

A New Direction in Mixed-Signal

December 2012

XRP7613

1.2A 36V Step Down High Brightness LED Driver

Rev. 1.2.0

GENERAL DESCRIPTION

The XRP7613 is a non-synchronous step down converter with integrated FET optimized to drive high power LEDs at up to 1.2A of continuous current. A wide 7.0V to 36V input voltage range allows for single supply operations from industry standard 12V, 18V or 24V power rails.

Based on a hysteretic PFM control scheme, the XRP7613 can operate at switching frequency of up to 1MHz and allows for small external components selection while providing very fast transient response and achieving excellent efficiency. The output current is programmable from 150mA to 1.2A through an external sense resistor.

Output current dimming is supported through an analog signal or PWM logic signal at up to 40kHz. A dynamic LED current thermal control further enhances the reliability of the end application by linearly reducing the LED current as temperature raises.

An open LED, LED short circuit, over temperature and under voltage lock out protection insures safe operations under abnormal operating conditions.

The XRP7613 is offered in RoHS compliant, "green"/halogen free 8-pin Exposed Pad SOIC package.

APPLICATIONS

- General Lighting and Displays
- Architectural and Accent Lighting
- Medical and Industrial Instrumentation
- Video Projectors

FEATURES

- **1.2A Continuous Output LED Current**
 - 150mA to 1.2A Programmable Range
- **7V to 36V Single Rail Input Voltage**
- **PWM & Analog Dimming Capability**
 - Up to 40kHz Frequency
- **LED Current Foldback Thermal Control**
 - Selectable Automatic Linear Dimming of LED Current with temperature
- **Shutdown Control**
- **Built-in Soft Start**
- **Open LED, LED Short Circuit and Over Temperature Protections**
- **RoHS Compliant "Green"/Halogen Free 8-pin Exposed Pad SOIC Package**

ABSOLUTE MAXIMUM RATINGS

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Input Voltage V_{IN} 40V
 ISEN Voltage($V_{IN}+0.3V$) to ($V_{IN}-5V$)
 EN/DIM Voltage.....-0.3V to 5V
 Junction Temperature 150°C
 Storage Temperature -65°C to 150°C
 Lead Temperature (Soldering, 10 sec)..... 260°C
 ESD Rating (HBM - Human Body Model)
 All pins..... 2kV

OPERATING RATINGS

Input Voltage Range V_{IN} 7V-36V
 Operating Temperature Range -40°C to 85°C
 Thermal Resistance
 θ_{JA}^1 60°C/W
 θ_{JC}^1 15°C/W

Note 1: Package is placed on 2-layer PCB with 2 ounces copper and 2 square inch, connected with 8 vias.

ELECTRICAL SPECIFICATIONS

Specifications with standard type are for an Operating Ambient Temperature of $T_J = T_A = 25^\circ C$ only; limits applying over the full Operating Ambient Temperature range are denoted by a "•". Minimum and Maximum limits are guaranteed through test, design, or statistical correlation. Typical values represent the most likely parametric norm at $T_A = 25^\circ C$, and are provided for reference purposes only. Unless otherwise indicated, $V_{IN} = 12V$, $L=47\mu H$, 1 x LED and $I_{LED}=330mA$ and $T_A= 25^\circ C$.

Parameter	Min.	Typ.	Max.	Units	Conditions
Quiescent Current		0.5	1	mA	Output switching EN/DIM floating, f=250kHz
		35	45	μA	Output not switching EN/DIM<0.2V
Mean Current Sense Threshold Voltage	95	100	105	mV	Measured on ISEN pin with respect to V_{IN} .
ISEN Threshold Hysteresis	-15		+15	%	
I_{LED} Output Current Range	150		1200	mA	$V_{IN}=12V$
Efficiency		93		%	$V_{IN}=12V, V_{OUT}=7.2V, L=47\mu F, I_{LED}=330mA$
Switch On Resistance $R_{DS(ON)}$		0.5		Ω	N-MOSFET (PVDD2=5V)
Switch Leakage Current		1	5	μA	
Operating Frequency f_{SW}		350		kHz	EN/DIM floating, L=47 μF , $I_{LED}=330mA$, 1xLED
Minimum Switch On Time		180		ns	
Minimum Switch OFF Time		280		ns	
VREF Voltage	2.46	2.5	2.54	V	
VREF Output Current			250	μA	
Recommended Duty Cycle Range at f_{SW_MAX}	30		70	%	
Under Voltage Lock Out Threshold		6		V	V_{IN} Rising
		5.5			V_{IN} Falling
Maximum Dimming Frequency			40	kHz	
EN/DIM Input Level Logic High	1.3			V	
EN/DIM Input Level Analog	0.4		1.25	V	
EN/DIM Input Level Logic Low			0.2	V	
EN/DIM Shutdown Delay		16		ms	
EN/DIM Pull Up Current		3.7		μA	
Thermal Shutdown Temperature		150		$^\circ C$	
Thermal Shutdown Hysteresis		30		$^\circ C$	
Thermal Regulation Input Level		0.4		V	$R_I=10k\Omega, R_{TH}=1.91k\Omega$
		0.28			$R_I=10k\Omega, R_{TH}=1.265k\Omega$

1.2A 36V Step Down High Brightness LED Driver

PIN DESCRIPTION

Name	Pin	Description
PGND	1	Power ground pin.
VIN	2	Power supply input pin. Place an input decoupling capacitor as close as possible to this pin.
ISEN	3	LED current setting pin. Connect resistor RSET from this pin to VIN (pin 2) to define nominal average LED current.
EN/DIM	4	Dimming and Enable pin. For automatic startup, leave pin floating.
TH	5	LED temperature protection sense input. Connect temperature thermal sense resistors to turn off output current above a preset temperature threshold.
VREF	6	Reference Voltage for thermal protection.
GND	7	Ground pin.
LX	8	Connect to the output inductor.
GND	Exposed Pad	Power ground pin.

ORDERING INFORMATION

Part Number	Ambient Temperature Range	Marking	Package	Packing Quantity	Note 1	Note 2
XRP7613IDBTR-F	-40°C ≤ T _A ≤ +125°C	XRP7613I YYWWF X	HSOICN-8 Exp. Pad	2.5K/Tape & Reel	Halogen Free	
XRP7613EVB	XRP7613 Evaluation Board					

“YY” = Year – “WW” = Work Week – “X” = Lot Number when applicable.

APPLICATION INFORMATION

HYSTERETIC OPERATION

The XRP7613 is a hysteretic step-down LED driver. It uses $\pm 15\%$ double-ended hysteresis to regulate the average LED current to the value programmed by RSET (refer to figure 1). The $\pm 15\%$ hysteresis is achieved with resistors R2 and R3 in the block diagram shown in figure 2. Average internal current through R1, R2 and R3 is given by $I_{INT(AVG)} = 0.1V/R1$. Note that voltage across RSET must be the same as voltage across R1. Therefore average LED current should be $I_{LED(AVG)} = 0.1V/R_{SET}$. During off time FETs N1 and N2 are off. Inductor current I_L ramps down through the external Schottky diode and voltage at ISEN decreases. This, in turn, causes the I_{INT} to decrease. When I_{INT} falls 15% below $I_{INT(AVG)}$, comparator is triggered on (note that this should correspond to I_{LED} falling 15% below $I_{LED(AVG)}$). N1 and N2 turn on and on time commences. N2 shorts R3 and thereby requires a higher I_{INT} in order to trigger the comparator off. N1 shorts the inductor to ground, I_L ramps up and voltage at ISEN increases. This causes the I_{INT} to increase. When I_{INT} rises 15% above $I_{INT(AVG)}$, comparator is triggered off and the cycle repeats.

TURN ON AND TURN OFF DELAY

As explained above when I_{INT} falls 15% below $I_{INT(AVG)}$, the comparator is triggered on. However, it takes 280ns (nominal) before N1 turns on and LX transitions from high to low voltage (refer to figure 20). The turn on delay time results in inductor current ripple ΔI_L to exceed the -15% hysteresis set by the internal control. Because this delay imposes a lower bound on the N1 off time, it has been called "Minimum Switch OFF Time" in the electrical specifications table.

When I_{INT} rises 15% above $I_{INT(AVG)}$, the comparator is triggered off. There is, however, a delay of 180ns before N1 turns off and LX transitions from low to high voltage. The turn off delay time results in ΔI_L exceeding the +15% hysteresis set by the internal control. Because this delay imposes a lower bound on

the N1 on time, it has been called "Minimum Switch ON Time" in the electrical specifications table.

Thus the delay times will cause the switching frequency to be lower than expected because the turn on and turn off time will take longer to complete. Graphs of typical switching frequency versus V_{IN} for various operating conditions are shown in figures 16-18.

The delay times, under some operating conditions, may force the average current to deviate from $I_{LED(AVG)} = 0.1V/R_{SET}$ if they cause asymmetric hysteresis. As an example in figure 20 the positive hysteresis is higher than the negative hysteresis and there is a positive offset. Average current is higher than $0.1V/R_{SET}$. The effect of delay times on average current has been taken into account by measuring the voltage across R_{SET} for various operating conditions. Graphs of V_{SET} versus V_{IN} are shown in (figures 6-8).

Fig. 20: Effect of Delay Times on Inductor and LED Current Ripple and Average Current

SHUTDOWN CONTROL

A shutdown control function is provided through the EN/DIM input pin. Connecting the EN/DIM input pin to ground or to a DC voltage lower than 200mV for longer than 20ms will completely shut down the XRP7613. In this state, the quiescent current is less than 35 μ A and the internal reference, error amplifier, comparators, and biasing circuitry completely turned off.

1.2A 36V Step Down High Brightness LED Driver

SETTING THE LED CURRENT

The output current I_{LED} of XRP7613 can be set by the external sense resistor R_{SET} . The relationship between I_{LED} and R_{SET} is

$$R_{SET} = \frac{V_{SET}}{I_{LED}}$$

V_{SET} can be determined from graphs in figures 6-8. As an example for the operating conditions $I_{LED}=350mA$, $V_{IN}=24V$, 3xLED; $V_{SET}=105mV$ from figure 6.

OPERATING FREQUENCY

The operating frequency of the XRP7613 can be calculated from the following equation

$$f_s = \frac{1}{T_{ON} + T_{OFF}}$$

where f_s is the operating frequency, T_{ON} is the switch on time and T_{OFF} is the switch off time.

The switch on time can be approximated from the following equation

$$T_{ON} = \frac{L \times \Delta I_L}{V_{IN} - V_{LED} - I_{LED} \times (R_{SET} + R_L + R_{DS(ON)})}$$

$$T_{ON(MIN)} > 250ns$$

The switch off time can be approximated from the following equation

$$T_{OFF} = \frac{L \times \Delta I_L}{V_{LED} + V_D + I_{LED} \times (R_{SET} + R_L)}$$

$$T_{OFF(MIN)} > 350ns$$

where V_{IN} is the input voltage

V_{LED} is the total LED forward voltage

I_{LED} is the LED average current

R_{SET} is current sense resistance

R_L is inductor resistance

$R_{DS(ON)}$ is switch on resistance (0.5Ω typ.)

L is the inductor value

ΔI_L is the inductor peak to peak current

V_D is diode forward voltage at the LED average current.

The recommended operating frequency should not exceed 1MHz.

DIMMING CONTROL

The XRP7613 offers two ways of achieving LED dimming: standard PWM dimming and analog dimming. The EN/DIM input pin is used not only to control the XRP7613 shutdown but also the PWM and analog dimming functions.

If dimming and/or shutdown controls are not required, the EN/DIM pin can be left floating for automatic turn on upon application of proper V_{IN} .

PWM Dimming

A logic-level PWM signal applied to the EN/DIM pin can be used for PWM dimming control of the LEDs. This external signal turns the MOSFET gate drive on and off, thereby modulating the average current delivered to the LED proportional to the duty cycle of the PWM signal. The EN/DIM signal will shutdown the XRP7613 when EN/DIM = L and turn-on the XRP7613 when DIM = H. The DIM signal needs to be greater than 1.3V minimum to turn-on and less than 200mV to fully turn-off the device.

The maximum allowed PWM dimming frequency that can be applied is 40 KHz.

Analog Dimming

The average current delivered to the LED, ie the LED brightness, can also be controlled by applying a variable DC voltage signal to the EN/DIM pin.

A DC voltage greater than 1.25V will drive output LED current to 100% of the LED current as set by the external sense resistor R_{SET} while a voltage lower than 200mV will shutdown the XRP7613. When analog dimming is required, the DC voltage range of EN/DIM should be between 0.4V to 1.25V in order modulating the average current delivered to the LED accordingly.

1.2A 36V Step Down High Brightness LED Driver

PROTECTIONS

LED Open Circuit Protection

Upon detection of an open-circuit on any LED connected to the XRP7613, the device will shut down.

LED Short Circuit Protection

Upon detecting a short-circuit on any LED connected to the XRP7613, the device will maintain the LED current as set by the external sense resistor R_{SET} .

UVLO Protection

The XRP7613 has an Under Voltage Lock-Out comparator to monitor the Input Voltage V_{IN} . The V_{IN} UVLO threshold is set internally: when V_{IN} pin is greater than 6.0V the XRP7613 is permitted to start up pending the removal of all other faults.

LED Thermal Protection

The XRP7613 includes a LED thermal regulation circuit to prevent an over temperature situation on the LED. When the LED temperature rises above a predefined threshold, the XRP7613 will reduce linearly the LED current from its nominal set value.

Fig. 21: V_{TH} Voltage

The XRP7613 continuously monitors the LED temperature by measuring the voltage on its TH pin. The V_{TH} voltage is created through a resistive network of a negative temperature coefficient (NTC) thermistor R_{TH} and a fixed resistor R_T between VREF pin and ground.

By setting $R_T=10K\Omega$ and using a 103KT1608 thermistor, the voltage on the TH pin will reduce to 0.4V when the LED temperature reaches 70°C. The LED average current will be decreased linearly when V_{TH} is between 0.4V and 0.28V. If the LED temperature is over 90°C, the voltage on the TH pin will reduce to 0.28V and the LED will be turned off in order to decrease the LED temperature. When the voltage on the TH pin rises to 0.3V, the LED will be turned on again.

If the LED thermal regulation function isn't required, the TH pin should be connected directly to VREF pin to disable this function.

DIODE SELECTION

Schottky diodes, with their low forward voltage drop and fast reverse recovery, are the ideal choices for any XRP7613 applications. The forward voltage drop of a Schottky diode represents the conduction losses in the diode, while the diode capacitance (C_T or C_D) represents the switching losses. For diode selection, both forward voltage drop and diode capacitance need to be considered. Schottky diodes with higher current ratings usually have lower forward voltage drop and larger diode capacitance, which can cause significant switching losses. A Schottky diode with a 2A current rating is adequate for most XRP7613 applications.

INPUT CAPACITOR SELECTION

Ceramic capacitors with their low ESR values and small size are ideal for the XRP7613 applications. When selecting an input capacitor, a low ESR capacitor is required to minimize the noise at the device input. It may be necessary to add an extra small value ceramic type capacitor in parallel with the input capacitor to prevent any possible ringing.

INDUCTOR SELECTION

Recommended inductor values for the XRP7613 are in the range of 22 μ H to 68 μ H. The inductor selected should have low core losses and low DCR.

1.2A 36V Step Down High Brightness LED Driver

LAYOUT CONSIDERATION

For proper operations of XRP7613, the following guidelines should be followed.

- 1.The input capacitor should be placed as close as possible to the V_{IN} pin in order to reduce the input voltage ripple and noise.
- 2.The inductor, internal power switch, Schottky diode, output capacitor and the LEDs should be kept as close as possible.
- 3.PCB traces with large current should be kept short and wide.

5.Effect from noise can be reduced by placing the XRP7613 GND pin as close as possible to the ground pin of the input bypass capacitor.

6.The ISEN pin and VIN pin should be connected to the sense resistor directly. Traces should be routed away from any potential sources.

7.The VREF pin and TH pin should be connected to the LED thermal sense resistors directly. Traces should be routed away from any potential sources.

TYPICAL APPLICATION CIRCUITS

PACKAGE SPECIFICATION

8-PIN EXPOSED PAD SOIC

- Note :
1. Refer to JEDEC MS-012E.
 2. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion or gate burrs shall not exceed 6 mil per side .
 3. Dimension "E" does not include inter-lead flash or protrusions.
 4. Controlling dimension is millimeter, converted inch dimensions are not necessarily exact.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
