

## Description

The AL1692 is a high performance, high power factor, high efficiency, and high current precision buck-boost and flyback dimmable LED controller/drivers for triac dimmable LED lamp applications. The AL1692 topology provides an accurate output current over wide line and load regulation. The wide switching frequency operates at boundary conduction mode (BCM) to ease EMI/EMC design and testing, to meet the latest regulatory standards.

The AL1692 controller with external MOSFET can support higher output power application, up to 25W. The AL1692 LED drivers have AL1692-30BA with 400V/3A and AL1692-20C with 600V/2A MOSFET. The AL1692 platform solutions can cover both 120Vac and 230Vac applications. The AL1692 has the built-in thermal fold-back protection trigger point to automatically reduce output current. Other protection features enhance LED lighting system's safety and reliability.

The AL1692 dimming curve is compliant with the NEMA SSL6 standard. The AL1692 applies to a wide range of dimmers, including leading edge and trailing edge dimmer, to achieve deep dimming down to 1%.

The AL1692 controller is available in SO-8 package. The Integrated MOSFET version AL1692-30BA and AL1692-20C are available in SO-7 package.

## Features

- Tight Current Sense Tolerance :  $\pm 3\%$
- Low Startup Current: 100 $\mu$ A Typical
- Low Operation Current: 210 $\mu$ A (Switching Frequency at 4kHz)
- Single Winding Inductor
- Wide Range of Dimmer Compatibility
- For Controller Power can Drive up to 25W
- For MOSFET Options : 400V/3A and 600V/2A
- NEMA SSL6 Dimming Curve Compliant
- Internal Protections
  - Under Voltage Lockout (UVLO)
  - Leading-Edge Blanking (LEB)
  - Cycle-by-cycle Over Current Protection (OCP)
  - Output Open/Short Protection (OVP/OSP)
  - Thermal Foldback Protection (TFP)
  - Over-Temperature Protection (OTP)
- SO-8 (Controller) and SO-7 (With MOSFET) Package
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

Notes:

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) & 2011/65/EU (RoHS 2) compliant.
2. See [http://www.diodes.com/quality/lead\\_free.html](http://www.diodes.com/quality/lead_free.html) for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

## Pin Assignments

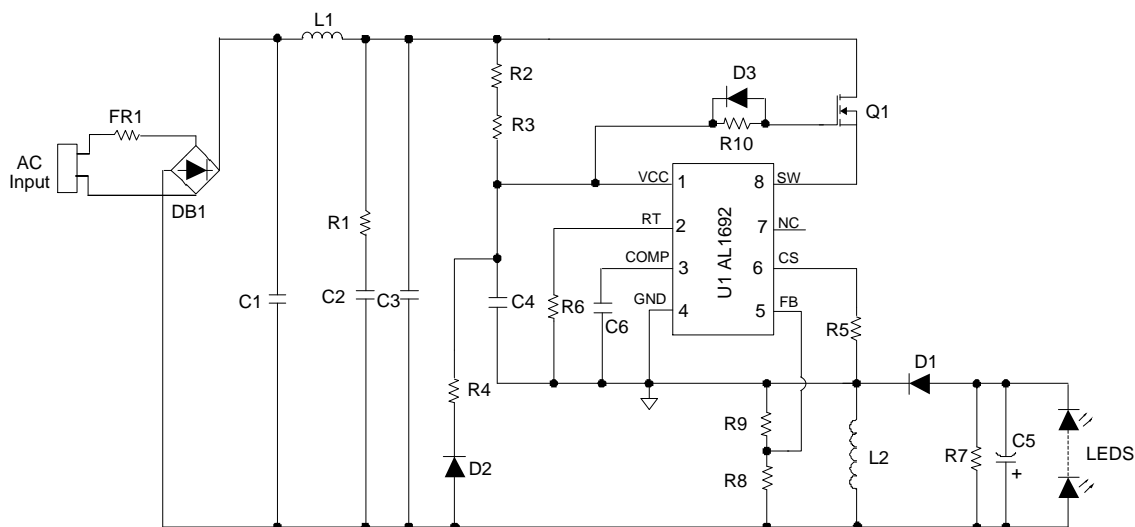

(Top View)

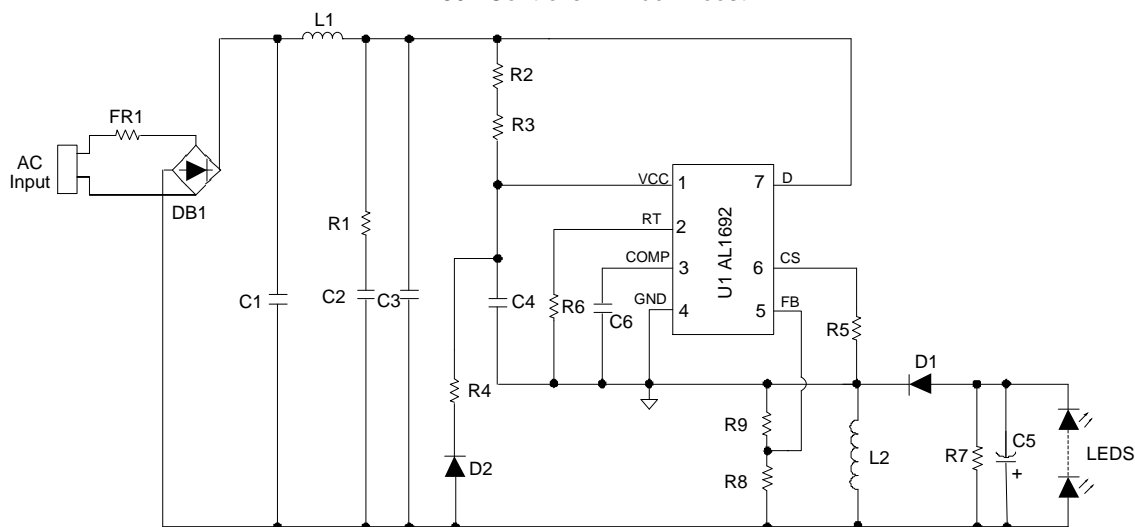

## Applications

- Mains Dimmable LED Lamps
- Offline LED Power Supply Driver

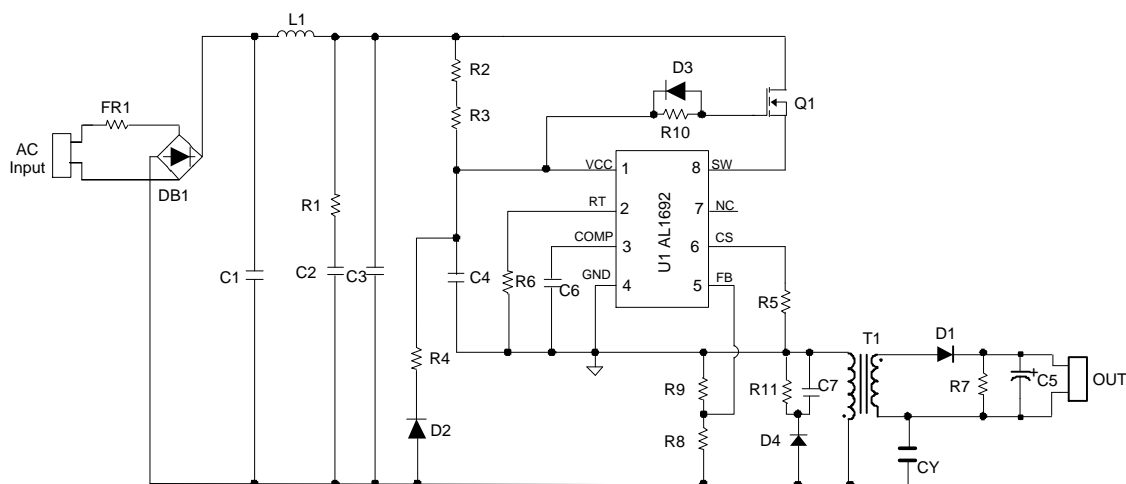

## Typical Application Circuits

AL1692 Controller in Buck-Boost

AL1692-30BA/20C Integrated MOS Version in Buck-Boost

AL1692 Controller in Fly-back

## Pin Descriptions

Pin Number		Pin Name	Function
SO-8	SO-7		
1	1	VCC	Power Supply Voltage
2	2	RT	Resistor Set the System'S Maximum $t_{ON}$
3	3	COMP	Compensation for Current Control
4	4	GND	Ground
5	5	FB	Feedback for LED Open Protection Voltage
6	6	CS	Current Sensing
7	7	NC (SO-8)	No Connected
		D (SO-7)	Drain of the Internal High Voltage MOSFET
8	--	SW	Source Driver of Switch

## Functional Block Diagram

AL1692 Controller

The block diagram illustrates the internal circuitry of the VCC clamp and current source. It features several key components and signal paths:

- Inputs:** VCC (Pin 1), RT (Pin 2), COMP (Pin 3), and GND (Pin 4).
- Outputs:** D (Pin 7), CS (Pin 6), and FB (Pin 5).
- Management Blocks:**
  - Fault Management:** Receives STOP, OTP, and OVP signals. It sends OFF and UVLO signals to the VCC Management block.
  - VCC Management:** Receives VCC and sends VDD and VREF signals. It is also connected to a VCC clamp circuit.
- Clamp and Detection Circuits:**
  - t<sub>ONS</sub> Detection (ZCD):** Receives a signal from the VCC Management block and outputs to the COMP pin.
  - Driver Supply Clamp:** Receives a signal from the VCC Management block and outputs to the COMP pin.
- Current Source and Feedback:**
  - Sample and Hold:** Receives a signal from the COMP pin and outputs to the CS pin.
  - OPC (Output Power Control):** Receives a signal from the COMP pin and outputs to the FB pin.
  - OVP (Over Voltage Protection):** Receives a signal from the FB pin and outputs to the OVP pin.

AL1692-30BA/20C with MOSFET

**Absolute Maximum Ratings** (@T<sub>A</sub> = +25°C, unless otherwise specified.) (Note 4)

Symbol	Parameter	Rating	Unit
V <sub>CC</sub>	Power Supply Voltage	18	V

	SO-7 Thermal Resistance (Junction to Case) (Note 6)	19	°C/W
—	ESD (Human Body Model)	2,000	V
	ESD (Machine Model)	200	V

- Notes:
- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability. All voltages unless otherwise stated and measured with respect to GND.
  - SW pin can withstand pulse voltage up to 25V with duration of 300ns.
  - Device mounted on 1"x1" FR-4 substrate PCB, 2oz copper, with minimum recommended pad layout.

**Recommended Operating Conditions** (@T<sub>A</sub> = +25°C, unless otherwise specified.)

Symbol	Parameter	Min	Max	Unit
T <sub>A</sub>	Ambient Temperature (Note 7)	-40	+105	°C

- Note:
- The device may operate normally at +125°C ambient temperature under the condition not trigger temperature protection.

Notes: 8. These parameters, although guaranteed by design, are not tested in production.  
9. The device will latch off when OTP happens, recovered after power cycle and the device won't operate normally at this temperature.

## Performance Characteristics (Note 10)

**Start-up Voltage vs. Ambient Temperature**

**Minimum Operating Voltage vs. Ambient Temperature**

**Start-up Current vs. Ambient Temperature**

**Operating Current vs. Ambient Temperature**

**VCC Clamp Voltage vs. Ambient Temperature**

**Feedback voltage vs. Ambient Temperature**

Note: 10. These electrical characteristics are tested under DC condition. The ambient temperature is equal to the junction temperature of the device.

## Functional Description and Application Information

### Operation

The AL1692 is a single stage, single winding, high efficiency, and high power factor dimmable LED driver controller/drivers for triac dimmable LED lamp applications. The AL1692 controller with an external MOSFET can support larger power application up to 25W. The AL1692 LED drivers: AL1692-30BA with 400V/3A and AL1692-20C with 600V/2A internal MOSFET options can cover both 120V<sub>AC</sub> and 230V<sub>AC</sub> application.

The AL1692 adopts source-driver technique to decrease the system operating current. It uses a novel method to detect the  $t_{OFF}$  time which results in the removal for the need of an auxiliary winding. The AL1692 operates at boundary conduction mode (BCM) which can ease EMI design and achieve high efficiency. High power factor (HPF) is achieved by using constant on-time mode; coupled with a closed loop of constant current control, the AL1692 achieves good line and load regulation.

### Start-up and Supply Voltage

Before start-up, the  $V_{CC}$  capacitor C4 is charged by the startup resistors (R2, R3) from the high voltage mains. When the start-up voltage is reached, the AL1692 starts switching. During normal operation, the  $V_{CC}$  supply is provided by start-up resistors (R2, R3) and the output voltage ( $V_{OUT}$ ) rectified by one diode (D2). In this way the system can provide  $V_{CC}$  supply at low dimming angle.

The AL1692 has an internal  $V_{CC}$  clamp voltage (typical 15.5V), which is limited by one internal active Zener diode.

When  $V_{CC}$  voltage drops to below the  $V_{OPR(MIN)}$ , switching is stop. So the device can operate normally when the voltage on  $V_{CC}$  pin is between  $V_{OPR(MIN)}$  and  $V_{CC}$  clamp voltage.

### Protections

#### Under Voltage Lockout (UVLO)

When the voltage on the  $V_{CC}$  pin drops to below  $V_{OPR(MIN)}$ , the IC stops switching. The IC can restart when the voltage on  $V_{CC}$  exceeds the startup voltage ( $V_{TH(ST)}$ ).

#### Leading-Edge Blanking (LEB)

To prevent false detection of the peak current of the inductor, a blanking time following switch-on is designed. When the internal switch turns on, a short current spike can occur because of the capacitive discharge of the voltage over the drain and source. It is disregarded during the LEB time ( $t_{ON\_MIN}$ ).

#### Cycle-by-cycle Over Current Protection (OCP)

The AL1692 has a built-in peak current detector. It triggers when the voltage on CS pin reaches the peak level  $V_{CS\_CLAMP}$ . The R5 is connected to the CS pin to sense the current of the inductor. The maximum peak current ( $I_{PEAK(MAX)}$ ) of the inductor can be calculated as below:

$$I_{PEAK(MAX)} = \frac{V_{CS\_CLAMP}}{R5} \dots\dots\dots(1)$$

The detection circuit is activated after the LEB time. When the detection circuit sense the CS voltage is higher than 1V, the IC will turn off the switching to limit the output current. It automatically provides protection for the maximum LED current during operation. A propagation delay exists between over current detection and actual source-switch off, so the actual peak current is a little higher than the OCP level set by the R5.

#### Over-Voltage Protection and Output-Open Protection (OVP)

The output voltage is sensed by the FB pin, which provides an over-voltage protection (OVP) function. When the output is open or large transient happens, the output voltage will exceed the rated value (R8, R9). When the voltage exceeds  $V_{FB}$ , the over-voltage is triggered and the IC will discharge  $V_{CC}$ . When the  $V_{CC}$  is below the UVLO threshold voltage, IC will restart and the  $V_{CC}$  capacitor is charged again by start-up resistance. If the over voltage condition still exists, the system will work in hiccup mode.

#### Output-Short Protection (OSP)

When LED is shorted, the device cannot detect the  $t_{OFF}$  time, and the device controls the system operation at 4kHz low frequency.

## Functional Description and Application Information (Cont.)

### Thermal Foldback Protection (TFP)

AL1692 has a thermal foldback protection (TFP) function and adopts self-adaptive control method, which can prevent the system breaking down caused by high temperature. The overheating temperature is set at +145°C typical, when the junction temperature of the IC is higher than +145°C typical, the device will linearly decrease the internal reference voltage to decrease the output current. As a result of this feature, the device can control the system's output power at high ambient temperature, to control the quantity of heat of the system. This enhances the safety of the system at high temperature.

Thermal foldback waveform is shown below:

Figure 1. Thermal Foldback Waveform

### Over-Temperature Protection (OTP)

The AL1692 has over temperature protection (OTP) function. When the junction temperature reach to +160°C typical, the IC will trigger an over-temperature protection, which causes the device to shut down and latched condition. Once OTP triggered, the system need to be resumed after the system's AC source supply has been reset and power up.

## Design Parameters

### Setting the Current Sense Resistor R5

The AL1692 adopts boundary conduction mode, the output current is calculated as below,

$$I_{O\_MEAN} = \frac{1}{\pi} \cdot \int_0^{\pi} \frac{1}{2} \cdot I_{PEAK} \cdot \frac{t_{OFF}}{t_{ON} + t_{OFF} + t_{DELAY}} dt \quad \dots\dots\dots (2)$$

Where,

$I_{PEAK}$  is the peak current of the inductance

$t_{ON}$  is the internal MOSFET on time

$t_{OFF}$  is the freewheel diode D1 conduction time

$t_{DELAY}$  is typical 0.4μs

The AL1692 is a closed loop constant current control with the relationship between output current and current sense voltage follows this equation

$$V_{REF} = \frac{1}{\pi} \cdot \int_0^{\pi} I_{PEAK} \cdot R5 \cdot \frac{t_{OFF}}{t_{ON} + t_{OFF} + t_{DELAY}} dt \quad \dots\dots\dots (3)$$

Where,

$V_{REF}$  is the internal reference, typical 0.4V.

$R5$  is the current sense resistor

So we can get the output current equation as below,

$$I_{O\_MEAN} = \frac{1}{2} \cdot \frac{V_{REF}}{R5} \quad \dots\dots\dots (4)$$

## Functional Description and Application Information (Cont.)

### Inductance Selection (L2)

In buck-boost structure, the peak current of the inductance can be calculated as below

$$I_{PEAK} = \frac{\pi \cdot V_{REF}}{R5 \cdot \int_0^{\pi} \sin(\theta) \cdot \frac{\sqrt{2} \cdot V_{IN\_RMS} \cdot \sin(\theta)}{\sqrt{2} \cdot V_{IN\_RMS} \cdot \sin(\theta) + V_O} d\theta} \dots\dots\dots (5)$$

Where,

V<sub>IN\_RMS</sub> is the input voltage's RMS value

V<sub>O</sub> is the system output voltage

The AL1692 controls the system operating at boundary conduction mode which results in its operating frequency not being constant. To set the minimum switching frequency f<sub>MIN</sub> at the crest of the minimum AC input.

$$L2 = \frac{\sqrt{2} V_{IN\_RMS} \cdot V_O}{I_{PEAK} \cdot (\sqrt{2} V_{IN\_RMS} + V_O) \cdot f_{MIN}} \dots\dots\dots (6)$$

According to the Faraday's Law, the winding number of the inductance can be calculated by:

$$N_{L2} = \frac{L2 \cdot I_{PEAK}}{A_e \cdot B_m} \dots\dots\dots (7)$$

Where,

A<sub>e</sub> is the core effective area.

B<sub>m</sub> is the maximum magnetic flux density.

### t<sub>ON\_MAX</sub> Setting

In order to get a good dimmer compatibility and a good dimming depth, the device sets a t<sub>ON\_MAX</sub> by one external resistor R<sub>T</sub> (R6).

And the t<sub>ON\_MAX</sub> time has the below equation:

$$t_{ON\_MAX} = \frac{3.3 \cdot C_{REF}}{\frac{V_{RT\_REF}}{10 \cdot R6} + 0.33\mu A} \dots\dots\dots (8)$$

Where

V<sub>RT\_REF</sub> is the internal RT pin 0.5V's reference.

C<sub>REF</sub> is the internal 1.5pF capacitor.

### Dimming Control

The AL1692 is a closed loop control device; the dimming function is realized by t<sub>ON\_MAX</sub> limited when dimmer is connected in. When the dimmer is at the largest conduction angle, the device still has the adjustability to control the output current constant before COMP voltage is adjusted to the maximum 4V, so for most of the dimmer, the output current is almost the same with the no dimmer condition at the largest conduction angle. If the conduction angle is decreased, the COMP pin voltage will continue to increase quickly till to the maximum level (typical 4V), the device will output t<sub>ON\_MAX</sub> to limit system's output current. The t<sub>ON\_MAX</sub> is set by RT pin connected with one resistor, so the dimming depth can be adjusted by RT resistor (R6).

Before the AL1692 enters t<sub>ON\_MAX</sub> mode, it keeps the output current constant the same as no dimmer condition. When enter t<sub>ON\_MAX</sub> mode, we can get the following equation:

$$I_{PEAK\_DIM} = \frac{V_{IN\_RMS} \cdot \sin(\theta) \cdot t_{ON\_MAX}}{L2} \dots\dots\dots (9)$$

## Functional Description and Application Information (Cont.)

From the buck-boost output current equation, we can get the output current when dimming:

$$I_o(\theta) = \begin{cases} \frac{1}{2} \cdot \frac{V_{REF}}{R5} & \text{if } t_{ON} < t_{ON\_MAX} \\ \frac{1}{\pi} \int_0^\alpha \frac{1}{2} \cdot I_{PEAK\_DIM} \cdot \frac{\sqrt{2}V_{IN\_RMS} \cdot \sin(\theta)}{\sqrt{2}V_{IN\_RMS} \cdot \sin(\theta) + V_o} d\theta & \text{else} \end{cases} \dots (10)$$

Where,  
 $\alpha$  is the dimmer conduction angle.

Figure.2 Dimming Curve

## Dimmer Compatibility

### Passive Bleeder Design

The passive bleeder is designed to supply latching and holding current to eliminate dimmer misfire and flicker.

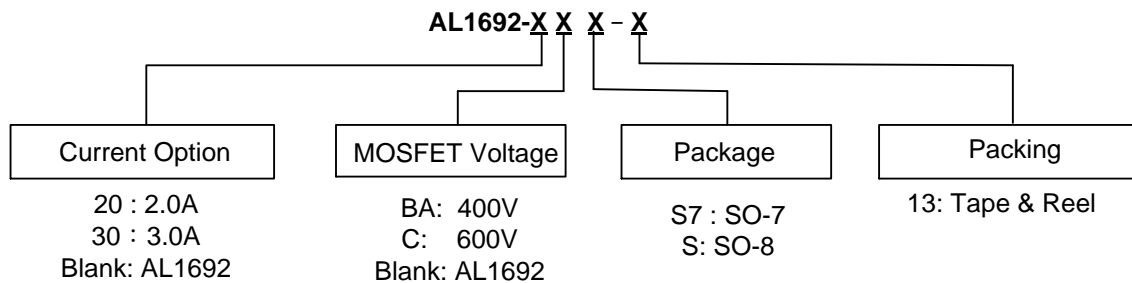

Figure.3 LED Driver Schematic with Passive Bleeder

The passive bleeder includes a capacitor (C2, in hundreds of nF) to provide latching current. A resistor (R1) is necessary to dampen the current spike. Because a large C2 will affect the PF, THD and efficiency, the value of the capacitor (C2) should be selected accordingly. Generally, 100nF/400V to 330nF/400V is recommended. R1 is used to limit the latching current, If R1 is too large, the latching current is not enough and the TRIAC dimmer will misfire causing LED flicker. If R1 is too small, it will result in greater power dissipation. Generally speaking, a 200Ω to 2KΩ resistor is selected for R1.

### Passive Damping Design

FR1 is the damper for reducing the spike current caused by quick charging of C2 at firing. In General, FR1 is selected from 20Ω to 100Ω for low line like 120V<sub>AC</sub> application, and 51Ω to 200Ω for high line like 230V<sub>AC</sub> application.

#### LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
