DESCRIPTION

The *ISSI* IS61/64WV10248EDBLL are very high-speed, low power, 1M-word by 8-bit CMOS static RAM. The IS61/64WV10248EDBLL are fabricated using *ISSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields higher performance and low power consumption devices.

When $\overline{CE}$ is HIGH (deselected), the device assumes a standby mode at which the power dissipation can be reduced down with CMOS input levels.

The IS61/64WV10248EDBLL operate from a single power supply and all inputs are TTL-compatible.

The IS61/64WV10248EDBLL are available in 48 ball mini BGA (6mm x 8mm) and 44-pin TSOP (Type II) packages.

Notes:
1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

OPERATING RANGE (V_{DD})[1]

Range	Ambient Temperature	IS61WV10248EDBLL V_{DD} (8, 10ns)	IS64WV10248EDBLL V_{DD} (10ns)
Industrial	–40°C to +85°C	2.4V-3.6V	—

ERROR DETECTION AND ERROR CORRECTION

- Independent ECC with hamming code for each byte
- Detect and correct one bit error per byte
- Better reliability than parity code schemes which can only detect an error but not correct an error
- Backward Compatible: Drop in replacement to current in industry standard devices (without ECC)
