
Microprocessor Supervisory Circuit with 2 Clock Input Pin

NO.EA-172-191206

OUTLINE

The R5109G is a microprocessor supervisory circuit and has high accuracy and ultra low supply current voltage detector with built-in delay circuit and watchdog timer. When the supply voltage is down across the threshold, or the watchdog timer does not detect the system clock from the microprocessor, the reset output is generated. The voltage detector circuit is used for the system reset, etc. The detector threshold is fixed internally, and the accuracy is $\pm 1.0\%$. The released delay time (Power-on Reset Delay) circuit is built-in, and output delay time is adjustable with an external capacitor, and the accuracy is $\pm 16\%^{(1)}$. When the supply voltage becomes the released voltage, the reset state will be maintained during the delay time. The output type of the reset is selectable, Nch open-drain, or CMOS.

The time out period of the watchdog timer can be also set with an external capacitor, and the accuracy is $\pm 33\%^{(1)}$.

The function to stop supervising clock by the watchdog timer (INH function) and the function to supervise two different clocks are built in this IC. There are another 4 products by the difference of packages and the function of voltage detector and watchdog timer. The package of R5109G is SSOP-8G.

FEATURES

- Operating Voltage Range (Maximum Rating) 0.9V to 6.0V (7.0V)
- Supply Current Typ. 11.5 μ A

< Voltage Detector Part >

- Detector Threshold Range 1.5V to 5.5V (0.1V steps)
- Detector Threshold Accuracy $\pm 1.0\%$
- Power-on Reset Delay Time accuracy $\pm 16\%^{(1)}$ ($-40^{\circ}\text{C} \leq \text{Ta} \leq 105^{\circ}\text{C}$)
- Power-on reset delay time of the voltage detector Typ. 370ms with an external capacitor : 0.1 μ F

< Watchdog Timer Part >

- Built-in a watchdog timer's time out period accuracy $\pm 33\%^{(1)}$ ($-40^{\circ}\text{C} \leq \text{Ta} \leq 105^{\circ}\text{C}$)
- Timeout period for watchdog timer Typ. 310ms with an external capacitor : 0.1 μ F
- Reset timer for watchdog timer Typ. 34ms with an external capacitor : 0.1 μ F
- With Inhibit pin (INH) Able to stop watchdog timer
- Dual clock input Able to supervise two microprocessors
- Package SSOP-8G

APPLICATIONS

- Supervisory circuit for equipment with using microprocessors.

⁽¹⁾ Accuracy to center value of (Min.+Max.)/2

SELECTION GUIDE

The detector threshold, the output type and the taping type for the ICs can be selected at the users' request.
The selection can be made with designating the part number as shown below;

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R5109Gxx1*-TR-FE	SSOP-8G	3,000 pcs	Yes	Yes

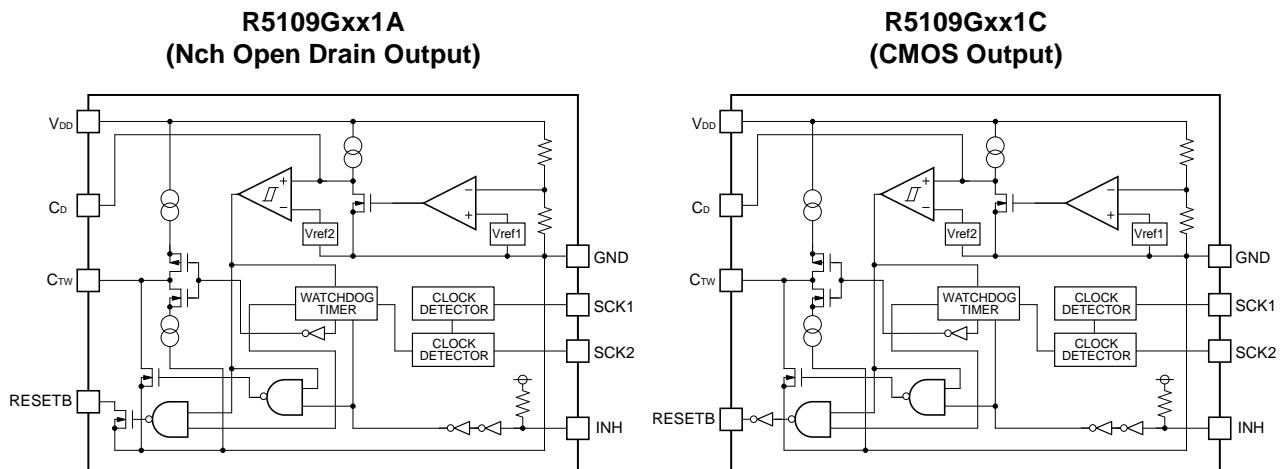

xx: The detector threshold ($-V_{DET}$) can be designated in the range from 1.5V(15) to 5.5V(55) in 0.1V steps.

* : Designation of Output Type
(A) Nch Open Drain
(C) CMOS

Series Selection

	R5105N	R5106N	R5107G	R5108G	R5109G
Package	SOT-23-6		SSOP-8G		
With INH pin (Inhibit)	No	Yes			
2 clock input	No			Yes	
With MR pin (Manual Reset)	No		Yes	No	
With SENSE pin	No			Yes	No
Remarks		C_D pin and C_{TW} pin are combined uses.		Operating Voltage Range 1.5V to 6.0V	Supply Current 11.5 μ A

BLOCK DIAGRAMS

PIN DESCRIPTIONS

• SSOP-8G

Pin No.	Symbol	Description
1	RESETB	Output Pin for Reset signal of Watchdog timer and Voltage Detector. (Output "L" at detecting Detector Threshold and Watchdog Timer Reset.)
2	INH	Inhibit Pin ("L": Inhibit the watchdog timer)
3	C _D	External Capacitor Pin for Setting Delay Time of Voltage Detector
4	GND	Ground Pin
5	SCK1	Clock Input Pin 1 from Microprocessor
6	SCK2	Clock Input Pin 2 from Microprocessor
7	C _{TW}	External Capacitor Pin for Setting Reset and Watchdog Timeout Periods
8	V _{DD}	Power supply Pin

ABSOLUTE MAXIMUM RATINGS

(Ta=25°C)

Symbol	Item		Rating	Unit
V _{DD}	Supply Voltage		–0.3 to 7.0	V
V _{CD}	Output Voltage	Voltage of C _D Pin	–0.3 to V _{DD} + 0.3	V
V _{CTW}		Voltage of C _{TW} Pin	–0.3 to V _{DD} + 0.3	V
V _{RESETB}		Voltage of RESETB Pin	–0.3 to 7.0	V
V _{SCK}	Input Voltage	Voltage of SCK1, SCK2 Pin	–0.3 to 7.0	V
V _{INH}		Voltage of INH Pin	–0.3 to 7.0	V
I _{RESETB}	Output Current	Current of RESETB Pin	20	mA
P _D	Power Dissipation ⁽¹⁾ (SSOP-8G)		380	mW
T _j	Junction Temperature		–40 to 125	°C
T _{stg}	Storage Temperature Range		–55 to 125	°C

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause permanent damage and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings are not assured.

RECOMMENDED OPERATING CONDITIONS

Symbol	Item	Rating	Unit
V _{IN}	Input Voltage	0.9 to 6.0	V
T _a	Operating Temperature Range	–40 to 105	°C

RECOMMENDED OPERATING CONDITIONS

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if they are used over such ratings by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

⁽¹⁾ Refer to *POWER DISSIPATION* for detailed information.

ELECTRICAL CHARACTERISTICS

$V_{DD}=6.0V$, $C_{TW}=0.1\mu F$, $C_D=0.1\mu F$, In case of Nch Open Drain Output type, the output pin is pulled up with a resistance of $100k\Omega$ (R5109Gxx1A), unless otherwise noted.

The specification in is checked and guaranteed by design engineering at $-40^\circ C \leq Ta \leq 105^\circ C$.

THEORY OF OPERATION

TIMING CHART

*) V_{TCD} : Threshold voltage of C_D pin when a power-on reset pulse inverting.

*) V_{ref2H} : C_{TW} pin voltage at the end of WDT timeout period.

*) V_{ref2L} : C_{TW} pin voltage at the begin of WDT timeout period

*) V_{DDL} : 0.9 V (Max.)

Operating Description

- (1) When the power supply, V_{DD} pin voltage becomes more than the released voltage ($+V_{DET}$), after the released delay time (or the power on reset time t_{PLH}), the output of RESETB becomes "H" level.
- (2) After the SCK1 pulse is input, when the SCK2 pulse is input, the watchdog timer is cleared, and C_{TW} pin mode changes from the discharge mode to the charge mode. When the C_{TW} pin voltage becomes higher than V_{ref2H} , the mode will change into the discharge mode, and next watchdog time count starts.
- (3) After the SCK1 pulse is input, unless the SCK2 pulse is input, WDT will not be cleared, and during the charging period of C_{TW} pin, RESETB="L".
- (4) When the V_{DD} pin becomes lower than the detector threshold voltage ($-V_{DET}$), RESETB outputs "L" after the t_{PHL} .
- (5) If "L" signal is input to the INH pin, the RESETB outputs "H", regardless the SCK clock state.
- (6) During the "L" period of INH pin, the voltage detector monitors the supply voltage.
- (7) When the signal to the INH pin is set from "L" to "H", the watchdog starts supervising the system clock, or charge cycle to the C_{TW} pin starts, the capacitor connected to the C_{TW} pin is charged with the current of setting Reset time of WDT.
- (8) After the SCK1 pulse is input, when the SCK2 is input, the WDT will be cleared.
- (9) Without the input of SCK1 pulse input, even if the SCK2 pulse is input, the WDT will not be cleared.
- (10) After the SCK1 pulse is input, when the SCK2 is input, the WDT will be cleared.
- (11) If SCK1 pulse and SCK2 pulse are input at the same time, the WDT will not be cleared.
- (12) After from the discharge of the external capacitor even if the clock pulse is input during the time period " t_{WDI} ", the clock pulse is ignored.
- (13) After the SCK1 pulse is input, when the SCK2 is input, the WDT will be cleared.
- (14) The WDT supervises SCK1 pulse and SCK2 pulse by turns, therefore, for example, if only SCK1 pulse is input twice or more without SCK2 pulse, the second or later consecutive SCK1 pulse will be ignored. After the SCK1 pulse is input, and when the SCK2 pulse is input, the WDT will be cleared. In the same way, if only SCK2 pulse is input twice or more without SCK1 pulse, the second or later consecutive SCK2 pulse will be ignored.

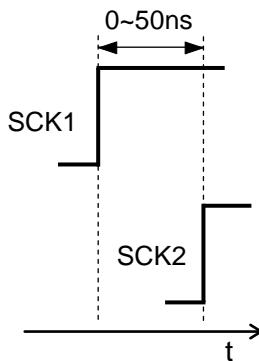

Too close timing of SCK1 pulse input and SCK2 pulse input means the rising edge interval time range from 0ns to 50ns. (Guaranteed by design, not mass production tested.)

Even if the SCK1 and SCK2 are input at almost the same time as above, the WDT will still try to supervise these two clock by turns.

Therefore, after the SCK1 pulse is input, if SCK1 pulse and SCK2 pulse are input at almost the same time, the WDT will be cleared. (as the status (8))

Likewise, after the SCK1 pulse and SCK2 pulse are input at almost the same time, when the SCK2 pulse is input, the WDT will be cleared. (as the status (10))

If the almost same timing input of SCK1 and SCK2 continues twice, the WDT will be cleared. (as the status (13))

Example timing of too close input pulses

(This pattern will be recognized the clock timing is same by the WDT)

Watchdog Timeout period/Reset hold time

The watchdog timeout period and reset hold time can be set with an external capacitor to C_{TW} pin.

The next equations describe the relation between the watchdog timeout period and the external capacitor value, or the reset hold time and the external capacitor value.

$$t_{WD} (s) = 3.1 \times 10^6 \times C (F)$$

$$t_{WR} (s) = t_{WD}/9$$

The watchdog timer (WDT) timeout period is determined with the discharge time of the external capacitor.

During the watchdog timeout period, if the clock pulse from the system is detected, WDT is cleared and the capacitor is charged. When the charge of the capacitor completes, another watchdog timeout period starts again. During the watchdog timeout period, if the clock pulse from the system is not detected, during the next reset hold time RESETB pin outputs "L".

During the reset time, (while charging the external capacitor) and after starting the watchdog timeout period, (just after from the discharge of the external capacitor) even if the clock pulse is input during the time period "t_{WDI}", the clock pulse is ignored.

$$t_{WDI} (s) = t_{WD}/10$$

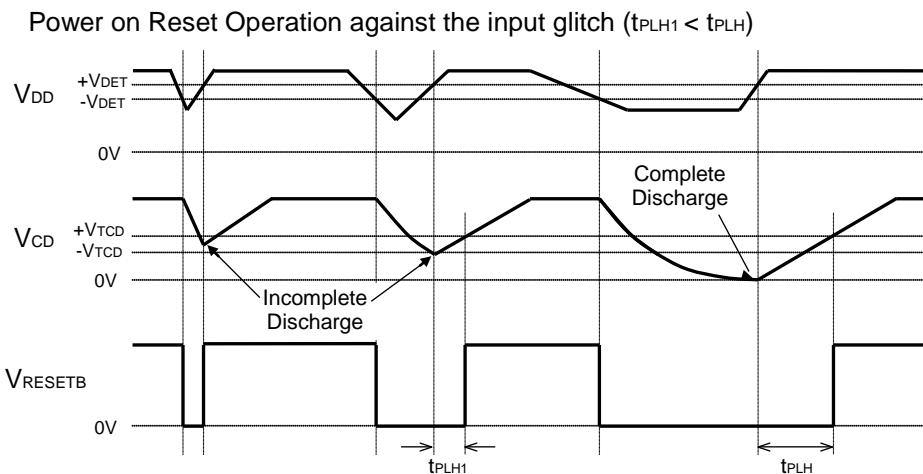

Released Delay Time (Power-on Reset delay time)

The released delay time can be set with an external capacitor connected to the C_D pin. The next equation describes the relation between the capacitance value and the released delay time (t_{PLH}).

$$t_{PLH} (s) = 3.7 \times 10^6 \times C (F)$$

The capacitor connected to C_D pin determines t_{WD} , t_{WR} , and t_{PLH} .

When the V_{DD} voltage becomes equal or less than $(-V_{DET})$, discharge of the capacitor connected to the C_D pin starts. Therefore, if the discharge is not enough and V_{DD} voltage returns to $(+V_{DET})$ or more, thereafter the delay time will be shorter than t_{PLH} which is expected.

Minimum Operating Voltage

We specified the minimum operating voltage as the minimum input voltage in which the condition of RESETB pin being 0.1V or lower than 0.1V. (Herein, pull-up resistance is set as $100\text{k}\Omega$ in the case of the Nch open-drain output type.)

Inhibit (INH) Function

If INH pin is set at "L", the watchdog timer stops monitoring the clock, and the RESETB output will be dominant by the voltage detector's operation. Therefore, if the supply voltage is set at more than the detector threshold level, RESETB outputs "H" regardless the clock pulse. INH pin is pulled up with a resistor (Typ. $110\text{k}\Omega$) internally.

RESETB Output

RESETB pin's output type is selectable either the Nch open-drain output or CMOS output. If the Nch open-drain type output is selected, the RESETB pin is pulled up with an external resistor to an appropriate voltage source.

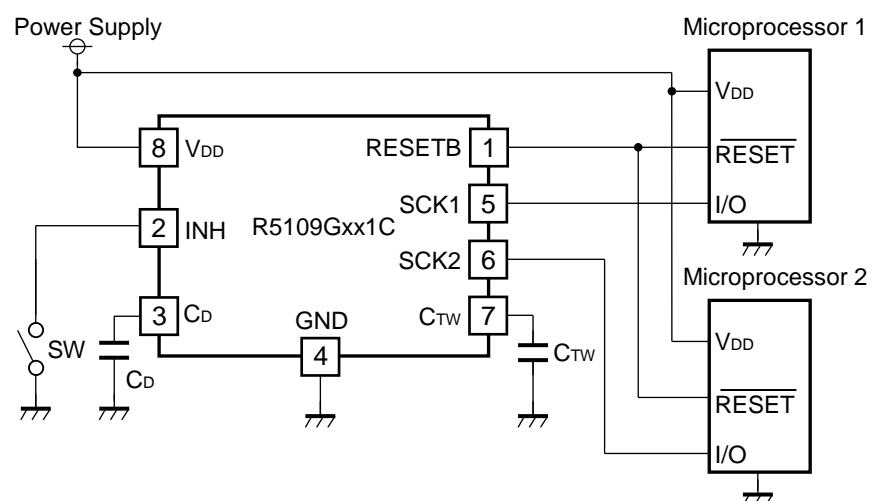

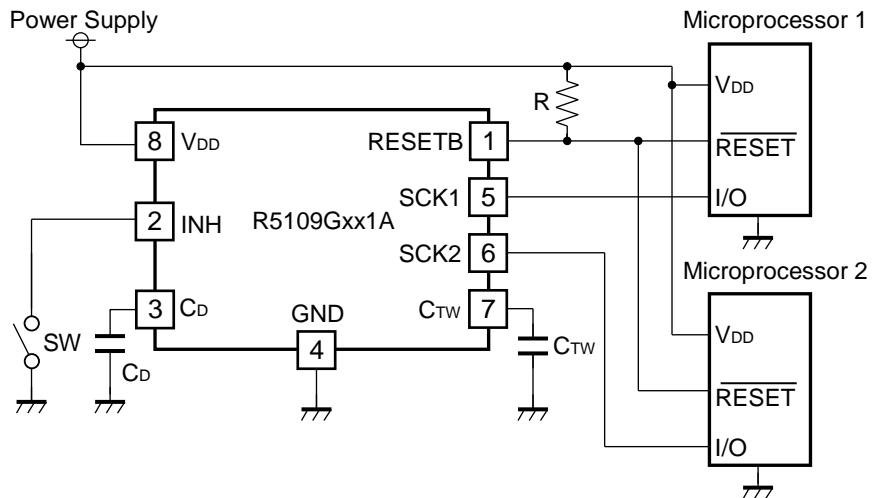

Clock Pulse Input

Built-in watchdog timer is cleared with the SCK clock pulse within the watchdog timeout period.

After the SCK1 clock pulse is input, when the SCK2 pulse is input, the watchdog timer will be cleared. If the system requires only one clock supervise, SCK1 pin and SCK2 pin must connect each other. In this case, the watchdog timer is cleared with every other clock pulse. Depending on the timing of these two clock pulses, SCK1 pulse and SCK2 pulse are recognized at almost the same time by the watchdog timer, during the watchdog timeout period, after the SCK1 clock pulse, two or more SCK2 clock pulses are desirable to put into.

APPLICATION INFORMATION

Typical Application Circuits

TECHNICAL NOTES

When connecting resistors to the device's input pin

When connecting a resistor (R1) to an input of this device, the input voltage decreases by [Device's Consumption Current] x [Resistance Value] only. And, the cross conduction current⁽¹⁾, which occurs when changing from the detecting state to the release state, is decreased the input voltage by [Cross Conduction Current] x [Resistance Value] only. And then, this device will enter the re-detecting state if the input voltage reduction is larger than the difference between the detector voltage and the released voltage.

When the input resistance value is large and the VDD is gone up at mildly in the vicinity of the released voltage, repeating the above operation may result in the occurrence of output.

As shown in Figure A/B, set R1 to become 100k Ω or less as a guide, and connect $C_{IN}^{(2)}$ of 0.1 μ F and more to between the input pin and GND. Besides, make evaluations including temperature properties under the actual usage condition, with using the evaluation board like this way. As result, make sure that the cross conduction current has no problem.

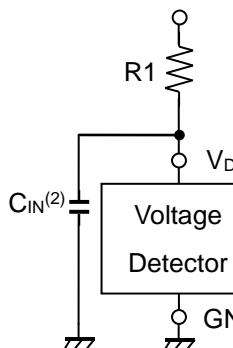

Figure A

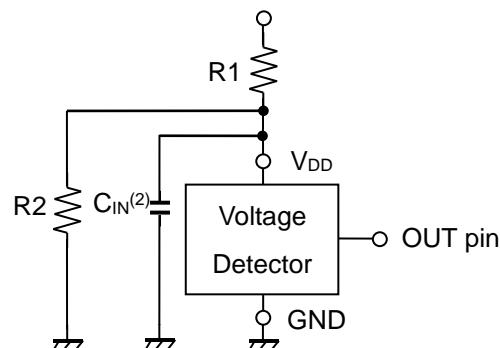

Figure B

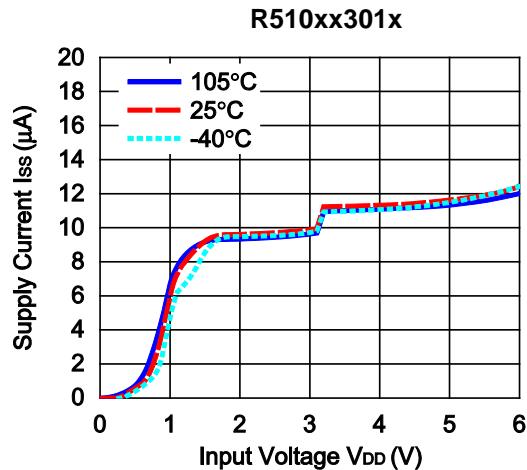

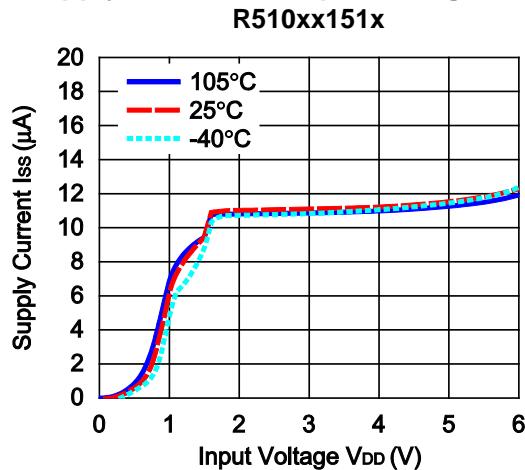

⁽¹⁾ In the CMOS output type, a charging current for OUT pin is included.

The power dissipation of the package is dependent on PCB material, layout, and environmental conditions. The following conditions are used in this measurement.

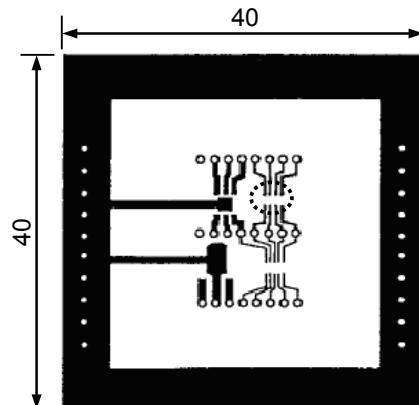

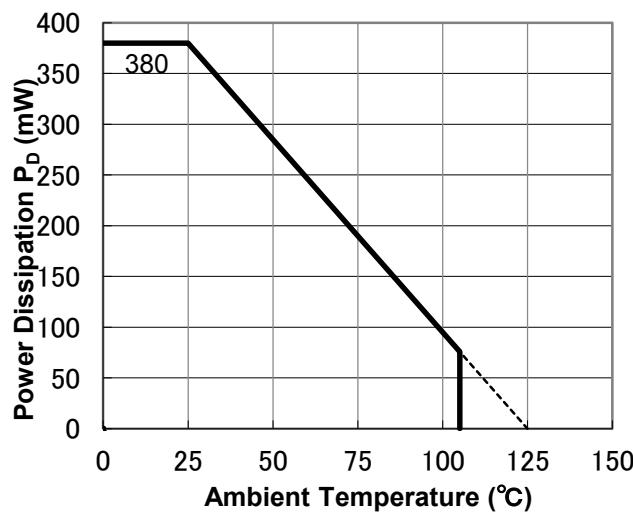

Measurement Conditions

Standard Test Land Pattern	
Environment	Mounting on Board (Wind Velocity = 0 m/s)
Board Material	Glass Cloth Epoxy Plastic (Double-Sided Board)
Board Dimensions	40 mm × 40 mm × 1.6 mm
Copper Ratio	Top Side: Approx. 50% Bottom Side: Approx. 50%
Through-holes	Ø 0.5 mm × 44 pcs

Measurement Result

(Ta = 25°C, Tjmax = 125°C)

Standard Test Land Pattern	
Power Dissipation	380 mW
Thermal Resistance	$\theta_{ja} = (125 - 25°C) / 0.38 W = 263°C/W$ $\theta_{jc} = 60°C/W$

SSOP-8G Package Dimensions (Unit: mm)

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.

Данный компонент на территории Российской Федерации**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибуторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ Р В 0015-002 и ЭС РД 009

Офис по работе с юридическими лицами:
