

**FEATURES**

**Worldwide NTSC/PAL/SECAM color demodulation support**  
**One 10-bit ADC, 4× oversampling per channel for CVBS, Y/C, and YPrPb modes**  
**Analog video input channels with on-chip antialiasing filter**  
  **ADV7280A: up to 4 input channels**  
  **ADV7280A-M: up to 8 input channels**  
**Video input support for CVBS (composite), S-Video (Y/C), and YPrPb (component)**  
**NTSC/PAL/SECAM autodetection**  
**Up to 1.47 V common-mode input range solution**  
**Excellent common-mode noise rejection capabilities**  
**5-line adaptive 2D comb filter and CTI video enhancement**  
**Integrated AGC with adaptive peak white mode**  
**Fast switching capability**  
**Integrated I<sup>2</sup>P video output converter (deinterlacer)**  
**ACE**  
**Downdither (8-bit to 6-bit)**  
**Rovi copy protection detection**  
**MIPI CSI-2 output interface (ADV7280A-M)**  
**8-bit ITU-R BT.656 YCrCb 4:2:2 output and HS, VS, or field synchronization (ADV7280A)**  
**Full featured VBI data slicer with WST support**  
**Power-down mode available**  
**2-wire, I<sup>2</sup>C-compatible serial interface**  
**Qualified for automotive applications**  
**−40°C to +105°C temperature grade**  
**32-lead, 5 mm × 5 mm, RoHS compliant LFCSP**

**APPLICATIONS**

**Advanced driver assistance**  
**Automotive infotainment**  
**DVRs for video security**  
**Media players**

**GENERAL DESCRIPTION**

The ADV7280A<sup>1</sup> has the same pinout as and is software compatible with the [ADV7280](#) with the exception of an updated IDENT code. The mobile industry processor interface (MIPI®) model of the ADV7280A (ADV7280A-M) has the same pinout and is software compatible with the [ADV7280-M](#) with the exception of an updated IDENT code.

All features, functionality, and specifications are shared by the ADV7280A and the ADV7280A-M, unless otherwise noted.

The ADV7280A is a versatile one-chip, multiformat video decoder that automatically detects standard analog baseband video signals and converts them into YCrCb 4:2:2 component video data streams.

The analog input of the ADV7280A is designed for single-ended input video signals. It features an input mux (4-channel on ADV7280A, 8-channel on ADV7280A-M) and a single 10-bit analog-to-digital converter (ADC).

The standard definition processor (SDP) in the ADV7280A automatically detects PAL, NTSC and SECAM standards in the form of composite, S-Video (Y/C) and component. The analog video is converted into a 4:2:2 component video data stream that is output either via an 8-bit ITU-R BT.656 standard compatible interface (ADV7280A) or via a MIPI CSI-2 Tx (hereafter referred to as MIPI Tx) interface (ADV7280A-M). The ADV7280A also features a deinterlacer for interlaced to progressive (I<sup>2</sup>P) conversion.

The ADV7280A is provided in a space-saving LFCSP surface-mount, RoHS compliant package. The ADV7280A is offered in an automotive grade rated over the −40°C to +105°C temperature range, as well as a −40°C to +85°C temperature range, making the device ideal for automotive, industrial, and consumer applications.

The ADV7280A must be configured in accordance with the I<sup>2</sup>C writes provided in the evaluation board script files available at [www.analog.com/ADV7280A](http://www.analog.com/ADV7280A).

<sup>1</sup> Protected by U.S. Patent 5,784,120.

<b>CRYSTAL OSCILLATOR<sup>1</sup></b>						
Transconductance	g <sub>M</sub>			30		mA/V

<sup>1</sup> Guaranteed by characterization.

<sup>2</sup> Typical current consumption values are measured with nominal voltage supply levels and a Society of Motion Picture and Television Engineers (SMPTE) bar test pattern.

<sup>3</sup> All specifications apply when the I<sup>2</sup>P core is activated, unless otherwise stated.

## VIDEO SPECIFICATIONS

V<sub>VDD</sub>, A<sub>VDD</sub>, D<sub>VDD</sub>, and M<sub>VDD</sub> = 1.71 V to 1.89 V, D<sub>VDDIO</sub> = 2.97 V to 3.63 V, specified at operating temperature range, unless otherwise noted. Specifications guaranteed by characterization. M<sub>VDD</sub> only applies to the ADV7280A-M.

Table 2.

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit
<b>NONLINEAR SPECIFICATIONS<sup>1</sup></b>						
Differential Phase	DP	CVBS input, modulated five-step		0.9		Degrees
Differential Gain	DG	CVBS input, modulated five-step		0.5		%
Luma Nonlinearity	LNL	CVBS input, five-step		2.0		%
<b>NOISE SPECIFICATIONS</b>						
Signal-to-Noise Ratio, Unweighted	SNR	Luma ramp Luma flat field		57.1 58		dB dB
Analog Front End (AFE) Crosstalk Common-Mode Rejection Ratio <sup>2</sup>	CMRR			60 73		dB dB
<b>LOCK TIME SPECIFICATIONS</b>						
Horizontal Lock Range			-5		+5	%
Vertical Lock Range			40		70	Hz
Subcarrier Lock Range	f <sub>sc</sub>			±1.3		kHz
Color Lock-In Time				60		Lines
Synchronization Depth Range			20		200	%
Color Burst Range			5		200	%
Vertical Lock Time				2		Fields
Autodetection Switch Speed <sup>3</sup>				100		Lines
Fast Switch Speed <sup>4</sup>				100		ms
<b>LUMA SPECIFICATIONS</b>						
Luma Brightness Accuracy		CVBS, 1 V input		1		%
Luma Contrast Accuracy				1		%

<sup>1</sup> These specifications apply for all CVBS input types (NTSC, PAL, and SECAM).

<sup>2</sup> The CMRR of this circuit design is critically dependent on the external resistor matching on the circuit inputs (see the Input Network section). The CMRR measurement was performed with 0.1% tolerant resistors, a common-mode voltage of 1 V, and a common-mode frequency of 10 kHz.

<sup>3</sup> Autodetection switch speed is the time required for the ADV7280/ADV7280-M to detect which video format is present at its input, for example, PAL I or NTSC M.

<sup>4</sup> Fast switch speed is the time required for the ADV7280/ADV7280-M to switch from one analog input to another, for example, switching from A<sub>IN1</sub> to A<sub>IN2</sub>.

**ANALOG SPECIFICATIONS**

$P_{VDD}$ ,  $A_{VDD}$ ,  $D_{VDD}$ , and  $M_{VDD}$  = 1.71 V to 1.89 V,  $D_{VDDIO}$  = 2.97 V to 3.63 V, specified at operating temperature range, unless otherwise noted. Specifications guaranteed by characterization.  $M_{VDD}$  only applies to the ADV7280A-M.

Table 3.

Parameter	Test Conditions/Comments	Min	Typ	Max	Unit
CLAMP CIRCUITRY					
External Clamp Capacitor	Clamps switched off		0.1		μF
Input Impedance			10		MΩ
Large Clamp Source Current			0.4		mA
Large Clamp Sink Current			0.4		mA
Fine Clamp Source Current			10		μA
Fine Clamp Sink Current			10		μA

**CLOCK AND I<sup>2</sup>C TIMING SPECIFICATIONS**

$A_{VDD}$ ,  $D_{VDD}$ ,  $P_{VDD}$ , and  $M_{VDD}$  = 1.71 V to 1.89 V,  $D_{VDDIO}$  = 2.97 V to 3.63 V, specified at operating temperature range, unless otherwise noted. Specifications guaranteed by characterization.  $M_{VDD}$  only applies to the ADV7280A-M.

RESET INPUT					
$\overline{\text{RESET}}$ Pulse Width		5			ms

Figure 3. I<sup>2</sup>C Timing Diagram

**MIPI Tx VIDEO OUTPUT AND TIMING SPECIFICATIONS (ADV7280A-M ONLY)**

$P_{VDD}$ ,  $A_{VDD}$ ,  $D_{VDD}$ , and  $M_{VDD} = 1.71\text{ V to }1.89\text{ V}$ ,  $D_{VDDIO} = 2.97\text{ V to }3.63\text{ V}$ , specified at operating temperature range, unless otherwise noted. The ADV7282A MIPI Tx conforms to the MIPI D-PHY Version 1.00.00 specification by characterization. The MIPI Tx clock lane of the ADV7280A-M remains in high speed mode even when the data lane enters low power (LP) mode. For this reason, some measurements on the clock lane that pertain to low power mode are not applicable. Unless otherwise stated, all high speed measurements were performed with the ADV7280A-M operating in progressive mode and with a nominal 432 Mbps output data rate. Specifications guaranteed by characterization.

**Table 5.**

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit
UNIT INTERVAL	UI					
Interlaced Output				4.63		ns
Progressive Output				2.31		ns
DATA LANE LP MIPI Tx DC SPECIFICATIONS <sup>1</sup>						
Thevenin Output High Level	$V_{OH}$		1.1	1.2	1.3	V
Thevenin Output Low Level	$V_{OL}$		-50	0	+50	mV
DATA LANE LP MIPI Tx AC SPECIFICATIONS <sup>1</sup>						
Rise Time, 15% to 85%					25	ns
Fall Time, 85% to 15%					25	ns

	t <sub>11</sub>	t <sub>10</sub> plus the high speed zero period	145 + (10 × UI)			ns
High Speed Differential Voltage Swing	V <sub>1</sub>		140	200	270	mV p-p
Differential Voltage Mismatch					10	mV
Single-Ended Output High Voltages					360	mV
Static Common-Mode Voltage Level			150	200	250	mV
Static Common-Mode Voltage Mismatch					5	mV
Dynamic Common Level Variations 50 MHz to 450 MHz					25	mV
Above 450 MHz					15	mV
Rise Time, 20% to 80%			0.15		0.3 × UI	ns
Fall Time, 80% to 20%			0.15		0.3 × UI	ns
High Speed to LP Transition Stage	t <sub>12</sub>	Time that the ADV7280A-M drives the flipped last data bit after sending the last payload data bit of a high speed transmission burst	60 + (4 × UI)			ns
	t <sub>13</sub>	Post end of transmission rise time (30% to 85%)			35	ns
	t <sub>14</sub>	Time from start of t <sub>12</sub> to start of low power state following a high speed transmission burst			105 + (12 × UI)	ns
	t <sub>15</sub>	Time that a low power state is transmitted after a high speed transmission burst			100	ns
CLOCK LANE HIGH SPEED MIPI Tx SIGNALING REQUIREMENTS LP to High Speed Transition Stage <sup>2</sup>		See Figure 4				
	t <sub>9</sub>	Time that the CLKP pin is at V <sub>OL</sub> and the CLKN pin is at V <sub>OH</sub>	50			ns
		Time that the CLKP and CLKN pins are at V <sub>OL</sub>	38		95	ns
		Clock high speed zero period	300	500		ns
High Speed Differential Voltage Swing	V <sub>2</sub>		140	200	270	mV p-p
Differential Voltage Mismatch						10
Single-Ended Output High Voltages					360	mV
Static Common-Mode Voltage Level			150	200	250	mV
Static Common-Mode Voltage Mismatch					5	mV
Dynamic Common Level Variations 50 MHz to 450 MHz					25	mV
Above 450 MHz					15	mV
Rise Time, 20% to 80%			0.15		0.3 × UI	ns
Fall Time, 80% to 20%			0.15		0.3 × UI	ns
HIGH SPEED MIPI Tx CLOCK TO DATA LANE TIMING REQUIREMENTS Data to Clock Skew			0.35 × UI		0.65 × UI	ns

<sup>1</sup> These measurements were performed with C<sub>LOAD</sub> = 50 pF.

<sup>2</sup> The clock lane remains in high speed mode throughout normal operation. These results apply only to the ADV7280-M during startup.

Figure 4. ADV7280A-M Output Timing Diagram (Conforms with MIPI CSI-2 Specification)

**PIXEL PORT TIMING SPECIFICATIONS (ADV7280A ONLY)**

$A_{VDD}$ ,  $D_{VDD}$ , and  $P_{VDD}$  = 1.71 V to 1.89 V,  $D_{VDDIO}$  = 1.62 V to 3.63 V, specified at operating temperature range, unless otherwise noted. Specifications guaranteed by characterization.

Table 6.

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit
CLOCK OUTPUTS						
LLC Mark Space Ratio	$t_9:t_{10}$		45:55		55:45	% duty cycle
DATA AND CONTROL OUTPUTS						
Data Output Transitional Time	$t_{11}$	Negative clock edge to start of valid data ( $t_{SETUP} = t_{10} - t_{11}$ )			3.8	ns
	$t_{12}$	End of valid data to negative clock edge ( $t_{HOLD} = t_9 - t_{12}$ )			6.9	ns

Figure 5. ADV7280A Pixel Port and Control Output Timing Diagram

## ABSOLUTE MAXIMUM RATINGS

Table 7.

Parameter <sup>1</sup>	Rating
$A_{VDD}$ to GND	2.2 V
$D_{VDD}$ to GND	2.2 V
$P_{VDD}$ to GND	2.2 V
$M_{VDD}$ to GND <sup>2</sup>	2.2 V
$D_{VDDIO}$ to GND	4 V
$P_{VDD}$ to $D_{VDD}$	-0.9 V to +0.9 V
$M_{VDD}$ to $D_{VDD}$ <sup>2</sup>	-0.9 V to +0.9 V
$A_{VDD}$ to $D_{VDD}$	-0.9 V to +0.9 V
Digital Inputs Voltage	GND - 0.3 V to $D_{VDDIO} + 0.3$ V
Digital Outputs Voltage	GND - 0.3 V to $D_{VDDIO} + 0.3$ V
Analog Inputs to Ground	GND - 0.3 V to $A_{VDD} + 0.3$ V
Maximum Junction Temperature ( $T_{J\ MAX}$ )	125°C
Storage Temperature Range	-65°C to +150°C
Infrared Reflow Soldering (20 sec)	JEDEC J-STD-020

<sup>1</sup> The absolute maximum ratings assume that the DGND pins and the exposed pad of the ADV7280A are connected together to a common ground plane (GND). This is part of the recommended layout scheme. See the PCB Layout Recommendations section for more information. The absolute maximum ratings are stated in relation to this common ground plane.

<sup>2</sup>  $M_{VDD}$  only applies to the ADV7280A-M.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

$\theta_{JA}$  is the natural convection junction to ambient thermal resistance measured in a one cubic foot sealed enclosure as per JEDEC JESD51.  $\Psi_{JT}$  is the junction to top thermal characterization parameter measured on a standard test board, as per JEDEC JESD51, allowing the heat generated in the ADV7280A die to flow normally along preferred thermal conduction paths that more closely represent the thermal flows in a typical application board.

Table 8. Thermal Resistance

Package	$\theta_{JA}$	$\Psi_{JT}$	Unit
CP-32-12 <sup>1</sup>	39.6	0.86	°C/W

<sup>1</sup> JEDEC JESD51 2s2p 4-layer PCB with two signal layers and two buried solid ground planes (GND), and with via nine thermal vias connecting the exposed pad to the ground plane (GND).

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES  
1. THE EXPOSED PAD MUST BE CONNECTED, TOGETHER WITH THE DGND PINS, TO A COMMON GROUND PLANE (GND).

18162-006

Figure 6. ADV7280A Pin Configuration

Table 9. Pin Function Descriptions, ADV7280A

Pin No.	Mnemonic	Type	Description
1, 4	DGND	Ground	Ground for Digital Supply.
2	DVDDIO	Power	Digital I/O Power Supply (1.8 V or 3.3 V).
3, 13	DVDD	Power	Digital Power Supply (1.8 V).
5 to 12	P7 to P0	Output	Video Pixel Output Ports.
14	XTALP	Output	Output Pin for the Crystal Oscillator Amplifier. Connect this pin to the external 28.63636 MHz crystal, or leave it unconnected if an external 1.8 V, 28.63636 MHz clock oscillator source is used to clock the ADV7280A. The crystal used with the ADV7280A must be a fundamental mode crystal.
15	XTALN	Input	Input Pin for the Crystal Oscillator Amplifier. The crystal used with the ADV7280A must be a fundamental mode crystal. If an external 1.8 V, 28.63636 MHz clock oscillator source is used to clock the ADV7280A, the output of the oscillator is fed into the XTALN pin.
16	PVDD	Power	PLL Power Supply (1.8 V).
17, 18, 22, 23	A <sub>IN1</sub> to A <sub>IN4</sub>	Input	Analog Video Input Channels.
19	VREFP	Output	Positive Internal Voltage Reference Output.
20	VREFN	Output	Negative Internal Voltage Reference Output.
21	A <sub>VDD</sub>	Power	Analog Power Supply (1.8 V).
24	INTRQ	Output	Interrupt Request Output. An interrupt occurs when certain signals are detected on the input video.
25	RESET	Input	System Reset Input (Active Low). A minimum low reset pulse width of 5 ms is required to reset the ADV7280A circuitry.
26	ALSB	Input	Address Least Significant Bit. This pin selects the I <sup>2</sup> C write address for the ADV7280A. When ALSB is set to Logic 0, the write address is 0x40; when ALSB is set to Logic 1, the write address is 0x42.
27	SDATA	Input/output	I <sup>2</sup> C Port Serial Data Input/Output.
28	SCLK	Input	I <sup>2</sup> C Port Serial Clock Input. The maximum clock rate is 400 kHz.
29	VS/FIELD/SFL	Output	Vertical Synchronization Output Signal/Field Synchronization Output Signal/Subcarrier Frequency Lock. When configured for the SFL function, this pin provides a serial output stream that can be used to lock the subcarrier frequency when the ADV7280A decoder is connected to any Analog Devices, Inc., digital video encoder.
30	HS	Output	Horizontal Synchronization Output Signal.
31	PWRDWN	Input	Power-Down. A logic low on this pin places the ADV7280A in power-down mode.
32	LLC	Output	Line Locked Clock for Output Pixel Data. The clock output is nominally 27 MHz, but it increases or decreases according to the video line length.
	EPAD (EP)		Exposed Ground Pad. The exposed pad must be connected, together with the DGND pins, to a common ground plane (GND).

Figure 7. ADV7280A-M Pin Configuration

Table 10. Pin Function Descriptions, ADV7280A-M

Pin No.	Mnemonic	Type	Description
1, 4	DGND	Ground	Ground for Digital Supply.
2	D <sub>VDDIO</sub>	Power	Digital I/O Power Supply (3.3 V).
3	D <sub>VDD</sub>	Power	Digital Power Supply (1.8 V).
5	INTRQ	Output	Interrupt Request Output. An interrupt occurs when certain signals are detected on the input video.
6 to 8	GPO2 to GPO0	Output	General-Purpose Outputs. These pins can be configured via I <sup>2</sup> C to allow control of external devices.
9	D0P	Output	Positive MIPI Differential Data Output.
10	D0N	Output	Negative MIPI Differential Data Output.
11	CLKP	Output	Positive MIPI Differential Clock Output.
12	CLKN	Output	Negative MIPI Differential Clock Output.
13	M <sub>VDD</sub>	Power	MIPI Digital Power Supply (1.8 V).
14	XTALP	Output	Output Pin for the Crystal Oscillator Amplifier. Connect this pin to the external 28.63636 MHz crystal, or leave it unconnected if an external 1.8 V, 28.63636 MHz clock oscillator source is used to clock the ADV7280A-M. The crystal used with the ADV7280A-M must be a fundamental mode crystal.
15	XTALN	Input	Input Pin for the Crystal Oscillator Amplifier. The crystal used with the ADV7280A-M must be a fundamental mode crystal. If an external 1.8 V, 28.63636 MHz clock oscillator source is used to clock the ADV7280A-M, the output of the oscillator is fed into the XTALN pin.
16	P <sub>VDD</sub>	Power	PLL Power Supply (1.8 V).
17, 18, 22, 23, 24, 25, 26, 27	A <sub>IN1</sub> to A <sub>IN8</sub>	Input	Analog Video Input Channels.
19	VREFP	Output	Positive Internal Voltage Reference Output.
20	VREFN	Output	Negative Internal Voltage Reference Output.
21	A <sub>VDD</sub>	Power	Analog Power Supply (1.8 V).
28	RESET	Input	System Reset Input (Active Low). A minimum low reset pulse width of 5 ms is required to reset the ADV7280A-M circuitry.
29	ALSB	Input	Address Least Significant Bit. This pin selects the I <sup>2</sup> C write address for the ADV7280A-M. When ALSB is set to Logic 0, the write address is 0x40; when ALSB is set to Logic 1, the write address is 0x42.
30	SDATA	Input/output	I <sup>2</sup> C Port Serial Data Input/Output.
31	SCLK	Input	I <sup>2</sup> C Port Serial Clock Input. The maximum clock rate is 400 kHz.
32	PWRDWN	Input	Power-Down. A logic low on this pin places the ADV7280A-M in power-down mode.
	EPAD (EP)		Exposed Ground Pad. The exposed pad must be connected, together with the DGND pins, to a common ground plane (GND).

## THEORY OF OPERATION

The ADV7280A is a versatile one-chip, multiformat video decoder that automatically detects standard analog baseband video signals and converts them into a YCrCb 4:2:2 component video data stream. The ADV7280A supports video signals compatible with worldwide NTSC, PAL and SECAM standards.

The analog front ends of the ADV7280A are designed for single-ended input video signals. They feature an input mux (4-channel for ADV7280A, 8-channel for ADV7280A-M) and a single 10-bit ADC. The analog video inputs accept single-ended video signals as well as S-Video (Y/C) and YPbPr video signals, supporting a wide range of automotive and consumer video sources.

The incoming analog video is converted into a digital 8-bit YCrCb 4:2:2 video stream that is output either via a digital 8-bit ITU-R BT.656 video stream (ADV7280A) or via a MIPI CSI-2 interface (ADV7280A-M). External horizontal sync (HS), vertical sync (VS), and field sync signals are available for the ITU-R BT.656 interface to provide timing references for LCD controllers and other video ASICs.

The ADV7280A features an advanced I<sup>2</sup>P function to convert interlaced input video to a progressive video output with no requirement for external memory. The I<sup>2</sup>P conversion uses edge adaptive technology to minimize video defects on low angle lines.

The ADV7280A also offers a dither mode, adaptive contrast enhancement (ACE), and general-purpose outputs (ADV7280A-M only).

The ADV7280A is programmed via a 2-wire, serial bidirectional port (I<sup>2</sup>C compatible) and can communicate with other devices via a hardware interrupt pin, INTRQ.

The ADV7280A is fabricated in a low power 1.8 V CMOS process and are provided in a space-saving LFCSP surface-mount, RoHS compliant package.

The ADV7280A is available in an automotive grade rated over the -40°C to +105°C temperature range, as well as a -40°C to +85°C temperature range, making them ideal for automotive, industrial, and consumer applications.

### ANALOG FRONT END

The AFE of the ADV7280A is composed of an input mux, a set of four antialiasing filters, and a single 10-bit ADC.

The input mux (4-channel for ADV7280A, 8-channel for ADV7280A-M) enables multiple composite video signals to be applied to the SDP and is software controlled.

The external resistor divider is required before each analog input channel to ensure that the input signal is kept within the range of the ADC. Current and voltage clamps in the circuit ensure that the video signal remains within the range on the ADC.

The single 10-bit ADC digitizes the analog video before it is applied to the SDP. Table 11 shows the three ADC clocking rates

that are determined by the video input format to be processed. These clock rates ensure 4× oversampling per channel for CVBS, Y/C, and YPrPb modes.

**Table 11. ADC Clock Rates**

Input Format	ADC Clock Rate (MHz) <sup>1</sup>	Oversampling Rate per Channel
CVBS	57.27	4×
S-Video (Y/C) <sup>2</sup>	114	4×
YPrPb <sup>2</sup>	172	4×

<sup>1</sup> Based on a 28.63636 MHz clock input to the ADV7280A.

<sup>2</sup> Configuration writes are required for the different S-Video (Y/C) and YPrPb modes.

### STANDARD DEFINITION PROCESSOR (SDP)

The SDP in the ADV7280A is capable of decoding a large selection of baseband video signals in composite (both single-ended and differential), S-Video (Y/C), and component formats. The video standards supported by the video processor include

- PAL B, PAL D, PAL G, PAL H, PAL I, PAL M, PAL N, PAL Nc, PAL 60
- NTSC J, NTSC M, NTSC 4.43
- SECAM B, SECAM D, SECAM G, SECAM K, SECAM L

The SDP in the ADV7280A can automatically detect the video standard and process it accordingly.

The ADV7280A has a five-line, superadaptive, 2D comb filter that provides superior chrominance and luminance separation when decoding a composite video signal. This highly adaptive filter automatically adjusts its processing mode according to the video standard and signal quality without requiring user intervention. Video user controls such as brightness, contrast, saturation, and hue are also available in the ADV7280A.

The ADV7280A implements a patented Adaptive Digital Line Length Tracking (ADLLT™) algorithm to track varying video line lengths from sources such as a VCR. ADLLT enables the ADV7280A to track and decode poor quality video sources such as VCRs and noisy sources from tuner outputs, VCD players, and camcorders. The ADV7280A contains a chroma transient improvement (CTI) processor that sharpens the edge rate of chroma transitions, resulting in sharper vertical transitions.

The ADV7280A features an automatic gain control (AGC) algorithm to ensure that the optimum luma gain is selected as the input video varies in brightness.

ACE is an algorithm that automatically varies the contrast level applied across an image to enhance the picture detail visible. This automatic variation enables the contrast in the dark areas of an image to be increased without saturating the bright areas, which is particularly useful in automotive applications where it can be important to be able to clearly discern objects in shaded areas.

Dithering from eight bits to six bits enables ease of design for standard LCD panels.

The SDP can handle a variety of vertical blanking interval (VBI) data services, such as closed captioning (CCAP), wide screen signaling (WSS), copy generation management system (CGMS), and teletext data slicing for world standard teletext (WST). Data is transmitted via the 8-bit video output port as ancillary data packets (ANC).

The ADV7280A is fully Rovi™ (formerly Macrovision® and now rebranded as TiVo upon acquisition of the same) compliant; detection circuitry enables Type I, Type II, and Type III protection levels to be identified and reported to the user. The SDP is fully robust to all Rovi signal inputs.

## POWER SUPPLY SEQUENCING

### OPTIMAL POWER-UP SEQUENCE

The optimal power-up sequence for the ADV7280A is guaranteed by production testing.

The optimal power-up sequence for the ADV7280A is to first power up the 3.3 V  $D_{VDDIO}$  supply, followed by the 1.8 V supplies:  $D_{VDD}$ ,  $P_{VDD}$ ,  $A_{VDD}$ , and  $M_{VDD}$  (for the ADV7280A-M).

When powering up the ADV7280A, follow these steps. During power-up, all supplies must adhere to the specifications listed in the Absolute Maximum Ratings section.

1. Assert the  $\overline{PWRDWN}$  and  $\overline{RESET}$  pins (pull the pins low).
2. Power up the  $D_{VDDIO}$  supply.
3. After  $D_{VDDIO}$  is fully asserted, power up the 1.8 V supplies.
4. After the 1.8 V supplies are fully asserted, pull the  $\overline{PWRDWN}$  pin high.
5. Wait 5 ms and then pull the  $\overline{RESET}$  pin high.
6. After all power supplies and the  $\overline{PWRDWN}$  and  $\overline{RESET}$  pins are powered up and stable, wait an additional 5 ms before initiating I<sup>2</sup>C communication with the ADV7280A.

### SIMPLIFIED POWER-UP SEQUENCE

The simplified power-up sequence is guaranteed by characterization.

Alternatively, the ADV7280A can be powered up by asserting all supplies and the  $\overline{PWRDWN}$  pin simultaneously. During this operation, the  $\overline{RESET}$  pin must remain low. After the supplies and  $\overline{PWRDWN}$  are fully asserted, wait for at least 5 ms before bringing the  $\overline{RESET}$  pin high. After the  $\overline{RESET}$  pin is fully

asserted, wait a further 5 ms before initiating I<sup>2</sup>C communication with the ADV7280A.

While the supplies are being established, take care to ensure that a lower rated supply does not go above a higher rated supply level. During power-up, all supplies must adhere to the specifications listed in the Absolute Maximum Ratings section.

### POWER-DOWN SEQUENCE

The ADV7280A supplies can be deasserted simultaneously as long as  $D_{VDDIO}$  does not go below a lower rated supply.

### UNIVERSAL POWER SUPPLY (ADV7280A ONLY)

The ADV7280A-M model requires a  $D_{VDDIO}$  supply at a nominal value of 3.3 V. The ADV7280A, however, can operate with a  $D_{VDDIO}$  supply at a nominal value of 1.8 V. Therefore, it is possible to power up all the supplies for the ADV7280A ( $D_{VDD}$ ,  $P_{VDD}$ ,  $A_{VDD}$ , and  $D_{VDDIO}$ ) to 1.8 V.

When  $D_{VDDIO}$  is at a nominal value of 1.8 V, power up the ADV7280A as follows:

1. Follow the power-up sequence described in the Optimal Power-Up Sequence section, but power up the  $D_{VDDIO}$  supply to 1.8 V instead of 3.3 V. Also, power up the  $\overline{PWRDWN}$  and  $\overline{RESET}$  pins to 1.8 V instead of 3.3 V.
2. Set the drive strengths of the digital outputs of the ADV7280A to their maximum setting.
3. Connect any pull-up resistors connected to pins on the ADV7280A (such as the SCLK and SDATA pins) to 1.8 V instead of 3.3 V.

Figure 8. Optimal Power-Up Sequence

## CRYSTAL OSCILLATOR DESIGN

The ADV7280A needs a stable and accurate clock source to guarantee their operation. This clock is typically provided by a crystal resonator (XTAL) but can also be provided by a clock oscillator.

The required circuitry for an XTAL is illustrated in Figure 16. A damping resistor ( $R_{DAMP}$ ) is required on the output of the ADV7280A XTAL amplifier (XTALP). The purpose of this damping resistor is to limit the current flowing through the XTAL and to limit the voltage across the XTAL amplifier. To define the appropriate value of the damping resistor  $R_{DAMP}$  (see the Typical Circuit Connections section), consult the accompanying calculator tool (visit the design resources section at [www.analog.com/ADV7280A](http://www.analog.com/ADV7280A) to download).

The other components in the XTAL circuit must be chosen carefully; for example, incorrectly selected load capacitors may result in an offset to the crystal oscillation frequency. For more information on such considerations, see the [AN-1260 Application Note](#), *Crystal Design Considerations for Video Decoders, HDMI Receivers, and Transceivers*. After the XTAL circuit is defined, it is recommended to consult with the XTAL vendor to ensure that the design operates with sufficient margin across all conditions.

The evaluation of the ADV7280A was completed using an XTAL with typical characteristics (see Table 12).

**Table 12. Reference XTAL Characteristics**

Characteristic	Value	Unit
Package	3.2 × 2.5 × 0.8	mm
Nominal Frequency	28.63636	MHz
Mode of Oscillation	Fundamental	
Frequency Calibration (at 25°C)	±20	ppm
Frequency Temperature Stability Tolerance	±50	ppm
Operating Temperature Range	−40 to +125	°C
Maximum Equivalent Series Resistance	25	Ω
Load Capacitance	12	pF
Drive Level	200	μW
Shunt Capacitance (Maximum)	5	pF
Aging per Year	±3	ppm

The values in Table 12 are provided for reference only. It is recommended to characterize the operation of the XTAL circuit thoroughly across the operating temperature range of the application, in conjunction with the XTAL vendor, prior to releasing any new design.

## INPUT NETWORK

An input network (external resistor and capacitor circuit) is required on the  $A_{INX}$  input pins of the decoder. Figure 9 shows the input network to use on each  $A_{INX}$  input pin of the ADV7280A when any of the following video input formats is used:

- Single-ended CVBS
- S-Video (Y/C)
- YPrPb

Figure 9. Input Network

The  $24\ \Omega$  and  $51\ \Omega$  resistors supply the  $75\ \Omega$  end termination required for the analog video input. These resistors also create a resistor divider with a gain of 0.68. The resistor divider attenuates the amplitude of the input analog video and scales the input to the ADC range of the ADV7280A. This resistor divider allows an input range to the ADV7280A of up to 1.47 V p-p. Amplifiers within the ADC restore the amplitude of the input signal so that SNR performance is maintained.

The  $100\ \text{nF}$  ac coupling capacitor removes the dc bias of the analog input video before it is fed into the  $A_{INX}$  pin of the ADV7280A. The clamping circuitry within the ADV7280A restores the dc bias of the input signal to the optimal level before it is fed into the ADC of the ADV7280A.

## APPLICATIONS INFORMATION

### INPUT CONFIGURATION

The input format of the ADV7280A is specified using the INSEL[4:0] bits (see Table 13). These bits also configure the SDP core to process CVBS, S-Video (Y/C), or component (YPrPb) format. The INSEL[4:0] bits are located in the user sub map of the register space at Address 0x00, Bits[4:0]. For more information about the registers, see the Register Maps section.

The INSEL[4:0] bits specify predefined analog input routing schemes, eliminating the need for manual mux programming and allowing the user to route the various video signal types to the decoder. For example, if the CVBS input is selected, the remaining channels are powered down.

### ADAPTIVE CONTRAST ENHANCEMENT (ACE)

The ADV7280A can increase the contrast of an image depending on the content of the picture, allowing bright areas to be made brighter and dark areas to be made darker. The optional ACE feature enables the contrast within dark areas to

be increased without significantly affecting the bright areas. The ACE feature is particularly useful in automotive applications, where it can be important to discern objects in shaded areas.

The ACE function is disabled by default. To enable the ACE function, execute the register writes shown in Table 14. To disable the ACE function, execute the register writes shown in Table 15.

### I<sup>2</sup>P FUNCTION

The advanced I<sup>2</sup>P function allows the ADV7280A to convert an interlaced video input into a progressive video output. This function is performed without the need for external memory. The ADV7280A uses edge adaptive technology to minimize video defects on low angle lines.

The I<sup>2</sup>P function is disabled by default. To enable the I<sup>2</sup>P function, use the recommended scripts from Analog Devices, Inc., available at [www.analog.com/ADV7280A](http://www.analog.com/ADV7280A).

**Table 13. Input Format Specified by the INSEL[4:0] Bits**

INSEL[4:0] Bit Value	Video Format	Analog Inputs

**ITU-R BT.656 Tx CONFIGURATION (ADV7280A ONLY)**

The ADV7280A receives analog video and outputs digital video according to the ITU-R BT.656 specification. The ADV7280A outputs the ITU-R BT.656 video data stream over the P0 to P7 data pins and has an LLC pin and two synchronization pins (HS and VS/FIELD/SFL).

Video data is output over the P0 to P7 pins in YCrCb 4:2:2 format. Synchronization signals are automatically embedded in the video data signal in accordance with the ITU-R BT.656 specification.

The LLC output is used to clock the output data on the P0 to P7 pins at a nominal frequency of 27 MHz.

The two synchronization pins (HS and VS/FIELD/SFL) output a variety of synchronization signals such as horizontal sync, vertical sync, field sync, and color subcarrier frequency lock (SFL) sync. The majority of these synchronization signals are already embedded in the video data. Therefore, the use of the synchronization pins is optional.

**MIPI Tx OUTPUT (ADV7280A-M ONLY)**

The decoder in the ADV7280A-M outputs an ITU-R BT.656 data stream. The ITU-R BT.656 data stream is connected into a CSI-2 Tx module. Data from the CSI-2 Tx module is fed into a D-PHY physical layer and output serially from the device.

The output of the ADV7280A-M consists of a single data channel on the D0P and D0N lanes and a clock channel on the CLKP and CLKN lanes.

Video data is output over the data lanes in high speed mode. The data lanes enter low power mode during the horizontal and vertical blanking periods.

The clock lanes clock the output video. After the ADV7280A-M is programmed, the clock lanes exit low power mode and remain in high speed mode until the device is reset or powered down.

The ADV7280A-M outputs video data in an 8-bit, YCrCb, 4:2:2 format. When the I<sup>2</sup>P core is disabled, the video data is output in an interlaced format at a nominal data rate of 216 Mbps. When the I<sup>2</sup>P core is enabled, the video data is output in a progressive format at a nominal data rate of 432 Mbps (see the I<sup>2</sup>P Function section for more information).

Figure 10. ITU-R BT.656 Output Stage of the ADV7280A

Figure 11. MIPI CSI-2 Output Stage of the ADV7280A-M

**I<sup>2</sup>C PORT DESCRIPTION**

The ADV7280A supports a 2-wire, I<sup>2</sup>C-compatible serial interface. Two inputs, serial data (SDATA) and serial clock (SCLK), carry information between the ADV7280A and the system I<sup>2</sup>C master controller. The I<sup>2</sup>C port of the ADV7280A allows the user to set up and configure the decoder and to read back captured VBI data.

The ADV7280A has a variety of possible I<sup>2</sup>C slave addresses and subaddresses (see the Register Maps section). The main map of the ADV7280A has four possible slave addresses for read and write operations, depending on the logic level of the ALSB pin (see Table 16).

**Table 16. Main Map I<sup>2</sup>C Addresses**

ALSB Pin	R/W Bit	Slave Address
0	0	0x40 (write)
0	1	0x41 (read)
1	0	0x42 (write)
1	1	0x43 (read)

The ALSB pin controls Bit 1 of the slave address. By changing the logic level of the ALSB pin, it is possible to control two ADV7280A devices in an application without using the same I<sup>2</sup>C slave address. The LSB (Bit 0) specifies either a read or write operation: Logic 1 corresponds to a read operation, and Logic 0 corresponds to a write operation.

To control the device on the bus, use the following protocol:

1. The master initiates a data transfer by establishing a start condition, defined as a high to low transition on SDATA while SCLK remains high, and indicates that an address/data stream follows.
2. All peripherals respond to the start condition and shift the next eight bits (the 7-bit address plus the R/W bit). The bits are transferred from MSB to LSB.
3. The peripheral that recognizes the transmitted address responds by pulling the data line low during the ninth clock pulse; this is known as an acknowledge (ACK) bit.

4. All other devices withdraw from the bus and maintain an idle condition. In the idle condition, the device monitors the SDATA and SCLK lines for the start condition and the correct transmitted address.

The R/W bit determines the direction of the data. Logic 0 on the LSB of the first byte means that the master writes information to the peripheral. Logic 1 on the LSB of the first byte means that the master reads information from the peripheral.

The ADV7280A acts as standard I<sup>2</sup>C slave devices on the bus. The data on the SDATA pin is eight bits long, supporting the 7-bit address plus the R/W bit. The device has subaddresses to enable access to the internal registers; therefore, it interprets the first byte as the device address and the second byte as the starting subaddress. The subaddresses auto-increment, allowing data to be written to or read from the starting subaddress. A data transfer is always terminated by a stop condition. The user can also access any unique subaddress register individually without updating all the registers.

Stop and start conditions can be detected at any stage during the data transfer. If these conditions are asserted out of sequence with normal read and write operations, they cause an immediate jump to the idle condition. During a given SCLK high period, issue only one start condition, one stop condition, or a single stop condition followed by a single start condition. If an invalid subaddress is issued by the user, the ADV7280A does not issue an acknowledge, and returns to the idle condition.

If the highest subaddress is exceeded in auto-increment mode, take one of the following actions:

- In read mode, the register contents of the highest subaddress continue to output until the master device issues a no acknowledge, indicating the end of a read. A no acknowledge condition occurs when the SDATA line is not pulled low on the ninth pulse.
- In write mode, the data for the invalid byte is not loaded into a subaddress register. A no acknowledge is issued by the ADV7280A, and the device returns to the idle condition.

Figure 12. Bus Data Transfer

Figure 13. Read and Write Sequence

## REGISTER MAPS

The ADV7280A contains two register maps: the main map, the video postprocessor (VPP) map, and the CSI map.

The main register map contains three sub maps: the user sub map, the interrupt/VDP sub map, and User Sub Map 2 (see Figure 14).

For more information about the ADV7280A registers, see the [ADV7280A/ADV7281A/ADV7282A Device Manual](#).

### Main Map

The I<sup>2</sup>C slave address of the main map of the ADV7280A is set by the ALSB pin (see Table 16). The main map allows the user to program the I<sup>2</sup>C slave addresses of the VPP and CSI maps. The three sub maps are accessed by writing to the SUB\_USR\_EN[1:0] bits (Address 0x0E, Bits[6:5]) within the user sub map (see Figure 14 and Table 17).

### User Sub Map

The user sub map contains registers that program the AFE and digital core of the ADV7280A. The user sub map has the same I<sup>2</sup>C slave address as the main map. To access the user sub map, set the SUB\_USR\_EN[1:0] bits in the user sub map (Address 0x0E, Bits[6:5]) to 00.

### Interrupt/VDP Sub Map

The interrupt/VDP sub map contains registers that program internal interrupts, control the INTRQ pin, and decode VBI data.

The interrupt/VDP sub map has the same I<sup>2</sup>C slave address as the main map. To access the interrupt/VDP sub map, set the SUB\_USR\_EN[1:0] bits in the user sub map (Address 0x0E, Bits[6:5]) to 01.

### User Sub Map 2

User Sub Map 2 contains registers that control the ACE, dither, and fast lock functions. It also contains controls that set the acceptable input luma and chroma limits before the ADV7280A enters free run and color kill modes.

User Sub Map 2 has the same I<sup>2</sup>C slave address as the main map. To access User Sub Map 2, set the SUB\_USR\_EN[1:0] bits in the user sub map (Address 0x0E, Bits[6:5]) to 10.

Figure 14. Register Map and Sub Map Access

<sup>1</sup> X and XX mean don't care.

**VPP Map**

The VPP map contains registers that control the I<sup>2</sup>P core (interlaced to progressive converter).

The VPP map has a programmable I<sup>2</sup>C slave address, which is programmed using Register 0xFD in the user sub map. The default value for the VPP map address is 0x00; however, the VPP map cannot be accessed until the I<sup>2</sup>C slave address is reset. The recommended I<sup>2</sup>C slave address for the VPP map is 0x84.

To reset the I<sup>2</sup>C slave address of the VPP map, write to the VPP\_SLAVE\_ADDR[7:1] bits in the user sub map (Address 0xFD, Bits[7:1]). Set these bits to a value of 0x84 (I<sup>2</sup>C write address; I<sup>2</sup>C read address is 0x85).

**CSI Map (ADV7280A-M Only)**

The CSI map contains registers that control the MIPI CSI-2 output stream from the ADV7280A-M.

The CSI map has a programmable I<sup>2</sup>C slave address, which is programmed using Register 0xFE in the user sub map. The

default value for the CSI map address is 0x00; however, the CSI map cannot be accessed until the I<sup>2</sup>C slave address is reset. The recommended I<sup>2</sup>C slave address for the CSI map is 0x88.

To reset the I<sup>2</sup>C slave address of the CSI map, write to the CSI\_TX\_SLAVE\_ADDR[7:1] bits in the user sub map (Address 0xFE, Bits[7:1]). Set these bits to a value of 0x88 (I<sup>2</sup>C write address; I<sup>2</sup>C read address is 0x89).

**SUB\_USR\_EN[1:0] Bits, Address 0x0E, Bits[6:5]**

The user sub map is available by default. The other two sub maps are accessed using the SUB\_USR\_EN[1:0] bits. When programming of the interrupt/VDP map or User Sub Map 2 is completed, it is necessary to write to the SUB\_USR\_EN[1:0] bits to return to the user sub map.

## PCB LAYOUT RECOMMENDATIONS

The ADV7280A is a high precision, high speed, mixed-signal device. To achieve maximum performance from the device, it is important to use a well designed PCB. This section provides guidelines for designing a PCB for use with the ADV7280A.

### ANALOG INTERFACE INPUTS

When routing the analog interface inputs on the PCB, keep track lengths to a minimum. Use  $75\ \Omega$  trace impedances when possible; trace impedances other than  $75\ \Omega$  increase the chance of reflections.

### POWER SUPPLY DECOUPLING

It is recommended that each power supply pin be decoupled with 100 nF and 10 nF capacitors. The basic principle is to place a decoupling capacitor within approximately 0.5 cm of the  $P_{VDD}$ ,  $A_{VDD}$ ,  $D_{VDD}$ , and  $M_{VDD}$  pins. Avoid placing the decoupling capacitors on the opposite side of the PCB from the ADV7280A because doing so introduces inductive vias in the path.

Place the decoupling capacitors between the power plane and the power pin. Current flows from the power plane to the capacitor and then to the power pin. Do not apply the power connection between the capacitor and the power pin. The best approach is to place a via near, or beneath, the decoupling capacitor pads down to the power plane (see Figure 15).

Figure 15. Recommended Power Supply Decoupling

Ensure that the power supplies connected to the ADV7280A,  $P_{VDD}$  and  $M_{VDD}$  ( $M_{VDD}$  only applies to the ADV7280A-M model) in particular, are well regulated and filtered. For optimum performance of the ADV7280A, it is recommended to isolate each supply and to use decoupling on each pin, located as physically close to the ADV7280A package as possible.

Some graphic controllers use substantially different levels of power when active (during active picture time) and when idle (during horizontal and vertical sync periods). This disparity can result in a measurable change in the voltage supplied to the analog supply regulator, which can, in turn, produce changes in the regulated analog supply voltage. This problem can be mitigated by regulating the analog supply, or at least the  $P_{VDD}$  supply, from a different, cleaner power source, for example, from a 12 V supply.

Using a single ground plane for the entire board is also recommended. Experience has shown that the noise performance is the same or better with a single ground plane. Using multiple ground planes can be detrimental because each separate ground plane is smaller, and long ground loops can result.

### VREFN AND VREFP PINS

Place the circuit associated with the VREFN and VREFP pins as close as possible to the ADV7280A and on the same side of the PCB as the device.

### DIGITAL OUTPUTS

The ADV7280A digital outputs are  $\overline{INTRQ}$ , LLC, HS, VS/FIELD/SFL, and P0 to P7. The ADV7280A-M digital outputs are INTRQ and GPO0 to GPO2.

Minimize the trace length that the digital outputs must drive. Longer traces have higher capacitance, requiring more current and, in turn, causing more internal digital noise. Shorter traces reduce the possibility of reflections.

Adding a  $30\ \Omega$  to  $50\ \Omega$  series resistor can suppress reflections, reduce electromagnetic interference (EMI), and reduce current spikes inside the ADV7280A. If using series resistors, place them as close as possible to the pins of the ADV7280A. However, try not to add vias or extra length to the output trace in an attempt to place the resistors closer.

If possible, limit the capacitance that each digital output must drive to less than 15 pF. This recommendation can be easily accommodated by keeping traces short and by connecting the outputs to only one device. Loading the outputs with excessive capacitance increases the current transients inside the ADV7280A, creating more digital noise on the power supplies.

### EXPOSED METAL PAD

The ADV7280A has an exposed metal pad on the bottom of the package. This pad must be soldered to ground. The exposed pad is used for proper heat dissipation, noise suppression, and mechanical strength.

### DIGITAL INPUTS

The digital inputs of the ADV7280A are designed to work with 1.8 V signals (3.3 V for  $D_{VDDIO}$ ) and are not tolerant of 5 V signals. Extra components are required if 5 V logic signals must be applied to the decoder.

### MIPI Tx OUTPUTS (ADV7280A-M ONLY)

It is recommended that the MIPI Tx output traces be kept as short as possible and on the same side of the PCB as the ADV7280A-M device. It is also recommended that a solid plane (preferably a ground plane) be placed on the layer adjacent to the MIPI Tx traces to provide a solid reference plane.

MIPI Tx transmission operates in both differential and single-ended modes. During high speed transmission, the pair of outputs operates in differential mode; in low power mode, the pair operates as two independent single-ended traces. Therefore, it is recommended that each output pair be routed as two loosely coupled  $50\ \Omega$  single-ended traces to reduce the risk of crosstalk between the two traces in low power mode.

### TYPICAL CIRCUIT CONNECTIONS

Figure 16 provides an example of how to connect the ADV7280A. Figure 17 provides an example of how to connect the ADV7280A-M.

For detailed schematics of the ADV7280A evaluation boards, visit the ADV7280A product page at [www.analog.com/ADV7280A](http://www.analog.com/ADV7280A).

See the XTAL data sheet (from the XTAL vendor), the [AN-1260 Application Note](#), and the calculator tool (visit the design resources section at [www.analog.com/ADV7280A](http://www.analog.com/ADV7280A) to download) for the correct values for C1, C2, and R<sub>DAMP</sub>.

<sup>1</sup> Z = RoHS Compliant Part.

<sup>2</sup> W = Qualified for Automotive Applications.

## AUTOMOTIVE PRODUCTS

The ADV7280AW models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

<sup>1</sup>C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
