

General Description

The MIC705, MIC706, MIC707, and MIC708 are inexpensive microprocessor supervisory circuit that monitors power supplies in microprocessor based systems. The circuit functions include a watchdog timer, microprocessor reset, backup battery switchover, power failure warning and a debounced manual reset input.

The MIC705 and MIC706 offer a watchdog timer function while the MIC707 and MIC708 have an active high reset output in addition to the active low reset output.

Supply voltage monitor levels of 4.65V and 4.4V are available. The MIC705 and MIC707 have a nominal reset threshold level of 4.65V while the MIC706 and MIC708 have a 4.4V nominal threshold level. When the supply voltage drops below the respective reset threshold level, /RESET is asserted.

Features

- 30µA Maximum Supply Current
- Debounced manual reset input is TTL/CMOS Compatible
- Reset Pulse Width, 200ms
- Watchdog timer, 1.6s (MIC706)
- Precision supply voltage monitor
- Early power fail warning or low battery detect

Applications

- Laptop computers
- Intelligent systems
- Critical microprocessor power monitoring
- Printers
- Computers
- Controllers

Ordering Information

Part Number		Temperature Range	Package
Standard	Pb-Free		
MIC70_N	MIC70_NY	-40°C to +85°C	8-Pin PDIP
MIC70_M	MIC70_MY	-40°C to +85°C	8-Pin SOIC

Typical Application

Pin Configuration

8-Pin PDIP Package
8-Pin SOIC Package

Pin Description

Pin Number MIC705/6	Pin Number MIC707/8	Pin Name	Pin Function
1	1	/MR	Manual Reset Input forces /RESET to assert when pulled below 0.8V. An internal pull-up current of 250 μ A on this input forces it high when left floating. This input can also be driven from TTL or CMOS logic.
2	2	VCC	Primary supply input, +5V
3	3	GND	IC ground pin, 0V reference
4	4	PFI	Power Fail Input. Internally connected to the power fail comparator which is referenced to 1.25V. The Power Fail Output (/PFO) remains high if PFI is above 1.25V. PFI should be connected to GND or V _{OUT} if the power fail comparator is not used.
5	5	/PFO	Power Fail Output. The power fail comparator is independent of all other function on this device.
6	N/A	WDI	Watch Dog Input. The WDI input monitors microprocessor activity, an internal watchdog timer resets itself with each transition on the watchdog input. If the WDI pin is held high or low for longer than the watchdog timeout period, /WDO is forced to active low. The watchdog function can be disabled by floating the WDI pin.
N/A	6	N/C	Not Internally Connected
7	7	/RESET	/RESET is asserted if either V _{CC} goes below the reset threshold voltage or by low signal on the manual reset input (/MR). /RESET remains asserted for one reset timeout period (200ms) after V _{CC} exceeds the reset threshold voltage or after the manual reset pin transition from low to high. The watchdog timer will not assert /RESET unless /WDO is connected to /MR
8	N/A	/WDO	Output for the Watchdog Timer. The watchdog timer resets itself with each transition on the watchdog input. If the WDI pin is held high or low for longer than the watchdog timeout period, /WDO is forced low. /WDO will also be forced low if V _{CC} is below the reset threshold voltage and will remain low until V _{CC} returns to a valid level.
N/A	8	RESET	RESET is the compliment of /RESET and is asserted if either V _{CC} goes below the reset threshold voltage or by a low signal on the manual reset input (/MR). RESET is suitable for microprocessor systems that use active high reset.

Absolute Maximum Ratings⁽¹⁾

Terminal Voltage

V_{CC}	-0.3V to +6.0V
All other inputs	-0.3V to (V_{OUT} + 0.3V)

Applications Information

Power Fail Warning

An additional comparator which is independent of the other functions on the MIC706P/R/S/T is provided for early warning of power failure. An external voltage divider can be used to compare unregulated DC to an internal 1.25V reference. The voltage divider ratio on the input of the power-fail comparator (PFI) can be chosen so as to trip the power fail comparator a few milliseconds before V_{CC} falls below the maximum reset threshold voltage. The output of the power-fail comparator (/PFO) can be used to interrupt the microprocessor when used in this mode and execute shut-down procedures prior to power loss. Hysteresis can be added to this comparator with external resistors, as is commonly done with any comparator. When $V_{CC} < VBATT - 1.2V$ (typ.), the power-fail comparator is turned off and /PFO is pulled low in order to conserve power.

Figure 1. Power Fail Comparator

Watchdog Timer

The microprocessor can be monitored by connecting the WDI pin (watchdog input) to a bus line or an I/O line. If a transition doesn't occur on the WDI pin within the watchdog timeout (Table 1.), the microprocessor is reset. /RESET will remain asserted for 200ms when this occurs. A minimum pulse of 100ns or any transition low-to-high or high-to-low on the WDI pin will reset the watchdog timer. The output of the watchdog timer (WDO) will remain high, if WDI sees a valid transition within the watchdog period or if V_{CC} falls below the reset threshold as the watchdog timer is disabled when this happens.

Microprocessor Reset

The /RESET pin is asserted whenever V_{CC} falls below the reset threshold voltage. The reset pin remains asserted for a period of 200ms after V_{CC} has risen above the reset threshold voltage. The reset timeout period can also be selected by the end user, see Table 1. The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure. /RESET will remain valid with V_{CC} as low as 1.4V and when auxiliary power is connected to VBATT ($VBATT > 2.0V$), the reset pin will remain valid with V_{CC} from 0V to 5.5V.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибуторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ Р В 0015-002 и ЭС РД 009
