## 4872 (H) x 3248 (V) Interline CCD Image Sensor

### Description

The KAI-16000 is an interline transfer CCD offering 16 million pixels at up to 3 frames per second through 2 outputs. This image sensor is organized into an array of 4,872 (H) x 3,248 (V) with 7.4 micron square pixels and full 35 mm optical format. As an interline transfer CCD, the KAI-16000 includes additional features such as progressive scan readout, electronic shutter, low noise, high dynamic range, and blooming suppression. These features make the KAI-16000 the perfect sensor for applications in Industrial, Aerial, Security, and Scientific markets.

**Table 1. GENERAL SPECIFICATIONS**

Parameter	Typical Value
Architecture	Interline CCD; Progressive Scan
Total Number of Pixels	4960 (H) x 3324 (V) = 16.6M
Number of Effective Pixels	4904 (H) x 3280 (V) = 16.1M
Number of Active Pixels	4872 (H) x 3248 (V) = 15.8M
Pixel Size	7.4 $\mu\text{m}$ (H) x 7.4 $\mu\text{m}$ (V)
Active Image Size	36.1 mm (H) x 24.0 mm (V) 43.3 mm (diagonal), 35 mm Optical Format
Aspect Ratio	3:2
Number of Outputs	1 or 2
Saturation Signal	30,000 electrons
Output Sensitivity	30 $\mu\text{V}/\text{e}^-$
Quantum Efficiency KAI-16000-AXA (500 nm)	45%
Quantum Efficiency KAI-16000-CXA R (630 nm), G (540 nm), B (470 nm)	30%, 37%, 42%
Read Noise (f = 30 MHz)	16 electrons
Dark Current	< 0.5 nA/cm <sup>2</sup>
Dark Current Doubling Temperature	7°C
Dynamic Range	65 dB
Charge Transfer Efficiency	0.99999
Blooming Suppression	> 100 X
Smear	< -80 dB
Image Lag	< 10 electrons
Maximum Data Rate	30 MHz per channel
Package	40 pin Grid Array
Cover Glass	AR coated, 2 sides

NOTE: All parameters above are specified at T = 40°C

DEVICE DESCRIPTION

Architecture

Figure 2. Sensor Architecture

There are 40 light shielded gray rows followed 3280 photoactive rows and finally 4 more light shielded gray rows. The first 16 and the last 16 photoactive rows are buffer rows giving a total of 3248 lines of image data.

In the single output mode all pixels are clocked out of the Video L output in the lower left corner of the sensor. The first 12 empty pixels of each line do not receive charge from the vertical shift register. The next 28 pixels receive charge from the left light shielded edge followed by 4904 photosensitive pixels and finally 28 more light shielded pixels from the right edge of the sensor. The first 16 and last 16 photosensitive pixels are buffer pixels giving a total of 4872 pixels of image data.

In the dual output mode the clocking of the right half of the horizontal CCD is reversed. The left half of the image is

clocked out Video L and the right half of the image is clocked out Video R. For the Video L each row consists of 12 empty pixels followed by 28 light shielded pixels followed by 2452 photosensitive pixels. For the Video R each row consists of 12 empty pixels followed by 28 light shielded pixels followed by 2452 photosensitive pixels. When reconstructing the image, data from Video R will have to be reversed in a line buffer and appended to the Video L data.

The gray rows are not entirely dark and so should not be used for a dark reference level. Use the dark columns on the left or right side of the image sensor as a dark reference.

Of the dark columns, the first and last dark columns should not be used for determining the zero signal level. Some light does leak into the first and last dark columns.

1. Per color
2. Value is over the range of 10% to 90% of photodiode saturation.
3. Value is for the sensor operated without binning.
4. The operating value of the substrate voltage, V<sub>AB</sub>, will be marked on the shipping container for each device. The value of V<sub>ab</sub> is set such that the photodiode charge capacity is 30,000 electrons.
5. At 30 MHz
6. Uses 20LOG (PNe/ n<sub>e-T</sub>)
7. "Die" indicates a parameter that is measured on every sensor during the production testing. "Design" designates a parameter that is quantified during the design verification activity.

1. Column and cluster defects are separated by no less than two (2) pixels in any direction (excluding single pixel defects).
2. Tested at 27°C and 40°C.
3. Tested at 40°C.

NOTE: Class X sensors are offered strictly "as available". ON Semiconductor cannot guarantee delivery dates. Please call for availability.

**Defect Map**

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point

defects are not included in the defect map. All defective pixels are reference to pixel 1, 1 in the defect maps.

**TEST DEFINITIONS**

**Test Regions of Interest**

Image Area ROI: Pixel (1, 1) to Pixel (4872, 3248)

Only the active pixels are used for performance and defect tests.

**Overclocking**

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions. See Figure 8 for a pictorial representation of the regions.

**Figure 8. Overclock Regions of Interest**

**Tests**

*Global Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 630 mV). Prior to this test being performed

$$\text{GlobalNon-Uniformity} = 100 \times \left( \frac{\text{ActiveAreaStandardDeviation}}{\text{ActiveAreaSignal}} \right)$$

Units: %rms.

Active Area Signal = Active Area Average – Dark Column Average

*Dark Field Defect Test*

This test is performed under dark field conditions. The sensor is partitioned into 384 sub regions of interest, each of which is 203 by 203 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the “Defect Definitions” section.

the substrate voltage has been set such that the charge capacity of the sensor is 900 mV. Global non-uniformity is defined as

*Bright Field Defect Test*

This test is performed with the imager illuminated to a level such that the output is at approximately 630 mV. Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 900 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

Dark defect threshold = Active Area Signal \* threshold  
 Bright defect threshold = Active Area Signal \* threshold

The sensor is then partitioned into 384 sub regions of interest, each of which is 203 by 203 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 630 mV
- Dark defect threshold: 630 mV \* 15% = 95 mV
- Bright defect threshold: 630 mV \* 15% = 95 mV
- Region of interest #1 selected. This region of interest is pixels 1, 1 to pixels 203, 203.
  - ♦ Median of this region of interest is found to be 630 mV.
  - ♦ Any pixel in this region of interest that is  $\geq (630 + 95 \text{ mV})$  725 mV in intensity will be marked defective.
  - ♦ Any pixel in this region of interest that is  $\leq (630 - 95 \text{ mV})$  535 mV in intensity will be marked defective.
- All remaining 384 sub regions of interest are analyzed for defective pixels in the same manner.

## OPERATION

Table 10. ABSOLUTE MAXIMUM RATINGS

Description	Symbol	Minimum	Maximum	Units	Notes
Operating Temperature	T <sub>OP</sub>	-50	70	°C	1
Humidity	RH	5	90	%	2
Output Bias Current	I <sub>out</sub>	0.0	-40	mA	3
Off-chip Load	C <sub>L</sub>		10	pF	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Noise performance will degrade at higher temperatures.
- T = 25°C. Excessive humidity will degrade MTTF.
- Total for all outputs. Maximum current is -20 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity). Operation at these values will reduce MTTF.

- The operating of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of Vab is set such that the photodiode charge capacity is 30,000 electrons.
- VESD must be at least 1 V more negative than H1<sub>lo</sub> and H2<sub>lo</sub> during sensor operation AND during camera power turn on.
- An output load sink must be applied to Vout to activate output amplifier.
- The maximum DC current is for one output unloaded. This is the maximum current that the first two stages of one output amplifier will draw. This value is with Vout disconnected.

## STORAGE AND HANDLING

Table 16. STORAGE CONDITIONS

Description	Symbol	Minimum	Maximum	Units	Notes
Temperature	T	-55	80	°C	1
Humidity	RH	5	90	%	2

1. Long-term exposure toward the maximum temperature will accelerate color filter degradation.
2. T = 25°C. Excessive humidity will degrade MTTF.

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
