

FEATURES

- **Guaranteed Offset Voltage:** 150 μ V Max
 -55°C to 125°C: 500 μ V Max
- **Guaranteed Drift:** 4 μ V/°C Max
- **Guaranteed Bias Current**
 70°C: 150pA Max
 125°C: 2.5nA Max
- **Guaranteed Slew Rate:** 12V/ μ s Min
- Available in 8-Pin PDIP and SO Packages

APPLICATIONS

- Precision, High Speed Instrumentation
- Logarithmic Amplifiers
- D/A Output Amplifiers
- Photodiode Amplifiers
- Voltage-to-Frequency Converters
- Frequency-to-Voltage Converters
- Fast, Precision Sample-and-Hold

DESCRIPTION

The **LT[®]1055/LT1056** JFET input operational amplifiers combine precision specifications with high speed performance.

For the first time, 16V/ μ s slew rate and 6.5MHz gain bandwidth product are simultaneously achieved with offset voltage of typically 50 μ V, 1.2 μ V/°C drift, bias currents of 40pA at 70°C and 500pA at 125°C.

The 150 μ V maximum offset voltage specification is the best available on any JFET input operational amplifier.

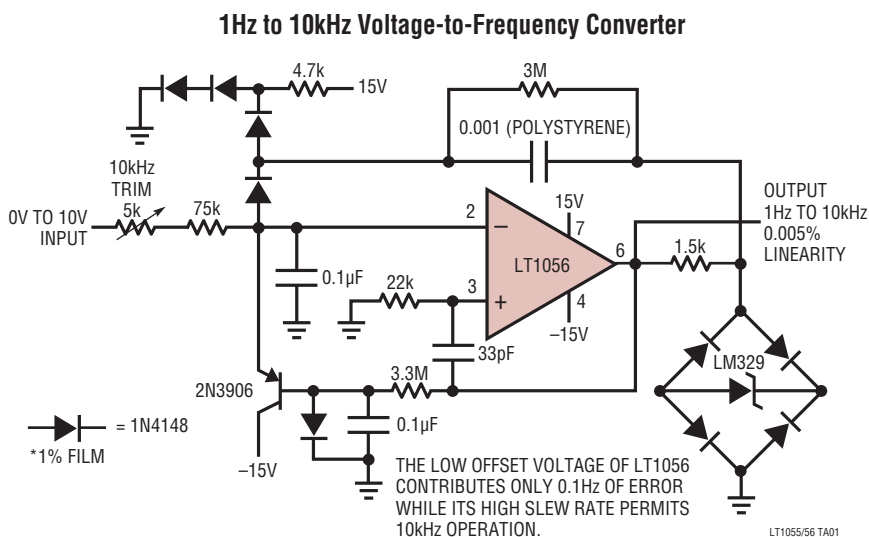

The LT1055 and LT1056 are differentiated by their operating currents. The lower power dissipation LT1055 achieves lower bias and offset currents and offset voltage. The additional power dissipation of the LT1056 permits higher slew rate, bandwidth and faster settling time with a slight sacrifice in DC performance.

The voltage-to-frequency converter shown below is one of the many applications which utilize both the precision and high speed of the LT1055/LT1056.

For a JFET input op amp with 23V/ μ s guaranteed slew rate, refer to the LT1022 data sheet.

LT1055/LT1056

ELECTRICAL CHARACTERISTICS

For MIL-STD components, please refer to LTC883 data sheet for test listing and parameters.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: Offset voltage is measured under two different conditions: (a) approximately 0.5 seconds after application of power; (b) at $T_A = 25^\circ\text{C}$ only, with the chip heated to approximately 38°C for the LT1055 and to 45°C for the LT1056, to account for chip temperature rise when the device is fully warmed up.

Note 3: 10Hz noise voltage density is sample tested on every lot of A grades. Devices 100% tested at 10Hz are available on request.

Note 4: This parameter is tested on a sample basis only.

Note 5: Current noise is calculated from the formula: $i_n = (2qI_B)^{1/2}$, where $q = 1.6 \cdot 10^{-19}$ coulomb. The noise of source resistors up to $1\text{G}\Omega$ swamps the contribution of current noise.

Note 6: Offset voltage drift with temperature is practically unchanged when the offset voltage is trimmed to zero with a 100k potentiometer between the balance terminals and the wiper tied to V^+ . Devices tested to tighter drift specifications are available on request.

TYPICAL PERFORMANCE CHARACTERISTICS

APPLICATIONS INFORMATION

The LT1055/LT1056 may be inserted directly into LF155A/LT355A, LF156A/LT356A, OP-15 and OP-16 sockets. Offset nulling will be compatible with these devices with the wiper of the potentiometer tied to the positive supply.

No appreciable change in offset voltage drift with temperature will occur when the device is nulled with a potentiometer, R_P , ranging from 10k to 200k.

The LT1055/LT1056 can also be used in LF351, LF411, AD547, AD611, OPA-111, and TL081 sockets, provided that the nulling circuitry is removed. Because of the LT1055/LT1056's low offset voltage, nulling will not be necessary in most applications.

Achieving Picoampere/Microvolt Performance

In order to realize the picoampere-microvolt level accuracy of the LT1055/LT1056 proper care must be exercised. For

example, leakage currents in circuitry external to the op amp can significantly degrade performance. High quality insulation should be used (e.g. Teflon, Kel-F); cleaning of all insulating surfaces to remove fluxes and other residues will probably be required. Surface coating may be necessary to provide a moisture barrier in high humidity environments.

Board leakage can be minimized by encircling the input circuitry with a guard ring operated at a potential close to that of the inputs: in inverting configurations the guard ring should be tied to ground, in noninverting connections to the inverting input at pin 2. Guarding both sides of the

APPLICATIONS INFORMATION

printed circuit board is required. Bulk leakage reduction depends on the guard ring width.

The LT1055/LT1056 has the lowest offset voltage of any JFET input op amp available today. However, the offset voltage and its drift with time and temperature are still not as good as on the best bipolar amplifiers because the transconductance of FETs is considerably lower than that of bipolar transistors. Conversely, this lower transconductance is the main cause of the significantly faster speed performance of FET input op amps.

Offset voltage also changes somewhat with temperature cycling. The AM grades show a typical $20\mu\text{V}$ hysteresis ($30\mu\text{V}$ on the M grades) when cycled over the -55°C to 125°C temperature range. Temperature cycling from 0°C to 70°C has a negligible (less than $10\mu\text{V}$) hysteresis effect.

The offset voltage and drift performance are also affected by packaging. In the plastic N8 package the molding compound is in direct contact with the chip, exerting pressure on the surface. While NPN input transistors are largely unaffected by this pressure, JFET device matching and drift are degraded. Consequently, for best DC performance, as shown in the typical performance distribution plots, the TO-5 H package is recommended.

Noise Performance

The current noise of the LT1055/LT1056 is practically immeasurable at $1.8\text{fA}/\sqrt{\text{Hz}}$. At 25°C it is negligible up to 1G of source resistance, R_S (compound to the noise of R_S). Even at 125°C it is negligible to 100M of R_S .

The voltage noise spectrum is characterized by a low $1/f$ corner in the 20Hz to 30Hz range, significantly lower than on other competitive JFET input op amps. Of particular interest is the fact that with any JFET IC amplifier, the frequency location of the $1/f$ corner is proportional to the square root of the internal gate leakage currents and, therefore, noise doubles every 20°C . Furthermore, as illustrated in the noise versus chip temperature curves, the 0.1Hz to 10Hz peak-to-peak noise is a strong function of temperature, while wideband noise ($f_0 = 1\text{kHz}$) is practically unaffected by temperature.

Consequently, for optimum low frequency noise, chip temperature should be minimized. For example, operat-

ing an LT1056 at $\pm 5\text{V}$ supplies or with a $20^\circ\text{C}/\text{W}$ case-to-ambient heat sink reduces 0.1Hz to 10Hz noise from typically $2.5\mu\text{V}_{\text{P-P}}$ ($\pm 15\text{V}$, free-air) to $1.5\mu\text{V}_{\text{P-P}}$. Similarly, the noise of an LT1055 will be $1.8\mu\text{V}_{\text{P-P}}$ typically because of its lower power dissipation and chip temperature.

High Speed Operation

Settling time is measured in the test circuit shown. This test configuration has two features which eliminate problems common to settling time measurements: (1) probe capacitance is isolated from the “false summing” node, and (2) it does not require a “flat top” input pulse since the input pulse is merely used to steer current through the diode bridges. For more details, please see Application Note 10.

As with most high speed amplifiers, care should be taken with supply decoupling, lead dress and component placement.

When the feedback around the op amp is resistive (R_F), a pole will be created with R_F , the source resistance and capacitance (R_S , C_S), and the amplifier input capacitance ($C_{\text{IN}} \approx 4\text{pF}$). In low closed-loop gain configurations and with R_S and R_F in the kilohm range, this pole can create excess phase shift and even oscillation. A small capacitor (C_F) in parallel with R_F eliminates this problem. With $R_S (C_S + C_{\text{IN}}) = R_F C_F$, the effect of the feedback pole is completely removed.

Phase Reversal Protection

Most industry standard JFET input op amps (e.g., LF155/LF156, LF351, LF411, OP15/16) exhibit phase reversal at the output when the negative common mode limit at the input is exceeded (i.e., from -12V to -15V with $\pm 15\text{V}$ supplies). This can cause lock-up in servo systems. As shown below, the LT1055/LT1056 does not have this problem due to unique phase reversal protection circuitry (Q1 on simplified schematic).

 3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS. MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED $.006''$ (0.15mm)
 4. PIN 1 CAN BE BEVEL EDGE OR A DIMPLE

S08 REV G 0212

REVISION HISTORY (Revision history begins at Rev D)

REV	DATE	DESCRIPTION	PAGE NUMBER
D	08/15	Corrected application circuit.	20

TYPICAL APPLICATION

±120V Output Precision Op Amp

RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
LT1122	Fast Settling JFET Op Amp	340ns Settling Time, GBW = 14MHz, SR = 60V/μs
LT1792	Low Noise JFET Op Amp	$e_n = 6nV/\sqrt{Hz}$ Max at $f = 1kHz$

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
