## APPLICATION CIRCUIT

### (1) Standard circuit

### (2) SAG correction unused circuit

### (1) Standard circuit

The SAG correction reduces output coupling capacitor values.

The capacitor of C1 (33μF) is recommended for the portable application.

However, the 33μF capacitor may deteriorate SAG, and lose synchronization by luminance fluctuation.

Adjust the C1 value, checking the waveform containing a lot of low frequency components like a bounce waveform (In case of worst condition). Change the capacitor of C1 into a large value to improve SAG.

### (2) SAG correction unused circuit

Cancel the SAG correction to improve lost synchronization.

Connect the coupling capacitor after connecting the Vout pin and Vsag pin. The recommended value is 470μF or more.

### (Note)

The NJM2274 can't drive two-line load of 150Ω.
