

40 W bridge car radio amplifier with low voltage operation

Datasheet - production data

- Protections:
 - Short circuit (to GND, to V_S , across the load)
 - Very inductive loads
 - Chip over temperature
 - Load dump
 - Open GND
 - ESD

Description

The TDA7391LV is a bridge class AB audio power amplifier for car radio applications.

The high power capability together with the possibility to operate either in differential input mode or single ended input mode makes it suitable for high end car radio equipment. The exclusive fully complementary output stage and the internal fixed gain configuration drop the external component count.

The on board clipping detector allows easy implementation of gain compression systems.

It is moreover compliant to the most recent OEM specifications for low voltage operation ('start-stop' battery profile during engine stop), and e-call functions.

Features

- High power capability:
 - 40 W/ 4 Ω max
 - 45 W/ 3.2 Ω max
 - 32 W/ 3.2 Ω @ $V_S = 14.4$ V, $f = 1$ kHz, THD = 10 %
 - 26 W/ 4 Ω @ $V_S = 14.4$ V, $f = 1$ kHz, THD = 10%
- Differential inputs (either single ended or differential input signal is accepted)
- Minimum external component count
- Standby function (CMOS compatible)
- Capable to operate to 6 V - 'start-stop' and 'e-call' compatibility

Table 2. Pins function

Multiwatt 11 Pin #	PowerSO-20 Pin #	Name	Description
1, 2	14, 15	INPUTS	The input stage is a high impedance type also capable of operation in single ended mode with one input capacitively coupled to the signal GND. The impedance seen by the inverting and non inverting input pins must be matched.
3, 9	5, 16	+Vs	Supply voltage.
4	17	CD	The TDA7391LV is equipped with a diagnostic circuitry able to detect the clipping in the Output Signal (distortion = 10%). The CD pin (open collector) gives out low level signal during clipping.

Table 2. Pins function (continued)

Multiwatt 11 Pin #	PowerSO-20 Pin #	Name	Description
5, 7	2, 19	OUTPUTS	The output stage is a bridge type able to drive loads as low as 3.2 Ω. It consists of two class AB fully complementary PNP/NPN stages fully protected. A rail to rail output voltage swing is achieved without need of bootstrap capacitors. No external compensation is necessary.
6	1, 10, 11, 20	GND	Power ground.
	12	S-GND	Signal ground.
8	4	STANDBY	The device features a standby function which shuts down all the internal bias supplies when the standby pin is low. In standby mode the amplifier sinks a small current (in the range of few μA). When the standby pin is high the IC becomes fully operational.
10	8	SYNC	A resistor (R ₂) between pin 8 and GND set the charging current of capacitor C ₃ (pin 9). The suggested values of C ₃ and R ₂ define the correct timing in order to switch on/off the amplifier without any pop noise.
11	9	MUTE	The pin is connected to a capacitor (C ₃) tied to GND to set the mute/standby time. An automatic mute during turn on/off is provided to prevent noisy transients.

3.4 Low voltage operation ('start stop')

The most recent OEM specification are requiring automatic stop of car engine at traffic light, in order to reduce emissions of polluting substances. The TDA7391LV allows a continuous operation when battery falls down to 6/7 V during such conditions. The maximum system power will be reduced accordingly.

Worst case battery cranking curves are shown below, indicating the shape and durations of allowed battery transitions.
