

## 

## Linear Li+ Battery Charger with Integrated Pass FET, Thermal Regulation, and $\overline{ACOK}$ in 3mm x 3mm TDFN

### **General Description**

The MAX1508 is an intelligent, stand-alone constant-current, constant-voltage (CCCV), thermally regulated linear charger for a single-cell lithium-ion (Li+) battery. The MAX1508 integrates the current-sense circuit, MOS pass element, and thermal-regulation circuitry, and also eliminates the reverse-blocking Schottky diode, to create the simplest and smallest charging solution for hand-held equipment.

The MAX1508 functions as a stand-alone charger to control the charging sequence from the pregualification state through fast-charge, top-off charge, and full-charge indication. The MAX1508Y and MAX1508Z eliminate the prequalification state to allow startup into a load without a batterv.

Proprietary thermal-regulation circuitry limits the die temperature to +100°C when fast charging or while exposed to high ambient temperatures, allowing maximum charging current without damaging the IC.

The MAX1508 achieves high flexibility by providing an adjustable fast-charge current by an external resistor. Other features include the charging status (CHG) of the battery, an active-low control input  $(\overline{EN})$  for the MAX1508 and MAX1508Z (active-high control input for the MAX1508Y), and an active-low input power-source detection output (ACOK).

The MAX1508 accepts a +4.25V to +13V supply, but disables charging when the input voltage exceeds +7V to protect against unqualified or faulty AC adapters. The MAX1508 operates over the extended temperature range (-40°C to +85°C) and is available in a compact 8-pin thermally enhanced 3mm x 3mm thin DFN package with 0.8mm height.

## **Applications**

Cellular and Cordless Phones **PDAs** Digital Cameras and MP3 Players **USB** Appliances Charging Cradles and Docks Bluetooth™ Equipment

Typical Operating Circuit appears at end of data sheet.

#### **Features**

- ♦ Stand-Alone Linear 1-Cell Li+ Battery Charger
- ♦ No External FET, Reverse-Blocking Diode, or **Current-Sense Resistor Required**
- ♦ Programmable Fast-Charge Current (0.8A max)
- **♦** Proprietary Die-Temperature Regulation Control (+100°C)
- ♦ +4.25V to +13V Input Voltage Range with Input Overvoltage Protection (OVP) Above +7V
- **♦** Charge-Current Monitor for Fuel Gauging
- ♦ Low Dropout Voltage—130mV at 0.425A
- ♦ Input Power-Source Detection Output (ACOK)
- ♦ Soft-Start Limits Inrush Current
- ♦ No Pregualification State for the MAX1508Y and **MAX1508Z**
- ♦ Charge Status Output (CHG) for LED or **Microprocessor Interface**
- ♦ Small 3mm x 3mm 8-Pin Thin DFN Package, 0.8mm High
- ♦ Active-Low Charge Enable (EN) (MAX1508 and MAX1508Z)
- ♦ Active-High Charge Enable (EN) (MAX1508Y)

## **Ordering Information**

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK

#### **ABSOLUTE MAXIMUM RATINGS**

IN, CHG to GND	0.3V to +14V
VL, BATT, ISET, EN, EN, ACOK to GND	0.3V to +6V
VL to IN	14V to +0.3V
IN to BATT Continuous Current	0.9A
Continuous Power Dissipation ( $T_A = +70^{\circ}C$ )	
8-Pin TDFN (derate 24.4mW/°C above +70°C	)1951mW

Short-Circuit Duration	Continuous
Operating Temperature Range	40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### ELECTRICAL CHARACTERISTICS

Note 1: Limits are 100% production tested at  $T_A = +25$ °C. Limits over operating temperature range are guaranteed through correlation using statistical quality control (SQC) methods.

### Typical Operating Characteristics

 $(V_{IN}=5V,V_{BATT}=4.0V,\overline{ACOK}=\overline{EN}=\overline{CHG}=$  unconnected, EN = VL (MAX1508Y), R<sub>ISET</sub> = 2.8k $\Omega$  to GND, C<sub>IN</sub> = 1 $\mu$ F, C<sub>BATT</sub> = 1 $\mu$ F, C<sub>VL</sub> = 0.47 $\mu$ F, T<sub>A</sub> = +25°C, unless otherwise noted.)

### **Pin Description**

PIN	NAME	FUNCTION
1	VL	Internally Generated Logic Supply for Chip. Bypass VL to GND with a 0.47µF capacitor.
2	IN	Input Supply Voltage. Bypass IN to GND with a 1µF capacitor to improve line noise and transient rejection.
3	GND	Ground. Connect GND and exposed pad to a large copper trace for maximum power dissipation.
4	ISET	Charge-Current Program and Fast-Charge Current Monitor. Output current from ISET is 0.958mA per amp of battery charging current. The charging current is set by connecting a resistor from ISET to GND. Fast-charge current = $1461V / R_{\text{ISET}}\Omega$ .
5	ĒN	Logic-Level Enable Input (MAX1508/1508Z). Drive EN high to disable charger. Pull EN low or float for normal operation. EN has an internal 200kΩ pulldown resistor.
	EN	Logic-Level Enable Input (MAX1508Y). Drive EN low to disable charger. Drive EN high for normal operation.
6	ACOK	Input Power-Detection Output. The open-drain $\overline{ACOK}$ output asserts low when $+4.25V \le V_{\text{IN}} \le +7V$ and $V_{\text{IN}} - V_{\text{BATT}} \ge 40\text{mV}$ . $\overline{ACOK}$ requires an external $100\text{k}\Omega$ pullup resistor. $\overline{ACOK}$ is high impedance in shutdown.
7	BATT	Li+ Battery Connection. Bypass BATT to GND with a capacitor of at least 1µF per ampere of charge current.
8	CHG	Charging Indicator, Open-Drain Output. CHG goes low (and can turn on an LED) when charging begins. CHG is high impedance when the battery current drops below 10% of the fast-charging current, or when EN is high. Connect a pullup resistor to the µP's I/O voltage when interfacing with a µP logic input.
_	PAD	Exposed Pad. Connect exposed pad to a large copper trace for maximum power dissipation. The pad is internally connected to GND.

## **Detailed Description**

The MAX1508 charger uses voltage, current, and thermal-control loops to charge a single Li+ cell and to protect the battery (Figure 1). When a Li+ battery with a cell voltage below 2.5V is inserted, the MAX1508 charger enters the prequalification stage where it precharges that cell with 10% of the user-programmed fast-charge current. There is no prequalification stage for the MAX1508Z and MAX1508Y in order to allow startup into a load without a battery. The CHG indicator output is driven low (Figure 2) to indicate entry into the pregualification state. Once the cell has passed 2.5V, the charger soft-starts before it enters the fast-charge stage. The fast-charge current level is programmed through a resistor from ISET to ground. As the battery voltage approaches 4.2V, the charging current is reduced. If the battery current drops to less than 10% of the fast-charging current, the CHG indicator goes high impedance, signaling the battery is fully charged. At this point the MAX1508 enters a constant voltage-regulation mode to maintain the battery at full charge. If, at any point while charging the battery, the die temperature approaches +100°C, the MAX1508 reduces the charging current so the die temperature does not exceed the temperature-regulation set point.

The thermal-regulation loop limits the MAX1508 die temperature to +100°C by reducing the charge current as necessary (see the *Thermal Regulation* section).

This feature not only protects the MAX1508 from overheating, but also allows higher charge current without risking damage to the system.

#### MAX1508/MAX1508Z EN Charger Enable Input

 $\overline{\text{EN}}$  is a logic input (active low) to enable the charger. Drive  $\overline{\text{EN}}$  low, leave floating, or connect to GND to enable the charger control circuitry. Drive  $\overline{\text{EN}}$  high to disable the charger control circuitry.  $\overline{\text{EN}}$  has a  $200\text{k}\Omega$  internal pulldown resistance.

#### MAX1508Y EN Charger Enable Input

EN is a logic input (active high) to enable the charger. Drive EN high to enable the charger control circuitry. Drive EN low to disable the charger control circuitry.

#### **ACOK Output**

Active-Low Output. The open-drain  $\overline{ACOK}$  output asserts low when +4.25V < V<sub>IN</sub> < +7V and V<sub>IN</sub> - V<sub>BATT</sub> > 40mV.  $\overline{ACOK}$  requires an external 100k $\Omega$  pullup resistor to the system's logic I/O voltage.  $\overline{ACOK}$  is high impedance in shutdown.

#### **VL Internal Voltage Regulator**

The MAX1508 linear charger contains an internal linear regulator available on the VL output pin. VL requires a 0.47µF ceramic bypass capacitor to GND. VL is regulated to 3.3V whenever the input voltage is above 3.5V.

#### **CHG** Charge Indicator Output

CHG is an open-drain current source for indicating charge status. Table 1 describes the state of CHG during different stages of operation.

 $\overline{\text{CHG}}$  is a nominal 12mA current source suitable for driving a charge-indication LED. If the MAX1508 is used in conjunction with a microprocessor, a pullup resistor to the logic I/O voltage allows  $\overline{\text{CHG}}$  to indicate charge status to the  $\mu P$  instead of driving an LED.

#### Soft-Start

An analog soft-start algorithm activates when entering fast-charge mode. When the prequalification state is complete (VBATT exceeds +2.5V), the charging current ramps up in 3ms to the full charging current. This reduces the inrush current on the input supply. Since the MAX1508Y and MAX1508Z do not have a prequalification state, they automatically enter soft-start upon activation.

Figure 1. Functional Diagram

Figure 2. Charge State Diagram

## \_Applications Information Charge-Current Selection

The maximum charging current is programmed by an external RISET resistor connected from ISET to GND. Select the RISET value based on the following formula:

$$I_{FAST} = 1461 \text{V} / R_{ISET} \Omega$$

where IFAST is in amps and RISET is in ohms. ISET can also be used to monitor the fast-charge current level. The output current from the ISET pin is 0.958mA per amp of charging current. The output voltage at ISET is proportional to the charging current as follows:

VISET = (ICHG x RISET) / 1044

The voltage at ISET is nominally 1.4V at the selected fast-charge current, and falls with charging current as the cell becomes fully charged.

#### **Thermal Regulation**

The MAX1508 features a proprietary thermal-regulation circuit to protect both the IC and the system from excessive heat. When the MAX1508's die temperature reaches +100°C, the charge current is reduced to prevent any additional increase in the die temperature. An active thermal loop does not indicate a fault condition. Thermal regulation allows the MAX1508 to provide continuous charge to the battery under adverse conditions without causing excessive power dissipation.

#### **Capacitor Selection**

Connect a ceramic capacitor from BATT to GND for proper stability. Use a  $1\mu F$  X5R ceramic capacitor for most applications.

Connect a 1µF ceramic capacitor from IN to GND. Use a larger input bypass capacitor for high input voltages or high charging currents to reduce supply noise.

Connect a 0.47µF ceramic capacitor from VL to GND.

#### **Thermal Considerations**

The MAX1508 is in a thermally enhanced thin DFN package with exposed paddle. Connect the exposed paddle of the MAX1508 to a large copper ground plane to provide a thermal contact between the device and the circuit board. The exposed paddle transfers heat away from the device, allowing the MAX1508 to charge the battery with maximum current, while minimizing the increase in die temperature.

#### **DC Input Sources**

The MAX1508 operates from well-regulated DC sources. The full-charging input voltage range is 4.25V to 7V. The device can stand up to 13V on the input without damage to the IC. If  $V_{\rm IN}$  is greater than 7V, then the MAX1508 stops charging.

An appropriate power supply must provide at least 4.25V when sourcing the desired peak charging current. It also must stay below 6.5V when unloaded.

#### **Application Circuits** Stand-Alone Li+ Charger

The MAX1508 provides a complete Li+ charging solution. The *Typical Operating Circuit* at the end of the data sheet shows the MAX1508 as a stand-alone Li+ battery charger. The 2.8k $\Omega$  resistor connected to ISET sets a charging current of 520mA. The LED indicates when either fast-charge or precharge qualification has begun. When the battery is full, the LED turns off.

#### Microprocessor-Interfaced Charger

Figure 3 shows the MAX1508 as a  $\mu$ P-cooperated Li+battery charger. The MAX1508 and MAX1508Z start charging the battery when  $\overline{EN}$  is low. The  $\mu$ P can drive  $\overline{EN}$  high to disable the charger (MAX1508 and MAX1508Z). The MAX1508's  $\overline{ACOK}$  output indicates the presence of a valid AC adapter to the  $\mu$ P.  $\overline{CHG}$  can be used to detect the charge status of a battery. By monitoring V<sub>ISET</sub>, the system can measure the charge current.

#### USB-Powered Li+ Charger

The universal serial bus (USB) provides a high-speed serial communication port as well as power for the remote device. The MAX1508 can be configured to charge its battery at the highest current possible from the host port. Figure 4 shows the MAX1508 as a USB battery charger. To make the circuit compatible with either 100mA or 500mA USB ports, the circuit initializes at 95mA charging current. The microprocessor then interrogates the host to determine its current capability. If the host port is capable, the charging current is increased to 435mA. The 435mA current was chosen to avoid exceeding the 500mA USB specification.

#### **Layout and Bypassing**

Connect a 1µF ceramic input capacitor as close to the device as possible. Provide a large copper GND plane to allow the exposed paddle to sink heat away from the device. Connect the battery to BATT as close to the device as possible to provide accurate battery voltage sensing. Make all high-current traces short and wide to minimize voltage drops. For an example layout, refer to the MAX1507/MAX1508 evaluation kit layout.

Chip Information

многоканальный

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

## Данный компонент на территории Российской Федерации Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

#### http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
