

Integrated Power Hybrid IC for
Appliance Motor Drive Applications

IRAM336-025SB

*i*MOTION™ Series

3 Phase Inverter HIC

2A, 500V

Description

International Rectifier's IRAM336-025SB is a multi-chip Hybrid IC developed for low power appliance motor control applications such as Fans, Pumps, and refrigerator compressors. The compact Single in line (SIP-S) package minimizes PCB space.

Several built-in protection features such as temperature feedback, shoot through prevention, under voltage lockout, and shutdown input makes this a very robust solution. The combination of highly efficient high voltage MOSFETs and the industry benchmark 3-phase HVIC driver (3.3V/5V input compatible) and thermally enhanced package makes this a highly competitive solution.

The bootstrapped power supplies for the high side drivers can be generated using internal bootstrap diodes eliminating the need for isolated power supplies. This feature reduces the component count, board space, and cost of the system.

Features

- Motor Power up to 250W / 85~253 Vac.
- Integrated Gate Drivers and Bootstrap Diodes.
- Over-current Shut-Down function.
- Under-voltage lockout for all switches.
- Matched propagation delay for all channels.
- Schmitt-triggered input logic.
- Cross-conduction prevention logic.
- Lower di/dt gate driver for better noise immunity.

Absolute Maximum Ratings

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to V_{SS} .

V_{DSS}	MOSFET Blocking Voltage	500	V
V_{bus}	Positive DC Bus Input Voltage	400	V
I_o @ $T_C=25^\circ\text{C}$	RMS Phase Current	2.0	A
I_o @ $T_C=100^\circ\text{C}$	RMS Phase Current (Note 1)	1.0	
I_{pk} @ $T_C=25^\circ\text{C}$	Maximum Peak Current ($t_p < 100\mu\text{s}$)	6.0	
P_d	Maximum Power dissipation per Fet @ $T_C = 25^\circ\text{C}$	15	W
T_J (MOSFET & IC)	Maximum Operating Junction Temperature	+150	$^\circ\text{C}$
T_C	Operating Case temperature Range	-20 to +100	
T_{STG}	Storage Temperature Range	-40 to +125	
T	Mounting torque (M3 screw)	0.6	Nm

Note 1: Sinusoidal Modulation at $V^+ = 360\text{V}$, $T_J = 150^\circ\text{C}$, $F_{PWM} = 20\text{kHz}$, $F_{MOD} = 50\text{Hz}$, $MI = 0.8$, $PF = 0.6$, See Figure 5.

Absolute Maximum Ratings (Continued)

Absolute Maximum Ratings indicate substained limits beyond which damage to the device may occur. All voltage paramaters are absolute voltages referenced to V_{SS} .

$V_{S1,2,3}$	High side floating supply offset voltage	$V_{B1,2,3} - 20$	$V_{B1,2,3} + 0.3$	V	
$V_{B1,2,3}$	High side floating supply voltage	-0.3	500	V	
V_{DD}	Low Side and logic fixed supply voltage	-0.3	20	V	
$V_{IN}, V_{F/EN}, V_{ITRIP}$	Input voltage LIN, HIN, Fault/EN, I_{Trip}	-0.3	Lower of ($V_{SS}+15V$) or $V_{DD}+0.3V$	V	

MOSFET Characteristics

V_{BIAS} (V_{CC}, V_B) = 15V and $T_A = 25^\circ C$ unless otherwise specified. The V_{DD} parameter is referenced to V_{SS} .

Symbol	Parameter	Min	Typ	Max	Units	Conditions
$V_{(BR)DSS}$	Drain-to-Source Breakdown Voltage	500	---	---	V	$V_{IN}=5V, I_D=250\mu A$

		---	0.76	---		$I_F=1.0A, T_J=150^\circ C$

Recommended Operating Conditions

The Input/Output logic timing diagram is shown in Figure 1. For proper operation the device should be used within the recommended conditions. All voltages are absolute referenced to V_{SS} . The V_S offset is tested with all supplies biased at 15V differential.

Symbol	Definition	Min	Typ	Max	Units
V^+	Positive Bus Input Voltage	---	---	360	V
$V_{B1,2,3}$	High side floating supply voltage	V_S+10	V_S+15	V_S+20	
V_{DD}	Low side and logic fixed supply voltage	10	15	20	V
V_{ITRIP}	I_{TRIP} input voltage	V_{SS}	---	$V_{SS}+5$	
$V_{IN}, V_{F/EN}, V_{ITRIP}$	Logic input voltage LIN, HIN, Fault/EN, I_{TRIP} - Note 2	V_{SS}	---	$V_{SS}+5$	V
F_p	Maximum PWM Carrier Frequency	---	---	20	KHz

Note 2: Logic operational for V_S from COM-5V to $V_{SS}+500V$. Logic state held for V_S from $V_{SS}-5V$ to $V_{SS}-V_{BS}$. (please refer to DT97-3 for more details).

Static Electrical Characteristics (T_J= 25°C Unless Otherwise Specified)

V_{BIAS} (V_{DD}, V_{BS1,2,3})=15V, unless otherwise specified. The V_{IN} and I_{IN} parameters are referenced to V_{SS} and are applicable to all six channels (Static Electrical Characteristics are Based on Driver IC Data Sheet).

Typical Application Circuit – IRAM336-025SB

Application Circuit Recommendation

1. Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible to reduce ringing and EMI problems. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
2. In order to provide good decoupling between VCC-VSS and Vb-Vs terminals, the capacitors shown connected between these terminals should be located very close to the module pins. Additional high frequency capacitors, typically 0.1μF, are strongly recommended.
3. Value of the boot-strap capacitors depends upon the switching frequency. Their selection should be made based on IR design tip DN 98-2a or application note AN-1044 or Figure 12.
4. **WARNING!** Please note that after approx. 8ms the FAULT is automatically reset (see Dynamic Characteristics Table on page 5). PWM generator must be disabled within automatic reset time ($T_{FLT-CLR}$) to guarantee shutdown of the system, over-current condition must be cleared before resuming operation.
5. **The case of the module is connected to the negative DC Bus and is NOT Isolated. It is recommended to provide isolation material between case and heat sink to avoid electrical shock.**

Integrated Bootstrap Functionality

The internal Driver IC in the Iram336-025SB embeds an integrated bootstrap FET that allows an alternative drive of the bootstrap supply for a wide range of applications.

There is one bootstrap FET for each channel and it is connected between each of the floating supply (V_{B1} , V_{B2} , V_{B3}) and V_{CC} as shown in Figure 3.

Figure 3. Simplified BootFet Connection

The Bootstrap FET of each channel follows the state of the respective low side output stage (i.e., bootFet is ON when LO is high, it is OFF when LO is low), unless the V_B voltage is higher than approximately $1.1(V_{CC})$. In that case the bootstrap FET stays off until the V_s voltage returns below that threshold (see Fig. 4).

Figure 4. State Diagram

Bootstrap FET is suitable for most PWM modulation schemes and can be used either in parallel with the external bootstrap network (diode+resistor) or as a replacement of it. The use of the integrated bootstrap as a replacement of the external bootstrap network may have some limitations in the following situations:

- When used in non-complementary PWM schemes (typically 6-step modulations).
- At a very high PWM duty cycle due to the bootstrap FET equivalent resistance (R_{BS} , see page 5).

In these cases, better performances can be achieved by using an external bootstrap network.

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
