## 14-Output Clock Generator

## FEATURES

Low phase noise, phase-locked loop (PLL)
External VCO/VCXO to 2.4 GHz optional
1 differential or 2 single-ended reference inputs
Reference monitoring capability
Automatic revertive and manual reference
switchover/holdover modes
Accepts LVPECL, LVDS, or CMOS references to $\mathbf{2 5 0} \mathbf{~ M H z}$
Programmable delays in path to PFD
Digital or analog lock detect, selectable
Six 1.6 GHz LVPECL outputs, arranged in 3 groups
Each group shares a 1-to-32 divider with coarse phase delay
Additive output jitter: 225 fs rms
Channel-to-channel skew paired outputs of $<10$ ps
Four $\mathbf{8 0 0} \mathbf{~ M H z}$ LVDS outputs, arranged in $\mathbf{2}$ groups
Each group has $\mathbf{2}$ cascaded 1-to- $\mathbf{3 2}$ dividers with coarse phase delay
Additive output jitter: 275 fs rms
Fine delay adjust ( $\Delta t$ ) on each LVDS output
Each LVDS output can be reconfigured as two 250 MHz CMOS outputs
Automatic synchronization of all outputs on power-up
Manual output synchronization available
Available in 64-lead LFCSP

## APPLICATIONS

Low jitter, low phase noise clock distribution
10/40/100 Gb/sec networking line cards, including SONET,
Synchronous Ethernet, OTU2/3/4
Forward error correction (G.710)
Clocking high speed ADCs, DACs, DDSs, DDCs, DUCs, MxFEs
High performance wireless transceivers
ATE and high performance instrumentation

## GENERAL DESCRIPTION

The AD9516-5 ${ }^{1}$ provides a multi-output clock distribution function with subpicosecond jitter performance, along with an on-chip PLL that can be used with an external VCO/VCXO of up to 2.4 GHz .
The AD9516-5 emphasizes low jitter and phase noise to maximize data converter performance, and it can benefit other applications with demanding phase noise and jitter requirements.

## AD9516-5

## SPECIFICATIONS

Typical is given for $\mathrm{V}_{\mathrm{S}}=\mathrm{V}_{\text {SLVPECL }}=3.3 \mathrm{~V} \pm 5 \% ; \mathrm{V}_{\mathrm{S}} \leq \mathrm{V}_{\mathrm{CP}} \leq 5.25 \mathrm{~V} ; \mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{SET}}=4.12 \mathrm{k} \Omega ; \mathrm{CP}_{\mathrm{RSET}}=5.1 \mathrm{k} \Omega$, unless otherwise noted. Minimum and maximum values are given over full $\mathrm{V}_{s}$ and $\mathrm{T}_{\mathrm{A}}\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$ variation.

## POWER SUPPLY REQUIREMENTS

Table 1.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{5}$ | 3.135 | 3.3 | 3.465 | V | $3.3 \mathrm{~V} \pm 5 \%$ |
| $V_{\text {S_LVPECL }}$ | 2.375 |  | VS | V | Nominally 2.5 V to $3.3 \mathrm{~V} \pm 5 \%$ |
| $V_{\text {cp }}$ | $\mathrm{V}_{5}$ |  | 5.25 | V | Nominally 3.3 V to $5.0 \mathrm{~V} \pm 5 \%$ |
| RSET Pin Resistor |  | 4.12 |  | $\mathrm{k} \Omega$ | Sets internal biasing currents; connect to ground |
| CPRSET Pin Resistor | 2.7 | 5.1 | 10 | $\mathrm{k} \Omega$ | Sets internal CP current range, nominally 4.8 mA (CP_Isb $=600 \mu \mathrm{~A}$ ); actual current can be calculated by: CP_Isb $=3.06 / \mathrm{CPRSET}$; connect to ground |

## PLL CHARACTERISTICS

Table 2.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PRESCALER (PART OF N DIVIDER) |  |  |  |  | See the VCXO/VCO Feedback Divider N-P, A, B section |
| Prescaler Input Frequency |  |  |  |  |  |
| $\mathrm{P}=1 \mathrm{FD}$ |  |  | 300 | MHz |  |
| $\mathrm{P}=2 \mathrm{FD}$ |  |  | 600 | MHz |  |
| $\mathrm{P}=3 \mathrm{FD}$ |  |  | 900 | MHz |  |
| $\mathrm{P}=2 \mathrm{DM}(2 / 3)$ |  |  | 200 | MHz |  |
| $\mathrm{P}=4 \mathrm{DM}(4 / 5)$ |  |  | 1000 | MHz |  |
| $\mathrm{P}=8 \mathrm{DM}(8 / 9)$ |  |  | 2400 | MHz |  |
| $\mathrm{P}=16 \mathrm{DM}(16 / 17)$ |  |  | 3000 | MHz |  |
| $\mathrm{P}=32 \mathrm{DM}(32 / 33)$ |  |  | 3000 | MHz |  |
| Prescaler Output Frequency |  |  | 300 | MHz | $A, B$ counter input frequency (prescaler input frequency divided by P) |
| PLL DIVIDER DELAYS |  |  |  |  | Register 0x019: R, Bits[5:3]; N, Bits[2:0]; see Table 49 |
| 000 |  | Off |  | ps |  |
| 001 |  | 330 |  | ps |  |
| 010 |  | 440 |  | ps |  |
| 011 |  | 550 |  | ps |  |
| 100 |  | 660 |  | ps |  |
| 101 |  | 770 |  | ps |  |
| 110 |  | 880 |  | ps |  |
| 111 |  | 990 |  | ps |  |
| NOISE CHARACTERISTICS |  |  |  |  |  |
| In-Band Phase Noise of the Charge Pump/Phase Frequency Detector (In-Band Is Within the LBW of the PLL) |  |  |  |  | The PLL in-band phase noise floor is estimated by measuring the in-band phase noise at the output of the VCO and subtracting $20 \log (\mathrm{~N})$ (where N is the value of the N divider) |
| At 500 kHz PFD Frequency |  | -165 |  | $\mathrm{dBc} / \mathrm{Hz}$ |  |
| At 1 MHz PFD Frequency |  | -162 |  | $\mathrm{dBc} / \mathrm{Hz}$ |  |
| At 10 MHz PFD Frequency |  | -151 |  | $\mathrm{dBc} / \mathrm{Hz}$ |  |
| At 50 MHz PFD Frequency |  | -143 |  | $\mathrm{dBc} / \mathrm{Hz}$ |  |
| PLL Figure of Merit (FOM) |  | -220 |  | $\mathrm{dBc} / \mathrm{Hz}$ | Reference slew rate $>0.25 \mathrm{~V} / \mathrm{ns} ; \mathrm{FOM}+10 \log \left(\mathrm{f}_{\text {PDD }}\right)$ is an approximation of the PFD/CP in-band phase noise (in the flat region) inside the PLL loop bandwidth; when running closed-loop, the phase noise, as observed at the VCO output, is increased by $20 \log (\mathrm{~N})$ |
| PLL DIGITAL LOCK DETECT WINDOW ${ }^{2}$ |  |  |  |  | Signal available at the LD, STATUS, and REFMON pins when selected by appropriate register settings |
| Required to Lock (Coincidence of Edges) |  |  |  |  | Selected by Register 0x017[1:0] and Register 0x018[4] |
| Low Range (ABP $1.3 \mathrm{~ns}, 2.9 \mathrm{~ns}$ ) |  | 3.5 |  | ns | Register 0x017[1:0] = 00b, 01b, 11b; Register 0x018[4] = 1b |
| High Range (ABP $1.3 \mathrm{~ns}, 2.9 \mathrm{~ns}$ ) |  | 7.5 |  | ns | Register 0x017[1:0] = 00b, 01b, 11b; Register 0x018[4] $=0 \mathrm{~b}$ |
| High Range (ABP 6.0 ns ) |  | 3.5 |  | ns | Register 0x017[1:0] = 10b; Register 0x018[4] = 0b |
| To Unlock After Lock (Hysteresis) ${ }^{2}$ |  |  |  |  |  |
| Low Range (ABP $1.3 \mathrm{~ns}, 2.9 \mathrm{~ns}$ ) |  | 7 |  | ns | Register 0x017[1:0] = 00b, 01b, 11b; Register 0x018[4] = 1b |
| High Range (ABP $1.3 \mathrm{~ns}, 2.9 \mathrm{~ns}$ ) |  | 15 |  | ns | Register 0x017[1:0] = 00b, 01b, 11b; Register 0x018[4] = 0b |
| High Range (ABP 6.0 ns ) |  | 11 |  | ns | Register 0x017[1:0] = 10b; Register $0 \times 018[4]=0 b$ |

[^0]
## AD9516-5

## CLOCK INPUTS

Table 3.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CLOCK INPUTS (CLK, $\overline{\text { CLK }}$ ) |  |  |  |  | Differential input |
| Input Frequency | $0{ }^{1}$ |  | 2.4 | GHz | High frequency distribution (VCO divider enabled) |
|  | $0^{1}$ |  | 1.6 | GHz | Distribution only (VCO divider bypassed; this is the frequency range supported by the channel divider) |
| Input Sensitivity, Differential |  | 150 |  | mVp-p | Measured at 2.4 GHz ; jitter performance is improved with slew rates > $1 \mathrm{~V} / \mathrm{ns}$ |
| Input Level, Differential |  |  | 2 | $\checkmark \mathrm{p}$-p | Larger voltage swings may turn on the protection diodes and may degrade jitter performance |
| Input Common-Mode Voltage, $\mathrm{V}_{\text {cm }}$ | 1.3 | 1.57 | 1.8 | V | Self-biased; enables ac coupling |
| Input Common-Mode Range, $\mathrm{V}_{\text {cmi }}$ | 1.3 |  | 1.8 | V | With 200 mV p-p signal applied; dc-coupled |
| Input Sensitivity, Single-Ended |  | 150 |  | mVp-p | CLK ac-coupled; $\overline{\text { CLK }}$ ac-bypassed to RF ground |
| Input Resistance | 3.9 | 4.7 | 5.7 | $k \Omega$ | Self-biased |
| Input Capacitance |  | 2 |  | pF |  |

${ }^{1}$ Below about 1 MHz , the input should be dc-coupled. Care should be taken to match $\mathrm{V}_{\mathrm{cm}}$.

## CLOCK OUTPUTS

Table 4.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :--- | :--- | :--- | :--- | :--- | :--- |

## CLOCK OUTPUT ADDITIVE PHASE NOISE (DISTRIBUTION ONLY; VCO DIVIDER NOT USED)

Table 5.

## AD9516-5

| Parameter | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :--- | :--- |
| CLK $=1 \mathrm{GHz}$, Output $=50 \mathrm{MHz}$ |  |  | Test Conditions/Comments |  |
| Divider $=20$ |  |  |  |  |
| At 10 Hz Offset |  |  |  |  |
| At 100 Hz Offset | -124 |  | $\mathrm{dBc} / \mathrm{Hz}$ |  |
| At 1 kHz Offset | -134 | $\mathrm{dBc} / \mathrm{Hz}$ |  |  |
| At 10 kHz Offset | -142 | $\mathrm{dBc} / \mathrm{Hz}$ |  |  |
| At 100 kHz Offset | -151 | $\mathrm{dBc} / \mathrm{Hz}$ |  |  |
| At 1 MHz Offset | -157 | $\mathrm{dBc} / \mathrm{Hz}$ |  |  |
| $>10 \mathrm{MHz}$ Offset | -160 | $\mathrm{dBc} / \mathrm{Hz}$ |  |  |

## CLOCK OUTPUT ABSOLUTE TIME JITTER (CLOCK GENERATION USING EXTERNAL VCXO)

Table 6.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| LVPECL OUTPUT ABSOLUTE TIME JITTER |  |  |  |  | Application example based on a typical setup using an external 245.76 MHz VCXO (Toyocom TCO-2112); reference $=15.36 \mathrm{MHz} ; \mathrm{R}=1$ |
| LVPECL $=245.76 \mathrm{MHz}$; PLL LBW $=125 \mathrm{~Hz}$ |  | 54 |  | fs rms | Integration bandwidth $=200 \mathrm{kHz}$ to 5 MHz |
|  |  | 77 |  | fs rms | Integration bandwidth $=200 \mathrm{kHz}$ to 10 MHz |
|  |  | 109 |  | fs rms | Integration bandwidth $=12 \mathrm{kHz}$ to 20 MHz |
| LVPECL $=122.88$ MHz; PLL LBW $=125$ Hz |  | 79 |  | fs rms | Integration bandwidth $=200 \mathrm{kHz}$ to 5 MHz |
|  |  | 114 |  | fs rms | Integration bandwidth $=200 \mathrm{kHz}$ to 10 MHz |
|  |  | 163 |  | fs rms | Integration bandwidth $=12 \mathrm{kHz}$ to 20 MHz |
| LVPECL $=61.44 \mathrm{MHz} ;$ PLL LBW $=125 \mathrm{~Hz}$ |  | 124 |  | fs rms | Integration bandwidth $=200 \mathrm{kHz}$ to 5 MHz |
|  |  | 176 |  | fs rms | Integration bandwidth $=200 \mathrm{kHz}$ to 10 MHz |
|  |  | 259 |  | fs rms | Integration bandwidth $=12 \mathrm{kHz}$ to 20 MHz |

## CLOCK OUTPUT ADDITIVE TIME JITTER (VCO DIVIDER NOT USED)

Table 7.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| LVPECL OUTPUT ADDITIVE TIME JITTER |  |  |  |  | Distribution section only; does not include PLL; uses rising edge of clock signal |
| ```CLK = 622.08 MHz; LVPECL = 622.08 MHz; Divider = 1``` |  | 40 |  | fs rms | Bandwidth $=12 \mathrm{kHz}$ to 20 MHz |
| $\begin{aligned} & \text { CLK }=622.08 \mathrm{MHz} ; \text { LVPECL }=155.52 \mathrm{MHz} ; \\ & \text { Divider }=4 \end{aligned}$ |  | 80 |  | fs rms | Bandwidth $=12 \mathrm{kHz}$ to 20 MHz |
| $\begin{aligned} & \text { CLK }=1.6 \mathrm{GHz} ; \text { LVPECL }=100 \mathrm{MHz} \\ & \text { Divider }=16 \end{aligned}$ |  | 215 |  | fs rms | Calculated from SNR of ADC method; DCC not used for even divides |
| $\begin{aligned} & \text { CLK }=500 \mathrm{MHz} ; \text { LVPECL }=100 \mathrm{MHz} ; \\ & \quad \text { Divider }=5 \end{aligned}$ |  | 245 |  | fs rms | Calculated from SNR of ADC method; DCC on |
| LVDS OUTPUT ADDITIVE TIME JITTER |  |  |  |  | Distribution section only; does not include PLL; uses rising edge of clock signal |
| $\begin{aligned} & \text { CLK }=1.6 \mathrm{GHz} ; \text { LVDS }=800 \mathrm{MHz} \text {; Divider }=2 \\ & \text { (VCO Divider Not Used) } \end{aligned}$ |  | 85 |  | fs rms | Bandwidth $=12 \mathrm{kHz}$ to 20 MHz |
| CLK = 1 GHz; LVDS = 200 MHz ; Divider $=5$ |  | 113 |  | fs rms | Bandwidth $=12 \mathrm{kHz}$ to 20 MHz |
| CLK $=1.6 \mathrm{GHz} ;$ LVDS $=100 \mathrm{MHz}$; Divider $=16$ |  | 280 |  | fs rms | Calculated from SNR of ADC method; DCC not used for even divides |
| CMOS OUTPUT ADDITIVE TIME JITTER |  |  |  |  | Distribution section only; does not include PLL; uses rising edge of clock signal |
| CLK $=1.6 \mathrm{GHz} ; \mathrm{CMOS}=100 \mathrm{MHz} ;$ Divider $=16$ |  | 365 |  | fs rms | Calculated from SNR of ADC method; DCC not used for even divides |

## CLOCK OUTPUT ADDITIVE TIME JITTER (VCO DIVIDER USED)

Table 8.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| LVPECL OUTPUT ADDITIVE TIME JITTER $\begin{gathered} \text { CLK }=2.4 \mathrm{GHz} ; \text { VCO Div }=2 ; \text { LVPECL }=100 \mathrm{MHz} ; \\ \text { Divider }=12 ; \text { Duty-Cycle Correction }=\text { Off } \end{gathered}$ |  | 210 |  | fs rms | Distribution section only; does not include PLL; uses rising edge of clock signal <br> Calculated from SNR of ADC method |
| LVDS OUTPUT ADDITIVE TIME JITTER $\begin{gathered} \text { CLK }=2.4 \mathrm{GHz} ; \text { VCO Div }=2 ; \text { LVDS }=100 \mathrm{MHz} ; \\ \text { Divider = 12; Duty-Cycle Correction = Off } \end{gathered}$ |  | 285 |  | fs rms | Distribution section only; does not include PLL; uses rising edge of clock signal Calculated from SNR of ADC method |
| CMOS OUTPUT ADDITIVE TIME JITTER $\begin{gathered} \text { CLK }=2.4 \mathrm{GHz} ; \text { VCO Div }=2 ; \text { CMOS }=100 \mathrm{MHz} ; \\ \text { Divider }=12 ; \text { Duty-Cycle Correction }=\text { Off } \end{gathered}$ |  | 350 |  | fs rms | Distribution section only; does not include PLL; uses rising edge of clock signal Calculated from SNR of ADC method |

## DELAY BLOCK ADDITIVE TIME JITTER

Table 9.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DELAY BLOCK ADDITIVE TIME JITTER ${ }^{1}$ |  |  |  |  | Incremental additive jitter |
| 100 MHz Output |  |  |  |  |  |
| Delay ( $1600 \mu \mathrm{~A}, 0 \times 1 \mathrm{C})$ Fine Adjust 000000b |  | 0.54 |  | ps rms |  |
| Delay ( $1600 \mu \mathrm{~A}, 0 \times 1 \mathrm{C})$ Fine Adjust 101111b |  | 0.60 |  | ps rms |  |
| Delay ( $800 \mu \mathrm{~A}, 0 \times 1 \mathrm{C}$ ) Fine Adjust 000000b |  | 0.65 |  | ps rms |  |
| Delay ( $800 \mu \mathrm{~A}, 0 \times 1 \mathrm{C}$ ) Fine Adjust 101111b |  | 0.85 |  | ps rms |  |
| Delay ( $800 \mu \mathrm{~A}, 0 \times 4 \mathrm{C}$ ) Fine Adjust 000000b |  | 0.79 |  | ps rms |  |
| Delay ( $800 \mu \mathrm{~A}, 0 \times 4 \mathrm{C}$ ) Fine Adjust 101111b |  | 1.2 |  | ps rms |  |
| Delay ( $400 \mu \mathrm{~A}, 0 \times 4 \mathrm{C}$ ) Fine Adjust 000000b |  | 1.2 |  | ps rms |  |
| Delay ( $400 \mu \mathrm{~A}, 0 \times 4 \mathrm{C}$ ) Fine Adjust 101111b |  | 2.0 |  | ps rms |  |
| Delay ( $200 \mu \mathrm{~A}, 0 \times 1 \mathrm{C}$ ) Fine Adjust 000000b |  | 1.3 |  | ps rms |  |
| Delay ( $200 \mu \mathrm{~A}, 0 \times 1 \mathrm{C}$ ) Fine Adjust 101111b |  | 2.5 |  | ps rms |  |
| Delay ( $200 \mu \mathrm{~A}, 0 \times 4 \mathrm{C})$ Fine Adjust 000000b |  | 1.9 |  | ps rms |  |
| Delay ( $200 \mu$ A, 0x4C) Fine Adjust 101111b |  | 3.8 |  | ps rms |  |

${ }^{1}$ This value is incremental; that is, it is in addition to the jitter of the LVDS or CMOS output without the delay. To estimate the total jitter, the LVDS or CMOS output jitter should be added to this value using the root sum of the squares (RSS) method.

## AD9516-5

## SERIAL CONTROL PORT

Table 10.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\overline{\overline{C S}}$ (INPUT) |  |  |  |  | $\overline{\mathrm{CS}}$ has an internal $30 \mathrm{k} \Omega$ pull-up resistor |
| Input Logic 1 Voltage | 2.0 |  |  | V |  |
| Input Logic 0 Voltage |  |  | 0.8 | V |  |
| Input Logic 1 Current |  |  | 3 | $\mu \mathrm{A}$ |  |
| Input Logic 0 Current |  | 110 |  | $\mu \mathrm{A}$ |  |
| Input Capacitance |  | 2 |  | pF |  |
| SCLK (INPUT) |  |  |  |  | SCLK has an internal $30 \mathrm{k} \Omega$ pull-down resistor |
| Input Logic 1 Voltage | 2.0 |  |  | V |  |
| Input Logic 0 Voltage |  |  | 0.8 | V |  |
| Input Logic 1 Current |  | 110 |  | $\mu \mathrm{A}$ |  |
| Input Logic 0 Current |  |  | 1 | $\mu \mathrm{A}$ |  |
| Input Capacitance |  | 2 |  | pF |  |
| SDIO (WHEN INPUT) |  |  |  |  |  |
| Input Logic 1 Voltage | 2.0 |  |  | V |  |
| Input Logic 0 Voltage |  |  | 0.8 | V |  |

## LD, STATUS, AND REFMON PINS

Table 12.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| OUTPUT CHARACTERISTICS |  |  |  |  | When selected as a digital output (CMOS); there are other modes in which these pins are not CMOS digital outputs; see Table 49: Register 0x017, Register 0x01A, and Register 0x01B |
| Output Voltage High, $\mathrm{V}_{\text {OH }}$ | 2.7 |  |  | V |  |
| Output Voltage Low, Vol |  |  | 0.4 | V |  |
| MAXIMUM TOGGLE RATE |  | 100 |  | MHz | Applies when mux is set to any divider or counter output or PFD up/down pulse; also applies in analog lock detect mode; usually debug mode only; beware that spurs may couple to output when any of these pins are toggling |
| ANALOG LOCK DETECT |  |  |  |  |  |
| Capacitance |  | 3 |  | pF | On-chip capacitance; used to calculate RC time constant for analog lock detect readback; use a pull-up resistor |
| REF1, REF2, AND CLK FREQUENCY STATUS MONITOR |  |  |  |  |  |
| Normal Range | 1.02 |  |  |  | Frequency above which the monitor always indicates the presence of the reference |
| Extended Range | 8 |  |  | kHz | Frequency above which the monitor always indicates the presence of the reference |
| LD PIN COMPARATOR |  |  |  |  |  |
| Trip Point |  | 1.6 |  | V |  |
| Hysteresis |  | 260 |  | mV |  |

## POWER DISSIPATION

Table 13.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| POWER DISSIPATION, CHIP |  |  |  |  | The values in this table include all power supplies, unless otherwise noted; the power deltas for individual drivers are at dc; see Figure 7, Figure 8, and Figure 9 for power dissipation vs. output frequency |
| Power-On Default |  | 1.0 | 1.2 | W | No clock; no programming; default register values; does not include power dissipated in external resistors; this configuration has the following blocks already powered up: VCO divider, six channel dividers, three LVPECL drivers, and two LVDS drivers |
| Full Operation; CMOS Outputs at 225 MHz |  | 1.5 | 2.1 | W | $\mathrm{f}_{\mathrm{CLK}}=2.25 \mathrm{GHz}$; VCO divider $=2$; all channel dividers on; six LVPECL outputs at 562.5 MHz ; eight CMOS outputs ( 10 pF load) at 225 MHz ; all four fine delay blocks on, maximum current; does not include power dissipated in external resistors |
| Full Operation; LVDS Outputs at 225 MHz |  | 1.5 | 2.1 | W | $\mathrm{f}_{\mathrm{CLK}}=2.25 \mathrm{GHz}$; VCO divider $=2$; all channel dividers on; six LVPECL outputs at 562.5 MHz ; four LVDS outputs at 225 MHz ; all four fine delay blocks on: maximum current; does not include power dissipated in external resistors |
| $\overline{\text { PD Power-Down }}$ |  | 75 | 185 | mW | $\overline{\mathrm{PD}}$ pin pulled low; does not include power dissipated in terminations |
| $\overline{\text { PD }}$ Power-Down, Maximum Sleep |  | 31 |  | mW | $\overline{\mathrm{PD}}$ pin pulled low; PLL power-down, Register 0x010[1:0] = 01b; SYNC power-down, Register 0x230[2] = 1b; REF for distribution power-down, Register 0x230[1] = 1b |
| VCP Supply |  | 4 | 4.8 | mW | PLL operating; typical closed-loop configuration (this number is included in all other power measurements) |
| AD9516 Core |  | 220 |  | mW | AD9516 core only, all drivers off, PLL off, VCO divider off, and delay blocks off; the power consumption of the configuration of the user can be derived from this number and the power deltas that follow |

## AD9516-5

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| POWER DELTAS, INDIVIDUAL FUNCTIONS |  |  |  |  | Power delta when a function is enabled/disabled |
| VCO Divider |  | 30 |  | mW | VCO divider bypassed |
| REFIN (Differential) |  | 20 |  | mW | All references off to differential reference enabled |
| REF1, REF2 (Single-Ended) |  | 4 |  | mW | All references off to REF1 or REF2 enabled; differential reference not enabled |
| PLL |  | 75 |  | mW | PLL off to PLL on, normal operation; no reference enabled |
| Channel Divider |  | 30 |  | mW | Divider bypassed to divide-by-2 to divide-by-32 |
| LVPECL Channel (Divider Plus Output Driver) |  | 120 |  | mW | No LVPECL output on to one LVPECL output on (that is, enabling OUT0 with OUT1 off; Divider 0 enabled), independent of frequency |
| LVPECL Driver |  | 90 |  | mW | Second LVPECL output turned on, same channel (that is, enabling OUT0 with OUT1 already on) |
| LVDS Channel (Divider Plus Output Driver) |  | 140 |  | mW | No LVDS output on to one LVDS output on (that is, enabling OUT8 with OUT9 off with Divider 4.1 enabled and Divider 4.2 bypassed); see Figure 8 for dependence on output frequency |
| LVDS Driver |  | 50 |  | mW | Second LVDS output turned on, same channel (that is, enabling OUT8 with OUT9 already on) |
| CMOS Channel (Divider Plus Output Driver) |  | 100 |  | mW | Static; no CMOS output on to one CMOS output on (that is, enabling OUT8A starting with OUT8 and OUT9 off); see Figure 9 for variation over output frequency |
| CMOS Driver (Second in Pair) |  | 0 |  | mW | Static; second CMOS output, same pair, turned on (that is, enabling OUT8A with OUT8B already on) |
| CMOS Driver (First in Second Pair) |  | 30 |  | mW | Static; first output, second pair, turned on (that is, enabling OUT9A with OUT9B off and OUT8A and OUT8B already on) |
| Fine Delay Block |  | 50 |  | mW | Delay block off to delay block enabled; maximum current setting |

## TIMING CHARACTERISTICS

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 6. Pin Configuration
Table 17. Pin Function Descriptions

| Pin No. | Input/ Output | Pin Type | Mnemonic | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & 1,11,12,30, \\ & 31,32,38, \\ & 49,50,51, \\ & 57,60,61 \end{aligned}$ | I | Power | VS | 3.3V Power Pins. |
| 2 | 0 | 3.3 V CMOS | REFMON | Reference Monitor (Output). This pin has multiple selectable outputs; see Table 49, Register 0x01B. |
| 3 | 0 | 3.3 V CMOS | LD | Lock Detect (Output). This pin has multiple selectable outputs; see Table 49, Register 0x01A. |
| 4 | 1 | Power | VCP | Power Supply for Charge Pump (CP); VS $\leq \mathrm{VCP} \leq 5.25 \mathrm{~V}$. |
| 5 | 0 | Loop filter | CP | Charge Pump (Output). This pin connects to an external loop filter. This pin can be left unconnected if the PLL is not used. |
| 6 | 0 | 3.3 V CMOS | STATUS | Status (Output). This pin has multiple selectable outputs; see Table 49, Register 0x017. |
| 7 | 1 | 3.3 V CMOS | REF_SEL | Reference Select. Selects REF1 (low) or REF2 (high). This pin has an internal $30 \mathrm{k} \Omega$ pull-down resistor. |
| 8 | I | 3.3 V CMOS | $\overline{\text { SYNC }}$ | Manual Synchronizations and Manual Holdover. This pin initiates a manual synchronization and is also used for manual holdover. Active low. This pin has an internal $30 \mathrm{k} \Omega$ pull-up resistor. |
| $\begin{aligned} & 9,10,15,18 \\ & 19,20 \end{aligned}$ | N/A | NC | NC | No Connection. These pins can be left floating. |
| 13 | 1 | Differential clock input | CLK | Along with $\overline{\mathrm{CLK}}$, this is the differential input for the clock distribution section. |
| 14 | 1 | Differential clock input | $\overline{\text { CLK }}$ | Along with CLK, this is the differential input for the clock distribution section. If a single-ended input is connected to the CLK pin, connect a $0.1 \mu \mathrm{~F}$ bypass capacitor from CLK to ground. |

| Pin No. | Input/ Output | Pin Type | Mnemonic | Description |
| :---: | :---: | :---: | :---: | :---: |
| 16 | I | 3.3 V CMOS | SCLK | Serial Control Port Data Clock Signal. |
| 17 | I | 3.3 V CMOS | $\overline{C S}$ | Serial Control Port Chip Select; Active Low. This pin has an internal $30 \mathrm{k} \Omega$ pull-up resistor. |
| 21 | 0 | 3.3 V CMOS | SDO | Serial Control Port Unidirectional Serial Data Output. |
| 22 | I/O | 3.3 V CMOS | SDIO | Serial Control Port Bidirectional Serial Data Input/Output. |
| 23 | 1 | 3.3 V CMOS | $\overline{\text { RESET }}$ | Chip Reset; Active Low. This pin has an internal $30 \mathrm{k} \Omega$ pull-up resistor. |
| 24 | 1 | 3.3 V CMOS | $\overline{\mathrm{PD}}$ | Chip Power-Down; Active Low. This pin has an internal $30 \mathrm{k} \Omega$ pull-up resistor. |
| 25 | 0 | LVPECL | OUT4 | LVPECL Output; One Side of a Differential LVPECL Output. |
| 26 | 0 | LVPECL | $\overline{\text { OUT4 }}$ | LVPECL Output; One Side of a Differential LVPECL Output. |
| 27,41, 54 | 1 | Power | VS_LVPECL | Extended Voltage 2.5 V to 3.3 V LVPECL Power Pins. |
| 28 | 0 | LVPECL | OUT5 | LVPECL Output; One Side of a Differential LVPECL Output. |
| 29 | O | LVPECL | $\overline{\text { OUT5 }}$ | LVPECL Output; One Side of a Differential LVPECL Output. |
| 33 | 0 | LVDS or CMOS | OUT8 (OUT8A) | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 34 | 0 | LVDS or CMOS | $\overline{\text { OUT8 ( }}$ (OUT8B) | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 35 | 0 | LVDS or CMOS | OUT9 (OUT9A) | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 36 | 0 | LVDS or CMOS | $\overline{\text { OUT9 ( }}$ (OUT9B) | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| $37,44,59,$ <br> EPAD | 1 | GND | GND | Ground Pins, Including External Paddle (EPAD). The external die paddle on the bottom of the package must be connected to ground for proper operation. |
| 39 | 0 | LVPECL | $\overline{\text { OUT3 }}$ | LVPECL Output; One Side of a Differential LVPECL Output. |
| 40 | 0 | LVPECL | OUT3 | LVPECL Output; One Side of a Differential LVPECL Output. |
| 42 | 0 | LVPECL | $\overline{\text { OUT2 }}$ | LVPECL Output; One Side of a Differential LVPECL Output. |
| 43 | 0 | LVPECL | OUT2 | LVPECL Output; One Side of a Differential LVPECL Output. |
| 45 | 0 | LVDS or CMOS | $\overline{\text { OUT7 (OUT7B) }}$ | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 46 | 0 | LVDS or CMOS | OUT7 (OUT7A) | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 47 | 0 | LVDS or CMOS | $\overline{\text { OUT6 (OUT6B) }}$ | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 48 | 0 | LVDS or CMOS | OUT6 (OUT6A) | LVDS/CMOS Output; One Side of a Differential LVDS Output, or a Single-Ended CMOS Output. |
| 52 | 0 | LVPECL | $\overline{\text { OUT1 }}$ | LVPECL Output; One Side of a Differential LVPECL Output. |
| 53 | 0 | LVPECL | OUT1 | LVPECL Output; One Side of a Differential LVPECL Output. |
| 55 | 0 | LVPECL | $\overline{\text { OUTO }}$ | LVPECL Output; One Side of a Differential LVPECL Output. |
| 56 | 0 | LVPECL | OUTO | LVPECL Output; One Side of a Differential LVPECL Output. |
| 58 | 0 | Current set resistor | RSET | A resistor connected to this pin sets internal bias currents. Nominal value $=4.12 \mathrm{k} \Omega$. |
| 62 | 0 | Current set resistor | CPRSET | A resistor connected to this pin sets the CP current range. Nominal value $=5.1 \mathrm{k} \Omega$. This resistor can be omitted if the PLL is not used. |
| 63 | 1 | Reference input | $\overline{\text { REFIN }}$ (REF2) | Along with REFIN, this pin is the differential input for the PLL reference. Alternatively, this pin is a single-ended input for REF2. This pin can be left unconnected when the PLL is not used. |
| 64 | I | Reference input | REFIN (REF1) | Along with $\overline{\operatorname{REFIN}}$, this pin is the differential input for the PLL reference. Alternatively, this pin is a single-ended input for REF1. This pin can be left unconnected when the PLL is not used. |

## TERMINOLOGY

## Phase Jitter and Phase Noise

An ideal sine wave can be thought of as having a continuous and even progression of phase with time from $0^{\circ}$ to $360^{\circ}$ for each cycle. Actual signals, however, display a certain amount of variation from ideal phase progression over time. This phenomenon is called phase jitter. Although many causes can contribute to phase jitter, one major cause is random noise, which is characterized statistically as being Gaussian (normal) in distribution.

This phase jitter leads to a spreading out of the energy of the sine wave in the frequency domain, producing a continuous power spectrum. This power spectrum is usually reported as a series of values whose units are $\mathrm{dBc} / \mathrm{Hz}$ at a given offset in frequency from the sine wave (carrier). The value is a ratio (expressed in decibels, dB ) of the power contained within a 1 Hz bandwidth with respect to the power at the carrier frequency. For each measurement, the offset from the carrier frequency is also given.
It is meaningful to integrate the total power contained within some interval of offset frequencies (for example, 10 kHz to 10 MHz ). This is called the integrated phase noise over that frequency offset interval and can be readily related to the time jitter due to the phase noise within that offset frequency interval.
Phase noise has a detrimental effect on the performance of ADCs, DACs, and RF mixers. It lowers the achievable dynamic range of the converters and mixers, although they are affected in somewhat different ways.

## Time Jitter

Phase noise is a frequency domain phenomenon. In the time domain, the same effect is exhibited as time jitter. When observing a sine wave, the time of successive zero crossings varies. In a square wave, the time jitter is a displacement of the edges from their ideal (regular) times of occurrence. In both cases, the variations in timing from the ideal are the time jitter. Because these variations are random in nature, the time jitter is specified in units of seconds root mean square (rms) or 1 sigma of the Gaussian distribution.

Time jitter that occurs on a sampling clock for a DAC or an ADC decreases the signal-to-noise ratio (SNR) and dynamic range of the converter. A sampling clock with the lowest possible jitter provides the highest performance from a given converter.

## Additive Phase Noise

Additive phase noise is the amount of phase noise that is attributable to the device or subsystem being measured. The phase noise of any external oscillators or clock sources is subtracted. This makes it possible to predict the degree to which the device impacts the total system phase noise when used in conjunction with the various oscillators and clock sources, each of which contributes its own phase noise to the total. In many cases, the phase noise of one element dominates the system phase noise. When there are multiple contributors to phase noise, the total is the square root of the sum of squares of the individual contributors.

## Additive Time Jitter

Additive time jitter is the amount of time jitter that is attributable to the device or subsystem being measured. The time jitter of any external oscillators or clock sources is subtracted. This makes it possible to predict the degree to which the device impacts the total system time jitter when used in conjunction with the various oscillators and clock sources, each of which contributes its own time jitter to the total. In many cases, the time jitter of the external oscillators and clock sources dominates the system time jitter.

## DETAILED BLOCK DIAGRAM

Figure 32. Detailed Block Diagram

## THEORY OF OPERATION

Figure 33. Clock Distribution or External VCO < 1600 MHz (Mode 1)

## OPERATIONAL CONFIGURATIONS

The AD9516 can be configured in several ways. These configurations must be set up by loading the control registers (see Table 47 and Table 48 through Table 57). Each section or function must be individually programmed by setting the appropriate bits in the corresponding control register or registers.

## Mode 1—Clock Distribution or External VCO < $\mathbf{1 6 0 0} \mathbf{~ M H z}$

Mode 1 bypasses the VCO divider. Mode 1 can be used only with an external clock source of $<1600 \mathrm{MHz}$, due to the maximum input frequency allowed at the channel dividers.

For clock distribution applications where the external clock is less than 1600 MHz , use the register settings shown in Table 18.

Table 18. Settings for Clock Distribution $<\mathbf{1 6 0 0} \mathbf{~ M H z}$

| Register | Description |
| :--- | :--- |
| $0 \times 010[1: 0]=01 \mathrm{~b}$ | PLL asynchronous power-down (PLL off) |
| $0 \times 1 \mathrm{E} 1[0]=1 \mathrm{~b}$ | Bypass the VCO divider as source for <br> distribution section |

When using the internal PLL with an external VCO of $<1600 \mathrm{MHz}$, the PLL must be turned on.

## AD9516-5

Table 19. Settings for Using an Internal PLL with an External VCO $<\mathbf{1 6 0 0}$ MHz

| Register | Description |
| :--- | :--- |
| $0 \times 1 \mathrm{E1}[0]=1 \mathrm{~b}$ | Bypass the VCO divider as source for <br> distribution section |
| $0 \times 010[1: 0]=00 \mathrm{~b}$ | PLL normal operation (PLL on) along with other <br> appropriate PLL settings in Register 0x010 to <br> Register 0x01E |

An external VCO/VCXO requires an external loop filter that must be connected between CP and the tuning pin of the VCO/ VCXO. This loop filter determines the loop bandwidth and stability of the PLL. Ensure that the correct PFD polarity is selected for the VCO/VCXO that is being used.

Table 20. Setting the PFD Polarity

| Register | Description |
| :--- | :--- |
| $0 \times 010[7]=0 \mathrm{~b}$ | PFD polarity positive (higher control voltage <br> produces higher frequency) |
| $0 \times 010[7]=1 \mathrm{~b}$ | PFD polarity negative (higher control voltage <br> produces lower frequency) |

After the appropriate register values are programmed, Register 0x232 must be set to 0x01 for the values to take effect.

## Mode 2 (High Frequency Clock Distribution)-CLK or External VCO > 1600 MHz

The AD9516 power-up default configuration has the PLL powered off and the routing of the input set so that the CLK/ $\overline{\mathrm{CLK}}$ input is connected to the distribution section through the VCO divider (divide-by-2/divide-by-3/divide-by-4/divide-by-5/ divide-by-6). This is a distribution-only mode that allows for an external input of up to 2400 MHz (see Table 4). For divide ratios other than 1 , the maximum frequency that can be applied to the channel dividers is 1600 MHz . Therefore, the VCO divider must be used to divide down input frequencies that are greater than 1600 MHz before the channel dividers can be used for further division. This input routing can also be used for lower input frequencies, but the minimum divide is 2 before the channel dividers.
When the PLL is enabled, this routing also allows the use of the PLL with an external VCO or VCXO with a frequency of $<2400 \mathrm{MHz}$. In this configuration, the external VCO/VCXO feeds directly into the prescaler.

The register settings shown in Table 21 are the default values of these registers at power-up or after a reset operation. If the contents of the registers are altered by prior programming after power-up or reset, these registers can also be set intentionally to these values.

Table 21. Default Settings of Some PLL Registers

| Register | Description |
| :--- | :--- |
| $0 \times 010[1: 0]=01 \mathrm{~b}$ | PLL asynchronous power-down (PLL off). |
| $0 \times 1 \mathrm{EO}[2: 0]=010 \mathrm{~b}$ | Set VCO divider $=4$. |
| $0 \times 1 \mathrm{E} 1[0]=0 \mathrm{~b}$ | Use the VCO divider. |

When using the internal PLL with an external VCO, the PLL must be turned on.

Table 22. Settings When Using an External VCO

| Register | Description |
| :--- | :--- |
| $0 \times 010[1: 0]=00 \mathrm{~b}$ | PLL normal operation (PLL on). |
| $0 \times 010$ to 0x01D | PLL settings. Select and enable a reference <br> input. Set R, N (P, A, B), PFD polarity, and Icp <br> according to the intended loop configuration. |
| $0 \times 1 \mathrm{E}[1]=0 \mathrm{~b}$ | CLK selected as the source. |

An external VCO requires an external loop filter that must be connected between CP and the tuning pin of the VCO. This loop filter determines the loop bandwidth and stability of the PLL. Ensure that the correct PFD polarity is selected for the VCO that is being used.

Table 23. Setting the PFD Polarity

| Register | Description |
| :--- | :--- |
| $0 \times 010[7]=0 \mathrm{~b}$ | PFD polarity positive (higher control <br> voltage produces higher frequency). |
| $0 \times 010[7]=1 \mathrm{~b}$ | PFD polarity negative (higher control <br> voltage produces lower frequency). |

After the appropriate register values are programmed, Register 0x232 must be set to $0 \times 01$ for the values to take effect.

Figure 34. High Frequency Clock Distribution—CLK or External VCO > 1600 MHz (Mode 2)

## AD9516-5

## Phase-Locked Loop (PLL)

Figure 35. PLL Functional Blocks

The AD9516 includes on-chip PLL blocks that can be used with an external VCO or VCXO to create a complete phase-locked loop. The PLL requires an external loop filter, which usually consists of a small number of capacitors and resistors. The configuration and components of the loop filter help to establish the loop bandwidth and stability of the PLL.
The AD9516 PLL is useful for generating clock frequencies from a supplied reference frequency. This includes conversion of reference frequencies to much higher frequencies for subsequent division and distribution. In addition, the PLL can be exploited to clean up jitter and phase noise on a noisy reference. The exact choices of PLL parameters and loop dynamics are very application specific. The flexibility and depth of the PLL allow the part to be tailored to function in many different applications and signal environments.

## Configuration of the PLL

Configuration of the PLL is accomplished by programming the various settings for the R divider, N divider, PFD polarity, and charge pump current. The combination of these settings determines the PLL loop bandwidth. These are managed through programmable register settings (see Table 47 and Table 49) and by the design of the external loop filter. Successful PLL operation and satisfactory PLL loop performance are highly dependent upon proper configuration of the PLL settings.
The design of the external loop filter is crucial to the proper operation of the PLL. A thorough knowledge of PLL theory and design is helpful.
ADIsimCLK ${ }^{m \mathrm{~m}}$ (V1.2 or later) is a free program that can help with the design and exploration of the capabilities and features of the AD9516, including the design of the PLL loop filter. It is available at www.analog.com/clocks.

## Phase Frequency Detector (PFD)

The PFD takes inputs from the R counter and N counter and produces an output proportional to the phase and frequency difference between them. The PFD includes a programmable delay element that controls the width of the antibacklash pulse. This pulse ensures that there is no dead zone in the PFD transfer function and minimizes phase noise and reference spurs. The antibacklash pulse width is set by Register 0x017[1:0].

An important limit to keep in mind is the maximum frequency allowed into the PFD, which, in turn, determines the correct antibacklash pulse setting. The antibacklash pulse setting is specified in the phase/frequency detector (PFD) parameter of Table 2.

## Charge Pump (CP)

The charge pump is controlled by the PFD. The PFD monitors the phase and frequency relationship between its two inputs, and tells the CP to pump up or pump down to charge or discharge the integrating node (part of the loop filter). The integrated and filtered CP current is transformed into a voltage that drives the tuning node of the external VCO to move the VCO frequency up or down. The CP can be set (via Register 0x010[6:4]) for high impedance (allows holdover operation), for normal operation (attempts to lock the PLL loop), for pump-up, or for pump-down (test modes). The CP current is programmable in eight steps from (nominally) $600 \mu \mathrm{~A}$ to 4.8 mA .
The exact value of the CP current LSB is set by the CPRSET resistor, which is nominally $5.1 \mathrm{k} \Omega$. If the value of the resistor connected to the CP_RSET pin is doubled, the resulting charge pump current range becomes $300 \mu \mathrm{~A}$ to 2.4 mA .

## PLL External Loop Filter

An example of an external loop filter for a PLL is shown in Figure 36. A loop filter must be calculated for each desired PLL configuration. The values of the components depend on the VCO frequency, the Kvco, the PFD frequency, the charge pump current, the desired loop bandwidth, and the desired phase margin. The loop filter affects the phase noise, loop settling time, and loop stability. A basic knowledge of PLL theory is helpful for understanding loop filter design. ADIsimCLK can help with calculation of a loop filter according to the application requirements.

Figure 36. Example of External Loop Filter for PLL

## PLL Reference Inputs

The AD9516 features a flexible PLL reference input circuit that allows a fully differential input or two separate single-ended inputs. The input frequency range for the reference inputs is specified in Table 2. Both the differential and the single-ended inputs are self-biased, allowing for easy ac coupling of input signals.
The differential input and the single-ended inputs share two pins, REFIN (REF1) and REFIN (REF2). The desired reference input type is selected and controlled by Register 0x01C (see Table 47 and Table 49).
When the differential reference input is selected, the self-bias level of the two sides is offset slightly (see Table 2) to prevent chattering of the input buffer when the reference is slow or missing. The specification for this voltage level is found in Table 2. The input hysteresis increases the voltage swing required of the driver to overcome the offset. The differential reference input can be driven by either ac-coupled LVDS or ac-coupled LVPECL signals.
The single-ended inputs can be driven by either a dc-coupled CMOS level signal or an ac-coupled sine wave or square wave. Each single-ended input can be independently powered down
when not needed to increase isolation and reduce power. Either a differential or a single-ended reference must be specifically enabled. All PLL reference inputs are off by default.
The differential reference input is powered down whenever the PLL is powered down, or when the differential reference input is not selected. The single-ended buffers power down when the PLL is powered down and when their individual power-down registers are set. When the differential mode is selected, the single-ended inputs are powered down.

In differential mode, the reference input pins are internally selfbiased so that they can be ac-coupled via capacitors. It is possible to dc couple to these inputs. If the differential REFIN is driven by a single-ended signal, the unused side ( $\overline{\text { REFIN }}$ ) should be decoupled via a suitable capacitor to a quiet ground. Figure 37 shows the equivalent circuit of REFIN.

Figure 37. REFIN Equivalent Circuit

## Reference Switchover

The AD9516 supports dual single-ended CMOS inputs, as well as a single differential reference input. In dual single-ended reference mode, automatic and manual PLL reference clock switching between REF1 (Pin REFIN) and REF2 (Pin REFIN) is supported. This feature supports networking and other applications that require smooth switching of redundant references. When used in conjunction with the automatic holdover function, the AD9516 can achieve a worst-case reference input switchover with an output frequency disturbance as low as 10 ppm .
When using reference switchover, the single-ended reference inputs should be dc-coupled CMOS levels that are never allowed to go to high impedance. If the inputs are allowed to go to high impedance, noise may cause the buffer to chatter, causing false detection of the presence of a reference. Reference switchover can be performed manually or automatically. Manual switchover is performed either through Register 0x01C or by using the REF_SEL pin.
Manual switchover requires the presence of a clock on the reference input that is being switched to, or that the deglitching feature be disabled (Register 0x01C[7]). The reference switching logic fails if this condition is not met, and the PLL does not reacquire.

## AD9516-5

Automatic revertive switchover relies on the REFMON pin to indicate when REF1 disappears. By programming Register 0x01B = $0 \mathrm{xF7}$ and Register 0x01C $=0 \times 26$, the REFMON pin is programmed to be high when REF1 is invalid, which commands the switch to REF2. When REF1 is valid again, the REFMON pin goes low, and the part again locks to REF1. The STATUS pin can also be used for this function, and REF2 can be used as the preferred reference.

A switchover deglitch feature ensures that the PLL does not receive rising edges that are far out of alignment with the newly selected reference. Automatic nonrevertive switching is not supported.

## Reference Divider $\boldsymbol{R}$

The reference inputs are routed to the reference divider, R. $R$ (a 14-bit counter) can be set to any value from 0 to 16,383 by writing to Register 0x011 and Register 0x012. (Both $\mathrm{R}=0$ and $\mathrm{R}=1$ give divide-by-1.) The output of the R divider goes to one of the PFD inputs to be compared with the VCO frequency divided by the N divider. The frequency applied to the PFD must not exceed the maximum allowable frequency, which depends on the antibacklash pulse setting (see Table 2).

The R counter has its own reset. The R counter can be reset via the shared reset bit of the $\mathrm{R}, \mathrm{A}$, and B counters. It can also be reset by a $\overline{S Y N C}$ operation.

## VCXO/VCO Feedback Divider N—P, A, B

The N divider is a combination of a prescaler $(\mathrm{P})$ and two counters, $A$ and $B$. The total divider value is

$$
N=(P \times B)+A
$$

where $P$ can be 2, 4, 8, 16, or 32 .

## Prescaler

The prescaler of the AD9516 allows for two modes of operation: a fixed divide (FD) mode of 1,2 , or 3 , and a dual modulus (DM) mode where the prescaler divides by $P$ and $(P+1)\{2$ and 3,4 and 5,8 and 9,16 and 17 , or 32 and 33$\}$. The prescaler modes of operation are given in Table 49, Register 0x016[2:0]. Not all modes are available at all frequencies (see Table 2).

When operating the AD9516 in dual modulus mode, $\mathrm{P} /(\mathrm{P}+1)$, the equation used to relate the input reference frequency to the VCO output frequency is

$$
f_{V C O}=\left(f_{R E F} / R\right) \times(P \times B+A)=f_{R E F} \times N / R
$$

However, when operating the prescaler in FD Mode 1, FD Mode 2, or FD Mode 3, the A counter is not used ( $\mathrm{A}=0$ ) and the equation simplifies to

$$
f_{V C O}=\left(f_{\text {REF }} / R\right) \times(P \times B)=f_{\text {REF }} \times N / R
$$

When $\mathrm{A}=0$, the divide is a fixed divide of $\mathrm{P}=2,4,8,16$, or 32 , in which case, the previous equation also applies.
By using combinations of DM and FD modes, the AD9516 can achieve values of N all the way down to $\mathrm{N}=1$ and up to $\mathrm{N}=$ 26,2175 . Table 24 shows how a 10 MHz reference input can be locked to any integer multiple of N .

Table 24. Using a 10 MHz Reference to Generate Different VCO Frequencies

| $\mathrm{f}_{\text {REF }}(\mathrm{MHz})$ | R | P | A | B | N | fvco (MHz) | Mode | Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 | 1 | 1 | $\mathrm{X}^{1}$ | 1 | 1 | 10 | FD | $P=1, B=1$ ( $A$ and $B$ counters are bypassed). |
| 10 | 1 | 2 | $\mathrm{X}^{1}$ | 1 | 2 | 20 | FD | $P=2, B=1$ ( $A$ and $B$ counters are bypassed). |
| 10 | 1 | 1 | $\mathrm{X}^{1}$ | 3 | 3 | 30 | FD | A counter is bypassed. |
| 10 | 1 | 1 | $\mathrm{X}^{1}$ | 4 | 4 | 40 | FD | A counter is bypassed. |
| 10 | 1 | 1 | $\mathrm{X}^{1}$ | 5 | 5 | 50 | FD | A counter is bypassed. |
| 10 | 1 | 2 | $\mathrm{X}^{1}$ | 3 | 6 | 60 | FD | A counter is bypassed. |
| 10 | 1 | 2 | 0 | 3 | 6 | 60 | DM |  |
| 10 | 1 | 2 | 1 | 3 | 7 | 70 | DM | Maximum frequency into prescaler in $\mathrm{P}=2 / 3$ mode is 200 MHz . If $\mathrm{N}=7$ or $\mathrm{N}=11$ is desired for prescaler input frequency of 200 MHz to 300 MHz , use $\mathrm{P}=1$, and $\mathrm{N}=7$ or 11, respectively. |
| 10 | 1 | 2 | 2 | 3 | 8 | 80 | DM |  |
| 10 | 1 | 2 | 1 | 4 | 9 | 90 | DM |  |
| 10 | 1 | 8 | 6 | 18 | 150 | 1500 | DM |  |
| 10 | 1 | 8 | 7 | 18 | 151 | 1510 | DM |  |
| 10 | 1 | 16 | 7 | 9 | 151 | 1510 | DM |  |
| 10 | 10 | 32 | 6 | 47 | 1510 | 1510 | DM |  |
| 10 | 1 | 8 | 0 | 25 | 200 | 2000 | DM |  |
| 10 | 1 | 16 | 14 | 16 | 270 | 2700 | DM | $\begin{aligned} & P=8 \text { is not allowed }(2700 \div 8>300 \mathrm{MHz}) . \\ & \mathrm{P}=32 \text { is not allowed ( } \mathrm{A}>\mathrm{B} \text { not allowed). } \end{aligned}$ |
| 10 | 10 | 32 | 22 | 84 | 2710 | 2710 | DM | $\begin{aligned} & P=32, A=22, B=84 . \\ & P=16 \text { is also permitted. } \end{aligned}$ |

[^3]Note that the same value of N can be derived in different ways, as illustrated by the case of $\mathrm{N}=12$. The user can choose a fixed divide mode of $\mathrm{P}=2$ with $\mathrm{B}=6$; use the dual modulus mode of $2 / 3$ with $A=0, B=6$; or use the dual modulus mode of $4 / 5$ with $\mathrm{A}=0, \mathrm{~B}=3$.

## $A$ and $B$ Counters

The B counter must be $\geq 3$ or bypassed, and, unlike the R counter, $\mathrm{A}=0$ is actually zero. When the prescaler is in dual modulus mode, the A counter must be less than the B counter.

The maximum input frequency to the A or B counter is reflected in the maximum prescaler output frequency $(\sim 300 \mathrm{MHz})$ that is specified in Table 2. This is the prescaler input frequency (external VCO or CLK) divided by P. For example, a dual modulus mode of $\mathrm{P}=8 / 9$ mode is not allowed if the external VCO frequency is greater than 2400 MHz because the frequency going to the A or B counter is too high.
When the $B$ counter is bypassed ( $B=1$ ), the A counter should be set to 0 , and the overall resulting divide is equal to the prescaler setting, $P$. The possible divide ratios in this mode are $1,2,3,4,8$, 16 , and 32 . This mode is useful only when an external VCO/VCXO is used because the frequency range of the internal VCO requires an overall feedback divider that is greater than 32 .

Although manual reset is not normally required, the A and $B$ counters have their own reset bit. Alternatively, the A and B counters can be reset using the shared reset bit of the R, A, and B counters. Note that these reset bits are not self-clearing.

## R, A, and B Counters- $\overline{\text { SYNC }}$ Pin Reset

The $\mathrm{R}, \mathrm{A}$, and B counters can also be reset simultaneously via the $\overline{\mathrm{SYNC}} \mathrm{pin}$. This function is controlled by Register $0 \times 019[7: 6$ ] (see Table 49). The $\overline{\text { SYNC }}$ pin reset is disabled by default.

## $R$ and N Divider Delays

Both the R and N dividers feature a programmable delay cell. These delays can be enabled to allow adjustment of the phase relationship between the PLL reference clock and the VCO or CLK. Each delay is controlled by three bits. The total delay range is about 1 ns . See Register 0x019 in Table 49.

## LOCK DETECT

## Digital Lock Detect (DLD)

By selecting the proper output through the mux on each pin, the DLD function can be made available at the LD, STATUS, and REFMON pins. The DLD circuit indicates a lock when the time difference of the rising edges at the PFD inputs is less than a specified value (the lock threshold). The loss of a lock is indicated when the time difference exceeds a specified value (the unlock threshold). Note that the unlock threshold is wider than the lock threshold, which allows some phase error in excess of the lock window to occur without chattering on the lock indicator.
The lock detect window timing depends on three settings: the digital lock detect window bit (Register 0x018[4]), the antibacklash pulse width setting (Register 0x017[1:0]), see Table 2), and the
lock detect counter (Register 0x018[6:5]). A lock is not indicated until there is a programmable number of consecutive PFD cycles with a time difference that is less than the lock detect threshold. The lock detect circuit continues to indicate a lock until a time difference greater than the unlock threshold occurs on a single subsequent cycle. For the lock detect to work properly, the period of the PFD frequency must be greater than the unlock threshold. The number of consecutive PFD cycles required for lock is programmable (Register 0x018[6:5]).

## Analog Lock Detect (ALD)

The AD9516 provides an ALD function that can be selected for use at the LD pin. There are two versions of ALD, as follows:

- N-channel open-drain lock detect. This signal requires a pull-up resistor to the positive supply, VS. The output is normally high with short, low going pulses. Lock is indicated by the minimum duty cycle of the low going pulses.
- P-channel open-drain lock detect. This signal requires a pull-down resistor to GND. The output is normally low with short, high going pulses. Lock is indicated by the minimum duty cycle of the high going pulses.
The analog lock detect function requires an R-C filter to provide a logic level indicating lock/unlock.

Figure 38. Example of Analog Lock Detect Filter, Using N -Channel Open-Drain Driver

## Current Source Digital Lock Detect (CSDLD)

During the PLL locking sequence, it is normal for the DLD signal to toggle a number of times before remaining steady when the PLL is completely locked and stable. There may be applications where it is desirable to have DLD asserted only after the PLL is solidly locked. This is made possible by using the current source lock detect function. This function is set when it is selected as the output from the LD pin control (Register 0x01A[5:0]).
The current source lock detect provides a current of $110 \mu \mathrm{~A}$ when DLD is true, and it shorts to ground when DLD is false. If a capacitor is connected to the LD pin, it charges at a rate that is determined by the current source during the DLD true time but is discharged nearly instantly when DLD is false. By monitoring the voltage at the LD pin (top of the capacitor), it is possible to get a logic high level only after the DLD has been true for a sufficiently long time. Any momentary DLD false resets the charging. By selecting a properly sized capacitor, it is possible to delay a lock detect indication until the PLL is locked in a stable condition and the lock detect does not chatter.

## AD9516-5

The voltage on the capacitor can be sensed by an external comparator connected to the LD pin. However, there is an internal LD pin comparator that can be read at the REFMON pin control (Register 0x01B[4:0]) or the STATUS pin control (Register 0x017[7:2]) as an active high signal. It is also available as an active low signal (REFMON, Register 0x01B[4:0] and STATUS, Register 0x017[7:2]). The internal LD pin comparator trip point and hysteresis are listed in Table 12.

Figure 39. Current Source Lock Detect

## External VCXO/VCO Clock Input (CLK/CLK)

CLK is a differential input that can be used to drive the AD9516 clock distribution section. This input can receive up to 2.4 GHz . The pins are internally self-biased, and the input signal should be ac-coupled via capacitors.

Figure 40. CLK Equivalent Input Circuit
The CLK/CLK input can be used either as a distribution only input (with the PLL off), or as a feedback input for an external VCO/VCXO using the PLL. The CLK/CLK input can be used for frequencies up to 2.4 GHz .

## Holdover

The AD9516 PLL has a holdover function. Holdover is implemented by putting the charge pump into a high impedance state. This is useful when the PLL reference clock is lost. Holdover mode allows the VCO to maintain a relatively constant frequency even though there is no reference clock. Without this function, the charge pump is placed into a constant pump-up or pumpdown state, resulting in a large VCO frequency shift. Because the charge pump is placed in a high impedance state, any leakage that occurs at the charge pump output or the VCO tuning node causes a drift of the VCO frequency. This can be mitigated by using a loop filter that contains a large capacitive component because this drift is limited by the current leakage induced slew rate ( $\mathrm{I}_{\text {LEAK }} / \mathrm{C}$ ) of the VCO control voltage. For most applications, the frequency is sufficient for 3 sec to 5 sec .
Both a manual holdover mode, using the $\overline{\text { SYNC }}$ pin, and an automatic holdover mode are provided. To use either function, the holdover function must be enabled (Register 0x01D[0] and Register 0x01D[2]).

## Manual Holdover Mode

A manual holdover mode can be enabled that allows the user to place the charge pump into a high impedance state when the $\overline{\text { SYNC }}$ pin is asserted low. This operation is edge sensitive, not level sensitive. The charge pump enters a high impedance state immediately. To take the charge pump out of a high impedance state, take the SYNC pin high. The charge pump then leaves the high impedance state synchronously with the next PFD rising edge from the reference clock. This prevents extraneous charge pump events from occurring during the time between SYNC going high and the next PFD event. This also means that the charge pump stays in a high impedance state as long as there is no reference clock present.
The B counter (in the N divider) is reset synchronously with the charge pump leaving the high impedance state on the reference path PFD event. This helps align the edges out of the R and N dividers for faster settling of the PLL. Because the prescaler is not reset, this feature works best when the $B$ and $R$ numbers are close because this results in a smaller phase difference for the loop to settle out.

When using this mode, set the channel dividers to ignore the $\overline{S Y N C}_{\text {pin (at least after an initial } \overline{\text { SYNC }} \text { event). If the dividers are }}$ not set to ignore the $\overline{\text { SYNC }}$ pin, the distribution outputs turn off each time SYNC is taken low to put the part into holdover.

## Automatic/Internal Holdover Mode

When enabled, this function automatically puts the charge pump into a high impedance state when the loop loses lock. The assumption is that the only reason that the loop loses lock is due to the PLL losing the reference clock; therefore, the holdover function puts the charge pump into a high impedance state to maintain the VCO frequency as close as possible to the original frequency before the reference clock disappears.
See Figure 41 for a flowchart of the internal/automatic holdover function operation.

The holdover function senses the logic level of the LD pin as a condition to enter holdover. The signal at LD can be from the DLD, ALD, or current source LD (CSDLD) mode. It is possible to disable the LD comparator (Register 0x01D[3]), which causes the holdover function to always sense LD as high. If DLD is used, it is possible for the DLD signal to chatter somewhat while the PLL is reacquiring lock. The holdover function may retrigger, thereby preventing the holdover mode from ever terminating. Use of the current source lock detect mode is recommended to avoid this situation (see the Current Source Digital Lock Detect section).

When in holdover mode, the charge pump stays in a high impedance state as long as there is no reference clock present.
As in the external holdover mode, the B counter (in the N divider) is reset synchronously with the charge pump leaving the high impedance state on the reference path PFD event. This helps to align the edges out of the R and N dividers for faster settling of the PLL and reduce frequency errors during settling. Because the prescaler is not reset, this feature works best when the $B$ and $R$ numbers are close because this results in a smaller phase difference for the loop to settle out.

After leaving holdover, the loop then reacquires lock, and the LD pin must charge (if Register 0x01D[3] = 1) before it can re-enter holdover (CP high impedance).
The holdover function always responds to the state of the currently selected reference (Register 0x01C). If the loop loses lock during a reference switchover (see the Reference Switchover section), holdover is triggered briefly until the next reference clock edge at the PFD.

Figure 41. Flowchart of Automatic/Internal Holdover Mode

## AD9516-5

The following registers affect the internal/automatic holdover function:

- Register 0x018[6:5], lock detect counter. These bits change how many PFD cycles with edges inside the lock detect window are required for the DLD indicator to indicate lock. This impacts the time required before the LD pin can begin to charge, as well as the delay from the end of a holdover event until the holdover function can be reengaged.
- Register 0x018[3], disable digital lock detect. This bit must be set to 0 b to enable the DLD circuit. Internal/automatic holdover does not operate correctly without the DLD function enabled.
- Register 0x01A[5:0], lock detect pin output select. Set this to 000100 b to put it in the current source lock detect mode if using the LD pin comparator. Load the LD pin with a capacitor of an appropriate value.
- Register 0x01D[3], LD pin comparator enable. $1 \mathrm{~b}=$ enable; $0 \mathrm{~b}=$ disable. When disabled, the holdover function always senses the LD pin as high.
- Register 0x01D[1], external holdover control.
- Register 0x01D[0] and Register 0x01D[2], holdover enable. If holdover is disabled, both external and automatic/internal holdover are disabled.

For example, to use automatic holdover with the following:

- Digital lock detect: five PFD cycles, high range window
- Automatic holdover using the LD pin comparator

Set the following registers (in addition to the normal PLL registers):

- Register $0 \times 018[6: 5]=00 b$; lock detect counter $=$ five cycles.
- Register $0 \times 018[4]=0 \mathrm{~b}$; lock detect window $=$ high range.
- Register 0x018[3] = 0b; DLD normal operation.
- Register 0x01A[5:0] = 000100b; current source lock detect mode.
- Register 0x01B[7:0] = 0xF7; set REFMON pin to status of REF1 (active low).
- Register 0x01C[2:1] = 11b; enable REF1 and REF2 input buffers.
- Register 0x01D[3] = 1b; enable LD pin comparator.
- Register 0x01D[2] = 1b; enable holdover function.
- Register 0x01D[1] = 0b; use internal/automatic holdover mode.
- Register 0x01D[0] = 1b; enable holdover function (complete VCO calibration before enabling this bit).
- Register $0 \times 232=0 \times 01$; update all registers.

And, finally,

- Connect REFMON pin to REFSEL pin.

## Frequency Status Monitors

The AD9516 contains three frequency status monitors that are used to indicate if the PLL reference (or references, in the case of single-ended mode) and the VCO have fallen below a threshold frequency. Figure 42 is a diagram that shows their location in the PLL.
The PLL reference frequency monitors have two threshold frequencies: normal and extended (see Table 12). The reference frequency monitor thresholds are selected in Register 0x01B[7:5]. The reference frequency monitor status can be found in Register 0x01F[3:1].

## CLOCK DISTRIBUTION

A clock channel consists of a pair (or double pair, in the case of CMOS) of outputs that share a common divider. A clock output consists of the drivers that connect to the output pins. The clock outputs have either LVPECL or LVDS/CMOS signal levels at the pins.
The AD9516 has five clock channels: three channels are LVPECL (six outputs); two channels are LVDS/CMOS (up to four LVDS outputs, or up to eight CMOS outputs).

Each channel has its own programmable divider that divides the clock frequency that is applied to its input. The LVPECL channel dividers can divide by any integer from 2 to 32 , or the divider can be bypassed to achieve a divide-by-1. Each LVDS/CMOS channel divider contains two of these divider blocks in a cascaded configuration. The total division of the channel is the product of the divide value of the cascaded dividers. This allows divide values of ( 1 to 32 ) $\times(1$ to 32 ), or up to 1024 (note that this is not all values from 1 to 1024 but only the set of numbers that are the product of the two dividers).

The VCO divider can be set to divide by $2,3,4,5$, or 6 and must be used if the external clock signal connected to the CLK input is greater than 1600 MHz .
The channel dividers allow for a selection of various duty cycles, depending on the currently set division. That is, for any specific division, D , the output of the divider can be set to high for $\mathrm{N}+1$ input clock cycles and low for $\mathrm{M}+1$ input clock cycles (where $\mathrm{D}=\mathrm{N}+\mathrm{M}+2$ ). For example, a divide-by- 5 can be high for one divider input cycle and low for four cycles, or a divide-by- 5 can be high for three divider input cycles and low for two cycles. Other combinations are also possible.
The channel dividers include a duty-cycle correction function that can be disabled. In contrast to the selectable duty cycle just described, this function can correct a non-50\% duty cycle caused by an odd division. However, this requires that the division be set by $\mathrm{M}=\mathrm{N}+1$.
In addition, the channel dividers allow a coarse phase offset or delay to be set. Depending on the division selected, the output can be delayed by up to 31 input clock cycles. The divider outputs can also be set to start high or start low.

## Operating Modes

There are two clock distribution operating modes. These operating modes are shown in Table 25.

It is not necessary to use the VCO divider if the CLK frequency is less than the maximum channel divider input frequency ( 1600 MHz ); otherwise, the VCO divider must be used to reduce the frequency going to the channel dividers.

Table 25. Clock Distribution Operating Modes

| Mode | 0x1E1[0] | VCO Divider |
| :--- | :--- | :--- |
| 2 | 0 | Used |
| 1 | 1 | Not used |

## CLK Direct to LVPECL Outputs

It is possible to connect the CLK directly to the LVPECL outputs, OUT0 to OUT5. However, the LVPECL outputs may not be able to provide full a voltage swing at the highest frequencies.
To connect the LVPECL outputs directly to the CLK input, the VCO divider must be selected as the source to the distribution section even if no channel uses it.

Table 26. Settings for Routing VCO Divider Input Directly to LVPECL Outputs

| Register Setting | Selection |
| :--- | :--- |
| $0 \times 1 \mathrm{E1}[0]=0 \mathrm{~b}$ | VCO divider selected |
| $0 \times 192[1]=1 \mathrm{~b}$ | Direct to OUT0, OUT1 outputs |
| $0 \times 195[1]=1 \mathrm{~b}$ | Direct to OUT2, OUT3 outputs |
| $0 \times 198[1]=1 \mathrm{~b}$ | Direct to OUT4, OUT5 outputs |

## Clock Frequency Division

The total frequency division is a combination of the VCO divider (when used) and the channel divider. When the VCO divider is used, the total division from the VCO or CLK to the output is the product of the VCO divider ( $2,3,4,5$, and 6 ) and the division of the channel divider. Table 27 and Table 28 indicate how the frequency division for a channel is set. For the LVPECL outputs, there is only one divider per channel. For the LVDS/ CMOS outputs, there are two dividers (X.1, X.2) cascaded per channel.

Table 27. Frequency Division for Divider 0 to Divider 2

| VCO <br> Divider <br> Setting | Channel <br> Divider <br> Setting | CLK Direct <br> to Output <br> Setting | Frequency <br> Division |
| :--- | :--- | :--- | :--- |
| 2 to 6 | Don't care | Enable | 1 |
| 2 to 6 | Bypass | Disable | $(2$ to 6) $\times(1)$ |
| 2 to 6 | 2 to 32 | Disable | $(2$ to $) \times(2$ to 32) |
| VCO Divider <br> Bypassed <br> VCO Divider <br> Bypassed Bypass | No | 1 |  |

Table 28. Frequency Division for Divider 3 and Divider 4

| Vco Divider <br> Setting | Channel Divider Setting |  | Resulting Frequency <br> Division |
| :--- | :--- | :--- | :--- |
|  | Xypass | X.2 | Bypass |
| 2 to 6 | 2 to $32 \times(1) \times(1)$ |  |  |
| 2 to 6 | 2 to 32 | Bypass | $(2$ to 6$) \times(2$ to 32$) \times(1)$ |
|  |  |  | $(2$ to 6$) \times(2$ to 32$) \times$ |
| Bypass | 1 | 1 | 1 |
| Bypass 32$)$ |  |  |  |
| Bypass | 2 to 32 | 1 | $(2$ to 32$) \times(1)$ |

The channel dividers feeding the LVPECL output drivers contain one 2-to-32 frequency divider. This divider provides for division by 2 to 32 . Division by 1 is accomplished by bypassing the divider. The dividers also provide for a programmable duty cycle, with optional duty-cycle correction when the divide ratio is odd.

## AD9516-5

A phase offset or delay in increments of the input clock cycle is selectable. The channel dividers operate with a signal at their inputs up to 1600 MHz . The features and settings of the dividers are selected by programming the appropriate setup and control registers (see Table 47 through Table 57).

## VCO Divider

The VCO divider provides frequency division between the external CLK input and the clock distribution channel dividers. The VCO divider can be set to divide by $2,3,4,5$, or 6 (see Table 55, Register 0x1E0[2:0]).

## Channel Dividers-LVPECL Outputs

Each pair of LVPECL outputs is driven by a channel divider. There are three channel dividers ( 0,1 , and 2 ) driving six LVPECL outputs (OUT0 to OUT5). Table 29 lists the register locations used for setting the division and other functions of these dividers. The division is set by the values of M and N . The divider can be bypassed (equivalent to divide-by-1, divider circuit is powered down) by setting the bypass bit. The duty-cycle correction can be enabled or disabled according to the setting of the DCCOFF bits.

Table 29. Setting $D_{x}$ for Divider 0, Divider 1, and Divider $2^{1}$

| Divider | Low Cycles | High Cycles | Bypass | DCCOFF |
| :--- | :--- | :--- | :--- | :--- |
| 0 | $0 \times 190[7: 4]$ | $0 \times 190[3: 0]$ | $0 \times 191[7]$ | $0 \times 192[0]$ |
| 1 | $0 \times 193[7: 4]$ | $0 \times 193[3: 0]$ | $0 \times 194[7]$ | $0 \times 195[0]$ |
| 2 | $0 \times 196[7: 4]$ | $0 \times 196[3: 0]$ | $0 \times 197[7]$ | $0 \times 198[0]$ |

${ }^{1}$ Note that the value stored in the register = \# of cycles minus 1. For example, 0x190[7:4] = 0001b equals two low cycles $(M=2)$ for Divider 0.

## Channel Frequency Division (0, 1, and 2)

For each channel (where the channel number is $\mathrm{x}: 0,1$, or 2 ), the frequency division, $\mathrm{D}_{\mathrm{x}}$, is set by the values of M and N (four bits each, representing Decimal 0 to Decimal 15), where

$$
\begin{aligned}
& \text { Number of Low Cycles }=M+1 \\
& \text { Number of High Cycles }=N+1
\end{aligned}
$$

The cycles are cycles of the clock signal currently routed to the input of the channel dividers (VCO divider out or CLK).
When a divider is bypassed, $\mathrm{D}_{\mathrm{x}}=1$.
Otherwise, $\mathrm{D}_{\mathrm{x}}=(\mathrm{N}+1)+(\mathrm{M}+1)=\mathrm{N}+\mathrm{M}+2$. This allows each channel divider to divide by any integer from 2 to 32 .
Duty Cycle and Duty-Cycle Correction (0, 1, and 2)
The duty cycle of the clock signal at the output of a channel is a result of some or all of the following conditions:

- What are the M and N values for the channel?
- Is the DCC enabled?
- Is the VCO divider used?
- What is the CLK input duty cycle?

The DCC function is enabled, by default, for each channel divider. However, the DCC function can be disabled individually for each channel divider by setting the DCCOFF bit for that channel.
Certain M and N values for a channel divider result in a non-50\% duty cycle. A non-50\% duty cycle can also result with an even division, if $\mathrm{M} \neq \mathrm{N}$. The duty-cycle correction function automatically corrects non-50\% duty cycles at the channel divider output to $50 \%$ duty cycle. Duty-cycle correction requires the following channel divider conditions:

- An even division must be set as $\mathrm{M}=\mathrm{N}$
- An odd division must be set as $\mathrm{M}=\mathrm{N}+1$

When not bypassed or corrected by the DCC function, the duty cycle of each channel divider output is the numerical value of $(\mathrm{N}+1) /(\mathrm{N}+\mathrm{M}+2)$, expressed as a percentage (\%).
Table 30 to Table 32 list the duty cycles at the output of the channel dividers for various configurations.

Table 30. Duty Cycle with VCO Divider, Input Duty Cycle Is 50\%

| VCO Divider | Dx | Output Duty Cycle |  |
| :---: | :---: | :---: | :---: |
|  | $\mathbf{N + M + 2}$ | DCCOFF = 1 | DCCOFF = 0 |
| Even | 1 (divider bypassed) | 50\% | 50\% |
| Odd $=3$ | 1 (divider bypassed) | $33.3 \%$ | 50\% |
| Odd $=5$ | 1 (divider bypassed) | 40\% | 50\% |
| Even, Odd | Even | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | 50\%, requires $\mathrm{M}=\mathrm{N}$ |
| Even, Odd | Odd | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $50 \%$, requires $\mathrm{M}=\mathrm{N}+1$ |

Table 31. Duty Cycle with VCO Divider, Input Duty Cycle Is X\%

| VCO Divider | $\mathrm{D}_{\mathrm{x}}$ | Output Duty Cycle |  |
| :---: | :---: | :---: | :---: |
|  | N+M+2 | DCCOFF = 1 | DCCOFF = 0 |
| Even | 1 (divider bypassed) | 50\% | 50\% |
| Odd $=3$ | 1 (divider bypassed) | 33.3\% | $(1+\mathrm{X} \%) / 3$ |
| Odd $=5$ | 1 (divider bypassed) | 40\% | $(2+X \%) / 5$ |
| Even | Even | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $\begin{aligned} & \text { 50\%, } \\ & \text { requires } M=N \end{aligned}$ |
|  | Odd | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $\begin{aligned} & 50 \% \text {, } \\ & \text { requires } \mathrm{M}=\mathrm{N}+1 \end{aligned}$ |
| Odd $=3$ | Even | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $\begin{aligned} & 50 \% \text {, } \\ & \text { requires } \mathrm{M}=\mathrm{N} \end{aligned}$ |
| Odd $=3$ | Odd | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $\begin{aligned} & (3 \mathrm{~N}+4+\mathrm{X} \%) /(6 \mathrm{~N}+9) \\ & \text { requires } \mathrm{M}=\mathrm{N}+1 \end{aligned}$ |
| Odd $=5$ | Even | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $\begin{aligned} & 50 \%, \\ & \text { requires } \mathrm{M}=\mathrm{N} \end{aligned}$ |
| Odd $=5$ | Odd | $\begin{aligned} & (N+1) / \\ & (N+M+2) \end{aligned}$ | $\begin{aligned} & (5 \mathrm{~N}+7+\mathrm{X} \%) /(10 \mathrm{~N}+15) \\ & \text { requires } \mathrm{M}=\mathrm{N}+1 \end{aligned}$ |

Table 32. Channel Divider Output Duty Cycle When the VCO Divider Is Not Used

| Input Clock Duty Cycle | $\frac{D_{x}}{N+M+2}$ | Output Duty Cycle |  |
| :---: | :---: | :---: | :---: |
|  |  | DCCOFF = 1 | DCCOFF = 0 |
| Any | Channel divider bypassed | 1 (divider bypassed) | Same as input duty cycle |
| Any | Even | $\begin{aligned} & (N+1) / \\ & (M+N+2) \end{aligned}$ | 50\%, requires $\mathrm{M}=\mathrm{N}$ |
| 50\% | Odd | $\begin{aligned} & (N+1) / \\ & (M+N+2) \end{aligned}$ | $50 \% \text {, requires }$ $M=N+1$ |
| X\% | Odd | $\begin{aligned} & (N+1) / \\ & (M+N+2) \end{aligned}$ | $\begin{aligned} & (\mathrm{N}+1+\mathrm{X} \%) /(2 \times \mathrm{N}+3) \\ & \text { requires } \mathrm{M}=\mathrm{N}+1 \end{aligned}$ |

If the CLK input is routed directly to the output, the duty cycle of the output is the same as the CLK input.

## Phase Offset or Coarse Time Delay (0, 1, and 2)

Each channel divider allows for a phase offset, or a coarse time delay, to be programmed by setting register bits (see Table 33). These settings determine the number of cycles (successive rising edges) of the channel divider input frequency by which to offset, or delay, the rising edge of the output of the divider. This delay is with respect to a nondelayed output (that is, with a phase offset of zero). The amount of the delay is set by five bits loaded into the phase offset (PO) register, plus the start high (SH) bit for each channel divider. When the start high bit is set, the delay is also affected by the number of low cycles (M) that are programmed for the divider.
The sync function must be used to make phase offsets effective (see the Synchronizing the Outputs-SYNC Function section).

Table 33. Setting Phase Offset and Division for Divider 0, Divider 1, and Divider $\mathbf{2}^{1}$

| Divider | Start <br> High (SH) | Phase <br> Offset (PO) | Low <br> Cycles (M) | High <br> Cycles (N) |
| :--- | :--- | :--- | :--- | :--- |
| 0 | $0 \times 191[4]$ | $0 \times 191[3: 0]$ | $0 \times 190[7: 4]$ | $0 \times 190[3: 0]$ |
| 1 | $0 \times 194[4]$ | $0 \times 194[3: 0]$ | $0 \times 193[7: 4]$ | $0 \times 193[3: 0]$ |
| 2 | $0 \times 197[4]$ | $0 \times 197[3: 0]$ | $0 \times 196[7: 4]$ | $0 \times 196[3: 0]$ |

${ }^{1}$ Note that the value stored in the register $=\#$ of cycles minus 1 . For example, Register 0x190[7:4] = 0001b equals two low cycles $(M=2)$ for Divider 0 .

## Let

$\Delta_{\mathrm{t}}=$ delay (in seconds).
$\Delta_{\mathrm{c}}=$ delay (in cycles of clock signal at input to $\mathrm{D}_{\mathrm{x}}$ ).
$\mathrm{T}_{\mathrm{X}}=$ period of the clock signal at the input of the divider, $\mathrm{D}_{\mathrm{X}}$ (in seconds).
$\Phi=$
$16 \times \mathrm{SH}[4]+8 \times \mathrm{PO}[3]+4 \times \mathrm{PO}[2]+2 \times \mathrm{PO}[1]+1 \times \mathrm{PO}[0]$
The channel divide-by is set as $\mathrm{N}=$ high cycles and $\mathrm{M}=$ low cycles.

Case 1
For $\Phi \leq 15$ :
$\Delta_{\mathrm{t}}=\Phi \times \mathrm{T}_{\mathrm{X}}$
$\Delta_{c}=\Delta_{t} / T_{\mathrm{X}}=\Phi$

## Case 2

For $\Phi \geq 16$ :
$\Delta_{\mathrm{t}}=(\Phi-16+\mathrm{M}+1) \times \mathrm{T}_{\mathrm{X}}$
$\Delta_{\mathrm{c}}=\Delta_{\mathrm{t}} / \mathrm{T}_{\mathrm{X}}$
By giving each divider a different phase offset, output-to-output delays can be set in increments of the channel divider input clock cycle. Figure 43 shows the results of setting such a coarse offset between outputs.

Figure 43. Effect of Coarse Phase Offset (or Delay)

## Channel Dividers—LVDS/CMOS Outputs

Channel Divider 3 and Channel Divider 4 each drive a pair of LVDS outputs, giving four LVDS outputs (OUT6 to OUT9). Alternatively, each of these LVDS differential outputs can be configured individually as a pair ( A and B ) of CMOS singleended outputs, providing for up to eight CMOS outputs. By default, the $B$ output of each pair is off but can be turned on as desired.

Channel Divider 3 and Channel Divider 4 each consist of two cascaded, 2 to 32, frequency dividers. The channel frequency division is $\mathrm{D}_{\mathrm{x} .1} \times \mathrm{D}_{\mathrm{x} .2}$, or up to 1024 . Divide-by- 1 is achieved by bypassing one or both of these dividers. Both of the dividers also have DCC enabled by default, but this function can be disabled, if desired, by setting the DCCOFF bit of the channel. A coarse phase offset or delay is also programmable (see the Phase Offset or Coarse Time Delay (Divider 3 and Divider 4) section). The channel dividers operate up to 1600 MHz . The features and settings of the dividers are selected by programming the appropriate setup and control registers (see Table 47 and Table 48 through Table 57).

Table 34. Setting Division ( $\mathrm{D}_{\mathrm{x}}$ ) for Divider 3 and Divider $4^{1}$

| Divider |  | $\mathbf{M}$ | $\mathbf{N}$ | Bypass | DCCOFF |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 3.1 | $0 \times 199[7: 4]$ | $0 \times 199[3: 0]$ | $0 \times 19 \mathrm{C}[4]$ | $0 \times 19 \mathrm{D}[0]$ |
|  | 3.2 | $0 \times 19 \mathrm{~B}[7: 4]$ | $0 \times 19 \mathrm{~B}[3: 0]$ | $0 \times 19 \mathrm{C}[5]$ | $0 \times 19 \mathrm{D}[0]$ |
| 4 | 4.1 | $0 \times 19 \mathrm{E}[7: 4]$ | $0 \times 19 \mathrm{E}[3: 0]$ | $0 \times 1 \mathrm{~A} 1[4]$ | $0 \times 1 \mathrm{~A} 2[0]$ |
|  | 4.2 | $0 \times 1 \mathrm{A0}[7: 4]$ | $0 \times 1 \mathrm{~A} 0[3: 0]$ | $0 \times 1 \mathrm{~A} 1[5]$ | $0 \times 1 \mathrm{~A} 2[0]$ |

[^4] Register 0x199[7:4] = 0001b equals two low cycles $(M=2)$ for Divider 3.1.

## AD9516-5

## Channel Frequency Division (Divider 3 and Divider 4)

The division for each channel divider is set by the bits in the registers for the individual dividers ( $\mathrm{X} . \mathrm{Y}=3.1,3.2,4.1$, and 4.2).

$$
\begin{aligned}
& \text { Number of Low Cycles }=M_{X . Y}+1 \\
& \text { Number of High Cycles }=N_{X . Y}+1
\end{aligned}
$$

When both X .1 and X .2 are bypassed, $\mathrm{D}_{\mathrm{X}}=1 \times 1=1$.
When only X .2 is bypassed, $\mathrm{D}_{\mathrm{X}}=\left(\mathrm{N}_{\mathrm{X} .1}+\mathrm{M}_{\mathrm{X} .1}+2\right) \times 1$.
When both X. 1 and X. 2 are not bypassed, $D_{X}=\left(\mathrm{N}_{\mathrm{X} .1}+\mathrm{M}_{\mathrm{X} .1}+2\right) \times$ $\left(\mathrm{N}_{\mathrm{X} .2}+\mathrm{M}_{\mathrm{X} .2}+2\right)$.

By cascading the dividers, channel division up to 1024 can be obtained. However, not all integer value divisions from 1 to 1024 are obtainable; only the values that are the product of the separate divisions of the two dividers ( $\mathrm{D}_{\mathrm{x}, 1} \times \mathrm{D}_{\mathrm{x}, 2}$ ) can be realized.
If only one divider is needed when using Divider 3 and Divider 4, use the first one (X.1) and bypass the second one (X.2). Do not bypass X. 1 and use X.2.

## Duty Cycle and Duty-Cycle Correction (Divider 3 and Divider 4)

The same duty cycle and DCC considerations apply to Divider 3 and Divider 4 as to Divider 0, Divider 1, and Divider 2 (see the Duty Cycle and Duty-Cycle Correction ( 0,1 , and 2) section); however, with these channel dividers, the number of possible configurations is more complex.

Duty-cycle correction on Divider 3 and Divider 4 requires the following channel divider conditions:

- An even $\mathrm{D}_{\mathrm{X} . \mathrm{Y}}$ must be set as $\mathrm{M}_{\mathrm{X} . \mathrm{Y}}=\mathrm{N}_{\mathrm{X} . \mathrm{Y}}$ (low cycles $=$ high cycles).
- An odd $\mathrm{D}_{\mathrm{X}, \mathrm{Y}}$ must be set as $\mathrm{M}_{\mathrm{X}, \mathrm{Y}}=\mathrm{N}_{\mathrm{X}, \mathrm{Y}}+1$ (number of low cycles must be one greater than the number of high cycles).
- If only one divider is bypassed, it must be the second divider, X.2.
- If only one divider has an even divide-by, it must be the second divider, X.2.

The possibilities for the duty cycle of the output clock from Divider 3 and Divider 4 are shown in Table 35 through Table 39.

Table 35. Divider 3 and Divider 4 Duty Cycle; VCO Divider Used; Duty Cycle Correction Off (DCCOFF = 1)

| VCO Divider | $\mathrm{D}_{\mathrm{x}, 1}$ | D. 2 | Output Duty Cycle |
| :---: | :---: | :---: | :---: |
|  | $\mathrm{N}_{\mathrm{x}, 1}+\mathrm{M}_{\mathrm{x}, 1}+2$ | $\mathbf{N}_{\mathrm{x} .2}+\mathrm{M}_{\mathrm{x}, 2}+2$ |  |
| Even | Bypassed | Bypassed | 50\% |
| Odd = 3 | Bypassed | Bypassed | 33.3\% |
| Odd $=5$ | Bypassed | Bypassed | 40\% |
| Even | Even, odd | Bypassed | $\begin{aligned} & \left(N_{\mathrm{x} .1}+1\right) / \\ & \left(\mathrm{N}_{\mathrm{x}, 1}+\mathrm{M}_{\mathrm{x}, 1}+2\right) \end{aligned}$ |
| Odd | Even, odd | Bypassed | $\begin{aligned} & \left(\mathrm{N}_{\mathrm{x}, 1}+1\right) / \\ & \left(\mathrm{N}_{\mathrm{x}, 1}+\mathrm{M}_{\mathrm{X}, 1}+2\right) \end{aligned}$ |
| Even | Even, odd | Even, odd | $\begin{aligned} & \left(N_{x .2}+1\right) / \\ & \left(N_{x .2}+M_{x .2}+2\right) \end{aligned}$ |
| Odd | Even, odd | Even, odd | $\begin{aligned} & \left(N_{\mathrm{X}, 2}+1\right) / \\ & \left(N_{\mathrm{X}, 2}+\mathrm{M}_{\mathrm{x}, 2}+2\right) \end{aligned}$ |

Table 36. Divider 3 and Divider 4 Duty Cycle; VCO Divider Not Used; Duty Cycle Correction Off (DCCOFF = 1)

| Input | D. 1 | D. 2 |  |
| :---: | :---: | :---: | :---: |
| Duty Cycle | $\mathrm{N}_{\mathrm{x} .1}+\mathrm{M}_{\mathrm{x} .1}+2$ | $\mathrm{N}_{\mathrm{x} .2}+\mathrm{M}_{\mathrm{x} .2}+2$ | Output Duty Cycle |

## Phase Offset or Coarse Time Delay (Divider 3 and Divider 4)

Divider 3 and Divider 4 can be set to have a phase offset or delay. The phase offset is set by a combination of the bits in the phase offset and start high registers (see Table 40).

Table 40. Setting Phase Offset and Division for Divider 3 and Divider $4^{1}$

| Divider |  | Start <br> High (SH) | Phase Offset (PO) | Low Cycles M | High Cycles N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 3.1 | 0x19C[0] | 0x19A[3:0] | 0x199[7:4] | 0x199[3:0] |
|  | 3.2 | 0x19C[1] | 0x19A[7:4] | 0x19B[7:4] | 0x19B[3:0] |
| 4 | 4.1 | 0x1A1[0] | 0x19F[3:0] | 0x19E[7:4] | 0x19E[3:0] |
|  | 4.2 | 0x1A1[1] | 0x19F[7:4] | 0x1A0[7:4] | 0x1AO[3:0] |

${ }^{1}$ Note that the value stored in the register is equal to the number of cycles minus 1. For example, Register 0x199[7:4] = 0001b equals two low cycles ( $M=2$ ) for Divider 3.1.

## AD9516-5

## Let

$\Delta_{t}=$ delay (in seconds).
$\Phi_{\mathrm{x} . \mathrm{y}}=16 \times \mathrm{SH}[0]+8 \times \mathrm{PO}[3]+4 \times \mathrm{PO}[2]+2 \times \mathrm{PO}[1]+$ $1 \times \mathrm{PO}$ [0].
$\mathrm{T}_{\mathrm{X}, 1}=$ period of the clock signal at the input to $\mathrm{D}_{\mathrm{X} .1}$ (in seconds).
$\mathrm{T}_{\mathrm{X} .2}=$ period of the clock signal at the input to $\mathrm{D}_{\mathrm{X} .2}$ (in seconds).

## Case 1

When $\Phi_{\mathrm{x}, 1} \leq 15$ and $\Phi_{\mathrm{x}, 2} \leq 15$ :
$\Delta_{\mathrm{t}}=\Phi_{\mathrm{x}, 1} \times \mathrm{T}_{\mathrm{X}, 1}+\Phi_{\mathrm{X} .2} \times \mathrm{T}_{\mathrm{x}, 2}$

## Case 2

When $\Phi_{\mathrm{x}, 1} \leq 15$ and $\Phi_{\mathrm{x}, 2} \geq 16$ :
$\Delta_{\mathrm{t}}=\Phi_{\mathrm{X} .1} \times \mathrm{T}_{\mathrm{X} .1}+\left(\Phi_{\mathrm{X}, 2}-16+\mathrm{M}_{\mathrm{X} .2}+1\right) \times \mathrm{T}_{\mathrm{X}, 2}$

## Case 3

When $\Phi_{\mathrm{X} .1} \geq 16$ and $\Phi_{\mathrm{X} .2} \leq 15$ :
$\Delta_{\mathrm{t}}=\left(\Phi_{\mathrm{X} .1}-16+\mathrm{M}_{\mathrm{x} .1}+1\right) \times \mathrm{T}_{\mathrm{x}, 1}+\Phi_{\mathrm{X} .2} \times \mathrm{T}_{\mathrm{X} .2}$

## Case 4

When $\Phi_{\mathrm{X} .1} \geq 16$ and $\Phi_{\mathrm{X} .2} \geq 16$ :
$\Delta_{\mathrm{t}}=$
$\left(\Phi_{\mathrm{X} .1}-16+\mathrm{M}_{\mathrm{x} .1}+1\right) \times \mathrm{T}_{\mathrm{X} .1}+\left(\Phi_{\mathrm{X} .2}-16+\mathrm{M}_{\mathrm{X} .2}+1\right) \times \mathrm{T}_{\mathrm{X} .2}$

## Fine Delay Adjust (Divider 3 and Divider 4)

Each AD9516 LVDS/CMOS output (OUT6 to OUT9) includes an analog delay element that can be programmed to give variable time delays $\left(\Delta_{\mathrm{t}}\right)$ in the clock signal at that output.

Figure 44. Fine Delay (OUT6 to OUT9)
The amount of delay applied to the clock signal is determined by programming four registers per output (see Table 41).

Table 41. Setting Analog Fine Delays

| OUTPUT <br> (LVDS/CMOS) | Ramp <br> Capacitors | Ramp <br> Current | Delay <br> Fraction | Delay <br> Bypass |
| :--- | :--- | :--- | :--- | :--- |
| OUT6 | $0 \times 0 A 1[5: 3]$ | $0 \times 0 A 1[2: 0]$ | $0 \times 0 A 2[5: 0]$ | $0 \times 0 A 0[0]$ |
| OUT7 | $0 \times 0 A 4[5: 3]$ | $0 \times 0 A 4[2: 0]$ | $0 \times 0 \mathrm{A5}[5: 0]$ | $0 \times 0 A 3[0]$ |
| OUT8 | $0 \times 0 A 7[5: 3]$ | $0 \times 0 A 7[2: 0]$ | $0 \times 0 \mathrm{AB}[5: 0]$ | $0 \times 0 A 6[0]$ |
| OUT9 | $0 \times 0 A A[5: 3]$ | $0 \times 0 A A[2: 0]$ | $0 \times 0 \mathrm{AB}[5: 0]$ | $0 \times 0 A 9[0]$ |

## Calculating the Fine Delay

The following values and equations are used to calculate the delay of the delay block.

```
IRAMP}(\mu\textrm{A})=200\times(\mathrm{ Ramp Current + 1)
Number of Capacitors = Number of Bits =
0 in Ramp Capacitors + 1
```

Example: $101=1+1=2 ; 110=1+1=2 ; 100=2+1=3$; $001=2+1=3 ; 111=0+1=1$.

Delay Range (ns) $=200 \times\left((\right.$ No. of Caps +3$\left.) /\left(I_{\text {RAMP }}\right)\right) \times 1.3286$
Offset $(\mathrm{ns})=0.34+\left(1600-I_{\text {RAMP }}\right) \times 10^{-4}+\left(\frac{\text { No.of Caps }-1}{I_{\text {RAMP }}}\right) \times 6$
Delay Full Scale (ns) = Delay Range + Offset
Fine Delay (ns) =
Delay Range $\times$ Delay Fraction $\times(1 / 63)+$ Offset
Note that only delay fraction values up to 47 decimal (101111b; 0 x 02 F ) are supported.

In no case can the fine delay exceed one-half of the output clock period. If a delay longer than half of the clock period is attempted, the output stops clocking.
The delay function adds some jitter that is greater than that specified for the nondelayed output. This means that the delay function should be used primarily for clocking digital chips, such as FPGA, ASIC, DUC, and DDC. An output with this delay enabled may not be suitable for clocking data converters. The jitter is higher for long full scales because the delay block uses a ramp and trip points to create the variable delay. A slower ramp time produces more time jitter.

## Synchronizing the Outputs-SYNC Function

The AD9516 clock outputs can be synchronized to each other. Outputs can be individually excluded from synchronization. Synchronization consists of setting the nonexcluded outputs to a preset set of static conditions and, subsequently, releasing these outputs to continue clocking at the same instant with the preset conditions applied. This allows for the alignment of the edges of two or more outputs or for the spacing of edges according to the coarse phase offset settings for two or more outputs.
Synchronization of the outputs is executed in several ways:

- By forcing the $\overline{\mathrm{SYNC}}$ pin and then releasing it (manual sync)
- By setting and then resetting any one of the following three bits: the soft SYNC bit (Register 0x230[0]), the soft reset bit (Register 0x000[2] [mirrored]), or the power-down distribution reference bit (Register 0x230[1])
- By executing synchronization of the outputs as part of the chip power-up sequence
- By forcing the $\overline{\mathrm{RESET}}$ pin low, then releasing it (chip reset)
- By forcing the PD pin low, then releasing it (chip power-down)

The most common way to execute the SYNC function is to use the $\overline{\text { SYNC }}$ pin to do a manual synchronization of the outputs. This requires a low going signal on the $\overline{\text { SYNC }}$ pin, which is held low and then released when synchronization is desired. The timing of the SYNC operation is shown in Figure 45 (using VCO divider) and Figure 46 (VCO divider not used). There is an uncertainty of up to one cycle of the clock at the input to the channel divider due to the asynchronous nature of the SYNC signal with respect to the clock edges inside the AD9516. The delay from the SYNC rising edge to the beginning of synchronized output clocking is
between 14 and 15 cycles of clock at the channel divider input, plus either one cycle of the VCO divider input (see Figure 45), or one cycle of the CLK input (see Figure 46), depending on whether the VCO divider is used. Cycles are counted from the rising edge of the signal.

Another common way to execute the SYNC function is by setting and resetting the soft SYNC bit at Register 0x230[0] (see Table 47 through Table 57 for details). Both the setting and resetting of the soft SYNC bit require an update all registers operation (Register $0 \times 232[0]=1$ ) to take effect.

Figure 45. SYNC Timing When VCO Divider Is Used—CLK or VCO Is Input

Figure 46. SYNC Timing When VCO Divider Is Not Used—CLK Input Only

## AD9516-5

A sync operation brings all outputs that have not been excluded (by the nosync bit) to a preset condition before allowing the outputs to begin clocking in synchronicity. The preset condition takes into account the settings in each of the channel's start high bit and its phase offset. These settings govern both the static state of each output when the sync operation is happening and the state and relative phase of the outputs when they begin clocking again upon completion of the sync operation. Between outputs and after synchronization, this allows for the setting of phase offsets.

The AD9516 outputs are in pairs, sharing a channel divider per pair (two pairs of pairs, four outputs, in the case of CMOS). The synchronization conditions apply to both outputs of a pair.
Each channel (a divider and its outputs) can be excluded from any sync operation by setting the nosync bit of the channel. Channels that are set to ignore SYNC (excluded channels) do not set their outputs static during a sync operation, and their outputs are not synchronized with those of the nonexcluded channels.

## Clock Outputs

The AD9516 offers three output level choices: LVPECL, LVDS, and CMOS. OUT0 to OUT5 are LVPECL differential outputs; and OUT6 to OUT9 are LVDS/CMOS outputs. These outputs can be configured as either LVDS differential or as pairs of single-ended CMOS outputs.

## LVPECL Outputs—OUT0 to OUT5

The LVPECL differential voltage (VOD) is selectable from 400 mV to 960 mV (see Register 0x0F0[3:2] to Register 0x0F5[3:2]). The LVPECL outputs have dedicated pins for power supply (VS_LVPECL), allowing a separate power supply to be used. Vs_lvpecl can range from 2.5 V to 3.3 V .

Figure 47. LVPECL Output, Simplified Equivalent Circuit
The LVPECL output polarity can be set as noninverting or inverting, which allows for the adjustment of the relative polarity of outputs within an application without requiring a board layout change. Each LVPECL output can be powered down or powered up as needed. Because of the architecture of the LVPECL output stages, there is the possibility of electrical overstress and breakdown under certain power-down conditions.

For this reason, the LVPECL outputs have several power-down modes. This includes a safe power-down mode that continues to protect the output devices while powered down, although it consumes somewhat more power than a total power-down. If the LVPECL output pins are terminated, it is best to select the safe power-down mode. If the pins are not connected (unused), it is acceptable to use the total power-down mode.

## LVDS/CMOS Outputs—OUT6 to OUT9

OUT6 to OUT9 can be configured as either an LVDS differential output or as a pair of CMOS single-ended outputs. The LVDS outputs allow for selectable output current from $\sim 1.75 \mathrm{~mA}$ to $\sim 7 \mathrm{~mA}$.

The LVDS output polarity can be set as noninverting or inverting, which allows for the adjustment of the relative polarity of outputs within an application without requiring a board layout change. Each LVDS output can be powered down, if not needed, to save power.

OUT6 to OUT9 can also be CMOS outputs. Each LVDS output can be configured to be two CMOS outputs. This provides for up to eight CMOS outputs: OUT6A, OUT6B, OUT7A, OUT7B, OUT8A, OUT8B, OUT9A, and OUT9B. When an output is configured as CMOS, the CMOS Output A is automatically turned on. The CMOS Output B can be turned on or off independently. The relative polarity of the CMOS outputs can also be selected for any combination of inverting and noninverting. See Table 52: Register 0x140[7:5], Register 0x141[7:5], Register 0x142[7:5], and Register 0x143[7:5].
Each LVDS/CMOS output can be powered down, as needed, to save power. The CMOS output power-down is controlled by the same bit that controls the LVDS power-down for that output. This power-down control affects both CMOS Output A and CMOS Output B. However, when CMOS Output A is powered up, CMOS Output B output can be powered on or off separately.

Figure 49. CMOS Equivalent Output Circuit

## RESET MODES

The AD9516 has several ways to force the chip into a reset condition that restores all registers to their default values and makes these settings active.

## Power-On Reset—Start-Up Conditions When VS Is Applied

A power-on reset (POR) is issued when the VS power supply is turned on. The POR pulse duration is $<100 \mathrm{~ms}$ and initializes the chip to the power-on conditions that are determined by the default register settings. These are indicated in the Default Value (Hex) column of Table 47. At power-on, the AD9516 also executes a SYNC operation, which brings the outputs into phase alignment according to the default settings. It is recommended that the user not toggle SCLK during the reset pulse.
Asynchronous Reset via the $\overline{\text { RESET }}$ Pin
An asynchronous hard reset is executed by momentarily pulling $\overline{\text { RESET }}$ low. A reset restores the chip registers to the default settings. It is recommended that the user not toggle SCLK for 20 ns after $\overline{\text { RESET }}$ goes high.

## Soft Reset via Register 0x000[2]

A soft reset is executed by writing Register 0x000[2] and Register $0 \times 000[5]=1 \mathrm{~b}$. This bit is not self-clearing; therefore, it must be cleared by writing Register 0x000[2] and Register $0 \mathrm{x} 000[2]=0 \mathrm{~b}$ to reset it and complete the soft reset operation. A soft reset restores the default values to the internal registers. The soft reset bit does not require an update registers command (Register 0x232 = 0x01) to be issued.

## POWER-DOWN MODES

## Chip Power-Down via $\overline{P D}$

The AD9516 can be put into a power-down condition by pulling the $\overline{\mathrm{PD}}$ pin low. Power-down turns off most of the functions and currents inside the AD9516. The chip remains in this power-down state until $\overline{\mathrm{PD}}$ is brought back to logic high. When the AD9516 wakes up, it returns to the settings programmed into its registers prior to the power-down, unless the registers are changed by new programming while the $\overline{\mathrm{PD}}$ pin is held low.
The $\overline{\mathrm{PD}}$ power-down shuts down the currents on the chip, except the bias current that is necessary to maintain the LVPECL outputs in a safe shutdown mode. This is needed to protect the LVPECL output circuitry from damage that can be caused by certain termination and load configurations when tristated. Because this is not a complete power-down, it can be called sleep mode.

When the AD9516 is in a $\overline{\mathrm{PD}}$ power-down, the chip is in the following state:

- The PLL is off (asynchronous power-down).
- The CLK input buffer is off.
- All dividers are off.
- All LVDS/CMOS outputs are off.
- All LVPECL outputs are in safe off mode.
- The serial port is active and responds to commands.

If the AD9516 clock outputs must be synchronized to each other, a SYNC is required upon exiting power-down (see the Synchronizing the Outputs-SYNC Function section).

## PLL Power-Down

The PLL section of the AD9516 can be selectively powered down. There are three PLL operating modes that are set by Register 0x010[1:0], as shown in Table 49.
In asynchronous power-down mode, the device powers down as soon as the registers are updated.

In synchronous power-down mode, the PLL power-down is gated by the charge pump to prevent unwanted frequency jumps. The device goes into power-down on the occurrence of the next charge pump event after the registers are updated.

## Distribution Power-Down

The distribution section can be powered down by writing to Register $0 \times 230[1]=1 \mathrm{~b}$. This turns off the bias to the distribution section. If the LVPECL power-down mode is normal operation (00b), it is possible for a low impedance load on that LVPECL output to draw significant current during this power-down. If the LVPECL power-down mode is set to 11b, the LVPECL output is not protected from reverse bias and can be damaged under certain termination conditions.

## Individual Clock Output Power-Down

Any of the clock distribution outputs can be powered down individually by writing to the appropriate registers. The register map details the individual power-down settings for each output. The LVDS/CMOS outputs can be powered down, regardless of their output load configuration.
The LVPECL outputs have multiple power-down modes (see Table 53) that give some flexibility in dealing with the various output termination conditions. When the mode is set to 10b, the LVPECL output is protected from reverse bias to $2 \mathrm{VBE}+1 \mathrm{~V}$. If the mode is set to 11 b , the LVPECL output is not protected from reverse bias and can be damaged under certain termination conditions. This setting also affects the operation when the distribution block is powered down with $0 \mathrm{x} 230[1]=1 \mathrm{~b}$ (see the Distribution Power-Down section).

## Individual Circuit Block Power-Down

Other AD9516 circuit blocks (such as CLK, REF1, and REF2) can be powered down individually. This gives flexibility in configuring the part for power savings whenever certain chip functions are not needed.

## AD9516-5

## SERIAL CONTROL PORT

The AD9516 serial control port is a flexible, synchronous, serial communications port that allows an easy interface with many industry-standard microcontrollers and microprocessors. The AD9516 serial control port is compatible with most synchronous transfer formats, including both the Motorola $\mathrm{SPI}^{\circ}$ and Intel ${ }^{\oplus}$ $\mathrm{SSR}^{\oplus}$ protocols. The serial control port allows read/write access to all registers that configure the AD9516. Single or multiple byte transfers are supported, as well as MSB first or LSB first transfer formats. The AD9516 serial control port can be configured for a single bidirectional I/O pin (SDIO only) or for two unidirectional I/O pins (SDIO/SDO). By default, the AD9516 is in bidirectional mode, long instruction (long instruction is the only instruction mode supported).

## SERIAL CONTROL PORT PIN DESCRIPTIONS

SCLK (serial clock) is the serial shift clock. This pin is an input. SCLK is used to synchronize serial control port reads and writes. Write data bits are registered on the rising edge of this clock, and read data bits are registered on the falling edge. This pin is internally pulled down by a $30 \mathrm{k} \Omega$ resistor to ground.

SDIO (serial data input/output) is a dual-purpose pin that acts as either an input only (unidirectional mode) or as both an input/ output (bidirectional mode). The AD9516 defaults to the bidirectional I/O mode (Register 0x000[0] = 0b).
SDO (serial data output) is used only in the unidirectional I/O mode (Register 0x000[0] = 1b) as a separate output pin for reading back data.
$\overline{\mathrm{CS}}$ (chip select bar) is an active low control that gates the read and write cycles. When $\overline{\mathrm{CS}}$ is high, SDO and SDIO are in a high impedance state. This pin is internally pulled up by a $30 \mathrm{k} \Omega$ resistor to VS.

Figure 50. Serial Control Port

## GENERAL OPERATION OF SERIAL CONTROL PORT

A write or a read operation to the AD9516 is initiated by pulling $\overline{\mathrm{CS}}$ low.
$\overline{\mathrm{CS}}$ stall high is supported in modes where three or fewer bytes of data (plus instruction data) are transferred (see Table 42). In these modes, $\overline{\mathrm{CS}}$ can temporarily return high on any byte boundary, allowing time for the system controller to process the next byte. $\overline{\mathrm{CS}}$ can go high on byte boundaries only and during either part (instruction or data) of the transfer.

During this period, the serial control port state machine enters a wait state until all data is sent. If the system controller decides to abort the transfer before all of the data is sent, the state machine must be reset, either by completing the remaining transfers or by returning the $\overline{\mathrm{CS}}$ low for at least one complete SCLK cycle (but less than eight SCLK cycles). Raising the $\overline{\mathrm{CS}}$ on a nonbyte boundary terminates the serial transfer and flushes the buffer.

In streaming mode (see Table 42), any number of data bytes can be transferred in a continuous stream. The register address is automatically incremented or decremented (see the MSB/LSB First Transfers section). $\overline{\mathrm{CS}}$ must be raised at the end of the last byte to be transferred, thereby ending the stream mode.

## Communication Cycle—Instruction Plus Data

There are two parts to a communication cycle with the AD9516. The first part writes a 16-bit instruction word into the AD9516, coincident with the first 16 SCLK rising edges. The instruction word provides the AD9516 serial control port with information regarding the data transfer, which is the second part of the communication cycle. The instruction word defines whether the upcoming data transfer is a read or a write, the number of bytes in the data transfer, and the starting register address for the first byte of the data transfer.

## Write

If the instruction word is for a write operation, the second part is the transfer of data into the serial control port buffer of the AD9516. Data bits are registered on the rising edge of SCLK.

The length of the transfer ( 1,2 , or 3 bytes or streaming mode) is indicated by two bits ([W1:W0]) in the instruction byte. When the transfer is 1,2 , or 3 bytes, but not streaming, $\overline{\mathrm{CS}}$ can be raised after each sequence of eight bits to stall the bus (except after the last byte, where it ends the cycle). When the bus is stalled, the serial transfer resumes when $\overline{\mathrm{CS}}$ is lowered. Raising $\overline{\mathrm{CS}}$ on a nonbyte boundary resets the serial control port. During a write, streaming mode does not skip over reserved or unused registers; therefore, the user must know the correct bit pattern to write to the reserved registers to preserve proper operation of the part. Refer to the register map (see Table 47) to determine if the default value for reserved registers is nonzero. It does not matter what data is written to blank or unused registers.
Because data is written into a serial control port buffer area, and not directly into the actual control registers of the AD9516, an additional operation is needed to transfer the serial control port buffer contents to the actual control registers of the AD9516, thereby causing them to become active. The update registers operation consists of setting Register $0 \times 232[0]=1 b$ (this bit is selfclearing). Any number of bytes of data can be changed before executing an update registers. The update registers operation simultaneously actuates all register changes that have been written to the buffer since any previous update.

## Read

If the instruction word is for a read operation, the next $\mathrm{N} \times 8$ SCLK cycles clock out the data from the address specified in the instruction word, where N is 1 to 3 , as determined by [W1:W0]. If $\mathrm{N}=4$, the read operation is in streaming mode, continuing until $\overline{\mathrm{CS}}$ is raised. Streaming mode does not skip over reserved or blank registers. The readback data is valid on the falling edge of SCLK.

The default mode of the AD9516 serial control port is the bidirectional mode. In bidirectional mode, both the sent data and the readback data appear on the SDIO pin. It is also possible to set the AD9516 to unidirectional mode via the SDO active bit (Register $0 x 000[0]=1 b$ ). In unidirectional mode, the readback data appears on the SDO pin.

A readback request reads the data that is in the serial control port buffer area, or the data that is in the active registers (see Figure 51). Readback of the buffer or active registers is controlled by Register 0x004[0].
The AD9516 supports only the long instruction mode; therefore, Register 0x000[4:3] must be set to 11b. (This register uses mirrored bits). Long instruction mode is the default at powerup or reset.

The AD9516 uses Register Address 0x000 to Register Address 0x232.

Figure 51. Relationship Between Serial Control Port Buffer Registers and Active Registers of the AD9516

## INSTRUCTION WORD (16 BITS)

The MSB of the instruction word is $R / \bar{W}$, which indicates whether the instruction is a read or a write. The next two bits, [W1:W0], indicate the length of the transfer in bytes. The final 13 bits are the address ([A12:A0]) at which to begin the read or write operation.

For a write, the instruction word is followed by the number of bytes of data indicated by Bits[W1:W0], see Table 42.

Table 42. Byte Transfer Count

| W1 | W0 | Bytes to Transfer |
| :--- | :--- | :--- |
| 0 | 0 | 1 |
| 0 | 1 | 2 |
| 1 | 0 | 3 |
| 1 | 1 | Streaming mode |

The 13 bits found in Bits[A12:A0] select the address within the register map that is written to or read from during the data transfer portion of the communications cycle. Only Bits[A9:A0] are needed to cover the range of the $0 \times 232$ registers used by the AD9516. Bits[A12:A10] must always be set to 0b. For multibyte transfers, this address is the starting byte address. In MSB first mode, subsequent bytes decrement the address.

## MSB/LSB FIRST TRANSFERS

The AD9516 instruction word and byte data can be MSB first or LSB first. Any data written to Register 0x000 must be mirrored; the upper four bits (Bits[7:4]) must mirror the lower four bits (Bits[3:0]). This makes it irrelevant whether LSB first or MSB first is in effect. As an example of this mirroring, see the default setting for this register: $0 \times 000$, which mirrors Bit 4 and Bit 3 . This sets the long instruction mode (which is the default and the only mode that is supported).

The default for the AD9516 is MSB first.
When LSB first is set by Register $0 \times 000$ [1] and Register $0 \times 000[6]$, it takes effect immediately, because it affects only the operation of the serial control port and does not require that an update be executed.

When MSB first mode is active, the instruction and data bytes must be written from MSB to LSB. Multibyte data transfers in MSB first format start with an instruction byte that includes the register address of the most significant data byte. Subsequent data bytes must follow, in order, from high address to low address. In MSB first mode, the serial control port internal address generator decrements for each data byte of the multibyte transfer cycle.

When LSB first is active, the instruction and data bytes must be written from LSB to MSB. Multibyte data transfers in LSB first format start with an instruction byte that includes the register address of the least significant data byte followed by multiple data bytes. The internal byte address generator of the serial control port increments for each byte of the multibyte transfer cycle.
The AD9516 serial control port register address decrements from the register address just written toward $0 \times 000$ for multibyte I/O operations if the MSB first mode is active (default). If the LSB first mode is active, the register address of the serial control port increments from the address just written toward Register 0x232 for multibyte I/O operations.

Streaming mode always terminates when it hits Address 0x232. Note that unused addresses are not skipped during multibyte I/O operations.

Table 43. Streaming Mode (No Addresses Are Skipped)

| Write Mode | Address Direction | Stop Sequence |
| :--- | :--- | :--- |
| LSB first | Increment | $0 \times 230,0 \times 231,0 \times 232$, stop |
| MSB first | Decrement | $0 \times 001,0 \times 000,0 \times 232$, stop |

Table 45. Serial Control Port Timing

| Parameter | D |
| :--- | :--- |
| $t_{\text {DS }}$ |  |
| $t_{\text {DH }}$ |  |
| $t_{\text {CLK }}$ |  |
| $t_{S}$ |  |
| $t_{C}$ |  |
| $t_{\text {HIGH }}$ |  |
| $t_{\text {LOW }}$ |  |
| $t_{\text {DV }}$ |  |

Description
Setup time between data and the rising edge of SCLK
Hold time between data and the rising edge of SCLK
Period of the clock
Setup time between the $\overline{C S}$ falling edge and the SCLK rising edge (start of communication cycle)
Setup time between the SCLK rising edge and the $\overline{C S}$ rising edge (end of communication cycle)
Minimum period that SCLK should be in a logic high state
Minimum period that SCLK should be in a logic low state
SCLK to valid SDIO and SDO (see Figure 55)

## AD9516-5

## THERMAL PERFORMANCE

Table 46. Thermal Parameters for 64-Lead LFCSP

| Symbol | Thermal Characteristic Using a JEDEC JESD51-7 Plus JEDEC JESD51-5 2S2P Test Board | Value ( ${ }^{\circ} \mathbf{C / W}$ ) |
| :--- | :--- | :--- |
| $\theta_{\mathrm{JA}}$ | Junction-to-ambient thermal resistance, natural convection per JEDEC JESD51-2 (still air) | 22.0 |
| $\theta_{J M A}$ | Junction-to-ambient thermal resistance, $1.0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-6 (moving air) | 19.2 |
| $\theta_{\text {JMA }}$ | Junction-to-ambient thermal resistance, $2.0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-6 (moving air) | 17.2 |
| $\Psi_{J B}$ | Junction-to-board characterization parameter, $1.0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-6 (moving air) | 11.6 |
| $\theta_{\mathrm{JC}}$ | and JEDEC JESD51-8 |  |
| $\psi_{J T}$ | Junction-to-case thermal resistance (die-to-heat sink) per MIL-Std 883, Method 1012.1 | 1.3 |

The AD9516 is specified for a case temperature (TCASE). To ensure that $\mathrm{T}_{\text {CASE }}$ is not exceeded, an airflow source can be used.
Use the following equation to determine the junction temperature on the application PCB:

$$
T_{J}=T_{\text {CASE }}+\left(\Psi_{J \mathrm{~T}} \times P D\right)
$$

where:
$T_{I}$ is the junction temperature ( ${ }^{\circ} \mathrm{C}$ ).
$T_{\text {CASE }}$ is the case temperature $\left({ }^{\circ} \mathrm{C}\right)$ measured by the user at the top center of the package.
$\Psi_{J T}$ is the value from Table 46.
$P D$ is the power dissipation of the device (see Table 13.)

Values of $\theta_{\mathrm{JA}}$ are provided for package comparison and PCB design considerations. $\theta_{\mathrm{JA}}$ can be used for a first-order approximation of $\mathrm{T}_{\mathrm{J}}$ by the following equation:

$$
T_{J}=T_{A}+\left(\theta_{J A} \times P D\right)
$$

where $T_{A}$ is the ambient temperature $\left({ }^{\circ} \mathrm{C}\right)$.
Values of $\theta_{\mathrm{IC}}$ are provided for package comparison and PCB design considerations when an external heat sink is required.
Values of $\Psi_{J B}$ are provided for package comparison and PCB design considerations.

## REGISTER MAPS

## REGISTER MAP OVERVIEW

Register addresses that are not listed in Table 47 (as well as ones marked unused) are not used and writing to those registers has no effect. The user should write the default value only to the register addresses marked reserved.

Table 47. Register Map Overview

|  | [5:3] | R path delay | R path delay (default $=0 \times 0$ ); see Table 2. |  |  |
|  | [2:0] | N path delay | N path delay (default = 0x0); see Table 2. |  |  |

## AD9516-5

## AD9516-5

| Reg. Addr. (Hex) | Bits | Name | Description |
| :---: | :---: | :---: | :---: |
| 0x01D | 4 | PLL status register disable | Disables the PLL status register readback. <br> 0 : PLL status register enable (default). <br> 1: PLL status register disable. |
|  | 3 | LD pin comparator enable | Enables the LD pin voltage comparator. This function is used with the LD pin current source lock detect mode. When in the internal (automatic) holdover mode, this function enables the use of the voltage on the LD pin to determine if the PLL was previously in a locked state (see Figure 41). Otherwise, this function can be used with the REFMON and STATUS pins to monitor the voltage on the LD pin. <br> 0: disables LD pin comparator; internal/automatic holdover controller treats this pin as true/high (default). <br> 1: enables LD pin comparator. |
|  | 2 | Holdover enable | Along with Register 0x01D[0], enables the holdover function. 0 : holdover disabled (default). <br> 1: holdover enabled. |
|  | 1 | External holdover control | Enables the external hold control through the $\overline{\overline{S Y N C}}$ pin. (This disables the internal holdover mode.) 0 : automatic holdover mode—holdover controlled by automatic holdover circuit (default). <br> 1: external holdover mode—holdover controlled by $\overline{\text { SYNC }}$ pin. |
|  | 0 | Holdover enable | Along with Register 0x01D[2], enables the holdover function. 0 : holdover disabled (default). <br> 1: holdover enabled. |
| 0x01F | 5 | Holdover active | Read-only register. Indicates if the part is in the holdover state (see Figure 41). This is not the same as holdover enabled. 0 : not in holdover. <br> 1: holdover state active. |
|  | 4 | REF2 selected | Read-only register. Indicates which PLL reference is selected as the input to the PLL. 0 : REF1 selected (or differential reference if in differential mode). <br> 1: REF2 selected. |
|  | 3 | CLK frequency > threshold | Read-only register. Indicates if the CLK frequency is greater than the threshold (see Table 12: REF1, REF2, and CLK frequency status monitor). <br> 0 : CLK frequency is less than the threshold. <br> 1: CLK frequency is greater than the threshold. |
|  | 2 | REF2 frequency > threshold | Read-only register. Indicates if the frequency of the signal at REF2 is greater than the threshold frequency set by Register 0x01A[6]. <br> 0 : REF2 frequency is less than threshold frequency. <br> 1: REF2 frequency is greater than threshold frequency. |
|  | 1 | REF1 frequency > threshold | Read-only register. Indicates if the frequency of the signal at REF2 is greater than the threshold frequency set by Register 0x01A[6]. <br> 0 : REF1 frequency is less than threshold frequency. <br> 1: REF1 frequency is greater than threshold frequency. |
|  | 0 | Digital lock detect | Read-only register. Digital lock detect. <br> 0 : PLL is not locked. <br> 1: PLL is locked. |

Table 50. Fine Delay Adjust-OUT6 to OUT9

## AD9516-5

| Reg. Addr. <br> (Hex) | Bits | Name | Description |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0x0A4 | [2:0] | OUT7 ramp current | Ramp current for the delay function. The combination of the number of capacitors and the ramp current sets the full-scale delay. |  |  |
|  |  |  | 2 | 100 | Current ( $\mu \mathrm{A}$ ) |
|  |  |  | 2 0 0 0 0 1 1 1 1 | 0 0 <br> 0 1 <br> 1 0 <br> 1 1 <br> 0 0 <br> 0 1 <br> 1 0 <br> 1 1 | $\begin{aligned} & 200 \text { (default) } \\ & 400 \\ & 600 \\ & 800 \\ & 1000 \\ & 1200 \\ & 1400 \\ & 1600 \end{aligned}$ |
| 0x0A5 | [5:0] | OUT7 delay fraction | Selects the fraction of the full-scale delay desired (6-bit binary). A setting of 000000b gives zero delay. Only delay values of up to 47 decimals (101111b; 0x02F) are supported (default: $0 \times 00$ ). |  |  |
| 0x0A6 | 0 | OUT8 delay bypass | Bypasses or uses the delay function. 0 : uses the delay function. <br> 1: bypasses the delay function (default). |  |  |
| 0x0A7 | [5:3] | OUT8 ramp capacitors | Selects the number of ramp capacitors used by the delay function. The combination of the number of capacitors and the ramp current sets the full-scale delay. |  |  |
|  |  |  | 5 | 4 3 | Number of Capacitors |
|  |  |  | a <br> 0 <br> 0 <br> 0 <br> 0 <br> 1 <br> 1 <br> 1 <br> 1 | 0 0 <br> 0 1 <br> 1 0 <br> 1 1 <br> 0 0 <br> 0 1 <br> 1 0 <br> 1 1 | 4 (default) 3 3 2 3 2 2 1 |
|  | [2:0] | OUT8 ramp current | Ramp current for the delay function. The combination of the number of capacitors and the ramp current sets the full-scale delay. |  |  |

Table 53. LVPECL Channel Dividers

| Reg. Addr. <br> (Hex) | Bits | Name | Description |
| :---: | :---: | :---: | :---: |
| 0x190 | [7:4] | Divider 0 low cycles | Number of clock cycles (minus 1) of the Divider 0 input during which the Divider 0 output stays low. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 0$ ). |
|  | [3:0] | Divider 0 high cycles | Number of clock cycles (minus 1) of the Divider 0 input during which the Divider 0 output stays high. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 0$ ). |
| 0x191 | 7 | Divider 0 bypass | Bypasses and powers down the divider; routes input to the divider output. <br> 0 : uses the divider. <br> 1: bypasses the divider (default). |
|  | 6 | Divider 0 nosync | No sync. <br> 0: obeys chip-level SYNC signal (default). <br> 1: ignores chip-level SYNC signal. |
|  | 5 | Divider 0 force high | Forces divider output to high. This operation requires that the Divider 0 nosync bit (Bit 6) also be set. This bit has no effect if the Divider 0 bypass bit (Bit 7 ) is set. <br> 0 : normal operation (default). <br> 1: divider output forced to the setting of the Divider 0 start high bit. |
|  | 4 | Divider 0 start high | Selects clock output to start high or start low. <br> 0 : starts low (default). <br> 1: starts high. |
|  | [3:0] | Divider 0 phase offset | Phase offset (default: $0 \times 0$ ). |
| 0x192 | 1 | Divider 0 direct to output | Connects OUT0 and OUT1 to Divider 0 or directly to CLK input. <br> 0 : OUT0 and OUT1 are connected to Divider 0 (default). <br> 1: If Register $0 \times 1 \mathrm{E} 1[0]=0 \mathrm{~b}$, the CLK is routed directly to OUT0 and OUT1. If Register $0 \times 1 \mathrm{E} 1[0]=1 b$, there is no effect. |
|  | 0 | Divider 0 DCCOFF | Duty-cycle correction function. <br> 0 : enables duty-cycle correction (default). <br> 1: disables duty-cycle correction. |
| 0x193 | [7:4] | Divider 1 low cycles | Number of clock cycles (minus 1 ) of the Divider 1 input during which the Divider 1 output stays low. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: 0xB). |
|  | [3:0] | Divider 1 high cycles | Number of clock cycles (minus 1 ) of the Divider 1 input during which the Divider 1 output stays high. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: 0xB). |
| 0x194 | 7 | Divider 1 bypass | Bypasses and powers down the divider; routes input to divider output. <br> 0 : uses divider (default). <br> 1: bypasses divider. |
|  | 6 | Divider 1 nosync | No sync. <br> 0: obeys chip-level SYNC signal (default). <br> 1: ignores chip-level SYNC signal. |

| Reg. Addr. (Hex) | Bits | Name | Description |
| :---: | :---: | :---: | :---: |
|  | 5 | Divider 1 force high | Forces divider output to high. This operation requires that the Divider 1 nosync bit (Bit 6) also be set. This bit has no effect if the Divider 1 bypass bit (Bit 7) is set. <br> 0 : normal operation (default). <br> 1: divider output forced to the setting of the Divider 1 start high bit. |
|  | 4 | Divider 1 start high | Selects clock output to start high or start low. 0 : starts low (default). <br> 1: starts high. |
|  | [3:0] | Divider 1 phase offset | Phase offset (default: 0x0). |
| 0x195 | 1 | Divider 1 direct to output | Connects OUT2 and OUT3 to Divider 1 or directly to CLK input. <br> 0: OUT2 and OUT3 are connected to Divider 1 (default). <br> 1: If Register $0 \times 1 \mathrm{E} 1[0]=0 \mathrm{~b}$, the CLK is routed directly to OUT2 and OUT3. If Register $0 \times 1 \mathrm{E} 1[0]=1 \mathrm{~b}$, this has no effect. |
|  | 0 | Divider 1 DCCOFF | Duty-cycle correction function. <br> 0 : enables duty-cycle correction (default). <br> 1: disables duty-cycle correction. |
| 0x196 | [7:4] | Divider 2 low cycles | Number of clock cycles (minus 1) of the Divider 2 input during which the Divider 2 output stays low. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 0$ ). |
|  | [3:0] | Divider 2 high cycles | Number of clock cycles (minus 1 ) of the Divider 2 input during which the Divider 2 output stays high. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 0$ ). |
| 0x197 | 7 | Divider 2 bypass | Bypasses and powers down the divider; route input to divider output. 0: uses divider (default). <br> 1: bypasses divider. |
|  | 6 | Divider 2 nosync | No sync. <br> 0: obeys chip-level SYNC signal (default). <br> 1: ignores chip-level SYNC signal. |
|  | 5 | Divider 2 force high | Forces divider output to high. This operation requires that the Divider 2 nosync bit (Bit 6) also be set. This bit has no effect if the Divider 2 bypass bit (Bit 7) is set. <br> 0 : normal operation (default). <br> 1: divider output forced to the setting of the Divider 2 start high bit. |
|  | 4 | Divider 2 start high | Selects clock output to start high or start low. <br> 0: starts low (default). <br> 1: starts high. |
|  | [3:0] | Divider 2 phase offset | Phase offset (default: $0 \times 0$ ). |
| 0x198 | 1 | Divider 2 direct to output | Connects OUT4 and OUT5 to Divider 2 or directly to CLK input. 0: OUT4 and OUT5 are connected to Divider 2 (default). <br> 1: if $0 \times 1 \mathrm{E} 1[0]=0 b$, the CLK is routed directly to OUT4 and OUT5. If $0 \times 1 \mathrm{E} 1[0]=1 b$, there is no effect. |
|  | 0 | Divider 2 DCCOFF | Duty-cycle correction function. 0 : enables duty-cycle correction (default). <br> 1: disables duty-cycle correction. |

## AD9516-5

Table 54. LVDS/CMOS Channel Dividers

| Reg. <br> Addr. <br> (Hex) | Bits | Name | Description |
| :---: | :---: | :---: | :---: |
| 0x199 | [7:4] | Low Cycles Divider 3.1 | Number of clock cycles (minus 1) of the Divider 3.1 input during which the Divider 3.1 output stays low. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 2$ ). |
|  | [3:0] | High Cycles Divider 3.1 | Number of clock cycles (minus 1) of the Divider 3.1 input during which the Divider 3.1 output stays high. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 2$ ). |
| 0x19A | [7:4] | Phase Offset Divider 3.2 | Refers to LVDS/CMOS channel divider function description (default: 0x0). |
|  | [3:0] | Phase Offset Divider 3.1 | Refers to LVDS/CMOS channel divider function description (default: 0x0). |
| 0x19B | [7:4] | Low Cycles Divider 3.2 | Number of clock cycles (minus 1) of the Divider 3.2 input during which the Divider 3.2 output stays low. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 1$ ). |
|  | [3:0] | High Cycles Divider 3.2 | Number of clock cycles (minus 1) of the Divider 3.2 input during which the Divider 3.2 output stays high. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 1$ ). |
| 0x19C | 5 | Bypass Divider 3.2 | Bypasses (and powers down) 3.2 divider logic, routes clock to 3.2 output. 0 : does not bypass (default). <br> 1: bypasses. |
|  | 4 | Bypass Divider 3.1 | Bypasses (and powers down) 3.1 divider logic, routes clock to 3.1 output. <br> 0 : does not bypass (default). <br> 1: bypasses. |
|  | 3 | Divider 3 nosync | No sync. <br> 0: obeys chip-level SYNC signal (default). <br> 1: ignores chip-level SYNC signal. |
|  | 2 | Divider 3 force high | Forces Divider 3 output high. Requires that the Divider 3 nosync bit (Bit 3) also be set. 0 : forces low (default). <br> 1: forces high. |
|  | 1 | Start High Divider 3.2 | Divider 3.2 starts high/low. <br> 0 : starts low (default). <br> 1: starts high. |
|  | 0 | Start High Divider 3.1 | Divider 3.1 starts high/low. <br> 0 : starts low (default). <br> 1: starts high. |
| 0x19D | 0 | Divider 3 DCCOFF | Duty-cycle correction function. <br> 0 : enables duty-cycle correction (default). <br> 1: disables duty-cycle correction. |
| 0x19E | [7:4] | Low Cycles Divider 4.1 | Number of clock cycles (minus 1) of the Divider 4.1 input during which the Divider 4.1 output stays low. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: $0 \times 2$ ). |
|  | [3:0] | High Cycles Divider 4.1 | Number of clock cycles (minus 1) of the Divider 4.1 input during which the Divider 4.1 output stays high. A value of $0 \times 7$ means that the divider is low for eight input clock cycles (default: 0x2). |
| 0x19F | [7:4] | Phase Offset Divider 4.2 | Refers to LVDSCMOS channel divider function description (default: $0 \times 0$ ). |

|  |  |  | $\mathbf{0}$ | Divide |  |
|  |  |  | 0 | 0 | 0 |
|  |  | 2 |  |  |  |
|  |  |  | 0 | 0 | 1 |

Table 56. System

| Reg. <br> Addr. <br> (Hex) | Bits | Name | Description |
| :---: | :---: | :---: | :---: |
| 230 | 2 | Power-down SYNC | Powers down the sync function. <br> 0 : normal operation of the sync function (default). <br> 1: powers down the SYNC circuitry. |
|  | 1 | Power-down distribution reference | Powers down the reference for distribution section. <br> 0 : normal operation of the reference for the distribution section (default). <br> 1: powers down the reference for the distribution section. |
|  | 0 | Soft SYNC | The soft SYNC bit works the same as the $\overline{\text { SYNC }}$ pin, except that the polarity of the bit is reversed; that is, a high level forces selected channels into a predetermined static state, and a 1-to-0 transition triggers a SYNC. <br> 0 : same as $\overline{\text { SYNC }}$ high (default). <br> 1: same as $\overline{\text { SYNC }}$ low. |

## AD9516-5

Table 57. Update All Registers

| Reg. <br> Addr. <br> (Hex) | Bits | Name |  |
| :--- | :--- | :--- | :--- |
| $0 \times 232$ | 0 | Update all registers | This bit must be set to 1 to transfer the contents of the buffer registers into the active registers, <br> which happens on the next SCLK rising edge. This bit is self-clearing; that is, it does not have to <br> be set back to 0. <br> $1:$ updates all active registers to the contents of the buffer registers (self-clearing). |

## APPLICATIONS INFORMATION

## FREQUENCY PLANNING USING THE AD9516

The AD9516 is a highly flexible PLL. When choosing the PLL settings and version of the AD9516, keep in mind the following guidelines.
The AD9516 has the following four frequency dividers: the reference (or R) divider, the feedback (or N ) divider, the VCO divider, and the channel divider. When trying to achieve a particularly difficult frequency divide ratio requiring a large amount of frequency division, some of the frequency division can be done by either the VCO divider or the channel divider, thus allowing a higher phase detector frequency and more flexibility in choosing the loop bandwidth.
Within the AD9516 family, lower VCO frequencies generally result in slightly lower jitter. The difference in integrated jitter (from 12 kHz to 20 MHz offset) for the same output frequency is usually less than 150 fs over the entire VCO frequency range ( 1.45 GHz to 2.95 GHz ) of the AD9516 family. If the desired frequency plan can be achieved with a version of the AD9516 that has a lower VCO frequency, choosing the lower frequency part results in the lowest phase noise and the lowest jitter. However, choosing a higher VCO frequency may result in more flexibility in frequency planning.
Choosing a nominal charge pump current in the middle of the allowable range as a starting point allows the designer to increase or decrease the charge pump current and, thus, allows the designer to fine-tune the PLL loop bandwidth in either direction.
ADIsimCLK is a powerful PLL modeling tool that can be downloaded from www.analog.com. It is a very accurate tool for determining the optimal loop filter for a given application.

## USING THE AD9516 OUTPUTS FOR ADC CLOCK APPLICATIONS

Any high speed ADC is extremely sensitive to the quality of its sampling clock. An ADC can be thought of as a sampling mixer, and any noise, distortion, or timing jitter on the clock is combined with the desired signal at the analog-to-digital output. Clock integrity requirements scale with the analog input frequency and resolution, with higher analog input frequency applications at $\geq 14$-bit resolution being the most stringent. The theoretical SNR of an ADC is limited by the ADC resolution and the jitter on the sampling clock.

Considering an ideal ADC of infinite resolution, where the step size and quantization error can be ignored, the available SNR can be expressed approximately by

$$
\operatorname{SNR}(\mathrm{dB})=20 \times \log \left(\frac{1}{2 \pi \times f_{A} \times t_{J}}\right)
$$

where:
$f_{A}$ is the highest analog frequency being digitized. $t_{\rho}$ is the rms jitter on the sampling clock.
Figure 58 shows the required sampling clock jitter as a function of the analog frequency and effective number of bits (ENOB).

Figure 58. SNR and ENOB vs. Analog Input Frequency
See the AN-756 Application Note, Sampled Systems and the Effects of Clock Phase Noise and Jitter; and the AN-501 Application Note, Aperture Uncertainty and ADC System Performance, at www.analog.com.
Many high performance ADCs feature differential clock inputs to simplify the task of providing the required low jitter clock on a noisy PCB. (Distributing a single-ended clock on a noisy PCB may result in coupled noise on the sample clock. Differential distribution has inherent common-mode rejection that can provide superior clock performance in a noisy environment.) The AD9516 features both LVPECL and LVDS outputs that provide differential clock outputs, which enable clock solutions that maximize converter SNR performance. The input requirements of the ADC (differential or single-ended, logic level, and termination) should be considered when selecting the best clocking/converter solution.

## AD9516-5

## LVPECL CLOCK DISTRIBUTION

The LVPECL outputs of the AD9516 provide the lowest jitter clock signals that are available from the AD9516. The LVPECL outputs (because they are open emitter) require a dc termination to bias the output transistors. The simplified equivalent circuit in Figure 47 shows the LVPECL output stage.

In most applications, an LVPECL far-end Thevenin termination (see Figure 59) or Y-termination (see Figure 60) is recommended. In each case, the $\mathrm{V}_{\mathrm{s}}$ of the receiving buffer should match the Vs_lvpect. If it does not match, ac coupling is recommended (see Figure 61).

The resistor network is designed to match the transmission line impedance ( $50 \Omega$ ) and the switching threshold ( $\mathrm{V}_{s}-1.3 \mathrm{~V}$ ).

Figure 59. DC-Coupled 3.3 V LVPECL Far-End Thevenin Termination

Figure 61. AC-Coupled LVPECL with Parallel Transmission Line

LVPECL Y-termination is an elegant termination scheme that uses the fewest components and offers both odd- and even-mode impedance matching. Even-mode impedance matching is an important consideration for closely coupled transmission lines at high frequencies. Its main drawback is that it offers limited flexibility for varying the drive strength of the emitter-follower LVPECL driver. This can be an important consideration when driving long trace lengths but is usually not an issue. In the case shown in Figure 60 , where $\mathrm{V}_{\text {s_lvpect }}=2.5 \mathrm{~V}$, the $50 \Omega$ termination resistor connected to ground should be changed to $19 \Omega$.

Thevenin-equivalent termination uses a resistor network to provide $50 \Omega$ termination to a dc voltage that is below Vol of the LVPECL driver. In this case, $\mathrm{V}_{\text {S_LvPect }}$ on the AD9516 should equal $\mathrm{V}_{\mathrm{S}}$ of the receiving buffer. Although the resistor combination shown in Figure 60 results in a dc bias point of $\mathrm{V}_{\text {s_lvpect }}-2 \mathrm{~V}$, the actual common-mode voltage is $\mathrm{V}_{\text {s_LVPELL }}-1.3 \mathrm{~V}$ because additional current flows from the AD9516 LVPECL driver through the pulldown resistor.
 pull-down resistor is $62.5 \Omega$ and the pull-up resistor is $250 \Omega$.

## LVDS CLOCK DISTRIBUTION

The AD9516 provides four clock outputs (OUT6 to OUT9) that are selectable as either CMOS or LVDS level outputs. LVDS is a differential output option that uses a current mode output stage. The nominal current is 3.5 mA , which yields a 350 mV output swing across a $100 \Omega$ resistor. An output current of 7 mA is also available in cases where a larger output swing is required. The LVDS output meets or exceeds all ANSI/TIA/EIA-644 specifications.
A recommended termination circuit for the LVDS outputs is shown in Figure 62.

Figure 62. LVDS Output Termination
See the AN-586 Application Note, LVDS Data Outputs for HighSpeed Analog-to-Digital Converters for more information on LVDS.

## CMOS CLOCK DISTRIBUTION

The AD9516 provides four clock outputs (OUT6 to OUT9) that are selectable as either CMOS or LVDS level outputs. When selected as CMOS, each output becomes a pair of CMOS outputs, each of which can be individually turned on or off and set as noninverting or inverting. These outputs are 3.3 V CMOS compatible.
Whenever single-ended CMOS clocking is used, some general guidelines should be followed.
Point-to-point nets should be designed such that a driver has only one receiver on the net, if possible. This allows for simple termination schemes and minimizes ringing due to possible mismatched impedances on the net. Series termination at the source is generally required to provide transmission line matching and/or to reduce current transients at the driver. The value of the resistor is dependent on the board design and timing requirements (typically $10 \Omega$ to $100 \Omega$ is used). CMOS outputs are also limited in terms of the capacitive load or trace length that they can drive. Typically, trace lengths less than 3 inches are recommended to preserve signal rise/fall times and preserve signal integrity.

Figure 63. Series Termination of CMOS Output
Termination at the far end of the PCB trace is a second option. The CMOS outputs of the AD9516 do not supply enough current to provide a full voltage swing with a low impedance resistive, farend termination, as shown in Figure 64. The far-end termination network should match the PCB trace impedance and provide the desired switching point. The reduced signal swing may still meet receiver input requirements in some applications. This can be useful when driving long trace lengths on less critical nets.

Figure 64. CMOS Output with Far-End Termination
Because of the limitations of single-ended CMOS clocking, consider using differential outputs when driving high speed signals over long traces. The AD9516 offers both LVPECL and LVDS outputs that are better suited for driving long traces where the inherent noise immunity of differential signaling provides superior performance for clocking converters.

## AD9516-5

## OUTLINE DIMENSIONS

ORDERING GUIDE

| Model $^{1}$ | Temperature Range | Package Description | Package Option |
| :--- | :--- | :--- | :--- |
| AD9516-5BCPZ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 64 -Lead Lead Frame Chip Scale Package (LFCSP_VQ) | CP-64-4 |
| AD9516-5BCPZ-REEL7 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 64-Lead Lead Frame Chip Scale Package (LFCSP_VQ) | CP-64-4 |
| AD9516-5/PCBZ |  | Evaluation Board |  |

${ }^{1} Z=$ RoHS Compliant Part.

NOTES

## NOTES

## Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

## http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
