

MAX4434–MAX4437

Single-Supply, 150MHz, 16-Bit Accurate, Ultra-Low Distortion Op Amps

General Description

The MAX4434/MAX4435 single and MAX4436/MAX4437 dual operational amplifiers feature wide bandwidth, 16-bit settling time in 23ns, and low-noise/low-distortion operation. The MAX4434/MAX4436 are compensated for unity-gain stability and have a small-signal -3dB bandwidth of 150MHz. The MAX4435/MAX4437 are compensated for closed-loop gains of +5 or greater and have a small-signal, -3dB bandwidth of 150MHz.

The MAX4434–MAX4437 op amps require only 15mA of supply current per amplifier while achieving 115dB open-loop gain. Voltage noise density is a low 2.2nV/ $\sqrt{\text{Hz}}$ and provides 97dB spurious-free dynamic range (SFDR) at 1MHz. These characteristics make these op amps ideal for driving modern, high-speed 14- and 16-bit analog-to-digital converters (ADCs).

These high-speed op amps feature wide-output voltage swings and a high-current output drive up to 65mA. Using a voltage feedback architecture, the MAX4434–MAX4437 meet the requirements of many applications that previously depended on current feedback amplifiers.

The MAX4434/MAX4435 are available in space-saving 5-pin SOT23 packages and the MAX4436/MAX4437 are available in 8-pin μMAX ® packages.

Applications

- High-Speed 14- and 16-Bit ADC Preamplifiers
- Low-Noise Preamplifiers
- IF/RF Amplifiers
- Low-Distortion Active Filters
- High-Performance Receivers
- Precision Instrumentation

μMAX is a registered trademark of Maxim Integrated Products, Inc.

Pin Configurations

Features

- 16-Bit Accurate Settling in 23ns (MAX4435/MAX4437)
- 97dB SFDR at 1MHz, 4V_{P-P} Output
- 2.2nV/ $\sqrt{\text{Hz}}$ Input Voltage-Noise Density
- 100dB (min) Open-Loop Gain
- 388V/ μs Slew Rate (MAX4435/MAX4437)
- 65mA High Output Drive
- Available in Space-Saving Packages
 - 5-Pin SOT23 (MAX4434/MAX4435)
 - 8-Pin μMAX (MAX4436/MAX4437)

Ordering Information

MAX4436 EUA	-40°C to +85°C	8 μMAX
MAX4436ESA	-40°C to +85°C	8 SO
MAX4437 EUA	-40°C to +85°C	8 μMAX
MAX4437ESA	-40°C to +85°C	8 SO

+Denotes lead (Pb)-free/RoHS-compliant package.

-Denotes a package containing lead (Pb).

Selector Guide appears at end of data sheet.

Typical Operating Circuit

Absolute Maximum Ratings

Supply Voltage ($V_{CC} - V_{EE}$).....+6V	8-Pin SO (derate 5.88mW/°C above +70°C).....471mW
Differential Input Voltage+2V	8-Pin μ MAX (derate 4.5mW/°C above +70°C)..... 330mW
Input Voltage Range.....($V_{CC} + 0.3V$) to ($V_{EE} - 0.3V$)	Operating Temperature Range..... -40°C to +85°C
Current into Any Input Pin $\pm 25mA$	Junction Temperature..... +150°C
Output Short-Circuit Duration to V_{CC} or V_{EE}(Note 1)	Storage Temperature Range -65°C to +150°C
Continuous Power Dissipation ($T_A = +70^\circ C$)	Lead Temperature (soldering, 10s) +300°C
5-Pin SOT23 (derate 7.1mW/°C above +70°C)571mW	

Note 1: The MAX4434–MAX4437 are not protected for output short-circuit conditions.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Electrical Characteristics

($V_{CC} = +5V$, $V_{EE} = 0V$, $R_L = \infty$ to $V_{CC}/2$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A = +25^\circ C$.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

6		INB-	Amplifier A Inverting Input
7		OUTB	Amplifier A Output
8		V_{CC}	Positive Power Supply

Detailed Description

The MAX4434–MAX4437 are wide-bandwidth, ultra-low-distortion, voltage-feedback amplifiers. The MAX4434/MAX4436 are internally compensated for unity gain. The MAX4435/MAX4437 are internally compensated for gains of +5V/V or greater.

These amplifiers have ultra-fast 35ns (MAX4434/MAX4436) 16-bit settling times, -97dB SFDR at 1MHz, and 4Vp-p output swing with minimum 115dB open-loop gain.

High-Speed ADC Input Driver Application

The MAX4434–MAX4437 op amps are ideal for driving high-speed 14- to 16-bit ADCs. In most cases, these ADCs operate with a charge balance scheme, with capacitive loads internally switched on and off from the input. The driver used must withstand these changing capacitive loads while holding the signal amplitude stability consistent with the ADC’s resolution and, at the same time, have a frequency response compatible with the sampling speed of the ADC (Figure 1).

Inverting and Noninverting Configurations

The circuits typically used for the inverting and noninverting configurations of the MAX4434–MAX4437 are shown in Figure 2a and Figure 2b. The minimum uncondition-

ally stable gain values are 1 for the MAX4434/MAX4436 and 5 for the MAX4435/MAX4437. Use care in selecting the value for the resistor marked R_S in both circuits. From dynamic stability considerations (based on the part’s frequency response and the input capacitance of the MAX4434–MAX4437), the maximum recommended value for R_S is 500Ω. In general, lower R_S values will yield a higher bandwidth and better dynamic stability, at the cost of higher power consumption, higher power dissipation in the IC, and reduced output drive availability. For a minimum R_S value, take into consideration that the current indicated as I_F is supplied by the output stage and must be discounted from the maximum output current to calculate the maximum current available to the load. I_F can be found using the following equation:

$$I_F = V_{IN(MAX)}/R_S$$

If DC thermal stability is an important design concern, the Thevenin resistance seen by both inputs at DC must be balanced. This includes the resistance of the signal source and termination resistors if the amplifier signal input is fed from a transmission line. The capacitance associated with the feedback resistors must also be considered as a possible limitation to the available bandwidth or to the dynamic stability. Only resistors with small parallel capacitance specifications should be considered.

Applications Information

Layout and Power-Supply Bypassing

The MAX4434–MAX4437 have wide bandwidth and consequently require careful board layout. To realize the full AC performance of these high-speed amplifiers, pay careful attention to power-supply bypassing and board layout. The PC board should have a large low-impedance ground plane that is as free of voids as possible. Do not use commercial breadboards. Keep signal lines as short and straight as possible. Observe high-frequency bypass-

Figure 1. Typical Application Circuit

Figure 2a. Noninverting Configuration

Figure 2b. Inverting Configuration

Figure 3. Capacitive-Load Driving Circuit

ing techniques to maintain the amplifier’s accuracy and stability. In general, use surface-mount components since they have shorter bodies and lower parasitic reactance. This will result in improved performance over through-hole components. The bypass capacitors should include 1nF and/or 0.1µF surface-mount ceramic capacitors between VCC and the ground plane, located as close to the package as possible. Place a 10µF tantalum capacitor at the power supply’s point of entry to the PC board to ensure the integrity of the incoming supplies. Input termination resistors and output back-termination resistors, if used, should be surface-mount types and should be placed as close to the IC pins as possible.

Driving Capacitive Loads

The MAX4434–MAX4437 can drive capacitive loads. However, excessive capacitive loads may cause ringing or instability at the output as phase margin is reduced. Adding a small isolation resistor in series with the output capacitive load helps reduce the ringing but slightly increases gain error (see [Typical Operating Characteristics](#) and [Figure 3](#)).

Selector Guide

PART	AMPS	MIN GAIN STABLE (V/V)	BW (MHz)	SETTLING TIME TO 0.0015% (ns)
MAX4434	1	+1	150	35
MAX4435	1	+5	150	23
MAX4436	2	+1	150	35
MAX4437	2	+5	150	23

Pin Configurations (continued)

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
