

CAT93C56, CAT93C57

2-Kb Microwire Serial CMOS EEPROM

Description

The CAT93C56/57 is a 2-kb CMOS Serial EEPROM device which is organized as either 128 registers of 16 bits (ORG pin at V_{CC}) or 256 registers of 8 bits (ORG pin at GND). Each register can be written (or read) serially by using the DI (or DO) pin. The CAT93C56/57 features sequential read and self-timed internal write with auto-clear. On-chip Power-On Reset circuitry protects the internal logic against powering up in the wrong state.

Features

- High Speed Operation: 2 MHz
- 1.8 V to 5.5 V Supply Voltage Range
- Selectable x8 or x16 Memory Organization
- Sequential Read
- Software Write Protection
- Power-up Inadvertant Write Protection
- Low Power CMOS Technology
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- Industrial and Extended Temperature Ranges
- 8-pin PDIP, SOIC, TSSOP and 8-pad TDFN Packages
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Figure 1. Functional Symbol

NOTE: When the ORG pin is connected to V_{CC} , the x16 organization is selected. When it is connected to ground, the x8 pin is selected. If the ORG pin is left unconnected, then an internal pullup device will select the x16 organization.

ON Semiconductor®

PIN CONFIGURATIONS

PDIP (L), SOIC (V, X),
TSSOP (Y), TDFN (VP2, ZD4*)

* TDFN 3x3 mm (ZD4) and SOIC (W) rotated pin-out packages are available for CAT93C57 and CAT93C56, Rev. E only (not recommended for new designs of CAT93C56)

PIN FUNCTION

Pin Name	Function
CS	Chip Select
SK	Clock Input
DI	Serial Data Input
DO	Serial Data Output
V_{CC}	Power Supply
GND	Ground
ORG	Memory Organization
NC	No Connection

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 16 of this data sheet.

CAT93C56, CAT93C57

Table 1. ABSOLUTE MAXIMUM RATINGS

Parameters	Ratings	Units
Storage Temperature	-65 to +150	°C
Voltage on Any Pin with Respect to Ground (Note 1)	-0.5 to +6.5	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The DC input voltage on any pin should not be lower than -0.5 V or higher than $V_{CC} + 0.5$ V. During transitions, the voltage on any pin may undershoot to no less than -1.5 V or overshoot to no more than $V_{CC} + 1.5$ V, for periods of less than 20 ns.

Table 2. RELIABILITY CHARACTERISTICS (Note 2)

Symbol	Parameter	Min	Units
N_{END} (Note 3)	Endurance	1,000,000	Program / Erase Cycles
T_{DR}	Data Retention	100	Years

2. These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.
3. Block Mode, $V_{CC} = 5$ V, 25°C

Output Load	Current Source I_{OLmax}/I_{OHmax} ; $CL=100$ pF	

Device Operation

The CAT93C56/57 is a 2048-bit nonvolatile memory intended for use with industry standard microprocessors. The CAT93C56/57 can be organized as either registers of 16 bits or 8 bits. When organized as X16, seven 10-bit instructions for 93C57 or seven 11-bit instructions for 93C56 control the reading, writing and erase operations of the device. When organized as X8, seven 11-bit instructions for 93C57 or seven 12-bit instructions for 93C56 control the reading, writing and erase operations of the device. The CAT93C56/57 operates on a single power supply and will generate on chip, the high voltage required during any write operation.

Instructions, addresses, and write data are clocked into the DI pin on the rising edge of the clock (SK). The DO pin is normally in a high impedance state except when reading data

from the device, or when checking the ready/busy status after a write operation. The serial communication protocol follows the timing shown in Figure 2.

The ready/busy status can be determined after the start of internal write cycle by selecting the device (CS high) and polling the DO pin; DO low indicates that the write operation is not completed, while DO high indicates that the device is ready for the next instruction. If necessary, the DO pin may be placed back into a high impedance state during chip select by shifting a dummy “1” into the DI pin. The DO pin will enter the high impedance state on the rising edge of the clock (SK). Placing the DO pin into the high impedance state is recommended in applications where the DI pin and the DO pin are to be tied together to form a common DI/O pin.

Figure 2. Synchronous Data Timing

CAT93C56, CAT93C57

The format for all instructions sent to the device is a logical “1” start bit, a 2-bit (or 4-bit) opcode, 7-bit address (CAT93C57) / 8-bit address (CAT93C56) (an additional bit

when organized X8) and for write operations a 16-bit data field (8-bit for X8 organizations). The instruction format is shown in Instruction Set table.

Table 10. INSTRUCTION SET

Instruction	Device Type	Start Bit	Opcode	Address		Data		Comments
				x8	x16	x8	x16	
READ	93C56 (Note 8)	1	10	A8–A0	A7–A0			Read Address AN–A0
	93C57	1	10	A7–A0	A6–A0			
ERASE	93C56 (Note 8)	1	11	A8–A0	A7–A0			Clear Address AN–A0
	93C57	1	11	A7–A0	A6–A0			
WRITE	93C56 (Note 8)	1	01	A8–A0	A7–A0	D7–D0	D15–D0	Write Address AN–A0
	93C57	1	01	A7–A0	A6–A0	D7–D0	D15–D0	
EWEN	93C56 (Note 8)	1	00	11XXXXXXX	11XXXXXX			Write Enable
	93C57	1	00	11XXXXXX	11XXXXXX			
EWDS	93C56 (Note 8)	1	00	00XXXXXXX	00XXXXXX			Write Disable
	93C57	1	00	00XXXXXX	00XXXXXX			
ERAL	93C56 (Note 8)	1	00	10XXXXXXX	10XXXXXX			Clear All Addresses
	93C57	1	00	10XXXXXX	10XXXXXX			
WRAL	93C56 (Note 8)	1	00	01XXXXXXX	01XXXXXX	D7–D0	D15–D0	Write All Addresses
	93C57	1	00	01XXXXXX	01XXXXXX	D7–D0	D15–D0	

8. Address bit A8 for 256x8 organization and A7 for 128x16 organization are “Don’t Care” bits, but must be kept at either a “1” or “0” for READ, WRITE and ERASE commands.

CAT93C56, CAT93C57

Read

Upon receiving a READ command and an address (clocked into the DI pin), the DO pin of the CAT93C56/57 will come out of the high impedance state and, after sending an initial dummy zero bit, will begin shifting out the data addressed (MSB first). The output data bits will toggle on the rising edge of the SK clock and are stable after the specified time delay (t_{PD0} or t_{PD1}).

For the CAT93C56/57, after the initial data word has been shifted out and CS remains asserted with the SK clock continuing to toggle, the device will automatically increment to the next address and shift out the next data word in a sequential READ mode. As long as CS is continuously asserted and SK continues to toggle, the device will keep incrementing to the next address automatically until it reaches to the end of the address space, then loops back to address 0. In the sequential READ mode, only the initial

data word is preceded by a dummy zero bit. All subsequent data words will follow without a dummy zero bit. The READ instruction timing is illustrated in Figure 3.

Erase/Write Enable and Disable

The CAT93C56/57 powers up in the write disable state. Any writing after power-up or after an EWDS (erase/write disable) instruction must first be preceded by the EWEN (erase/write enable) instruction. Once the write instruction is enabled, it will remain enabled until power to the device is removed, or the EWDS instruction is sent. The EWDS instruction can be used to disable all CAT93C56/57 write and erase instructions, and will prevent any accidental writing or clearing of the device. Data can be read normally from the device regardless of the write enable/disable status. The EWEN and EWDS instructions timing is shown in Figure 4.

Figure 3. READ Instruction Timing

Figure 4. EWEN/EWDS Instruction Timing

CAT93C56, CAT93C57

Write

After receiving a WRITE command (Figure 5), address and the data, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking clear and data store cycle of the memory location specified in the instruction. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C56/57 can be determined by selecting the device and polling the DO pin. Since this device features Auto-Clear before write, it is NOT necessary to erase a memory location before it is written into.

Erase

Upon receiving an ERASE command and address, the CS (Chip Select) pin must be deasserted for a minimum of t_{CSMIN} (Figure 6). The falling edge of CS will start the self clocking clear cycle of the selected memory location. The clocking of the SaK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C56/57 can be determined by selecting the device and polling the DO pin. Once cleared, the content of a cleared location returns to a logical “1” state.

Figure 5. Write Instruction Timing

Figure 6. Erase Instruction Timing

CAT93C56, CAT93C57

Erase All

Upon receiving an ERAL command (Figure 7), the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking clear cycle of all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C56/57 can be determined by selecting the device and polling the DO pin. Once cleared, the contents of all memory bits return to a logical “1” state.

Write All

Upon receiving a WRAL command and data, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} (Figure 8). The falling edge of CS will start the self clocking data write to all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C56/57 can be determined by selecting the device and polling the DO pin. It is not necessary for all memory locations to be cleared before the WRAL command is executed.

Example of Ordering Information

CAT93C56, Die Rev. G, New Product

9. The device used in the above example is a CAT93C56VI–GT3 (SOIC, Industrial Temperature, NiPdAu, Tape & Reel).

CAT93C56/57, Die Rev. E, Mature Product

(CAT93C56, Rev. E – Not Recommended for New Designs)

10. All packages are RoHS-compliant (Lead-free, Halogen-free).

11. The standard lead finish is NiPdAu.

12. The device used in the above example is a CAT93C56VI–1.8–GT3 (SOIC green package, Industrial Temperature, 1.8 Volt to 5.5 Volt Operating Voltage, NiPdAu finish, Tape & Reel).

13. Product die revision letter is marked on top of the package as a suffix to the production date code (e.g., AYWW). For additional information, please contact your ON Semiconductor sales office.

14. For SOIC, EIAJ (X) package the standard lead finish is Matte-Tin. This package is available in 2,000 pcs/reel, i.e. CAT93C56XI–T2.

15. For additional package and temperature options, please contact your nearest ON Semiconductor sales office.

16. For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

CAT93C56, CAT93C57

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
