1 FEATURES

- 80C51 CPU
- 32 kbytes on-chip ROM, expandable externally to 64 kbytes Program Memory address space
- P83C524:
 - 16 kbytes on-chip ROM, expandable externally from 32 kbytes to 64 kbytes Program Memory address space (address space 16 k to 32 k not usable)
- P80C528:
 - ROMless version of P83C528
- P83C528:
 - 32 kbytes on-chip ROM, expandable externally from 32 kbytes to 64 kbytes Program Memory address space
- EPROM versions are available: see separate data sheet P87C524 and P87C528
- 512 bytes on-chip RAM, expandable externally to 64 kbytes Data Memory address space
- Four 8-bit I/O ports
- Full-duplex UART compatible with the standard 80C51 and the 8052
- Two standard 16-bit timer/counters
- An additional 16-bit timer (functionally equivalent to the timer 2 of the 8052)
- On-chip Watchdog Timer (WDT) with an own oscillator
- Bit-level I²C-bus hardware serial I/O Port
- 7-source and 7-vector interrupt structure with 2 priority levels
- Up to 3 external interrupt request inputs
- Two programmable power reduction modes (Idle and Power-down)
- Termination of Idle mode by any interrupt, external or WDT (watchdog) reset
- Wake-up from Power-down by external interrupt, external or WDT reset
- ROM code protection
- XTAL frequency range: 3.5 MHz to 16 MHz and 3.5 MHz to 24 MHz
- All packaging pin-outs fully compatible to the standard 8051/8052.

P83C524; P80C528; P83C528

2 GENERAL DESCRIPTION

The P83C524 and P83C528 single-chip 8-bit microcontrollers are manufactured in an advanced CMOS process and are derivatives of the PCB80C51 microcontroller family. These devices provide architectural enhancements that make them applicable in a variety of applications in general control systems, especially in those systems which need a large ROM and RAM capacity on chip.

The P83C524 and P83C528 contain a non-volatile 16 k × 8 respectively 32 k × 8 read-only program memory, a volatile 512 bytes × 8 read/write data memory, four 8-bit I/O ports, two 16-bit timer/event counters (identical to the timers of the 80C51), a 16-bit timer (identical to the timer 2 of the 8052), a multi-source, two-priority-level, nested interrupt structure, two serial interfaces (UART and bit-level I²C-bus), a watchdog timer (WDT) with a separate oscillator, an on-chip oscillator and timing circuits. For systems that require extra capability, the P83C524 and P83C528 can be expanded using standard TTL compatible memories and logic.

The device also functions as an arithmetic processor having facilities for both binary and BCD arithmetic plus bit-handling capabilities. The P83C524 and P83C528 have the same instruction set as the PCB80C51 which consists of over 100 instructions: 49 one-byte, 46 two-byte and 16 three-byte. With a 16 MHz crystal, 58% of the instructions are executed in 750 ns and 40% in 1.5 μ s. Multiply and divide instructions require 3 μ s.

7.2 **Pin description**

	PIN		DESCRIPTION				
SYMBOL	SOT 129-1	SOT 187-2	SOT 307-2		DESCRIPTION		
P1.0-P1.7	1 to 8	2–9 (1 n.c.)	1–3, 40–44 (39 n.c.)	Port 1 : 8-bit quasi-bidirectional I/O Port. Port 1 can sink/source one TTL (= 4 LSTTL) input. It can drive CMOS inputs without external pull-ups, except P1.6 and P1.7 which have open drain outputs.			
				Port 1 alt	ternative functions:		
T2	1	2	40	P1.0	Timer/event counter 2 external event counter input (falling edge triggered)		
T2EX	2	3	41	P1.1	Timer/event counter 2 capture/reload trigger or external interrupt 2 input (falling edge triggered)		
SCL	7	8	2	P1.6	I ² C-bus Serial Port clock line		
SDA	8	9	3	P1.7	I ² C-bus Serial Port data line.		
RST	9	10	4	RESET : a HIGH level on this pin for two machine cycles while the oscillator is running, resets the device. An internal pull-down resistor permits power-on reset using only a capacitor connected to V_{DD} . After a WDT overflow this pin is pulled HIGH while the internal reset signal is active.			
P3.0-P3.7	10–17	11, 13–19	5, 7–13	Port 3: 8-bit quasi-bidirectional I/O Port with internal pull-ups.			
		(12 n.c.)	(6 n.c.)	Port 3 can sink/source one TTL (= 4 LSTTL) input. It can drive CMOS inputs without external pull-ups.			
				Port 3 alternative functions:			
RXD/data	10	11	5	P3.0 Serial Port data input (asynchronous) or data input/output (synchronous)			
TXD/clock	11	13	7	P3.1 Serial Port data output (asynchronous) or clock output (synchronous)			
INT0	12	14	8	P3.2	external interrupt 0 or gate control input for timer/event counter 0		
INT1	13	15	9	P3.3	external interrupt 1 or gate control input for timer/event counter 1		
TO	14	16	10	P3.4	external input for timer/event counter 0		
T1	15	17	11	P3.5	external input for timer/event counter 1		
WR	16	18	12	P3.6	external data memory write strobe		
RD	17	19	13	P3.7	external data memory read strobe.		
				The generation or use of a Port 3 pin as an alternative function is carried out automatically by the P83C528 provided the associated Special Function Register (SFR) bit is set HIGH.			
XTAL2	18	20	14	Crystal input 2 : output of the inverting amplifier that forms the oscillator. This pin left open-circuit when an external oscillator clock is used (see Figures 22 and 23).			

Table 1 Pin description for P83C524, P80C528 and P83C528; see note 1

P83C524; P80C528; P83C528

SYMBOL	PIN			DESCRIPTION	
STIVIBUL	SOT 129-1	SOT 187-2	SOT 307-2	DESCRIPTION	
XTAL1	19	21	15	Crystal input 1 : input to the inverting amplifier that forms the oscillator, and input to the internal clock generator. Receives the external oscillator clock signal when an external oscillator is used (see Figures 22 and 23).	
V _{SS}	20	22	16	Ground: circuit ground potential.	
P2.0-P2.7	21–28	24–31 (23 n.c.)	18–25 (17 n.c.)	Port 2 : 8-bit quasi-bidirectional I/O Port with internal pull-ups. During access to external memories (RAM/ROM) that use 16-bit addresses (MOVX @DPTR) Port 2 emits the high-order address byte (A8 to A15). Port 2 can sink/source one TTL (= 4 LSTTL) input. It can drive CMOS inputs without external pull-ups.	
PSEN	29	32	26	Program Store Enable output: read strobe to the external program memory via Port 0 and Port 2. It is activated twice each machine cycle during fetches from external program memory. When executing out of external program memory two activations of <u>PSEN</u> are skipped during each access to external data memory. <u>PSEN</u> is not activated (remains HIGH) during no fetches from external program memory. <u>PSEN</u> can sink/source 8 LSTTL inputs. It can drive CMOS inputs without external pull-ups.	
ALE	30	33	27	Address Latch Enable output : latches the LOW byte of the address during access to external memory in normal operation. It is activated every six oscillator periods except during an external data memory access. ALE can sink/source 8 LSTTL inputs. It can drive CMOS inputs without an external pull-up.	
ĒĀ	31	35 (34 n.c.)	29 (28 n.c.)	External Access input : when during RESET, EA is held at a TTL HIGH level, the CPU executes out of the internal program ROM, provided the program counter is less than 32768. When EA is held at a TTL LOW level during RESET, the CPU executes out of external program memory via Port 0 and Port 2. EA is not allowed to float.	
P0.0-P0.7	32–39	36–43	30–37	Port 0 : 8-bit open drain bidirectional I/O Port. It is also the multiplexed low-order address and data bus during accesses to external memory (AD0 to AD7). During these accesses internal pull-ups are activated. Port 0 can sink/source 8 LSTTL inputs.	
V _{DD}	40	44	38	Power supply : +5 V power supply pin during normal operation, Idle mode and Power-down mode.	

Note

1. To avoid a 'latch-up' effect at power-on, the voltage on any pin (at any time) must not be higher than V_{DD} +0.5 V or lower than V_{SS} –0.5 V respectively.

8 FUNCTIONAL DESCRIPTION

8.1 General

The P83C524, P80C528 and P83C528 are stand-alone high-performance microcontrollers designed for use in real time applications such as instrumentation, industrial control, medium to high-end consumer applications and specific automotive control applications.

In addition to the 80C51 standard functions, the devices provide a number of dedicated hardware functions for these applications. The P83C524 and P83C528 are control-oriented CPUs with on-chip program and data memory. They can be extended with external program memory up to 64 kbytes. They can also access up to 64 kbytes of external data memory. For systems requiring extra capability, the P83C524 and P83C528 can be expanded using standard memories and peripherals.

The P83C524, P80C528 and P83C528 have two software selectable modes of reduced activity for further power reduction: Idle and Power-down. The Idle mode freezes the CPU while allowing the RAM, timers, serial ports and interrupt system to continue functioning. The Power-down mode saves the RAM contents but freezes the oscillator causing all other chip functions to be inoperative except the WDT if it is enabled. The Power-down mode can be terminated by an external reset, a WDT overflow, and in addition, by either of the two external interrupts.

8.2 Instruction Set Execution

The P83C524, P80C528 and P83C528 use the powerful instruction set of the 80C51. Additional SFRs are incorporated to control the on-chip peripherals. The instruction set consists of 49 single-byte, 46 two-byte and 16 three-byte instructions. When using a 16 MHz oscillator, 64 instructions execute in 750 ns and 45 instructions execute in 1.5 s. Multiply and divide instructions execute in 3 μ s (see Chapter 18).

9 MEMORY ORGANIZATION

The central processing unit (CPU) manipulates operands in three memory spaces; these are the 64 kbyte external data memory (of which the lower 256 bytes reside in the internal AUX-RAM), 512 byte internal data memory (consisting of 256 bytes standard RAM and 256 bytes AUX-RAM) and the 64 kbyte internal and external program memory.

P83C524; P80C528; P83C528

9.1 Program Memory

The program memory address space of the P83C528 comprises an internal and an external memory portion. The P83C528 has 32 kbyte of program memory on-chip. The program memory can be externally expanded up to 64 kbyte. If the EA pin is held HIGH, the P83C528 executes out of the internal program memory unless the address exceeds 7FFFH. Locations 8000H through 0FFFFH are then fetched from the external program memory. If the EA pin is held LOW, the P83C528 fetches all instructions from the external program memory. Fig.6 illustrates the program memory address space.

By setting a mask programmable security bit the ROM content is protected i.e. it cannot be read out by any test mode or by any instruction in the external program memory space. The MOVC instructions are the only ones which have access to program code in the internal or external program memory. The EA input is latched during RESET and is 'don't care' after RESET. This implementation prevents reading from internal program code by switching from external program memory to internal program memory during MOVC instruction or an instruction that handles immediate data. Table 2 lists the access to the internal and external program memory by the MOVC instructions when the security bit has been set to a logical one. If the security bit has been set to a logical 0 there are no restrictions for the MOVC instructions.

P83C524; P80C528; P83C528

Table 2 Internal and external program memory access with security bit s	Table 2	Internal and external program me	emory access with security bit se
--	---------	----------------------------------	-----------------------------------

INSTRUCTION	ACCESS TO INTERNAL PROGRAM MEMORY	ACCESS TO EXTERNAL PROGRAM MEMORY		
MOVC in internal program memory	YES	YES		
MOVC in external program memory	NO	YES		

9.2 Internal Data Memory

The internal data memory is divided into three physically separated parts: 256 byte of RAM, 256 byte of AUX-RAM, and a 128 byte special function area (SFR). These parts can be addressed as follows (see Table 3 and Fig.11):

- RAM 0 to 127 can be addressed directly and indirectly as in the 80C51. Address pointers are R0 and R1 of the selected register bank.
- RAM 128 to 255 can only be addressed indirectly. Address pointers are R0 and R1 of the selected register bank.
- AUX-RAM 0 to 255 is indirectly addressable as the external data memory locations 0 to 255 with the MOVX instructions. Address pointers are R0 and R1 of the selected register bank and DPTR. When executing from internal program memory, an access to AUX-RAM 0 to 255 will not affect the ports P0, P2, P3.6 and P3.7.
- the SFRs can only be addressed directly in the address range from 128 to 255.

An access to external data memory locations higher than 255 will be performed with the MOVX DPTR instructions in the same way as in the 80C51 structure, i.e. with P0 and P2 as data/address bus and P3.6 and P3.7 as write and read timing signals (see Figures 7, 8, 9 and 10). Note that the external data memory cannot be accessed with R0 and R1 as address pointer.

Fig.11 shows the internal and external data memory address space. Fig.12 shows the Special Function Register (SFR) memory map. Four 8-bit register banks occupy locations 0 through 31 in the lower RAM area. Only one of these banks may be enabled at a time. The next 16 bytes, locations 32 through 47, contain 128 directly addressable bit locations.

The stack can be located anywhere in the internal 256 byte RAM. The stack depth is only limited by the available internal RAM space of 256 bytes. All registers except the Program Counter and the four 8-bit register banks reside in the SFR address space.

LOCATION	ADDRESSED
RAM 0 to 127	DIRECT and INDIRECT
RAM 128 to 255	INDIRECT only
AUX-RAM 0 to 255	INDIRECT only with MOVX
Special Function Register (SFR) 128 to 255	DIRECT only

P83C524; P80C528; P83C528

9.3 Addressing

The P83C528 has five modes for addressing:

- Register
- Direct
- Register-Indirect
- Immediate
- Base-Register plus Index-Register-Indirect.

The first three methods can be used for addressing destination operands. Most instructions have a 'destination/source' field that specifies the data type, addressing methods and operands involved. For operations other than MOVs, the destination operand is also a source operand.

Access to memory addresses is as follows:

- Register in one of the four 8-bit register banks through Register, Direct or Register-Indirect addressing.
- 512 bytes of internal RAM through Direct or Register-Indirect addressing. Bytes 0-127 of internal RAM may be addressed directly/indirectly. Bytes 128-255 of internal RAM share their address location with the SFRs and so may only be addressed indirectly as data RAM. Bytes 0-255 of AUX-RAM can only be addressed indirectly via MOVX.
- SFR through Direct addressing at address locations 128-255.
- External data memory through Register-Indirect addressing.
- Program memory look-up tables through Base-Register plus Index-Register-Indirect addressing.

P83C524; P80C528; P83C528

10 I/O FACILITIES

The P83C528 has four 8-bit ports. Ports 0-3 are the same as in the 80C51, with the exception of the additional function of Port 1. Port lines P1.0 and P1.1 may be used as inputs for Timer 2, P1.1 may also be used as an additional (third) external interrupt request input. Port lines P1.6 and P1.7 may be selected as the SCL and SDA lines of Serial Port SIO1 (I²C). Because the I²C-bus may be active while the device is disconnected from V_{DD}, these pins are provided with open drain drivers. Pins P1.6 and P1.7 do not have pull-up devices when used as ports.

Ports 0, 1, 2, and 3 perform the following alternative functions:

- Port 0: provides the multiplexed low-order address and data bus used for expanding the P83C528 with standard memories and peripherals.
- Port 1: pins can be configured individually to provide: external interrupt request input (external interrupt 2); external inputs for Timer/counter 2; SCL and SDA for the I²C interface.

- Port 2: provides the high-order address bus when expanding the P83C528 with external program memory and/or external data memory.
- Port 3: pins can be configured individually to provide: external interrupt request inputs (external interrupt 0/1); external inputs for Timer/counter 0 and Timer/counter 1; Serial Port receiver input and transmitter output control-signals to read and write external data memory.

Bits which are not used for the alternative functions may be used as normal bidirectional I/O pins. The generation or use of a Port 1 or Port 3 pin as an alternative function is carried out automatically by the P83C528 provided the associated SFR bit is HIGH. Otherwise the port pin is held at a logical LOW level.

11 TIMERS/COUNTERS

The P83C528 contains three 16-bit timer/counters, Timer 0, Timer 1 and Timer 2, and one 8-bit timer, the Watchdog Timer T3. Timer 0, Timer 1 and Timer 2 may be programmed to carry out the following functions:

- · measure time intervals and pulse durations
- count events
- generate interrupt requests.

11.1 Timer 0 and Timer 1

Timers 0 and 1 each have a control bit in TMOD SFR that selects the timer or counter function of the corresponding timer. In the timer function, the register is incremented every machine cycle. Thus, one can think of it as counting machine cycles. Since a machine cycle consists of 12 oscillator periods, the count rate is 1/12 of the oscillator frequency.

In the counter function, the register is incremented in response to a HIGH-to-LOW transition at the corresponding external input pin, T0 or T1. In this function, the external input is sampled during S5P2 of every machine cycle. When the samples show a HIGH in one cycle and a LOW in the next cycle, the counter is incremented. Thus, it takes two machine cycles (24 oscillator periods) to recognize a HIGH-to-LOW transition. There are no restrictions on the duty cycle of the external input signal, but to ensure that a given level is sampled at least once before it changes, it should be held for at least one full machine cycle.

Timer 0 and Timer 1 can be programmed independently to operate in one of four modes:

- Mode 0 8-bit timer/counter with divide-by-32 prescaler
- Mode 1 16-bit timer/counter
- Mode 2 8-bit timer/counter with automatic reload
- Mode 3 Timer 0: one 8-bit timer/counter and one 8-bit timer. Timer 1: stopped.

P83C524; P80C528; P83C528

When Timer 0 is in Mode 3, Timer 1 can be programmed to operate in Modes 0, 1 or 2 but cannot set an interrupt request flag and generate an interrupt. However, the overflow from Timer 1 can be used to pulse the Serial Port transmission-rate generator. With a 16 MHz crystal, the counting frequency of these timer/counters is as follows:

- in the timer function, the timer is incremented at a frequency of 1.33 MHz (oscillator frequency divided by 12).
- in the counter function, the frequency handling range for external inputs is 0 Hz to 0.66 MHz.

Both internal and external inputs can be gated to the timer by a second external source for directly measuring pulse duration.

The timers are started and stopped under software control. Each one sets its interrupt request flag when it overflows from all logic 1's to all logic 0's (respectively, the automatic reload value), with the exception of Mode 3 as previously described.

5	TF0	Timer 0 overflow flag : set by hardware on timer/counter overflow. Cleared when interrupt is processed.
4	TR0	Timer 0 run control bit: set/cleared by software to turn timer/counter ON/OFF.
3	IE1	Interrupt 1 edge flag : set by hardware when external interrupt is detected. Cleared when interrupt is processed.
2	IT1	Interrupt 1 type control bit : set/cleared by software to specify falling edge/LOW level triggered external interrupt.
1	IE0	Interrupt 0 edge flag : set by hardware when external interrupt is detected. Cleared when interrupt is processed.
0	ITO	Interrupt 0 type control bit : set/cleared by software to specify falling edge/LOW level triggered external interrupt.

P83C524; P80C528; P83C528

11.2 Timer 2

Timer 2 is functionally similar to the Timer 2 of the 8052AH. Timer 2 is a 16-bit timer/counter which is formed by two SFRs, TL2 and TH2. Another pair of SFRs, RCAP2L and RCAP2H, form a 16-bit capture register or a 16-bit reload register. Like Timer 0 and 1, Timer 2 can operate either as timer or as event counter. This is selected by bit C/T2 in the T2CON SFR. The timer has three operating modes: 'capture', 'autoload' and 'baud rate generator', which are selected by bits in the T2CON SFR (see Table 9).

Table 9	Timer 2	operating	modes
	111101 2	oporating	modoo

RCLK + TCLK	CP/RL2	TR2	MODE
0	0	1	16-bit automatic reload
0	1	1	16-bit capture

Х	Х	0	OFF

11.2.1 TIMER 2 CONTROL REGISTER (T2CON)

Table 10 Timer 2 Control register (address C8H)

7	6	5	4	3	2	1	0
TF2	EXF2	RCLK	TCLK	EXEN2	TR2	C/T2	CP/RL2

Table 11 Description of the T2CON bits

MNEMONIC	POSITION	FUNCTION
TF2	T2CON.7	Timer 2 overflow flag : set by a Timer 2 overflow and must be cleared by software. TF2 will not be set when either RCLK = 1 or TCLK = 1. When Timer 2 interrupt is enabled, TF2 = 1 (see EXF2).
EXF2	T2CON.6	Timer 2 external flag : set when either a capture or reload is caused by a negative transition on T2EX and EXEN2 = 1. When Timer 2 interrupt is enabled, EXF2 = 1 will cause the CPU to vector to Timer 2 interrupt routine.
RCLK	T2CON.5	Receive clock flag : when set, causes the Serial Port to use Timer 2 overflow pulses for its receive clock in Modes 1 and 3. RCLK = 0 causes Timer 1 overflows to be used for the receive clock.
TCLK	T2CON.4	Transmit clock flag : when set, causes the Serial Port to use Timer 2 overflow pulses for its transmit clock in Modes 1 and 3. TCLK = 0 causes Timer 1 overflows to be used for the transmit clock.
EXEN2	T2CON.3	Timer 2 external enable flag : when set, allows a capture or reload to occur as a result of a negative transition on T2EX if Timer 2 is not being used to clock the Serial Port. EXEN2 = 0 causes Timer 2 to ignore events at T2EX.
TR2	T2CON.2	Start/stop control: a logic 1 starts Timer 2. A logic 0 stops Timer 2.
C/T2	T2CON.1	Timer/counter select : 0 = internal timer (OSC/12). 1 = external event counter (falling edge triggered).
CP/RL2	T2CON.0	Capture/reload flag : when set, capture will occur on negative transitions at T2EX if EXEN2 = 1. When cleared, reloads will occur upon either Timer 2 overflows or negative transitions at T2EX if EXEN2 = 1. When either RCLK = 1 or TCLK = 1, this bit is ignored and the timer is forced to reload upon overflow.

11.2.2 CAPTURE MODE

In the capture mode (see Fig.14) there are two options which are selected by bit EXEN2 in T2CON. If EXEN2 = 0, then Timer 2 is a 16-bit timer/counter which on overflow sets bit TF2 (Timer 2 overflow bit). TF2 can be used to generate an interrupt. If EXEN2 = 1, Timer 2 operates as above, with the added feature that a HIGH-to-LOW transition at the external input T2EX causes the current value in Timer 2 registers (TL2 and TH2) to be captured into registers RCAP2L and RCAP2H, respectively. The HIGH-to-LOW transition of T2EX also causes bit EXF2 in T2CON to be set. EXF2 can be used to generate an interrupt.

11.2.3 AUTOMATIC RELOAD MODE

In the automatic reload mode (see Fig.15)there are two options which are selected by bit EXEN2 in T2CON. If EXEN2 = 0, then a Timer 2 overflow sets TF2 and causes the Timer 2 registers to be reloaded with the 16-bit value in registers RCAP2L and RCAP2H, which are preset by software.

If EXEN2 = 1, Timer 2 operates as above, with the added feature that a HIGH-to-LOW transition at the external input T2EX triggers the 16-bit reload and sets EXF2.

P83C524; P80C528; P83C528

11.2.4 BAUD RATE GENERATOR MODE

The baud rate generator mode (see Fig.16) is selected by RCLK = 1 and/or TCLK = 1 in T2CON. Overflows of either Timer 2 or Timer 1 can be used independently for generating baud rates for transmit and receive. The baud rate generation by Timer 1 and/or Timer 2 is used for the Serial Port in Mode 1 and Mode 3. The baud rate generation mode is similar to the automatic reload mode, in that a rollover in TH2 causes the Timer 2 registers to be reloaded with the 16-bit value in registers RCAP2L and RCAP2H, which are preset by software. The baud rate for the Serial Port in Modes 1 and 3 are determined by Timer 2's overflow rate as follows:

Baud Rate =
$$\frac{\text{Timer 2 overflow rate}}{16}$$

Timer 2 can be configured for either 'timer' or 'counter' operation. In timer operation a prescaler divides the oscillator frequency by 2 (by 12 in the previous modes) and the baud rate is given by the formula:

Baud Rate = $\frac{\text{oscillator frequency}}{32 \times [65536 - (RCAP2H, RCAP2L)]}$

In this mode an overflow of Timer 2 does not set TF2. If EXEN2 = 1, a HIGH-to-LOW transition at pin T2EX sets EXF2 and can be used to generate an interrupt.

11.3 Watchdog Timer T3

The Watchdog Timer (WDT) see Fig.17, consists of an 11-bit prescaler and an 8-bit timer formed by SFR T3. The prescaler is incremented by an on-chip oscillator with a fixed frequency of 1 MHz. The maximum tolerance on this frequency is -50% and +100%. The 8-bit timer increments every 2048 cycles of the on-chip oscillator. When a timer overflow occurs, the microcontroller is reset and a reset-output-pulse of 16 x 2048 cycles of the on-chip oscillator is generated at pin RST. The internal RESET signal is not inhibited when the external RST pin is kept LOW by e.g. an external reset circuit. The RESET signal drives Ports 1, 2 and 3 outputs into the High state and Port 0 into high impedance, no matter if the XTAL-clock is running or not.

The WDT is controlled by WDCON SFR with the direct address location A5H. WDCON can be read and written by software. A value of A5H in WDCON halts the on-chip oscillator and clears both the prescaler and Timer T3. After RESET, WDCON contains A5H. Every value other than A5H in WDCON enables the WDT. When the WDT is enabled it runs independent of the XTAL-clock.

Timer T3 can be read on the fly. Timer T3 can be written only if WDCON has previously been loaded with 5AH, otherwise T3 and the prescaler are not affected. A successful write operation to T3 also clears the prescaler and clears WDCON. During a read or write operation addressing T3, the output of the on-chip oscillator is

P83C524; P80C528; P83C528

inhibited to prevent timing problems due to asynchronous increments of T3. To prevent an overflow of the WDT, the user program has to reload T3 within periods that are shorter than the programmed Watchdog time interval. This time interval is determined by the 8-bit reload value that is written into register T3.

Watchdog time interval = $\frac{[256 - (T3)] \times 2048}{\text{on-chip oscillator frequency}}$ The advantages of this implementation are:

- Only an internal reset connection to the microcontroller core
- The Power-down mode and the Watchdog (WDT) function can be used concurrently
- The WDT also monitors the XTAL oscillator. In case of a failure the port outputs are forced to a defined High state
- Interference will not disable the WDT because it is unlikely that it will force WDCON to A5H
- Tolerances of the on-chip oscillator can be adjusted by testing the T3 value and adapting the reload value
- The WDT can be enabled and disabled under control of the user software. This gives the possibility to use both the Watchdog function and the Power-down function
- The direct address A5H of WDCON and its disable value A5H will not unintentionally be present at a random location in the field of program code, except for immediate data, because the opcode A5H is not used in the instruction set.

12 SERIAL PORT (UART)

The Serial Port is functionally similar to the implementation in the 8052AH, with the possibility of two different baud rates for receive and transmit with Timer 1 and Timer 2 as baud rate generators. It is full duplex, meaning it can receive and transmit simultaneously. It is also receive-buffered, meaning it can commence reception of a second byte before a previously received byte has been read from the receive register. However, if the first byte still has not been read by the time the reception of the second byte is complete, one of the bytes will be lost. The Serial Port receive and transmit registers are both accessed as SBUF SFR. Writing to SBUF loads the transmit register, and reading SBUF accesses the physically separate receive register. The Serial Port can operate in one of four modes:

- Mode 0 serial data enters and exits through RXD. TXD outputs the shift clock. 8 bits are transmitted/received: 8 data bits (LSB first). The baud rate is fixed at 1/12 the oscillator frequency.
- Mode 1 10 bits are transmitted (through TXD) or received (through RXD): a start bit (0), 8 data bits (LSB first), and a stop bit (1). On receive, the stop bit goes into RB8 in SCON SFR. The baud rate is variable.
- Mode 2 11 bits are transmitted (through TXD) or received (through RXD): a start bit (0), 8 data bits (LSB first), a programmable 9th data bit, and a stop bit (1). On transmit, the 9th data bit (TB8 in SCON) can be assigned the value of 0 or 1. For example, the parity bit (P, in the PSW) could be moved into TB8. On receive, the 9th data bit goes into RB8 in SCON, while the stop bit is ignored. The baud rate is programmable to either 1/32 or 1/64 the oscillator frequency.
- Mode 3 11 bits are transmitted (through TXD) or received (through RXD): a start bit (0), 8 data bits (LSB first), a programmable 9th data bit, and a stop bit (1). In fact, Mode 3 is the same as Mode 2 in all respects except the baud rate. The baud rate in Mode 3 is variable.

P83C524; P80C528; P83C528

In all four modes, transmission is initiated by any instruction that uses SBUF as a destination register. In Mode 0, reception is initiated by the condition RI = 0 and REN = 1. Reception is initiated by incoming start bit if REN = 1 in the other modes.

P83C524; P80C528; P83C528

12.1 Serial Port Control Register (SCON)

Table 12 Serial Port Control register (address 98H)

7	6	5	4	3	2	1	0
SM0	SM1	SM2	REN	TB8	RB8	TI	RI

Table 13 Description of the SCON bits

BIT	SYMBOL	FUNCTION
7	SM0	see Table 14.
6	SM1	see Table 14.
5	SM2	Enables the multiprocessor communication feature in Modes 2 and 3 . In these modes, if SM2 is set to 1 then RI will not be activated if the received 9th data bit (RB8) is 0. In Mode 1, if SM2 = 1, then RI will not be activated if a valid stop bit is not received. In Mode 0, SM2 should be 0.
4	REN	Enables serial reception. Set and cleared by software as required.
3	TB8	9th data bit that will be transmitted in Modes 2 and 3 . Set and cleared by software as required.
2	RB8	In Modes 2 and 3, RB8 is the 9th data bit that is received. In Mode 1, if SM2 = 0, RB8 is the stop bit that is received. In Mode 0, RB8 is not used.
1	ТІ	Transmit interrupt flag . It is set by hardware at the end of the 8th bit time in Mode 0, or at the beginning of the stop bit in the other modes. TI must be cleared by software.
0	RI	Receive interrupt flag . It is set by hardware at the end of the 8th bit time in Mode 0, or halfway through the stop bit time in the other modes (except: see SM2). RI must be cleared by software.

12.2 SM0 and SM1 operating modes (SCON)

SCON bits SM0 and SM1 can operate in the following modes (see Table 14):

 Table 14 SM0 and SM1 operating modes

MODE	SM0	SM1	DESCRIPTION	BAUD RATE
0	0	0	shift register	¹ / ₁₂ fosc
1	0	1	8-bit UART	variable
2	1	0	9-bit UART	¹ / ₃₂ fosc, ¹ / ₆₄ fosc
3	1	1	9-bit UART	variable

13 BIT-LEVEL I²C INTERFACE

This bit-level serial I/O interface supports the I²C-bus (see Fig.18). P1.6/SCL and P1.7/SDA are the serial I/O pins. These two pins meet the I²C specification concerning the input levels and output drive capability. Consequently, these pins have an open drain output configuration. All four modes of the I²C-bus are supported:

- master transmitter
- master receiver
- slave transmitter
- slave receiver.

The advantages of the bit-level I^2C hardware compared with a full software I^2C implementation are:

- the hardware can generate the SCL pulse
- testing a single bit (RBF respectively, WBF) is sufficient as a check for error free transmission.

The bit-level I²C hardware operates on serial bit level and performs the following functions:

- · filtering the incoming serial data and clock signals
- recognizing the START condition
- generating a serial interrupt request SI after reception of a START condition and the first falling edge of the serial clock
- · recognizing the STOP condition
- recognizing a serial clock pulse on the SCL line
- latching a serial bit on the SDA line (SDI)
- stretching the SCL LOW period of the serial clock to suspend the transfer of the next serial data bit
- setting Read Bit Finished (RBF) when the SCL clock pulse has finished and Write Bit Finished (WBF) if there is no arbitration loss detected (i.e. SDA = 0 while SDO = 1)
- setting a serial clock LOW-to-HIGH detected (CLH) flag
- setting a Bus Busy (BB) flag on a START condition and clearing this flag on a STOP condition
- releasing the SCL line and clearing the CLH, RBF and WBF flags to resume transfer of the next serial data bit
- generating an automatic clock if the single bit data register S1BIT is used in master mode.

P83C524; P80C528; P83C528

The following functions must be done in software:

- handling the I²C START interrupts
- converting serial to parallel data when receiving
- converting parallel to serial data when transmitting
- · comparing the received slave address with its own
- interpreting the acknowledge information
- guarding the I²C status if RBF or WBF = 0.

additionally, if acting as master:

- · generating START and STOP conditions
- · handling bus arbitration
- generating serial clock pulses if S1BIT is not used.

Three SFRs control the bit-level I²C interface: S1INT, S1BIT and S1SCS.

P83C524; P80C528; P83C528

13.1 I²C Interrupt Register (S1INT)

Table 15 I²C Interrupt register (address DAH) ⁽¹⁾

7	6	5	4	3	2	1	0
SI	Х	Х	Х	Х	Х	Х	Х

Note

1. **SI bit**: writing a logic 0 clears this bit, writing a logic 1 has no effect.

Table 16 Description of the S1INT bits

BIT	SYMBOL	FUNCTION
7	SI	Serial Interrupt request (SI) flag : if a START condition occurs the SI flag in the S1INT SFR is set on the falling edge of the filtered serial clock. If SI = 1 is detected during a transfer this can be a 'spurious START' error condition. If no transfer is taking place the SI = 1 is a START from an external master. Provided the bits EA and ES1 in IE SFR are set, SI then generates an interrupt so that a slave address receive routine can be started. SI can be cleared by accessing the S1BIT register or by writing '00' to S1INT. Also after reception of a START condition, the LOW period of the clock pulse is stretched, suspending the serial transfer to allow the software to take action. This clock stretching is ended by a read or write access to S1BIT.
6 to 0	-	X = undefined during read, don't care during write.

13.2 Single-bit Data Register with I²C Auto-clock (S1BIT)

Table 17 Single-bit Data register with I²C Auto-clock (address D9H)⁽¹⁾

7	6	5	4	3	2	1	0
READ							
SDI	0	0	0	0	0	0	0
WRITE			-				
SDO	Х	X	Х	Х	Х	Х	X

Note

1. Access of the **S1BIT SFR** clears SI, CLH, RBF and WBF. It starts the auto-clock if SCO = 0.

Table 18 Description of the S1BIT bits

BIT	SYMBOL	FUNCTION
7	SDO/SDI	Serial Data Output (SDO) and the filtered Serial Data Input (SDI). SDI data is latched
		on the rising edge of the filtered serial clock. S1BIT.7 accesses the same memory
		locations as STSCS.7. STBIT SFR is not bit-addressable.
6 to 0	_	X = don't care.

13.2.1 READING OR WRITING THE S1BIT SFR

Reading or writing the S1BIT SFR starts an $I^{2}C$ bit I/O sequence: some flags are cleared (SI, CLH, RBF, WBF), clock stretching is finished and the auto-clock is started. An auto-clock pulse is 'OR-ed' with SCO and thus will be output only if the SCO flag has been set to 0. SCO = 1 inhibits the auto-clock start, so a dummy read or write of S1BIT SFR can be used to finish clock stretching and clear SI, CLH, RBF and WBF if the auto-clock is not used.

The auto-clock is an active HIGH SCL pulse that starts 28 XTAL clock periods after the SDI read or SDO write via S1BIT. The duration of the auto-clock pulse is 100 XTAL clock periods. If the SCL line is kept LOW by any device that wants to hold up the bus transfer, the auto-clock counter waits after 20 XTAL clock periods so that the auto-clock pulse length will be at least 80 XTAL clock periods (5 μ s at f_{OSC} = 16 MHz).

P83C524; P80C528; P83C528

Every bit I/O should be followed by a RBF or WBF bit test. A bit transfer has been finished successfully if after reading a bit the RBF flag is 1 or after writing a bit the WBF flag is 1. When after reading a bit the RBF flag is still 0, the bus status just before the S1SCS status read can be determined as follows:

- if CLH = 0 then a bus device is still stretching the clock
- if SCI = 1 while CLH = 1 then the SCL pulse is not finished
- if BB = 0 there has been a STOP condition.

When after writing a bit the WBF flag is still 0 and none of the 3 status conditions mentioned for RBF are found then a 'bus arbitration lost' condition will be the cause. This can be determined also from the states of the received bit and the last transmitted bit: 'arbitration loss' if SDO = 1 and SDI = 0.

13.3 Control and Status Register for the I²C-bus (S1SCS)

7	6	5	4	3	2	1	0
READ							
SDI ⁽¹⁾	SCI ⁽¹⁾	CLH ⁽²⁾	BB	RBF ⁽³⁾	WBF ⁽⁴⁾	STR	ENS
WRITE							
SDO	SCO	CLH ⁽²⁾	Х	Х	Х	STR	ENS

 Table 19 Control and Status register for the I²C-bus (address D8H)

Notes

1. **SDI and SCI bits**: read-modify-write operations like 'SETB bit' or 'CLR bit' access SDO and SCO for reading and writing.

- 2. CLH bit: writing a logic 0 clears this bit, writing a 1 has no effect.
- 3. RBF and WBF bits: writing a logic 0 to CLH also clears these bits.
- 4. X = don't care.

P83C524; P80C528; P83C528

BIT	SYMBOL	FUNCTION
7	SDO/SDI	Serial Data Output and the filtered Serial Data Input. SDI data is latched on the rising edge of the filtered serial clock. S1SCS.7 accesses the same memory locations as S1BIT.7. Access of the data bit via S1SCS will not start an auto-clock pulse.
6	SCO/SCI	Serial Clock Output and the filtered Serial Clock Input. Serial clock output SCO is 'OR-ed' with the auto-clock. If SCO = 1 the auto-clock output is inhibited. The internal clock stretching logic and external devices can pull the SCL line LOW. If the auto-clock is not used, the SCL line has to be controlled by setting SCO = 1, waiting for CLH = 1 and setting SCO = 0 after the specified SCL HIGH time. (Because of the input filter, CLH will be set at least 8 XTAL clock periods after the SCL LOW-to-HIGH transition.)
5	CLH	Serial Clock LOW-to-HIGH transition flag: set with a rising edge of the filtered serial clock. CLH = 1 indicates that, since the last CLH reset, a new valid data bit has been latched in SDI. CLH can be reset by writing a 0 to S1SCS.5 or by a read/write of S1BIT. Clearing CLH also clears RBF and WBF.
4	BB	Bus Busy flag : indicating that there has been a START condition that was not yet followed by a STOP condition.
3	RBF	Read Bit Finished flag: indicating a successful bit read. RBF = 1 implies the following conditions: CLH = 1: SCL had a rising edge SCI = 0: the SCL pulse has finished SI = 0: no START condition occurred BB = 1: no STOP condition occurred The RBF flag can be cleared by clearing the CLH flag.
2	WBF	Write Bit Finished flag: indicating a successful bit write. The same conditions as for RBF are true and also no 'arbitration loss' condition occurred. Arbitration is lost if a 1 data bit in SDO was over-ruled on SDA by an external device. The WBF flag can be cleared by clearing the CLH flag.
1	STR	 STRetch control flag. STR = 1 enables stretching of all SCL LOW periods. This allows the processor in I²C slave mode to react on a fast master. The STR flag remains set until cleared by writing a 0 to S1SCS.1. The STretch (ST) flag (not readable) pulls the serial clock LOW while ST = 1. The ST flag is set on the falling edge of the filtered serial clock if STR = 1. It is also set after reception of a START condition, regardless of the STR contents. ST is cleared with a
0	ENS	FNable Serial I/O flag ENS = 1 enables the START detection and clock stretching

Table 20 Description of the S1SCS bits

 0
 ENS
 ENable Serial I/O flag. ENS = 1 enables the START detection and clock stretching logic. ENS = 0 can be used to switch off the I²C-bus hardware. Note that the SDO and SCO control flags must be set to 1 before ENS is set to avoid pulling SCL or SDA lines to 0.
14 INTERRUPT SYSTEM

The P83C528 contains the same interrupt structure as the PCB80C51BH, but with a seven-source interrupt structure with two priority levels (see Fig.19).

The External Interrupts INTO and INT1 can each be either level-activated or transition-activated, depending on bits IT0 and IT1 in TCON SFR. The flags that actually generate these interrupts are bits IE0 and IE1 in TCON. When an external interrupt is generated, the corresponding request flag is cleared by the hardware when the service routine is vectored to, only if the interrupt was transition-activated. If the interrupt was level-activated then the interrupt request flag remains set until the external interrupt pin INTx goes high.

The Timer 0 and Timer 1 Interrupts are generated by TF0 and TF1, which are set by a rollover in their respective timer/counter register (except for Timer 0 in Mode 3 of the serial interface). When a Timer interrupt is generated, the flag that generated it is cleared by the on-chip hardware when the service routine is vectored to.

The Serial Port Interrupt is generated by the logical 'OR' of RI and TI. Neither of these flags is cleared by hardware. The service routine will normally have to determine whether it was RI or TI that generated the interrupt, and the bit will have to be cleared by software.

The Timer 2 Interrupt is generated by the logical OR of TF2 and EXF2. Neither of these flags is cleared by hardware. In fact the service routine may have to determine whether it was TF2 or EXF2 that generated the interrupt, and the bit will have to be cleared by software.

An additional (third) external interrupt is available, if Timer 2 is not used as timer/counter or if Timer 2 is used in baud rate generator mode. That external interrupt 2 is falling edge triggered. It shares the Timer 2 interrupt vector, interrupt enable and interrupt priority bits. If bit T2CON.3/EXEN2 = 1, a HIGH-to-LOW transition at pin P1.1/T2EX sets the interrupt request flag T2CON.6/EXF2 and can be used to generate an external interrupt.

P83C524; P80C528; P83C528

The I²C interrupt is generated by SI in S1INT. This flag has to be cleared by software. All of the bits that generate interrupts can be set or cleared by software, with the same result as though they had been set or cleared by hardware, with the exception of the I²C interrupt request flag SI, which cannot be set by software. That is, interrupts can be generated or pending interrupts can be cancelled in software.

5	IE1	-	0013H
6	TF1	-	001BH
7	RI + TI	(lowest)	0023H

15 IDLE AND POWER-DOWN OPERATION

Idle mode operation permits the interrupt, serial ports and timer blocks to function while the CPU is halted. The following functions remain active during Idle mode. These functions may generate an interrupt or reset and thus end the Idle mode:

- Timer 0, Timer 1, Timer 2, Watchdog Timer
- UART, I²C-Interface
- External interrupt

P83C524; P80C528; P83C528

The Power-down operation freezes the oscillator. The Power-down mode can only be activated by setting the PD bit in the PCON register (see Fig.20).

P83C524; P80C528; P83C528

15.1 Power Control Register (PCON)

Special modes are activated by software via the PCON SFR. PCON is not bit addressable. The reset value of PCON is 0XXX0000.

H)

7	6	5	4	3	2	1	0
SMOD	_	_	_	GF1	GF0	PD	IDL

Table 27 Description of the PCON bits

BIT	SYMBOL	FUNCTION
7	SMOD	Double Baud rate bit : when set to logic 1 the baud rate is doubled when Timer 1 is used to generate baud rate, and the Serial Port is used in modes 1, 2 or 3.
6	-	reserved for future use
5	—	reserved for future use
4	-	reserved for future use
3	GF1	general-purpose flag bit
2	GF0	general-purpose flag bit
1	PD	Power-down bit: setting this bit activates Power-down mode
0	IDL	Idle mode bit: setting this bit activates the Idle mode.

Notes

1. If logic 1s are written to PD and IDL at the same time, PD takes precedence.

2. User software should not write 1s to reserved bits. These bits may be used in future 80C51 family products to invoke new features.

15.2 Idle Mode

The instruction that sets PCON.0 is the last instruction executed in the normal operating mode before Idle mode is activated. Once in the Idle mode, the CPU status is preserved in its entirety: the Stack Pointer, Program Counter, Program Status Word, Accumulator, RAM and all other registers maintain their data during Idle mode. The status of external pins during Idle mode is shown in Table 28.

There are three ways to terminate the Idle mode:

- Activation of any enabled interrupt will cause PCON.0 to be cleared by hardware terminating Idle mode. The interrupt is serviced, and following return from interrupt instruction RETI, the next instruction to be executed will be the one which follows the instruction that wrote a logic 1 to PCON.0.
- The flag bits GF0 and GF1 may be used to determine whether the interrupt was received during normal execution or during the Idle mode. For example, the instruction that writes to PCON.0 can also set or clear one or both flag bits. When Idle mode is terminated by an interrupt, the service routine can examine the status of the flag bits.

P83C524; P80C528; P83C528

- The second way of terminating the Idle mode is with an external hardware reset. Since the oscillator is still running, the hardware reset is required to be active for two machine cycles (24 oscillator periods) to complete the reset operation.
- The third way of terminating the Idle mode is by internal watchdog reset.

15.3 Power-down Mode

The instruction that sets PCON.1 is the last executed prior to going into the Power-down mode. The oscillator is stopped. Note that the Power-down mode also can be entered when the watchdog has been enabled. The Power-down mode can be terminated by an external RESET in the same way as in the 80C51 or in addition by any one of the two external interrupts, IE0 or IE1 (see Section 15.4). A reset generated by the WDT terminates the Power-down mode in the same way as an external RESET.

The status of the external pins during Power-down mode is shown in Table 28. If the Power-down mode is activated while in external program memory, the port data that is held in the P2 SFR is restored to Port 2. If the data is a logic 1, the port pin is held HIGH during the Power-down mode by the strong pull-up transistor p1 (see Fig.13).

MODE	MEMORY	ALE	PSEN	PORT 0	PORT 1	PORT 2	PORT 3
Idle	internal	1	1	port data	port data	port data	port data
Idle	external	1	1	floating	port data	address	port data
Power-down	internal	0	0	port data	port data	port data	port data
Power-down	external	0	0	floating	port data	port data	port data

 Table 28 Status of the external pins during Idle and Power-down modes

P83C524; P80C528; P83C528

15.4 Wake-up from Power-down Mode

The Power-down mode of the P83C528 can also be terminated by any one of the two external interrupts, IE0 or IE1. A termination with an external interrupt does not affect the internal data memory and does not affect the Special Function Registers (SFRs). This gives the possibility to exit Power-down without changing the port output levels. To terminate the Power-down mode with an external interrupt, IE0 or IE1 must be switched to be level-sensitive and must be enabled. The external interrupt input signal INT0 and INT1 must be kept LOW till the oscillator has restarted and stabilized (see Fig.21).

In order to prevent any interrupt priority problems during wake-up, the priority of the desired wake-up interrupt should be higher than the priorities of all other enabled interrupt sources. The instruction following the one that put the device into the Power-down mode will be the first one which will be executed after an interrupt has been serviced.

Table 20 Internal registers status after a PESET

16 OSCILLATOR CIRCUIT

The oscillator circuit of the P83C528 is a single-stage inverting amplifier in a Pierce oscillator configuration. The circuitry between the XTAL1 and XTAL2 is basically an inverter biased to the transfer point. Either a crystal or ceramic resonator can be used as the feedback element to complete the oscillator circuitry. Both are operated in parallel resonance. XTAL1 is the high gain amplifier input, and XTAL2 is the output (see Fig.22). To drive the P83C528 externally, XTAL1 is driven from an external source and XTAL2 left open-circuit (see Fig.23).

P83C524; P80C528; P83C528

17 RESET CIRCUIT

The reset circuitry for the P83C528 is connected to the reset pin RST. A Schmitt trigger is used at the input for noise rejection. The output of the Schmitt trigger is sampled by the reset circuitry every machine cycle.

A reset is accomplished by holding the RST pin HIGH for at least two machine cycles (24 oscillator periods). The CPU responds by executing an internal reset. During reset ALE and PSEN output a HIGH level. In order to perform a correct reset, this level must not be affected by external elements.

With the P83C528, the RST line can also be pulled HIGH internally by a pull-up transistor activated by the WDT T3. The length of the reset pulse from T3 is 16 x 2048 cycles of the on-chip watchdog oscillator. If the WDT is also used to reset external devices, the usual capacitor arrangement should not be connected to RST pin. Instead, an extra circuit should be used to perform the Power-on Reset operation. It should be remembered that a Timer T3 overflow, if enabled, will force a reset condition to the P83C528 by an internal connection, whether the output RST is tied LOW or not (see Fig.24).

The internal reset is executed during the second cycle in which RST is pulled HIGH and is repeated every cycle until RST goes LOW. It leaves the internal registers as shown by Table 29.

P83C524; P80C528; P83C528

17.1 Power-on reset

When V_{DD} is turned on, and provided its rise-time does not exceed 10 ms, an automatic reset can be obtained by connecting the RST pin to V_{DD} via a 2.2 µF capacitor. When the power is switched on, the voltage on the RST pin is equal to V_{DD} minus the capacitor voltage, and decreases from V_{DD} as the capacitor charges through the internal resistor (R_{RST}) to ground. The larger the capacitor, the more slowly V_{RST} decreases. V_{RST} must remain above the lower threshold of the Schmitt trigger long enough to effect a complete reset. The time required is the oscillator start-up time, plus 2 machine cycles, or 16 x 2048 cycles of the on-chip watchdog oscillator if it is running, whichever is longer (see Fig.25).

P83C524; P80C528; P83C528

18 INSTRUCTION SET

The instruction set consists of 49 single-byte, 46 two-byte and 16 three-byte instructions. When using a 12 MHz oscillator, 64 instructions execute in 1 cycle (1 μ s) and 45 instructions execute in 2 cycles (2 μ s). Multiply and divide instructions execute in 4 cycles (4 μ s).

Table 34 Description of the mnemonics in the Instruction set

MNEMONIC	DESCRIPTION
Data addressin	g modes
Rr	working register R0-R7.
direct	128 internal RAM locations and any special function register (SFR).
@Ri	indirect internal RAM location addressed by register R0 or R1 of the actual register bank.
#data	8-bit constant included in instruction.
#data 16	16-bit constant included as bytes 2 and 3 of instruction.
bit	direct addressed bit in internal RAM or SFR.
addr16	16-bit destination address. Used by LCALL and LJMP. The branch will be anywhere within the 64 kbytes program memory address space.
addr11	11-bit destination address. Used by ACALL and AJMP. The branch will be within the same 2 kbytes page of program memory as the first byte of the following instruction.
rel	Signed (two's complement) 8-bit offset byte. Used by SJMP and all conditional jumps. Range is -128 to +127 bytes relative to first byte of the following instruction.

Notes to the DC characteristics

- 1. Conditions for:
 - a) The operating supply current is measured with all output pins disconnected; XTAL1 driven with $t_r = t_f = 5$ ns; $V_{IL} = V_{SS} + 0.5$ V; $V_{IH} = V_{DD} - 0.5$ V; XTAL2 not connected; $\overline{EA} = RST = Port 0 = P1.6 = P1.7 = V_{DD}$; the WDT is disabled (by the external RESET).
- 2. Conditions for:
 - a) The Idle mode supply current is measured with all output pins disconnected; XTAL1 driven with $t_r = t_f = 5$ ns; $V_{IL} = V_{SS} + 0.5$ V; $V_{IH} = V_{DD} - 0.5$ V; XTAL2 not connected; the WDT is disabled; $\overline{EA} = RST = V_{SS}$; Port $0 = P1.6 = P1.7 = V_{DD}$.
- 3. Conditions for:
 - a) The Power-down current is measured with all output pins disconnected; XTAL2 not connected; WDT is disabled; $\overline{EA} = RST = XTAL1 = V_{SS}$; Port 0 = P1.6 = P1.7 = V_{DD}.
- 4. Capacitive loading on Port 0 and Port 2 may cause spurious noise pulses to be superimposed on the LOW level output voltage of ALE, Port 1 and Port 3. The noise is due to external bus capacitance discharging into the Port 0 and Port 2 pins when these pins make a HIGH-to-LOW transition during bus operations. In the worst cases (capacitive loading > 100pF), the noise pulse on the ALE line may exceed 0.8 V. In such cases it may be desirable to qualify ALE with a Schmitt Trigger, or use an address latch with a Schmitt Trigger STROBE input.
- Capacitive loading on Port 0 and Port 2 may cause the HIGH level output voltage on ALE and PSEN to momentarily fall below the 0.9 V_{DD} specification when the address bits are stabilizing.
- The input threshold voltage of P1.6 and P1.7 (SIO1) meets the I²C specification, so a voltage below 0.3 V_{DD} will be recognized as a logic 0 while an input above 0.7 V_{DD} will be recognized as a logic 1.
- 7. Under steady state (non-transient) conditions, I_{OL} must be externally limited as follows:
 - a) Maximum I_{OL} per port pin:10 mA.
 - b) Maximum I_{OL} per 8-bit port:- Port 0: 26 mA; Ports 1, 2 and 3: 15 mA.
 - c) Maximum total I_{OL} for all output pins: 71 mA. If I_{OL} exceeds the test condition, V_{OL} may exceed the related specification.
 - d) Pins are not guaranteed to sink current greater than the listed test conditions.
- 8. I_{DD} max. at other frequencies can be derived from Fig.26 where f is the external oscillator frequency in MHz; I_{DD} max. is given in mA.

Notes to the AC Characteristics 16 and 24 MHz versions

1. For the AC Characteristics the following conditions are valid:

a) **P83C52x EBx**: $V_{DD} = 5 V \pm 10\%$; $V_{SS} = 0 V$; $T_{amb} = 0$ to +70 °C; t_{CK} min. = 63 ns

b) **P83C52x EFx:** $V_{DD} = 5 V \pm 10\%$; $V_{SS} = 0 V$; $T_{amb} = -40$ to +85 °C; t_{CK} min. = 63 ns.

- 2. t_{CK} min. = 1/f max. (maximum operating frequency); t_{CK} = clock period (see section for timing symbol definitions).
- 3. The maximum operating frequency is limited to 16/24 MHz and the minimum to 3.5 MHz (all versions lxx/Exx).

P83C524; P80C528; P83C528

22 I²C CHARACTERISTICS (BIT-LEVEL)

SYMBOL	PARAMETER	INPUT	OUTPUT	I ² C SPEC	UNIT
SCL timing			•		•
t _{HD;STA}	START condition hold time	\geq 14 t _{CK} ; note 1	note 2	≥ 4.0	μs
t _{LOW}	SCL LOW time	≥ 16 t _{CK}	note 2	≥ 4.7	μs
t _{HIGH}	SCL HIGH time	\geq 14 t _{CK} ; note 1	\geq 80 t _{CK} ; note 3	≥ 4.0	μs
t _{RC}	SCL RISE time	≤ 1; note 4	note 5	≤ 1.0	μs
t _{FC}	SCL FALL time	≤ 0.3; note 4	≤ 0.3; note 6	≤ 0.3	μs
SDA timing					
t _{SU;DAT}	data set-up time	≥ 250 ns	note 2	≥ 250	ns
t _{HD;DAT}	data hold time	≥ 0 ns	note 2	≥0	ns
t _{SU;STA}	repeated START set-up time	\geq 14 t _{CK} ; note 1	note 2	≥ 4.7	μs
t _{SU;STO}	STOP condition set-up time	\geq 14 t _{CK} ; note 1	note 2	≥ 4.0	μs
t _{BUF}	bus free time	\geq 14 t _{CK} ; note 1	note 2	≥ 4.7	μs
t _{RD}	SDA RISE time	≤ 1; note 4	note 5	≤ 1.0	μs
t _{FD}	SDA FALL time	≤ 300 ns; note 4	≤ 0.3; note 6	≤ 0.3	μs

Notes

1. At $f_{CLK} = 3.5$ MHz, this evaluates to 14×286 ns = 4 μ s, i.e. the bit-level I²C interface can respond to the I²C protocol for $f_{CLK} \ge 3.5$ MHz.

- 2. This parameter is determined by the user software, it has to comply with the I²C specification.
- This value gives the auto-clock pulse length which meets the I²C specification for the specified XTAL1 clock frequency range. Alternatively, the SCL pulse may be timed by software.
- 4. Spikes on SDA and SCL lines with a duration of less than $4 \times f_{CLK}$ will be filtered out.
- 5. The RISE time is determined by the external bus line capacitance and pull-up resistor, it must be $\leq 1 \mu s$.
- 6. The maximum capacitance on bus lines SDA and SCL is 400 pF.

25.1 Timing symbol definitions

Oscillator:

 f_{CLK} = clock frequency

 t_{CK} = clock period

Timing symbols (acronyms):

Each timing symbol has five characters. The first character is always a 't' (= time). the remaining four characters of the symbol (typed in subscript), depending on their relative positions, indicate the name of a signal or the logical status of that signal. the designations are as follows:

- A =address
- C = clock
- D = input data
- H = logic level HIGH
- I = instruction (program memory contents)
- L = Logic level LOW or ALE
- $P = \overline{PSEN}$
- Q = output data
- $R = \overline{RD}$ signal
- t = time
- V = valid
- $W = \overline{WR}$ signal
- X = no longer a valid logic level
- Z = float

Examples:

 t_{AVLL} = time for address valid to ALE LOW

 t_{LLPL} = time for ALE LOW to \overline{PSEN} LOW

PLCC44: plastic leaded chip carrier; 44 leads

27 SOLDERING

27.1 Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

27.2 DIP

27.2.1 SOLDERING BY DIPPING OR BY WAVE

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

27.2.2 REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

27.3 PLCC and QFP

27.3.1 REFLOW SOLDERING

Reflow soldering techniques are suitable for all PLCC and QFP packages.

The choice of heating method may be influenced by larger PLCC or QFP packages (44 leads, or more). If infrared or vapour phase heating is used and the large packages are not absolutely dry (less than 0.1% moisture content by weight), vaporization of the small amount of moisture in them can cause cracking of the plastic body. For more information, refer to the Drypack chapter in our "Quality Reference Handbook" (order code 9397 750 00192).

P83C524; P80C528; P83C528

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 50 and 300 seconds depending on heating method. Typical reflow peak temperatures range from 215 to 250 °C.

27.3.2 WAVE SOLDERING

27.3.2.1 PLCC

Wave soldering techniques can be used for all PLCC packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream corners.

27.3.2.2 QFP

Wave soldering is **not** recommended for QFP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

CAUTION

Wave soldering is NOT applicable for all QFP packages with a pitch (e) equal or less than 0.5 mm.

If wave soldering cannot be avoided, for QFP packages with a pitch (e) larger than 0.5 mm, the following conditions must be observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The footprint must be at an angle of 45° to the board direction and must incorporate solder thieves downstream and at the side corners.

P83C524; P80C528; P83C528

27.3.2.3 Method (PLCC and QFP)

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

REPAIRING SOLDERED JOINTS 27.3.3

Fix the component by first soldering two diagonallyopposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

28 DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	

Limiting values

Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of this specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information

Where application information is given, it is advisory and does not form part of the specification.

29 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

30 PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.З, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
