MT8815

8 x 12 Analog Switch Array

Data Sheet

September 2011

Features

- Internal control latches and address decoder
- Short set-up and hold times
- Wide operating voltage: 4.5V to 13.2V
- 12Vpp analog signal capability
- R_{ON} 65Ω max. @ V_{DD}=12V, 25×C
- $\Delta R_{ON} \leq 10\Omega$ @ V_{DD}=12V, 25°C
- Full CMOS switch for low distortion
- Minimum feedthrough and crosstalk
- Separate analog and digital reference supplies
- Low power consumption ISO-CMOS technology

Applications

- Key systems
- PBX systems
- Mobile radio
- Test equipment /instrumentation
- Analog/digital multiplexers
- Audio/Video switching

Description

The Zarlink MT8815 is fabricated in Zarlink's ISO-CMOS technology providing low power dissipation and high reliability. The device contains a 8 x 12 array of crosspoint switches along with a 7 to 96 line decoder and latch circuits. Any one of the 96 switches can be addressed by selecting the appropriate seven address bits. The selected switch can be turned on or off by applying a logical one or zero to the DATA input. V_{SS} is the ground reference of the digital inputs. The range of the analog signal is from V_{DD} to V_{EE}.

Functional Description

The MT8815 is an analog switch matrix with an array size of 8×12. The switch array is arranged such that there are 8 columns by 12 rows. The columns are referred to as the Y inputs/outputs and the rows are the X inputs/outputs. The crosspoint analog switch array will interconnect any X I/O with any Y I/O when turned on and provide a high degree of isolation when turned off. The control memory consists of a 96 bit write only RAM in which the bits are selected by the address inputs (AY0-AY2, AX0-AX3). Data is presented to the memory on the DATA input. Data is asynchronously written into memory whenever the STROBE input is high and is latched on the falling edge of STROBE. A logical “1” written into a memory cell turns the corresponding crosspoint switch on and a logical “0” turns the crosspoint off. Only the crosspoint switches corresponding to the addressed memory location are altered when data is written into memory. The remaining switches retain their previous states. Any combination of X and Y inputs/outputs can be interconnected by establishing appropriate patterns in the control memory. A logical “1” on the RESET input will asynchronously return all memory locations to logical “0” turning off all crosspoint switches. Two voltage reference pins (V_{SS} and V_{EE}) are provided for the MT8815 to enable switching of negative analog signals. The range for digital signals is from V_{DD} to V_{SS} while the range for analog signals is from V_{DD} to V_{EE}. V_{SS} and V_{EE} pins can be tied together if a single voltage reference is needed.

Address Decode

The seven address inputs along with the STROBE are logically ANDed to form an enable signal for the resettable transparent latches. The DATA input is buffered and is used as the input to all latches. To write to a location, RESET must be low while the address and data are set up. Then the STROBE input is set high and then low causing the data to be latched. The data can be changed while STROBE is high, however, the corresponding switch will turn on and off in accordance with the DATA input. DATA must be stable on the falling edge of STROBE in order for correct data to be written to the latch.
