

CAV93C86

16 Kb Microwire Serial EEPROM

Description

The CAV93C86 is a 16 Kb Serial EEPROM memory device which is configured as either registers of 16 bits (ORG pin at V_{CC}) or 8 bits (ORG pin at GND). Each register can be written (or read) serially by using the DI (or DO) pin. The CAV93C86 is manufactured using ON Semiconductor's advanced CMOS EEPROM floating gate technology. The device is designed to endure 1,000,000 program/erase cycles and has a data retention of 100 years. The device is available in 8-pin SOIC and TSSOP packages.

Features

- Automotive Temperature Grade 1 (-40°C to $+125^{\circ}\text{C}$)
- High Speed Operation: 2 MHz
- Low Power CMOS Technology
- 2.5 V to 5.5 V Operation
- Selectable x8 or x16 Memory Organization
- Self-timed Write Cycle with Auto-clear
- Hardware and Software Write Protection
- Power-up Inadvertent Write Protection
- Sequential Read
- Program Enable (PE) Pin
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- 8-pin SOIC and TSSOP Packages
- These Devices are Pb-Free, Halogen Free/BFR Free, and RoHS Compliant

Figure 1. Functional Symbol

Note: When the ORG pin is connected to V_{CC} , the x16 organization is selected. When it is connected to ground, the x8 pin is selected. If the ORG pin is left unconnected, then an internal pull-up device will select the x16 organization.

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 9 of this data sheet.

Table 1. ABSOLUTE MAXIMUM RATINGS

| Parameters | Ratings | Units |
|--|--------------|-------|
| Storage Temperature | -65 to +150 | °C |
| Voltage on Any Pin with Respect to Ground (Note 1) | -0.5 to +6.5 | V |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The DC input voltage on any pin should not be lower than -0.5 V or higher than $V_{CC} + 0.5$ V. During transitions, the voltage on any pin may undershoot to no less than -1.5 V or overshoot to no more than $V_{CC} + 1.5$ V, for periods of less than 20 ns.

Table 2. RELIABILITY CHARACTERISTICS (Note 2)

| Symbol | Parameter | Min | Units |
|--------------------|----------------|-----------|------------------------|
| N_{END} (Note 3) | Endurance | 1,000,000 | Program / Erase Cycles |
| T_{DR} | Data Retention | 100 | Years |

2. These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.
3. Block Mode, $V_{CC} = 5$ V, 25°C.

Table 3. D.C. OPERATING CHARACTERISTICS

($V_{CC} = +2.5$ V to +5.5 V, $T_A = -40^\circ\text{C}$ to +125°C unless otherwise specified.)

| Symbol | Parameter | Test Conditions | Min | Max | Units |
|-----------|----------------------------|--|---------------------|---------------------|---------------|
| I_{CC1} | Supply Current (Write) | Write, $V_{CC} = 5.0$ V | | 2 | mA |
| I_{CC2} | Supply Current (Read) | Read, DO open, $f_{SK} = 2$ MHz, $V_{CC} = 5.0$ V | | 500 | μA |
| I_{SB1} | Standby Current (x8 Mode) | $V_{IN} = \text{GND or } V_{CC}$ $CS = \text{GND, ORG} = \text{GND}$ | | 5 | μA |
| I_{SB2} | Standby Current (x16 Mode) | $V_{IN} = \text{GND or } V_{CC}$ $CS = \text{GND, ORG} = \text{Float or } V_{CC}$ | | 3 | μA |
| I_{LI} | Input Leakage Current | $V_{IN} = \text{GND to } V_{CC}$ | | 2 | μA |
| I_{LO} | Output Leakage Current | $V_{OUT} = \text{GND to } V_{CC}$ $CS = \text{GND}$ | | 2 | μA |
| V_{IL1} | Input Low Voltage | $4.5 \text{ V} \leq V_{CC} < 5.5 \text{ V}$ | -0.1 | 0.8 | V |
| V_{IH1} | Input High Voltage | $4.5 \text{ V} \leq V_{CC} < 5.5 \text{ V}$ | 2 | $V_{CC} + 1$ | V |
| V_{IL2} | Input Low Voltage | $2.5 \text{ V} \leq V_{CC} < 4.5 \text{ V}$ | 0 | $V_{CC} \times 0.2$ | V |
| V_{IH2} | Input High Voltage | $2.5 \text{ V} \leq V_{CC} < 4.5 \text{ V}$ | $V_{CC} \times 0.7$ | $V_{CC} + 1$ | V |
| V_{OL1} | Output Low Voltage | $4.5 \text{ V} \leq V_{CC} < 5.5 \text{ V}$, $I_{OL} = 2.1$ mA | | 0.4 | V |
| V_{OH1} | Output High Voltage | $4.5 \text{ V} \leq V_{CC} < 5.5 \text{ V}$, $I_{OH} = -400$ μA | 2.4 | | V |
| V_{OL2} | Output Low Voltage | $2.5 \text{ V} \leq V_{CC} < 4.5 \text{ V}$, $I_{OL} = 1$ mA | | 0.2 | V |
| V_{OH2} | Output High Voltage | $2.5 \text{ V} \leq V_{CC} < 4.5 \text{ V}$, $I_{OH} = -100$ μA | $V_{CC} - 0.2$ | | V |

Table 4. PIN CAPACITANCE (Note 4)

| Symbol | Test | Conditions | Min | Typ | Max | Units |
|-----------|-------------------------------------|-----------------|-----|-----|-----|-------|
| C_{OUT} | Output Capacitance (DO) | $V_{OUT} = 0$ V | | | 5 | pF |
| C_{IN} | Input Capacitance (CS, SK, DI, ORG) | $V_{IN} = 0$ V | | | 5 | pF |

Table 5. POWER-UP TIMING (Notes 4, 5)

| Symbol | Parameter | Max | Units |
|-----------|-----------------------------|-----|-------|
| t_{PUR} | Power-up to Read Operation | 1 | ms |
| t_{PUW} | Power-up to Write Operation | 1 | ms |

Table 6. A.C. TEST CONDITIONS

| | | |
|---------------------------|--|--|
| Input Rise and Fall Times | ≤ 50 ns | |
| Input Pulse Voltages | 0.4 V to 2.4 V | $4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$ |
| Timing Reference Voltages | 0.8 V, 2.0 V | $4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$ |
| Input Pulse Voltages | $0.2 V_{CC}$ to $0.7 V_{CC}$ | $2.5\text{ V} \leq V_{CC} \leq 4.5\text{ V}$ |
| Timing Reference Voltages | $0.5 V_{CC}$ | $2.5\text{ V} \leq V_{CC} \leq 4.5\text{ V}$ |
| Output Load | Current Source I_{OLmax}/I_{OHmax} ; $CL = 100$ pF | |

4. These parameters are tested initially and after a design or process change that affects the parameter.
 5. t_{PUR} and t_{PUW} are the delays required from the time V_{CC} is stable until the specified operation can be initiated.
 6. The input levels and timing reference points are shown in the "A.C. Test Conditions" table.

Table 7. A.C. CHARACTERISTICS

($V_{CC} = +2.5\text{ V}$ to $+5.5\text{ V}$, $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, unless otherwise specified.)

| Symbol | Parameter | Min | Max | Units |
|-------------------|------------------------------|------|------|---------------|
| t_{CSS} | CS Setup Time | 50 | | ns |
| t_{CSH} | CS Hold Time | 0 | | ns |
| t_{DIS} | DI Setup Time | 100 | | ns |
| t_{DIH} | DI Hold Time | 100 | | ns |
| t_{PD1} | Output Delay to 1 | | 0.25 | μs |
| t_{PD0} | Output Delay to 0 | | 0.25 | μs |
| t_{HZ} (Note 7) | Output Delay to High-Z | | 100 | ns |
| t_{EW} | Program/Erase Pulse Width | | 5 | ms |
| t_{CSMIN} | Minimum CS Low Time | 0.25 | | μs |
| t_{SKHI} | Minimum SK High Time | 0.25 | | μs |
| t_{SKLOW} | Minimum SK Low Time | 0.25 | | μs |
| t_{SV} | Output Delay to Status Valid | | 0.25 | μs |
| SK_{MAX} | Maximum Clock Frequency | DC | 2000 | kHz |

7. This parameter is tested initially and after a design or process change that affects the parameter.

| WRAL | 1 | 00 | 01XXXXXXXX | 01XXXXXXXX | D7-D0 | D15-D0 | Write All Addresses |

Device Operation

The CAV93C86 is a 16,384-bit nonvolatile memory intended for use with industry standard microprocessors. The CAV93C86 can be organized as either registers of 16 bits or 8 bits. When organized as X16, seven 13-bit instructions control the reading, writing and erase operations of the device. When organized as X8, seven 14-bit instructions control the reading, writing and erase operations of the device. The CAV93C86 operates on a single power supply and will generate on chip, the high voltage required during any write operation.

Instructions, addresses, and write data are clocked into the DI pin on the rising edge of the clock (SK). The DO pin is normally in a high impedance state except when reading data from the device, or when checking the ready/busy status after a write operation.

The ready/busy status can be determined after the start of a write operation by selecting the device (CS high) and polling the DO pin; DO low indicates that the write operation is not completed, while DO high indicates that the device is ready for the next instruction. If necessary, the DO pin may be placed back into a high impedance state during chip select by shifting a dummy "1" into the DI pin. The DO pin will enter the high impedance state on the falling edge of the clock (SK). Placing the DO pin into the high impedance state is recommended in applications where the DI pin and the DO pin are to be tied together to form a common DI/O pin.

The format for all instructions sent to the device is a logical "1" start bit, a 2-bit (or 4-bit) opcode, 10-bit address (an additional bit when organized X8) and for write operations a 16-bit data field (8-bit for X8 organizations).

Note: The Write, Erase, Write all and Erase all instructions require PE = 1. If PE is left floating, 93C86 is in Program Enabled mode. For Write Enable and Write Disable instruction PE = don't care.

Read

Upon receiving a READ command and an address (clocked into the DI pin), the DO pin of the CAV93C86 will come out of the high impedance state and, after sending an initial dummy zero bit, will begin shifting out the data addressed (MSB first). The output data bits will toggle on the rising edge of the SK clock and are stable after the specified time delay (t_{PD0} or t_{PD1}).

After the initial data word has been shifted out and CS remains asserted with the SK clock continuing to toggle, the device will automatically increment to the next address and shift out the next data word in a sequential READ mode. As long as CS is continuously asserted and SK continues to toggle, the device will keep incrementing to the next address automatically until it reaches to the end of the address space, then loops back to address 0. In the sequential READ mode, only the initial data word is preceeded by a dummy zero bit. All subsequent data words will follow without a dummy zero bit.

Write

After receiving a WRITE command, address and the data, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking clear and data store cycle of the memory location specified in the instruction. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAV93C86 can be determined by selecting the device and polling the DO pin. Since this device features Auto-Clear before write, it is NOT necessary to erase a memory location before it is written into.

CAV93C86

Figure 2. Synchronous Data Timing

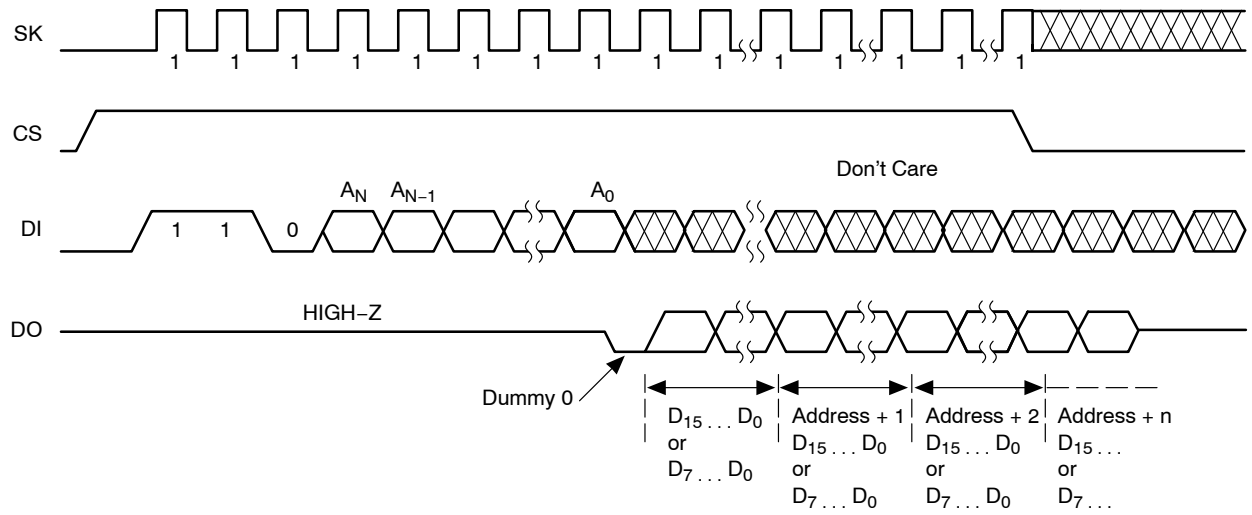

Figure 3. Read Instruction Timing

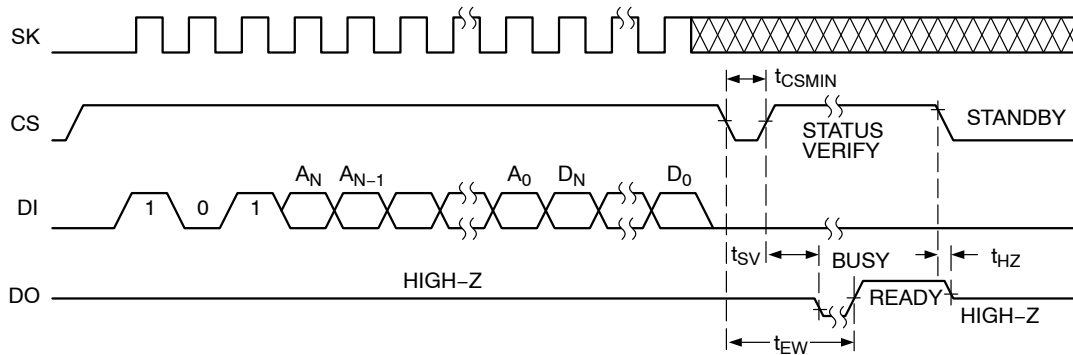

Figure 4. Write Instruction Timing

Erase

Upon receiving an ERASE command and address, the CS (Chip Select) pin must be deasserted for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking clear cycle of the selected memory location. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAV93C86 can be determined by selecting the device and polling the DO pin. Once cleared, the content of a cleared location returns to a logical “1” state.

Erase/Write Enable and Disable

The CAV93C86 powers up in the write disable state. Any writing after power-up or after an EWDS (write disable) instruction must first be preceded by the EWEN (write enable) instruction. Once the write instruction is enabled, it will remain enabled until power to the device is removed, or the EWDS instruction is sent. The EWDS instruction can be used to disable all CAV93C86 write and clear instructions, and will prevent any accidental writing or clearing of the device. Data can be read normally from the device regardless of the write enable/disable status.

Erase All

Upon receiving an ERAL command, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking clear cycle of all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAV93C86 can be determined by selecting the device and polling the DO pin. Once cleared, the contents of all memory bits return to a logical “1” state.

Write All

Upon receiving a WRAL command and data, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking data write to all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAV93C86 can be determined by selecting the device and polling the DO pin. It is not necessary for all memory locations to be cleared before the WRAL command is executed.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
