

FEATURES

- ±8 kV ESD IEC 61000-4-2 contact discharge on receiver input pins
- 400 Mbps (200 MHz) switching rates
- 100 ps channel-to-channel skew (typical)
- 100 ps differential skew (typical)
- 3.3 ns propagation delay (maximum)
- 3.3 V power supply
- High impedance outputs on power-down
- Low power design (10 mW quiescent typical)
- Interoperable with existing 5 V LVDS drivers
- Accepts small swing (350 mV typical) differential input signal levels
- Supports open, short, and terminated input fail-safe
- Conforms to TIA/EIA-644 LVDS standard
- Industrial operating temperature range of -40°C to +85°C
- Available in surface-mount SOIC package and low profile TSSOP package

APPLICATIONS

- Point-to-point data transmission
- Multidrop buses
- Clock distribution networks
- Backplane receivers

GENERAL DESCRIPTION

The ADN4666 is a quad-channel, CMOS low voltage differential signaling (LVDS) line receiver offering data rates of over 400 Mbps (200 MHz) and ultralow power consumption.

The device accepts low voltage (350 mV typical) differential input signals and converts them to a single-ended, 3 V TTL/CMOS logic level.

The ADN4666 also offers active high and active low enable/disable inputs (EN and $\overline{\text{EN}}$) that control all four receivers. These inputs

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

disable the receivers and switch the outputs to a high impedance state. Consequently, the outputs of one or more ADN4666 devices can be multiplexed together to reduce the quiescent power consumption to 10 mW typical.

The ADN4666 and its companion driver, the [ADN4665](#), offer a new solution to high speed, point-to-point data transmission and offer a low power alternative to emitter-coupled logic (ECL) or positive emitter-coupled logic (PECL).

OUTPUTS (R_{OUTX})						
Output High Voltage	V_{OH}	2.7	3.0		V	$I_{OH} = -0.4\text{ mA}$, $V_{ID} = 200\text{ mV}$
		2.7	3.0		V	$I_{OH} = -0.4\text{ mA}$, input terminated
		2.7	3.0		V	$I_{OH} = -0.4\text{ mA}$, input shorted
Output Low Voltage	V_{OL}		0.1	0.25	V	$I_{OL} = 2\text{ mA}$, $V_{ID} = -200\text{ mV}$
Output Short-Circuit Current ⁵	I_{OS}	-15	-48	-120	mA	Outputs enabled, $V_{OUT} = 0\text{ V}$
Output Off State Current	I_{OZ}	-10	± 1	+10	μA	Outputs disabled, $V_{OUT} = 0\text{ V}$ or V_{CC}
POWER SUPPLY						
No Load Supply, Current Receivers Enabled	I_{CC}		10	15	mA	\overline{EN} and $\overline{EN} = V_{CC}$ or GND, inputs open
No Load Supply, Current Receivers Disabled	I_{CCZ}		3	5	mA	$\overline{EN} = \text{GND}$ and $\overline{EN} = V_{CC}$, inputs open
ESD PROTECTION						
R_{INX+} , R_{INX-} Pins			± 8		kV	IEC 61000-4-2 contact discharge
			± 15		kV	Human body model
All Pins Except R_{INX+} , R_{INX-}			± 4		kV	Human body model

¹ Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground, unless otherwise specified.

² All typical values are given for $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$.

³ V_{CC} is always higher than the R_{INX+} and R_{INX-} voltage. R_{INX-} and R_{INX+} have a voltage range of -0.2 V to $V_{CC} - V_{ID}/2$. However, to be compliant with ac specifications, the common-mode voltage range is 0.1 V to 2.3 V .

⁴ V_{CMR} is reduced for larger input differential voltage (V_{ID}). For example, if V_{ID} is 400 mV , V_{CMR} is 0.2 V to 2.2 V . The fail-safe condition with inputs shorted is not supported over the common-mode range of 0 V to 2.4 V , but is supported only with inputs shorted and no external common-mode voltage applied. V_{ID} up to $V_{CC} - 0\text{ V}$ can be applied to the R_{INX+}/R_{INX-} inputs with the common-mode voltage set to $V_{CC}/2$. Propagation delay and differential pulse skew decrease when V_{ID} is increased from 200 mV to 400 mV . Skew specifications apply for $200\text{ mV} \leq V_{ID} \leq 800\text{ mV}$ over the common-mode range.

⁵ Output short-circuit current (I_{OS}) is specified as magnitude only; a minus sign indicates direction only. Note that only one output should be shorted at a time; do not exceed the maximum junction temperature specification (150°C).

TIMING SPECIFICATIONS

$V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $C_L = 15\text{ pF to GND}$, all specifications T_{MIN} to T_{MAX} , unless otherwise noted.¹

Table 2.

Parameter ²	Symbol	Min	Typ ³	Max	Unit	Test Conditions/Comments ^{4, 5}
AC CHARACTERISTICS						
Differential Propagation Delay, High to Low	t_{PHLD}	1.8		3.3	ns	$C_L = 15\text{ pF}$, $V_{ID} = 300\text{ mV}$ (see Figure 2 and Figure 3)
Differential Propagation Delay, Low to High	t_{PLHD}	1.8		3.3	ns	$C_L = 15\text{ pF}$, $V_{ID} = 300\text{ mV}$ (see Figure 2 and Figure 3)

Enable Time, Z to High	t_{PZH}		11	17	ns	$R_L = 2\text{ k}\Omega$, $C_L = 15\text{ pF}$ (see Figure 4 and Figure 5)
Enable Time, Z to Low	t_{PZL}		11	17	ns	$R_L = 2\text{ k}\Omega$, $C_L = 15\text{ pF}$ (see Figure 4 and Figure 5)
Maximum Operating Frequency ¹⁰	f_{MAX}	200	250		MHz	All channels switching

¹ Generator waveform for all tests, unless otherwise specified: $f = 1\text{ MHz}$, $Z_O = 50\text{ }\Omega$, t_{TLH} and t_{THL} (0% to 100%) $\leq 3\text{ ns}$ for R_{INx+}/R_{INx-} .

² AC parameters are guaranteed by design and characterization.

³ All typical values are given for $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$.

⁴ Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground, unless otherwise specified.

⁵ C_L includes load and jig capacitance.

⁶ t_{SKD1} is the magnitude difference in the differential propagation delay time between the positive-going edge and the negative-going edge of the same channel.

⁷ Channel-to-channel skew, t_{SKD2} , is defined as the difference between the propagation delay of one channel and that of the others on the same chip with any event on the inputs.

⁸ t_{SKD3} part-to-part skew is the differential channel-to-channel skew of any event between devices. The t_{SKD3} specification applies to devices at the same V_{CC} and within 5°C of each other within the operating temperature range.

⁹ t_{SKD4} part-to-part skew is the differential channel-to-channel skew of any event between devices. The t_{SKD4} specification applies to devices over the recommended operating temperature and voltage ranges and across process distribution. t_{SKD4} is defined as |maximum – minimum| differential propagation delay.

¹⁰ f_{MAX} generator input conditions: $f = 200\text{ MHz}$, $t_{TLH} = t_{THL} < 1\text{ ns}$ (0% to 100%), 50% duty cycle, differential (1.05 V to 1.35 V p-p). f_{MAX} generator output criteria: 60%/40% duty cycle, V_{OL} (maximum = 0.4 V), V_{OH} (minimum = 2.7 V), and load = 15 pF (stray plus probes).

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 3.

Parameter	Rating
V_{CC} to GND	$-0.3\text{ V to }+4\text{ V}$
Input Voltage (R_{INX+} , R_{INX-}) to GND	$-0.3\text{ V to }V_{CC} + 0.3\text{ V}$
Enable Input Voltage (\overline{EN} , \overline{EN}) to GND	$-0.3\text{ V to }V_{CC} + 0.3\text{ V}$
Output Voltage (R_{OUTx}) to GND	$-0.3\text{ V to }V_{CC} + 0.3\text{ V}$
Industrial Operating Temperature Range	$-40^\circ\text{C to }+85^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Maximum Junction Temperature ($T_{J\text{ MAX}}$)	150°C
θ_{JA} Thermal Impedance	150.4°C/W
Power Dissipation	$(T_{J\text{ MAX}} - T_A)/\theta_{JA}$
Reflow Soldering Peak Temperature, Pb-Free	$260^\circ\text{C} \pm 5^\circ\text{C}$

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 6. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	R _{IN1-}	Receiver Channel 1 Inverting Input. When this input is more negative than R _{IN1+} , R _{OUT1} is high. When this input is more positive than R _{IN1+} , R _{OUT1} is low.
2	R _{IN1+}	Receiver Channel 1 Noninverting Input. When this input is more positive than R _{IN1-} , R _{OUT1} is high. When this input is more negative than R _{IN1-} , R _{OUT1} is low.
3	R _{OUT1}	Receiver Channel 1 Output (3 V TTL/CMOS). If the differential input voltage between R _{IN1+} and R _{IN1-} is positive, this output is high. If the differential input voltage is negative, this output is low.
4	EN	Active High Enable and Power-Down Input (3 V TTL/CMOS). When EN is low and $\overline{\text{EN}}$ is high, the receiver outputs are disabled and are in a high impedance state. When $\overline{\text{EN}}$ is high and EN is low or when EN is low and $\overline{\text{EN}}$ is low, the receiver outputs are enabled. When EN is high and $\overline{\text{EN}}$ is high, the receiver outputs are enabled.
5	R _{OUT2}	Receiver Channel 2 Output (3 V TTL/CMOS). If the differential input voltage between R _{IN2+} and R _{IN2-} is positive, this output is high. If the differential input voltage is negative, this output is low.
6	R _{IN2+}	Receiver Channel 2 Noninverting Input. When this input is more positive than R _{IN2-} , R _{OUT2} is high. When this input is more negative than R _{IN2-} , R _{OUT2} is low.
7	R _{IN2-}	Receiver Channel 2 Inverting Input. When this input is more negative than R _{IN2+} , R _{OUT2} is high. When this input is more positive than R _{IN2+} , R _{OUT2} is low.
8	GND	Ground Reference Point for All Circuitry on the Part.
9	R _{IN3-}	Receiver Channel 3 Inverting Input. When this input is more negative than R _{IN3+} , R _{OUT3} is high. When this input is more positive than R _{IN3+} , R _{OUT3} is low.
10	R _{IN3+}	Receiver Channel 3 Noninverting Input. When this input is more positive than R _{IN3-} , R _{OUT3} is high. When this input is more negative than R _{IN3-} , R _{OUT3} is low.
11	R _{OUT3}	Receiver Channel 3 Output (3 V TTL/CMOS). If the differential input voltage between R _{IN3+} and R _{IN3-} is positive, this output is high. If the differential input voltage is negative, this output is low.
12	$\overline{\text{EN}}$	Active Low Enable and Power-Down Input with Pull-Down (3 V TTL/CMOS). When EN is low and $\overline{\text{EN}}$ is high, the receiver outputs are disabled and are in a high impedance state. When EN is high and $\overline{\text{EN}}$ is low or when EN is low and $\overline{\text{EN}}$ is low, the receiver outputs are enabled. When EN is high and $\overline{\text{EN}}$ is high, the receiver outputs are enabled.
13	R _{OUT4}	Receiver Channel 4 Output (3 V TTL/CMOS). If the differential input voltage between R _{IN4+} and R _{IN4-} is positive, this output is high. If the differential input voltage is negative, this output is low.
14	R _{IN4+}	Receiver Channel 4 Noninverting Input. When this input is more positive than R _{IN4-} , R _{OUT4} is high. When this input is more negative than R _{IN4-} , R _{OUT4} is low.
15	R _{IN4-}	Receiver Channel 4 Inverting Input. When this input is more negative than R _{IN4+} , R _{OUT4} is high. When this input is more positive than R _{IN4+} , R _{OUT4} is low.
16	V _{CC}	Power Supply Input. The ADN4666 can be operated from 3.0 V to 3.6 V.

THEORY OF OPERATION

The ADN4666 is a quad-channel line receiver for low voltage differential signaling (LVDS). It takes a differential input signal of 350 mV typical and converts it into a single-ended, 3 V TTL/CMOS logic signal.

A differential current input signal, received via a transmission medium such as a twisted pair cable, develops a voltage across a termination resistor, R_T . This resistor is chosen to match the characteristic impedance of the medium, typically around 100 Ω . The differential voltage is detected by the receiver and converted back into a single-ended logic signal.

When the noninverting receiver input, R_{INx+} , is positive with respect to the inverting input, R_{INx-} (that is, when current flows through R_T from R_{INx+} to R_{INx-}), R_{OUTx} is high. When the noninverting receiver input, R_{INx+} , is negative with respect to the inverting input, R_{INx-} (that is, when current flows through R_T from R_{INx-} to R_{INx+}), R_{OUTx} is low.

Using the ADN4665 as a driver, the received differential current is between ± 2.5 mA and ± 4.5 mA (± 3.5 mA typical), developing between ± 250 mV and ± 450 mV across a 100 Ω termination resistor. The received voltage is centered around the receiver offset of 1.2 V. Therefore, the noninverting receiver input is typically 1.375 V (that is, 1.2 V + [350 mV/2]) and the inverting receiver input is 1.025 V (that is, 1.2 V – [350 mV/2]) for a Logic 1. For a Logic 0, the inverting and noninverting input voltages are reversed. Note that because the differential voltage reverses polarity, the peak-to-peak voltage swing across R_T is twice the differential voltage.

Current-mode drivers offer considerable advantages over voltage-mode drivers, such as the RS-422 drivers. The operating current remains fairly constant with increased switching frequency, whereas the operating current of voltage-mode drivers increases exponentially in most cases. This increase is caused by the overlap as internal gates switch between high and low, causing currents to flow from V_{CC} to ground. A current-mode device reverses a constant current between its two outputs, with no significant overlap currents.

This is similar to emitter-coupled logic (ECL) and positive emitter-coupled logic (PECL), but without the high quiescent current of ECL and PECL.

ENABLE INPUTS

The ADN4666 has active high and active low enable inputs that put all the logic outputs into a high impedance state when disabled, reducing device current consumption from 10 mA typical to 3 mA typical. See Table 5 for a truth table of the enable inputs.

Table 5. Enable Inputs Truth Table

Pin Logic Level		R_{INx+}	R_{INx-}	R_{OUTx}
EN	$\overline{\text{EN}}$			
Low	High	X ¹	X ¹	High-Z
Low	Low	1.025 V	1.375 V	0
Low	Low	1.375 V	1.025 V	1
High	Low	1.025 V	1.375 V	0
High	Low	1.375 V	1.025 V	1

¹ X = don't care.

APPLICATIONS INFORMATION

Figure 12 shows a typical application for point-to-point data transmission using the ADN4665 as the driver and the ADN4666 as the receiver.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
