**Product Description**

The TriQuint TGC4703-FC is a flip-chip frequency doubler. It combines an input and output buffer amplifier and a frequency doubler for use in automotive radar. The TGC4703-FC is designed using TriQuint’s proven 0.13  $\mu\text{m}$  pHEMT process and front-side Cu / Sn pillar technology for simplified assembly and low interconnect inductance. Die reliability is enhanced by using TriQuint’s BCB polymeric passivation process.

The TGC4703-FC typically provides 14 dBm saturated output power with 8 dB conversion gain.

Lead-free and RoHS compliant.

- 1/ For a median life of 2.4E+7 hours, Power Dissipation is limited to  

$$Pd(max) = (150\text{ °C} - Tbase\text{ °C})/\theta_{jc}.$$
- 2/ Channel operating temperature will directly affect the device median time to failure (MTTF). For maximum life, it is recommended that channel temperatures be maintained at the lowest possible levels.
- 3/ For this flip-chip die, the baseplate is a plane between the Cu/Sn pillars and the test board. For the TGC4703-FC, the critical pillars for thermal power dissipation are 24 thru 28 and 30. (See Mechanical Drawing.)

## Assembly Notes

Component placement and die attach assembly notes:

- Vacuum pencils and/or vacuum collets are the preferred method of pick up.
- Air bridges must be avoided during placement.
- Cu pillars on die are 65 um tall with a 22 um tall Sn solder cap.
- Recommended board metallization is evaporated TiW followed by nickel/gold at pillar attach interface. Ni is the adhesion layer for the solder and the gold keeps the Ni from oxidizing. The Au should be kept to a minimum to avoid embrittlement; suggested Au / Sn mass ratio must not exceed 8%.
- Au metallization is not recommended on traces due to solder wicking and consumption concerns. If Au traces are used, a physical solder barrier must be applied or designed into the pad area of the board. The barrier must be sufficient to keep the solder from undercutting the barrier.

Reflow process assembly notes:

- Minimum alloying temperatures 245 °C.
- Repeating reflow cycles is not recommended due to Sn consumption on the first reflow cycle.
- An alloy station or conveyor furnace with an inert atmosphere such as N2 should be used.
- Dip copper pillars in “no-clean flip chip” flux prior to solder attach. Suggest using a high temperature flux. Avoid exposing entire die to flux.
- If screen printing flux, use small apertures and minimize volume of flux applied.
- Coefficient of thermal expansion matching between the MMIC and the substrate/board is critical for long-term reliability.
- Devices must be stored in a dry nitrogen atmosphere.
- Suggested reflow will depend on board material and density.
