

# 8-Bit, 50 MSPS/80 MSPS/100 MSPS 3 V A/D Converter

## AD9283

### FEATURES

8-Bit, 50, 80, and 100 MSPS ADC

Low Power: 90 mW at 100 MSPS

On-Chip Reference and Track/Hold

475 MHz Analog Bandwidth

SNR = 46.5 dB @ 41 MHz at 100 MSPS

1 V p-p Analog Input Range

Single 3.0 V Supply Operation (2.7 V–3.6 V)

Power-Down Mode: 4.2 mW

### APPLICATIONS

Battery Powered Instruments

Hand-Held Scopemeters

Low Cost Digital Oscilloscopes

### FUNCTIONAL BLOCK DIAGRAM

### GENERAL DESCRIPTION

The AD9283 is an 8-bit monolithic sampling analog-to-digital converter with an on-chip track-and-hold circuit and is optimized for low cost, low power, small size and ease of use. The product operates at a 100 MSPS conversion rate, with outstanding dynamic performance over its full operating range.

The ADC requires only a single 3.0 V (2.7 V to 3.6 V) power supply and an encode clock for full performance operation. No external reference or driver components are required for many applications. The digital outputs are TTL/CMOS compatible and a separate output power supply pin supports interfacing with 3.3 V or 2.5 V logic.

The encoder input is TTL/CMOS compatible. A power-down function may be exercised to bring total consumption to 4.2 mW. In power-down mode, the digital outputs are driven to a high impedance state.

Fabricated on an advanced CMOS process, the AD9283 is available in a 20-lead surface mount plastic package (SSOP) specified over the industrial temperature range (–40°C to +85°C).

## NOTES

<sup>1</sup>Gain error and gain temperature coefficient are based on the ADC only (with a fixed 1.25 V external reference).

<sup>2</sup> $t_V$  and  $t_{PD}$  are measured from the 1.5 V level of the ENCODE input to the 50%/50% levels of the digital outputs swing. The digital output load during test is not to exceed an ac load of 10 pF or a dc current of  $\pm 40 \mu\text{A}$ .

<sup>3</sup>Power dissipation measured with encode at rated speed and a dc analog input.

<sup>4</sup>Typical thermal impedance for the RS style (SSOP) 20-lead package:  $\theta_{JC} = 46^\circ\text{C/W}$ ,  $\theta_{CA} = 80^\circ\text{C/W}$ ,  $\theta_{JA} = 126^\circ\text{C/W}$ .

<sup>5</sup>SNR/harmonics based on an analog input voltage of  $-0.7 \text{ dBFS}$  referenced to a 1.024 V full-scale input range.

Specifications subject to change without notice.

## ABSOLUTE MAXIMUM RATINGS\*

|                                    |                                              |
|------------------------------------|----------------------------------------------|
| $V_D, V_{DD}$ .....                | 4 V                                          |
| Analog Inputs .....                | $-0.5 \text{ V}$ to $V_D + 0.5 \text{ V}$    |
| Digital Inputs .....               | $-0.5 \text{ V}$ to $V_{DD} + 0.5 \text{ V}$ |
| $V_{REF IN}$ .....                 | $-0.5 \text{ V}$ to $V_D + 0.5 \text{ V}$    |

| Maximum Case Temperature .....     | $150^\circ\text{C}$                          |

\*Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions outside of those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

## ORDERING GUIDE

| Model          | Temperature Ranges                         | Package Descriptions | Package Options |
|----------------|--------------------------------------------|----------------------|-----------------|
| AD9283BRS      |                                            |                      |                 |
| -50, -80, -100 | $-40^\circ\text{C}$ to $+85^\circ\text{C}$ | 20-Lead SSOP         | RS-20           |
| AD9283/PCB     | $25^\circ\text{C}$                         | Evaluation Board     |                 |

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD9283 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

# AD9283

## EXPLANATION OF TEST LEVELS

### Test Level

- I 100% production tested.
- II 100% production tested at 25°C and sample tested at specified temperatures.
- III Sample tested only.
- IV Parameter is guaranteed by design and characterization testing.
- V Parameter is a typical value only.
- VI 100% production tested at 25°C; guaranteed by design and characterization testing for industrial temperature range; 100% production tested at temperature extremes for military devices.

Table I. Output Coding (VREF = 1.25 V)

## APPLICATIONS

### Theory of Operation

The analog signal is applied differentially or single-endedly to the inputs of the AD9283. The signal is buffered and fed forward to an on-chip sample-and-hold circuit. The ADC core architecture is a bit-per-stage pipeline type converter utilizing switch capacitor techniques. The bit-per-stage blocks determine the 5 MSBs and drive a FLASH converter to encode the 3 LSBs. Each of the 5 MSB stages provides sufficient overlap and error correction to allow optimization of performance with respect to comparator accuracy. The output staging block aligns the data, carries out the error correction and feeds the data to the eight output buffers. The AD9283 includes an on-chip reference (nominally 1.25 V) and generates all clocking signals from one externally applied encode command. This makes the ADC easy to interface with and requires very few external components for operation.

### ENCODE Input

The ENCODE input is fully TTL/CMOS compatible with a nominal threshold of 1.5 V. Care was taken on the chip to match clock line delays and maintain sharp clock logic transitions. Any high speed A/D converter is extremely sensitive to the quality of the sampling clock provided by the user. This ADC uses an on-chip sample-and-hold circuit which is essentially a mixer. Any timing jitter on the ENCODE will be combined with the desired signal and degrade the high frequency performance of the ADC. The user is advised to give commensurate thought to the clock source.

### Analog Input

The analog input to the ADC is fully differential and both inputs are internally biased. This allows the most flexible use of ac or dc and differential or single-ended input modes. For peak performance the inputs are biased at  $0.3 \times V_D$ . See the specification table for allowable common-mode range when dc coupling the input. The inputs are also buffered to reduce the load the user needs to drive. For best dynamic performance, the impedances at  $A_{IN}$  and  $\bar{A}_{IN}$  should be matched. The importance of this increases with sampling rate and analog input frequency. The nominal input range is 1.024 V p-p.

### Digital Outputs

The digital outputs are TTL/CMOS compatible. The output buffers are powered from a separate supply, allowing adjustment of the output voltage swing to ease interfacing with 2.5 V or 3.3 V logic. The AD9283 goes into a low power state within two clock cycles following the assertion of the PWRDWN input. PWRDWN is asserted with a logic high. During power-down the outputs transition to a high impedance state. The time it takes to achieve optimal performance after disabling the power-down mode is approximately 15 clock cycles. Care should be taken when loading the digital outputs of any high speed ADC. Large output loads create current transients on the chip that can degrade the converter's performance.

### Voltage Reference

A stable and accurate 1.25 V voltage reference is built into the AD9283 (VREF OUT). In normal operation, the internal reference is used by strapping Pins 2 and 3 of the AD9283 together. The input range can be adjusted by varying the reference voltage applied to the AD9283. No degradation in performance occurs when the reference is adjusted  $\pm 5\%$ . The full-scale range of the ADC tracks reference voltage changes linearly. Whether used or not, the internal reference (Pin 2) should be bypassed with a 0.1  $\mu$ F capacitor to ground.

### Timing

The AD9283 provides latched data outputs with four pipeline delays. Data outputs are available one propagation delay ( $t_{PD}$ ) after the rising edge of the encode command (Figure 1. Timing Diagram). The minimum guaranteed conversion rate to the ADC is 1 MSPS. The dynamic performance of the converter will degrade at encode rates below this sample rate.

### Evaluation Board

The AD9283 evaluation board offers an easy way to test the AD9283. It only requires a 3 V supply, an analog input and encode clock to test the AD9283. The board is shipped with the 100 MSPS grade ADC.

The analog input to the board accepts a 1 V p-p signal centered at ground. J1 should be used (Jump E3–E4, E18–E19) to drive the ADC through Transformer T1. J2 should be used for single-ended input drive (Jump E19–E21).

Both J1 and J2 are terminated to 50  $\Omega$  on the PCB. Each analog path is ac-coupled to an on-chip resistor divider which provides the required dc bias.

A (TTL/CMOS Level) sample clock is applied to connector J3 which is terminated through 50  $\Omega$  on the PCB. This clock is buffered by U5 which also provides the clocks for the 574 latches, DAC, and the off-card latch clock CLKCON. (Timing can be modified at E17.)

There is a reconstruction DAC (AD9760) on the PCB. The DAC is on the board to assist in debug only—the outputs should not be used to measure performance of the ADC.

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
