

Low voltage 16-bit constant current LED sink driver with output error detection

Datasheet - production data

feeds a 16-bit D-type storage register. In the output stage, sixteen regulated current sources are designed to provide 3 to 40 mA of constant current to drive the LEDs. The STP16DPP05 features open and short LED detection on the outputs. The detection circuit checks for 3 different conditions that can occur on the output line: short to GND, short to V_O or open line. The data detection results are loaded in the shift registers and shifted out via the serial line output. The detection functionality is implemented without increasing the pin count, through a secondary function of the output enable and latch pin (DM1 and DM2 respectively). A dedicated logic sequence allows the device to enter or exit from detection mode. The STP16DPP05 output current can be adjusted through an external resistor to control the light intensity of the LEDs. LED brightness is adjustable from 0% to 100% via the $\overline{OE/DM2}$ pin. The STP16DPP05 guarantees a 20 V output driving capability, allowing users to connect more LEDs in series. The high 30 MHz clock frequency makes the device suitable for high data rate transmission. The 3.3 V supply is well suited for applications which interface a 3.3 V MCU. Compared to a standard TSSOP package, the TSSOP with exposed pad increases heat dissipation capability by a factor of 2.5.

Features

- Low voltage power supply down to 3 V
- 16 constant current output channels
- Adjustable output current through external resistor
- Short and open output error detection
- Serial data IN/parallel data OUT
- 3.3 V MCU-driving capability
- Output current: 3 to 40 mA
- 30 MHz clock frequency
- Available in high thermal efficiency TSSOP exposed pad
- ESD protection: 2 kV HBM, 200 V MM

Description

The STP16DPP05 is a monolithic, low voltage, low current power 16-bit shift register designed for LED panel displays. The device features a 16-bit serial-in, parallel-out shift register that

Table 1: Device summary

1 Summary description

Table 2: Typical current accuracy

Output voltage	Current accuracy		Output current	V _{DD}	Temperature
	Between bits	Between ICs			
≥ 1.3 V	± 1%	± 2%	5 to 40 mA	3.3 V to 5 V	25 °C

1.1 Pin connection and description

Figure 1: Pin connection

The exposed pad should be electrically connected to a metal land electrically isolated or connected to ground.

Table 3: Pin description

Pin n°	Symbol	Name and function
1	GND	Ground terminal
2	SDI	Serial data input terminal
3	CLK	Clock input terminal
4	LE/DM1	Latch input terminal - detect mode 1 (see operation principle)
5-20	OUT 0-15	Output terminal
21	OE/DM2	Input terminal of output enable (active low) - detect mode 1 (see operation principle)
22	SDO	Serial data out terminal
23	R-EXT	Input terminal for an external resistor for constant current programming
24	V _{DD}	Supply voltage terminal

2 Electrical ratings

2.1 Absolute maximum ratings

Stressing the device above the ratings listed in the “absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other condition above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 4: Absolute maximum ratings

Symbol	Parameter	Value	Unit
V _{DD}	Supply voltage	0 to 7	V
V _O	Output voltage	-0.5 to 20	V
I _O	Output current	50	mA
V _I	Input voltage	-0.4 to V _{DD}	V
I _{GND}	GND terminal current	800	mA
f _{CLK}	Clock frequency	50	MHz
T _J	Junction temperature range ⁽¹⁾	-40 to +170	°C

Notes:

⁽¹⁾ Such absolute value is based on the thermal shutdown protection.

2.2 Thermal data

Table 5: Thermal data

Symbol	Parameter	Value	Unit	
T _A	Operating free-air temperature range	-40 to +125	°C	
T _{J-OPR}	Operating thermal junction temperature range	-40 to +150	°C	
T _{STG}	Storage temperature range	-55 to +150	°C	
R _{thJA}	Thermal resistance junction-ambient ⁽¹⁾	SO-24	42.7	°C/W
		TSSOP24	55	°C/W
		TSSOP24 ⁽²⁾ exposed pad	37.5	°C/W
		QSOP-24	55	°C/W

Notes:

⁽¹⁾ According with JEDEC standard 51-7.

⁽²⁾ The exposed pad should be soldered directly to the PCB to obtain the thermal benefits.

2.3 Recommended operating conditions

Table 6: Recommended operating conditions

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V _{DD}	Supply voltage		3		5.5	V
V _O	Output voltage				20	V
I _O	Output current	OUT _n	3		40	mA
I _{OH}	Output current	SERIAL-OUT			1	mA
I _{OL}	Output current	SERIAL-OUT			-1	mA
V _{IH}	Input voltage		0.7 V _{DD}		V _{DD}	V
V _{IL}	Input voltage		-0.3		0.3 V _{DD}	V
t _{wLAT}	LE/DM1 pulse width	V _{DD} = 3.0 V to 5.0 V	20			ns
t _{wCLK}	CLK pulse width		10			ns
t _{wEN}	$\overline{\text{OE/DM2}}$ pulse width		100			ns
t _{SETUP(D)}	Setup time for DATA					ns
t _{HOLD(D)}	Hold time for DATA		5			ns
t _{SETUP(L)}	Setup time for LATCH		8			ns
f _{CLK}	Clock frequency		Cascade operation ⁽¹⁾			30

Notes:

⁽¹⁾ If the device is connected in cascade, it may not be possible to achieve the maximum data transfer. Please consider the timings carefully.

3 Electrical characteristics

$V_{DD} = 3.3\text{ V to }5\text{ V}$, $T_A = 25\text{ }^\circ\text{C}$, unless otherwise specified.

Table 7: Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit

Figure 16: Turn ON output current characteristics⁽¹⁾

GIPD300920151315MT

Figure 17: Turn OFF output current characteristics⁽²⁾

GIPD300920151316MT

Notes:

- (1) The reference level for the TON characteristics is 50% of $\overline{OE/DM2}$ signal and 90 % of output current.
- (2) The reference level for the TOFF characteristics is 50% of $\overline{OE/DM2}$ signal and 10 % of output current.

Electrical conditions: $V_{dd} = 3.3\text{ V}$, $V_{in} = V_{dd}$, $V_{led} = 3.0\text{ V}$, $R_L = 60\ \Omega$, $C_L = 10\text{ pF}$ Ch1 (Yellow) = $\overline{OE/DM2}$, Ch2 (Blue) = SDI, Ch3 (Purple) = VOUT, Ch4 (Green) = OUT

7 Error detection mode functionality

7.1 Phase one: entering error detection mode

From the “normal mode” condition the device can switch to “error mode” by a logic sequence on the $\overline{\text{OE/DM2}}$ and LE/DM1 pins, as shown in the following table and diagram:

Table 13: Entering error detection mode - truth table

CLK	1°	2°	3°	4°	5°
$\overline{\text{OE/DM2}}$	H	L	H	H	H
LE/DM1	L	L	L	H	L

Figure 18: Entering error detection mode - timing diagram

After these five CLK cycles, the device goes into “error detection mode” and at the rising edge of the 6th CLK cycle, the SDI data are ready for sampling.

7.2 Phase two: error detection

The 16 data bits must be set to “1” in order for all the outputs to be ON during error detection. The data are latched by LE/DM1, after which the outputs are ready for the detection process. When the microcontroller switches the $\overline{\text{OE/DM2}}$ to LOW, the device drives the LEDs to analyze if an OPEN or SHORT condition has occurred.

Figure 19: Detection diagram

The status of the LEDs is detected in at least 1 microsecond, and after this period the microcontroller sets $\overline{\text{OE/DM2}}$ to HIGH state and the output data detection result is sent to the microcontroller via SDO. Error detection mode and normal mode both use the same data format. As soon as all the detection data bits are available on the serial line, the device may return to normal mode of operation. To re-detect the status, the device must first return to normal mode and reenter error detection mode.

Figure 20: Timing example for open and/or short-circuit detection

7.3 Phase three: resuming normal mode

The sequence for reentering normal mode is shown in the following table:

Table 14: Resuming normal mode - timing diagram

CLK	1°	2°	3°	4°	5°
$\overline{\text{OE/DM2}}$	H	L	H	H	H
LE/DM1	L	L	L	L	L

For proper device operation, the “entering error detection” sequence must be followed by a “resume mode” sequence, it is not possible to insert consecutive equal sequences.

7.4 Error detection conditions

Table 15: Detection conditions (VDD = 3.3 to 5 V, temperature range -40 to 125 °C)

Configuration	Detect mode	Detection results		
SW-1 or SW-3b	Open line or output short to GND detected	$\implies I_{\text{ODEC}} \leq 0.5 \times I_o$	No error detected	$\implies I_{\text{ODEC}} \geq 0.5 \times I_o$
SW-2 or SW-3a	Short on LED or short to V-LED detected	$\implies V_o \geq 2.6 \text{ V}$	No error detected	$\implies V_o \leq 2.3 \text{ V}$

Where: I_o = the output current programmed by the R-EXT, I_{ODEC} = the detected output current in detection mode

Figure 21: Detection circuit
