## GENERAL DESCRIPTION

The **ADG658** and **ADG659** are low voltage, CMOS analog multiplexers comprised of eight single channels and four differential channels, respectively. The **ADG658** switches one of eight inputs (S1–S8) to a common output, D, as determined by the 3-bit binary address lines A0, A1, and A2. The **ADG659** switches one of four differential inputs to a common differential output, as determined by the 2-bit binary address lines A0 and A1. An  $\overline{\text{EN}}$  input on both devices enables or disables the device. When disabled, all channels are switched off.

These devices are designed on an enhanced process that provides lower power dissipation yet gives high switching speeds. These devices can operate equally well as either multiplexers or demultiplexers and have an input range that extends to the supplies. All channels exhibit break-before-make switching action, preventing momentary shorting when switching channels. All digital inputs have 0.8 V to 2.4 V logic thresholds, ensuring TTL/CMOS logic compatibility when using single +5 V or dual  $\pm 5$  V supplies.

## FUNCTIONAL BLOCK DIAGRAM

Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

### $\Delta R_{ON}$

On Resistance Match between Any Two Channels, i.e.,  $R_{ONmax}$  –  $R_{ONmin}$ .

### $R_{FLAT(ON)}$

Flatness is defined as the difference between the maximum and minimum value of ON Resistance as measured over the specified analog signal range.

### $I_S$ (OFF)

Source Leakage Current with the Switch OFF.

### $I_D$ (OFF)

Drain Leakage Current with the Switch OFF.

### $I_D, I_S$ (ON)

Channel Leakage Current with the Switch ON.

### $V_{INL}$

Maximum Input Voltage for Logic 0.

### $V_{INH}$

Minimum Input Voltage for Logic 1.

### $I_{INL}$ ( $I_{INH}$ )

Input Current of the Digital Input.

### $C_S$ (OFF)

OFF Switch Source Capacitance. Measured with reference to ground.

### $C_D$ (OFF)

OFF Switch Drain Capacitance. Measured with reference to ground.

### $C_D, C_S$ (ON)

ON Switch Capacitance. Measured with reference to ground.

### $C_{IN}$

Digital Input Capacitance.

### $t_{ON}$

Delay between Applying the Digital Control Input and the Output Switching ON. See Figure 27.

### $t_{OFF}$

Delay between Applying the Digital Control Input and the Output Switching OFF.

### $t_{BEM}$

ON Time. Measured between 80% points of both switches when switching from one address state to another.

### Charge Injection

Measure of the Glitch Impulse Transferred from the Digital Input to the Analog Output during Switching.

### Off Isolation

Measure of Unwanted Signal Coupling through an OFF Switch.

### Crosstalk

Measure of Unwanted Signal Coupled through from One Channel to Another as a Result of Parasitic Capacitance.

### Bandwidth

The Frequency at which the Output is Attenuated by 3 dB.

### On Response

The Frequency Response of the ON Switch.

### Insertion Loss

The Loss Due to the ON Resistance of the Switch.
