

Ultralow Power Boost Converters with Output Disconnect

DESCRIPTION

Demonstration circuits 1387A-A, and -B are Ultralow Power Boost Converters with Output Disconnect featuring the LT8410 and LT8410-1. Both versions convert a 3V-10V source to 16V. The -A version supplies 1.6mA at 3V_{IN} and the -B supplies 0.5mA.

Both versions feature a low noise control scheme, integrated schottky diode and output disconnect function, ultra-low quiescent current, built in soft-start and over-voltage protection. The LT8410 datasheet gives a complete description of the parts, their operation and application information. The datasheet must be read in conjunction with this quick start guide for working on or modifying the demo circuit 1387.

These circuits are intended for space-conscious applications such as Sensor Power, RF Mems and General Purpose Bias Supplies.

QUICK START PROCEDURE

Demonstration circuit 1387 is easy to set up to evaluate the performance of the LT8410 and LT8410-1. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

NOTE. When measuring the input or output voltage ripple, care must be taken to avoid a long ground lead on the oscilloscope probe. Measure the input or output voltage ripple by touching the probe tip directly across the V_{in} or V_{out} and GND terminals. See Figure 2 for proper scope probe technique.

1. Place jumpers in the following positions:

JP1 Run

2. With power off, connect the input power supply to V_{in} and GND.

3. Turn on the power at the input.

Check for the proper output voltages. $V_{out} = 15.52V$ to $16.48V$.

NOTE. If there is no output, temporarily disconnect the load to make sure that the load is not set too high.

4. Once the proper output voltage is established, adjust the load within the operating range and observe the output voltage regulation, ripple voltage, efficiency and other parameters.
