 10 kΩ. The ADCMP371 has a push-pull output stage, which has an internal PMOS pull-up and, therefore, does not require an external resistor. Faster switching speeds between low and high rails are possible, but the logic high level is limited to V<sub>CC</sub>.

Figure 18. Basic Comparator and Input and Output Signals

### ADDING HYSTERESIS

To prevent oscillations at the output caused by noise or slowly moving signals passing the switching threshold, positive feedback can be used to add hysteresis to the differential input.

For the noninverting configuration, shown in Figure 19, two resistors are used to create different switching thresholds, depending on whether the input signal is increasing or decreasing in magnitude. When the input voltage is increasing, the threshold is above V<sub>REF</sub> and when it is decreasing, the threshold is below V<sub>REF</sub>.

The upper input threshold level is given by

$$V_{IN\_HI} = \frac{V_{REF}(R1 + R2) - V_{CC}R1}{R2}$$

The lower input threshold level is given by

$$V_{IN\_LO} = \frac{V_{REF}(R1 + R2)}{R2}$$

The hysteresis is the difference between these voltage levels

$$\Delta V_{IN} = \frac{V_{CC}R1}{R2}$$

In the example in Figure 19, Resistor R1 and Resistor R2 are chosen to give 1 V hysteresis about the reference of 2.5 V, with V<sub>CC</sub> = 5 V.

Figure 19. Noninverting ADCMP371 Comparator Configuration with Hysteresis

With the inverting configuration, the upper and lower switching thresholds are

$$V_{IN\_HI} = \frac{V_{CC}R2}{(R1 \parallel R3) + R2}$$

$$V_{IN\_HI} = \frac{V_{CC} \times R2(R1 + R3)}{(R1 \times R3) + (R2 \times R1) + (R2 \times R3)}$$

$$V_{IN\_LO} = \frac{V_{CC}(R2 \parallel R3)}{R1 + (R2 \parallel R3)}$$

$$V_{IN\_LO} = \frac{V_{CC} \times R2 \times R3}{(R1 \times R3) + (R2 \times R1) + (R2 \times R3)}$$

# ADCMP370/ADCMP371

The hysteresis is the difference between these voltage levels and is given by

$$\Delta V_{IN} = \frac{V_{CC} \times R1 \times R2}{(R1 \times R3) + (R2 \times R1) + (R2 \times R3)}$$

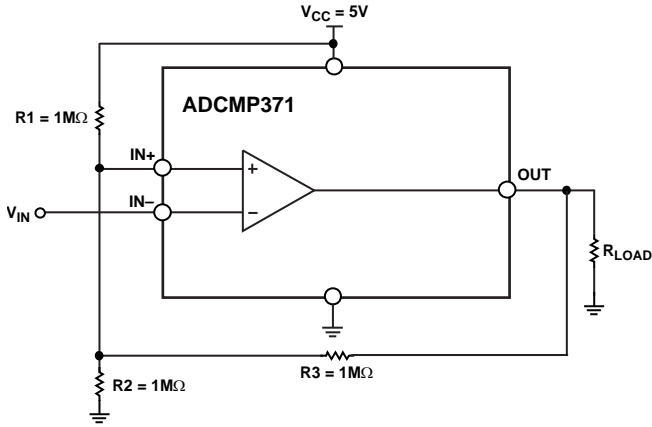

Figure 20. Inverting ADCMP371 Comparator Configuration with Hysteresis

For the ADCMP370 configuration, a pull-up resistor is required for the open-drain output, which affects the hysteresis calculation. The noninverting ADCMP370 configuration is shown in Figure 21. The upper switching threshold is

$$V_{IN\_HI} = \frac{V_{REF} (R1 + R2 + R_{PULLUP}) - V_{CC} R1}{R2 + R_{PULLUP}}$$

The lower input threshold level is given by

$$V_{IN\_LO} = \frac{V_{REF} (R1 + R2)}{R2}$$

The hysteresis is the difference between these voltage levels

$$\Delta V_{IN} = \frac{V_{CC} R1}{R2 + R_{PULLUP}}$$

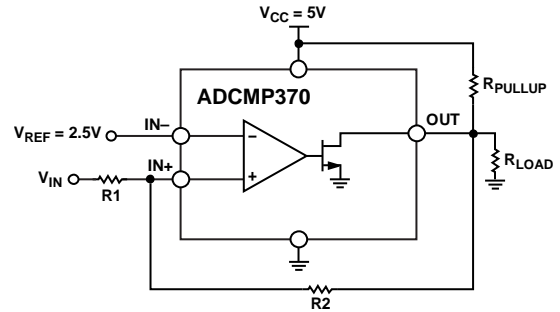

Figure 21. Noninverting ADCMP370 Comparator Configuration with Hysteresis

The inverting ADCMP370 configuration is shown in Figure 22. The upper and lower switching thresholds are

$$V_{IN\_HI} = \frac{V_{CC} R2}{(R1 \parallel (R3 + R_{PULLUP})) + R2}$$

$$V_{IN\_HI} = \frac{V_{CC} \times R2 (R1 + (R3 + R_{PULLUP}))}{(R1 \times (R3 + R_{PULLUP})) + (R2 \times R1) + (R2 \times (R3 + R_{PULLUP}))}$$

$$V_{IN\_LO} = \frac{V_{CC} (R2 \parallel (R3 + R_{PULLUP}))}{R1 + (R2 \parallel (R3 + R_{PULLUP}))}$$

$$V_{IN\_LO} = \frac{V_{CC} \times R2 \times (R3 + R_{PULLUP})}{(R1 \times (R3 + R_{PULLUP})) + (R2 \times R1) + (R2 \times (R3 + R_{PULLUP}))}$$

assuming  $R_{LOAD} \gg R1, R2, R3, R_{PULLUP}$ .

The hysteresis is the difference between these voltage levels and is given by

$$\Delta V_{IN} = \frac{V_{CC} \times R1 \times R2}{(R1 \times (R3 + R_{PULLUP})) + (R2 \times R1) + (R2 \times (R3 + R_{PULLUP}))}$$

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
