DESCRIPTION

The DS1135 series is a low-power, +5V high-speed version of the popular DS1013 and DS1035.

The DS1135 series of delay lines have three independent logic buffered delays in a single package. The device is our fastest 3-in-1 delay line. It is available in a standard 8-pin 150-mil SO.

The device features precise leading and trailing edge accuracy. It has the inherent reliability of an all-silicon delay line solution. Each output is capable of driving up to 10 LS loads.

Standard delay values are indicated in Table 1.

NOTES:

1. Nominal conditions are +25°C and $V_{CC} = +5.0V$.
2. Voltage range of 4.75V to 5.25V.
3. Delay accuracies are for both leading and trailing edges.

TEST SETUP DESCRIPTION

Figure 2 illustrates the hardware configuration used for measuring the timing parameters of the DS1135. The input waveform is produced by a precision pulse generator under software control. Time delays are measured by a time interval counter (20ps resolution) connected to the output. The DS1135 output taps are selected and connected to the interval counter by a VHF switch control unit. All measurements are fully automated with each instrument controlled by the computer over an IEEE 488 bus.

|---|-------------------|
| Voltage Range on Any Pin Relative to Ground | -1.0V to +6.0V |
| Short Circuit Output Current | 50mA for 1 second |
| Operating Temperature | -40°C to +85°C |
| Storage Temperature | -55°C to +125°C |
