

LED Drivers for LED Decoration

LED Driver for Indicators and Signage

BD7844AEFV

No.11107EBT01

●Description

BD7844AEFV is LED Display Driver. It can control 16ch Nch Open Drain output for LED drive. It can control the luminance of the LEDs by the setting of the internal register, with 256 steps PWM control. It supports I²C interface. HTSSOP-B28 (with Back-side metal for heat radiation) package.

●Features

- 1) 16ch × 80mA (Absolute Maximum Rating)
- 2) Conforming to I²C -bus I/F (1MHz Fast mode Plus)
- 3) Either of interactive or single direction can be selected with the I2CSEL pin. (2MHz clock frequency on single direction)
- 4) Independent setting of output brightness is possible by register setting for each channel. (PWM 256 steps)
- 5) Power supply voltage : 4.5 ~ 5.5V
- 6) Max voltage of Open-drain output terminals: 20.0V (Absolute Maximum Rating)
- 7) Built-in thermal shutdown (TSD) circuit
- 8) Built-in power-on reset circuit
- 9) Small package with back-side metal for heat radiation: HTSSOP-B28

●Absolute Maximum Ratings (Ta=25°C)

| Parameter | Symbol | Ratings | Unit |
|------------------------------|---------|----------------------|-------|
| Power supply voltage | VDDMAX1 | -0.3 ~ 7.0 | V |
| Operating voltage range | VDDMAX2 | 4.5 ~ 5.5 | V |
| Output terminal voltage | VOUTMAX | -0.3 ~ 20.0 | V |
| Output terminal current | IOUTMAX | 80 *1 | mA/ch |
| Logic input terminal voltage | VINMAX | -0.3 ~ VDD+0.3 ≤ 7.0 | V |
| Permissible dissipation | Pd | 1.45 *2 | W |
| Operating temperature range | Topr | -40 ~ 85 | °C |
| Storage temperature range | Tstr | -55 ~ 150 | °C |
| Junction temperature | Tjmax | 150 | °C |

Please be careful that the anti-radiation design is not applied to this IC.

*1) Please take the IC's power consumption & permissible dissipation into consideration before using it.

*2) Mounted on ROHM standard board (70mm×70mm×1.6mm (thickness), glass-epoxy board).
Ta=25°C or more, it is reduced with 11.6mW/°C.

●Operating conditions (Ta=-40~85°C)

| Parameter | Symbol | Ratings | Unit | Conditions |
|--------------------------|--------|---------------|------|---------------------------------------|
| Power supply voltage | VDD | 4.5 ~ 5.5 | V | |
| High level input voltage | VIH | VDDx0.7 ~ VDD | V | SDA,SCL,RESETB, I2CSEL,A0,A1,A2,A3 |
| Low level input voltage | VIL | 0 ~ VDDx0.3 | V | |
| Low level output current | IOL | ~ 30 | mA | SDA |

● **Electrical Characteristics** (Unless otherwise specified, Ta=25°C, VDD=5.0V, GND=0V)

| Parameter | Symbol | Limits | | | Unit | Conditions |
|--------------------------------------|--------|--------|------|-------|------|---|
| | | Min. | Typ. | Max. | | |
| VDD Circuit current1(All ch OFF) | IDD1 | — | 8.7 | 11.9 | mA | Input pin fixed |
| VDD Circuit current2(All ch full ON) | IDD2 | — | 9.5 | 13.0 | mA | Input pin fixed |
| Input/Output leak current | ILEAK1 | — | — | 1.0 | μA | SDA,SCL,A0,A1,A2,A3 VIN = VDD or GND |
| Pull Up Resistor | RRSTB | 30 | 60 | 90 | kΩ | RESETB |
| | RI2C | 55 | 110 | 165 | kΩ | I2CSEL |
| Output pin leak current | ILEAK2 | — | — | 1.0 | μA | OUT0 ~ OUT15 VOU = 20V |
| Power On Reset voltage | VPOR | — | 2.4 | — | V | |
| Low level output current | IOL | 30 | — | — | mA | SDA VOL = 0.4V |
| Low level output voltage | VOL | — | 200 | 550 | mV | OUT0 ~ OUT15 IOU = 80mA |
| Resistor at ON | RON | — | 2.5 | 6.875 | Ω | OUT0 ~ OUT15 IOU = 80mA |
| Input capacitance | Ci | — | 6 | — | pF | SCL,RESETB,I2CSEL, A0,A1,A2,A3 |
| I/O capacitance | Cio | — | 12 | — | pF | SDA |

● **Logic signal timing specification** (Unless otherwise specified, Ta=25°C, VDD=5.0V, GND=0V)

| Parameter | Symbol | Limits | | | Unit | Conditions |
|---|---------|--------|------|------|------|----------------------|
| | | Min. | Typ. | Max. | | |
| SCL Clock frequency 1 | fSCL1 | - | - | 1.0 | MHz | I2CSEL=H : SDA=I/O |
| SCL Clock frequency 2 | fSCL2 | - | - | 2.0 | MHz | I2CSEL=L : SDA=input |
| Bus free time between a STOP and START condition ^{*1} | tBUF | 500 | - | - | ns | |
| Hold time (repeated) START condition. After this period, the first clock is generated | tHD;STA | 260 | - | - | ns | |
| Set-up time for a repeated START condition | tSU;STA | 260 | - | - | ns | |
| Set-up time for STOP condition | tSU;STO | 260 | - | - | ns | |
| SDA Data hold time | tHD;DAT | 0 | - | - | ns | |
| SDA data valid acknowledge time ^{*2} | tVD;ACK | - | - | 450 | ns | I2CSEL=H : SDA=I/O |
| SDA data valid time ^{*3} | tVD;DAT | - | - | 450 | ns | I2CSEL=H : SDA=I/O |
| SDA Data set-up time | tSU;DAT | 50 | - | - | ns | |
| SCL clock low period1 | tLOW1 | 500 | - | - | ns | I2CSEL=H : SDA=I/O |
| SCL clock high period1 | tHIGH1 | 260 | - | - | ns | I2CSEL=H : SDA=I/O |
| SCL, SDA fall time1 | tf1 | - | - | 120 | ns | I2CSEL=H : SDA=I/O |
| SCL, SDA rise time1 | tr1 | - | - | 120 | ns | I2CSEL=H : SDA=I/O |
| SCL clock low period2 | tLOW2 | 230 | - | - | ns | I2CSEL=L : SDA=input |
| SCL clock high period2 | tHIGH2 | 250 | - | - | ns | I2CSEL=L : SDA=input |
| SCL, SDA fall time2 | tf2 | - | - | 50 | ns | I2CSEL=L : SDA=input |
| SCL, SDA rise time2 | tr2 | - | - | 50 | ns | I2CSEL=L : SDA=input |
| Pulse width of spikes which must be suppressed by SCL, SDA filter | tSP | - | 50 | - | ns | |
| Reset pulse width ^{*4} | tW | - | 10 | - | ns | |

*1) Keep more than 100us Bus free time after power on.

*2) tVD;ACK : Time for acknowledge signal from SCL='L' to SDA(output)='L'

*3) tVD;DAT : Time for from SCL='L' to SDA valid data output

*4) Miss-operation is likely to happen with reset in accessing I²C bus.

●Block Diagram / Application Circuit example

Fig.1 Block Diagram / Application Circuit example

Notes on using BD7844AEFV

- Please do not make output terminal current per one terminal exceed 80mA by putting current limit resistor for open drain output terminal from OUT0 to OUT15.
- Low output drive ability of SDA terminal becomes high, which cause undershoot noise at Low output. It is possible to remove undershoot noise by inserting damping resistor as close as SDA terminal.
- It is recommended that power supply VDD and LED power supply VLED should be used with separated power supply. If using both VDD and VLED with common power supply, malfunction might be occurred by transmitting noise associated with PWM signal of open drain output terminal from VLED wiring to VDD wiring. In case of using VDD and VLED with common power supply, please insert bypass capacitor as close as VDD terminal after separating VDD wiring and VLED wiring from the end in order to make common impedance minimum. In addition, please insert bypass capacitor on VLED wiring as necessary in order to prevent noise of VLED wiring side from being transmitted to VDD side as much as possible.

●Pin Arrangement [Top View]

| 9 | OUT3 | O | - | GND | - | GND | Open Drain output |
| 10 | GND | - | - | GND | VDD | - | Ground |
| 11 | OUT4 | O | - | GND | - | GND | Open Drain output |
| 12 | OUT5 | O | - | GND | - | GND | Open Drain output |
| 13 | OUT6 | O | - | GND | - | GND | Open Drain output |
| 14 | OUT7 | O | - | GND | - | GND | Open Drain output |
| 15 | OUT8 | O | - | GND | - | GND | Open Drain output |
| 16 | OUT9 | O | - | GND | - | GND | Open Drain output |
| 17 | OUT10 | O | - | GND | - | GND | Open Drain output |
| 18 | OUT11 | O | - | GND | - | GND | Open Drain output |
| 19 | GND | - | - | GND | VDD | - | Ground |
| 20 | OUT12 | O | - | GND | - | GND | Open Drain output |
| 21 | OUT13 | O | - | GND | - | GND | Open Drain output |
| 22 | OUT14 | O | - | GND | - | GND | Open Drain output |
| 23 | OUT15 | O | - | GND | - | GND | Open Drain output |
| 24 | GND | - | - | GND | VDD | - | Ground |
| 25 | RESETB | I | 60k Ω | GND | VDD | GND | Reset input pin (L: reset, H: reset cancel) |
| 26 | SCL | I | - | GND | - | GND | Serial clock input pin |
| 27 | SDA | I/O | - | GND | - | GND | Serial data I/O pin |
| 28 | VDD | - | - | GND | - | GND | Power supply |

* Please connect the unused LED pins to the ground.

* It is prohibition to set the registers for unused LED.

● Definition of logic signal timing

| protocol | START Condition (S) | bit 7 MSB (A7) | bit 6 (A7) | bit 7 (D1) | bit 8 (D0) | acknowledge (A) | STOP condition (P) |
|----------|---------------------|----------------|------------|------------|------------|-----------------|--------------------|
|----------|---------------------|----------------|------------|------------|------------|-----------------|--------------------|

Fig.3 Definition of logic signal timing

●Logic Function explaining

1. Slave address

LED driver BD7844AEFV is a slave device. The master device outputs the transmission clock and the transmission data, and BD7844AEFV who is the slave returns the acknowledgement. The master device transmits the slave address of BD7844AEFV following the START condition. Afterwards, BD7844AEFV can be controlled in the command by transmitting the register address and the register data continuously, and doing the transmission completion under the STOP condition. Fig. 4 shows basic format (I²C) of the control command of BD7844AEFV.

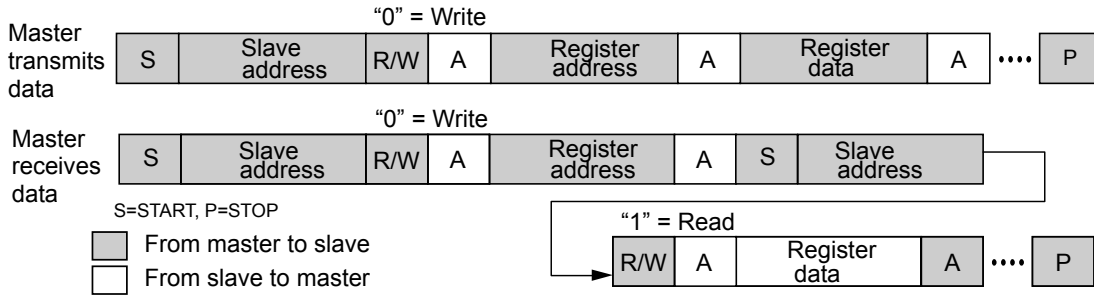

Fig. 4 Basic format of control command (I²C)

BD7844AEFV has three kinds of slave addresses (for usually, for all calls, and for software reset).

1-1. Usual slave address

Fig. 5 shows the slave address of BD7844AEFV. Because an internal pull-up resistor has not placed to the address terminal (A[3:0]) that can be selected with hardware to save power consumption, it is necessary to connect them with high (=VDD) or low (=GND).

Fig. 5 Usual slave address

The last RW bit of the slave address byte defines the executed operation. Reading is selected when setting it to logic 1, and writing is selected when setting it to logic 0.

| Fixed | A3 | A2 | A1 | A0 | R/W | Function |
|-------|----|----|----|----|-----|----------------|
| 101 | 0 | 0 | 0 | 0 | R/W | Usual 1 |
| 101 | 0 | 0 | 0 | 1 | R/W | Usual 2 |
| 101 | 0 | 0 | 1 | 0 | R/W | Usual 3 |
| 101 | 0 | 0 | 1 | 1 | R/W | Usual 4 |
| 101 | 0 | 1 | 0 | 0 | R/W | Usual 5 |
| 101 | 0 | 1 | 0 | 1 | R/W | Usual 6 |
| 101 | 0 | 1 | 1 | 0 | R/W | Usual 7 |
| 101 | 0 | 1 | 1 | 1 | R/W | Usual 8 |
| 101 | 1 | 0 | 0 | 0 | R/W | All call |
| 101 | 1 | 0 | 0 | 1 | R/W | Usual 9 |
| 101 | 1 | 0 | 1 | 0 | R/W | Usual 10 |
| 101 | 1 | 0 | 1 | 1 | 0 | Software reset |
| 101 | 1 | 1 | 0 | 0 | R/W | Usual 11 |
| 101 | 1 | 1 | 0 | 1 | R/W | Usual 12 |
| 101 | 1 | 1 | 1 | 0 | R/W | Usual 13 |
| 101 | 1 | 1 | 1 | 1 | R/W | Usual 14 |

Table 1. Slave address

- 1-2. Slave address for all call
[1011000] is used as a slave address for all call. (Fig. 6)

Fig. 6 Slave address for all call

All BD7844AEFV on the bus can control in the command at the same time by the slave address for all call. It enters the state that can respond to all call when power supply (VDD) is turned on.

It can be selected not to respond when the ALL CALL bit of mode1 register is set to logic "0".

Because the register data is returned from all BD7844AEFV on the bus when the last R/W bit of the slave address byte is set to logic "1" (read) when the slave address for all calls is used, the master cannot read the register data of specific BD7844AEFV.

Please use a usual slave address to read the register data of specific BD7844AEFV.

Take care: Slave address [1011000] for all calls must not use as a usual slave address because it becomes enable when power supply (VDD) is turned on.

- 1-3. Slave address for software reset
[1011011] is used as a slave address for software reset. (Fig. 7)

Fig. 7 Slave address for software reset

All BD7844AEFV on the bus can be reset at the same time by the slave address for software reset.

It is necessary to use the slave address for software reset with R/W=0. BD7844AEFV doesn't recognize software reset for R/W=1. Please refer to "3-2. Software reset" for details.

Take care: Because slave address [1011011] for software reset is a reserved address, It is not possible to use it as a usual slave address.

2. Register address

After completing the acknowledgement of the slave address, the master device transmits the register address to BD7844AEFV. Fig. 8 shows the register address.

Fig. 8 Register address

The auto increment option is specified for MSB 3bit. The address of the register that wants to be controlled is specified for LSB 5bit. Sending register data continuously with the auto increment option in the three high rank bits can continuously set each brightness control register. (Mode1 register cannot be set by the auto increment option.)

The register of BD7844AEFV is shown in Table 2 and the auto increment option is shown in Table 3

| Register address(Hex) | Register name | Initial Value after reset | Access | Function |
|-----------------------|---------------|---------------------------|--------|-------------------------------------|
| 00 | PWM0 [7:0] | 00h | R/W | Brightness control (256steps) OUT0 |
| 01 | PWM1 [7:0] | 00h | R/W | Brightness control (256steps) OUT1 |
| 02 | PWM2 [7:0] | 00h | R/W | Brightness control (256steps) OUT2 |
| 03 | PWM3 [7:0] | 00h | R/W | Brightness control (256steps) OUT3 |
| 04 | PWM4 [7:0] | 00h | R/W | Brightness control (256steps) OUT4 |
| 05 | PWM5 [7:0] | 00h | R/W | Brightness control (256steps) OUT5 |
| 06 | PWM6 [7:0] | 00h | R/W | Brightness control (256steps) OUT6 |
| 07 | PWM7 [7:0] | 00h | R/W | Brightness control (256steps) OUT7 |
| 08 | PWM8 [7:0] | 00h | R/W | Brightness control (256steps) OUT8 |
| 09 | PWM9 [7:0] | 00h | R/W | Brightness control (256steps) OUT9 |
| 0A | PWM10 [7:0] | 00h | R/W | Brightness control (256steps) OUT10 |
| 0B | PWM11 [7:0] | 00h | R/W | Brightness control (256steps) OUT11 |
| 0C | PWM12 [7:0] | 00h | R/W | Brightness control (256steps) OUT12 |
| 0D | PWM13 [7:0] | 00h | R/W | Brightness control (256steps) OUT13 |
| 0E | PWM14 [7:0] | 00h | R/W | Brightness control (256steps) OUT14 |
| 0F | PWM15 [7:0] | 00h | R/W | Brightness control (256steps) OUT15 |
| 1A* | MODE1 [7:0] | 03h | R/W | Mode 1 setting |

*MODE1 register cannot be set by the auto increment option.

Table 2. Register

| AI2 | AI1 | AI0 | Function |
|-----|-----|-----|--|
| 0 | 0 | 0 | Auto increment none |
| 0 | 0 | 1 | Address auto increment (+1) for brightness control register PWM0~15only. |
| 0 | 1 | 0 | Prohibited |
| 0 | 1 | 1 | |
| 1 | 0 | 0 | |
| 1 | 0 | 1 | |
| 1 | 1 | 0 | |
| 1 | 1 | 1 | |

Table 3. Auto increment option

2-1. PWM0 ~ PWM15 register data

The brightness of output terminal OUT0 ~ OUT15 is set by the register data of PWM0(address:00h) ~ PWM15(address:0Fh).

The PWM brightness control in 256 steps is possible from 00h (complete off) to FFh (complete on).

2-2. Mode1 registers data

The operation mode of BD7844AEFV is set according to mode1 register (address: 1Ah) data.

Table 4 shows the allocation of the bit of mode1 register data.

| Bit | Bit name | Access | Value | Function |
|-----|-------------|--------|-------|--|
| 7 | LIMITRESET | R/W | 0* | Device limitation software reset : off |
| | | | 1 | Device limitation software reset : on |
| 6 | PROTECT0 | R/W | 0 | Please write "0". It is not recognized as Mode1 register data at "1". |
| | | | | 1 |
| 5 | Reservation | R/W | 0* | Please write "0" |
| | | | 1 | Prohibited |
| 4 | PWMSLOW | R/W | 0* | PWM period is 60kHz |
| | | | 1 | PWM period is 2kHz |
| 3 | Reservation | R/W | 0* | Please write "0". |
| | | | 1 | Prohibited |
| 2 | Reservation | R/W | 0* | Please write "0". |
| | | | 1 | Prohibited |
| 1 | PROTECT1 | R/W | 1 | Please write "1". It is not recognized as Mode1 register data at "0". |
| | | | 0 | It doesn't respond to the slave address for all call. |
| 0 | ALLCALL | R/W | 0 | It doesn't respond to the slave address for all call. |
| | | | 1* | It responds to the slave address for all call. |

*Default value after reset

Table 4. Mode1 register (Address: 1Ah) data

Mode1 register data cannot be set by the auto increment option. Please set it alone by the following format. In the correct execution, there should not be device that monopolizes the bus.

2-3. Mode1 register data setting procedure

1. The START condition is sent by the I²C bus master.
2. The slave address of BD7844AEFV that wants to be set by mode1 register is sent by the master.
3. When the slave address is sent and recognized, the master sends mode1 register address [00011010] (1Ah).
It is recognized only when LSB 5bit are [11010] and the auto increment option in MSB 3bit are [000].
4. When mode1 register address is sent and recognized, the master sends mode1 register data.
It recognizes it as data only when the data confirmation bit (bit 6=0 and bit 1=1) is all correct.
5. When correct mode1 register data is sent and recognized, the master sends the STOP condition to end mode1 setting command. Afterwards, LIMITRESET, PWMSLOW, and ALLCALL become effective.

3. Reset

BD7844AEFV has four kinds of resets (power on, software, device limitation software, external,).

3-1. Power-on reset

When the power supply is forced to VDD, internal power-on reset maintains BD7844AEFV in the state of reset until VDD reaches Vpor. Reset is liberated at Vpor, and the register and the I²C bus state machine of BD7844AEFV are initialized in the state of default.

3-2. Software reset

All BD7844AEFV on the I²C bus can be reset in the power supply on condition by software reset. In the correct execution, there should not be device that monopolizes the bus. Software reset is defined as follows.

1. The START condition is sent by the I²C bus master.
2. The slave address for software reset that the R/W bit is set to "0" (write) is sent by the I²C bus master.
3. Only when it is recognized that the slave address for software reset is [10110110] (B6h), BD7844AEFV executes reset. When the R/W bit is set to logic "1" (read), it is not recognized. Even R/W bit is logic "0" and "1", the acknowledgement is returned. But it is only logic "0" that reset is recognized.
4. When the slave address for software reset is sent and recognized, the master sends two bytes with two specific values. Byte 1= A5h: BD7844AEFV recognizes only this value. When byte 1 is not A5h, BD7844AEFV doesn't recognize it. Byte 2= 5Ah: BD7844AEFV recognizes only this value. When byte 2 is not 5Ah, BD7844AEFV doesn't recognize it.
5. The master sends the STOP condition to terminate the software reset command when correct two bytes are sent and it is recognized correctly. Afterwards, BD7844AEFV is reset in the power supply on condition.

3-3. Device limitation software reset

Only BD7844AEFV selected in the slave address can be reset in the power supply on condition by making the LIMITRESET bit of the Mode1 register logic 1.

3-4. External reset

External reset is executed by maintaining RESETB terminal for the period of minimum tW. The register and the I²C bus state machine of BD7844AEFV is maintained in the state of default until becoming RESETB input becomes "H" level.

Take care: Please connect the RESETB terminal with "H", when you do not use an active connection.

4. I2CSEL function

It can be set that the SDA terminal accepts only the input by connecting the I2CSEL terminal with "L".

Take care: Because the acknowledge and reading data of the register is not returned to the master device, control software for I²C cannot be used as it is.

●Notes for use

1. Absolute Maximum Ratings
An excess in the absolute maximum ratings, such as supply voltage, temperature range of operating conditions, etc., can break down devices, thus making impossible to identify breaking mode such as a short circuit or an open circuit. If any special mode exceeding the absolute maximum ratings is assumed, consideration should be given to take physical safety measures including the use of fuses, etc.
2. Power supply and ground line
Design PCB pattern to provide low impedance for the wiring between the power supply and the ground lines. Pay attention to the interference by common impedance of layout pattern when there are plural power supplies and ground lines. Especially, when there are ground pattern for small signal and ground pattern for large current included the external circuits, please separate each ground pattern. Furthermore, for all power supply pins to ICs, mount a capacitor between the power supply and the ground pin. At the same time, in order to use a capacitor, thoroughly check to be sure the characteristics of the capacitor to be used present no problem including the occurrence of capacity dropout at a low temperature, thus determining the constant.
3. Ground voltage
Make setting of the potential of the ground pin so that it will be maintained at the minimum in any operating state. Furthermore, check to be sure no pins are at a potential lower than the ground voltage including an actual electric transient.
4. Short circuit between pins and erroneous mounting
In order to mount ICs on a set PCB, pay thorough attention to the direction and offset of the ICs. Erroneous mounting can break down the ICs. Furthermore, if a short circuit occurs due to foreign matters entering between pins or between the pin and the power supply or the ground pin, the ICs can break down.
5. Operation in strong electromagnetic field
Be noted that using ICs in the strong electromagnetic field can malfunction them.
6. Input pins
In terms of the construction of IC, parasitic elements are inevitably formed in relation to potential. The operation of the parasitic element can cause interference with circuit operation, thus resulting in a malfunction and then breakdown of the input pin. Therefore, pay thorough attention not to handle the input pins, such as to apply to the input pins a voltage lower than the ground respectively, so that any parasitic element will operate. Furthermore, do not apply a voltage to the input pins when no power supply voltage is applied to the IC. In addition, even if the power supply voltage is applied, apply to the input pins a voltage lower than the power supply voltage or within the guaranteed value of electrical characteristics.
7. External capacitor
In order to use a ceramic capacitor as the external capacitor, determine the constant with consideration given to a degradation in the nominal capacitance due to DC bias and changes in the capacitance due to temperature, etc.
8. Thermal shutdown circuit (TSD)
This LSI builds in a thermal shutdown (TSD) circuit. When junction temperatures become detection temperature or higher, the thermal shutdown circuit operates and turns a switch OFF. The thermal shutdown circuit, which is aimed at isolating the LSI from thermal runaway as much as possible, is not aimed at the protection or guarantee of the LSI. Therefore, do not continuously use the LSI with this circuit operating or use the LSI assuming its operation.
9. Thermal design
Perform thermal design in which there are adequate margins by taking into account the permissible dissipation (Pd) in actual states of use.
10. About the pin for the test, the un-use pin
Prevent a problem from being in the pin for the test and the un-use pin under the state of actual use. Please refer to a function manual and an application notebook. And, as for the pin that doesn't specially have an explanation, ask our company person in charge.
11. About the rush current
For ICs with more than one power supply, it is possible that rush current may flow instantaneously due to the internal powering sequence and delays. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of wiring.
12. About the function description or application note or more.
The function description and the application notebook are the design materials to design a set. So, the contents of the materials aren't always guaranteed. Please design application by having fully examination and evaluation include the external elements.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing ROHM's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from ROHM upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, ROHM shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM and other parties. ROHM shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While ROHM always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. ROHM shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). ROHM shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.

Thank you for your accessing to ROHM product informations.

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
