ATA6623C/ATA6625C

## LIN Bus Transceiver with Integrated Voltage Regulator

DATASHEET

Features

- Supply voltage up to 40V
- Operating voltage V_S = 5V to 27V
- Typically 10µA supply current during sleep mode
- Typically 57µA Supply current in silent mode
- Linear low-drop voltage regulator, 85mA current capability:
    - Normal, fail-safe, and silent mode
    - Atmel® ATA6623C: V_{CC} = 3.3V ±2%
    - Atmel ATA6625C: V_{CC} = 5.0V ±2%
    - Sleep mode: V_{CC} is switched off
- V_{CC} undervoltage detection with reset open drain output NRES (4ms reset time)
- Voltage regulator is short-circuit and over-temperature protected
- LIN physical layer according to LIN 2.0, 2.1 and SAEJ2602-2
- Wake-up capability via LIN bus (90µs dominant)
- TXD time-out timer
- Bus pin is overtemperature and short-circuit protected versus GND and battery
- Advanced EMC and ESD performance
- Fulfills the OEM "Hardware Requirements for LIN in Automotive Applications Rev1.0"
- Interference and damage protection according to ISO7637
- Package: SO8

1. Description

The Atmel® ATA6623C/ATA6625C is a fully integrated LIN transceiver, designed according to the LIN specification 2.0 and 2.1, with a low-drop voltage regulator (3.3V/5V/85mA). The combination of voltage regulator and bus transceiver makes it possible to develop simple, but powerful, slave nodes in LIN Bus systems. The Atmel ATA6623C/ATA6625C is designed to handle the low-speed data communication in vehicles (for example, in convenience electronics). Improved slope control at the LIN driver ensures secure data communication up to 20kBaud with an RC oscillator for the protocol handling. The bus output is designed to withstand high voltage. Sleep mode (voltage regulator switched off) and silent mode (communication off; V_{CC} voltage on) guarantee minimized current consumption.

Table 2-1.   Pin Description

Pin	Symbol	Function
1	VS	Battery supply
2	EN	Enables normal mode if the input is high
3	GND	Ground, heat sink
4	LIN	LIN bus line input/output
5	RXD	Receive data output
6	TXD	Transmit data input
7	NRES	Output undervoltage reset, low at reset
8	VCC	Output voltage regulator 3.3V/5V/85mA

3. Functional Description

3.1 Physical Layer Compatibility

Since the LIN physical layer is independent from higher LIN layers (e.g., LIN protocol layer), all nodes with a LIN physical layer according to revision 2.x can be mixed with LIN physical layer nodes, which are according to older versions (i.e., LIN 1.0, LIN 1.1, LIN 1.2, LIN 1.3) without any restrictions.

3.2 Supply Pin (VS)

LIN operating voltage is V_S = 5V to 27V. An undervoltage detection is implemented to disable transmission if V_S falls below 5V, in order to avoid false bus messages. After switching on V_S, the IC starts with the fail-safe mode and the voltage regulator is switched on.

The supply current in sleep mode is typically 10µA and 57µA in silent mode.

3.3 Ground Pin (GND)

The IC does not affect the LIN Bus in the event of GND disconnection. It is able to handle a ground shift up to 11.5% of V_S.

3.4 Voltage Regulator Output Pin (VCC)

The internal 3.3V/5V voltage regulator is capable of driving loads up to 85mA, supplying the microcontroller and other ICs on the PCB and is protected against overload by means of current limitation and overtemperature shut-down. Furthermore, the output voltage is monitored and will cause a reset signal at the NRES output pin if it drops below a defined threshold V_{thun}.

3.5 Undervoltage Reset Output (NRES)

If the V_{CC} voltage falls below the undervoltage detection threshold of V_{thun}, NRES switches to low after tres_f (). Even if V_{CC} = 0V the NRES stays low, because it is internally driven from the V_S voltage. If V_S voltage ramps down, NRES stays low until V_S < 1.5V and then becomes highly resistant.

The implemented undervoltage delay keeps NRES low for t_{Reset} = 4ms after V_{CC} reaches its nominal value.

3.6 Bus Pin (LIN)

A low-side driver with internal current limitation and thermal shutdown as well as an internal pull-up resistor according to LIN specification 2.x is implemented. The voltage range is from –27V to +40V. This pin exhibits no reverse current from the LIN bus to V_S, even in the event of a GND shift or V_{Batt} disconnection. The LIN receiver thresholds are compatible with the LIN protocol specification.

The fall time (from recessive to dominant) and the rise time (from dominant to recessive) are slope controlled.

3.7 Input Pin (TXD)

In normal mode the TXD pin is the microcontroller interface to control the state of the LIN output. TXD must be pulled to ground in order to drive the LIN bus low. If TXD is high or unconnected (internal pull-up resistor), the LIN output transistor is turned off and the bus is in the recessive state.

3.8 Dominant Time-out Function (TXD)

The TXD input has an internal pull-up resistor. An internal timer prevents the bus line from being driven permanently in the dominant state. If TXD is forced to low longer than t_{dom} > 6ms, the LIN bus driver is switched to the recessive state.

To reactivate the LIN bus driver, switch TXD to high (> 10µs).

3.9 Output Pin (RXD)

This output pin reports the state of the LIN-bus to the microcontroller. LIN high (recessive state) is reported by a high level at RXD; LIN low (dominant state) is reported by a low level at RXD. The output has an internal pull-up resistor with typically 5kΩ to V_{CC}. The AC characteristics are measured with an external load capacitor of 20pF.

The output is short-circuit protected. In unpowered mode (that is, V_S = 0V), RXD is switched off.

Atmel

3.10   Enable Input Pin (EN)

The Enable Input pin controls the operation mode of the device. If EN is high, the circuit is in normal mode, with transmission paths from TXD to LIN and from LIN to RXD both active. The VCC voltage regulator operates with 3.3V/5V/85mA output capability.

If EN is switched to low while TXD is still high, the device is forced to silent mode. No data transmission is then possible, and the current consumption is reduced to I_{VS} typ. 57µA. The VCC regulator has its full functionality.

If EN is switched to low while TXD is low, the device is forced to sleep mode. No data transmission is possible, and the voltage regulator is switched off.

4.   Modes of Operation

Figure 4-1.   Modes of Operation
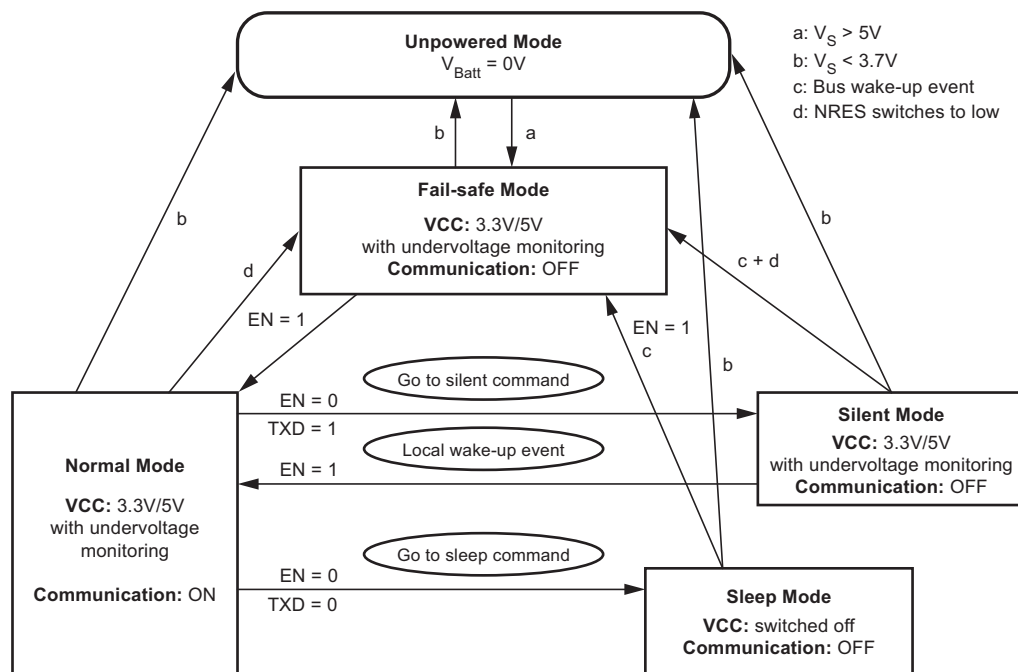

Table 4-1.   Modes of Operation

Mode of Operation	Transceiver	V_{CC}	RXD	LIN
Fail safe	OFF	3.3V/5V	High, Except after wake-up	Recessive
Normal	ON	3.3V/5V	LIN depending	TXD depending
Silent	OFF	3.3V/5V	High	Recessive
Sleep	OFF	0V	0V	Recessive

4.1 Normal Mode

This is the normal transmitting and receiving mode of the LIN Interface, in accordance with LIN specification 2.x. The V_{CC} voltage regulator operates with a 3.3V/5V output voltage, with a low tolerance of ±2% and a maximum output current of 85mA.

If an undervoltage condition occurs, NRES is switched to low and the IC changes its state to fail-safe mode.

4.2 Silent Mode

A falling edge at EN while TXD is high switches the IC into silent mode. The TXD Signal has to be logic high during the mode select window (Figure 4-2 on page 6). The transmission path is disabled in silent mode. The overall supply current from V_{Batt} is a combination of the I_{VSsi} = 57µA plus the V_{CC} regulator output current I_{VCC}.

In silent mode the internal slave termination between pin LIN and pin VS is disabled, and only a weak pull-up current (typically 10µA) between pin LIN and pin VS is present. The silent mode can be activated independently from the current level on pin LIN.

If an undervoltage condition occurs, NRES is switched to low and the IC changes its state to fail-safe mode.

A voltage less than the LIN Pre-wake detection V_{LINL} at pin LIN activates the internal LIN receiver and switches on the internal slave termination between the LIN pin and the VS pin.

A falling edge at the LIN pin followed by a dominant bus level maintained for a certain time period (> t_{bus}) and the following rising edge at pin LIN (see Figure 4-3 on page 7) results in a remote wake-up request.

The device switches from silent mode to fail-safe mode, and the remote wake-up request is indicated by a low level at pin RXD to interrupt the microcontroller (Figure 4-3 on page 7). EN high can be used to switch directly to normal mode.

Figure 4-2. Switch to Silent Mode
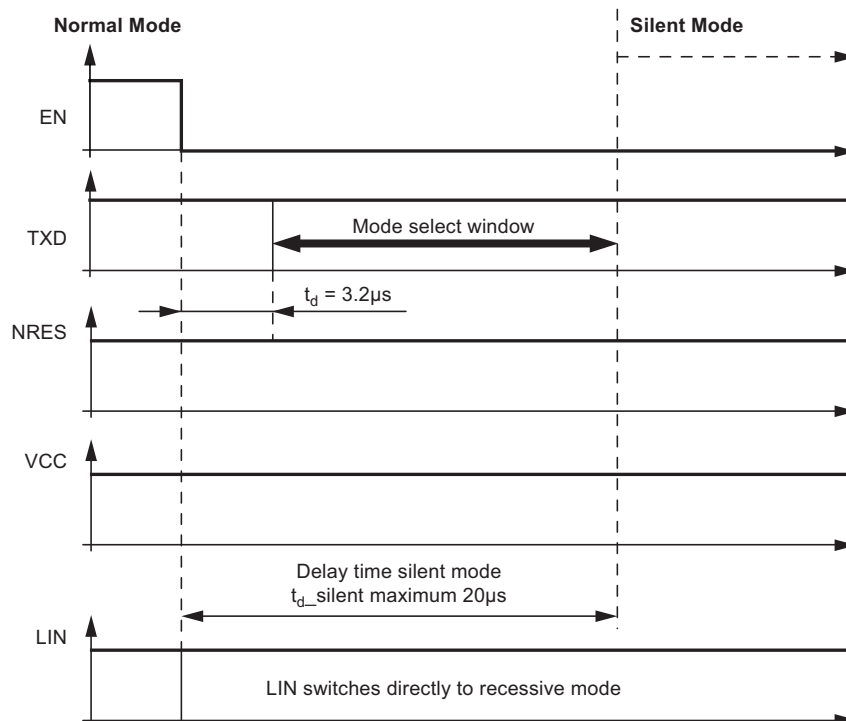

Figure 4-3. LIN Wake-up Waveform Diagram from Silent Mode
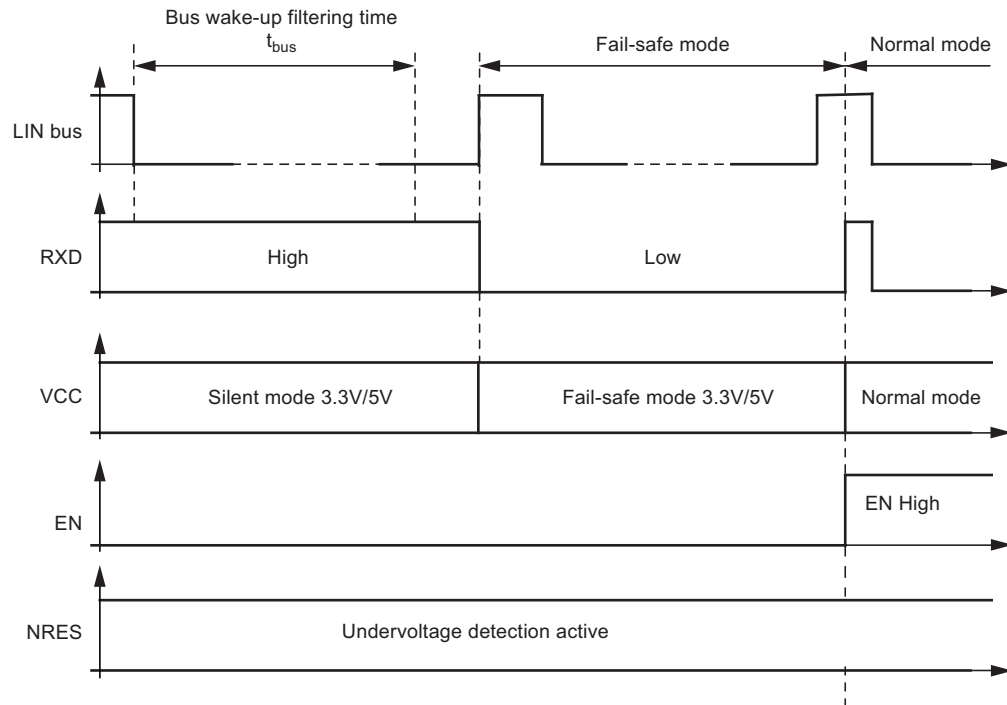

4.3 Sleep Mode

A falling edge at EN while TXD is low switches the IC into sleep mode. The TXD Signal has to be logic low during the mode select window (Figure 4-4 on page 8). To avoid influencing the LIN-pin during the switch to sleep mode, it is possible to switch the EN up to 3.2µs earlier to LOW than the TXD. Even if the two falling edges at TXD and EN occur at the same time, the LIN line will remain uninfluenced.

In sleep mode the transmission path is disabled. The supply current $I_{VSsleep}$ from V_{Batt} is typically 10µA. The V_{CC} regulator is switched off, NRES and RXD are low. The internal slave termination between pin LIN and pin VS is disabled, only a weak pull-up current (typically 10µA) between pin LIN and pin VS is present. sleep mode can be activated independently from the current level on pin LIN.

A voltage less than the LIN Pre-wake detection V_{LINL} at pin LIN activates the internal LIN receiver and switches on the internal slave termination between the LIN pin and the VS pin.

A falling edge at the LIN pin followed by a dominant bus level maintained for a certain time period (> t_{bus}) and a following rising edge at pin LIN results in a remote wake-up request. The device switches from sleep mode to fail-safe mode.

The V_{CC} regulator is activated, and the remote wake-up request is indicated by a low level at the RXD pin to interrupt the microcontroller (Figure 4-5 on page 9).
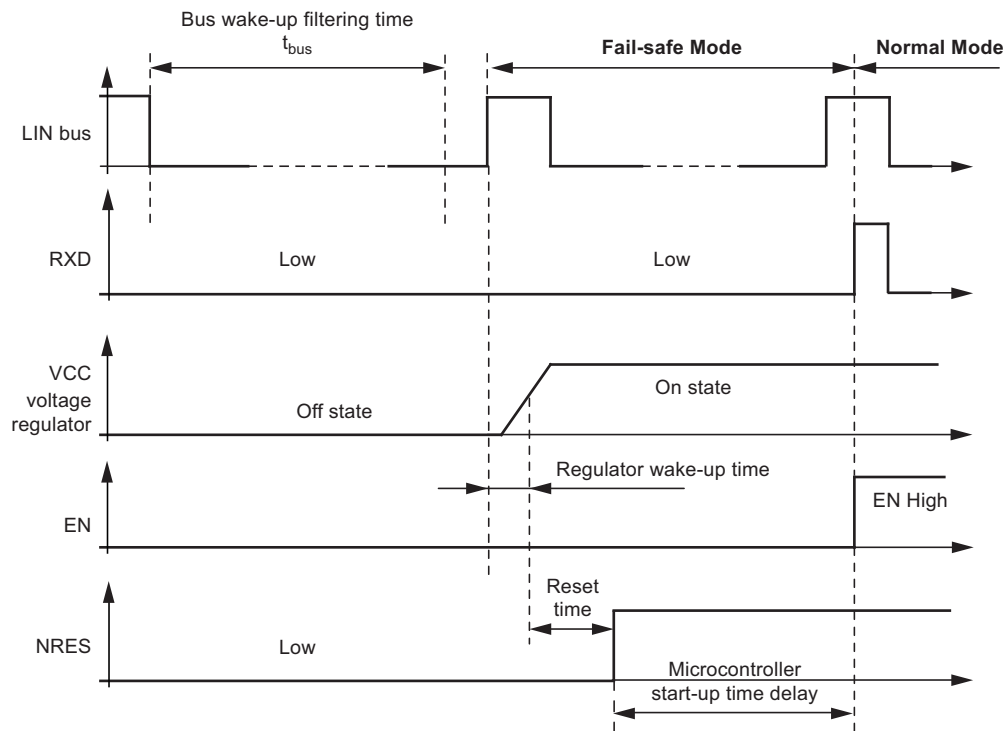

EN high can be used to switch directly from sleep to fail-safe mode. If EN is still high after VCC ramp up and undervoltage reset time, the IC switches to normal mode.

Figure 4-4. Switch to Sleep Mode
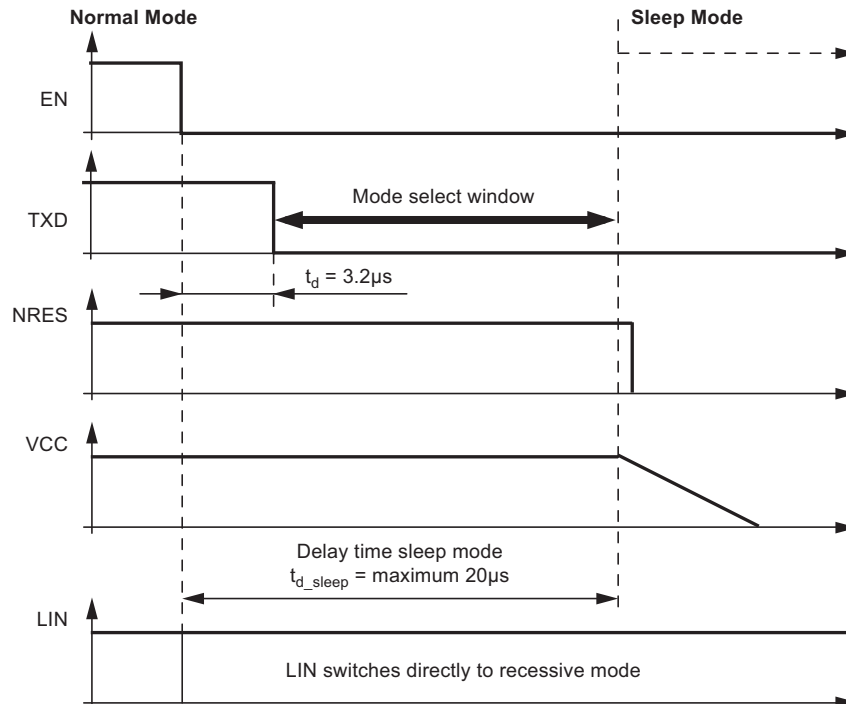

Figure 4-5. LIN Wake-up Diagram from Sleep Mode

4.4 Fail-safe Mode

At system power-up the device automatically switches to fail-safe mode. The voltage regulator is switched on (see Figure 6-1 on page 11). The NRES output switches to low for t_{res} = 4ms and gives a reset to the microcontroller. LIN communication is switched off. The IC stays in this mode until EN is switched to high, and changes then to the normal mode. A power down of V_{Batt} (V_S < 3.7V) during silent or sleep mode switches the IC into the fail-safe mode after power up. A logic low at NRES switches the IC into fail-safe mode directly.

4.5 Unpowered Mode

If you connect battery voltage to the application circuit, the voltage at the VS pin increases according to the block capacitor (see Figure 6-1 on page 11). After VS is higher than the VS undervoltage threshold VS_{th}, the IC mode changes from unpowered mode to fail-safe mode. The VCC output voltage reaches its nominal value after t_{VCC}. This time, t_{VCC}, depends on the VCC capacitor and the load.

NRES is low for the reset time delay t_{Reset}; no mode change is possible during this time.

5. Fail-safe Features

- During a short-circuit at LIN to $V_{Battery}$, the output limits the output current to I_{BUS_lim}. Due to the power dissipation, the chip temperature exceeds T_{LINoff} and the LIN output is switched off. The chip cools down and after a hysteresis of T_{hys}, switches the output on again. RXD stays on high because LIN is high. During LIN overtemperature switch-off, the V_{CC} regulator is working independently.

- During a short-circuit from LIN to GND the IC can be switched into sleep or silent mode. If the short-circuit disappears, the IC starts with a remote wake-up.

- The reverse current is very low < 2µA at pin LIN during loss of V_{Batt}. This is optimal behavior for bus systems where some slave nodes are supplied from battery or ignition.

- During a short circuit at VCC, the output limits the output current to I_{VCClim}. Because of undervoltage, NRES switches to low and sends a reset to the microcontroller. The IC switches into fail-safe mode. If the chip temperature exceeds the value T_{VCCoff}, the V_{CC} output switches off. The chip cools down and after a hysteresis of T_{hys}, switches the output on again. Because of fail-safe mode, the V_{CC} voltage will switch on again although EN is switched off from the microcontroller. The microcontroller can then start with normal operation.

- Pin EN provides a pull-down resistor to force the transceiver into recessive mode if EN is disconnected.

- Pin RXD is set floating if V_{Batt} is disconnected.

- Pin TXD provides a pull-up resistor to force the transceiver into recessive mode if TXD is disconnected.

- If TXD is short-circuited to GND, it is possible to switch to sleep mode via ENABLE after t_{dom} > 20ms.

Atmel

6. Voltage Regulator

Figure 6-1. V_{CC} Voltage Regulator: Ramp Up and Undervoltage
The voltage regulator needs an external capacitor for compensation and to smooth the disturbances from the microcontroller. It is recommended to use an electrolythic capacitor with C > 1.8µF and a ceramic capacitor with C = 100nF. The values of these capacitors can be varied by the customer, depending on the application.

With this special SO8 package (fused lead frame to pin 3) an R_{thja} of 80K/W is achieved.
Therefore, it is recommended to connect pin 3 with a wide GND plate on the printed board to get a good heat sink.

The main power dissipation of the IC is created from the V_{CC} output current I_{VCC}, which is needed for the application.

Figure 6-2 shows the safe operating area of the Atmel® ATA6625C.

Figure 6-2. Power Dissipation: Safe Operating Area: V_{CC} Output Current versus Supply Voltage V_S at Different Ambient Temperatures Due to R_{thja} = 80K/W
To program the microcontroller it may be necessary to supply the V_{CC} output via an external power supply while the V_S Pin of the system basis chip is disconnected. This will not affect the system basis chip.

7. Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Min.	Typ.	Max.	Unit
Supply voltage V_S	V_S	–0.3		+40	V
Pulse time ≤ 500ms $T_a = 25°C$ Output current $I_{VCC} \le 85mA$	V_S			+40	V
Pulse time ≤ 2min $T_a = 25°C$ Output current $I_{VCC} \le 85mA$	V_S			27	V
Logic pins (RxD, TxD, EN, NRES)		–0.3		+5.5	V

12.   Revision History

Please note that the following page numbers referred to in this section refer to the specific revision mentioned, not to this document.

Revision No.	History
4957L-AUTO-09/14	• Section 10 "Ordering Information" on page 20 updated
4957K-AUTO-02/13	• Section 10 "Ordering Information" on page 20 updated
4957J-AUTO-11/12	• Section 10 "Ordering Information" on page 20 updated
4957I-AUTO-03/11	• Features on page 1 changed • Section 1 "Description" on pages 1 to 2 changed • Table 2-1 "Pin Description" on page 2 changed • Section 3 "Functional Description" on pages 3 to 4 changed • Section 4 "Modes of Operation" on pages 5 to 9 changed • Section 6 "Voltage Regulator" on pages 11 to 12 changed • Section 7 "Absolute Maximum Ratings" on page 13 changed • Section 8 "Electrical Characteristics" on pages 14 to 16 changed
4957H-AUTO-05/10	• New Part numbers ATA6623C and ATA6625C added • Features on page 1 changed • Text under heading 3.3 on page 3 changed • Text under heading 3.9 on page 4 changed • Abs.Max.Rat.Table -> Values in row "ESD HBM following...." changed • El.Char.Table -> rows changed: 5.1, 5.2, 6.5, 6.6, 6.7, 6.8, 7.6, 7.7, 7.8,7.9, 10.2 • El.Char.Table -> row 8.13 added • Ord.Info.Table -> Part numbers ATA6623C and ATA6625C added
4957G-AUTO-09/09	• Figures changed: 1-1, 4-2, 4-3, 4-4, 4-5, 6-2, 9-2 • Sections changed: 3.1, 3.6, 3.8, 3.9, 3.10, 4.1, 4.2, 4.3, 5 • Description Text changed • Table 4-1 changed • Abs. Max. Ratings table changed • El. Characteristics table changed
4957F-AUTO-02/08	• "Pre-normal Mode" in "Fail-safe Mode" changed • Section 7 "Absolute Maximum Ratings" on page 13 changed • Section 8 "Electrical Characteristics" numbers 10.5 to 10.10 on pages 17 to 18 changed
4957E-AUTO-10/07	• Section 9 "Ordering Information" on page 20 changed

4957D-AUTO-07/07	• Features changed
	• Block diagram changed
	• Application diagram changed
	• Text changed under the headings:
	  3.2, 3.3, 3.4, 3.6, 3.7, 3.8, 3.9, 4, 4.1, 4.2, 4.3, 4.4, 4.5, 5.5, 5.6, 6
	• Figure 4-2, 4-3, 4-4, 4-5, 8-2: changed
	• Figure title 6-1: text changed
	• Abs. Max. Ratings: row "Output current NRES" added
	• El. Char. table: values changed in the following rows:
	  1.3, 5.1, 5.3, 5.4, 6.9, 6.12, 7.9, 11.1

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001
Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
