

256K x 18 Synchronous-Pipelined Cache RAM

Features

- Supports 100-MHz bus for Pentium® and PowerPC™ operations with zero wait states
- Fully registered inputs and outputs for pipelined operation
- 256K by 18 common I/O architecture
- 3.3V core power supply
- 2.5V / 3.3V I/O operation
- Fast clock-to-output times
 - 3.5 ns (for 166-MHz device)
 - 4.0 ns (for 133-MHz device)
 - 5.5 ns (for 100-MHz device)
- User-selectable burst counter supporting Intel® Pentium interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed writes
- Asynchronous Output Enable
- JEDEC-standard 100 TQFP pinout
- “ZZ” Sleep Mode option and Stop Clock option

Functional Description

The WCSS0418V1P is a 3.3V, 256K by 18 synchronous-pipelined cache SRAM designed to support zero wait state secondary cache with minimal glue logic.

The WCSS0418V1P I/O pins can operate at either the 2.5V or the 3.3V level. The I/O pins are 3.3V tolerant when $V_{DQ}=2.5V$.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise is 3.5 ns (166-MHz device).

The WCSS0418V1P supports either the interleaved burst sequence used by the Intel Pentium processor or a linear burst sequence used by processors such as the PowerPC. The burst sequence is selected through the MODE pin. Accesses can be initiated by asserting either the Processor Address Strobe (ADSP) or the Controller Address Strobe (ADSC) at clock rise. Address advancement through the burst sequence is controlled by the ADV input. A 2-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the four Byte Write Select ($BW_{[1:0]}$) inputs. A Global Write Enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are conducted with on-chip synchronous self-timed write circuitry.

Three synchronous Chip Selects ($\overline{CE}_1$, CE_2 , $\overline{CE}_3$) and an asynchronous Output Enable ($\overline{OE}$) provide for easy bank selection and output three-state control. In order to provide proper data during depth expansion, $\overline{OE}$ is masked during the first clock of a read cycle when emerging from a deselected state.

Intel and Pentium are registered trademarks of Intel Corporation.
PowerPC is a trademark of IBM Corporation.

Pin Definitions

Name	I/O	Description
A _[17:0]	Input-Synchronous	Address Inputs used to select one of the 64K address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and CE ₁ , CE ₂ , and CE ₃ are sampled active. A _[1:0] feed the 2-bit counter.
BW _[1:0]	Input-Synchronous	Byte Write Select Inputs, active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
GW	Input-Synchronous	Global Write Enable Input, active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (ALL bytes are written, regardless of the values on BW _[1:0] and BWE).
BWE	Input-Synchronous	Byte Write Enable Input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
CLK	Input-Clock	Clock Input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation.
CE ₁	Input-Synchronous	Chip Enable 1 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₂ and CE ₃ to select/deselect the device. ADSP is ignored if CE ₁ is HIGH.
CE ₂	Input-Synchronous	Chip Enable 2 Input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₃ to select/deselect the device.
CE ₃	Input-Synchronous	Chip Enable 3 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₂ to select/deselect the device.
OE	Input-Asynchronous	Output Enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are three-stated, and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.
ADV	Input-Synchronous	Advance Input Signal, sampled on the rising edge of CLK. When asserted, it automatically increments the address in a burst cycle.
ADSP	Input-Synchronous	Address Strobe from Processor, sampled on the rising edge of CLK. When asserted LOW, A _[17:0] is captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when CE ₁ is deasserted HIGH.

Pin Definitions (continued)

Name	I/O	Description
ADSC	Input-Synchronous	Address Strobe from Controller, sampled on the rising edge of CLK. When asserted LOW, $A_{[17:0]}$ is captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.
ZZ	Input-Asynchronous	ZZ "sleep" Input. This active HIGH input places the device in a non-time critical "sleep" condition with data integrity preserved. Leaving ZZ floating or NC will default the device into an active state. ZZ pin has an internal pull-down.
DQ _[15:0] DP _[1:0]	I/O-Synchronous	Bidirectional Data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by $A_{[17:0]}$ during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQ _[15:0] and DP _[1:0] are placed in a three-state condition.
V _{DD}	Power Supply	Power Supply inputs to the core of the device. Should be connected to 3.3V power supply.
V _{SS}	Ground	Ground for the core of the device. Should be connected to ground of the system.
V _{DDQ}	I/O Power Supply	Power Supply for the I/O circuitry. Should be connected to a 3.3V or 2.5V power supply.
V _{SSQ}	I/O Ground	Ground for the I/O circuitry. Should be connected to ground of the system.
MODE	Input-Static	Selects Burst Order. When tied to GND selects linear burst sequence. When tied to V _{DDQ} or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. When left floating or NC, defaults to interleaved burst order. Mode pin has an internal pull-up.
NC		No Connects.

Introduction

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CO}) is 3.5 ns (166-MHz device).

The WCSS0418V1P supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486 processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the Processor Address Strobe (ADSP) or the Controller Address Strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the Byte Write Enable (BWE) and Byte Write Select (BW_[1:0]) inputs. A Global Write Enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous Chip Selects ($\overline{CE}_1$, CE₂, $\overline{CE}_3$) and an asynchronous Output Enable (OE) provide for easy bank selection and output three-state control. ADSP is ignored if CE₁ is HIGH.

Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW, (2) $\overline{CE}_1$, CE₂, $\overline{CE}_3$ are all asserted active, and (3) the write signals (GW, BWE) are all deasserted HIGH. ADSP is ignored if CE₁

is HIGH. The address presented to the address inputs ($A_{[17:0]}$) is stored into the address advancement logic and the Address Register while being presented to the memory core. The corresponding data is allowed to propagate to the input of the Output Registers. At the rising edge of the next clock the data is allowed to propagate through the output register and onto the data bus within 3.5 ns (166-MHz device) if OE is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state, its outputs are always three-stated during the first cycle of the access. After the first cycle of the access, the outputs are controlled by the OE signal. Consecutive single read cycles are supported. Once the SRAM is deselected at clock rise by the chip select and either ADSP or ADSC signals, its output will three-state immediately.

Single Write Accesses Initiated by $\overline{ADSP}$

This access is initiated when both of the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW, and (2) $\overline{CE}_1$, CE₂, $\overline{CE}_3$ are all asserted active. The address presented to $A_{[17:0]}$ is loaded into the address register and the address advancement logic while being delivered to the RAM core. The write signals (GW, BWE, and BW_[1:0]) and ADV inputs are ignored during this first cycle.

ADSP-triggered write accesses require two clock cycles to complete. If GW is asserted LOW on the second clock rise, the data presented to the DQ_[15:0] and DP_[1:0] inputs is written into the corresponding address location in the RAM core. If GW is HIGH, then the write operation is controlled by BWE and BW_[1:0] signals. The WCSS0418V1P provides byte write capability that is described in the Write Cycle Description table. Asserting the Byte Write Enable input (BWE) with the selected Byte Write (BW_[1:0]) input will selectively write to only the desired bytes. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the WCSS0418V1P is a common I/O device, the Output Enable ($\overline{OE}$) must be deasserted HIGH before presenting data to the $DQ_{[15:0]}$ and $DP_{[1:0]}$ inputs. Doing so will three-state the output drivers. As a safety precaution, $DQ_{[15:0]}$ and $DP_{[1:0]}$ are automatically three-stated whenever a write cycle is detected, regardless of the state of $\overline{OE}$.

Single Write Accesses Initiated by $\overline{ADSC}$

$\overline{ADSC}$ write accesses are initiated when the following conditions are satisfied: (1) $\overline{ADSC}$ is asserted LOW, (2) $\overline{ADSP}$ is deasserted HIGH, (3) CE_1 , CE_2 , CE_3 are all asserted active, and (4) the appropriate combination of the write inputs (GW , BWE , and $BW_{[1:0]}$) are asserted active to conduct a write to the desired byte(s). $\overline{ADSC}$ -triggered write accesses require a single clock cycle to complete. The address presented to $A_{[17:0]}$ is loaded into the address register and the address advancement logic while being delivered to the RAM core. The $\overline{ADV}$ input is ignored during this cycle. If a global write is conducted, the data presented to the $DQ_{[15:0]}$ and $DP_{[1:0]}$ is written into the corresponding address location in the RAM core. If a byte write is conducted, only the selected bytes are written. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the WCSS0418V1P is a common I/O device, the Output Enable ($\overline{OE}$) must be deasserted HIGH before presenting data to the $DQ_{[15:0]}$ and $DP_{[1:0]}$ inputs. Doing so will three-state the output drivers. As a safety precaution, $DQ_{[15:0]}$ and $DP_{[1:0]}$ are automatically three-stated whenever a write cycle is detected, regardless of the state of $\overline{OE}$.

Burst Sequences

The WCSS0418V1P provides a two-bit wraparound counter, fed by $A_{[1:0]}$, that implements either an interleaved or linear burst sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow

a linear burst sequence. The burst sequence is user selectable through the $\overline{MODE}$ input.

Asserting $\overline{ADV}$ LOW at clock rise will automatically increment the burst counter to the next address in the burst sequence. Both read and write burst operations are supported.

Interleaved Burst Sequence

First Address	Second Address	Third Address	Fourth Address
$A_{[1:0]}$	$A_{[1:0]}$	$A_{[1:0]}$	$A_{[1:0]}$
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

Linear Burst Sequence

First Address	Second Address	Third Address	Fourth Address
$A_{[1:0]}$	$A_{[1:0]}$	$A_{[1:0]}$	$A_{[1:0]}$
00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

Sleep Mode

The $\overline{ZZ}$ input pin is an asynchronous input. Asserting $\overline{ZZ}$ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. CE_1 , CE_2 , CE_3 , $\overline{ADSP}$, and $\overline{ADSC}$ must remain inactive for the duration of t_{ZZREC} after the $\overline{ZZ}$ input returns LOW.

ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min.	Max.	Unit
I_{DDZZ}	Snooze mode standby current	$ZZ \geq V_{DD} - 0.2V$		3	mA
t_{ZZS}	Device operation to $\overline{ZZ}$	$ZZ \geq V_{DD} - 0.2V$		$2t_{CYC}$	ns
t_{ZZREC}	$\overline{ZZ}$ recovery time	$ZZ \leq 0.2V$	$2t_{CYC}$		ns

Notes:

1. X = "Don't Care," 1 = HIGH, 0 = LOW.
2. Write is defined by BWE, BW_[1:0], and GW. See Write Cycle Description table.
3. The DQ pins are controlled by the current cycle and the OE signal. OE is asynchronous and is not sampled with the clock.

Industrial	-40°C to +85°C		

Notes:

- X = "Don't Care," 1 = Logic HIGH, 0 = Logic LOW.
- The SRAM always initiates a read cycle when ADSP asserted, regardless of the state of $\overline{\text{GW}}$, $\overline{\text{BWE}}$, or $\overline{\text{BW}}_{[1:0]}$. Writes may occur only on subsequent clocks after the ADSP or with the assertion of ADSC. As a result, $\overline{\text{OE}}$ must be driven HIGH prior to the start of the write cycle to allow the outputs to three-state. $\overline{\text{OE}}$ is a don't care for the remainder of the write cycle.
- $\overline{\text{OE}}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle $\text{DQ}_{[15:0]}; \text{DP}_{[1:0]}$ = High-Z when $\overline{\text{OE}}$ is inactive or when the device is deselected, and $\text{DQ}_{[15:0]}; \text{DP}_{[1:0]}$ = data when $\overline{\text{OE}}$ is active.
- Minimum voltage equals -2.0V for pulse durations of less than 20 ns.
- T_A is the case temperature.

t _{DS}	Data Input Set-Up Before CLK Rise	2.0		2.5		2.5		ns
t _{DH}	Data Input Hold After CLK Rise	0.5		0.5		0.5		ns
t _{CES}	Chip Select Set-Up	2.0		2.5		2.5		ns
t _{CEH}	Chip Select Hold After CLK Rise	0.5		0.5		0.5		ns
t _{CHZ}	Clock to High-Z ^[12]		3.5		3.5		3.5	ns
t _{CLZ}	Clock to Low-Z ^[12]	0		0		0		ns
t _{EOHZ}	$\overline{\text{OE}}$ HIGH to Output High-Z ^[12, 13]		3.5		3.5		5.5	ns
t _{EOLZ}	$\overline{\text{OE}}$ LOW to Output Low-Z ^[12, 13]	0		0		0		ns
t _{EOV}	$\overline{\text{OE}}$ LOW to Output Valid ^[12]		3.5		4.0		5.5	ns

Notes:

- Input waveform should have a slew rate of 1 V/ns.
- Unless otherwise noted, test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and load capacitance. Shown in (a) and (b) of AC Test Loads.
- t_{CHZ}, t_{CLZ}, t_{EOV}, t_{EOLZ}, and t_{EOHZ} are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
- At any given voltage and temperature, t_{EOHZ} is less than t_{EOLZ} and t_{CHZ} is less than t_{CLZ}.

Switching Waveforms

Write Cycle Timing^[14, 15]

Notes:

14. WE is the combination of $\overline{BWE}$, $\overline{BW}_{[1:0]}$, and $\overline{GW}$ to define a write cycle (see Write Cycle Description table).
15. WDX stands for Write Data to Address X.

Switching Waveforms (continued)

Read Cycle Timing^[14, 16]

Note:

16. RDx stands for Read Data from Address X.

Switching Waveforms (continued)

Read/Write Cycle Timing^[14, 15, 16, 17]

Note:

17. Data bus is driven by SRAM, but data is not guaranteed.

Switching Waveforms (continued)

Pipeline Timing^[18, 19]

Notes:

18. Device originally deselected.
19. CE is the combination of CE₂ and CE₃. All chip selects need to be active in order to select the device.

Switching Waveforms (continued)

ZZ Mode Timing^[20, 21]

Notes:

20. Device must be deselected when entering "ZZ" mode. See Cycle Description table for all possible signal conditions to deselect the device.
21. I/Os are in three-state when exiting "ZZ" sleep mode.

Ordering Information

Speed (MHz)	Ordering Code	Package Name	Package Type	Operating Range
166	WCSS0418V1P-166AC	A101	100-Lead Thin Quad Flat Pack	Commercial
	WCSS0418V1P-166BGC	BG119	119-Ball BGA	
133	WCSS0418V1P-133AC	A101	100-Lead Thin Quad Flat Pack	Commercial
	WCSS0418V1P-133BGC	BG119	119-Ball BGA	
	WCSS0418V1P-133AI	A101	100-Lead Thin Quad Flat Pack	Industrial

Document Title: CY7C1327B 256K x 18 Synchronous-Pipelined Cache RAM
Document Number: 38-05140

REV.	ECN NO.	Issue Date	Orig. of Change	Description of Change
**	109884	09/10/01	SZV	Change from Spec number: 38-00935 to 38-05140
New	113310	02/04/02	GLC	Change from Spec number: 38-05140 to 38-05247

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
