

## DC Brushless Motor Drivers for Fans

# Standard Single-phase Full wave Fan Motor Driver

### BD69830FV

#### Description

The BD69830FV is a 24V single-coil brushless DC FAN motor driver. The device incorporates high efficiency DMOS H-bridge driver, regulated voltage output for hall element, and rotation speed is controlled by input PWM signal.

#### Features

- Power DMOS FET integrated
- Direct PWM speed control
- Low duty start up function
- Quick start function
- Constant voltage output for hall element
- Lock protection and auto restart (without external capacitor)
- Rotating speed pulse signal (FG) output and ALARM signal output selectable

#### Package

SSOP-B14

W(Typ) x D(Typ) x H(Max)

5.00mm x 6.40mm x 1.35mm

#### Applications

- BD player, Projector, STB etc.,
- Office equipment, Copier, FAX, Laser Printer, etc.,

#### Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Supply Voltage	$V_{CC}$	30	V
Power Dissipation	$P_d$	0.87 <sup>(Note 1)</sup>	W
Operating Temperature	$T_{opr}$	-40 to +105	°C
Storage Temperature	$T_{stg}$	-55 to +150	°C
Junction Temperature	$T_{jmax}$	150	°C
Output Voltage	$V_{OMAX}$	30	V
Output Current	$I_{OMAX}$	900 <sup>(Note 2)</sup>	mA
Hall Input Voltage	$V_H$	7	V
PWM Input Voltage	$V_{PWM}$	7	V
SEL Input Voltage	$V_{SEL}$	7	V
Signal Output Voltage	$V_{SIG}$	30	V
Signal Output Current	$I_{SIG}$	10	mA
HB Current Ability	$I_{HB}$	10	mA

(Note 1) Reduce by 7.0mW/°C over 25°C. (On 70.0mmx70.0mmx1.6mm glass epoxy board)

(Note 2) This value is not to exceed  $P_d$ .

**Caution:** Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

## Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Supply Voltage	$V_{CC}$	6	24	28	V
Hall Input Voltage	$V_H$	0	-	2	V
PWM Input Frequency	$f_{PWM}$	2	-	50	kHz

Electrical Characteristics (Unless otherwise specified  $T_a=25^{\circ}\text{C}$ ,  $V_{CC}=24\text{V}$ )

## Block Diagram, Application Circuit, and Pin Assignment

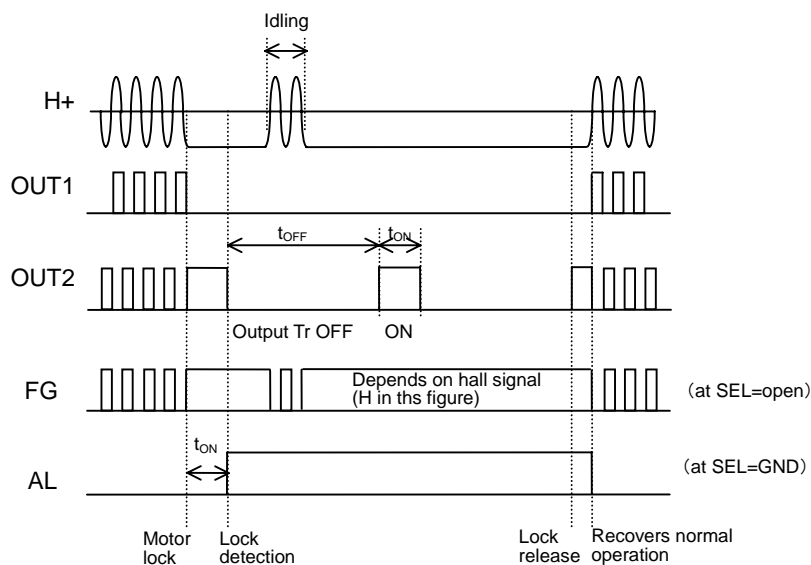

## Pin Description

Pin No.	Pin Name	Function
1	GND	GND
2	OUT2	Motor output 2
3	VCC	Power supply
4	VCC	Power supply
5	N.C.	-
6	PWM	PWM signal Input
7	SIG	Signal output (FG/AL signal)
8	H-	Hall Input -
9	HB	Constant voltage output for hall element
10	H+	Hall Input +
11	SEL	FG/AL select pin
12	N.C.	-
13	OUT1	Motor output1
14	GND	GND

### Description of Operations

### 1) Lock Protection and Automatic Restart

Motor rotation is detected by hall signal period. IC detects motor rotation is stop when the period becomes longer than the time set up at the internal counter, and IC turns off the output. Lock detection ON time ( $t_{ON}$ ) and lock detection OFF time ( $t_{OFF}$ ) are set by the digital counter based on internal oscillator. Therefore the ratio of ON/OFF time is always constant. Timing chart is shown in Figure 13.

SIG (7pin) output : FG signal output at SEL=open  
AL signal output at SEL=GND

Figure 13. Lock Protection Timing Chart

## 2) Constant Voltage Output for Hall Element

By connecting a hall element to HB pin directly, hall signal amplitude does not depend on temperature change.

Figure 14. Normal Connection of Hall Element

The output voltage of HB is 1.2V (Typ).

If the resistance of hall element is 300Ω, current value which flows into a hall element is

$$1.2\text{V} / 300\Omega = 4\text{mA}$$

Power supply voltage = 24V, HB output voltage = 1.2V, current to hall element = 4mA, in this condition, the heat generation of HB output is

$$(24\text{V} - 1.2\text{V}) \times 4\text{mA} = 91.2\text{mW} \quad \cdots (1)$$

If motor driving current is less, and there are some margins to power dissipation, the above-mentioned connection method is the simplest. In the case which motor driving current is large and it needs to reduce heat generation of IC, the application of following Figure 15 is recommended to suppress heat generation at HB output part.

Figure 15. Dividing Heat Generation into Resistor

Resistance of hall element  $R_H[\Omega]$ , Pull-up resistor  $R1[\Omega]$ , the heat generation of IC can be suppressed by choosing the resistance of  $R1$  so that it may be applied to this condition.

$$V_{CC} \times R_H / (R1 + R_H) < V_{HB}$$

The current supplied to a Hall element is mainly supplied from the resistance side, and only current for a voltage to become fixed value is supplied from HB pin.

e.g.  $V_{CC} = 24\text{V}$ ,  $R_H = 300\Omega$ ,  $R1 = 6\text{k}\Omega$

$$V_{CC} \times R_H / (R1 + R_H) = 24\text{V} \times 0.0476 = 1.143\text{V} < V_{HB} = 1.2\text{V}$$

Current supply source from HB is

$$(1.2\text{V} / 300\Omega) - \{(24\text{V} - 1.2\text{V}) / 6\text{k}\Omega\} = 0.2\text{mA}$$

And then, power consumption at HB output part is

$$(24\text{V} - 1.2\text{V}) \times 0.2\text{mA} = 4.56\text{mW}$$

It is clear that heat generation decreases greatly compared with the calculated value of (1).

HB pin has only current source ability.

If ambient temperature becomes high, the resistance of hall element becomes small. The voltage which supplies for a hall element at the condition of low temperature may exceed the maximum rating of a hall element, if the value of  $R1$  is set up on the basis of the hall resistance at the condition of high temperature.

## 3) Hall Input Setting

Figure 16. Hall Input Voltage Range

The input voltage of a hall signal is input in "Hall Input Voltage" including signal amplitude.

In order to detect rotation of a motor, the amplitude of hall signal more than "Hall Input Hysteresis" is required. Input the hall signal more than 30mVpp at least.

## ○Reducing the Noise of Hall Signal

Hall element may be affected by Vcc noise or the like depending on the wiring pattern of board. In this case, place a capacitor like C1 in Figure 17. In addition, when wiring from the hall element output to IC hall input is long, noise may be loaded on wiring. In this case, place a capacitor like C2 in Figure 17.

Figure 17. Application near of Hall Signal

## ○Regeneration adjustment by hall signal level

The amplitude of hall signal can be adjusted by putting in resistor like R2 of Figure 17. There is the regeneration section of back electromotive force at phase change timing (refer to Figure 18)

The section is determined by "Hall Input Hysteresis" and hall input signal amplitude.

In large back electromotive force (Back EMF) motor, output voltage may overshoot at the time of phase change, and it may exceed the maximum rating voltage. In that case, set to lower the hall signal amplitude by R2, and make the wide recirculation section.

#### 4) PWM Speed Control

Rotation speed of motor can be changed by controlling ON/OFF of upper output depending on the duty of the input signal to PWM pin.

When the voltage input to PWM pin applies

H logic : normal operation

L logic : H side output is off, L side output is ON

When PWM pin is open, H logic is applied.

Figure 18. Timing Chart of PWM Control and Hall Signal

#### 5) Quick Start Function

When PWM signal is input, the motor starts rotation at once regardless of the lock detection time.

Lock protection function is turned off when the time of PWM=L has elapsed more than 1ms in order to disable lock protection function when the motor is stopped by PWM signal. When H level duty of PWM input signal is close to 0%, lock protection function does not work if input frequency is slower than 1kHz. Therefore enter a frequency faster than 2kHz.

#### 6) Low Duty Start up Function

Even if the input duty of PWM signal is low, the motor can start rotation by this function.

During the motor starts up from stop condition, outputs are driven by a PWM signal of 100% duty until detecting motor rotation (max 200ms). It doesn't depend on input PWM duty (except 0% duty).

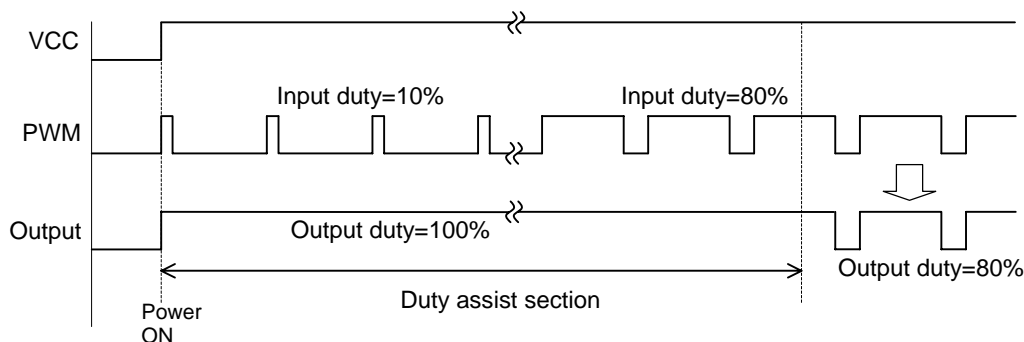

Figure 19. Low Duty Start up Function

4) SIG output

5) PWM input

6) SEL input

**Safety Measure****1) Reverse Connection Protection Diode**

Reverse connection of power results in IC destruction as shown in Figure 20. When reverse connection is possible, reverse connection protection diode must be added between power supply and VCC.

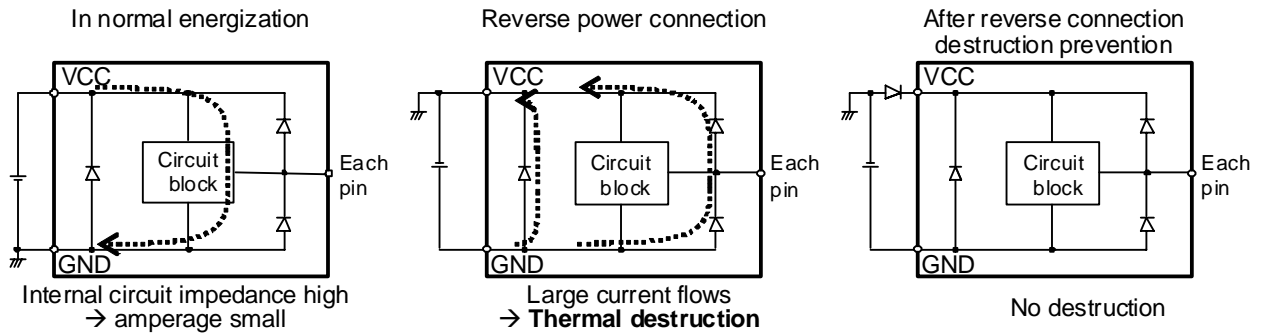

Figure 20. Flow of Current when Power is Connected Reverse

**2) Protection against VCC Voltage Rise by Back Electromotive Force**

Back EMF generates regenerative current to power supply. However, when reverse connection protection diode is connected, VCC voltage rises because the diode prevents current flow to power supply.

Figure 21. VCC Voltage Rise by Back Electromotive Force

When the absolute maximum rated voltage may be exceeded due to voltage rise by back electromotive force, place (A) Capacitor or (B) Zener diode between VCC and GND. It necessary, add both (C).

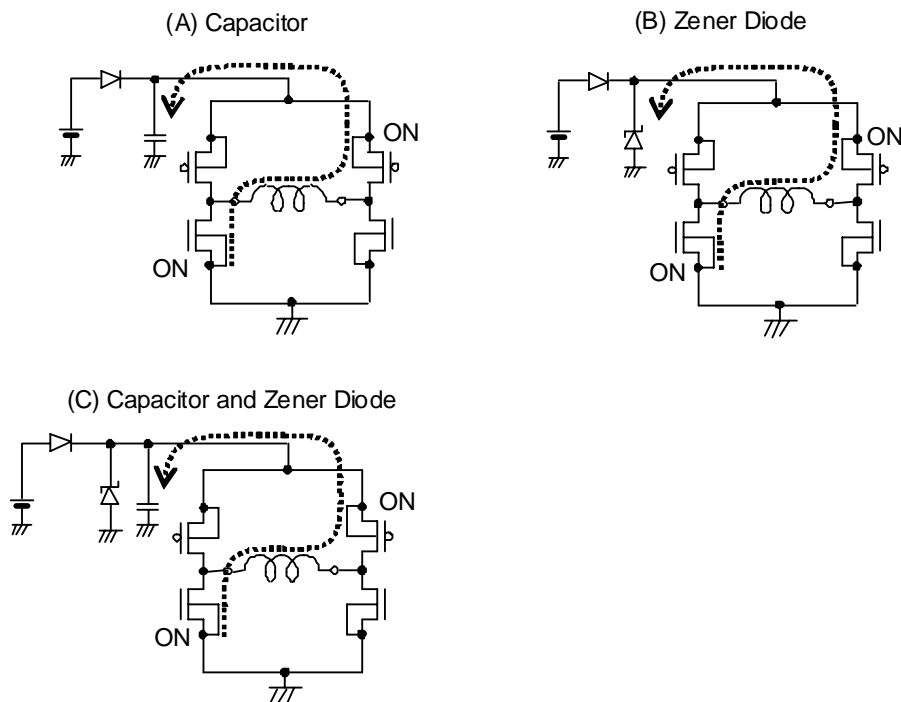

Figure 22. Protection against VCC Voltage Rise

## 3) Problem of GND Line PWM Switching

Do not perform PWM switching of GND line because GND potential cannot be kept to a minimum.

Figure 23. GND Line PWM Switching Prohibited

## 4) SIG Output

SIG is an open drain output and requires pull-up resistor. VCC voltage that is beyond its absolute maximum rating when SIG pin is directly connected to power supply, could damage the IC. The IC can be protected by adding resistor R1. (as shown in Figure 24)

Figure 24. Protection of SIG Pin

## Thermal Derating Curve

Thermal derating curve indicates power that can be consumed by IC with reference to ambient temperature. Power that can be consumed by IC begins to attenuate at certain ambient temperature. This gradient is determined by thermal resistance  $\theta_{ja}$ .

Thermal resistance  $\theta_{ja}$  depends on chip size, power consumption, package ambient temperature, packaging condition, wind velocity, etc., even when the same package is used. Thermal derating curve indicates a reference value measured at a specified condition. Figure 25 shows a thermal derating curve.

Reduce by 7.0 mW/°C over 25°C.  
(70.0mm x 70.0mm x 1.6mm glass epoxy board)

Figure 25. Thermal Derating Curve

## Operational Notes

### 1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

### 2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

### 3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition. However, pins that drive inductive loads (e.g. motor driver outputs, DC-DC converter outputs) may inevitably go below ground due to back EMF or electromotive force. In such cases, the user should make sure that such voltages going below ground will not cause the IC and the system to malfunction by examining carefully all relevant factors and conditions such as motor characteristics, supply voltage, operating frequency and PCB wiring to name a few.

### 4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

### 5. Thermal Consideration

Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. The absolute maximum rating of the Pd stated in this specification is when the IC is mounted on a 70mm x 70mm x 1.6mm glass epoxy board. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

### 6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

### 7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

### 8. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

### 9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

### 10. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

## Operational Notes – continued

**11. Unused Input Pins**

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

**12. Regarding the Input Pin of the IC**

This monolithic IC contains P<sup>+</sup> isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.

When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

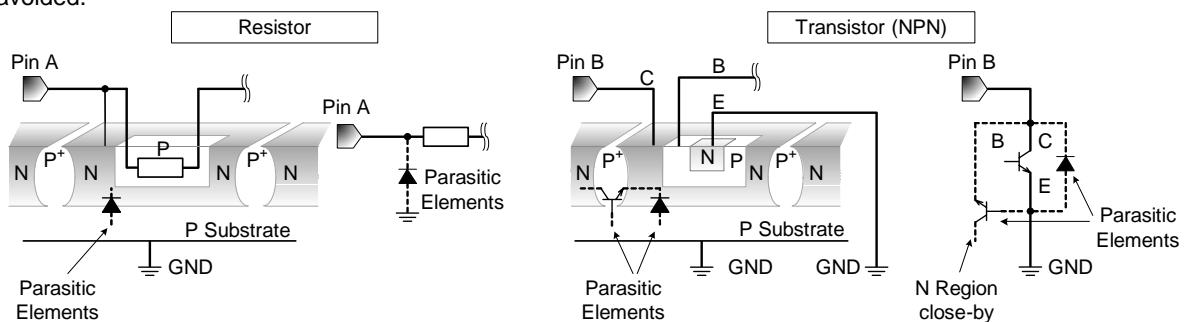

Figure 26. Example of monolithic IC structure

**13. Ceramic Capacitor**

When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

**14. Thermal Shutdown Circuit(TSD)**

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's power dissipation rating. If however the rating is exceeded for a continued period, the junction temperature ( $T_j$ ) will rise which will activate the TSD circuit that will turn OFF all output pins. When the  $T_j$  falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

## Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - Installation of protection circuits or other protective devices to improve system safety
  - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
  - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - Sealing or coating our Products with resin or other coating materials
  - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

## Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

## Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

## Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

## Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

## Precaution for Product Label

QR code printed on ROHM Products label is for ROHM's internal use only.

## Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

## Precaution for Foreign Exchange and Foreign Trade act

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

## Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:
2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

## Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
