

GA10SICP12-263

Normally – OFF Silicon Carbide Junction Transistor

 V_{DS} = 1200 V $R_{DS(ON)}$ = 100 mΩ $I_{D (@ 25^{\circ}C)}$ = 25 A $I_{D (@ 150^{\circ}C)}$ = 10 A $h_{FE (@ 25^{\circ}C)}$ = 80

Features

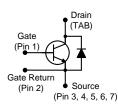

- 175 °C Maximum Operating Temperature
- Gate Oxide Free SiC Switch
- Optional Gate Return Pin
- Exceptional Safe Operating Area
- Integrated SiC Schottky Rectifier
- · Excellent Gain Linearity
- Temperature Independent Switching Performance
- Low Output Capacitance
- Positive Temperature Coefficient of R_{DS,ON}
- Suitable for Connecting an Anti-parallel Diode

Advantages

- Compatible with Si MOSFET/IGBT Gate Drive ICs
- > 20 µs Short-Circuit Withstand Capability
- Lowest-in-class Conduction Losses
- High Circuit Efficiency
- Minimal Input Signal Distortion
- · High Amplifier Bandwidth

Package

7L D2PAK (TO-263-7L)

Please note: The Source and Gate Return pins are not exchangeable. Their exchange might lead to malfunction.

Applications

- Down Hole Oil Drilling, Geothermal Instrumentation
- Hybrid Electric Vehicles (HEV)
- Solar Inverters
- Switched-Mode Power Supply (SMPS)
- Power Factor Correction (PFC)
- · Induction Heating
- Uninterruptible Power Supply (UPS)
- Motor Drives

Pulsed Power	Medium	N/A	Pulse Power	Coming Soon

A: Static TTL Logic Driving

The GA10SICP12-263 may be driven with direct (5 V) TTL logic and current amplification. The amplified current level of the supply must meet or exceed the steady state gate current ($I_{G,steady}$) required to operate the GA10SICP12-263. Minimum $I_{G,steady}$ is dependent on the anticipated drain current I_D through the SJT and the DC current gain h_{FE} , it may be calculated from the following equation. An accurate value of the h_{FE} may be read from Figure 4. An optional resistor R_G may be used in series with the gate pin to trim $I_{G,steady}$, also an optional capacitor C_G may be added in parallel with R_G to facilitate faster SJT switching if desired, further details on these options are given in the following section.

$$I_{G,steady} \approx \frac{I_D}{h_{FE}(T, I_D)} * 1.5$$

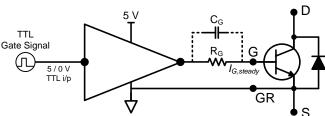

Figure 23: TTL Gate Drive Schematic

B: High Speed Driving

The SJT is a current controlled transistor which requires a positive gate current for turn-on and to remain in on-state. An idealized gate current waveform for ultra-fast switching of the SJT while maintaining low gate drive losses is shown in Figure 24, it features a positive current peak during turn-on, a negative current peak during turn-off, and continuous gate current during on-state.

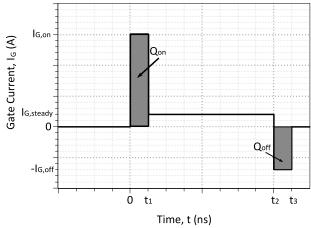

Figure 24: An idealized gate current waveform for fast switching of an SJT.

An SJT is rapidly switched from its blocking state to on-state when the necessary gate charge, Q_G , for turn-on is supplied by a burst of high gate current, $I_{G,on}$, until the SJT gate-source capacitance, C_{GS} , and gate-drain capacitance, C_{GD} , are fully charged.

$$Q_{on} = I_{G,on} * t_1$$
$$Q_{on} \ge Q_{gs} + Q_{gd}$$

Ideally, $I_{G,on}$ should terminate when the drain voltage falls to its on-state value in order to avoid unnecessary drive losses during the steady on-state. In practice, the rise time of the $I_{G,on}$ pulse is affected by the parasitic inductances, L_{par} in the device package and drive circuit. A voltage developed across the parasitic inductance in the source path, Ls, can de-bias the gate-source junction, when high drain currents begin to flow through the device. The voltage applied to the gate pin should be maintained high enough, above the $V_{GS,sat}$ (see Figure 7) level to counter these effects.

A high negative peak current, $-I_{G,off}$ is recommended at the start of the turn-off transition, in order to rapidly sweep out the injected carriers from the gate, and achieve rapid turn-off. Turn off can be achieved with $V_{GS} = 0$ V, however a negative gate voltage V_{GS} may be used in order to speed up the turn-off transition.

Gate Return Pin

The optional gate return (GR) pin allows for a reduction of source path inductive and resistive coupling in the gate driver connection to the GA10SICP12-263. Drain currents through the source pin during transient and steady state operation induce an undesirable source voltage in all power transistors due to unavoidable source pin inductance and resistance. This voltage can negatively affect gate driving performance, however the gate return pin allows for decoupling from these source current path effects which results in faster switching and higher efficiency gate driving.

B:1: High Speed, Low Loss Drive with Boost Capacitor, GA03IDDJT30-FR4

The GA10SICP12-263 may be driven using a High Speed, Low Loss Drive with Boost Capacitor topology in which multiple voltage levels, a gate resistor, and a gate capacitor are used to provide fast switching current peaks at turn-on and turn-off and a continuous gate current while in on-state. A 3 kV isolated evaluation gate drive board (GA03IDDJT30-FR4) utilizing this topology is commercially available for high and low-side driving, its datasheet provides additional details about this drive topology.

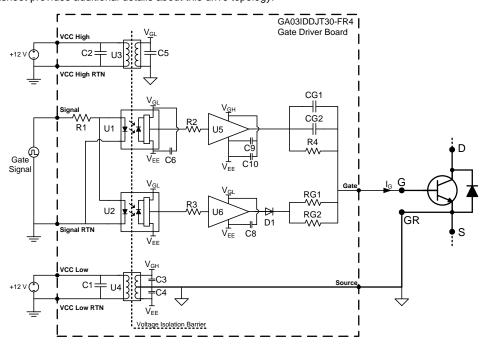

Figure 25: Topology of the GA03IDDJT30-FR4 Two Voltage Source gate driver.

The GA03IDDJT30-FR4 evaluation board comes equipped with two on board gate drive resistors (RG1, RG2) pre-installed for an effective gate resistance³ of $R_G = 3.75\,\Omega$. It may be necessary for the user to reduce RG1 and RG2 under high drain current conditions for safe operation of the GA10SICP12-263. The steady state current supplied to the gate pin of the GA10SICP12-263 with on-board $R_G = 3.75\,\Omega$, is shown in Figure 26. The maximum allowable safe value of RG for the user's required drain current can be read from Figure 27.

For the GA10SICP12-263, R_G must be reduced for I_D ≥ ~10 A for safe operation with the GA03IDDJT30-FR4.

For operation at $I_D \ge -10$ A, R_G may be calculated from the following equation, which contains the DC current gain h_{FE} (Figure 4) and the gate-source saturation voltage $V_{GS,sat}$ (Figure 7).

$$R_{G,max} = \frac{\left(4.7V - V_{GS,sat}\right) * h_{FE}(T, I_D)}{I_D * 1.5} - 0.6\Omega$$

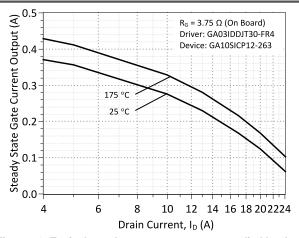

Figure 26: Typical steady state gate current supplied by the GA03IDDJT30-FR4 board for the GA10SICP12-263 with the on board resistance of 3.75 Ω

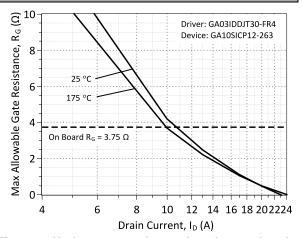

Figure 27: Maximum gate resistance for safe operation of the GA10SICP12-263 at different drain currents using the GA03IDDJT30-FR4 board.

B:2: High Speed, Low Loss Drive with Boost Inductor

A High Speed, Low-Loss Driver with Boost Inductor is also capable of driving the GA10SICP12-263 at high-speed. It utilizes a gate drive inductor instead of a capacitor to provide the high-current gate current pulses $I_{G,on}$ and $I_{G,off}$. During operation, inductor L is charged to a specified $I_{G,on}$ current value then made to discharge I_L into the SJT gate pin using logic control of S_1 , S_2 , S_3 , and S_4 , as shown in Figure 28. After turn on, while the device remains on the necessary steady state gate current $I_{G,steady}$ is supplied from source V_{CC} through R_G . Please refer to the article "A current-source concept for fast and efficient driving of silicon carbide transistors" by Dr. Jacek Rąbkowski for additional information on this driving topology.⁴

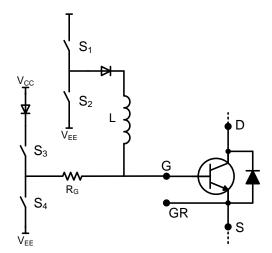

Figure 28: Simplified Inductive Pulsed Drive Topology

 $^{^3}$ – R_G = (1/RG1 +1/RG2) $^{-1}$. Driver is pre-installed with RG1 = RG2 = 7.5 Ω

⁴ - Archives of Electrical Engineering, Volume 62, Issue 2, Pages 333–343, ISSN (Print) 0004-0746, DOI: 10.2478/aee-2013-0026, June 2013

C: Proportional Gate Current Driving

For applications in which the GA10SICP12-263 will operate over a wide range of drain current conditions, it may be beneficial to drive the device using a proportional gate drive topology to optimize gate drive power consumption. A proportional gate driver relies on instantaneous drain current I_D feedback to vary the steady state gate current $I_{G,steady}$ supplied to the GA10SICP12-263

C:1: Voltage Controlled Proportional Driver

The voltage controlled proportional driver relies on a gate drive IC to detect the GA10SICP12-263 drain-source voltage V_{DS} during on-state to sense I_D . The gate drive IC will then increase or decrease $I_{G,steady}$ in response to I_D . This allows $I_{G,steady}$, and thus the gate drive power consumption, to be reduced while I_D is relatively low or for $I_{G,steady}$ to increase when is I_D higher. A high voltage diode connected between the drain and sense protects the IC from high-voltage when the driver and GA10SICP12-263 are in off-state. A simplified version of this topology is shown in Figure 29, additional information will be available in the future at http://www.genesicsemi.com/commercial-sic/sic-junction-transistors/

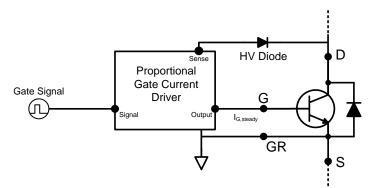

Figure 29: Simplified Voltage Controlled Proportional Driver

C:2: Current Controlled Proportional Driver

The current controlled proportional driver relies on a low-loss transformer in the drain or source path to provide feedback I_D of the GA10SICP12-263 during on-state to supply $I_{G,steady}$ into the device gate. $I_{G,steady}$ will then increase or decrease in response to I_D at a fixed forced current gain which is set be the turns ratio of the transformer, $h_{force} = I_D / I_G = N_2 / N_1$. GA10SICP12-263 is initially turned-on using a gate current pulse supplied into an RC drive circuit to allow I_D current to begin flowing. This topology allows $I_{G,steady}$, and thus the gate drive power consumption, to be reduced while I_D is relatively low or for $I_{G,steady}$ to increase when is I_D higher. A simplified version of this topology is shown in Figure 30, additional information will be available in the future at http://www.genesicsemi.com/commercial-sic/sic-junction-transistors/.

ПОСТАВКА ЭЛЕКТРОННЫХ КОМПОНЕНТОВ

многоканальный

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
