

Ultra-low-power 32-bit MCU ARM<sup>®</sup>-based Cortex<sup>®</sup>-M3,  
256KB Flash, 32KB SRAM, 8KB EEPROM, LCD, USB, ADC, DAC

Datasheet - production data

## Features

- Ultra-low-power platform
  - 1.65 V to 3.6 V power supply
  - **-40 °C to 105 °C** temperature range
  - 0.29µA Standby mode (3 wakeup pins)
  - **1.15 µA Standby mode + RTC**
  - 0.44 µA Stop mode (16 wakeup lines)
  - 1.4 µA Stop mode + RTC
  - 8.6 µA Low-power run mode
  - 185 µA/MHz Run mode
  - 10 nA ultra-low I/O leakage
  - 8 µs wakeup time
- Core: ARM<sup>®</sup> Cortex<sup>®</sup>-M3 32-bit CPU
  - From 32 kHz up to 32 MHz max
  - 1.25 DMIPS/MHz (Dhrystone 2.1)
  - Memory protection unit
- Reset and supply management
  - Low-power, ultrasafe BOR (brownout reset) with 5 selectable thresholds
  - Ultra-low-power POR/PDR
  - Programmable voltage detector (PVD)
- Clock sources
  - 1 to 24 MHz crystal oscillator
  - 32 kHz oscillator for RTC with calibration
  - High Speed Internal 16 MHz factory-trimmed RC (+/- 1%)
  - Internal Low-power 37 kHz RC
  - Internal multispeed low-power 65 kHz to 4.2 MHz PLL for CPU clock and USB (48 MHz)
- Pre-programmed bootloader
  - USB and USART supported
- Development support
  - Serial wire debug supported
  - JTAG and trace supported
- Up to 83 fast I/Os (70 I/Os 5V tolerant), all mappable on 16 external interrupt vectors

- Memories
  - 256 KB Flash memory with ECC
  - 32 KB RAM
  - 8 KB of true EEPROM with ECC
  - 128 Byte backup register
- LCD Driver (except STM32L151xC devices) up to 8x40 segments, contrast adjustment, blinking mode, step-up converter
- Rich analog peripherals (down to 1.8 V)
  - 2x operational amplifiers
  - 12-bit ADC 1Msps up to 25 channels
  - 12-bit DAC 2 channels with output buffers
  - 2x ultra-low-power-comparators (window mode and wake up capability)
- DMA controller 12x channels
- 9x peripheral communication interfaces
  - 1x USB 2.0 (internal 48 MHz PLL)
  - 3x USART
  - 3x SPI 16 Mbits/s (2x SPI with I2S)
  - 2x I2C (SMBus/PMBus)
- 11x timers: 1x 32-bit, 6x 16-bit with up to 4 IC/OC/PWM channels, 2x 16-bit basic timers, 2x watchdog timers (independent and window)
- Up to 23 capacitive sensing channels
- CRC calculation unit, 96-bit unique ID

Table 1. Device summary

| Reference                  | Part number                  |
|----------------------------|------------------------------|
| STM32L151CC                | STM32L151CCT6, STM32L151CCU6 |
| STM32L151RC <sup>(1)</sup> | STM32L151RCT6                |
| STM32L151UC                | STM32L151UCY6                |
| STM32L151VC <sup>(1)</sup> | STM32L151VCT6, STM32L151VCH6 |
| STM32L152CC                | STM32L152CCT6, STM32L152CCU6 |
| STM32L152RC <sup>(1)</sup> | STM32L152RCT6                |
| STM32L152UC                | STM32L152UCY6                |
| STM32L152VC <sup>(1)</sup> | STM32L152VCT6, STM32L152VCH6 |

1. For sales types ending with "A" and STM32L15xxC products in WLCSP64 package, please refer to STM32L15xxC/C-A datasheet.

| 3.10.1   | Temperature sensor                                    | 26        |
| 3.10.2   | Internal voltage reference ( $V_{REFINT}$ )           | 26        |
| 3.11     | DAC (digital-to-analog converter)                     | 26        |
| 3.12     | Operational amplifier                                 | 27        |
| 3.13     | Ultra-low-power comparators and reference voltage     | 27        |
| 3.14     | System configuration controller and routing interface | 27        |
| 3.15     | Touch sensing                                         | 27        |

|          |                                                                        |           |
|----------|------------------------------------------------------------------------|-----------|
| 3.16     | Timers and watchdogs                                                   | 28        |
| 3.16.1   | General-purpose timers (TIM2, TIM3, TIM4, TIM5, TIM9, TIM10 and TIM11) | 28        |
| 3.16.2   | Basic timers (TIM6 and TIM7)                                           | 29        |
| 3.16.3   | SysTick timer                                                          | 29        |
| 3.16.4   | Independent watchdog (IWDG)                                            | 29        |
| 3.16.5   | Window watchdog (WWDG)                                                 | 29        |
| 3.17     | Communication interfaces                                               | 29        |
| 3.17.1   | I <sup>2</sup> C bus                                                   | 29        |
| 3.17.2   | Universal synchronous/asynchronous receiver transmitter (USART)        | 30        |
| 3.17.3   | Serial peripheral interface (SPI)                                      | 30        |
| 3.17.4   | Inter-integrated sound (I2S)                                           | 30        |
| 3.17.5   | Universal serial bus (USB)                                             | 30        |
| 3.18     | CRC (cyclic redundancy check) calculation unit                         | 30        |
| 3.19     | Development support                                                    | 31        |
| 3.19.1   | Serial wire JTAG debug port (SWJ-DP)                                   | 31        |
| 3.19.2   | Embedded Trace Macrocell™                                              | 31        |
| <b>4</b> | <b>Pin descriptions</b>                                                | <b>32</b> |
| <b>5</b> | <b>Memory mapping</b>                                                  | <b>51</b> |
| <b>6</b> | <b>Electrical characteristics</b>                                      | <b>52</b> |
| 6.1      | Parameter conditions                                                   | 52        |
| 6.1.1    | Minimum and maximum values                                             | 52        |
| 6.1.2    | Typical values                                                         | 52        |
| 6.1.3    | Typical curves                                                         | 52        |
| 6.1.4    | Loading capacitor                                                      | 52        |
| 6.1.5    | Pin input voltage                                                      | 52        |
| 6.1.6    | Power supply scheme                                                    | 53        |
| 6.1.7    | Optional LCD power supply scheme                                       | 54        |
| 6.1.8    | Current consumption measurement                                        | 54        |
| 6.2      | Absolute maximum ratings                                               | 55        |
| 6.3      | Operating conditions                                                   | 56        |
| 6.3.1    | General operating conditions                                           | 56        |
| 6.3.2    | Embedded reset and power control block characteristics                 | 57        |
| 6.3.3    | Embedded internal reference voltage                                    | 59        |

|          |                                                                                         |            |
|----------|-----------------------------------------------------------------------------------------|------------|
| 6.3.4    | Supply current characteristics                                                          | 60         |
| 6.3.5    | Wakeup time from low-power mode                                                         | 71         |
| 6.3.6    | External clock source characteristics                                                   | 72         |
| 6.3.7    | Internal clock source characteristics                                                   | 77         |
| 6.3.8    | PLL characteristics                                                                     | 80         |
| 6.3.9    | Memory characteristics                                                                  | 80         |
| 6.3.10   | EMC characteristics                                                                     | 82         |
| 6.3.11   | Electrical sensitivity characteristics                                                  | 83         |
| 6.3.12   | I/O current injection characteristics                                                   | 84         |
| 6.3.13   | I/O port characteristics                                                                | 85         |
| 6.3.14   | NRST pin characteristics                                                                | 88         |
| 6.3.15   | TIM timer characteristics                                                               | 89         |
| 6.3.16   | Communications interfaces                                                               | 90         |
| 6.3.17   | 12-bit ADC characteristics                                                              | 98         |

# 1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32L151xC and STM32L152xC ultra-low-power ARM® Cortex®-M3 based microcontroller product line with a Flash memory of 256 Kbytes.

The ultra-low-power STM32L151xC and STM32L152xC family includes devices in 6 different package types: from 48 pins to 100 pins. Depending on the device chosen, different sets of peripherals are included, the description below gives an overview of the complete range of peripherals proposed in this family.

These features make the ultra-low-power STM32L151xC and STM32L152xC microcontroller family suitable for a wide range of applications:

- Medical and handheld equipment
- Application control and user interface
- PC peripherals, gaming, GPS and sport equipment
- Alarm systems, wired and wireless sensors, video intercom
- Utility metering

This STM32L151xC and STM32L152xC datasheet should be read in conjunction with the STM32L1xxx reference manual (RM0038). The application note “Getting started with STM32L1xxx hardware development” (AN3216) gives a hardware implementation overview. Both documents are available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the ARM® Cortex®-M3 core please refer to the ARM® Cortex®-M3 technical reference manual, available from the [www.arm.com](http://www.arm.com) website. [Figure 1](#) shows the general block diagram of the device family.

## 2 Description

The ultra-low-power STM32L151xC and STM32L152xC devices incorporate the connectivity power of the universal serial bus (USB) with the high-performance ARM® Cortex®-M3 32-bit RISC core operating at a frequency of 32 MHz (33.3 DMIPS), a memory protection unit (MPU), high-speed embedded memories (Flash memory up to 256 Kbytes and RAM up to 32 Kbytes) and an extensive range of enhanced I/Os and peripherals connected to two APB buses.

The STM32L151xC and STM32L152xC devices offer two operational amplifiers, one 12-bit ADC, two DACs, two ultra-low-power comparators, one general-purpose 32-bit timer, six general-purpose 16-bit timers and two basic timers, which can be used as time bases.

Moreover, the STM32L151xC and STM32L152xC devices contain standard and advanced communication interfaces: up to two I2Cs, three SPIs, two I2S, three USARTs and an USB. The STM32L151xC and STM32L152xC devices offer up to 23 capacitive sensing channels to simply add a touch sensing functionality to any application.

They also include a real-time clock and a set of backup registers that remain powered in Standby mode.

Finally, the integrated LCD controller (except STM32L151xC devices) has a built-in LCD voltage generator that allows to drive up to 8 multiplexed LCDs with the contrast independent of the supply voltage.

The ultra-low-power STM32L151xC and STM32L152xC devices operate from a 1.8 to 3.6 V power supply (down to 1.65 V at power down) with BOR and from a 1.65 to 3.6 V power supply without BOR option. They are available in the -40 to +85 °C and -40 to +105 °C temperature ranges. A comprehensive set of power-saving modes allows the design of low-power applications.

## 2.1 Device overview

Table 2. Ultra-low-power STM32L151xC and STM32L152xC device features and peripheral counts

| Peripheral                      |                  | STM32L15xCC                                                                                                | STM32L15xUC<br>STM32L15xRC | STM32L15xVC          |
|---------------------------------|------------------|------------------------------------------------------------------------------------------------------------|----------------------------|----------------------|
| Flash (Kbytes)                  |                  | 256                                                                                                        |                            |                      |
| Data EEPROM (Kbytes)            |                  | 8                                                                                                          |                            |                      |

## 2.2 Ultra-low-power device continuum

The ultra-low-power family offers a large choice of cores and features. From proprietary 8-bit to up to Cortex-M3, including the Cortex-M0+, the STM32Lx series are the best choice to answer your needs, in terms of ultra-low-power features. The STM32 ultra-low-power series are the best fit, for instance, for gas/water meter, keyboard/mouse or fitness and healthcare, wearable applications. Several built-in features like LCD drivers, dual-bank memory, Low-power run mode, op-amp, AES 128-bit, DAC, USB crystal-less and many others will clearly allow to build very cost-optimized applications by reducing BOM.

*Note: STMicroelectronics as a reliable and long-term manufacturer ensures as much as possible the pin-to-pin compatibility between any STM8Lxxxxx and STM32Lxxxxx devices and between any of the STM32Lx and STM32Fx series. Thanks to this unprecedented scalability, your old applications can be upgraded to respond to the latest market features and efficiency demand.*

### 2.2.1 Performance

All families incorporate highly energy-efficient cores with both Harvard architecture and pipelined execution: advanced STM8 core for STM8L families and ARM Cortex-M3 core for STM32L family. In addition specific care for the design architecture has been taken to optimize the mA/DMIPS and mA/MHz ratios.

This allows the ultra-low-power performance to range from 5 up to 33.3 DMIPs.

### 2.2.2 Shared peripherals

STM8L15xxx, STM32L15xxx and STM32L162xx share identical peripherals which ensure a very easy migration from one family to another:

- Analog peripherals: ADC, DAC and comparators
- Digital peripherals: RTC and some communication interfaces

### 2.2.3 Common system strategy.

To offer flexibility and optimize performance, the STM8L15xxx, STM32L15xxx and STM32L162xx family uses a common architecture:

- Same power supply range from 1.65 V to 3.6 V
- Architecture optimized to reach ultra-low consumption both in low-power modes and Run mode
- Fast startup strategy from low-power modes
- Flexible system clock
- Ultrasafe reset: same reset strategy including power-on reset, power-down reset, brownout reset and programmable voltage detector

### 2.2.4 Features

ST ultra-low-power continuum also lies in feature compatibility:

- More than 15 packages with pin count from 20 to 144 pins and size down to 3 x 3 mm
- Memory density ranging from 2 to 512 Kbytes

### 3 Functional overview

Figure 1. Ultra-low-power STM32L151xC and STM32L152xC block diagram

MSv34177V1

### 3.1 Low-power modes

The ultra-low-power STM32L151xC and STM32L152xC devices support dynamic voltage scaling to optimize its power consumption in run mode. The voltage from the internal low-drop regulator that supplies the logic can be adjusted according to the system's maximum operating frequency and the external voltage supply.

There are three power consumption ranges:

- Range 1 ( $V_{DD}$  range limited to 1.71 V - 3.6 V), with the CPU running at up to 32 MHz
- Range 2 (full  $V_{DD}$  range), with a maximum CPU frequency of 16 MHz
- Range 3 (full  $V_{DD}$  range), with a maximum CPU frequency limited to 4 MHz (generated only with the multispeed internal RC oscillator clock source)

Seven low-power modes are provided to achieve the best compromise between low-power consumption, short startup time and available wakeup sources:

- **Sleep mode**  
In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs. Sleep mode power consumption at 16 MHz is about 1 mA with all peripherals off.
- **Low-power run mode**  
This mode is achieved with the multispeed internal (MSI) RC oscillator set to the minimum clock (131 kHz), execution from SRAM or Flash memory, and internal regulator in low-power mode to minimize the regulator's operating current. In low-power run mode, the clock frequency and the number of enabled peripherals are both limited.
- **Low-power sleep mode**  
This mode is achieved by entering Sleep mode with the internal voltage regulator in Low-power mode to minimize the regulator's operating current. In Low-power sleep mode, both the clock frequency and the number of enabled peripherals are limited; a typical example would be to have a timer running at 32 kHz.  
When wakeup is triggered by an event or an interrupt, the system reverts to the run mode with the regulator on.
- **Stop mode with RTC**  
Stop mode achieves the lowest power consumption while retaining the RAM and register contents and real time clock. All clocks in the  $V_{CORE}$  domain are stopped, the PLL, MSI RC, HSI RC and HSE crystal oscillators are disabled. The LSE or LSI is still running. The voltage regulator is in the low-power mode.  
The device can be woken up from Stop mode by any of the EXTI line, in 8  $\mu$ s. The EXTI line source can be one of the 16 external lines. It can be the PVD output, the Comparator 1 event or Comparator 2 event (if internal reference voltage is on), it can be the RTC alarm(s), the USB wakeup, the RTC tamper events, the RTC timestamp event or the RTC wakeup.

- **Stop mode without RTC**

Stop mode achieves the lowest power consumption while retaining the RAM and register contents. All clocks are stopped, the PLL, MSI RC, HSI and LSI RC, LSE and HSE crystal oscillators are disabled. The voltage regulator is in the low-power mode. The device can be woken up from Stop mode by any of the EXTI line, in 8  $\mu$ s. The EXTI line source can be one of the 16 external lines. It can be the PVD output, the Comparator 1 event or Comparator 2 event (if internal reference voltage is on). It can also be wakened by the USB wakeup.

- **Standby mode with RTC**

Standby mode is used to achieve the lowest power consumption and real time clock. The internal voltage regulator is switched off so that the entire  $V_{CORE}$  domain is powered off. The PLL, MSI RC, HSI RC and HSE crystal oscillators are also switched off. The LSE or LSI is still running. After entering Standby mode, the RAM and register contents are lost except for registers in the Standby circuitry (wakeup logic, IWDG, RTC, LSI, LSE Crystal 32K osc, RCC\_CSR).

The device exits Standby mode in 60  $\mu$ s when an external reset (NRST pin), an IWDG reset, a rising edge on one of the three WKUP pins, RTC alarm (Alarm A or Alarm B), RTC tamper event, RTC timestamp event or RTC Wakeup event occurs.

- **Standby mode without RTC**

Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire  $V_{CORE}$  domain is powered off. The PLL, MSI RC, HSI and LSI RC, HSE and LSE crystal oscillators are also switched off. After entering Standby mode, the RAM and register contents are lost except for registers in the Standby circuitry (wakeup logic, IWDG, RTC, LSI, LSE Crystal 32K osc, RCC\_CSR).

The device exits Standby mode in 60  $\mu$ s when an external reset (NRST pin) or a rising edge on one of the three WKUP pin occurs.

*Note: The RTC, the IWDG, and the corresponding clock sources are not stopped automatically by entering Stop or Standby mode.*

**Table 3. Functionalities depending on the operating power supply range**

| Operating power supply range                        | Functionalities depending on the operating power supply range |                |                               |                            |
|-----------------------------------------------------|---------------------------------------------------------------|----------------|-------------------------------|----------------------------|
|                                                     | DAC and ADC operation                                         | USB            | Dynamic voltage scaling range | I/O operation              |
| $V_{DD} = V_{DDA} = 1.65$ to $1.71$ V               | Not functional                                                | Not functional | Range 2 or Range 3            | Degraded speed performance |
| $V_{DD} = V_{DDA} = 1.71$ to $1.8$ V <sup>(1)</sup> | Not functional                                                | Not functional | Range 1, Range 2 or Range 3   | Degraded speed performance |
| $V_{DD} = V_{DDA} = 1.8$ to $2.0$ V <sup>(1)</sup>  | Conversion time up to 500 Ksps                                | Not functional | Range 1, Range 2 or Range 3   | Degraded speed performance |

Table 3. Functionalities depending on the operating power supply range (continued)

| Operating power supply range                     | Functionalities depending on the operating power supply range |                           |                               |                      |
|--------------------------------------------------|---------------------------------------------------------------|---------------------------|-------------------------------|----------------------|
|                                                  | DAC and ADC operation                                         | USB                       | Dynamic voltage scaling range | I/O operation        |
| $V_{DD}=V_{DDA} = 2.0 \text{ to } 2.4 \text{ V}$ | Conversion time up to 500 Ksps                                | Functional <sup>(2)</sup> | Range 1, Range 2 or Range 3   | Full speed operation |
| $V_{DD}=V_{DDA} = 2.4 \text{ to } 3.6 \text{ V}$ | Conversion time up to 1 Msps                                  | Functional <sup>(2)</sup> | Range 1, Range 2 or Range 3   | Full speed operation |

1. CPU frequency changes from initial to final must respect " $F_{CPU \text{ initial}} < 4 * F_{CPU \text{ final}}$ " to limit  $V_{CORE}$  drop due to current consumption peak when frequency increases. It must also respect 5  $\mu$ s delay between two changes. For example to switch from 4.2 MHz to 32 MHz, you can switch from 4.2 MHz to 16 MHz, wait 5  $\mu$ s, then switch from 16 MHz to 32 MHz.
2. Should be USB compliant from I/O voltage standpoint, the minimum  $V_{DD}$  is 3.0 V.

Table 4. CPU frequency range depending on dynamic voltage scaling

| CPU frequency range                                | Dynamic voltage scaling range |
|----------------------------------------------------|-------------------------------|
| 16 MHz to 32 MHz (1ws)<br>32 kHz to 16 MHz (0ws)   | Range 1                       |
| 8 MHz to 16 MHz (1ws)<br>32 kHz to 8 MHz (0ws)     | Range 2                       |
| 2.1MHz to 4.2 MHz (1ws)<br>32 kHz to 2.1 MHz (0ws) | Range 3                       |

1. The startup on communication line wakes the CPU which was made possible by an EXTI, this induces a delay before entering run mode.

## 3.2 ARM<sup>®</sup> Cortex<sup>®</sup>-M3 core with MPU

The ARM<sup>®</sup> Cortex<sup>®</sup>-M3 processor is the industry leading processor for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The ARM<sup>®</sup> Cortex<sup>®</sup>-M3 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

The memory protection unit (MPU) improves system reliability by defining the memory attributes (such as read/write access permissions) for different memory regions. It provides up to eight different regions and an optional predefined background region.

Owing to its embedded ARM core, the STM32L151xC and STM32L152xC devices are compatible with all ARM tools and software.

### **Nested vectored interrupt controller (NVIC)**

The ultra-low-power STM32L151xC and STM32L152xC devices embed a nested vectored interrupt controller able to handle up to 53 maskable interrupt channels (not including the 16 interrupt lines of ARM® Cortex®-M3) and 16 priority levels.

- Closely coupled NVIC gives low-latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of *late arriving*, higher-priority interrupts
- Support for tail-chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimal interrupt latency.

## **3.3 Reset and supply management**

### **3.3.1 Power supply schemes**

- $V_{DD} = 1.65$  to  $3.6$  V: external power supply for I/Os and the internal regulator. Provided externally through  $V_{DD}$  pins.
- $V_{SSA}$ ,  $V_{DDA} = 1.65$  to  $3.6$  V: external analog power supplies for ADC, reset blocks, RCs and PLL (minimum voltage to be applied to  $V_{DDA}$  is  $1.8$  V when the ADC is used).  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$ , respectively.

### **3.3.2 Power supply supervisor**

The device has an integrated ZEROPOWER power-on reset (POR)/power-down reset (PDR) that can be coupled with a brownout reset (BOR) circuitry.

The device exists in two versions:

- The version with BOR activated at power-on operates between  $1.8$  V and  $3.6$  V.
- The other version without BOR operates between  $1.65$  V and  $3.6$  V.

After the  $V_{DD}$  threshold is reached ( $1.65$  V or  $1.8$  V depending on the BOR which is active or not at power-on), the option byte loading process starts, either to confirm or modify default thresholds, or to disable the BOR permanently: in this case, the  $V_{DD}$  min value becomes  $1.65$  V (whatever the version, BOR active or not, at power-on).

When BOR is active at power-on, it ensures proper operation starting from  $1.8$  V whatever the power ramp-up phase before it reaches  $1.8$  V. When BOR is not active at power-up, the

power ramp-up should guarantee that 1.65 V is reached on  $V_{DD}$  at least 1 ms after it exits the POR area.

Five BOR thresholds are available through option bytes, starting from 1.8 V to 3 V. To reduce the power consumption in Stop mode, it is possible to automatically switch off the internal reference voltage ( $V_{REFINT}$ ) in Stop mode. The device remains in reset mode when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$  or  $V_{BOR}$ , without the need for any external reset circuit.

*Note: The start-up time at power-on is typically 3.3 ms when BOR is active at power-up, the start-up time at power-on can be decreased down to 1 ms typically for devices with BOR inactive at power-up.*

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. This PVD offers 7 different levels between 1.85 V and 3.05 V, chosen by software, with a step around 200 mV. An interrupt can be generated when  $V_{DD}/V_{DDA}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}/V_{DDA}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.3.3 Voltage regulator

The regulator has three operation modes: main (MR), low-power (LPR) and power down.

- MR is used in Run mode (nominal regulation)
- LPR is used in the Low-power run, Low-power sleep and Stop modes
- Power down is used in Standby mode. The regulator output is high impedance, the kernel circuitry is powered down, inducing zero consumption but the contents of the registers and RAM are lost except for the standby circuitry (wake-up logic, IWDG, RTC, LSI, LSE crystal 32K osc, RCC\_CSR).

### 3.3.4 Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from Flash memory
- Boot from System memory
- Boot from embedded RAM

The boot loader is located in System memory. It is used to reprogram the Flash memory by using USART1, USART2 or USB. See Application note “STM32 microcontroller system memory boot mode” (AN2606) for details.

### 3.4 Clock management

The clock controller distributes the clocks coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness. It features:

- **Clock prescaler:** to get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- **Safe clock switching:** clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock source:** three different clock sources can be used to drive the master clock SYSCLK:
  - 1-24 MHz high-speed external crystal (HSE), that can supply a PLL
  - 16 MHz high-speed internal RC oscillator (HSI), trimmable by software, that can supply a PLL
  - Multispeed internal RC oscillator (MSI), trimmable by software, able to generate 7 frequencies (65 kHz, 131 kHz, 262 kHz, 524 kHz, 1.05 MHz, 2.1 MHz, 4.2 MHz). When a 32.768 kHz clock source is available in the system (LSE), the MSI frequency can be trimmed by software down to a  $\pm 0.5\%$  accuracy.
- **Auxiliary clock source:** two ultra-low-power clock sources that can be used to drive the LCD controller and the real-time clock:
  - 32.768 kHz low-speed external crystal (LSE)
  - 37 kHz low-speed internal RC (LSI), also used to drive the independent watchdog. The LSI clock can be measured using the high-speed internal RC oscillator for greater precision.
- **RTC and LCD clock sources:** the LSI, LSE or HSE sources can be chosen to clock the RTC and the LCD, whatever the system clock.
- **USB clock source:** the embedded PLL has a dedicated 48 MHz clock output to supply the USB interface.
- **Startup clock:** after reset, the microcontroller restarts by default with an internal 2 MHz clock (MSI). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** this feature can be enabled by software. If a HSE clock failure occurs, the master clock is automatically switched to HSI and a software interrupt is generated if enabled.
- **Clock-out capability (MCO: microcontroller clock output):** it outputs one of the internal clocks for external use by the application.

Several prescalers allow the configuration of the AHB frequency, each APB (APB1 and APB2) domains. The maximum frequency of the AHB and the APB domains is 32 MHz. See [Figure 2](#) for details on the clock tree.

Figure 2. Clock tree

- For the USB function to be available, both HSE and PLL must be enabled, with the CPU running at either 24 MHz or 32 MHz.

### 3.5 Low-power real-time clock and backup registers

The real-time clock (RTC) is an independent BCD timer/counter. Dedicated registers contain the sub-second, second, minute, hour (12/24 hour), week day, date, month, year, in BCD (binary-coded decimal) format. Correction for 28, 29 (leap year), 30, and 31 day of the month are made automatically. The RTC provides two programmable alarms and programmable periodic interrupts with wakeup from Stop and Standby modes.

The programmable wakeup time ranges from 120  $\mu$ s to 36 hours.

The RTC can be calibrated with an external 512 Hz output, and a digital compensation circuit helps reduce drift due to crystal deviation.

The RTC can also be automatically corrected with a 50/60Hz stable powerline.

The RTC calendar can be updated on the fly down to sub second precision, which enables network system synchronization.

A time stamp can record an external event occurrence, and generates an interrupt.

There are thirty-two 32-bit backup registers provided to store 128 bytes of user application data. They are cleared in case of tamper detection.

Three pins can be used to detect tamper events. A change on one of these pins can reset backup register and generate an interrupt. To prevent false tamper event, like ESD event, these three tamper inputs can be digitally filtered.

### 3.6 GPIOs (general-purpose inputs/outputs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions, and can be individually remapped using dedicated AFIO registers. All GPIOs are high current capable. The alternate function configuration of I/Os can be locked if needed following a specific sequence in order to avoid spurious writing to the I/O registers. The I/O controller is connected to the AHB with a toggling speed of up to 16 MHz.

#### External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 24 edge detector lines used to generate interrupt/event requests. Each line can be individually configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 83 GPIOs can be connected to the 16 external interrupt lines. The 8 other lines are connected to RTC, PVD, USB, comparator events or capacitive sensing acquisition.

## 3.7 Memories

The STM32L151xC and STM32L152xC devices have the following features:

- 32 Kbytes of embedded RAM accessed (read/write) at CPU clock speed with 0 wait states. With the enhanced bus matrix, operating the RAM does not lead to any performance penalty during accesses to the system bus (AHB and APB buses).
- The non-volatile memory is divided into three arrays:
  - 256 Kbytes of embedded Flash program memory
  - 8 Kbytes of data EEPROM
  - Options bytes

The options bytes are used to write-protect or read-out protect the memory (with 4 KB granularity) and/or readout-protect the whole memory with the following options:

- Level 0: no readout protection
- Level 1: memory readout protection, the Flash memory cannot be read from or written to if either debug features are connected or boot in RAM is selected
- Level 2: chip readout protection, debug features (ARM Cortex-M3 JTAG and serial wire) and boot in RAM selection disabled (JTAG fuse)

The whole non-volatile memory embeds the error correction code (ECC) feature.

The user area of the Flash memory can be protected against Dbus read access by PCROP feature (see RM0038 for details).

## 3.8 DMA (direct memory access)

The flexible 12-channel, general-purpose DMA is able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The DMA controller supports circular buffer management, avoiding the generation of interrupts when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with software trigger support for each channel. Configuration is done by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I<sup>2</sup>C, USART, general-purpose timers, DAC and ADC.

### 3.9 LCD (liquid crystal display)

The LCD drives up to 8 common terminals and 44 segment terminals to drive up to 320 pixels.

- Internal step-up converter to guarantee functionality and contrast control irrespective of  $V_{DD}$ . This converter can be deactivated, in which case the  $V_{LCD}$  pin is used to provide the voltage to the LCD
- Supports static, 1/2, 1/3, 1/4 and 1/8 duty
- Supports static, 1/2, 1/3 and 1/4 bias
- Phase inversion to reduce power consumption and EMI
- Up to 8 pixels can be programmed to blink
- Unneeded segments and common pins can be used as general I/O pins
- LCD RAM can be updated at any time owing to a double-buffer
- The LCD controller can operate in Stop mode
- $V_{LCD}$  rail decoupling capability

**Table 6.  $V_{LCD}$  rail decoupling**

|                | Bias          |               |               | Pin  |      |
|----------------|---------------|---------------|---------------|------|------|
|                | 1/2           | 1/3           | 1/4           |      |      |
| $V_{LCDRAIL1}$ | 1/2 $V_{LCD}$ | 2/3 $V_{LCD}$ | 1/2 $V_{LCD}$ | PB2  |      |
| $V_{LCDRAIL2}$ | N/A           | 1/3 $V_{LCD}$ | 1/4 $V_{LCD}$ | PB12 | PE11 |
| $V_{LCDRAIL3}$ | N/A           | N/A           | 3/4 $V_{LCD}$ | PB0  | PE12 |

### 3.10 ADC (analog-to-digital converter)

A 12-bit analog-to-digital converters is embedded into STM32L151xC and STM32L152xC devices with up to 25 external channels, performing conversions in single-shot or scan mode. In scan mode, automatic conversion is performed on a selected group of analog inputs with up to 24 external channels in a group.

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all scanned channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the general-purpose timers (TIMx) can be internally connected to the ADC start triggers, to allow the application to synchronize A/D conversions and timers. An injection mode allows high priority conversions to be done by interrupting a scan mode which runs in as a background task.

The ADC includes a specific low-power mode. The converter is able to operate at maximum speed even if the CPU is operating at a very low frequency and has an auto-shutdown function. The ADC's runtime and analog front-end current consumption are thus minimized whatever the MCU operating mode.

### 3.10.1 Temperature sensor

The temperature sensor (TS) generates a voltage  $V_{\text{SENSE}}$  that varies linearly with temperature.

The temperature sensor is internally connected to the ADC\_IN16 input channel which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode. See [Table 61: Temperature sensor calibration values](#).

### 3.10.2 Internal voltage reference ( $V_{\text{REFINT}}$ )

The internal voltage reference ( $V_{\text{REFINT}}$ ) provides a stable (bandgap) voltage output for the ADC and Comparators.  $V_{\text{REFINT}}$  is internally connected to the ADC\_IN17 input channel. It enables accurate monitoring of the  $V_{\text{DD}}$  value (when no external voltage,  $V_{\text{REF+}}$ , is available for ADC). The precise voltage of  $V_{\text{REFINT}}$  is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode. See [Table 16: Embedded internal reference voltage calibration values](#).

## 3.11 DAC (digital-to-analog converter)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in non-inverting configuration.

This dual digital Interface supports the following features:

- Two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channels, independent or simultaneous conversions
- DMA capability for each channel (including the underrun interrupt)
- External triggers for conversion
- Input reference voltage  $V_{\text{REF+}}$

Eight DAC trigger inputs are used in the STM32L151xC and STM32L152xC devices. The DAC channels are triggered through the timer update outputs that are also connected to different DMA channels.

### 3.12 Operational amplifier

The STM32L151xC and STM32L152xC devices embed two operational amplifiers with external or internal follower routing capability (or even amplifier and filter capability with external components). When one operational amplifier is selected, one external ADC channel is used to enable output measurement.

The operational amplifiers feature:

- Low input bias current
- Low offset voltage
- Low-power mode
- Rail-to-rail input

### 3.13 Ultra-low-power comparators and reference voltage

The STM32L151xC and STM32L152xC devices embed two comparators sharing the same current bias and reference voltage. The reference voltage can be internal or external (coming from an I/O).

- One comparator with fixed threshold
- One comparator with rail-to-rail inputs, fast or slow mode. The threshold can be one of the following:
  - DAC output
  - External I/O
  - Internal reference voltage ( $V_{REFINT}$ ) or a sub-multiple (1/4, 1/2, 3/4)

Both comparators can wake up from Stop mode, and be combined into a window comparator.

The internal reference voltage is available externally via a low-power / low-current output buffer (driving current capability of 1  $\mu$ A typical).

### 3.14 System configuration controller and routing interface

The system configuration controller provides the capability to remap some alternate functions on different I/O ports.

The highly flexible routing interface allows the application firmware to control the routing of different I/Os to the TIM2, TIM3 and TIM4 timer input captures. It also controls the routing of internal analog signals to ADC1, COMP1 and COMP2 and the internal reference voltage  $V_{REFINT}$ .

### 3.15 Touch sensing

The STM32L151xC and STM32L152xC devices provide a simple solution for adding capacitive sensing functionality to any application. These devices offer up to 23 capacitive sensing channels distributed over 10 analog I/O groups. Both software and timer capacitive sensing acquisition modes are supported.

Capacitive sensing technology is able to detect the presence of a finger near a sensor which is protected from direct touch by a dielectric (glass, plastic...). The capacitive variation

introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists of charging the sensor capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. The capacitive sensing acquisition only requires few external components to operate. This acquisition is managed directly by the GPIOs, timers and analog I/O groups (see [Section 3.14: System configuration controller and routing interface](#)).

Reliable touch sensing functionality can be quickly and easily implemented using the free STM32L1xx STMTouch touch sensing firmware library.

## 3.16 Timers and watchdogs

The ultra-low-power STM32L151xC and STM32L152xC devices include seven general-purpose timers, two basic timers, and two watchdog timers.

[Table 7](#) compares the features of the general-purpose and basic timers.

**Table 7. Timer feature comparison**

| Timer            | Counter resolution | Counter type      | Prescaler factor                | DMA request generation | Capture/compare channels | Complementary outputs |
|------------------|--------------------|-------------------|---------------------------------|------------------------|--------------------------|-----------------------|
| TIM2, TIM3, TIM4 | 16-bit             | Up, down, up/down | Any integer between 1 and 65536 | Yes                    | 4                        | No                    |
| TIM5             | 32-bit             | Up, down, up/down | Any integer between 1 and 65536 | Yes                    | 4                        | No                    |
| TIM9             | 16-bit             | Up, down, up/down | Any integer between 1 and 65536 | No                     | 2                        | No                    |
| TIM10, TIM11     | 16-bit             | Up                | Any integer between 1 and 65536 | No                     | 1                        | No                    |
| TIM6, TIM7       | 16-bit             | Up                | Any integer between 1 and 65536 | Yes                    | 0                        | No                    |

### 3.16.1 General-purpose timers (TIM2, TIM3, TIM4, TIM5, TIM9, TIM10 and TIM11)

There are seven synchronizable general-purpose timers embedded in the STM32L151xC and STM32L152xC devices (see [Table 7](#) for differences).

#### **TIM2, TIM3, TIM4, TIM5**

TIM2, TIM3, TIM4 are based on 16-bit auto-reload up/down counter. TIM5 is based on a 32-bit auto-reload up/down counter. They include a 16-bit prescaler. They feature four independent channels each for input capture/output compare, PWM or one-pulse mode output. This gives up to 16 input captures/output compares/PWMs on the largest packages.

TIM2, TIM3, TIM4, TIM5 general-purpose timers can work together or with the TIM10, TIM11 and TIM9 general-purpose timers via the Timer Link feature for synchronization or event chaining. Their counter can be frozen in debug mode. Any of the general-purpose timers can be used to generate PWM outputs.

TIM2, TIM3, TIM4, TIM5 all have independent DMA request generation.

These timers are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.

#### **TIM10, TIM11 and TIM9**

TIM10 and TIM11 are based on a 16-bit auto-reload upcounter. TIM9 is based on a 16-bit auto-reload up/down counter. They include a 16-bit prescaler. TIM10 and TIM11 feature one independent channel, whereas TIM9 has two independent channels for input capture/output compare, PWM or one-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers.

They can also be used as simple time bases and be clocked by the LSE clock source (32.768 kHz) to provide time bases independent from the main CPU clock.

### **3.16.2 Basic timers (TIM6 and TIM7)**

These timers are mainly used for DAC trigger generation. They can also be used as generic 16-bit time bases.

### **3.16.3 SysTick timer**

This timer is dedicated to the OS, but could also be used as a standard downcounter. It is based on a 24-bit downcounter with autoreload capability and a programmable clock source. It features a maskable system interrupt generation when the counter reaches 0.

### **3.16.4 Independent watchdog (IWDG)**

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 37 kHz internal RC and, as it operates independently of the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes. The counter can be frozen in debug mode.

### **3.16.5 Window watchdog (WWDG)**

The window watchdog is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

## **3.17 Communication interfaces**

### **3.17.1 I<sup>2</sup>C bus**

Up to two I<sup>2</sup>C bus interfaces can operate in multimaster and slave modes. They can support standard and fast modes.

They support dual slave addressing (7-bit only) and both 7- and 10-bit addressing in master mode. A hardware CRC generation/verification is embedded.

They can be served by DMA and they support SM Bus 2.0/PM Bus.

### 3.17.2 Universal synchronous/asynchronous receiver transmitter (USART)

The three USART interfaces are able to communicate at speeds of up to 4 Mbit/s. They support IrDA SIR ENDEC and have LIN Master/Slave capability. The three USARTs provide hardware management of the CTS and RTS signals and are ISO 7816 compliant.

All USART interfaces can be served by the DMA controller.

### 3.17.3 Serial peripheral interface (SPI)

Up to three SPIs are able to communicate at up to 16 Mbits/s in slave and master modes in full-duplex and half-duplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC modes.

The SPIs can be served by the DMA controller.

### 3.17.4 Inter-integrated sound (I<sup>2</sup>S)

Two standard I2S interfaces (multiplexed with SPI2 and SPI3) are available. They can operate in master or slave mode, and can be configured to operate with a 16-/32-bit resolution as input or output channels. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both of the I2S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

The I2Ss can be served by the DMA controller.

### 3.17.5 Universal serial bus (USB)

The STM32L151xC and STM32L152xC devices embed a USB device peripheral compatible with the USB full-speed 12 Mbit/s. The USB interface implements a full-speed (12 Mbit/s) function interface. It has software-configurable endpoint setting and supports suspend/resume. The dedicated 48 MHz clock is generated from the internal main PLL (the clock source must use a HSE crystal oscillator).

## 3.18 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

## 3.19 Development support

### 3.19.1 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target. The JTAG JTMS and JTCK pins are shared with SWDAT and SWCLK, respectively, and a specific sequence on the JTMS pin is used to switch between JTAG-DP and SW-DP.

The JTAG port can be permanently disabled with a JTAG fuse.

### 3.19.2 Embedded Trace Macrocell™

The ARM® Embedded Trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32L151xC and STM32L152xC device through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer running debugger software. TPA hardware is commercially available from common development tool vendors. It operates with third party debugger software tools.

| D3       | 99      | 63     | A7      | 47                | V <sub>SS_3</sub> | S                       | -               | V <sub>SS_3</sub>                             | -                   | -                    |
| C4       | 100     | 64     | B7      | 48                | V <sub>DD_3</sub> | S                       | -               | V <sub>DD_3</sub>                             | -                   | -                    |

1. I = input, O = output, S = supply.

2. Function availability depends on the chosen device.

3. Applicable to STM32L152xC devices only. In STM32L151xC devices, this pin should be connected to V<sub>DD</sub>.

4. The PC14 and PC15 I/Os are only configured as OSC32\_IN/OSC32\_OUT when the LSE oscillator is ON (by setting the LSEON bit in the RCC\_CSR register). The LSE oscillator pins OSC32\_IN/OSC32\_OUT can be used as general-purpose PH0/PH1 I/Os, respectively, when the LSE oscillator is off (after reset, the LSE oscillator is off). The LSE has priority over the GPIO function. For more details, refer to Using the OSC32\_IN/OSC32\_OUT pins as GPIO PC14/PC15 port pins section in the STM32L151xx, STM32L152xx and STM32L162xx reference manual (RM0038).

5. The PH0 and PH1 I/Os are only configured as OSC\_IN/OSC\_OUT when the HSE oscillator is ON (by setting the HSEON bit in the RCC\_CR register). The HSE oscillator pins OSC\_IN/OSC\_OUT can be used as general-purpose PH0/PH1 I/Os, respectively, when the HSE oscillator is off (after reset, the HSE oscillator is off). The HSE has priority over the GPIO function.

## Alternate functions

Table 10. Alternate function input/output

Figure 9. Memory map

## 6 Electrical characteristics

### 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 6.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^{\circ}\text{C}$  and  $T_A = T_{A\text{max}}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean  $\pm 3\sigma$ ).

#### 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 3.6\text{ V}$  (for the  $1.65\text{ V} \leq V_{DD} \leq 3.6\text{ V}$  voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean  $\pm 2\sigma$ ).

#### 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 10](#).

#### 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 11](#).

## 6.1.6 Power supply scheme

Figure 12. Power supply scheme

### 6.1.7 Optional LCD power supply scheme

Figure 13. Optional LCD power supply scheme

1. Option 1: LCD power supply is provided by a dedicated V\_LCD supply source, VSEL switch is open.
2. Option 2: LCD power supply is provided by the internal step-up converter, VSEL switch is closed, an external capacitance is needed for correct behavior of this converter.

### 6.1.8 Current consumption measurement

Figure 14. Current consumption measurement scheme

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 11: Voltage characteristics](#), [Table 12: Current characteristics](#), and [Table 13: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 11. Voltage characteristics**

| Symbol                  | Ratings                                                                         | Min                                | Max          | Unit |
|-------------------------|---------------------------------------------------------------------------------|------------------------------------|--------------|------|
| $V_{DD}-V_{SS}$         | External main supply voltage (including $V_{DDA}$ and $V_{DD}$ ) <sup>(1)</sup> | -0.3                               | 4.0          | V    |
| $V_{IN}$ <sup>(2)</sup> | Input voltage on five-volt tolerant pin                                         | $V_{SS}-0.3$                       | $V_{DD}+4.0$ |      |
|                         | Input voltage on any other pin                                                  | $V_{SS}-0.3$                       | 4.0          |      |
| $ \Delta V_{DDx} $      | Variations between different $V_{DD}$ power pins                                | -                                  | 50           | mV   |
| $ V_{SSx}-V_{SS} $      | Variations between all different ground pins                                    | -                                  | 50           |      |
| $V_{REF+}-V_{DDA}$      | Allowed voltage difference for $V_{REF+} > V_{DDA}$                             | -                                  | 0.4          | V    |
| $V_{ESD(HBM)}$          | Electrostatic discharge voltage (human body model)                              | see <a href="#">Section 6.3.11</a> |              |      |

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 12](#) for maximum allowed injected current values.

**Table 12. Current characteristics**

| Symbol                           | Ratings                                                                        | Max.  | Unit |
|----------------------------------|--------------------------------------------------------------------------------|-------|------|
| $I_{VDD(\Sigma)}$                | Total current into sum of all $V_{DD\_x}$ power lines (source) <sup>(1)</sup>  | 100   | mA   |
| $I_{VSS(\Sigma)}$ <sup>(2)</sup> | Total current out of sum of all $V_{SS\_x}$ ground lines (sink) <sup>(1)</sup> | 100   |      |
| $I_{VDD(PIN)}$                   | Maximum current into each $V_{DD\_x}$ power pin (source) <sup>(1)</sup>        | 70    |      |
| $I_{VSS(PIN)}$                   | Maximum current out of each $V_{SS\_x}$ ground pin (sink) <sup>(1)</sup>       | -70   |      |
| $I_{IO}$                         | Output current sunk by any I/O and control pin                                 | 25    |      |
|                                  | Output current sourced by any I/O and control pin                              | - 25  |      |
| $\Sigma I_{IO(PIN)}$             | Total output current sunk by sum of all IOs and control pins <sup>(2)</sup>    | 60    |      |
|                                  | Total output current sourced by sum of all IOs and control pins <sup>(2)</sup> | -60   |      |
| $I_{INJ(PIN)}$ <sup>(3)</sup>    | Injected current on five-volt tolerant I/O <sup>(4)</sup> , RST and B pins     | -5/+0 |      |
|                                  | Injected current on any other pin <sup>(5)</sup>                               | ± 5   |      |
| $\Sigma I_{INJ(PIN)}$            | Total injected current (sum of all I/O and control pins) <sup>(6)</sup>        | ± 25  |      |

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count LQFP packages.
3. Negative injection disturbs the analog performance of the device. See note in [Section 6.3.17](#).
4. Positive current injection is not possible on these I/Os. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 11](#) for maximum allowed input voltage values.

5. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 11: Voltage characteristics](#) for the maximum allowed input voltage values.
6. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 13. Thermal characteristics

| Symbol    | Ratings                      | Value       | Unit |
|-----------|------------------------------|-------------|------|
| $T_{STG}$ | Storage temperature range    | -65 to +150 | °C   |
| $T_J$     | Maximum junction temperature | 150         | °C   |

## 6.3 Operating conditions

### 6.3.1 General operating conditions

Table 14. General operating conditions

| Symbol          | Parameter                                                                                                   | Conditions                                 | Min  | Max          | Unit |
|-----------------|-------------------------------------------------------------------------------------------------------------|--------------------------------------------|------|--------------|------|
| $f_{HCLK}$      | Internal AHB clock frequency                                                                                | -                                          | 0    | 32           | MHz  |
| $f_{PCLK1}$     | Internal APB1 clock frequency                                                                               | -                                          | 0    | 32           |      |
| $f_{PCLK2}$     | Internal APB2 clock frequency                                                                               | -                                          | 0    | 32           |      |
| $V_{DD}$        | Standard operating voltage                                                                                  | BOR detector disabled                      | 1.65 | 3.6          | V    |
|                 |                                                                                                             | BOR detector enabled, at power on          | 1.8  | 3.6          |      |
|                 |                                                                                                             | BOR detector disabled, after power on      | 1.65 | 3.6          |      |
| $V_{DDA}^{(1)}$ | Analog operating voltage (ADC and DAC not used)                                                             | Must be the same voltage as $V_{DD}^{(2)}$ | 1.65 | 3.6          | V    |
|                 | Analog operating voltage (ADC or DAC used)                                                                  |                                            | 1.8  | 3.6          |      |
| $V_{IN}$        | I/O input voltage                                                                                           | FT pins; $2.0\text{ V} \leq V_{DD}$        | -0.3 | $5.5^{(3)}$  | V    |
|                 |                                                                                                             | FT pins; $V_{DD} < 2.0\text{ V}$           | -0.3 | $5.25^{(3)}$ |      |
|                 |                                                                                                             | BOOT0 pin                                  | 0    | 5.5          |      |
|                 |                                                                                                             | Any other pin                              | -0.3 | $V_{DD}+0.3$ |      |
| $P_D$           | Power dissipation at $T_A = 85\text{ °C}$ for suffix 6 or $T_A = 105\text{ °C}$ for suffix 7 <sup>(4)</sup> | LQFP48 package                             | -    | 364          | mW   |

|                 |                                                                                                             | WLCSP63 package                            | -    | 408          |      |
| $T_A$           | Ambient temperature for 6 suffix version                                                                    | Maximum power dissipation <sup>(5)</sup>   | -40  | 85           | °C   |
|                 | Ambient temperature for 7 suffix version                                                                    | Maximum power dissipation                  | -40  | 105          |      |

Table 14. General operating conditions (continued)

| Symbol         | Parameter                  | Conditions       | Min | Max | Unit |
|----------------|----------------------------|------------------|-----|-----|------|
| T <sub>J</sub> | Junction temperature range | 6 suffix version | −40 | 105 | °C   |
|                |                            | 7 suffix version | −40 | 110 |      |

1. When the ADC is used, refer to [Table 56: ADC characteristics](#).
2. It is recommended to power V<sub>DD</sub> and V<sub>DDA</sub> from the same source. A maximum difference of 300 mV between V<sub>DD</sub> and V<sub>DDA</sub> can be tolerated during power-up and up to 140 mV in operation.
3. To sustain a voltage higher than VDD+0.3V, the internal pull-up/pull-down resistors must be disabled.
4. If T<sub>A</sub> is lower, higher P<sub>D</sub> values are allowed as long as T<sub>J</sub> does not exceed T<sub>J</sub> max (see [Table 73: Thermal characteristics on page 128](#)).
5. In low-power dissipation state, T<sub>A</sub> can be extended to −40°C to 105°C temperature range as long as T<sub>J</sub> does not exceed T<sub>J</sub> max (see [Table 73: Thermal characteristics on page 128](#)).

### 6.3.2 Embedded reset and power control block characteristics

The parameters given in the following table are derived from the tests performed under the conditions summarized in [Table 14](#).

Table 15. Embedded reset and power control block characteristics

| Symbol                               | Parameter                           | Conditions                                          | Min  | Typ  | Max  | Unit |
|--------------------------------------|-------------------------------------|-----------------------------------------------------|------|------|------|------|
| t <sub>VDD</sub> <sup>(1)</sup>      | V <sub>DD</sub> rise time rate      | BOR detector enabled                                | 0    | -    | ∞    | μs/V |
|                                      |                                     | BOR detector disabled                               | 0    | -    | 1000 |      |
|                                      | V <sub>DD</sub> fall time rate      | BOR detector enabled                                | 20   | -    | ∞    |      |
|                                      |                                     | BOR detector disabled                               | 0    | -    | 1000 |      |
| T <sub>RSTTEMPO</sub> <sup>(1)</sup> | Reset temporization                 | V <sub>DD</sub> rising, BOR enabled                 | -    | 2    | 3.3  | ms   |
|                                      |                                     | V <sub>DD</sub> rising, BOR disabled <sup>(2)</sup> | 0.4  | 0.7  | 1.6  |      |
| V <sub>POR/PDR</sub>                 | Power on/power down reset threshold | Falling edge                                        | 1    | 1.5  | 1.65 | V    |
|                                      |                                     | Rising edge                                         | 1.3  | 1.5  | 1.65 |      |
| V <sub>BOR0</sub>                    | Brown-out reset threshold 0         | Falling edge                                        | 1.67 | 1.7  | 1.74 |      |
|                                      |                                     | Rising edge                                         | 1.69 | 1.76 | 1.8  |      |
| V <sub>BOR1</sub>                    | Brown-out reset threshold 1         | Falling edge                                        | 1.87 | 1.93 | 1.97 |      |
|                                      |                                     | Rising edge                                         | 1.96 | 2.03 | 2.07 |      |
| V <sub>BOR2</sub>                    | Brown-out reset threshold 2         | Falling edge                                        | 2.22 | 2.30 | 2.35 |      |
|                                      |                                     | Rising edge                                         | 2.31 | 2.41 | 2.44 |      |

Table 15. Embedded reset and power control block characteristics (continued)

| Symbol     | Parameter                                 | Conditions                                | Min  | Typ  | Max  | Unit |
|------------|-------------------------------------------|-------------------------------------------|------|------|------|------|
| $V_{BOR3}$ | Brown-out reset threshold 3               | Falling edge                              | 2.45 | 2.55 | 2.6  | V    |

| $V_{PVD0}$ | Programmable voltage detector threshold 0 | Falling edge                              | 1.8  | 1.85 | 1.88 |      |
|            |                                           | Rising edge                               | 1.88 | 1.94 | 1.99 |      |
| $V_{PVD1}$ | PVD threshold 1                           | Falling edge                              | 1.98 | 2.04 | 2.09 |      |
|            |                                           | Rising edge                               | 2.08 | 2.14 | 2.18 |      |
| $V_{PVD2}$ | PVD threshold 2                           | Falling edge                              | 2.20 | 2.24 | 2.28 |      |
|            |                                           | Rising edge                               | 2.28 | 2.34 | 2.38 |      |
| $V_{PVD3}$ | PVD threshold 3                           | Falling edge                              | 2.39 | 2.44 | 2.48 |      |
|            |                                           | Rising edge                               | 2.47 | 2.54 | 2.58 |      |
| $V_{PVD4}$ | PVD threshold 4                           | Falling edge                              | 2.57 | 2.64 | 2.69 |      |
|            |                                           | Rising edge                               | 2.68 | 2.74 | 2.79 |      |
| $V_{PVD5}$ | PVD threshold 5                           | Falling edge                              | 2.77 | 2.83 | 2.88 |      |
|            |                                           | Rising edge                               | 2.87 | 2.94 | 2.99 |      |
| $V_{PVD6}$ | PVD threshold 6                           | Falling edge                              | 2.97 | 3.05 | 3.09 |      |
|            |                                           | Rising edge                               | 3.08 | 3.15 | 3.20 |      |
| $V_{hyst}$ | Hysteresis voltage                        | BOR0 threshold                            | -    | 40   | -    | mV   |
|            |                                           | All BOR and PVD thresholds excepting BOR0 | -    | 100  | -    |      |

1. Guaranteed by characterization results, not tested in production.

2. Valid for device version without BOR at power up. Please see option "D" in Ordering information scheme for more details.

### 6.3.3 Embedded internal reference voltage

The parameters given in [Table 17](#) are based on characterization results, unless otherwise specified.

**Table 16. Embedded internal reference voltage calibration values**

| Calibration value name | Description                                                                                       | Memory address            |
|------------------------|---------------------------------------------------------------------------------------------------|---------------------------|
| VREFINT_CAL            | Raw data acquired at temperature of 30 °C $\pm$ 5 °C<br>$V_{DDA} = 3 \text{ V} \pm 10 \text{ mV}$ | 0x1FF8 00F8 - 0x1FF8 00F9 |

**Table 17. Embedded internal reference voltage**

| Symbol                          | Parameter                                                                                 | Conditions                                                                     | Min   | Typ   | Max     | Unit                     |
|---------------------------------|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|-------|-------|---------|--------------------------|
| $V_{\text{REFINT\_out}}^{(1)}$  | Internal reference voltage                                                                | $-40\text{ °C} < T_J < +110\text{ °C}$                                         | 1.202 | 1.224 | 1.242   | V                        |
| $I_{\text{REFINT}}$             | Internal reference current consumption                                                    | -                                                                              | -     | 1.4   | 2.3     | $\mu\text{A}$            |
| $T_{\text{VREFINT}}$            | Internal reference startup time                                                           | -                                                                              | -     | 2     | 3       | ms                       |

1. Guaranteed by test in production.

2. The internal  $V_{\text{REF}}$  value is individually measured in production and stored in dedicated EEPROM bytes.

3. Guaranteed by characterization results, not tested in production.

4. Shortest sampling time can be determined in the application by multiple iterations.

5. To guarantee less than 1% VREF\_OUT deviation.

### 6.3.4 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code. The current consumption is measured as described in [Figure 14: Current consumption measurement scheme](#).

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to the Dhrystone 2.1 code, unless otherwise specified. The current consumption values are derived from tests performed under ambient temperature  $T_A = 25\text{ }^{\circ}\text{C}$  and  $V_{DD}$  supply voltage conditions summarized in [Table 14: General operating conditions](#), unless otherwise specified.

The MCU is placed under the following conditions:

- All I/O pins are configured in analog input mode
- All peripherals are disabled except when explicitly mentioned.
- The Flash memory access time, 64-bit access and prefetch is adjusted depending on  $f_{HCLK}$  frequency and voltage range to provide the best CPU performance.
- When the peripherals are enabled  $f_{APB1} = f_{APB2} = f_{AHB}$ .
- When PLL is ON, the PLL inputs are equal to HSI = 16 MHz (if internal clock is used) or HSE = 16 MHz (if HSE bypass mode is used).
- The HSE user clock applied to OSCI\_IN input follows the characteristic specified in [Table 27: High-speed external user clock characteristics](#).
- For maximum current consumption  $V_{DD} = V_{DDA} = 3.6\text{ V}$  is applied to all supply pins.
- For typical current consumption  $V_{DD} = V_{DDA} = 3.0\text{ V}$  is applied to all supply pins if not specified otherwise.

Table 18. Current consumption in Run mode, code with data processing running from Flash

1. Guaranteed by characterization results, not tested in production, unless otherwise specified.
2. LCD enabled with external VLCD, static duty, division ratio = 256, all pixels active, no LCD connected.
3. LCD enabled with external VLCD, 1/8 duty, 1/3 bias, division ratio = 64, all pixels active, no LCD connected.
4. Based on characterization done with a 32.768 kHz crystal (MC306-G-06Q-32.768, manufacturer JFVNY) with two 6.8 pF loading capacitors.
5. Guaranteed by test in production.
6. When MSI = 64 kHz, the RMS current is measured over the first 15  $\mu\text{s}$  following the wakeup event. For the remaining part of the wakeup period, the current corresponds the Run mode current.

Table 24. Typical and maximum current consumptions in Standby mode

1. Guaranteed by characterization results, not tested in production, unless otherwise specified.

2. Guaranteed by test in production.

3. Based on characterization done with a 32.768 kHz crystal (MC306-G-06Q-32.768, manufacturer JFVNY) with two 6.8pF loading capacitors.

### On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in the following table. The MCU is placed under the following conditions:

- all I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- all peripherals are disabled unless otherwise mentioned
- the given value is calculated by measuring the current consumption
  - with all peripherals clocked off
  - with only one peripheral clocked on

Table 25. Peripheral current consumption<sup>(1)</sup>

| Peripheral |        | Typical consumption, $V_{DD} = 3.0\text{ V}$ , $T_A = 25\text{ °C}$ |                                                          |                                                          |                               | Unit                                |

1. Data based on differential I<sub>DD</sub> measurement between all peripherals OFF and one peripheral with clock enabled, in the following conditions: f<sub>HCLK</sub> = 32 MHz (range 1), f<sub>HCLK</sub> = 16 MHz (range 2), f<sub>HCLK</sub> = 4 MHz (range 3), f<sub>HCLK</sub> = 64kHz (Low-power run/sleep), f<sub>APB1</sub> = f<sub>HCLK</sub>, f<sub>APB2</sub> = f<sub>HCLK</sub>, default prescaler value for each peripheral. The CPU is in Sleep mode in both cases. No I/O pins toggling. Not tested in production.

2. HSI oscillator is OFF for this measure.

3. In Low-power sleep and run mode, the Flash memory must always be in power-down mode.
4. Data based on a differential  $I_{DD}$  measurement between ADC in reset configuration and continuous ADC conversion (HSI consumption not included).
5. Data based on a differential  $I_{DD}$  measurement between DAC in reset configuration and continuous DAC conversion of  $V_{DD}/2$ . DAC is in buffered mode, output is left floating.
6. Including supply current of internal reference voltage.

### 6.3.5 Wakeup time from low-power mode

The wakeup times given in the following table are measured with the MSI RC oscillator. The clock source used to wake up the device depends on the current operating mode:

- Sleep mode: the clock source is the clock that was set before entering Sleep mode
- Stop mode: the clock source is the MSI oscillator in the range configured before entering Stop mode
- Standby mode: the clock source is the MSI oscillator running at 2.1 MHz

All timings are derived from tests performed under the conditions summarized in [Table 14](#).

**Table 26. Low-power mode wakeup timings**

### 6.3.6 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO. The external clock signal has to respect the I/O characteristics in [Section 6.3.12](#). However, the recommended clock input waveform is shown in [Figure 15](#).

**Table 27. High-speed external user clock characteristics<sup>(1)</sup>**

### High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 1 to 24 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 29](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 29. HSE oscillator characteristics<sup>(1)(2)</sup>

| Symbol                       | Parameter                                                                                                | Conditions                                              | Min | Typ | Max                                | Unit       |

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
2. Guaranteed by characterization results, not tested in production.
3. The relatively low value of the RF resistor offers a good protection against issues resulting from use in a humid environment, due to the induced leakage and the bias condition change. However, it is recommended to take this point into account if the MCU is used in tough humidity conditions.
4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 17](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ . Refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website [www.st.com](http://www.st.com).

Figure 17. HSE oscillator circuit diagram

1.  $R_{EXT}$  value depends on the crystal characteristics.

### Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 30](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 30. LSE oscillator characteristics ( $f_{LSE} = 32.768$  kHz)<sup>(1)</sup>**

| Symbol              | Parameter                                                                                                | Conditions                          | Min | Typ    | Max | Unit |

| $I_{LSE}$           | LSE driving current                                                                                      | $V_{DD} = 3.3$ V, $V_{IN} = V_{SS}$ | -   | -      | 1.1 | μA   |
| $I_{DD} (LSE)$      | LSE oscillator current consumption                                                                       | $V_{DD} = 1.8$ V                    | -   | 450    | -   | nA   |
|                     |                                                                                                          | $V_{DD} = 3.0$ V                    | -   | 600    | -   |      |
|                     |                                                                                                          | $V_{DD} = 3.6$ V                    | -   | 750    | -   |      |
| $g_m$               | Oscillator transconductance                                                                              | -                                   | 3   | -      | -   | μA/V |
| $t_{SU(LSE)}^{(4)}$ | Startup time                                                                                             | $V_{DD}$ is stabilized              | -   | 1      | -   | s    |

1. Guaranteed by characterization results, not tested in production.
2. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers".
3. The oscillator selection can be optimized in terms of supply current using an high quality resonator with small  $R_S$  value for example MSIV-TIN32.768kHz. Refer to crystal manufacturer for more details.

4.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

**Note:** For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality ceramic capacitors in the 5 pF to 15 pF range selected to match the requirements of the crystal or resonator (see Figure 18).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . Load capacitance  $C_L$  has the following formula:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$  where  $C_{stray}$  is the pin capacitance and board or trace PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

**Caution:** To avoid exceeding the maximum value of  $C_{L1}$  and  $C_{L2}$  (15 pF) it is strongly recommended to use a resonator with a load capacitance  $C_L \leq 7$  pF. Never use a resonator with a load capacitance of 12.5 pF.

**Example:** if you choose a resonator with a load capacitance of  $C_L = 6$  pF and  $C_{stray} = 2$  pF, then  $C_{L1} = C_{L2} = 8$  pF.

**Figure 18. Typical application with a 32.768 kHz crystal**

1. The trimming step differs depending on the trimming code. It is usually negative on the codes which are multiples of 16 (0x00, 0x10, 0x20, 0x30...0xE0).
2. Guaranteed by characterization results, not tested in production.
3. Guaranteed by test in production.

#### Low-speed internal (LSI) RC oscillator

**Table 32. LSI oscillator characteristics**

| Symbol                     | Parameter                                                                                        | Min | Typ | Max | Unit          |

|                              |                                    | MSI range 5                              | -   | 2   |               |
|                              |                                    | MSI range 6,<br>Voltage range 1<br>and 2 | -   | 2   |               |
|                              |                                    | MSI range 3,<br>Voltage range 3          | -   | 3   |               |
| $f_{\text{OVER(MSI)}}$       | MSI oscillator frequency overshoot | Any range to<br>range 5                  | -   | 4   | MHz           |
|                              |                                    | Any range to<br>range 6                  | -   | 6   |               |

1. This is a deviation for an individual part, once the initial frequency has been measured.
2. Guaranteed by characterization results, not tested in production.

### 6.3.8 PLL characteristics

The parameters given in [Table 34](#) are derived from tests performed under the conditions summarized in [Table 14](#).

**Table 34. PLL characteristics**

| Symbol                 | Parameter                                               | Value |     |                    | Unit |
|------------------------|---------------------------------------------------------|-------|-----|--------------------|------|
|                        |                                                         | Min   | Typ | Max <sup>(1)</sup> |      |
| f <sub>PLL_IN</sub>    | PLL input clock <sup>(2)</sup>                          | 2     | -   | 24                 | MHz  |
|                        | PLL input clock duty cycle                              | 45    | -   | 55                 | %    |
| f <sub>PLL_OUT</sub>   | PLL output clock                                        | 2     | -   | 32                 | MHz  |
| t <sub>LOCK</sub>      | PLL lock time<br>PLL input = 16 MHz<br>PLL VCO = 96 MHz | -     | 115 | 160                | μs   |
| Jitter                 | Cycle-to-cycle jitter                                   | -     | -   | ±600               | ps   |
| I <sub>DDA</sub> (PLL) | Current consumption on V <sub>DDA</sub>                 | -     | 220 | 450                | μA   |
| I <sub>DD</sub> (PLL)  | Current consumption on V <sub>DD</sub>                  | -     | 120 | 150                |      |

1. Guaranteed by characterization results, not tested in production.
2. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by f<sub>PLL\_OUT</sub>.

### 6.3.9 Memory characteristics

The characteristics are given at T<sub>A</sub> = -40 to 105 °C unless otherwise specified.

#### RAM memory

**Table 35. RAM and hardware registers**

| Symbol | Parameter                          | Conditions           | Min  | Typ | Max | Unit |
|--------|------------------------------------|----------------------|------|-----|-----|------|
| VRM    | Data retention mode <sup>(1)</sup> | STOP mode (or RESET) | 1.65 | -   | -   | V    |

1. Minimum supply voltage without losing data stored in RAM (in Stop mode or under Reset) or in hardware registers (only in Stop mode).

## Flash memory and data EEPROM

Table 36. Flash memory and data EEPROM characteristics

| Symbol     | Parameter                                                                      | Conditions                                                   | Min  | Typ  | Max <sup>(1)</sup> | Unit          |
|------------|--------------------------------------------------------------------------------|--------------------------------------------------------------|------|------|--------------------|---------------|
| $V_{DD}$   | Operating voltage<br>Read / Write / Erase                                      | -                                                            | 1.65 | -    | 3.6                | V             |
| $t_{prog}$ | Programming/ erasing<br>time for byte / word /<br>double word / half-page      | Erasing                                                      | -    | 3.28 | 3.94               | ms            |
|            |                                                                                | Programming                                                  | -    | 3.28 | 3.94               |               |
| $I_{DD}$   | Average current during<br>the whole programming /<br>erase operation           | $T_A = 25\text{ }^{\circ}\text{C}$ , $V_{DD} = 3.6\text{ V}$ | -    | 600  | 900                | $\mu\text{A}$ |
|            | Maximum current (peak)<br>during the whole<br>programming / erase<br>operation |                                                              | -    | 1.5  | 2.5                | mA            |

1. Guaranteed by design, not tested in production.

Table 37. Flash memory and data EEPROM endurance and retention

| Symbol          | Parameter                                                                                       | Conditions                                                              | Value              |     |     | Unit    |
|-----------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|--------------------|-----|-----|---------|

| $t_{RET}^{(2)}$ | Data retention (program memory) after<br>10 kcycles at $T_A = 85\text{ }^{\circ}\text{C}$       | $T_{RET} = +85\text{ }^{\circ}\text{C}$                                 | 30                 | -   | -   | years   |
|                 | Data retention (EEPROM data memory)<br>after 300 kcycles at $T_A = 85\text{ }^{\circ}\text{C}$  | $T_{RET} = +85\text{ }^{\circ}\text{C}$                                 | 30                 | -   | -   |         |
|                 | Data retention (program memory) after<br>10 kcycles at $T_A = 105\text{ }^{\circ}\text{C}$      | $T_{RET} = +105\text{ }^{\circ}\text{C}$                                | 10                 | -   | -   |         |
|                 | Data retention (EEPROM data memory)<br>after 300 kcycles at $T_A = 105\text{ }^{\circ}\text{C}$ | $T_{RET} = +105\text{ }^{\circ}\text{C}$                                | 10                 | -   | -   |         |

1. Guaranteed by characterization results, not tested in production.

2. Characterization is done according to JEDEC JESD22-A117.

### 6.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB: A Burst of Fast Transient voltage** (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 38](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 38. EMS characteristics**

| Symbol     | Parameter                                                                                                                         | Conditions                                                                                                                          | Level/Class |
|------------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------|
| $V_{FESD}$ | Voltage limits to be applied on any I/O pin to induce a functional disturbance                                                    | $V_{DD} = 3.3\text{ V}$ , LQFP100, $T_A = +25\text{ }^{\circ}\text{C}$ ,<br>$f_{HCLK} = 32\text{ MHz}$<br>conforms to IEC 61000-4-2 | 2B          |
| $V_{EFTB}$ | Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance | $V_{DD} = 3.3\text{ V}$ , LQFP100, $T_A = +25\text{ }^{\circ}\text{C}$ ,<br>$f_{HCLK} = 32\text{ MHz}$<br>conforms to IEC 61000-4-4 | 4A          |

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

##### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

##### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

**Table 39. EMI characteristics**

| Symbol           | Parameter  | Conditions                                                                                           | Monitored frequency band | Max vs. frequency range |                        |                        | Unit |
|------------------|------------|------------------------------------------------------------------------------------------------------|--------------------------|-------------------------|------------------------|------------------------|------|

### 6.3.11 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

**Table 40. ESD absolute maximum ratings**

| Symbol                | Ratings                                               | Conditions                                                | Class | Maximum value <sup>(1)</sup> | Unit |
|-----------------------|-------------------------------------------------------|-----------------------------------------------------------|-------|------------------------------|------|
| V <sub>ESD(HBM)</sub> | Electrostatic discharge voltage (human body model)    | T <sub>A</sub> = +25 °C, conforming to JESD22-A114        | 2     | 2000                         | V    |
| V <sub>ESD(CDM)</sub> | Electrostatic discharge voltage (charge device model) | T <sub>A</sub> = +25 °C, conforming to ANSI/ESD STM5.3.1. | II    | 500                          | V    |

1. Guaranteed by characterization results, not tested in production.

### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

**Table 41. Electrical sensitivities**

| Symbol | Parameter             | Conditions                                                 | Class      |
|--------|-----------------------|------------------------------------------------------------|------------|
| LU     | Static latch-up class | $T_A = +105\text{ }^{\circ}\text{C}$ conforming to JESD78A | II level A |

### 6.3.12 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of  $-5\text{ }\mu\text{A}/+0\text{ }\mu\text{A}$  range), or other functional failure (for example reset occurrence oscillator frequency deviation, LCD levels).

The test results are given in the [Table 42](#).

**Table 42. I/O current injection susceptibility**

| Symbol    | Description                                    | Functional susceptibility |                    | Unit |
|-----------|------------------------------------------------|---------------------------|--------------------|------|
|           |                                                | Negative injection        | Positive injection |      |
| $I_{INJ}$ | Injected current on all 5 V tolerant (FT) pins | -5 <sup>(1)</sup>         | NA                 | mA   |
|           | Injected current on BOOT0                      | -0                        | NA                 |      |
|           | Injected current on any other pin              | -5 <sup>(1)</sup>         | +5                 |      |

1. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.

### 6.3.13 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 49](#) are derived from tests performed under the conditions summarized in [Table 14](#). All I/Os are CMOS and TTL compliant.

**Table 43. I/O static characteristics**

| Symbol    | Parameter                                             | Conditions                                                            | Min                        | Typ                 | Max                   | Unit       |

| $C_{IO}$  | I/O pin capacitance                                   | -                                                                     | -                          | 5                   | -                     | pF         |

1. Guaranteed by test in production

2. Guaranteed by design, not tested in production.

3. With a minimum of 200 mV.

4. The max. value may be exceeded if negative current is injected on adjacent pins.

5. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This MOS/NMOS contribution to the series resistance is minimum (~10% order).

## Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and sink or source up to  $\pm 20$  mA with the non-standard  $V_{OL}/V_{OH}$  specifications given in [Table 44](#).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $I_{VDD(\Sigma)}$  (see [Table 12](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $I_{VSS(\Sigma)}$  (see [Table 12](#)).

## Output voltage levels

Unless otherwise specified, the parameters given in [Table 44](#) are derived from tests performed under the conditions summarized in [Table 14](#). All I/Os are CMOS and TTL compliant.

**Table 44. Output voltage characteristics**

| Symbol            | Parameter                                | Conditions                                       | Min           | Max  | Unit |
|-------------------|------------------------------------------|--------------------------------------------------|---------------|------|------|
| $V_{OL}^{(1)(2)}$ | Output low level voltage for an I/O pin  | $I_{IO} = 8$ mA<br>$2.7$ V < $V_{DD}$ < $3.6$ V  | -             | 0.4  | V    |
| $V_{OH}^{(2)(3)}$ | Output high level voltage for an I/O pin |                                                  | $V_{DD}-0.4$  | -    |      |
| $V_{OL}^{(3)(4)}$ | Output low level voltage for an I/O pin  | $I_{IO} = 4$ mA<br>$1.65$ V < $V_{DD}$ < $3.6$ V | -             | 0.45 |      |
| $V_{OH}^{(3)(4)}$ | Output high level voltage for an I/O pin |                                                  | $V_{DD}-0.45$ | -    |      |
| $V_{OL}^{(1)(4)}$ | Output low level voltage for an I/O pin  | $I_{IO} = 20$ mA<br>$2.7$ V < $V_{DD}$ < $3.6$ V | -             | 1.3  |      |
| $V_{OH}^{(3)(4)}$ | Output high level voltage for an I/O pin |                                                  | $V_{DD}-1.3$  | -    |      |

1. The  $I_{IO}$  current sunk by the device must always respect the absolute maximum rating specified in [Table 12](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .
2. Guaranteed by test in production.
3. The  $I_{IO}$  current sourced by the device must always respect the absolute maximum rating specified in [Table 12](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VDD}$ .
4. Guaranteed by characterization results, not tested in production.

### Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 19](#) and [Table 45](#), respectively.

Unless otherwise specified, the parameters given in [Table 45](#) are derived from tests performed under the conditions summarized in [Table 14](#).

**Table 45. I/O AC characteristics<sup>(1)</sup>**

1. The I/O speed is configured using the OSPEEDRx[1:0] bits. Refer to the STM32L151xx, STM32L152xx and STM32L162xx reference manual for a description of GPIO Port configuration register.

2. Guaranteed by design, not tested in production.

3. The maximum frequency is defined in [Figure 19](#).

Figure 19. I/O AC characteristics definition

### 6.3.14 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 46](#))

Unless otherwise specified, the parameters given in [Table 46](#) are derived from tests performed under the conditions summarized in [Table 14](#).

Table 46. NRST pin characteristics

| Symbol                | Parameter                                       | Conditions                                                             | Min               | Typ                | Max          | Unit |

| $V_{NF(NRST)}^{(3)}$  | NRST input not filtered pulse                   | -                                                                      | 350               | -                  | -            | ns   |

1. Guaranteed by design, not tested in production.

2. With a minimum of 200 mV.

3. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is around 10%.

Figure 20. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 46](#). Otherwise the reset will not be taken into account by the device.

### 6.3.15 TIM timer characteristics

The parameters given in the [Table 47](#) are guaranteed by design.

Refer to [Section 6.3.13: I/O port characteristics](#) for details on the input/output cition characteristics (output compare, input capture, external clock, PWM output).

Table 47. TIMx<sup>(1)</sup> characteristics

| Symbol           | Parameter                                                                                | Conditions                     | Min    | Max                  | Unit          |
|------------------|------------------------------------------------------------------------------------------|--------------------------------|--------|----------------------|---------------|
| $t_{res(TIM)}$   | Timer resolution time                                                                    | -                              | 1      | -                    | $t_{TIMxCLK}$ |

1. TIMx is used as a general term to refer to the TIM2, TIM3 and TIM4 timers.

### 6.3.16 Communications interfaces

#### I<sup>2</sup>C interface characteristics

The device I<sup>2</sup>C interface meets the requirements of the standard I<sup>2</sup>C communication protocol with the following restrictions: SDA and SCL are not “true” open-drain I/O pins. When configured as open-drain, the PMOS connected between the I/O pin and V<sub>DD</sub> is disabled, but is still present.

The I<sup>2</sup>C characteristics are described in [Table 48](#). Refer also to [Section 6.3.13: I/O port characteristics](#) for more details on the input/output cation characteristics (SDA and SCL).

**Table 48. I<sup>2</sup>C characteristics**

| C <sub>b</sub>                               | Capacitive load for each bus line                              | -                                                   | 400                 | -                                            | 400                | pF   |
| t <sub>SP</sub>                              | Pulse width of spikes that are suppressed by the analog filter | 0                                                   | 50 <sup>(4)</sup>   | 0                                            | 50 <sup>(4)</sup>  | ns   |

1. Guaranteed by design, not tested in production.
2. f<sub>PCLK1</sub> must be at least 2 MHz to achieve standard mode I<sup>2</sup>C frequencies. It must be at least 4 MHz to achieve fast mode I<sup>2</sup>C frequencies. It must be a multiple of 10 MHz to reach the 400 kHz maximum I<sup>2</sup>C fast mode clock.
3. The maximum Data hold time has only to be met if the interface does not stretch the low period of SCL signal.
4. The minimum width of the spikes filtered by the analog filter is above t<sub>SP(max)</sub>.

Figure 21. I<sup>2</sup>C bus AC waveforms and measurement circuit

1.  $R_S$  = series protection resistor.
2.  $R_P$  = external pull-up resistor.
3.  $V_{DD\_I2C}$  is the I2C bus power supply.
4. Measurement points are done at CMOS levels:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

Table 49. SCL frequency ( $f_{PCLK1} = 32\text{ MHz}$ ,  $V_{DD} = V_{DD\_I2C} = 3.3\text{ V}$ )<sup>(1)(2)</sup>

| $f_{SCL}$ (kHz) | I2C_CCR value              |
|-----------------|----------------------------|
|                 | $R_P = 4.7\text{ k}\Omega$ |
| 400             | 0x801B                     |
| 300             | 0x8024                     |
| 200             | 0x8035                     |
| 100             | 0x00A0                     |
| 50              | 0x0140                     |
| 20              | 0x0320                     |

1.  $R_P$  = External pull-up resistance,  $f_{SCL}$  = I<sup>2</sup>C speed.
2. For speeds around 200 kHz, the tolerance on the achieved speed is of  $\pm 5\%$ . For other speed ranges, the tolerance on the achieved speed is  $\pm 2\%$ . These variations depend on the accuracy of the external components used to design the application.

**SPI characteristics**

Unless otherwise specified, the parameters given in the following table are derived from tests performed under the conditions summarized in [Table 14](#).

Refer to [Section 6.3.12: I/O current injection characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

**Table 50. SPI characteristics<sup>(1)</sup>**

1. The characteristics above are given for voltage range 1.
2. Guaranteed by characterization results, not tested in production.
3. The maximum SPI clock frequency in slave transmitter mode is given for an SPI slave input clock duty cycle (DuCy(SCK)) ranging between 40 to 60%.
4. Min time is for the minimum time to drive the output and max time is for the maximum time to validate the data.

1. The maximum for 256x $F_s$  is 8 MHz

**Note:** Refer to the I2S section of the product reference manual for more details about the sampling frequency ( $F_s$ ),  $f_{MCK}$ ,  $f_{CK}$  and  $D_{CK}$  values. These values reflect only the digital peripheral behavior, source clock precision might slightly change them.  $D_{CK}$  depends mainly on the

ODD bit value, digital contribution leads to a min of  $(I2SDIV/(2*I2SDIV+ODD))$  and a max of  $(I2SDIV+ODD)/(2*I2SDIV+ODD)$ . Fs max is supported for each mode/condition.

**Figure 26. I<sup>2</sup>S slave timing diagram (Philips protocol)<sup>(1)</sup>**

1. Measurement points are done at CMOS levels:  $0.3 \times V_{DD}$  and  $0.7 \times V_{DD}$ .
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

**Figure 27. I<sup>2</sup>S master timing diagram (Philips protocol)<sup>(1)</sup>**

1. Guaranteed by characterization results, not tested in production.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

### 6.3.17 12-bit ADC characteristics

Unless otherwise specified, the parameters given in [Table 56](#) are guaranteed by design.

| $t_{\text{STAB}}$      | Power-up time                                      | -                                                                     | -                                                         | -   | 3.5                 | $\mu\text{s}$      |

1. The  $V_{\text{ref+}}$  input can be grounded if neither the ADC nor the DAC are used (this allows to shut down an external voltage reference).
2. The current consumption through  $V_{\text{REF}}$  is composed of two parameters:
  - one constant (max 300  $\mu\text{A}$ )
  - one variable (max 400  $\mu\text{A}$ ), only during sampling time + 2 first conversion pulses
 So, peak consumption is  $300+400 = 700\text{ }\mu\text{A}$  and average consumption is  $300 + [(4\text{ sampling} + 2) / 16] \times 400 = 450\text{ }\mu\text{A}$  at 1Msps
3.  $V_{\text{REF+}}$  can be internally connected to  $V_{\text{DDA}}$  and  $V_{\text{REF-}}$  can be internally connected to  $V_{\text{SSA}}$ , depending on the package. Refer to [Section 4: Pin descriptions](#) for further details.
4.  $V_{\text{SSA}}$  or  $V_{\text{REF-}}$  must be tied to ground.
5. Minimum sampling time is reached for an external input impedance limited to a value as defined in [Table 58: Maximum source impedance  \$R\_{\text{AIN max}}\$](#)
6. External impedance has another high value limitation when using short sampling time as defined in [Table 58: Maximum source impedance  \$R\_{\text{AIN max}}\$](#)

1. ADC DC accuracy values are measured after internal calibration.
2. ADC accuracy vs. negative injection current: Injecting a negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents. Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 6.3.12](#) does not affect the ADC accuracy.
3. Guaranteed by characterization results, not tested in production.

Figure 28. ADC accuracy characteristics

Figure 29. Typical connection diagram using the ADC

1. Refer to [Table 58: Maximum source impedance  \$R\_{\text{AIN max}}\$](#)  for the value of  $R_{\text{AIN}}$  and [Table 56: ADC characteristics](#) for the value of  $C_{\text{ADC}}$ .
2.  $C_{\text{parasitic}}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{\text{parasitic}}$  value will downgrade conversion accuracy. To remedy this,  $f_{\text{ADC}}$  should be reduced.

1. Guaranteed by design, not tested in production.

2. Number of samples calculated for  $f_{ADC} = 16\ MHz$ . For  $f_{ADC} = 8$  and  $4\ MHz$  the number of sampling cycles can be reduced with respect to the minimum sampling time  $T_s$  ( $\mu s$ ),

### General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 12](#). The applicable procedure depends on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. The  $100\ nF$  capacitors should be ceramic (good quality). They should be placed as close as possible to the chip.

### 6.3.18 DAC electrical specifications

Data guaranteed by design, not tested in production, unless otherwise specified.

| PSRR+                     | V <sub>DDA</sub> supply rejection ratio (static DC measurement)                                                                                | C <sub>L</sub> ≤ 50 pF, R <sub>L</sub> ≥ 5 kΩ                                                               | -   | -60          | -35          | dB    |

1. Data based on characterization results.

2. Connected between DAC\_OUT and V<sub>SSA</sub>.

3. Difference between two consecutive codes - 1 LSB.

4. Difference between measured value at Code  $i$  and the value at Code  $i$  on a line drawn between Code 0 and last Code 4095.
5. Difference between the value measured at Code (0x800) and the ideal value =  $V_{REF+}/2$ .
6. Difference between the value measured at Code (0x001) and the ideal value.
7. Difference between ideal slope of the transfer function and measured slope computed from code 0x000 and 0xFFFF when buffer is OFF, and from code giving 0.2 V and ( $V_{DDA} - 0.2$ ) V when buffer is ON.
8. In buffered mode, the output can overshoot above the final value for low input code (starting from min value).

**Figure 31. 12-bit buffered /non-buffered DAC**

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

### 6.3.19 Operational amplifier characteristics

**Table 60. Operational amplifier characteristics**

| Symbol                 | Parameter                    |                           | Condition <sup>(1)</sup> | Min <sup>(2)</sup> | Typ | Max <sup>(2)</sup> | Unit              |
|------------------------|------------------------------|---------------------------|--------------------------|--------------------|-----|--------------------|-------------------|

1. Operating conditions are limited to junction temperature (0 °C to 105 °C) when  $V_{DD}$  is below 2 V. Otherwise to the full ambient temperature range (-40 °C to 85 °C, -40 °C to 105 °C).

2. Guaranteed by characterization results, not tested in production.

### 6.3.20 Temperature sensor characteristics

**Table 61. Temperature sensor calibration values**

| Calibration value name | Description                                                                                               | Memory address            |
|------------------------|-----------------------------------------------------------------------------------------------------------|---------------------------|
| TS_CAL1                | TS ADC raw data acquired at temperature of 30 °C $\pm 5$ °C<br>$V_{DDA} = 3 \text{ V} \pm 10 \text{ mV}$  | 0x1FF8 00FA - 0x1FF8 00FB |
| TS_CAL2                | TS ADC raw data acquired at temperature of 110 °C $\pm 5$ °C<br>$V_{DDA} = 3 \text{ V} \pm 10 \text{ mV}$ | 0x1FF8 00FE - 0x1FF8 00FF |

**Table 62. Temperature sensor characteristics**

| Symbol                   | Parameter                                      | Min  | Typ     | Max     | Unit  |
|--------------------------|------------------------------------------------|------|---------|---------|-------|
| $T_L^{(1)}$              | $V_{SENSE}$ linearity with temperature         | -    | $\pm 1$ | $\pm 2$ | °C    |
| Avg_Slope <sup>(1)</sup> | Average slope                                  | 1.48 | 1.61    | 1.75    | mV/°C |
| $V_{110}$                | Voltage at 110°C $\pm 5$ °C <sup>(2)</sup>     | 612  | 626.8   | 641.5   | mV    |
| $I_{DDA(TEMP)}^{(3)}$    | Current consumption                            | -    | 3.4     | 6       | μA    |
| $t_{START}^{(3)}$        | Startup time                                   | -    | -       | 10      | μs    |
| $T_{S\_temp}^{(3)}$      | ADC sampling time when reading the temperature | 4    | -       | -       |       |

1. Guaranteed by characterization results, not tested in production.
2. Measured at  $V_{DD} = 3 \text{ V} \pm 10 \text{ mV}$ .  $V_{110}$  ADC conversion result is stored in the TS\_CAL2 byte.
3. Guaranteed by design, not tested in production.

### 6.3.21 Comparator

**Table 63. Comparator 1 characteristics**

| Symbol              | Parameter                                                      | Conditions                                                                                              | Min <sup>(1)</sup> | Typ     | Max <sup>(1)</sup> | Unit      |
|---------------------|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|--------------------|---------|--------------------|-----------|

| $d_{V_{offset}}/dt$ | Comparator offset variation in worst voltage stress conditions | $V_{DDA} = 3.6 \text{ V}$<br>$V_{IN+} = 0 \text{ V}$<br>$V_{IN-} = V_{REFINT}$<br>$T_A = 25 \text{ °C}$ | 0                  | 1.5     | 10                 | mV/1000 h |
| $I_{COMP1}$         | Current consumption <sup>(3)</sup>                             | -                                                                                                       | -                  | 160     | 260                | nA        |

1. Guaranteed by characterization results, not tested in production.
2. The delay is characterized for 100 mV input step with 10 mV overdrive on the inverting input, the non-inverting input set to the reference.
3. Comparator consumption only. Internal reference voltage not included.

**Table 64. Comparator 2 characteristics**

1. Guaranteed by characterization results, not tested in production.
2. The delay is characterized for 100 mV input step with 10 mV overdrive on the inverting input, the non-inverting input set to the reference.
3. Comparator consumption only. Internal reference voltage (necessary for comparator operation) is not included.

### 6.3.22 LCD controller

The device embeds a built-in step-up converter to provide a constant LCD reference voltage independently from the  $V_{DD}$  voltage. An external capacitor  $C_{ext}$  must be connected to the  $V_{LCD}$  pin to decouple this converter.

**Table 65. LCD controller characteristics**

| Symbol                | Parameter                                                          | Min  | Typ           | Max       | Unit      |

1. LCD enabled with 3 V internal step-up active, 1/8 duty, 1/4 bias, division ratio= 64, all pixels active, no LCD connected.
2. Guaranteed by design, not tested in production.
3. Guaranteed by characterization results, not tested in production.

## 7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

Technical drawing of a rectangular plate with dimensions and labels. The drawing shows a top-down view of the plate with a central vertical line and a horizontal line intersecting at the center. The dimensions are as follows:

- Overall width: 16.7
- Overall height: 16.7
- Distance from the left edge to the center line: 12.3
- Distance from the center line to the right edge: 12.3
- Distance from the bottom edge to the center line: 12.3
- Distance from the center line to the top edge: 12.3
- Distance from the left edge to the first vertical line: 1.2
- Distance from the first vertical line to the center line: 12.3
- Distance from the center line to the second vertical line: 12.3
- Distance from the second vertical line to the right edge: 1.2
- Distance from the bottom edge to the first horizontal line: 1.2
- Distance from the first horizontal line to the center line: 12.3
- Distance from the center line to the second horizontal line: 12.3
- Distance from the second horizontal line to the top edge: 1.2

The labels 75, 51, 76, 50, 100, 26, 1, and 25 are placed near the corners of the plate. The labels 0.5 and 0.3 are placed near the center of the plate.

### Marking of engineering samples

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

**Figure 34. LQFP100, 14 x 14 mm, 100-pin low-profile quad flat package top view example**

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity

1. Values in inches are converted from mm and rounded to 4 decimal digits.

## Marking of engineering samples

The following figure gives an example of topside marking orientation versus ball A1 identifier location.

**Figure 48. WLCSP63 device marking example**

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity

## 7.7 Thermal characteristics

The maximum chip-junction temperature,  $T_J \text{ max}$ , in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A \text{ max}$  is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D \text{ max}$  is the sum of  $P_{INT} \text{ max}$  and  $P_{I/O} \text{ max}$  ( $P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$ ),
- $P_{INT} \text{ max}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O} \text{ max}$  represents the maximum power dissipation on output pins where:

$$P_{I/O} \text{ max} = \Sigma (V_{OL} \times I_{OL}) + \Sigma (V_{DD} - V_{OH}) \times I_{OH},$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 73. Thermal characteristics**

| Symbol        | Parameter                                                                         | Value | Unit |
|---------------|-----------------------------------------------------------------------------------|-------|------|
| $\Theta_{JA}$ | <b>Thermal resistance junction-ambient</b><br>UFBGA100 - 7 x 7 mm                 | 59    | °C/W |
|               | <b>Thermal resistance junction-ambient</b><br>LQFP100 - 14 x 14 mm / 0.5 mm pitch | 43    |      |
|               | <b>Thermal resistance junction-ambient</b><br>LQFP64 - 10 x 10 mm / 0.5 mm pitch  | 46    |      |
|               | <b>Thermal resistance junction-ambient</b><br>WLCSP63 - 0.400 mm pitch            | 49    |      |
|               | <b>Thermal resistance junction-ambient</b><br>LQFP48 - 7 x 7 mm / 0.5 mm pitch    | 55    |      |
|               | <b>Thermal resistance junction-ambient</b><br>UFQFPN48 - 7 x 7 mm / 0.5 mm pitch  | 32    |      |

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
