General Description

The HMC870LC5 is a GaAs MMIC pHEMT Distributed Driver Amplifier packaged in a leadless 5x5 mm surface mount package which operates between DC and 20 GHz. The amplifier provides 17 dB of gain, 8Vp-p saturated output swing and features output swing cross point adjustment. Gain flatness is excellent at $\pm 0.5 \text{ dB}$ as well as very low additive RMS jitter of 300 fs for 10 Gbps operation. HMC870LC5 provides Metro and Long Haul designers with scalable power dissipation for varying output drive requirements. ($<0.4\text{W}$ at $V_{\text{out}} = 3.6 \text{ Vp-p}$ and $<1\text{W}$ at $V_{\text{out}} = 8.5 \text{ Vp-p}$) The HMC870LC5 has a very wide supply (V_{dd}) operating range from +3.3V to +7V, and the RF I/Os are internally matched to 50 Ohms.

Electrical Specifications, $T_A = +25^\circ \text{C}$, $V_{\text{dd}} = 7\text{V}$, $V_{\text{ctl}} = 1\text{V}$, $I_{\text{dd}} = 165\text{mA}^*$

[2] Circuit Board Material: Arlon 25FR or Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and package bottom should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Hittite upon request.

MZ OPTICAL MODULATOR DRIVER, DC - 20 GHz

Device Operation

These devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

The input to this device should be AC-coupled. To provide the typical 8Vp-p output voltage swing, a 1.2Vp-p AC-coupled input voltage swing is required.

Device Power Up Instructions

1. Ground the device
 2. Set V_{gg} to -2V (no drain current)
 3. Set V_{ctl} to +1V (no drain current)
 4. Set V_{dd} to +5V (no drain current)
 5. Adjust V_{gg} for I_{dd} = 140mA
- V_{gg} may be varied between -1V and 0V to provide the desired eye crossing point percentage (i.e. 50% crosspoint) and a limited cross point control capability.
 - V_{dd} may be increased to +7V if required to achieve greater output voltage swing.
 - V_{ctl} may be adjusted between +2V and +0V to vary the output voltage swing.

Device Power Down Instructions

1. Reverse the sequence identified above in steps 1 through 4.
