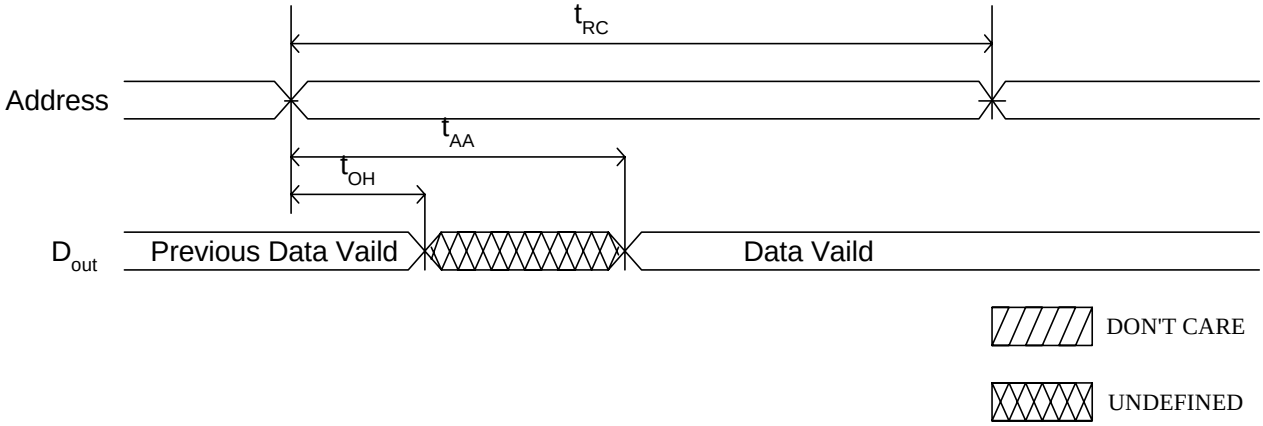
TIMING WAVEFORMS

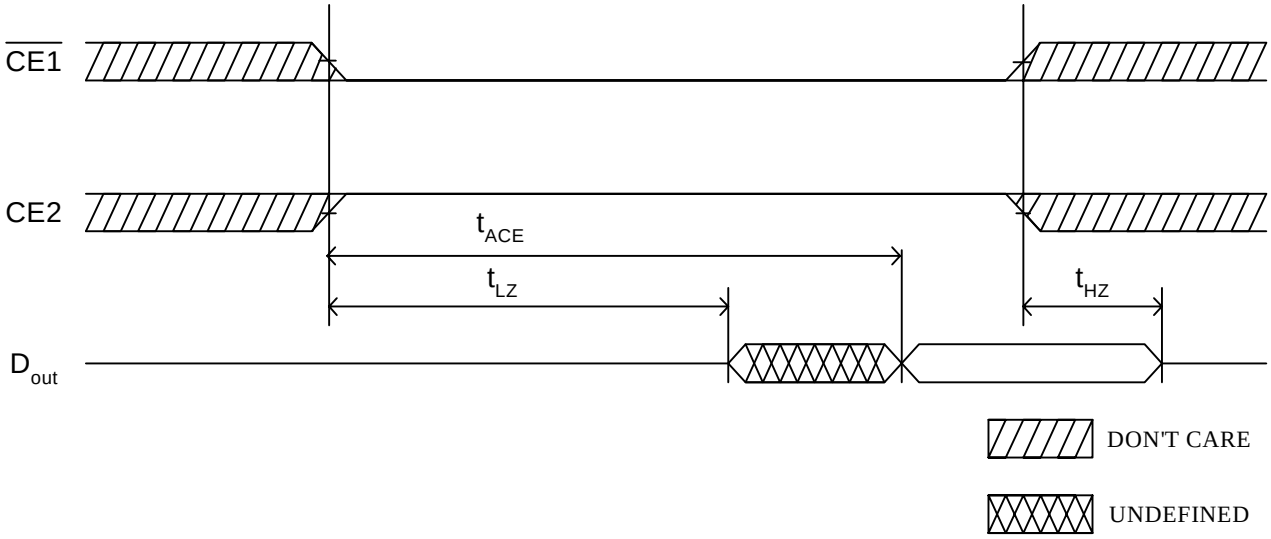
READ CYCLE 1

(Address Controlled)



READ CYCLE 2

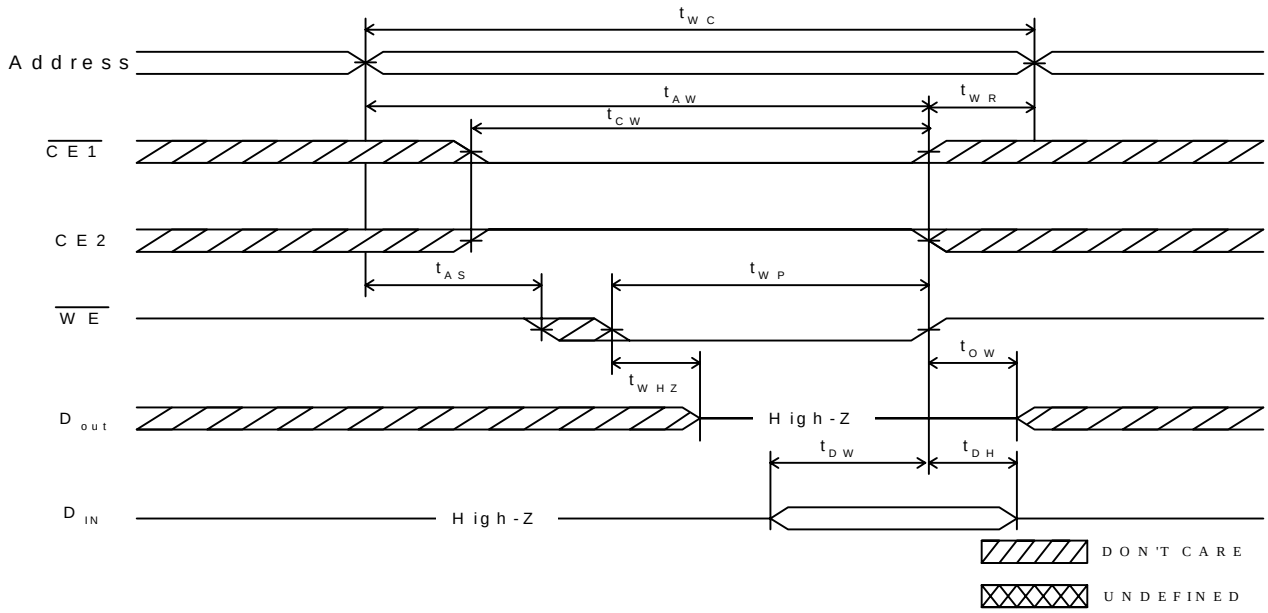
(Chip Enable Controlled)



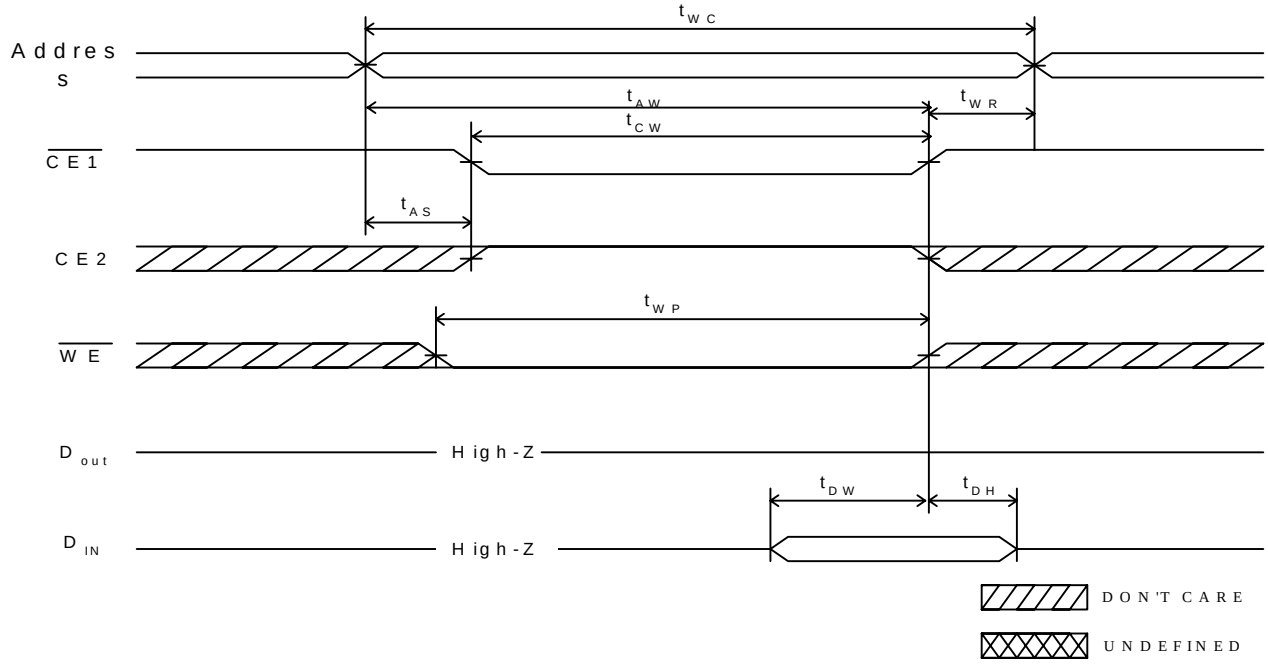
Notes (READ CYCLE) :

1. $\overline{\mathbf{WE}}$ are high for read cycle.
2. All read cycle timing is referenced from the last valid address to the first transition address.
3. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit condition referenced to V_{OH} or V_{OL} levels.
4. At any given temperature and voltage condition. t_{HZ} (max.) is less than t_{LZ} (min.) both for a given device and from device to device interconnection.
5. Transition is measured ±200mV from steady state voltage with load. This parameter is sampled and not 100% tested.
6. Device is continuously selected with $\overline{\mathbf{CE}}1 = V_{IL}$.

WRITE CYCLE 1 ($\overline{WE}$ Controlled)



WRITE CYCLE 2 ($\overline{CE}$ Controlled)



NOTES (WRITE CYCLE) :

1. A write occurs during the overlap of a low $\overline{CE}1$, a high CE2 and a low $\overline{WE}$. A write begins at the lateat transition among $\overline{CE}1$ goes low, CE2 going high and $\overline{WE}$ going low. A write end at the earliest transition among $\overline{CE}1$ going high, CE2 going low and $\overline{WE}$ going high. tWP is measured from the beginning of write to the end of write.
2. tCW is measured from the later of $\overline{CE}1$ going low or CE2 going high to the end of write.
3. tAS is measured from the address valid to the beginning of write.
4. tWR is measured from the end of write to the address change.
