

Description

The 9ZXL0831E / 9ZXL0851E are second-generation enhanced performance DB800ZL differential buffers. The parts are pin-compatible upgrades to the 9ZXL0831A and 9ZXL0851A, while offering a much improved phase jitter performance. A fixed external feedback maintains low drift for critical QPI/UPI applications.

PCIe Clocking Architectures Supported

- Common Clocked (CC)
- Independent Reference (IR) with and without spread spectrum

Typical Application

- Servers
- Storage
- Networking
- SSDs

Output Features

- 8 Low-Power (LP) HCSL output pairs (0831E)
- 8 Low-Power (LP) HCSL output pairs with 85Ω Zout (0851E)

Features

- LP-HCSL outputs; eliminate 16 resistors, save 27mm² of area (0831E)
- LP-HCSL outputs with 85Ω Zout; eliminate 32 resistors, save 64mm² of area (0851E)
- 8 OE# pins; hardware control of each output
- Selectable PLL BW; minimizes jitter peaking in cascaded PLL topologies
- Hardware/SMBus control of PLL bandwidth and bypass; change mode without power cycle
- Spread spectrum compatible; tracks spreading input clock for EMI reduction
- 100MHz & 133.33MHz PLL mode; UPI and legacy QPI support
- 6 × 6 mm 48-VFQFPN package; small board footprint

Key Specifications

- Cycle-to-cycle jitter < 50ps
- Output-to-output skew < 50ps
- Input-to-output delay: Fixed at 0ps
- Input-to-output delay variation < 50ps
- Phase jitter: PCle Gen4 < 0.5ps rms
- Phase jitter: QPI/UPI ≥ 9.6GB/s < 0.2ps rms
- Phase jitter: IF-UPI < 1.0ps rms

Pin Descriptions

Pin#	Pin Name	Туре	Description
1	^CKPWRGD_PD#	IN	Input notifies device to sample latched inputs and start up on first high assertion. Low enters Power Down Mode,
	_		subsequent high assertions exit Power Down Mode. This pin has internal pull-up resistor.
2	GNDR	GND	Analog ground pin for the differential input (receiver).
3	VDDR	PWR	Power supply for differential input clock (receiver). This VDD should be treated as an analog power rail and
J			filtered appropriately. Nominally 3.3V.
4	DIF_IN	IN	HCSL true input.
5	DIF_IN#	IN	HCSL complementary input
6	SMBDAT	I/O	Data pin of SMBUS circuitry
7	SMBCLK	IN	Clock pin of SMBUS circuitry
8	FBOUT_NC#	OUT	Complementary half of differential feedback output. This pin should NOT be connected to anything outside the
	_		chip. It exists to provide delay path matching to get 0 propagation delay.
9	FBOUT_NC	OUT	True half of differential feedback output. This pin should NOT be connected to anything outside the chip. It exists
	_		to provide delay path matching to get 0 propagation delay.
10	VDD	PWR	Power supply, nominally 3.3V.
11	vOE0#	IN	Active low input for enabling output 0. This pin has an internal pull-down.

Alternate Terminations

The LP-HCSL output can easily drive other logic families. See <u>"AN-891 Driving LVPECL, LVDS, and CML Logic with IDT's "Universal" Low-Power HCSL Outputs"</u> for termination schemes for LVPECL, LVDS, CML and SSTL.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9ZXL0831E / 9ZXL0851E. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

² Measured from differential waveform.

³ Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

⁴ Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

⁵ Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

⁶ The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting Δ-Vcross to be smaller than Vcross absolute.

⁷ At default SMBus settings.

Notes for n	Additive jitter in Bypass Mode			0.1	5	ps	1,11

Notes for preceding table:

¹ Measured into fixed 2 pF load cap. Input to output skew is measured at the first output edge following the corresponding input.

² Measured from differential cross-point to differential cross-point. This parameter can be tuned with external feedback path, if present.

³ All Bypass Mode Input-to-Output specs refer to the timing between an input edge and the specific output edge created by it.

⁴ This parameter is deterministic for a given device.

⁵ Measured with scope averaging on to find mean value.

⁶ t is the period of the input clock.

⁷ Measured as maximum pass band gain. At frequencies within the loop BW, highest point of magnification is called PLL jitter peaking.

^{8.} Guaranteed by design and characterization, not 100% tested in production.

⁹ Measured at 3 db down or half power point.

¹⁰ Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

¹¹ Measured from differential waveform.

Notes for PCIe Filtered Phase Jitter tables (CC) and (IR)

¹ Applies to all differential outputs, guaranteed by design and characterization.

² Calculated from Intel-supplied Clock Jitter Tool, when driven by 9SQL495x or equivalent with spread on and off.

³ Sample size of at least 100K cycles. This figure extrapolates to 108ps pk-pk at 1M cycles for a BER of 1⁻¹².

⁴ For RMS values, additive jitter is calculated by solving for b [$b = sart(c^2 - a^2)$], where "a" is rms input jitter and "c" is rms total jitter.

⁵ IR is the new name for Separate Reference Independent Spread (SRIS) and Separate Reference no Spread (SRNS) PCIe clock architectures. According to the PCIe Base Specification Rev 4.0 version 0.7 draft, the jitter transfer functions and corresponding jitter limits are not defined for the IR clock architecture. Widely accepted industry limits using widely accepted industry filters are used to populate this table. There are no accepted filters or limits for IR clock architectures at PCIe Gen1 or Gen4 data rates.

¹ Applies to all differential outputs, guaranteed by design and characterization.

Electrical Characteristics-Unfiltered Phase Jitter Parameters - 12kHz to 20MHz

T_{AMB} = over the specified operating range. Supply voltages per normal operation conditions; see Test Loads for loading conditions

¹ Applies to all outputs when driven by Wenzel Associates source.

² Calculated from Intel-supplied Clock Jitter Tool, when driven by 9SQL495x or equivalent with spread on and off.

³ For RMS values, additive jitter is calculated by solving for b [$b = sqrt(c^2 - a^2)$], where "a" is rms input jitter and "c" is rms total jitter.

⁴ Calculated from phase noise analyzer when driven by Wenzel Associates source with Intel-specified brick-wall filter applied.

⁵ Top number is when the buffer is in Low BW mode, bottom number is when the buffer is in High BW mode.

² 12kHz to 20MHz brick wall filter.

³ For RMS values, additive jitter is calculated by solving for b [$b = sqrt(c^2 - a^2)$], where "a" is rms input jitter and "c" is rms total jitter.

Notes:

¹ Guaranteed by design and characterization, not 100% tested in production.

² All Long Term Accuracy specifications are guaranteed with the assumption that the input clock complies with CK420BQ accuracy requirements (+/-100ppm). The buffer itself does not contribute to ppm error.

³ Driven by SRC output of main clock, 100MHz PLL Mode or Bypass Mode.

⁴ Driven by CPU output of main clock, 133MHz PLL Mode or Bypass Mode.

Note that Bits 7 and 6 will keep the value originally latched on pin 5. If the user changes these bits, a warm reset of the system will have to be accomplished.

Revision History

Revision Date Description of Change	
November 30, 2018	Updated tPD_BYP minimum and maximum values to 2 and 3, respectively.
August 14, 2018	Updated block diagram.
July 17, 2018	Corrected typos in Byte 1, bits 1 and 2.
April 12, 2018	Updated absolute maximum supply voltage rating and VIHSMB to 3.9V.
December 1, 2017	Removed "5V tolerant" reference in pins 6 and 7 descriptions.
September 29, 2017	Initial release.

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
