⁸⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

⁹⁾ Requires $150\ \Omega$ resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 2 and circuit page 9).

¹⁰⁾ This range for the current sense ratio refers to all devices. The accuracy of the k_{ILIS} can be raised at least by a factor of two by matching the value of k_{ILIS} for every single device.
In the case of current limitation the sense current I_{IS} is zero and the diagnostic feedback potential V_{ST} is High. See figure 2b, page 11.

Status signal after the time delay shown in the diagrams (see fig 5. page 12...13)

- ¹⁶⁾ The voltage drop over the power transistor is $V_{bb} - V_{OUT} > \text{typ.} 3V$. Under this condition the sense current I_{IS} is zero
- ¹⁷⁾ An external short of output to V_{bb} , in the off state, causes an internal current from output to ground. If R_{GND} is used, an offset voltage at the GND and ST pins will occur and the $V_{ST \text{ low}}$ signal may be errorious.
- ¹⁸⁾ Low ohmic short to V_{bb} may reduce the output current I_L and therefore also the sense current I_{IS} .
- ¹⁹⁾ Power Transistor off, high impedance
- ²⁰⁾ with external resistor between pin 4 and pin 6&7

Open-load detection

OFF-state diagnostic condition: $V_{OUT} > 3 \text{ V typ.}$; IN low

GND disconnect

Any kind of load. In case of Input=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$.

V_bb disconnect with energized inductive load

Normal load current can be handled by the PROFET itself.

V_{bb} disconnect with charged external inductive load

If other external inductive loads L are connected to the PROFET, additional elements like D are necessary.

Inductive Load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot (V_{bb} + |V_{OUT(CL)}|) \cdot \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$
