

## Automotive fully integrated H-bridge motor driver

Datasheet - production data

- Output protected against short to ground and short to  $V_{CC}$
- Standby mode
- Half bridge operation
- Package: ECOPACK®

### Features

Type	$R_{DS(on)}$	$I_{out}$	$V_{CCmax}$
VNH7070AY	72 m $\Omega$ typ (per leg)	20 A	38 V

- AEC-Q100 qualified 
- Output current: 20 A
- 3 V CMOS compatible inputs
- Undervoltage shutdown
- Overvoltage clamp
- Thermal shutdown
- Cross-conduction protection
- Current and power limitation
- Very low standby power consumption
- Protection against loss of ground and loss of  $V_{CC}$
- PWM operation up to 20 KHz
- Multisense monitoring functions
  - Analog motor current feedback
  - Chip temperature monitoring
  - Battery voltage monitoring
- Multisense diagnostic functions
  - Output short to ground detection
  - Thermal shutdown indication
  - OFF-state open-load detection
  - High-side power limitation indication
  - Low-side overcurrent shutdown indication
  - Output short to  $V_{CC}$  detection

### Description

The device is a full bridge motor driver intended for a wide range of automotive applications. The device incorporates a dual monolithic high-side driver and two low-side switches. All switches are designed using STMicroelectronics® well known and proven proprietary VIPower® M0 technology that allows to efficiently integrate on the same die a true Power MOSFET with an intelligent signal/protection circuitry. The three dice are assembled in a PowerSSO-36 package equipped with three exposed islands for optimized dissipation performances. This package is specifically designed for the harsh automotive environment and offers improved thermal performance thanks to exposed die pads. A Multisense\_EN pin is available to enable the MultiSense diagnostic. The input signals  $IN_A$  and  $IN_B$  can directly interface the microcontroller to select the motor direction and the brake condition. Two selection pins (SEL0 and SEL1) are available to address to the microcontroller the information available on the Multisense. The Multisense pin allows to monitor the motor current by delivering a current proportional to the motor current value and provides also the diagnostic feedback according to the implemented truth table. When MultiSense\_EN pin is driven low, MultiSense pin is in high impedance condition. The PWM, up to 20 KHz, allows to control the speed of the motor in all possible conditions. In all cases, a low level state on the PWM pin turns off both the  $LS_A$  and  $LS_B$  switches.

# 1 Block diagram and pin description

Figure 1. Block diagram

Table 1. Block description

Name	Description
Logic control	Allows the turn-on and the turn-off of the high-side and the low-side switches according to the truth table.
Undervoltage	Shuts down the device for battery voltage below (4 V).
High-side and low-side clamp voltage	Protect the high-side and the low-side switches from high voltage on the battery line.
High-side and low-side driver	Drive the gate of the concerned switch to allow a proper $R_{DS(on)}$ for the leg of the bridge.
Current limitation	Limits the motor current in case of short circuit.
High-side and low-side overtemperature protection	In case of short-circuit with the increase of the junction temperature, it shuts down the concerned driver to prevent degradation and to protect the die.
Low-side overcurrent detector	Detects when low-side current exceeds shutdown current and latches off the concerned low-side.
Fault detection	Signalizes an abnormal condition of the switch (output shorted to ground or output shorted to battery) by a feedback on the MultiSense
Power limitation	Limits the power dissipation of the high-side driver inside safe range in case of short to ground condition.

**Table 1. Block description (continued)**

Name	Description
Open-load in OFF-state	Signalize an open-load when the switches are off by a feedback on the MultiSense
T <sub>chip</sub> monitoring	Provides a signal linked to the Chip temperature by a feedback on the MultiSense
V <sub>CC</sub> monitoring	Provides a signal linked to the Chip temperature by a feedback on the MultiSense

**Table 2. Suggested connections for unused and not connected pins**

Connection / pin	MultiSense	N.C.	SOURCE_HSx	DRAIN_LSx	INPUTx, PWM SELx MultiSense_EN
Floating	Not allowed	X	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	X	Through 15 kΩ resistor

**Figure 2. Configuration diagram (top view)**

Table 3. Pin definitions and functions

Pin N°	Symbol	Function
1, 18, 36	NC	Not connected.
10, 27	V <sub>CC</sub> , Heat slug1	Drain of high-side switches and power supply voltage.
16	IN <sub>A</sub>	Clockwise input.
17	PWM	PWM input.
19	MultiSense	Output of current sense and diagnostic feedback
20	MultiSense_EN	Enables the MultiSense diagnostic pin
15	SEL0	Address the MultiSense multiplexer
22	SEL1	Address the MultiSense multiplexer
21	IN <sub>B</sub>	Counter clockwise input.
28, 29, 35	Drain_LSD <sub>B</sub> , Heat Slug3	Drain of low-side switch B.
23, 24, 25, 26	Source_HSD <sub>B</sub>	Source of high-side switch B
30, 31, 32, 33, 34	GND <sub>B</sub>	Source of low-side switch B.
2, 8, 9	Drain_LSD <sub>A</sub> , Heat Slug2	Drain of low-side switch A.
11, 12, 13, 14	Source_HSD <sub>A</sub>	Source of high-side switch A
3, 4, 5, 6, 7	GND <sub>A</sub>	Source of low-side switch A.

Table 4. Pin functions description

Name	Description
V <sub>CC</sub>	Battery connection.
GND	Power ground.
Source_LSD <sub>A</sub> , Source_LSD <sub>B</sub> <sup>(1)</sup>	Power connections to the motor or the bridge configuration: Source HSD <sub>A</sub> and Drain LSD <sub>A</sub> must be externally connected; Source HSD <sub>B</sub> and Drain LSD <sub>B</sub> must be externally connected.
IN <sub>A</sub> IN <sub>B</sub>	Voltage controlled input pins with hysteresis, CMOS compatible. These two pins control the state of the bridge in normal operation according to the truth table (brake to V <sub>CC</sub> , Brake to GND, clockwise and counterclockwise).
PWM	Voltage controlled input pin with hysteresis, CMOS compatible. This pin turns ON the low-side driver according to the IN <sub>A</sub> and IN <sub>B</sub> settings (see <a href="#">Table 13</a> ). Gates of low-side FETS get modulated by the PWM signal during their on phase allowing speed control of the motor.
SEL <sub>0</sub> SEL <sub>1</sub>	Active high compatible with 3 V and 5 V CMOS output pin; they addresses the Multisense multiplexer

Table 4. Pin functions description (continued)

Name	Description
MultiSense	Multiplexed Analog Signal. It delivers a current proportional to the load or a voltage proportional to the $V_{CC}$ voltage or a voltage proportional to the chip temperature whenever the MultiSense_EN is set to high. The desired signal is chosen via SEL0 and SEL1 levels. The MultiSense pin supplies as well a Fault Flag when a fault is detected on the selected path A or B.
MultiSense_EN	Active high compatible with 3 V and 5 V CMOS output pin. It enables the MultiSense diagnostic pin.

1. If the device is used in Bridge configuration we indicate: Source\_HSD<sub>A</sub> = Drain\_LSD<sub>A</sub> = OUT<sub>A</sub>;  
Source HSD<sub>B</sub> = Drain LSD<sub>B</sub> = OUT<sub>B</sub>; OUT<sub>A</sub> and OUT<sub>B</sub> are the power connections to the motor.

## 2 Electrical specifications

Figure 3. Current and voltage conventions

### 2.1 Absolute maximum ratings

Table 5. Absolute maximum ratings

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	38	V
$-V_{CC}$	Reverse $V_{CC}$ supply voltage	0.3	V
$I_{max}$	DC output current (continuous)	Internally limited	A
$I_R$	Reverse output current (continuous) <sup>(1)</sup>	-16	A
$V_{CCPK}$	Maximum transient supply voltage (ISO 16750-2 2010 Test B clamped to 40 V; $R_L = 4 \Omega$ )	40	V
$V_{CCJS}$	Maximum jump start voltage for single pulse short circuit protection	28	V
$I_{IN}$	Input current ( $IN_A$ and $IN_B$ pins)	-1 to 10	mA
$I_{SEL}$	$SEL_{0,1}$ DC input current		
$I_{PWM}$	PWM Input current		
$I_{SENSE\_EN}$	MultiSense_EN DC input current	-1 to 1.5	mA
$I_{SENSE}$	CS pin DC output current ( $V_{GND} = V_{CC}$ and $V_{SENSE} < 0 V$ )	10	mA
	CS pin DC output current in reverse ( $V_{CC} < 0 V$ )	-20	

**Table 5. Absolute maximum ratings (continued)**

Symbol	Parameter	Value	Unit
V <sub>ESD</sub>	Electrostatic discharge (Human body model: R = 1.5 kΩ; C = 100 pF)		
	– IN <sub>A</sub> , IN <sub>B</sub> , PWM	2	kV
	– MultiSense, SEL0, SEL1, MultiSense_EN	2	
	– V <sub>CC</sub>	4	
– Output	4		
T <sub>c</sub>	Junction operating temperature	-40 to 150	°C
T <sub>STG</sub>	Storage temperature	-55 to 150	°C

1. Based on the internal wires capability.

## 2.2 Thermal data

**Table 6. Thermal data**

Symbol	Parameter	Max. value	Unit
R <sub>thj-case</sub>	Thermal resistance junction-case (per leg) (JEDEC JESD 51-8)	HSD	4 °C/W
		LSD	4.3 °C/W
R <sub>thj-amb</sub>	Thermal resistance junction-ambient	See <a href="#">Section 9.1.1</a>	°C/W

## 2.3 Electrical characteristics

$V_{CC} = 7\text{ V}$  up to  $28\text{ V}$ ;  $-40\text{ °C} < T_j < 150\text{ °C}$ , unless otherwise specified.

**Table 7. Power section**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$V_{CC}$	Operating supply voltage		4		28	V
$I_S$	Supply current	Off-state standby $I_{N_A} = I_{N_B} = PWM = 0$ ; $SEL_{0,1} = 0$ ; $T_j = 25\text{ °C}$ ; $V_{CC} = 13\text{ V}$ ; $MultiSense\_EN = 0$			1	$\mu\text{A}$
		Off-state standby <sup>(1)</sup> ; $I_{N_A} = I_{N_B} = PWM = 0$ ; $SEL_{0,1} = 0$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 85\text{ °C}$ ; $MultiSense\_EN = 0$			1	$\mu\text{A}$
		Off-state standby; $I_{N_A} = I_{N_B} = PWM = 0$ ; $SEL_{0,1} = 0$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 125\text{ °C}$ ; $MultiSense\_EN = 0$			3	$\mu\text{A}$
		Off-state (no standby) $I_{N_A} = I_{N_B} = PWM = 0$ ; $SEL_{0,1} = 1$ ; $MultiSense\_EN = 0$		2	4	mA
		On-state: $I_{N_A}$ or $I_{N_B} = 5\text{ V}$ ; $PWM = 1$ ; $SEL_{0,1} = 0$ ; $MultiSense\_EN = 0$ ; No Load		3.5	6	mA
$t_{D\_STBY}^{(2)}$	Standby mode blanking time	$V_{CC} = 13\text{ V}$ ; $I_{N_A} = I_{N_B} = MultiSense\_EN = 0\text{ V}$ ; $PWM = SEL_1 = 0\text{ V}$ ; $V_{SEL0}$ from $5\text{ V}$ to $0\text{ V}$ .	60	300	550	$\mu\text{s}$
$R_{ONHS}$	Static high-side resistance	$I_{OUTx} = 3.5\text{ A}$ ; $T_j = 25\text{ °C}$		42		m $\Omega$
		$I_{OUTx} = 3.5\text{ A}$ ; $T_j = -40\text{ °C}$ to $150\text{ °C}$			85	m $\Omega$
		$V_{CC} = 4\text{ V}$ ; $I_{OUT} = 3.5\text{ A}$ ; $T_j = 25\text{ °C}$		42		m $\Omega$
$R_{ONLS}$	Static low-side resistance	$I_{OUTx} = 3.5\text{ A}$ ; $T_j = 25\text{ °C}$		30		m $\Omega$
		$I_{OUTx} = 3.5\text{ A}$ ; $T_j = -40\text{ °C}$ to $150\text{ °C}$			60	m $\Omega$
		$V_{CC} = 4\text{ V}$ ; $I_{OUT} = 3.5\text{ A}$ ; $T_j = 25\text{ °C}$		30		m $\Omega$
$V_f$	High-side free-wheeling diode forward voltage	$I_{OUTx} = -5\text{ A}$ ; $T_j = 150\text{ °C}$		0.7	0.9	V
$I_{L(off)}$	Off-State Output current of one leg	$T_j = 25\text{ °C}$ ; $V_{CC} = 13\text{ V}$ ; $V_{OUTA} = 0$ or $V_{OUTB} = 0$ ; $I_{N_A} = I_{N_B} = PWM = 0$	0		1	$\mu\text{A}$
		$T_j = 125\text{ °C}$ ; $V_{CC} = 13\text{ V}$ ; $V_{OUTA} = 0$ or $V_{OUTB} = 0$ ; $I_{N_A} = I_{N_B} = PWM = 0$	0		3	$\mu\text{A}$
$I_{L(off)h}$	Off-state output current of one leg with other HSD on	$I_{N_A} = PWM = 0$ ; $I_{N_B} = 5\text{ V}$ ; $V_{CC} = 13\text{ V}$ ; $V_{OUTA} = 0$	20		60	$\mu\text{A}$

- Parameter guaranteed by design and characterization; not subject to production test.
- To power on the device from standby, it is recommended to: toggle  $I_{N_A}$  or  $I_{N_B}$  or  $SEL_0$  or  $SEL_1$  or  $MultiSense\_EN$  from 0 to 1 first to come out from STBY mode; toggle  $PWM$  from 0 to 1 with a delay of  $20\text{ }\mu\text{s}$  this avoids any overstress on the device in case of existing short-to-battery.

**Table 8. Logic inputs ( $V_{CC}=7\text{ V}$  up to  $28\text{ V}$ ;  $-40\text{ }^{\circ}\text{C} < T_j < 150\text{ }^{\circ}\text{C}$ )**

1. The device enters standby mode after  $TD_{sdbly}$ .
2. To power on the device from standby, it is recommended to: toggle INA or INB or SEL0 or SEL1 from 0 to 1 first to come out from STBY mode; toggle PWM from 0 to 1 with a delay of 20  $\mu s$  this avoids any overstress on the device in case of existing short-to-battery.

## 3 Protections

### 3.1 Power limitation (high-side driver)

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing  $\Delta T_j$  through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as  $\Delta T_j$  exceeds the safety level of  $\Delta T_{j\_SD}$ . The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue. When Power Limitation is reached, The device enters in latch mode and generates the Fault Flag on Multisense=VsenseH when the faulty leg diagnostic is selected (please refer to [Table 13](#)).

### 3.2 Thermal shutdown (high-side and low-side)

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175 °C), the device enters in latch mode and generates the Fault Flag on Multisense = VsenseH (please refer to [Table 13](#)). The concerned high side can be switched ON again as soon as  $T_j$  drops below TTR\_HSD, INX is set low for a duration > TLATCH\_RST\_HS and set high again.

### 3.3 Current limitation and over current detector

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. High-side current limitation: in case of short-circuit, overload or during load power-up, the output current is clamped to a safety level,  $I_{LIM\_HSD}$ , by operating the output power MOSFET in the active region.

Low-side overcurrent detector: this protection senses the current flowing in the low-side. If the current exceeds a safety level  $I_{SD\_LS}$ , the device will switch off after a filtering time  $t_{sd\_ld}$ .

In case of fault conditions caused by Power Limitation or overtemperature or open load/short to VCC in OFF state, the fault is indicated by the MultiSense pin being internally switched to a "current limited" voltage source pulled to level VSENSEH (please refer to [Table 13](#)).

# 4 Typical application schematic

Figure 16. Typical application schematic

Note: To protect the device against Battery disconnection with energized inductive load when the bridge driver goes into 3-state, suggested  $C(V_{cc})$  is:

$$C(V_{cc}) = \frac{E_{motor}}{0.5 \cdot DV_{cc, max}^2}$$

where:

$E_{motor} = 19.4 \text{ mJ}$ ;

$DV_{cc, max} = V_{cc\_AMR} - V_{cc\_max}$ ;

$V_{cc\_AMR} = 38 \text{ V}$ ;

$V_{cc\_max} = 26 \text{ V}$  ( $V_{cc}$  at jump start);

$C(V_{cc}) = 270 \mu\text{F}$ .

## 5 MultiSense operation

### 5.1 MultiSense analog monitoring

Diagnostic information on device and load status are provided by an analog output pin (MultiSense) delivering the following signals:

- Current monitor: current mirror of channel output current
- $V_{CC}$  monitor: voltage proportional to  $V_{CC}$
- $T_{CASE}$ : voltage proportional to chip temperature

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in MultiSense multiplexer addressing table.

Figure 17. MultiSense analog monitoring

## 5.2 Multisense diagnostics flag in fault conditions

Multisense pin delivers fixed voltage (VSENSEH) with a certain current capability in case of:

- Fault condition on **activated high-side** (in ON state) triggered by Power Limitation, overtemperature protection, where MultiSense output is selected by SEL0 to high-side in fault state.
- Fault condition on **activated low-side** (in ON state) triggered by overcurrent shutdown, overtemperature protection, where MultiSense output is selected by SEL0 to the same leg (of high-side) where low-side is in fault state.
- Short-circuit to VCC on **OUT in OFF state** (INA = INB = PWM = 0) selected by SEL0; Special care must be taken for the OUTB (SEL0 = 0) because the fixed voltage is available only before the device enters its stand-by mode after TD\_STDBY (because all control signals are set to 0).
- In the configuration of **half bridge** (load connected between OUT and ground), when open-load appears on OUT in OFF state (selected by SEL0) with activated external pull-up resistor. Such condition causes an effect similar to the short circuit to  $V_{CC}$  on leg in OFF state (as mentioned in the above case, output voltage exceeds open-load threshold  $V_{OL}$ ).

## 6 Reverse battery protection

The picture below shows a P-Channel MOSFET connected to the  $V_{CC}$  pin.

**Figure 18. P-channel MOSFET connected to the  $V_{CC}$  pin**

In normal operation the Zener diode plus the resistor generate a gate-source voltage enough to switch on the P-MOSFET. In case of reverse battery polarity: the P-Ch is switched off since its gate voltage is low. No current can flow in this state.

## 7 Open Load detection in off-state

The Open Load (OL) detection in off-state operates when output is deactivated (it means  $INA = INB = PWM = 0$ ). Open load detection is performed by reading the MultiSense output. External (switched) pull-up resistor has to be used and dimensioned to pull output voltage above the maximum open load detection voltage ( $V_{OL\ MAX}$ ) when load is not connected.

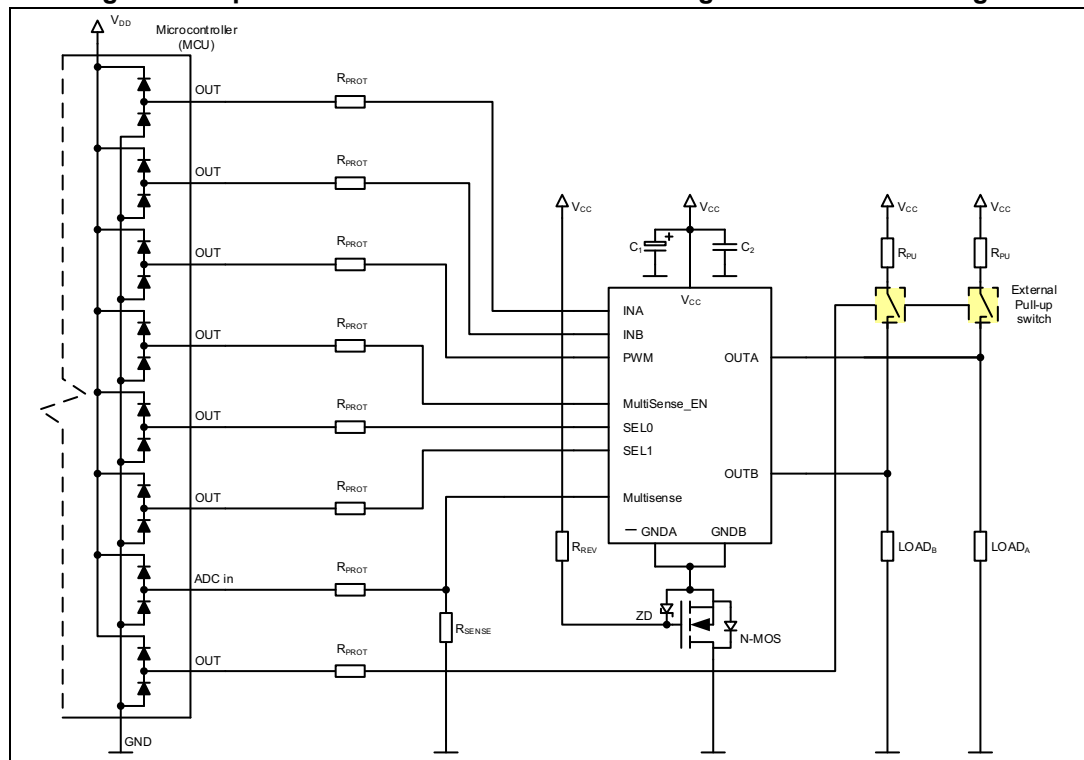

Possible conditions are specified in [Table 14](#).

If pull up resistor is applied over switched circuitry, it allows to detect short to VCC from Open load.

Depending on the application setup, two cases can be applied:

- Half-bridge, with separate loads on OUTA and OUTB, open-load pull-up resistor  $R_{PU}$  is applied for each side; see an example in the figure below.

**Figure 19. Open load detection in off-state - configuration two half-bridges**

if the device is used in half bridge configuration, the  $R_{PU}$  value has to be:

$$R_{pull\_up} < \frac{V_{BATTmin} - V_{OLmax}}{I_{L(off2)min[@VOLmax]}}$$

- Full bridge (load connected between OUTA and OUTB), only one pull-up resistor  $R_{PU}$  is sufficient; see an example in the figure below.

Figure 20. Open load detection in off-state - configuration full-bridge

if the device is used in H-bridge configuration, the equation is:

$$R_{\text{pull\_up}} < \frac{V_{\text{BATTmin}} - V_{\text{OLmax}}}{2 \times I_{\text{L(off2)min}}[\text{@VOLmax}]}$$

## 8 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the VCC pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 15: ISO 7637-2 electrical transient conduction along supply line](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), Section 4. The DUT is intended as the present device only, without components and accessed through VCC and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

**Table 15. ISO 7637-2 electrical transient conduction along supply line**

Test pulse 2011(E)	Test pulse severity level with status II functional performance status		Minimum number of pulses or test time	Burst cycle/pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	U <sub>S</sub> <sup>(1)</sup>		min.	max.	
1	III	-112 V	500 pulses	0.5 s		2 ms, 10 Ω
2a	III	+55	500 pulses	0.2 s	5 s	50 μs, 2 Ω
3a	IV	-220 V	1h	90 ms	100 ms	0.1 μs, 50 Ω
3b	IV	+150 V	1h	90 ms	100 ms	0.1 μs, 50 Ω
4 <sup>(2)</sup>	IV	-7 V	1 pulse			100 ms, 0.01 Ω
<b>Load dump according to ISO 16750-2:2010</b>						
Test B <sup>(3)</sup>		40 V	5 pulse	1 min		400 ms, 2 Ω

1. U<sub>S</sub> is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E)
2. Test pulse from ISO 7637-2:2004(E)
3. With 40 V external suppressor referred to ground (-40 °C < T<sub>J</sub> < 150 °C)

## 9 Package and PCB thermal data

### 9.1 PowerSSO-36 thermal data

Figure 21. PowerSSO-36™ PC board

**Note:** Board finish thickness 1.6 mm +/- 10%, board double layers and four layers, board dimension 129x60, board material FR4, Cu thickness 0.070 mm (front and back side), thermal vias spaced on a 1.2 mm x 1.2 mm grid, Vias pad clearance thickness 0.2 mm, thermal via diameter 0.3 mm ± 0.08 mm, Cu thickness on vias 0.025 mm, footprint dimension 4.1 mm x 6.5 mm.

Figure 22. Chipset configuration

Figure 23. Auto and mutual  $R_{thj-amb}$  vs PCB copper area in open box free air condition

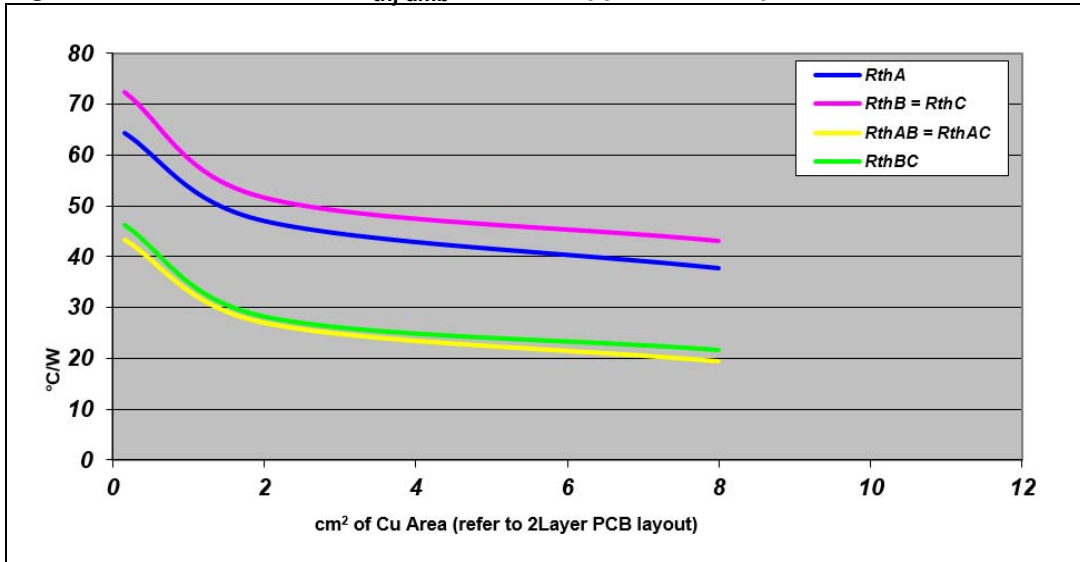

Table 16. Thermal resistance junction-ambient

	Footprint	Cu 2 cm <sup>2</sup>	Cu 8 cm <sup>2</sup>	4Layer
°C/W				
<b>RthA</b>	64.4	47.1	37.8	24.1
<b>RthB=RthC</b>	72.4	51.7	43.2	30.2
<b>RthAB=RthAC</b>	43.3	26.8	19.3	10.8
<b>RthBC</b>	46.3	28.2	21.6	13.8

### 9.1.1 Thermal resistances definition (values according to the PCB heatsink area)

- $R_{thHS} = R_{thHSA} = R_{thHSB}$  = high-side chip thermal resistance junction to ambient (HSA or HSB in ON state)
- $R_{thLS} = R_{thLSA} = R_{thLSB}$  = low-side chip thermal resistance junction to ambient
- $R_{thHSL} = R_{thHSLSA} = R_{thHSLSB}$  = mutual thermal resistance junction to ambient between high-side and low-side chips
- $R_{thLSL} = R_{thLSLSA} = R_{thLSLSB}$  = mutual thermal resistance junction to ambient between low-side chip.

**Table 17. Thermal model for junction temperature calculation in steady-state conditions**

Chip 1	Chip 2	Chip 3	Tjchip1	Tjchip2	Tjchip3
ON	OFF	ON	$\frac{P_{dchip1} \cdot R_{thA} + P_{dchip3} \cdot R_{thAC} + T_{amb}}$	$\frac{P_{dchip1} \cdot R_{thAB} + P_{dchip3} \cdot R_{thBC} + T_{amb}}$	$\frac{P_{dchip1} \cdot R_{thAC} + P_{dchip3} \cdot R_{thC} + T_{amb}}$
ON	ON	OFF	$\frac{P_{dchip1} \cdot R_{thA} + P_{dchip2} \cdot R_{thAB} + T_{amb}}$	$\frac{P_{dchip1} \cdot R_{thAB} + P_{dchip2} \cdot R_{thB} + T_{amb}}$	$\frac{P_{dchip1} \cdot R_{thAC} + P_{dchip2} \cdot R_{thBC} + T_{amb}}$
ON	OFF	OFF	$\frac{P_{dchip1} \cdot R_{thA} + T_{amb}}$	$\frac{P_{dchip1} \cdot R_{thAB} + T_{amb}}$	$\frac{P_{dchip1} \cdot R_{thAC} + T_{amb}}$
OFF	ON	ON	$\frac{(P_{dchip2} + P_{dchip3}) \cdot R_{thAB} + T_{amb}}$	$\frac{P_{dchip2} \cdot R_{thB} + P_{dchip3} \cdot R_{thBC} + T_{amb}}$	$\frac{P_{dchip2} \cdot R_{thBC} + P_{dchip3} \cdot R_{thC} + T_{amb}}$

## 9.2 Thermal Characterization during transients

$$T_{hs} = P_{D_{hs}} \cdot Z_{hs} + Z_{hsIs} \cdot (P_{d_{IsA}} + P_{d_{IsB}}) + T_{amb}$$

$$T_{IsA} = P_{d_{IsA}} \cdot Z_{Is} + P_{D_{hs}} \cdot Z_{hsIs} + P_{d_{IsB}} \cdot Z_{IsIs} + T_{amb}$$

$$T_{IsB} = P_{d_{IsB}} \cdot Z_{Is} + P_{D_{hs}} \cdot Z_{hsIs} + P_{d_{IsA}} \cdot Z_{IsIs} + T_{amb}$$

# 10 Package and packing information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com).

ECOPACK<sup>®</sup> is an ST trademark.

Figure 28. PowerSSO-36 TP tube shipment (no suffix)

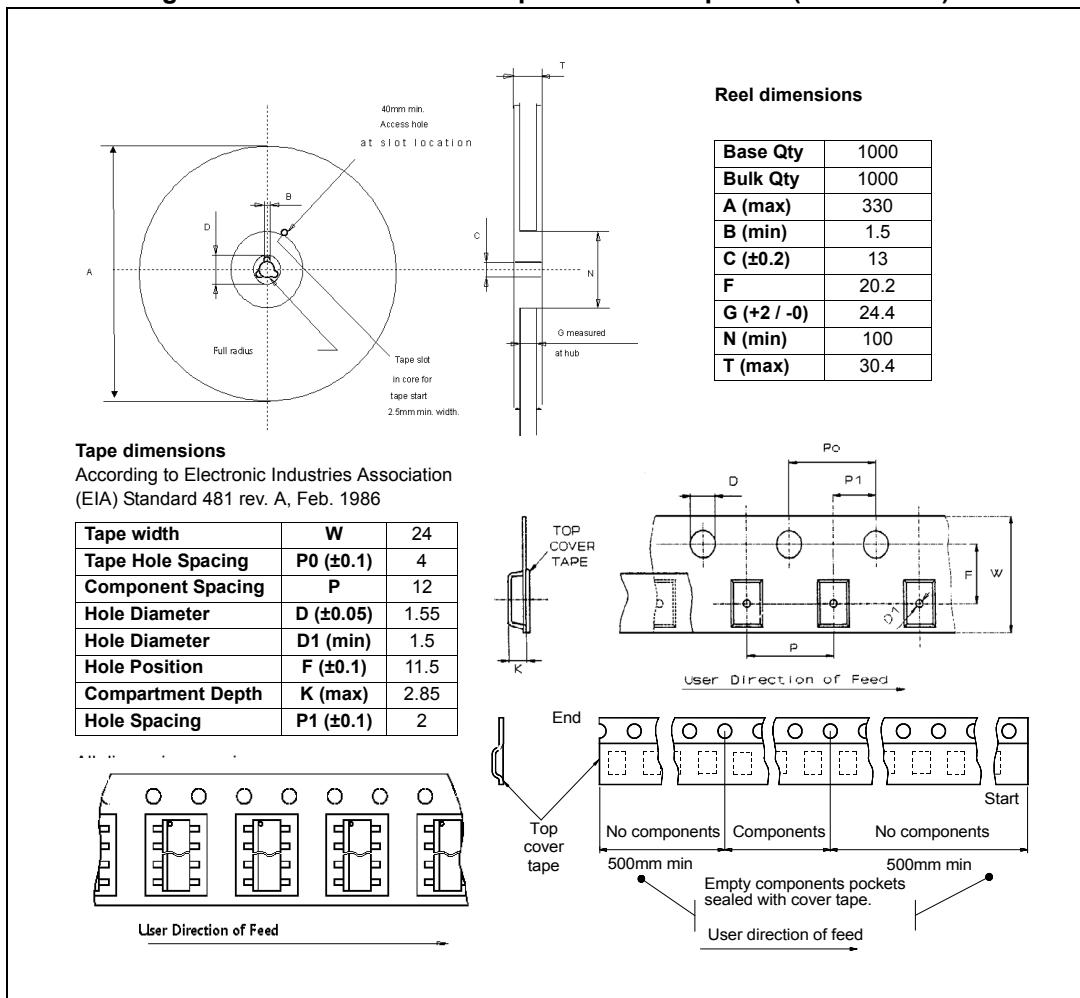

Figure 29. PowerSSO-36 TP tape and reel shipment (suffix “TR”)

### 10.3 PowerSSO-36 marking information

Figure 30. PowerSSO-36 marking information

Parts marked as '&' are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 11 Order codes

**Table 20. Device summary**

Package	Order codes	
	Tube	Tape and reel
PowerSSO-36 TP	VNH7070AY	VNH7070AYTR

## 12 Revision history

**Table 21. Document revision history**

Date	Revision	Description of changes
13-Jul-2017	1	Initial release.
17-May-2018	2	Updated <a href="#">Table 7: Power section</a> ; <a href="#">Table 10: Protections and diagnostics</a> ( $7\text{ V} < VCC < 18\text{ V}$ ; $-40\text{ °C} < Tj < 150\text{ °C}$ ); <a href="#">Table 11: MultiSense</a> ( $7\text{ V} < VCC < 18\text{ V}$ ; $-40\text{ °C} < Tj < 150\text{ °C}$ ). Updated <a href="#">Section 3.1: Power limitation (high-side driver)</a> and <a href="#">Section 3.2: Thermal shutdown (high-side and low-side)</a> .
25-Jan-2019	3	Updated in cover page the first feature with "AEC-Q100 qualified". Updated <a href="#">Table 6</a> , <a href="#">Table 11</a> , <a href="#">Table 17</a> and <a href="#">Figure 16</a> . Added <a href="#">Figure 23</a> , <a href="#">Table 16</a> , <a href="#">Figure 24</a> , <a href="#">Figure 25</a> and <a href="#">Table 18</a> .
11-Feb-2019	4	In <a href="#">Table 7</a> updated Typ. value for $R_{ONHS}$ parameter. In <a href="#">Table 11</a> updated Min. value for $I_{OUT\_SAT}$ parameter.
14-Mar-2019	5	Updated <a href="#">Figure 23</a> , <a href="#">Figure 24</a> and <a href="#">Figure 25</a> . Updated <a href="#">Table 16</a> and <a href="#">Table 18</a> .

## Данный компонент на территории Российской Федерации

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
