

Features

Type	$R_{DS(on)}$	I_{OUT}	V_{CC}
VN800PS-E	135 m Ω	0.7 A	36 V

- ECOPACK[®]: lead free and RoHS compliant
- Automotive Grade: compliance with AEC guidelines
- Very low standby current
- CMOS compatible input
- Thermal shutdown protection and diagnosis
- Undervoltage shutdown
- Overvoltage clamp
- Load current limitation
- Reverse battery protection
- Electrostatic discharge protection

Description

The VN800PS-E is monolithic device made by using STMicroelectronics[™] VIPower[™] M0-3 technology, intended for driving any kind of load with one side connected to ground.

Active V_{CC} pin voltage clamp protects the device against low energy spikes. Active current limitation combined with thermal shutdown and automatic restart protect the device against overload. Device automatically turns off in case of ground pin disconnection.

This device is especially suitable for industrial applications in norms conformity with IEC1131 (Programmable Controllers International Standard).

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

3 Application information

Figure 9. Application schematic

3.1 GND protection network against reverse battery

3.1.1 Solution 1: resistor in the ground line (R_{GND} only)

This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

$$1) R_{GND} \leq 600 \text{ mV} / (I_{S(ON)max})$$

$$2) R_{GND} \geq (-V_{CC}) / (-I_{GND})$$

where -I_{GND} is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power dissipation in R_{GND} (when V_{CC} < 0: during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where I_{S(ON)max} becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the R_{GND} produces a shift (I_{S(ON)max} * R_{GND}) in the input thresholds and the status output values. This shift varies depending on many devices are on in the case of several high side drivers sharing the same R_{GND}.

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see [Section 3.1.2](#)).

3.1.2 Solution 2: diode (D_{GND}) in the ground line

A resistor ($R_{GND} = 1\text{ k}\Omega$) should be inserted in parallel to D_{GND} if the device is driving an inductive load.

This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network produces a shift ($\approx 600\text{ mV}$) in the input threshold and the status output values if the microprocessor ground is not common with the device ground. This shift not varies if more than one HSD shares the same diode/resistor network.

Series resistor in input and status lines are also required to prevent that, during battery voltage transient, the current exceeds the absolute maximum rating.

Safest configuration for unused input and status pin is to leave them unconnected.

3.2 Microcontroller I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins are pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the microcontroller I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

$$\text{For } V_{CCpeak} = -100\text{ V and } I_{latchup} \geq 20\text{ mA; } V_{OH\mu C} \geq 4.5\text{ V}$$

$$5\text{ k}\Omega \leq R_{prot} \leq 65\text{ k}\Omega.$$

Recommended R_{prot} value is $10\text{ k}\Omega$.

3.4 SO-8 maximum demagnetization energy

Figure 22. SO-8 maximum turn off current versus load inductance

Note:

Legend

A = Single pulse at $T_{Jstart} = 150\text{ }^{\circ}\text{C}$

B = Repetitive pulse at $T_{Jstart} = 100\text{ }^{\circ}\text{C}$

C = Repetitive Pulse at $T_{Jstart} = 125\text{ }^{\circ}\text{C}$

Conditions:

$V_{CC} = 13.5\text{ V}$

Values are generated with $R_L = 0\text{ }\Omega$

In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
