### DESCRIPTION

The *ISSI* IS62WV51216EALL/ IS62WV51216EBLL are high-speed, 8M bit static RAMs organized as 512K words by 16 bits. It is fabricated using *ISSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields high-performance and low power consumption devices.

When  $\overline{CS1}$  is HIGH (deselected) or when  $\overline{CS2}$  is low (deselected) or when  $\overline{CS1}$  is low,  $\overline{CS2}$  is high and both  $\overline{LB}$  and  $\overline{UB}$  are HIGH, the device assumes a standby mode at which the power dissipation can be reduced down with CMOS input levels.

Easy memory expansion is provided by using Chip Enable and Output Enable inputs. The active LOW Write Enable ( $\overline{WE}$ ) controls both writing and reading of the memory. A data byte allows Upper Byte ( $\overline{UB}$ ) and Lower Byte ( $\overline{LB}$ ) access.

The IS62WV51216EALL and IS62WV51216EBLL are packaged in the JEDEC standard 48-pin mini BGA (6mm x8mm), 44-Pin TSOP (TYPE II) and 48-pin TSOP (TYPE I).

**FUNCTION DESCRIPTION**

SRAM is one of random access memories. Each byte or word has an address and can be accessed randomly. SRAM has three different modes supported. Each function is described below with Truth Table.

**STANDBY MODE**

Device enters standby mode when deselected ( $\overline{CS1}$  HIGH or CS2 LOW or both  $\overline{UB}$  and  $\overline{LB}$  are HIGH). The input and output pins (I/O0-15) are placed in a high impedance state. The current consumption in this mode will be either ISB1 or ISB2 depending on the input level. CMOS input in this mode will maximize saving power.

**WRITE MODE**

Write operation issues with Chip selected ( $\overline{CS1}$  LOW and CS2 HIGH) and Write Enable ( $\overline{WE}$ ) input LOW. The input and output pins(I/O0-15) are in data input mode. Output buffers are closed during this time even if  $\overline{OE}$  is LOW.  $\overline{UB}$  and  $\overline{LB}$  enables a byte write feature. By enabling  $\overline{LB}$  LOW, data from I/O pins (I/O0 through I/O7) are written into the location specified on the address pins. And with  $\overline{UB}$  being LOW, data from I/O pins (I/O8 through I/O15) are written into the location.

**READ MODE**

Read operation issues with Chip selected ( $\overline{CS1}$  LOW and CS2 HIGH) and Write Enable ( $\overline{WE}$ ) input HIGH. When  $\overline{OE}$  is LOW, output buffer turns on to make data output. Any input to I/O pins during READ mode is not permitted.  $\overline{UB}$  and  $\overline{LB}$  enables a byte read feature. By enabling  $\overline{LB}$  LOW, data from memory appears on I/O0-7. And with  $\overline{UB}$  being LOW, data from memory appears on I/O8-15.

In the READ mode, output buffers can be turned off by pulling  $\overline{OE}$  HIGH. In this mode, internal device operates as READ but I/Os are in a high impedance state. Since device is in READ mode, active current is used.

Notes:

1. Tested with the load in Figure 1.
2. Tested with the load in Figure 2. Transition is measured  $\pm 500$  mV from steady-state voltage. tHZOE, tHZCS, tHZB, and tHZWE transitions are measured when the output enters a high impedance state. Not 100% tested.
3. The internal write time is defined by the overlap of  $\overline{CS1}$ =LOW, CS2=HIGH, ( $\overline{UB}$  or  $\overline{LB}$ )=LOW, and  $\overline{WE}$ =LOW. All four conditions must be in valid states to initiate a Write, but any condition can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the write.
4. tPWE > tHZWE + tSD when OE is LOW.
5. Address inputs must meet  $V_{IH}$  and  $V_{IL}$  SPEC during this period. Any glitch or unknown inputs are not permitted. Unknown input with standby mode is acceptable.
6. Data retention characteristics are defined later in DATA RETENTION CHARACTERISTICS.

**READ CYCLE NO. 1<sup>(1,2)</sup> (ADDRESS CONTROLLED) ( $\overline{CS1}=\overline{OE}=VIL$ ,  $CS2=\overline{WE}=VIH$ )**

**READ CYCLE NO. 2<sup>(1,3)</sup> ( $\overline{CS1}$ ,  $CS2$ ,  $\overline{OE}$ , AND  $\overline{UB}$  &  $\overline{LB}$  CONTROLLED)**

Notes:

1.  $\overline{WE}$  is HIGH for Read Cycle.
2. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CS1}$ ,  $\overline{UB}$ , or  $\overline{LB}=VIL$ .  $CS2=\overline{WE}=VIH$ .
3. Address is valid prior to or coincident with  $\overline{CS1}$  LOW transition.

**WRITE CYCLE NO. 1 ( $\overline{CS1}$  CONTROLLED,  $\overline{OE}$  = HIGH OR LOW)**

Notes:

1. tHZWE is based on the assumption when tSA=0nS after READ operation. Actual DOUT for tHZWE may not appear if  $\overline{OE}$  goes high before Write Cycle. tHZOE is the time DOUT goes to High-Z after  $\overline{OE}$  goes high.
2. During this period the I/Os are in output state. Do not apply input signals.

**WRITE CYCLE NO. 2 ( $\overline{WE}$  CONTROLLED:  $\overline{OE}$  IS HIGH DURING WRITE CYCLE)**

Notes:

1. tHZWE is based on the assumption when tSA=0nS after READ operation. Actual DOUT for tHZWE may not appear if  $\overline{OE}$  goes high before Write Cycle. tHZOE is the time DOUT goes to High-Z after  $\overline{OE}$  goes high.
2. During this period the I/Os are in output state. Do not apply input signals.

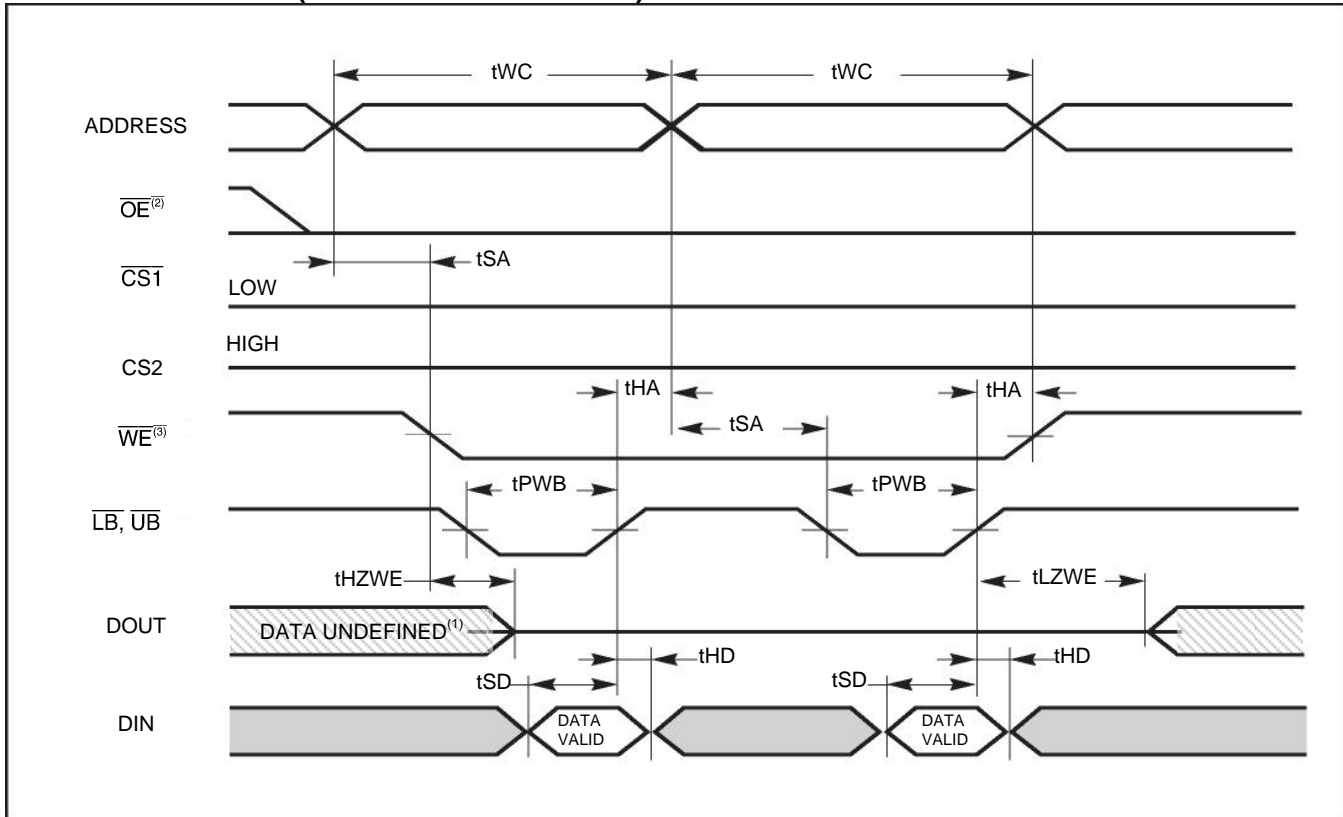

WRITE CYCLE NO. 3 ( $\overline{WE}$  CONTROLLED:  $\overline{OE}$  IS LOW DURING WRITE CYCLE)

Notes:

1. If  $\overline{OE}$  is low during write cycle,  $t_{HZWE}$  must be met in the application. Do not apply input signal during this period. Data output from the previous READ operation will drive IO BUS.

WRITE CYCLE NO. 4 ( $\overline{UB}$  &  $\overline{LB}$  CONTROLLED)

Notes:

1. If  $\overline{OE}$  is low during write cycle,  $t_{HZWE}$  must be met in the application. Do not apply input signal during this period. Data output from the previous READ operation will drive IO BUS.
2. Due to the restriction of note 1,  $\overline{OE}$  is recommended to be HIGH during write period.
3. Note  $\overline{WE}$  stays LOW in this example. If  $\overline{WE}$  toggles,  $t_{PWE}$  and  $t_{HZWE}$  must be considered.
