3.3V Differential In 1:10 Differential Fanout Clock Driver with HCSL Level Output

Description

The NB4N111K is a differential input clock 1 to 10 HCSL fanout buffer, optimized for ultra low propagation delay variation. The NB4N111K is designed with HCSL clock distribution for FBDIMM applications in mind.

Inputs can accept differential LVPECL, CML, or LVDS levels. Single-ended LVPECL, CML, LVCMOS or LVTTL levels are accepted with the proper V_{REFAC} supply (see Figures 5, 10, 11, 12, and 13). Clock input pins incorporate an internal $50\ \Omega$ on die termination resistors. Outputs can interface with LVDS with proper termination (See Figure 15).

The NB4N111K specifically guarantees low output-to-output skews. Optimal design, layout, and processing minimize skew within a device and from device to device. System designers can take advantage of the NB4N111K's performance to distribute low skew clocks across the backplane or the motherboard.
