

TMS320C6743 Fixed- and Floating-Point Digital Signal Processor

1 TMS320C6743 Fixed- and Floating-Point Digital Signal Processor

1.1 Features

- Applications
 - Networking
 - High-Speed Encoding
 - Professional Audio™
- Software Support
 - TI DSP/BIOS™
 - Chip Support Library and DSP Library
- 375-MHz TMS320C674x Fixed- and Floating-Point VLIW DSP Core
 - Load-Store Architecture with Nonaligned Support
 - 64 General-Purpose Registers (32-Bit)
 - Six ALU (32- and 40-Bit) Functional Units
 - Supports 32-Bit Integer, SP (IEEE Single Precision/32-Bit) and DP (IEEE Double Precision/64-Bit) Floating Point
 - Supports up to Four SP Additions Per Clock, Four DP Additions Every 2 Clocks
 - Supports up to Two Floating Point (SP or DP) Reciprocal Approximation (RCPxP) and Square-Root Reciprocal Approximation (RSQRxP) Operations Per Cycle
 - Two Multiply Functional Units
 - Mixed-Precision IEEE Floating Point Multiply Supported up to:
 - 2 SP x SP -> SP Per Clock
 - 2 SP x SP -> DP Every Two Clocks
 - 2 SP x DP -> DP Every Three Clocks
 - 2 DP x DP -> DP Every Four Clocks
 - Fixed-Point Multiply Supports Two 32 x 32-Bit Multiplies, Four 16 x 16-Bit Multiplies, or Eight 8 x 8-Bit Multiplies per Clock Cycle, and Complex Multiplies
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
 - Hardware Support for Modulo Loop Operation
 - Protected Mode Operation
 - Exceptions Support for Error Detection and Program Redirection
- C674x Instruction Set Features
 - Superset of the C67x+ and C64x+ ISAs
 - 3000 MIPS and 2250 MFLOPS C674x
 - Byte-Addressable (8-, 16-, 32-, and 64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - Compact 16-Bit Instructions
- C674x Two-Level Cache Memory Architecture
 - 32KB of L1P Program RAM/Cache
 - 32KB of L1D Data RAM/Cache
 - 128KB of L2 Unified Mapped RAM/Cache
 - Flexible RAM/Cache Partition (L1 and L2)
- Enhanced Direct Memory Access Controller 3 (EDMA3):
 - 2 Transfer Controllers
 - 32 Independent DMA Channels
 - 8 Quick DMA Channels
 - Programmable Transfer Burst Size
- 3.3-V LVCMOS I/Os
- Two External Memory Interfaces:
 - EMIFA
 - NOR (8-Bit-Wide Data)
 - NAND (8-Bit-Wide Data)
 - EMIFB
 - 16-bit SDRAM, up to 128MB
- Two Configurable 16550-Type UART Modules:
 - UART0 with Modem Control Signals
 - 16-Byte FIFO
 - 16x or 13x Oversampling Option
- One Serial Peripheral Interface (SPI) with One Chip Select
- Multimedia Card (MMC)/Secure Digital (SD)
- Two Master and Slave Inter-Integrated Circuit (I²C Bus™)
- Programmable Real-Time Unit Subsystem (PRUSS)
 - Two Independent Programmable Real-Time Unit (PRU) Cores
 - 32-Bit Load-Store RISC Architecture
 - 4KB of Instruction RAM per Core
 - 512 Bytes of Data RAM per Core
 - PRUSS can be Disabled Through Software to Save Power
 - Register 30 of each PRU is Exported from the Subsystem in Addition to the Normal R31 Output of the PRU Cores
 - Standard Power-Management Mechanism
 - Clock Gating
 - Entire Subsystem Under a Single PSC Clock Gating Domain
- Dedicated Interrupt Controller

- Dedicated Switched Central Resource
- Two Multichannel Audio Serial Ports (McASPs):
 - Supports TDM, I2S, and Similar Formats
 - FIFO Buffers for Transmit and Receive
- 10/100 Mbps RMI Ethernet Media Access Controller (EMAC):
 - IEEE 802.3 Compliant (3.3-V I/O Only)
 - RMI Media-Independent Interface
 - Management Data I/O (MDIO) Module
- One 64-Bit General-Purpose Timer (Configurable as Two 32-Bit Timers)
- One 64-Bit General-Purpose Watchdog Timer (Configurable as Two 32-Bit Timers)
- Three Enhanced Pulse Width Modulators (eHRPWMs):
 - Dedicated 16-Bit Time-Base Counter with Period and Frequency Control
- 6 Single Edge, 6 Dual Edge Symmetric, or 3 Dual Edge Asymmetric Outputs
- Dead-Band Generation
- PWM Chopping by High-Frequency Carrier
- Trip Zone Input
- Three 32-Bit Event Capture (eCAP) Modules:
 - Configurable as 3 Capture Inputs or 3 Auxiliary Pulse Width Modulator (APWM) Outputs
 - Single-Shot Capture of up to Four Event Time-Stamps
- Two 32-Bit Enhanced Quadrature Encoder Pulse (eQEP) Modules
- 256-Ball Pb-Free Plastic Ball Grid Array (PBGA) [ZKB Suffix], 1.0-mm Ball Pitch
- 176-Pin Thin Quad Flat Pack (TQFP) [PTP Suffix], 0.5-mm Pin Pitch
- Commercial or Automotive Temperature

1.2 Applications

- A/V Receivers
- Automotive Amplifiers
- Soundbars
- Home Theatre Systems
- Professional Audio
- Network Streaming Audio

1.3 Description

The C6743 device is a low-power digital signal processor based on C674x DSP core. The device consumes significantly lower power than other members of the TMS320C6000™ platform of DSPs.

The C6743 device enables original-equipment manufacturers (OEMs) and original-design manufacturers (ODMs) to quickly bring to market devices featuring high processing performance.

The C6743 DSP core uses a two-level cache-based architecture. The Level 1 program cache (L1P) is a 32-KB direct mapped cache and the Level 1 data cache (L1D) is a 32-KB 2-way set-associative cache. The Level 2 program cache (L2P) consists of a 128-KB of memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two.

The peripheral set includes: a 10/100 Mbps Ethernet MAC (EMAC) with a management data input/output (MDIO) module; two I²C Bus interfaces; two multichannel audio serial ports (McASPs) with 14/9 serializers and FIFO buffers; two 64-bit general-purpose timers each configurable (one configurable as watchdog); up to 8 banks of 16 pins of general-purpose input/output (GPIO) with programmable interrupt/event generation modes, multiplexed with other peripherals; two UART interfaces (one with both $\overline{\text{RTS}}$ and $\overline{\text{CTS}}$); three enhanced high-resolution pulse width modulator (eHRPWM) peripherals; three 32-bit enhanced capture (eCAP) module peripherals which can be configured as 3 capture inputs or 3 auxiliary pulse width modulator (APWM) outputs; two 32-bit enhanced quadrature encoded pulse (eQEP) peripherals; and 2 external memory interfaces (EMIFs): an asynchronous external memory interface (EMIFA) for slower memories or peripherals, and a higher speed memory interface (EMIFB) for SDRAM.

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the C6743 and the network. The EMAC supports both 10Base-T and 100Base-TX, or 10 Mbps and 100 Mbps in either half- or full-duplex mode. Additionally, an MDIO interface is available for PHY configuration.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections later in this document and the associated peripheral reference guides.

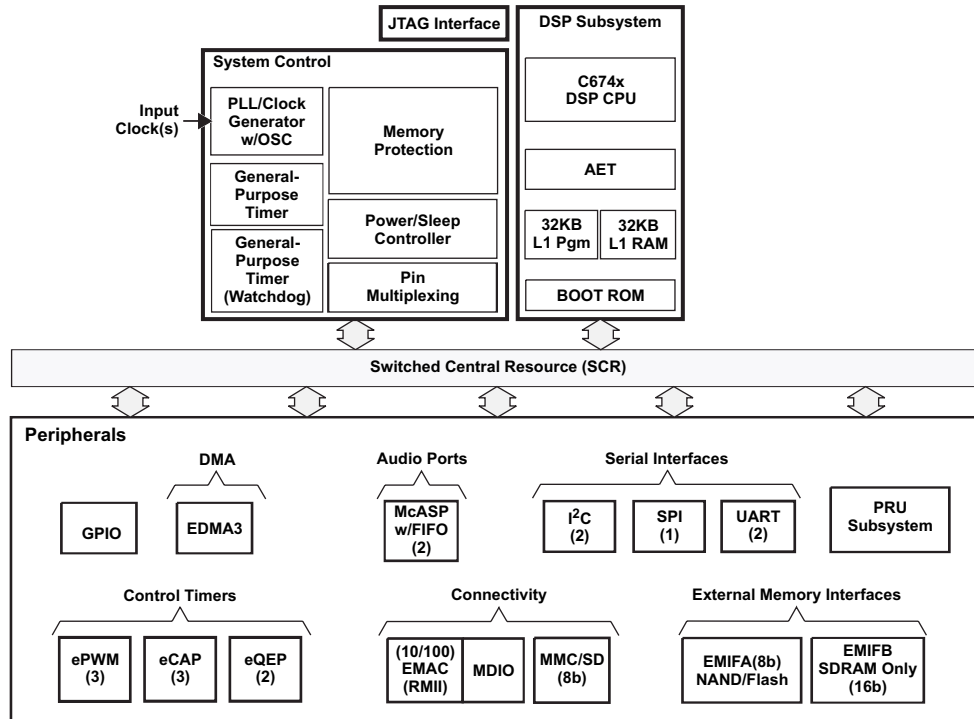

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE
TMS320C6743	BGA (256)	17.00 mm x 17.00 mm
TMS320C6743	HLQFP (176)	24.00 mm x 24.00 mm

3 Device Overview

3.1 Device Characteristics

provides an overview of the C6743 Low power digital signal processor. The table shows significant features of the device, including the capacity of on-chip RAM, peripherals, and the package type with pin count.

Characteristics of the C6743 Processor

HARDWARE FEATURES		C6743	
Peripherals Not all peripherals pins are available at the same time (for more detail, see the Device Configurations section).	EMIFB	SDRAM only, 16-bit bus width, up to 128 MB (PTP)	SDRAM only, 16-bit bus width, up to 128 MB (ZKB)
	EMIFA	Asynchronous (8-bit bus width) RAM, Flash, NOR, NAND	
	Flash Card Interface	MMC and SD cards supported.	
	EDMA3	32 independent channels, 8 QDMA channels, 2 Transfer controllers	
	Timers	2 64-Bit General Purpose (configurable as 2 separate 32-bit timers, 1 configurable as Watch Dog)	
	UART	2 (One with RTS and CTS flow control)	
	SPI	One with one hardware chip select	
	I ² C	2 (both Master/Slave)	
	Multichannel Audio Serial Port [McASP]	2 (each with transmit/receive, FIFO buffer, 14/9 serializers)	
	10/100 Ethernet MAC with Management Data I/O	1 (RMII Interface)	
	eHRPWM	6 Single Edge, 6 Dual Edge Symmetric, or 3 Dual Edge Asymmetric Outputs	
	eCAP	3 32-bit capture inputs or 3 32-bit auxiliary PWM outputs	
	eQEP	2 32-bit QEP channels with 4 inputs/channel	
	General-Purpose Input/Output Port	8 banks of 16-bit	
	PRU Subsystem (PRUSS)	2 Programmable PRU Cores	
On-Chip Memory	Size (Bytes)	320KB RAM	
	Organization	DSP 32KB L1 Program (L1P)/Cache (up to 32KB) 32KB L1 Data (L1D)/Cache (up to 32KB) 128KB Unified Mapped RAM/Cache (L2) DSP Memories can be made accessible to EDMA3, and other peripherals.

(1) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

3.2 Device Compatibility

The C674x DSP core is code-compatible with the C6000™ DSP platform and supports features of both the C64x+ and C67x+ DSP families.

3.3 DSP Subsystem

The DSP Subsystem includes the following features:

- C674x DSP CPU
- 32KB L1 Program (L1P)/Cache (up to 32KB)
- 32KB L1 Data (L1D)/Cache (up to 32KB)
- 128KB Unified Mapped RAM/Cache (L2)
- Boot ROM (cannot be used for application code)
- Little endian

Figure 3-1. C674x Megamodule Block Diagram

3.3.1 C674x DSP CPU Description

The C674x Central Processing Unit (CPU) consists of eight functional units, two register files, and two data paths as shown in [Figure 3-2](#). The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

Each C674x .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, one 16 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, two 16 x 16 bit multiplies with add/subtract capabilities, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes four 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produces one 32-bit packed output that contain 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or (Arithmetic Logic Unit) now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C674x core enhances the .S unit in several ways. On the previous cores, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C674x core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C674x compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.
- **Instruction Set Enhancement** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.
- **Exceptions Handling** - Intended to aid the programmer in isolating bugs. The C674x CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.
- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is **not** sensitive to system stalls.

For more details on the C674x CPU and its enhancements over the C64x architecture, see the following documents:

- *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* ([SPRU732](#))
- *TMS320C64x Technical Overview* ([SPRU395](#))

- A. On .M unit, dst2 is 32 MSB.
- B. On .M unit, dst1 is 32 LSB.
- C. On C64x CPU .M unit, src2 is 32 bits; on C64x+ CPU .M unit, src2 is 64 bits.
- D. On .L and .S units, odd dst connects to odd register files and even dst connects to even register files.

Figure 3-2. TMS320C674x CPU (DSP Core) Data Paths

3.3.2 DSP Memory Mapping

The DSP memory map is shown in [Section 3.4](#).

3.3.2.1 External Memories

The DSP has access to the following External memories:

- Asynchronous EMIF / NAND / NOR Flash (EMIFA)
- SDRAM (EMIFB)

3.3.2.2 DSP Internal Memories

The DSP has access to the following DSP memories:

- L2 RAM
- L1P RAM
- L1D RAM

3.3.2.3 C674x CPU

The C674x core uses a two-level cache-based architecture. The Level 1 Program cache (L1P) is 32 KB direct mapped cache and the Level 1 Data cache (L1D) is 32 KB 2-way set associated cache. The Level 2 memory/cache (L2) consists of a 128 KB memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or a combination of both.

[Table 3-1](#) shows a memory map of the C674x CPU cache registers for the device.

Table 3-1. C674x Cache Registers

HEX ADDRESS RANGE	REGISTER NAME	DESCRIPTION
0x0184 0000	L2CFG	L2 Cache configuration register (See the Technical Reference Manual SPRUH90 for reset configuration)

3.5 Pin Assignments

Extensive use of pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings.

3.5.1 Pin Map (Bottom View)

Figure 3-3 and Figure 3-4 show the pin assignments for ZKB package and PTP packages, respectively.

Figure 3-3. Pin Map (ZKB)

Figure 3-4. Pin Map (PTP)

3.6 Terminal Functions

Table 3-3 to Section 3.6.17 identify the external signal names, the associated pin/ball numbers along with the mechanical package designator, the pin type (I, O, IO, OZ, or PWR), whether the pin/ball has any internal pullup/pulldown resistors, whether the pin/ball is configurable as an IO in GPIO mode, and a functional pin description.

3.6.1 Device Reset and JTAG

Table 3-3. Reset and JTAG Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
RESET						
$\overline{\text{RESET}}$	146	G3	I			Device reset input
JTAG						
TMS	152	J1	I	IPU		JTAG test mode select
TDI	153	J2	I	IPU		JTAG test data input
TDO	156	J3	O	IPU		JTAG test data output
TCK	155	H3	I	IPU		JTAG test clock
$\overline{\text{TRST}}$	150	J4	I	IPD		JTAG test reset
EMU0/GP7[15]	-	J5	I/O	IPD	GPIO	Emulation Signal

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.2 High-Frequency Oscillator and PLL

Table 3-4. High-Frequency Oscillator and PLL Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	DESCRIPTION
	PTP	ZKB			
1.2-V OSCILLATOR					
OSCIN	143	F2	I		Oscillator input
OSCOU	145	F1	O		Oscillator output
OSCVSS	144	E2	GND		Oscillator ground (for filter only)
1.2-V PLL					
PLL0_VDDA	141	D1	PWR		PLL analog V_{DD} (1.2-V filtered supply)
PLL0_VSSA	142	E1	GND		PLL analog V_{SS} (for filter)

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

SPI0_ENA / UART0_CTS /EQEP0A/GP5[3]/BOOT[3]	12	R5	I/O	IPU	UART0, EQEP0A, GPIO, BOOT	SPI0 enable
SPI0_CLK /EQEP1I/GP5[2]/BOOT[2]	11	T5	I/O	IPD	eQEP1, GPIO, BOOT	SPI0 clock
SPI0_SIMO[0] /EQEP0S/GP5[1]/BOOT[1]	18	P6	I/O	IPD	eQEP0, GPIO, BOOT	SPI0 data slave-in-master-out
SPI0_SOMI[0] /EQEP0I/GP5[0]/BOOT[0]	17	R6	I/O	IPD	eQEP0, GPIO, BOOT	SPI0 data slave-out-master-in

(1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.6 Enhanced Capture/Auxiliary PWM Modules (eCAP0, eCAP1, eCAP2)

The eCAP Module pins function as either input captures or auxiliary PWM 32-bit outputs, depending upon how the eCAP module is programmed.

Table 3-8. Enhanced Capture Module (eCAP) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
eCAP0						
ACLKX0/ ECAP0/APWM0 /GP2[12]	126	C5	I/O	IPD	McASP0, GPIO	enhanced capture 0 input or auxiliary PWM 0 output
eCAP1						
ACLKR0/ ECAP1/APWM1 /GP2[15]	130	B4	I/O	IPD	McASP0, GPIO	enhanced capture 1 input or auxiliary PWM 1 output
eCAP2						
ACLKR1/ ECAP2/APWM2 /GP4[12]	165	L2	I/O	IPD	McASP1, GPIO	enhanced capture 2 input or auxiliary PWM 2 output

(1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.7 Enhanced Pulse Width Modulators (eHRPWM0, eHRPWM1, eHRPWM2)

Table 3-9. Enhanced Pulse Width Modulator (eHRPWM) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
eHRPWM0						
ACLKX1/EPWM0A/GP3[15]	162	K3	I/O	IPD	McASP1, GPIO	eHRPWM0 A output (with high-resolution)
AHCLKX1/EPWM0B/GP3[14]	160	K2	I/O	IPD		eHRPWM0 B output
AMUTE1/EPWMTZ/GP4[14]	132	D4	I/O	IPD	McASP1, eHRPWM1, GPIO, eHRPWM2	eHRPWM0 trip zone input
AFSX1/EPWMSYNCI/EPWMSYNCO/GP4[10]	163	K4	I/O	IPD	McASP1, eHRPWM0, GPIO	Sync input to eHRPWM0 module or sync output to external PWM
eHRPWM1						
AXR1[8]/EPWM1A/GP4[8]	168	M2	I/O	IPD	McASP1, GPIO	eHRPWM1 A (with high-resolution)
AXR1[7]/EPWM1B/GP4[7]	169	M3	I/O	IPD		eHRPWM1 B output
AMUTE1/EPWMTZ/GP4[14]	132	D4	I/O	IPD	McASP1, eHRPWM0, GPIO, eHRPWM2	eHRPWM1 trip zone input
eHRPWM2						
AXR1[6]/EPWM2A/GP4[6]	170	M4	I/O	IPD	McASP1, GPIO	eHRPWM2 A (with high-resolution)
AXR1[5]/EPWM2B/GP4[5]	171	N1	I/O	IPD		eHRPWM2 B output
AMUTE1/EPWMTZ/GP4[14]	132	D4	I/O	IPD	McASP1, eHRPWM0, GPIO, eHRPWM2	eHRPWM2 trip zone input

(1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.8 Enhanced Quadrature Encoder Pulse Module (eQEP)

Table 3-10. Enhanced Quadrature Encoder Pulse Module (eQEP) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
eQEP0						
SPI0_ENA/UART0_CTS/EQEP0A/GP5[3]/BOOT[3]	12	R5	I	IPU	SPI0, UART0, GPIO, BOOT	eQEP0A quadrature input
SPI0_SCS[0]/UART0_RTS/EQEP0B/GP5[4]/BOOT[4]	9	N4	I	IPU		eQEP0B quadrature input
SPI0_SOMI[0]/EQEP0I/GP5[0]/BOOT[0]	17	R6	I	IPD	SPI0, GPIO, BOOT	eQEP0 index
SPI0_SIMO[0]/EQEP0S/GP5[1]/BOOT[1]	18	P6	I	IPD		eQEP0 strobe
eQEP1						
AXR1[3]/EQEP1A/GP4[3]	174	P1	I	IPD	McASP1, GPIO	eQEP1A quadrature input
AXR1[4]/EQEP1B/GP4[4]	173	N2	I	IPD		eQEP1B quadrature input
SPI0_CLK/EQEP1I/GP5[2]/BOOT[2]	11	T5	I	IPD	SPI0, GPIO, BOOT	eQEP1 index
EQEP1S/GP5[7]/BOOT[7]	16	T6	I	IPD	GPIO, BOOT	eQEP1 strobe

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.9 Boot

Table 3-11. Boot Terminal Functions⁽¹⁾

SIGNAL NAME	PIN NO		TYPE ⁽²⁾	PULL ⁽³⁾	MUXED	DESCRIPTION
	PTP	ZKB				
$\overline{\text{EMA_CS}}[2]/\text{GP2}[5]/\text{BOOT}[15]$	23	P7	I	IPU	EMIFA, GPIO	BOOT[15]
$\overline{\text{EMA_WE}}/\text{AXR0}[12]/\text{GP2}[3]/\text{BOOT}[14]$	55	M13	I	IPU	EMIFA, McASP0, GPIO	BOOT[14]
$\text{EMA_D}[7]/\text{MMCS_D}[7]/\text{GP0}[7]/\text{BOOT}[13]$	54	M15	I	IPU	EMIFA, MMC/SD, GPIO	BOOT[13]

$\text{AHCLKR0}/\text{RMII_MHZ_50_CLK}/\text{GP2}[14]/\text{BOOT}[11]$	129	A4	I	IPD	McASP0, EMAC, GPIO	BOOT[11]
$\text{AFSX0}/\text{GP2}[13]/\text{BOOT}[10]$	127	D5	I	IPD	McASP0, GPIO	BOOT[10]
$\text{UART0_TXD}/\text{I2C0_SCL}/\text{TM64P0_OUT12}/\text{GP5}[9]/\text{BOOT}[9]$	3	P3	I	IPU	UART0, I2C0, Timer0, GPIO	BOOT[9]
$\text{UART0_RXD}/\text{I2C0_SDA}/\text{TM64P0_IN12}/\text{GP5}[8]/\text{BOOT}[8]$	2	R3	I	IPU	UART0, I2C0, Timer0, GPIO	BOOT[8]
$\text{EQEP1S}/\text{GP5}[7]/\text{BOOT}[7]$	16	T6	I	IPD	eQEP1, GPIO	BOOT[7]
$\text{I2C1_SDA}/\text{GP5}[6]/\text{BOOT}[6]$	14	N5	I	IPU	I2C1, GPIO	BOOT[6]
$\text{I2C1_SCL}/\text{GP5}[5]/\text{BOOT}[5]$	13	P5	I	IPU		BOOT[5]
$\overline{\text{SPI0_SCS}}[0]/\overline{\text{UART0_RTS}}/\text{EQEP0B}/\text{GP5}[4]/\text{BOOT}[4]$	9	N4	I	IPU	SPI0, UART0, eQEP0, GPIO	BOOT[4]
$\overline{\text{SPI0_ENA}}/\text{UART0_CTS}/\text{EQEP0A}/\text{GP5}[3]/\text{BOOT}[3]$	12	R5	I	IPU	SPI0, UART0, eQEP0, GPIO	BOOT[3]
$\text{SPI0_CLK}/\text{EQEP1I}/\text{GP5}[2]/\text{BOOT}[2]$	11	T5	I	IPD	SPI0, eQEP1, GPIO	BOOT[2]
$\text{SPI0_SIMO}[0]/\text{EQEP0S}/\text{GP5}[1]/\text{BOOT}[1]$	18	P6	I	IPD	SPI0, eQEP0, GPIO	BOOT[1]
$\text{SPI0_SOMI}[0]/\text{EQEP0I}/\text{GP5}[0]/\text{BOOT}[0]$	17	R6	I	IPD		BOOT[0]

(1) Boot decoding will be defined in the ROM datasheet.

(2) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(3) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

Universal Asynchronous Receiver/Transmitters (UART0, UART2)

Table 3-12. Universal Asynchronous Receiver/Transmitter (UART) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
UART0						
UART0_RXD/I2C0_SDA/TM64P0_IN12/GP5[8]/BOOT[8]	2	R3	I	IPU	I2C0, BOOT, Timer0, GPIO,	UART0 receive data
UART0_TXD/I2C0_SCL/TM64P0_OUT12/GP5[9]/BOOT[9]	3	P3	O	IPU	I2C0, Timer0, GPIO, BOOT	UART0 transmit data
$\overline{\text{SPIO_SCS}}[0]/ \overline{\text{UART0_RTS}} / \text{EQEP0B}/\text{GP5}[4]/\text{BOOT}[4]$	9	N4	O	IPU	SPIO, eQEP0, GPIO, BOOT	UART0 ready-to-send output
$\overline{\text{SPIO_ENA}}/ \overline{\text{UART0_CTS}} / \text{EQEP0A}/\text{GP5}[3]/\text{BOOT}[3]$	12	R5	I	IPU		UART0 clear-to-send input
UART2						
UART2_RXD/GP5[12]	7	R4	I	IPU	GPIO	UART2 receive data
UART2_TXD/GP5[13]	8	P4	O	IPU		UART2 transmit data

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.10 Inter-Integrated Circuit Modules (I2C0, I2C1)

Table 3-13. Inter-Integrated Circuit (I2C) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
I2C0						
UART0_RXD/I2C0_SDA/TM64P0_IN12/GP5[8]/BOOT[8]	2	R3	I/O	IPU	UART0, Timer0, GPIO, BOOT	I2C0 serial data
UART0_TXD/I2C0_SCL/TM64P0_OUT12/GP5[9]/BOOT[9]	3	P3	I/O	IPU	UART0, Timer0, GPIO, BOOT	I2C0 serial clock
I2C1						
I2C1_SDA/GP5[6]/BOOT[6]	14	N5	I/O	IPU	GPIO, BOOT	I2C1 serial data
I2C1_SCL/GP5[5]/BOOT[5]	13	P5	I/O	IPU		I2C1 serial clock

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.11 Timers

Table 3-14. Timers Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
TIMER0						
UART0_RXD/I2C0_SDA/TM64P0_IN12/GP5[8]/BOOT[8]	2	R3	I	IPU	UART0, I2C0, GPIO, BOOT	Timer0 lower input
UART0_TXD/I2C0_SCL/TM64P0_OUT12/GP5[9]/BOOT[9]	3	P3	O	IPU		Timer0 lower output
TIMER1 (Watchdog)						
No external pins. The Timer1 peripheral pins are not pinned out as external pins.						

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.12 Multichannel Audio Serial Ports (McASP0, McASP1)

Table 3-15. Multichannel Audio Serial Ports (McASPs) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
McASP0

AXR0[1]/RMII_TXD[1]/GP3[1]	112	C8	O	IPD		
AXR0[0]/RMII_TXD[0]/GP3[0]	111	B8	O	IPD		
MDIO						
AXR0[8]/MDIO_D/GP3[8]	121	B6	I/O	IPU	McASP0, GPIO	MDIO serial data
AXR0[7]/MDIO_CLK/GP3[7]	120	A6	O	IPD		MDIO data clock

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.14 Multimedia Card/Secure Digital (MMC/SD)

Table 3-17. Multimedia Card/Secure Digital (MMC/SD) Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
EMA_A[1]/MMCS_D_CLK/GP1[1]	30	R9	O	IPU	EMIFA, GPIO	MMCS_D_CLK
EMA_A[2]/MMCS_D_CMD/GP1[2]	31	P9	I/O	IPU		MMCS_D_CMD
EMA_D[7]/MMCS_D_DAT[7]/GP0[7]/BOOT[13]	54	M15	I/O	IPU	EMIFA, GPIO, BOOT	MMC/SD data
EMA_D[6]/MMCS_D_DAT[6]/GP0[6]	52	N13	I/O	IPU	EMIFA, GPIO	
EMA_D[5]/MMCS_D_DAT[5]/GP0[5]	51	N15	I/O	IPU		
EMA_D[4]/MMCS_D_DAT[4]/GP0[4]	49	P13	I/O	IPU		
EMA_D[3]/MMCS_D_DAT[3]/GP0[3]	48	P15	I/O	IPU		
EMA_D[2]/MMCS_D_DAT[2]/GP0[2]	46	R13	I/O	IPU		
EMA_D[1]/MMCS_D_DAT[1]/GP0[1]	45	R15	I/O	IPU		
EMA_D[0]/MMCS_D_DAT[0]/GP0[0]/BOOT[12]	44	T13	I/O	IPU	EMIFA, GPIO, BOOT	

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.15 General-Purpose IO Only Terminal Functions

Table 3-18. General-Purpose IO Only Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP	ZKB				
GP0[15]	-	M16	I/O/Z	IPD	None	General-Purpose IO
GP0[14]	-	N14	I/O/Z	IPD		
GP0[13]	-	N16	I/O/Z	IPD		
GP0[12]	-	P14	I/O/Z	IPD		
GP0[11]	-	P16	I/O/Z	IPD		
GP0[10]	-	R14	I/O/Z	IPD		
GP0[9]	-	T14	I/O/Z	IPD		
GP0[8]	-	N12	I/O/Z	IPD		
GP5[11]	6	-	I/O/Z	IPD		
GP5[10]	4	-	I/O/Z	IPD		
GP7[14] ⁽³⁾	157	K1	I/O	IPD		
EMU0/GP7[15]	-	J5	I/O	IPD	Emulation	

(1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

(3) GP7[14] is initially configured as a reserved function after reset and will not be in a predictable state. This signal will be stable only after the GPIO configuration for this pin has been completed. Users should carefully consider the system implications of this pin being in an unknown state after reset.

3.6.16 Reserved and No Connect Terminal Functions

Table 3-19. Reserved and No Connect Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	DESCRIPTION
	PTP	ZKB		
RSV1	-	F7	-	Reserved. (Leave unconnected, do not connect to power or ground.)
RSV2	133	B1	PWR	Reserved. For proper device operation, this pin must be tied either directly to CV _{DD} or left unconnected (do not connect to ground).
RSV3	149	-	PWR	Reserved. For proper device operation, this pin must be tied directly to CV _{DD} .
RSV4	148	H1	I	Reserved. For proper device operation, this pin must be tied low or to CV _{DD} .
NC	134, 135, 137, 138, 140	A12, A13, A14, B13, B14, C1, C2, C3, D2, D3, E3, E4, E14, E15, F14, F15, G14, G15, H2, H5, H14, H15, J14, K13, K16, L4, L14, L15, L16, M1, M14, N3, N7, P12, R12, T4, T8, T12	-	No Connect (leave unconnected)
	136, 139	F3, H4,	-	This pin may be left unconnected or connected to V _{SS} .

(1) PWR = Supply voltage.

3.6.17 Supply and Ground Terminal Functions

Table 3-20. Supply and Ground Terminal Functions

SIGNAL NAME	PIN NO		TYPE ⁽¹⁾	DESCRIPTION
	PTP	ZKB		
CVDD (Core supply)	10, 20, 28, 38, 50, 56, 61, 69, 77, 93, 104, 114, 147, 154, 161, 167	F6, G1, G6, G7, G10, G11, H7, H10, H11, J6, J7, J10, J11, J12, K6, K7, K10, K11, L6	PWR	1.2-V core supply voltage pins
RVDD (Internal RAM supply)	67, 159	H6, H12	PWR	1.2V internal ram supply voltage pins
DVDD (I/O supply)	5, 15, 24, 33, 43, 47, 53, 58, 65, 71, 75, 81, 87, 90, 99, 109, 119, 128, 151, 158, 164, 172,	B16, E5, E8, E9, E12, F5, F11, F12, G5, G12, K5, K12, L5, L11, L12, M5, M8, M9, M12, R1, R16	PWR	3.3-V I/O supply voltage pins.
V_{SS} (Ground)	177	A1, A2, A3, A15, A16, B2, B3, E6, E7, E10, E11, F4, F8, F9, F10, G2, G4, G8, G9, H8, H9, J8, J9, K8, K9, L7, L8, L9, L10, M6, M7, M10, M11, T1, T2, T15, T16	GND	Ground pins.

(1) PWR = Supply voltage, GND - Ground.

4 Device Configuration

4.1 Boot Modes

This device supports a variety of boot modes through an internal ROM bootloader. This device does not support dedicated hardware boot modes; therefore, all boot modes utilize the internal ROM. The input states of the BOOT pins are sampled and latched into the BOOTCFG register, which is part of the system configuration (SYSCFG) module, when device reset is deasserted. Boot mode selection is determined by the values of the BOOT pins.

See Using the D800K001 Bootloader Application Report ([SPRAB04](#)) for more details on the ROM Boot Loader.

The following boot modes are supported:

- NAND Flash boot
 - 8-bit NAND
- NOR Flash boot
 - NOR Direct boot (8-bit)
 - NOR Legacy boot (8-bit)
 - NOR AIS boot (8-bit)
- I2C0 / I2C1 Boot
 - EEPROM (Master Mode)
 - External Host (Slave Mode)
- SPI0 Boot
 - Serial Flash (Master Mode)
 - SERIAL EEPROM (Master Mode)
 - External Host (Slave Mode)
- UART0 / UART2 Boot
 - External Host

4.2 SYSCFG Module

The following system level features of the chip are controlled by the SYSCFG peripheral:

- Readable Device, Die, and Chip Revision ID
- Control of Pin Multiplexing
- Priority of bus accesses different bus masters in the system
- Capture at power on reset the chip BOOT[15:0] pin values and make them available to software
- Special case settings for peripherals:
 - Locking of PLL controller settings
 - Default burst sizes for EDMA3 TC0 and TC1
 - Selection of the source for the eCAP module input capture (including on chip sources)
 - Clock source selection for EMIFA and EMIFB
- Selects the source of emulation suspend signal (from DSP) of peripherals supporting this function.

Since the SYSCFG peripheral controls global operation of the device, its registers are protected against erroneous accesses by several mechanisms:

- Additionally, many registers are accessible only by a host (DSP) when it is operating in its privileged mode. (ex. from the kernel, but not from user space code).

4.3 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- **Boot and Configuration Pins:** If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is strongly recommended, even if the IPU/IPD matches the desired value/state.
- **Other Input Pins:** If the IPU/IPD does not match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the boot and configuration pins, if they are both routed out and 3-stated (not driven), it is strongly recommended that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot and configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the IO supply rail.
- For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.
- For most systems, a 20-k Ω resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.
- For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the device, see [Section 5.3](#), Recommended Operating Conditions.
- For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

5 Device Operating Conditions

5.1 Absolute Maximum Ratings Over Operating Junction Temperature Range (Unless Otherwise Noted) ⁽¹⁾

Supply voltage ranges	Core (CVDD, RVDD, PLL0_VDDA) ⁽²⁾	-0.5 V to 1.4 V
	I/O, 3.3V (DVDD) ⁽²⁾	-0.5 V to 3.8V
Input voltage ranges	V _I I/O, 1.2V (OSCIN)	-0.3 V to CVDD + 0.35V
	V _I I/O, 3.3V (Steady State)	-0.3V to DVDD + 0.3V
	V _I I/O, 3.3V (Transient Overshoot/Undershoot)	20% of DVDD for up to 20% of the signal period
Output voltage ranges	V _O I/O, 3.3V (Steady State)	-0.5 V to DVDD + 0.3V
	V _O I/O, 3.3V (Transient Overshoot/Undershoot)	20% of DVDD for up to 20% of the signal period
Clamp Current	Input or Output Voltages 0.3V above or below their respective power rails. Limit clamp current that flows through the I/O's internal diode protection cells.	±20mA
Operating Junction Temperature ranges, T _J	(default)	0°C to 90°C
	(T version)	-40°C to 125°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS}, PLL0_VSSA, OSCVSS

5.2 Handling Ratings

			UNIT
Storage temperature range, T _{stg}	(default)	-55 to 150	°C
ESD Stress Voltage, V _{ESD} ⁽¹⁾	Human Body Model (HBM) ⁽²⁾	>2000	V
	Charged Device Model (CDM) ⁽³⁾	>500	V

- (1) Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.
- (2) Level listed above is the passing level per ANSI/ESDA/JEDEC JS-001-2010. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500V HBM is possible if necessary precautions are taken. Pins listed as 1000V may actually have higher performance.
- (3) Level listed above is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process. Pins listed as 250V may actually have higher performance.

5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
CVDD	Supply voltage, Core (CVDD, PLL0_VDDA)	1.14	1.2	1.32	V
RVDD	Supply Voltage, Internal RAM	1.14	1.2	1.32	V
DVDD	Supply voltage, I/O, 3.3V (DVDD)	3.0	3.3	3.45	V
V _{SS}	Supply ground (V _{SS} , PLL0_VSSA, OSCVSS ⁽¹⁾)	0	0	0	V
V _{IH}	High-level input voltage, I/O, 3.3V	2			V
	High-level input voltage, OSCIN	0.7*CVDD			V
V _{IL}	Low-level input voltage, I/O, 3.3V			0.8	V
	Low-level input voltage, OSCIN			0.3*CVDD	V
V _{HYS}	Input Hysteresis		160		mV
t _t	Transition time, 10%-90%, All Inputs (unless otherwise specified in the electrical data sections)			0.25P or 10 ⁽²⁾	ns
T _J	Operating junction temperature range	Default		90	°C
		Automotive (T suffix)	-40	125	°C
F _{SYSCLK1,6}	DSP Operating Frequency (SYSCLK1,6)	Default		375 or 200	MHz
		Automotive (T suffix)	0	375 or 200	MHz

- (1) When an external crystal is used oscillator (OSC_VSS) ground must be kept separate from other grounds and connected directly to the crystal load capacitor ground. These pins are shorted to V_{SS} on the device itself and should not be connected to V_{SS} on the circuit board. If a crystal is not used and the clock input is driven directly, then the oscillator V_{SS} may be connected to board ground.
- (2) Whichever is smaller. P = the period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.

5.4 Notes on Recommended Power-On Hours (POH)

The information in the section below is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

To avoid significant degradation, the device power-on hours (POH) must be limited to the following:

Table 5-1. Recommended Power-On Hours

SILICON REVISION	SPEED GRADE	OPERATING JUNCTION TEMPERATURE (Tj)	NOMINAL CVDD VOLTAGE (V)	POWER-ON HOURS [POH] (HOURS)
D	300 MHZ	0 to 90 °C	1.2V	100,000
D	200 MHZ	0 to 90 °C	1.2V	100,000
D	200 MHZ	-40 to 125 °C	1.2V	20,000
D	375 MHz	0 to 90 °C	1.2V	100,000
D	375 MHZ	-40 to 125 °C	1.2V	20,000

Note: Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

The above notations cannot be deemed a warranty or deemed to extend or modify the warranty under TI's standard terms and conditions for TI semiconductor products.

5.5 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Junction Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OH}	High-level output voltage (3.3V I/O)	DVDD= 3.15V, I _{OH} = 4 mA	2.4			V
		DVDD= 3.15V, I _{OH} = 100 μA	2.95			V
V _{OL}	Low-level output voltage (3.3V I/O)	DVDD= 3.15V, I _{OL} = -4mA			0.4	V
		DVDD= 3.15V, I _{OL} = -100 μA			0.2	V
I _I ⁽¹⁾	Input current	V _I = V _{SS} to DVDD without opposing internal resistor			±35	μA
		V _I = V _{SS} to DVDD with opposing internal pullup resistor ⁽²⁾	-30		-200	μA
		V _I = V _{SS} to DVDD with opposing internal pulldown resistor ⁽²⁾	50		300	μA
I _{OH}	High-level output current	All peripherals			-4	mA
I _{OL}	Low-level output current	All peripherals			4	mA
I _{OZ} ⁽³⁾	I/O Off-state output current	VO = VDD or V _{SS} ; Internal pull disabled			±35	μA
C _I	Input capacitance	LVC MOS signals			3	pF
		OSCIN			2	pF
C _O	Output capacitance	LVC MOS signals			3	pF

- (1) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
- (2) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
- (3) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.

6 Peripheral Information and Electrical Specifications

6.1 Parameter Information

6.1.1 Parameter Information Device-Specific Information

- A. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin and the input signals are driven between 0V and the appropriate IO supply rail for the signal.

Figure 6-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.1.1.1 Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3 V I/O, $V_{ref} = 1.65$ V. For 1.2 V I/O, $V_{ref} = 0.6$ V.

Figure 6-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks.

Figure 6-3. Rise and Fall Transition Time Voltage Reference Levels

6.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

6.3 Power Supplies

6.3.1 Power-On Sequence

The device should be powered-on in the following order:

1. Logic supplies:
 - (a) CVDD core logic supply
 - (b) Other static logic supplies (RVDD, PLL0_VDDA).

Groups 1a) and 1b) may be powered up together; or 1a) first, followed by 1b).

2. All digital IO supplies (DVDD).

There is no specific required voltage ramp rate for any of the supplies.

Note: Future devices may support higher performance at a higher core logic voltage (CVDD). If future migration is desired, the current design should provide separate supplies for 1a) and 1b). If not, then 1a) and 1b) may be provided by a single supply.

RESET must be maintained active until all power supplies have reached their nominal values.

6.3.2 Power-Off Sequence

The power supplies can be powered-off in any order as long as the 3.3V supplies do not remain powered with the other supplies unpowered.

6.4 Reset

6.4.1 Power-On Reset (POR)

A power-on reset (POR) is required to place the device in a known good state after power-up. Power-On Reset is initiated by bringing $\overline{\text{RESET}}$ and $\overline{\text{TRST}}$ low at the same time. POR sets all of the device internal logic to its default state. All pins are tri-stated with the exception of GP7[14]. During reset, GP7[14] is configured as a reserved function, and its behavior is not guaranteed; the user should be aware that this pin will drive a level, and in fact may toggle, during reset.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the device to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and device's emulation logic in the reset state.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. Note: $\overline{\text{TRST}}$ is synchronous and must be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

$\overline{\text{RESET}}$ must be released only in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$. For maximum reliability, the device includes an internal pulldown on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

A summary of the effects of Power-On Reset is given below:

- All internal logic (including emulation logic and the PLL logic) is reset to its default state
- Internal memory is not maintained through a POR
- All device pins go to a high-impedance state

CAUTION

A watchdog reset triggers a POR.

6.4.2 Warm Reset

A warm reset provides a limited reset to the device. Warm Reset is initiated by bringing only $\overline{\text{RESET}}$ low ($\overline{\text{TRST}}$ is maintained high through a warm reset). Warm reset sets certain portions of the device to their default state while leaving others unaltered. All pins are tri-stated with the exception of GP7[14]. During reset, GP7[14] is configured as a reserved function, and its behavior is not deterministic; the user should be aware that this pin will drive a level, and in fact may toggle, during reset.

During emulation, the emulator will maintain $\overline{\text{TRST}}$ high so only warm reset (not POR) is available during emulation debug and development.

A summary of the effects of Warm Reset is given below:

- All internal logic (except for the emulation logic and the PLL logic) is reset to its default state
- Internal memory is maintained through a warm reset
- All device pins go to a high-impedance state

6.4.3 Reset Electrical Data Timings

Table 6-1 assumes testing over the recommended operating conditions.

Table 6-1. Reset Timing Requirements⁽¹⁾

NO.			MIN	MAX	UNIT
1	$t_{w(RSTL)}$	Pulse width, $\overline{RESET}/\overline{TRST}$ low	100		ns
2	$t_{su(BPV-RSTH)}$	Setup time, boot pins valid before $\overline{RESET}/\overline{TRST}$ high	20		ns
3	$t_{h(RSTH-BPV)}$	Hold time, boot pins valid after $\overline{RESET}/\overline{TRST}$ high	20		ns

(1) For power-on reset (POR), the reset timings in this table refer to \overline{RESET} and \overline{TRST} together. For warm reset, the reset timings in this table refer to \overline{RESET} only (\overline{TRST} is held high).

Figure 6-4. Power-On Reset (RESET and TRST active) Timing

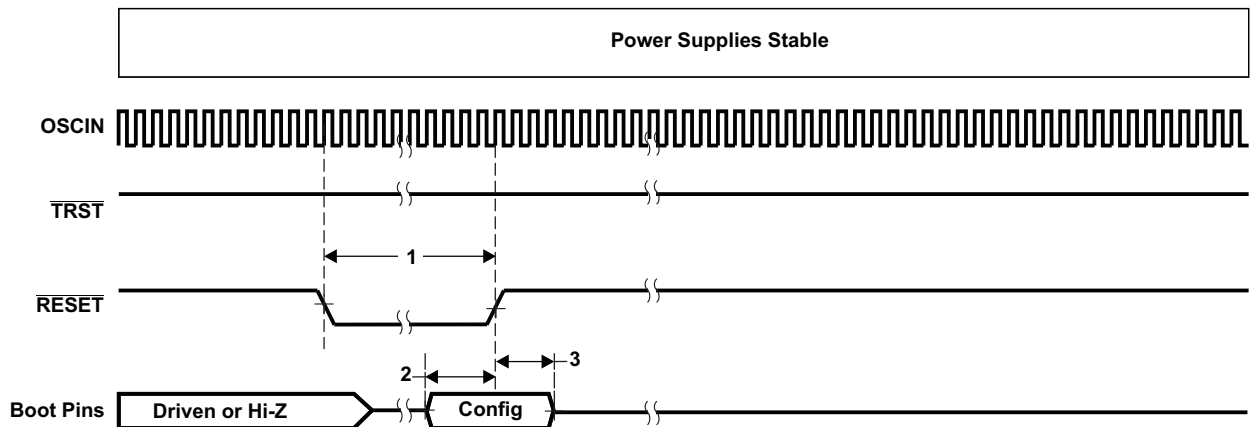

Figure 6-5. Warm Reset (RESET active, TRST high) Timing

6.5 Crystal Oscillator or External Clock Input

The device includes two choices to provide an external clock input, which is fed to the on-chip PLL to generate high-frequency system clocks. These options are illustrated in Figure 6-6 and Figure 6-7. For input clock frequencies between 12 and 20 MHz, a crystal with 80 ohm max ESR is recommended. For input clock frequencies between 20 and 30 MHz, a crystal with 60 ohm max ESR is recommended. Typical load capacitance values are 10-20 pF, where the load capacitance is the series combination of C1 and C2.

The CLKMODE bit in the PLLCTL register must be 0 to use the on-chip oscillator. If CLKMODE is set to 1, the internal oscillator is disabled.

- Figure 6-6 illustrates the option that uses on-chip 1.2V oscillator with external crystal circuit.
- Figure 6-7 illustrates the option that uses an external 1.2V clock input.

Figure 6-6. On-Chip 1.2V Oscillator

Table 6-2. Oscillator Timing Requirements

NO	PARAMETER	MIN	MAX	UNIT
f _{osc}	Oscillator frequency range (OSCIN/OSCOUT)	12	30	MHz

Figure 6-7. External 1.2V Clock Source

Table 6-3. OSCIN Timing Requirements for Externally Driven Clock

NO		MIN	MAX	UNIT
f_{OSCIN}	OSCIN frequency range (OSCIN)	12	50	MHz
$t_{\text{c}}(\text{OSCIN})$	Cycle time, external clock driven on OSCIN	20		ns
$t_{\text{w}}(\text{OSCINH})$	Pulse width high, external clock on OSCIN	$0.4 t_{\text{c}}(\text{OSCIN})$		ns
$t_{\text{w}}(\text{OSCINL})$	Pulse width low, external clock on OSCIN	$0.4 t_{\text{c}}(\text{OSCIN})$		ns
$t_{\text{t}}(\text{OSCIN})$	Transition time, OSCIN		$0.25P$ or $10^{(1)}$	ns
$t_{\text{j}}(\text{OSCIN})$	Period jitter, OSCIN		$0.02P$	ns

(1) Whichever is smaller. P = the period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.

6.6 Clock PLLs

The device has one PLL controller that provides clock to different parts of the system. PLL0 provides clocks (though various dividers) to most of the components of the device.

The PLL controller provides the following:

- Glitch-Free Transitions (on changing clock settings)
- Domain Clocks Alignment
- Clock Gating
- PLL power down

The various clock outputs given by the controller are as follows:

- Domain Clocks: SYSCLK [1:n]
- Auxiliary Clock from reference clock source: AUXCLK

Various dividers that can be used are as follows:

- Post-PLL Divider: POSTDIV
- SYSCLK Divider: D1, $\frac{1}{4}$, Dn

Various other controls supported are as follows:

- PLL Multiplier Control: PLLM
- Software programmable PLL Bypass: PLEN

6.6.1 PLL Device-Specific Information

The device DSP generates the high-frequency internal clocks it requires through an on-chip PLL.

The PLL requires some external filtering components to reduce power supply noise as shown in [Figure 6-8](#).

Figure 6-8. PLL External Filtering Components

The input to the PLL is either from the on-chip oscillator or from an external clock on the OSCIN pin. The PLL outputs seven clocks that have programmable divider options. [Figure 6-9](#) illustrates the PLL Topology.

The PLL is disabled by default after a device reset. It must be configured by software according to the allowable operating conditions listed in [Table 6-4](#) before enabling the DSP to run from the PLL by setting PLEN = 1.

Figure 6-9. PLL Topology

Table 6-4. Allowed PLL Operating Conditions

NO	PARAMETER	Default Value	MIN	MAX	UNIT
1	PLLRST: Assertion time during initialization	N/A	1000	N/A	ns
2	Lock time: The time that the application has to wait for the PLL to acquire locks before setting PLEN, after changing PREDIV, PLLM, or OSCIN	N/A	N/A	$\text{Max PLL Lock Time} = \frac{2000 N}{\sqrt{m}}$ where N = Pre-Divider Ratio M = PLL Multiplier	OSCIN cycles
3	PREDIV	/1	/1	/32	
4	PLL input frequency (PLLREF)		12	30 (if internal oscillator is used) 50 (if external clock source is used)	MHz
5	PLL multiplier values (PLLM) ⁽¹⁾	x20	x4	x32	
6	PLL output frequency. (PLLOUT)	N/A	300	600	MHz
7	POSTDIV	/1	/1	/32	

(1) The multiplier values must be chosen such that the PLL output frequency (at PLLOUT) is between 300 and 600 MHz, but the frequency going into the SYSCLK dividers (after the post divider) cannot exceed the maximum clock frequency defined for the device at a given voltage operating point.

6.6.2 Device Clock Generation

PLL0 is controlled by PLL Controller 0. The PLLC0 manages the clock ratios, alignment, and gating for the system clocks to the chip. The PLLC is responsible for controlling all modes of the PLL through software, in terms of pre-division of the clock inputs, multiply factor within the PLL, and post-division for each of the chip-level clocks from the PLL output. The PLLC also controls reset propagation through the chip, clock alignment, and test points.

PLLC0 generates several clocks from the PLL0 output clock for use by the various modules. These are summarized in [Table 6-5](#). The clock ratios between SYSCLK1, SYSCLK2, SYSCLK4 and SYSCLK6 must always be maintained as shown in the table.

Table 6-5. System PLLC0 Output Clocks

OUTPUT CLOCK	USED BY	DEFAULT RATIO (RELATIVE TO SYSCLK1)	NOTES
SYSCLK1	DSP	/1	No Required Ratio
SYSCLK2	EDMA, DSP ports, EMIFB (ports to switch fabric), ECAP 0/1/2, EPWM 0/1/2, EQEP 0/1, McASP/FIFO 0/1, UART 2, HRPWM 0/1/2, SPI0	/2	SYSCLK1 / 2
SYSCLK3	EMIFA	/3	No Required Ratio
SYSCLK4	SYSCFG, Interrupt Controller, PLLC0, PSC 0, EMAC/MDIO, GPIO, I2C 1, PSC 1	/4	SYSCLK1 / 4
SYSCLK5	EMIFB	/3	No Required Ratio
SYSCLK7	RMII clock to EMAC	/6	No Required Ratio ; Should be set to 50 MHz
AUXCLK	McASP AuxClk, Timer64P0, Timer64P1, I2C0,	N/A	No Required Ratio
DIV4p5	133MHz clock source for EMIFB	PLL output/4.5	No Required Ratio

- The divide values in the PLL Controller 0 for SYSCLK1/SYSCLK6, SYSCLK2 and SYSCLK4 are not fixed so that user can change the divide values for power saving reasons. But users are responsible to guarantee that the divide ratios between these clock domains must be fixed to 1:2:4.
- Although the PLL is capable of running at 600 MHz, the SYSCLK dividers in the PLLC0 are not (maximum 400 MHz). For this reason, the post-divider in the PLLC0 should be configured for /2 to provide 300 MHz to each of the SYSCLK dividers.
- The DIV4p5 (/4.5) hardware clock divider is provided to generate 133 MHz from the 600 MHz PLL clock for use as clocks to the EMIFs.

6.6.3 PLL Controller 0 Registers

Table 6-6. PLL Controller 0 Registers

ADDRESS	REGISTER NAME	REGISTER DESCRIPTION

6.7 DSP Interrupts

The C674x DSP interrupt controller combines device events into 12 prioritized interrupts. The source for each of the 12 CPU interrupts is user programmable and is listed in [Table 6-7](#). Also, the interrupt controller controls the generation of the CPU exception, NMI, and emulation interrupts. summarizes the C674x interrupt controller registers and memory locations.

Table 6-7. C6743 DSP Interrupts

EVT#	INTERRUPT NAME	SOURCE
0	EVT0	C674x Int Ctl 0
1	EVT1	C674x Int Ctl 1

6.8 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register can control the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts and EDMA events in different interrupt/event generation modes. The GPIO peripheral provides generic connections to external devices. The GPIO pins are grouped into banks of 16 pins per bank (i.e., bank 0 consists of GPIO [0:15]). See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

The GPIO peripheral supports the following:

- Up to 128 Pins on ZKB and up to 109 Pins on PTP package configurable as GPIO
- External Interrupt and DMA request Capability
 - Every GPIO pin may be configured to generate an interrupt request on detection of rising and/or falling edges on the pin.
 - The interrupt requests within each bank are combined (logical or) to create eight unique bank level interrupt requests.
 - The bank level interrupt service routine may poll the INTSTATx register for its bank to determine which pin(s) have triggered the interrupt.
 - GPIO Banks 0, 1, 2, 3, 4, 5, 6, and 7 Interrupts assigned to DSP Events 65, 41, 49, 52, 54, 59, 62 and 72 respectively
 - Additionally, GPIO Banks 0, 1, 2, 3, 4, and 5 Interrupts assigned to EDMA events 6, 7, 22, 23, 28, and 29 respectively.
- Set/clear functionality: Firmware writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple firmware processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate Input/Output registers
- Output register in addition to set/clear so that, if preferred by firmware, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic be implemented.

The memory map for the GPIO registers is shown in [Table 6-8](#).

6.8.2 GPIO Peripheral Input/Output Electrical Data/Timing

Table 6-9. Timing Requirements for GPIO Inputs⁽¹⁾ (see Figure 6-10)

NO.			MIN	MAX	UNIT
1	$t_{w(GPIH)}$	Pulse duration, GPIx high	$2C^{(1) (2)}$		ns
2	$t_{w(GPIL)}$	Pulse duration, GPIx low	$2C^{(1) (2)}$		

- (1) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the device recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to allow the device enough time to access the GPIO register through the internal bus.
- (2) $C = \text{SYSCLK4}$ period in ns.

Table 6-10. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs (see Figure 6-10)

NO.		PARAMETER	MIN	MAX	UNIT
3	$t_{w(GPOH)}$	Pulse duration, GPOx high	$2C^{(1) (2)}$		ns
4	$t_{w(GPOL)}$	Pulse duration, GPOx low	$2C^{(1) (2)}$		ns

- (1) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.
- (2) $C = \text{SYSCLK4}$ period in ns.

Figure 6-10. GPIO Port Timing

6.8.3 GPIO Peripheral External Interrupts Electrical Data/Timing

Table 6-11. Timing Requirements for External Interrupts⁽¹⁾ (see Figure 6-11)

NO.			MIN	MAX	UNIT
1	$t_{w(ILOW)}$	Width of the external interrupt pulse low	$2C^{(1) (2)}$		ns
2	$t_{w(IHIGH)}$	Width of the external interrupt pulse high	$2C^{(1) (2)}$		

- (1) The pulse width given is sufficient to generate an interrupt or an EDMA event. However, if a user wants to have the device recognize the GPIO changes through software polling of the GPIO register, the GPIO duration must be extended to allow the device enough time to access the GPIO register through the internal bus.
- (2) $C = \text{SYSCLK4}$ period in ns.

Figure 6-11. GPIO External Interrupt Timing

6.9 EDMA

Table 6-12 is the list of EDMA3 Channel Controller Registers and Table 6-13 is the list of EDMA3 Transfer Controller registers. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide (SPRUFK9)* for more details.

0x01C0 0620	QWMTHRA	Queue Watermark Threshold A Register
0x01C0 0640	CCSTAT	EDMA3CC Status Register

(1) On previous architectures, the EDMA3TC priority was controlled by the queue priority register (QUEPRI) in the EDMA3CC memory-map. However for this device, the priority control for the transfer controllers is controlled by the chip-level registers in the System Configuration Module. You should use the chip-level registers and not QUEPRI to configure the TC priority.

Table 6-14 shows an abbreviation of the set of registers which make up the parameter set for each of 128 EDMA events. Each of the parameter register sets consist of 8 32-bit word entries. Table 6-15 shows the parameter set entry registers with relative memory address locations within each of the parameter sets.

Table 6-14. EDMA Parameter Set RAM

HEX ADDRESS RANGE	DESCRIPTION
0x01C0 4000 - 0x01C0 401F	Parameters Set 0 (8 32-bit words)
0x01C0 4020 - 0x01C0 403F	Parameters Set 1 (8 32-bit words)
0x01C0 4040 - 0x01C0 405F	Parameters Set 2 (8 32-bit words)

6.10 External Memory Interface A (EMIFA)

EMIFA is one of two external memory interfaces supported on the device. It is primarily intended to support asynchronous memory types, such as NAND and NOR flash and Asynchronous SRAM. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

6.10.1 EMIFA Asynchronous Memory Support

EMIFA supports asynchronous:

- SRAM memories
- NAND Flash memories
- NOR Flash memories

The EMIFA data bus width is up to 16-bits on the ZKB package and 8 bits on the PTP package. Both devices support up to fifteen address lines and an external wait/interrupt input. Up to four asynchronous chip selects are supported by EMIFA ($\overline{\text{EMA_CS}}[5:2]$). All four chip selects are available on the ZKB package. Two of the four are available on the PTP package ($\overline{\text{EMA_CS}}[3:2]$).

Each chip select has the following individually programmable attributes:

- Data Bus Width
- Read cycle timings: setup, hold, strobe
- Write cycle timings: setup, hold, strobe
- Bus turn around time
- Extended Wait Option With Programmable Timeout
- Select Strobe Option
- NAND flash controller supports 1-bit and 4-bit ECC calculation on blocks of 512 bytes.

6.10.2 EMIFA Connection Examples

A likely use case with more than one EMIFA chip select used for NAND flash is illustrated in [Figure 6-12](#). This figure shows how two multiplane NAND flash devices with two chip selects each would connect to the EMIFA. In this case if NAND is the boot memory, then the boot image needs to be stored in the NAND area selected by $\overline{\text{EMA_CS}}[3]$. Part of the application image could spill over into the NAND regions selected by other EMIFA chip selects; but would rely on the code stored in the $\overline{\text{EMA_CS}}[3]$ area to bootload it.

Figure 6-12. C6743 EMIFA Connection Diagram: Multiple NAND Flash Planes

6.10.3 External Memory Interface (EMIF) Registers

Table 6-17 is a list of the EMIF registers.

Table 6-17. External Memory Interface (EMIFA) Registers

BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION

6.10.4 EMIFA Electrical Data/Timing

Table 6-18 and Table 6-19 assume testing over recommended operating conditions.

Table 6-18. EMIFA Asynchronous Memory Timing Requirements⁽¹⁾

NO.			MIN	NOM	MAX	UNIT
READS and WRITES						
E	$t_{c(CLK)}$	Cycle time, EMIFA module clock	10			ns
2	$t_{w(EM_WAIT)}$	Pulse duration, EM_WAIT assertion and deassertion	2E			ns
READS						
12	$t_{su(EMDV-EMOEH)}$	Setup time, EMA_D[15:0] valid before $\overline{EM_OE}$ high	3			ns
13	$t_{h(EMOEH-EMDIV)}$	Hold time, EMA_D[15:0] valid after $\overline{EM_OE}$ high	0			ns
14	$t_{su(EMOEL-EMWAIT)}$	Setup time, EM_WAIT asserted before end of Strobe Phase ⁽²⁾	4E+3			ns
WRITES						
28	$t_{su(EMWEL-EMWAIT)}$	Setup time, EM_WAIT asserted before end of Strobe Phase ⁽²⁾	4E+3			ns

- (1) E = EMA_CLK period or in ns. EMA_CLK is selected either as SYSCLK3 or the PLL output clock divided by 4.5. As an example, when SYSCLK3 is selected and set to 100MHz, E=10ns.
- (2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be asserted to add extended wait states. Figure 6-15 and Figure 6-16 describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 6-19. EMIFA Asynchronous Memory Switching Characteristics^{(1) (2) (3)}

NO.	PARAMETER		MIN	NOM	MAX	UNIT
READS and WRITES						
1	$t_d(TURNAROUND)$	Turn around time	(TA)*E-3	(TA)*E	(TA)*E+3	ns
READS						
3	$t_{c(EMRCYCLE)}$	EMIF read cycle time (EW = 0)	(RS+RST+RH)*E-3	(RS+RST+RH)*E	(RS+RST+RH)*E+3	ns
		EMIF read cycle time (EW = 1)	(RS+RST+RH+EWC)*E-3	(RS+RST+RH+EWC)*E	(RS+RST+RH+EWC)*E+3	ns
4	$t_{su(EMCEL-EMOEL)}$	Output setup time, $\overline{EMA_CE}$ [5:2] low to $\overline{EMA_OE}$ low (SS = 0)	(RS)*E-3	(RS)*E	(RS)*E+3	ns
		Output setup time, $\overline{EMA_CE}$ [5:2] low to $\overline{EMA_OE}$ low (SS = 1)	-3	0	+3	ns
5	$t_{h(EMOEH-EMCEH)}$	Output hold time, $\overline{EMA_OE}$ high to $\overline{EMA_CE}$ [5:2] high (SS = 0)	(RH)*E-3	(RH)*E	(RH)*E+3	ns
		Output hold time, $\overline{EMA_OE}$ high to $\overline{EMA_CE}$ [5:2] high (SS = 1)	-3	0	+3	ns
6	$t_{su(EMBAV-EMOEL)}$	Output setup time, $\overline{EMA_BA}$ [1:0] valid to $\overline{EMA_OE}$ low	(RS)*E-3	(RS)*E	(RS)*E+3	ns
7	$t_{h(EMOEH-EMBAIV)}$	Output hold time, $\overline{EMA_OE}$ high to $\overline{EMA_BA}$ [1:0] invalid	(RH)*E-3	(RH)*E	(RH)*E+3	ns
8	$t_{su(EMBAV-EMOEL)}$	Output setup time, $\overline{EMA_A}$ [13:0] valid to $\overline{EMA_OE}$ low	(RS)*E-3	(RS)*E	(RS)*E+3	ns

- (1) TA = Turn around, RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold, MEWC = Maximum external wait cycles. These parameters are programmed via the Asynchronous Bank and Asynchronous Wait Cycle Configuration Registers. These support the following range of values: TA[4-1], RS[16-1], RST[64-1], RH[8-1], WS[16-1], WST[64-1], WH[8-1], and MEW[1-256].
- (2) E = EMA_CLK period or in ns. EMA_CLK is selected either as SYSCLK3 or the PLL output clock divided by 4.5. As an example, when SYSCLK3 is selected and set to 100MHz, E=10ns.
- (3) EWC = external wait cycles determined by EMA_WAIT input signal. EWC supports the following range of values EWC[256-1]. Note that the maximum wait time before timeout is specified by bit field MEWC in the Asynchronous Wait Cycle Configuration Register.

Table 6-19. EMIFA Asynchronous Memory Switching Characteristics^{(1) (2) (3)} (continued)

NO.	PARAMETER	MIN	NOM	MAX	UNIT

6.11 External Memory Interface B (EMIFB)

Figure 6-17, EMIFB Functional Block Diagram illustrates a high-level view of the EMIFB and its connections within the device. Multiple requesters have access to EMIFB through a switched central resource (indicated as crossbar in the figure). The EMIFB implements a split transaction internal bus, allowing concurrence between reads and writes from the various requesters. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

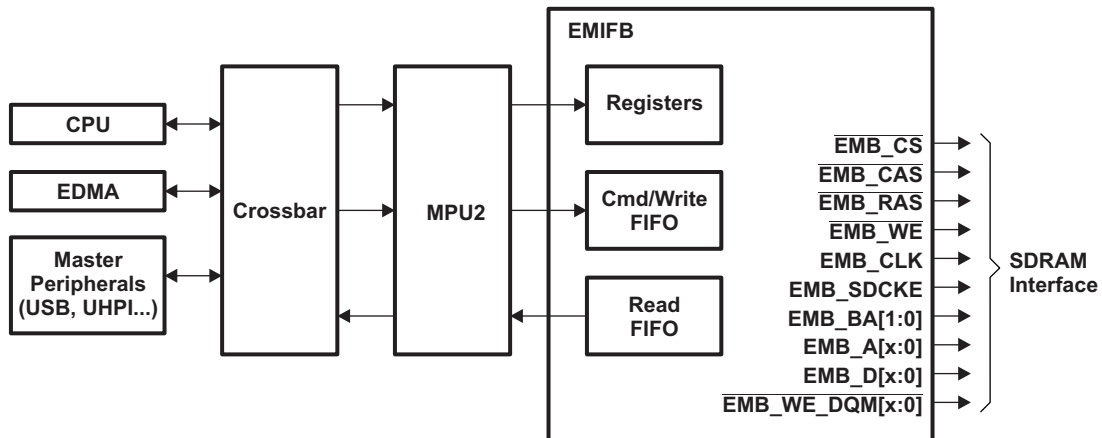

Figure 6-17. EMIFB Functional Block Diagram

EMIFB supports a 3.3V LVCMOS Interface.

6.11.1 EMIFB SDRAM Loading Limitations

EMIFB supports SDRAM up to 152MHz with up to two SDRAM or asynchronous memory loads. Additional loads will limit the SDRAM operation to lower speeds and the maximum speed should be confirmed by board simulation using IBIS models.

6.11.2 Interfacing to SDRAM

The EMIFB supports a glueless interface to SDRAM devices with the following characteristics:

- Pre-charge bit is A[10]
- Supports 8, 9, 10 or 11 column address bits.
- Supports up to 13 row address bits is 13.
- Supports 1, 2 or 4 internal banks.

Table 6-20 shows the supported SDRAM configurations for EMIFB.

Table 6-20. EMIFB Supported SDRAM Configurations⁽¹⁾

SDRAM Memory Data Bus Width (bits)	Number of Memories	EMIFB Data Bus Size	Rows	Columns	Banks	Total Memory (Mbits)	Total Memory (Mbytes)	Memory Density (Mbits)
16	1	16	13	8	1	32	4	32
	1	16	13	8	2	64	8	64
	1	16	13	8	4	128	16	128
	1	16	13	9	1	64	8	64
	1	16	13	9	2	128	16	128
	1	16	13	9	4	256	32	256
	1	16	13	10	1	128	16	128
	1	16	13	10	2	256	32	256
	1	16	13	10	4	512	64	512

	2	16	13	10	2	256	32	128
	2	16	13	10	4	512	64	256
	2	16	13	11	1	256	32	128
	2	16	13	11	2	512	64	256
	2	16	13	11	4	1024	128	512

(1) The shaded cells indicate configurations that are possible on the EMIFB interface but as of this writing SDRAM memories capable of supporting these densities are not available in the market.

Figure 6-18 shows an interface between the EMIFB and a 2M × 16 × 4 bank SDRAM device. In addition, and shows an interface between the EMIFB and two 4M × 16 × 4 bank SDRAM devices. Refer to Table 6-21, as an example that shows additional list of commonly-supported SDRAM devices and the required connections for the address pins. Note that in Table 6-21, page size/column size (not indicated in the table) is varied to get the required addressability range.

Figure 6-18. EMIFB to 2M x 16 x 4 Bank SDRAM Interface

Table 6-21. Example of 16/32-Bit EMIFB Address Pin Connections

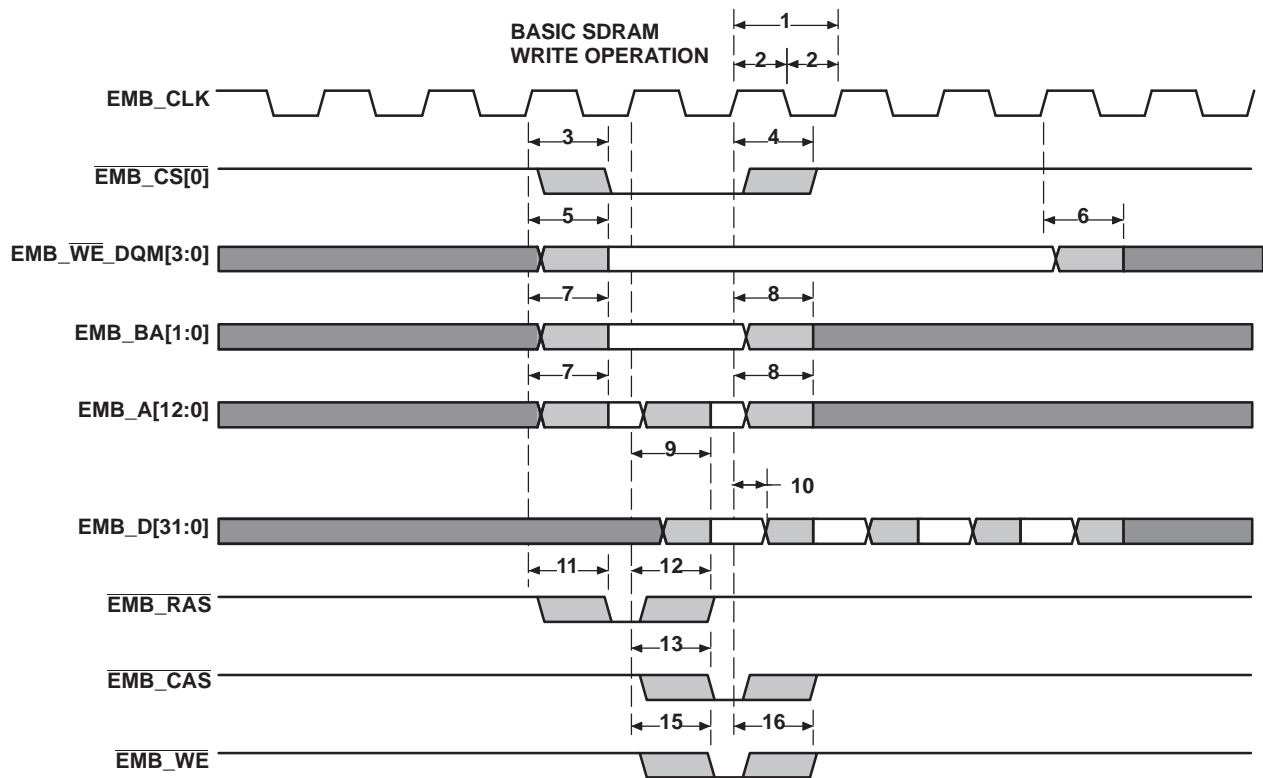

Figure 6-19. EMIFB Basic SDRAM Write Operation

Figure 6-20. EMIFB Basic SDRAM Read Operation

6.12 Memory Protection Units

The MPU performs memory protection checking. It receives requests from a bus master in the system and checks the address against the fixed and programmable regions to see if the access is allowed. If allowed, the transfer is passed unmodified to its output bus (to the targeted address). If the transfer is illegal (fails the protection check) then the MPU does not pass the transfer to the output bus but rather services the transfer internally back to the input bus (to prevent a hang) returning the fault status to the requestor as well as generating an interrupt about the fault. The following features are supported by the MPU:

- Provides memory protection for fixed and programmable address ranges.
- Supports multiple programmable address region.
- Supports secure and debug access privileges.
- Supports read, write, and execute access privileges.
- Supports privid(8) associations with ranges.
- Generates an interrupt when there is a protection violation, and saves violating transfer parameters.
- MMR access is also protected.

6.13 MMC / SD / SDIO (MMCSD)

The C6743 includes an MMCSD controller which is compliant with MMC V3.31, Secure Digital Part 1 Physical Layer Specification V1.1 and Secure Digital Input Output (SDIO) V2.0 specifications. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

The MMC/SD Controller has following features:

- MultiMediaCard (MMC)
- Secure Digital (SD) Memory Card
- MMC/SD protocol support
- SD high capacity support
- SDIO protocol support
- Programmable clock frequency
- 512 bit Read/Write FIFO to lower system overhead
- Slave EDMA transfer capability

The C6743 MMC/SD Controller does not support SPI mode.

6.14 Ethernet Media Access Controller (EMAC)

The Ethernet Media Access Controller (EMAC) provides an efficient interface between C6743 and the network. The EMAC supports both 10Base-T and 100Base-TX, or 10 Mbps/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QoS) support.

The EMAC controls the flow of packet data from the C6743 device to the PHY. The MDIO module controls PHY configuration and status monitoring.

Both the EMAC and the MDIO modules interface to the C6743 device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

6.14.1 EMAC Peripheral Register Description(s)

Table 6-30. Ethernet Media Access Controller (EMAC) Registers

BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01E2 3000	TXREV	Transmit Revision Register
0x01E2 3004	TXCONTROL	Transmit Control Register
0x01E2 3008	TXTEARDOWN	Transmit Teardown Register
0x01E2 3010	RXREV	Receive Revision Register
0x01E2 3014	RXCONTROL	Receive Control Register
0x01E2 3018	RXTEARDOWN	Receive Teardown Register
0x01E2 3080	TXINTSTATRAW	Transmit Interrupt Status (Unmasked) Register
0x01E2 3084	TXINTSTATMASKED	Transmit Interrupt Status (Masked) Register

BYTE ADDRESS	DESCRIPTION
0x01E2 0000 - 0x01E2 1FFF	EMAC Local Buffer Descriptor Memory

6.14.2 EMAC Electrical Data/Timing

Table 6-33. RMII Timing Requirements⁽¹⁾

NO.			MIN	TYP	MAX	UNIT
1	tc(REFCLK)	Cycle Time, RMII_MHZ_50_CLK		20		ns
2	tw(REFCLKH)	Pulse Width, RMII_MHZ_50_CLK High	7		13	ns
3	tw(REFCLKL)	Pulse Width, RMII_MHZ_50_CLK Low	7		13	ns
6	tsu(RXD-REFCLK)	Input Setup Time, RXD Valid before RMII_MHZ_50_CLK High	4			ns
7	th(REFCLK-RXD)	Input Hold Time, RXD Valid after RMII_MHZ_50_CLK High	2			ns
8	tsu(CRSDV-REFCLK)	Input Setup Time, CRSDV Valid before RMII_MHZ_50_CLK High	4			ns
9	th(REFCLK-CRSDV)	Input Hold Time, CRSDV Valid after RMII_MHZ_50_CLK High	2			ns
10	tsu(RXER-REFCLK)	Input Setup Time, RXER Valid before RMII_MHZ_50_CLK High	4			ns
11	th(REFCLKR-RXER)	Input Hold Time, RXER Valid after RMII_MHZ_50_CLK High	2			ns

(1) Per the RMII industry specification, the RMII reference clock (RMII_MHZ_50_CLK) must have jitter tolerance of 50 ppm or less.

Table 6-34. RMII Switching Characteristics

NO.			MIN	TYP	MAX	UNIT
4	td(REFCLK-TXD)	Output Delay Time, RMII_MHZ_50_CLK High to TXD Valid	2.5		13	ns
5	td(REFCLK-TXEN)	Output Delay Time, RMII_MHZ_50_CLK High to TXEN Valid	2.5		13	ns

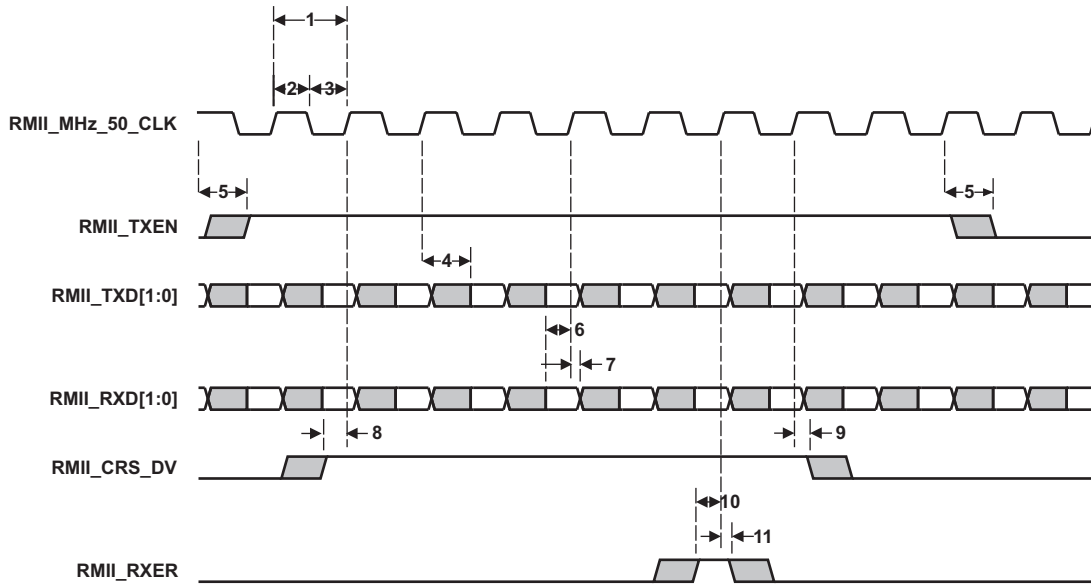

Figure 6-25. RMII Timing Diagram

6.15 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. Only one PHY may be connected at any given time. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

6.15.1 MDIO Peripheral Register Description(s)

For a list of supported MDIO registers see [Table 6-35](#) [MDIO Registers].

Table 6-35. MDIO Register Memory Map

BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION

6.16 Multichannel Audio Serial Ports (McASP0, McASP1)

The McASP serial port is specifically designed for multichannel audio applications. Its key features are:

- Flexible clock and frame sync generation logic and on-chip dividers
- Up to fourteen transmit or receive data pins and serializers
- Large number of serial data format options, including:
 - TDM Frames with 2 to 32 time slots per frame (periodic) or 1 slot per frame (burst)
 - Time slots of 8, 12, 16, 20, 24, 28, and 32 bits
 - First bit delay 0, 1, or 2 clocks
 - MSB or LSB first bit order
 - Left- or right-aligned data words within time slots
- Extensive error checking and mute generation logic
- All unused pins GPIO-capable

Additionally, while the McASP modules are backward compatible with the McASP on previous devices; the McASP also includes the following new features:

- Transmit & Receive FIFO Buffers for each McASP. Allows the McASP to operate at a higher sample rate by making it more tolerant to DMA latency.
- Dynamic Adjustment of Clock Dividers
 - Clock Divider Value may be changed without resetting the McASP

See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

The three McASPs on the C6743 are configured with the following options:

Table 6-38. C6743 McASP Configurations⁽¹⁾

MODULE	SERIALIZERS	AFIFO	DIT	C6743 PINS
McASP0	16	64 Word RX 64 Word TX	N	AXR0[15:0], AHCLKR0, ACLKR0, AFSR0, AHCLKX0, ACLKX0, AFSX0
McASP1	12	64 Word RX 64 Word TX	N	AXR1[11:10], AXR1[8:0], AHCLKR1, ACLKR1, AFSR1, AHCLKX1, ACLKX1, AFSX1, AMUTE1

(1) Pins available are the maximum number of pins that may be configured for a particular McASP; not including pin multiplexing.

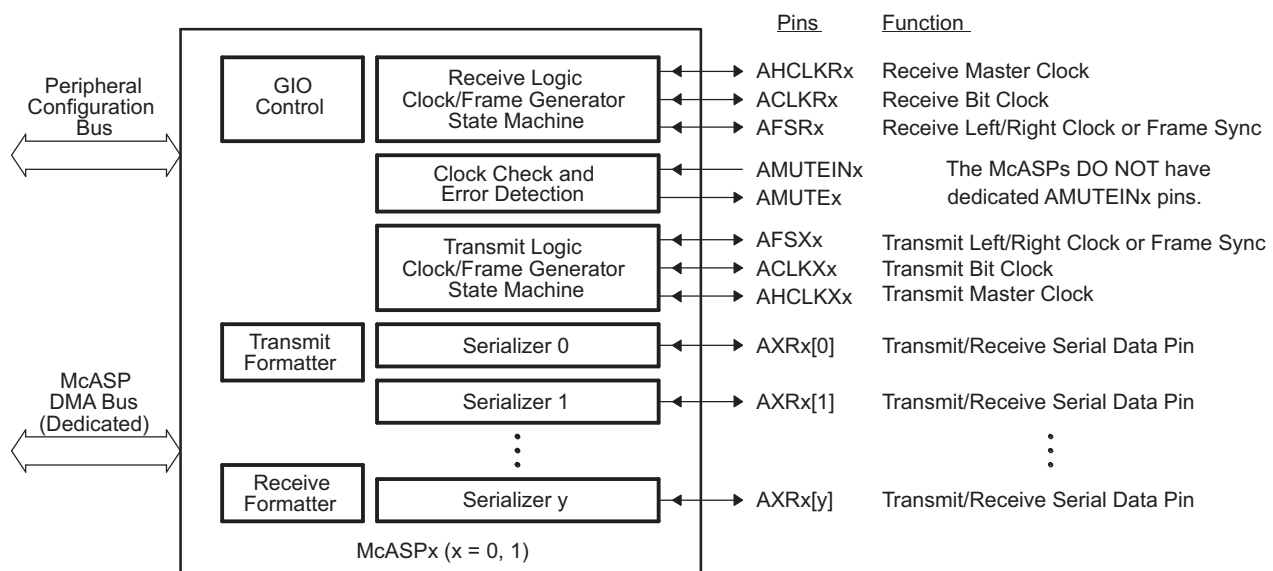

Figure 6-28. McASP Block Diagram

6.16.1 McASP Peripheral Registers Description(s)

Registers for the McASP are summarized in [Table 6-39](#). The registers are accessed through the peripheral configuration port. The receive buffer registers (RBUF) and transmit buffer registers (XBUF) can also be accessed through the DMA port, as listed in [Table 6-40](#)

Registers for the McASP Audio FIFO (AFIFO) are summarized in [Table 6-41](#). Note that the AFIFO Write FIFO (WFIFO) and Read FIFO (RFIFO) have independent control and status registers. The AFIFO control registers are accessed through the peripheral configuration port.

Table 6-39. McASP Registers Accessed Through Peripheral Configuration Port

McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01D0 0000	0x01D0 4000	REV	Revision identification register
0x01D0 0010	0x01D0 4010	PFUNC	Pin function register

0x01D0 007C	0x01D0 407C	RINTCTL	Receiver interrupt control register
0x01D0 0080	0x01D0 4080	RSTAT	Receiver status register
0x01D0 0084	0x01D0 4084	RSLOT	Current receive TDM time slot register
0x01D0 0088	0x01D0 4088	RCLKCHK	Receive clock check control register
0x01D0 008C	0x01D0 408C	REVTCTL	Receiver DMA event control register
0x01D0 00A0	0x01D0 40A0	XGBLCTL	Transmitter global control register. Alias of GBLCTL, only transmit bits are affected - allows transmitter to be reset independently from receiver
0x01D0 00A4	0x01D0 40A4	XMASK	Transmit format unit bit mask register
0x01D0 00A8	0x01D0 40A8	XFMT	Transmit bit stream format register
0x01D0 00AC	0x01D0 40AC	AFSXCTL	Transmit frame sync control register
0x01D0 00B0	0x01D0 40B0	ACLKXCTL	Transmit clock control register
0x01D0 00B4	0x01D0 40B4	AHCLKXCTL	Transmit high-frequency clock control register
0x01D0 00B8	0x01D0 40B8	XTDM	Transmit TDM time slot 0-31 register
0x01D0 00BC	0x01D0 40BC	XINTCTL	Transmitter interrupt control register
0x01D0 00C0	0x01D0 40C0	XSTAT	Transmitter status register
0x01D0 00C4	0x01D0 40C4	XSLOT	Current transmit TDM time slot register
0x01D0 00C8	0x01D0 40C8	XCLKCHK	Transmit clock check control register
0x01D0 00CC	0x01D0 40CC	XEVTCTL	Transmitter DMA event control register

Table 6-39. McASP Registers Accessed Through Peripheral Configuration Port (continued)

McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01D0 0100	0x01D0 4100	DITCSRA0	Left (even TDM time slot) channel status register (DIT mode) 0

(1) Writes to XBUF originate from peripheral configuration port only when XBUSEL = 1 in XFMT.

(2) Reads from XBUF originate on peripheral configuration port only when RBUSEL = 1 in RFMT.

Table 6-40. McASP Registers Accessed Through DMA Port

HEX ADDRESS	McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
Read Accesses	01D0 2000	01D0 6000	RBUF	Receive buffer DMA port address. Cycles through receive serializers, skipping over transmit serializers and inactive serializers. Starts at the lowest serializer at the beginning of each time slot. Reads from DMA port only if RBUSEL = 0 in RFMT.
Write Accesses	01D0 2000	01D0 6000	XBUF	Transmit buffer DMA port address. Cycles through transmit serializers, skipping over receive and inactive serializers. Starts at the lowest serializer at the beginning of each time slot. Writes to DMA port only if XBUSEL = 0 in XFMT.

Table 6-41. McASP AFIFO Registers Accessed Through Peripheral Configuration Port

McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01D0 1000	0x01D0 5000	AFIFOREV	AFIFO revision identification register
0x01D0 1010	0x01D0 5010	WFIFOCTL	Write FIFO control register
0x01D0 1014	0x01D0 5014	WFIFOSTS	Write FIFO status register
0x01D0 1018	0x01D0 5018	RFIFOCTL	Read FIFO control register
0x01D0 101C	0x01D0 501C	RFIFOSTS	Read FIFO status register

6.16.2 McASP Electrical Data/Timing

6.16.2.1 Multichannel Audio Serial Port 0 (McASP0) Timing

Table 6-42 and Table 6-43 assume testing over recommended operating conditions (see Figure 6-29 and Figure 6-30).

Table 6-42. McASP0 Timing Requirements⁽¹⁾⁽²⁾

NO.			MIN	MAX	UNIT
1	$t_{c(AHCLKRX)}$	Cycle time, AHCLKR0 external, AHCLKR0 input	25		ns
		Cycle time, AHCLKX0 external, AHCLKX0 input	25

(2) AHR - Cycle time, AHCLKR1.

(3) AHX - Cycle time, AHCLKX1.

(4) P = SYSCLK2 period

(5) AR - ACLKR1 period.

(6) AX - ACLKX1 period.

(7) McASP1 ACLKXCTL.ASYNC=1: Receiver is clocked by its own ACLKR1

- A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).
- B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

Figure 6-29. McASP Input Timings

- A. For $CLKRP = CLKXP = 1$, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).
- B. For $CLKRP = CLKXP = 0$, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 6-30. McASP Output Timings

6.17 Serial Peripheral Interface Ports (SPI0)

Figure 6-31 is a block diagram of the SPI module, which is a simple shift register and buffer plus control logic. Data is written to the shift register before transmission occurs and is read from the buffer at the end of transmission. The SPI can operate either as a master, in which case, it initiates a transfer and drives the SPIx_CLK pin, or as a slave. Four clock phase and polarity options are supported as well as many data formatting options.

Figure 6-31. Block Diagram of SPI Module

The SPI supports 3-, 4-, and 5-pin operation with three basic pins (SPIx_CLK, SPIx_SIMO, and SPIx_SOMI) and two optional pins (SPIx_SCS, SPIx_ENA).

The optional $\overline{\text{SPIx_SCS}}$ (Slave Chip Select) pin is most useful to enable in slave mode when there are other slave devices on the same SPI port. The C6743 will only shift data and drive the SPIx_SOMI pin when $\overline{\text{SPIx_SCS}}$ is held low.

In slave mode, $\overline{\text{SPIx_ENA}}$ is an optional output and can be driven in either a push-pull or open-drain manner. The $\overline{\text{SPIx_ENA}}$ output provides the status of the internal transmit buffer (SPIDAT0/1 registers). In four-pin mode with the enable option, $\overline{\text{SPIx_ENA}}$ is asserted only when the transmit buffer is full, indicating that the slave is ready to begin another transfer. In five-pin mode, the $\overline{\text{SPIx_ENA}}$ is additionally qualified by $\overline{\text{SPIx_SCS}}$ being asserted. This allows a single handshake line to be shared by multiple slaves on the same SPI bus.

In master mode, the $\overline{\text{SPIx_ENA}}$ pin is an optional input and the master can be configured to delay the start of the next transfer until the slave asserts $\overline{\text{SPIx_ENA}}$. The addition of this handshake signal simplifies SPI communications and, on average, increases SPI bus throughput since the master does not need to delay each transfer long enough to allow for the worst-case latency of the slave device. Instead, each transfer can begin as soon as both the master and slave have actually serviced the previous SPI transfer. Although the SPI module supports two interrupt outputs, SPIx_INT1 is the only interrupt connected on this device. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

Figure 6-32. Illustration of SPI Master-to-SPI Slave Connection

6.17.1 SPI Peripheral Registers Description(s)

Table 6-46 is a list of the SPI registers.

Table 6-46. SPIx Configuration Registers

SPI0 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01C4 1000	SPIGCR0	Global Control Register 0
0x01C4 1004	SPIGCR1	Global Control Register 1
0x01C4 1008	SPIINT0	Interrupt Register
0x01C4 100C	SPIVLV	Interrupt Level Register
0x01C4 1010	SPIFLG	Flag Register
0x01C4 1014	SPIPC0	Pin Control Register 0 (Pin Function)
0x01C4 1018	SPIPC1	Pin Control Register 1 (Pin Direction)
0x01C4 101C	SPIPC2	Pin Control Register 2 (Pin Data In)
0x01C4 1020	SPIPC3	Pin Control Register 3 (Pin Data Out)
0x01C4 1024	SPIPC4	Pin Control Register 4 (Pin Data Set)
0x01C4 1028	SPIPC5	Pin Control Register 5 (Pin Data Clear)
0x01C4 102C	Reserved	Reserved - Do not write to this register
0x01C4 1030	Reserved	Reserved - Do not write to this register
0x01C4 1034	Reserved	Reserved - Do not write to this register
0x01C4 1038	SPIDAT0	Shift Register 0 (without format select)
0x01C4 103C	SPIDAT1	Shift Register 1 (with format select)
0x01C4 1040	SPIBUF	Buffer Register
0x01C4 1044	SPIEMU	Emulation Register

Table 6-46. SPIx Configuration Registers (continued)

SPI0 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01C4 1048	SPIDELAY	Delay Register
0x01C4 104C	SPIDEF	Default Chip Select Register
0x01C4 1050	SPIFMT0	Format Register 0
0x01C4 1054	SPIFMT1	Format Register 1
0x01C4 1058	SPIFMT2	Format Register 2
0x01C4 105C	SPIFMT3	Format Register 3
0x01C4 1060	Reserved	Reserved - Do not write to this register
0x01C4 1064	INTVEC1	Interrupt Vector for SPI INT1

6.17.2 SPI Electrical Data/Timing

6.17.2.1 Serial Peripheral Interface (SPI) Timing

Table 6-47 assumes testing over recommended operating conditions (see Figure 6-33 through Figure 6-36).

Table 6-47. General Timing Requirements for SPI0 Master Modes⁽¹⁾

NO.			MIN	MAX	UNIT
1	$t_{c(SPC)M}$	Cycle Time, SPI0_CLK, All Master Modes	greater of 3P or 20	256P	ns
2	$t_{w(SPCH)M}$	Pulse Width High, SPI0_CLK, All Master Modes	$0.5t_{c(SPC)M} - 1$		ns
3	$t_{w(SPCL)M}$	Pulse Width Low, SPI0_CLK, All Master Modes	$0.5t_{c(SPC)M} - 1$		ns
4	$t_{d(SIMO_SPC)M}$	Delay, initial data bit valid on SPI0_SIMO after initial edge on SPI0_CLK ⁽²⁾	Polarity = 0, Phase = 0, to SPI0_CLK rising	5	ns
			Polarity = 0, Phase = 1, to SPI0_CLK rising	$-0.5t_{c(SPC)M} + 5$	
			Polarity = 1, Phase = 0, to SPI0_CLK falling	5	
			Polarity = 1, Phase = 1, to SPI0_CLK falling	$-0.5t_{c(SPC)M} + 5$	
5	$t_{d(SPC_SIMO)M}$	Delay, subsequent bits valid on SPI0_SIMO after transmit edge of SPI0_CLK	Polarity = 0, Phase = 0, from SPI0_CLK rising	5	ns
			Polarity = 0, Phase = 1, from SPI0_CLK falling	5	
			Polarity = 1, Phase = 0, from SPI0_CLK falling	5	
			Polarity = 1, Phase = 1, from SPI0_CLK rising	5	
6	$t_{oh(SPC_SIMO)M}$	Output hold time, SPI0_SIMO valid after receive edge of SPI0_CLK	Polarity = 0, Phase = 0, from SPI0_CLK falling	$0.5t_{c(SPC)M} - 3$	ns
			Polarity = 0, Phase = 1, from SPI0_CLK rising	$0.5t_{c(SPC)M} - 3$	
			Polarity = 1, Phase = 0, from SPI0_CLK rising	$0.5t_{c(SPC)M} - 3$	
			Polarity = 1, Phase = 1, from SPI0_CLK falling	$0.5t_{c(SPC)M} - 3$	
7	$t_{su(SOMI_SPC)M}$	Input Setup Time, SPI0_SOMI valid before receive edge of SPI0_CLK	Polarity = 0, Phase = 0, to SPI0_CLK falling	0	ns
			Polarity = 0, Phase = 1, to SPI0_CLK rising	0	
			Polarity = 1, Phase = 0, to SPI0_CLK rising	0	
			Polarity = 1, Phase = 1, to SPI0_CLK falling	0	
8	$t_{ih(SPC_SOMI)M}$	Input Hold Time, SPI0_SOMI valid after receive edge of SPI0_CLK	Polarity = 0, Phase = 0, from SPI0_CLK falling	5	ns
			Polarity = 0, Phase = 1, from SPI0_CLK rising	5	
			Polarity = 1, Phase = 0, from SPI0_CLK rising	5	
			Polarity = 1, Phase = 1, from SPI0_CLK falling	5	

(1) P = SYSCLK2 period

(2) First bit may be MSB or LSB depending upon SPI configuration. MO(0) refers to first bit and MO(n) refers to last bit output on SPI0_SIMO. MI(0) refers to the first bit input and MI(n) refers to the last bit input on SPI0_SOMI.

Table 6-48. General Timing Requirements for SPI0 Slave Modes⁽¹⁾

NO.			MIN	MAX	UNIT
9	$t_{c(SPC)}S$	Cycle Time, SPI0_CLK, All Slave Modes	greater of 3P or 40		ns
10	$t_{w(SPCH)}S$	Pulse Width High, SPI0_CLK, All Slave Modes	18		ns
11	$t_{w(SPCL)}S$	Pulse Width Low, SPI0_CLK, All Slave Modes	18		ns
12	$t_{su(SOMI_SPC)}S$	Setup time, transmit data written to SPI before initial clock edge from master. ^{(2) (3)}	Polarity = 0, Phase = 0, to SPI0_CLK rising	2P	ns
			Polarity = 0, Phase = 1, to SPI0_CLK rising	2P	
			Polarity = 1, Phase = 0, to SPI0_CLK falling	2P	
			Polarity = 1, Phase = 1, to SPI0_CLK falling	2P	
13	$t_{d(SPC_SOMI)}S$	Delay, subsequent bits valid on SPI0_SOMI after transmit edge of SPI0_CLK	Polarity = 0, Phase = 0, from SPI0_CLK rising	18.5	ns
			Polarity = 0, Phase = 1, from SPI0_CLK falling	18.5	
			Polarity = 1, Phase = 0, from SPI0_CLK falling	18.5	
			Polarity = 1, Phase = 1, from SPI0_CLK rising	18.5	
14	$t_{oh(SPC_SOMI)}S$	Output hold time, SPI0_SOMI valid after receive edge of SPI0_CLK	Polarity = 0, Phase = 0, from SPI0_CLK falling	$0.5t_{c(SPC)}S - 3$	ns
			Polarity = 0, Phase = 1, from SPI0_CLK rising	$0.5t_{c(SPC)}S - 3$	
			Polarity = 1, Phase = 0, from SPI0_CLK rising	$0.5t_{c(SPC)}S - 3$	
			Polarity = 1, Phase = 1, from SPI0_CLK falling	$0.5t_{c(SPC)}S - 3$	
15	$t_{su(SIMO_SPC)}S$	Input Setup Time, SPI0_SIMO valid before receive edge of SPI0_CLK	Polarity = 0, Phase = 0, to SPI0_CLK falling	0	ns
			Polarity = 0, Phase = 1, to SPI0_CLK rising	0	
			Polarity = 1, Phase = 0, to SPI0_CLK rising	0	
			Polarity = 1, Phase = 1, to SPI0_CLK falling	0	
16	$t_{ih(SPC_SIMO)}S$	Input Hold Time, SPI0_SIMO valid after receive edge of SPI0_CLK	Polarity = 0, Phase = 0, from SPI0_CLK falling	5	ns
			Polarity = 0, Phase = 1, from SPI0_CLK rising	5	
			Polarity = 1, Phase = 0, from SPI0_CLK rising	5	
			Polarity = 1, Phase = 1, from SPI0_CLK falling	5	

(1) P = SYSCLK2 period

(2) First bit may be MSB or LSB depending upon SPI configuration. SO(0) refers to first bit and SO(n) refers to last bit output on SPI0_SOMI. SI(0) refers to the first bit input and SI(n) refers to the last bit input on SPI0_SIMO.

(3) Measured from the termination of the write of new data to the SPI module. In analyzing throughput requirements, additional internal bus cycles must be accounted for to allow data to be written to the SPI module by the DSP CPU.

Table 6-49. Additional⁽¹⁾ SPI0 Master Timings, 4-Pin Enable Option⁽²⁾ (3)

NO.	PARAMETER	MIN	MAX	UNIT
17	$t_{d(ENA_SPC)M}$ Delay from slave assertion of $\overline{SPI0_ENA}$ active to first $SPI0_CLK$ from master. ⁽⁴⁾	Polarity = 0, Phase = 0, to $SPI0_CLK$ rising	$3P + 3.6$	ns
		Polarity = 0, Phase = 1, to $SPI0_CLK$ rising	$0.5t_{c(SPC)M} + 3P + 3.6$	
		Polarity = 1, Phase = 0, to $SPI0_CLK$ falling	$3P + 3.6$	
		Polarity = 1, Phase = 1, to $SPI0_CLK$ falling	$0.5t_{c(SPC)M} + 3P + 3.6$	
18	$t_{d(SPC_ENA)M}$ Max delay for slave to deassert $\overline{SPI0_ENA}$ after final $SPI0_CLK$ edge to ensure master does not begin the next transfer. ⁽⁵⁾	Polarity = 0, Phase = 0, from $SPI0_CLK$ falling	$0.5t_{c(SPC)M} + P + 5$	ns
		Polarity = 0, Phase = 1, from $SPI0_CLK$ falling	$P + 5$	
		Polarity = 1, Phase = 0, from $SPI0_CLK$ rising	$0.5t_{c(SPC)M} + P + 5$	
		Polarity = 1, Phase = 1, from $SPI0_CLK$ rising	$P + 5$	

(1) These parameters are in addition to the general timings for SPI master modes (Table 6-47).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four master clocking modes.

(4) In the case where the master SPI is ready with new data before $\overline{SPI0_ENA}$ assertion.

(5) In the case where the master SPI is ready with new data before $\overline{SPI0_EN A}$ deassertion.

Table 6-50. Additional⁽¹⁾ SPI0 Master Timings, 4-Pin Chip Select Option⁽²⁾ (3)

NO.	PARAMETER	MIN	MAX	UNIT
19	$t_{d(SCS_SPC)M}$ Delay from $\overline{SPI0_SCS}$ active to first $SPI0_CLK$ ⁽⁴⁾ (5)	Polarity = 0, Phase = 0, to $SPI0_CLK$ rising	$2P - 5$	ns
		Polarity = 0, Phase = 1, to $SPI0_CLK$ rising	$0.5t_{c(SPC)M} + 2P - 5$	
		Polarity = 1, Phase = 0, to $SPI0_CLK$ falling	$2P - 5$	
		Polarity = 1, Phase = 1, to $SPI0_CLK$ falling	$0.5t_{c(SPC)M} + 2P - 5$	
20	$t_{d(SPC_SCS)M}$ Delay from final $SPI0_CLK$ edge to master deasserting $\overline{SPI0_SCS}$ ⁽⁶⁾ (7)	Polarity = 0, Phase = 0, from $SPI0_CLK$ falling	$0.5t_{c(SPC)M} + P - 3$	ns
		Polarity = 0, Phase = 1, from $SPI0_CLK$ falling	$P - 3$	
		Polarity = 1, Phase = 0, from $SPI0_CLK$ rising	$0.5t_{c(SPC)M} + P - 3$	
		Polarity = 1, Phase = 1, from $SPI0_CLK$ rising	$P - 3$	

(1) These parameters are in addition to the general timings for SPI master modes (Table 6-47).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four master clocking modes.

(4) In the case where the master SPI is ready with new data before $\overline{SPI0_SCS}$ assertion.

(5) This delay can be increased under software control by the register bit field SPIDELAY.C2TDELAY[4:0].

(6) Except for modes when SPIDAT1.CSHOLD is enabled and there is additional data to transmit. In this case, $\overline{SPI0_SCS}$ will remain asserted.

(7) This delay can be increased under software control by the register bit field SPIDELAY.T2CDELAY[4:0].

Table 6-51. Additional⁽¹⁾ SPI0 Master Timings, 5-Pin Option⁽²⁾ ⁽³⁾

NO.			MIN	MAX	UNIT
18	$t_{d(SPC_ENA)M}$	Max delay for slave to deassert $\overline{SPI0_ENA}$ after final $SPI0_CLK$ edge to ensure master does not begin the next transfer. ⁽⁴⁾	Polarity = 0, Phase = 0, from $SPI0_CLK$ falling	$0.5t_{c(SPC)M} + P + 5$	ns
			Polarity = 0, Phase = 1, from $SPI0_CLK$ falling	$P + 5$

NO.	PARAMETER		MIN	MAX	UNIT
25	$t_{d(SCSL_SPC)S}$	Required delay from $\overline{SPI0_SCS}$ asserted at slave to first SPI0_CLK edge at slave.	2P		ns
26	$t_{d(SPC_SCSH)S}$	Required delay from final SPI0_CLK edge before $\overline{SPI0_SCS}$ is deasserted.	Polarity = 0, Phase = 0, from SPI0_CLK falling	$0.5t_{c(SPC)M} + 5$	ns
			Polarity = 0, Phase = 1, from SPI0_CLK falling	5	
			Polarity = 1, Phase = 0, from SPI0_CLK rising	$0.5t_{c(SPC)M} + 5$	
			Polarity = 1, Phase = 1, from SPI0_CLK rising	5	
27	$t_{ena(SCSL_SOMI)S}$	Delay from master asserting $\overline{SPI0_SCS}$ to slave driving SPI0_SOMI valid		P + 18.5	ns
28	$t_{dis(SCSH_SOMI)S}$	Delay from master deasserting $\overline{SPI0_SCS}$ to slave 3-stating SPI0_SOMI		P + 18.5	ns
29	$t_{ena(SCSL_ENA)S}$	Delay from master deasserting $\overline{SPI0_SCS}$ to slave driving SPI0_ENA valid		18.5	ns
30	$t_{dis(SPC_ENA)S}$	Delay from final clock receive edge on SPI0_CLK to slave 3-stating or driving high SPI0_ENA. ⁽⁴⁾	Polarity = 0, Phase = 0, from SPI0_CLK falling	2.5 P + 18.5	ns
			Polarity = 0, Phase = 1, from SPI0_CLK rising	2.5 P + 18.5	
			Polarity = 1, Phase = 0, from SPI0_CLK rising	2.5 P + 18.5	
			Polarity = 1, Phase = 1, from SPI0_CLK falling	2.5 P + 18.5	

(1) These parameters are in addition to the general timings for SPI slave modes (Table 6-48).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four slave clocking modes.

(4) SPI0_ENA is driven low after the transmission completes if the SPIINT0.ENABLE_HIGHZ bit is programmed to 0. Otherwise it is tri-stated. If tri-stated, an external pullup resistor should be used to provide a valid level to the master. This option is useful when tying several SPI slave devices to a single master.

Figure 6-35. SPI Timings—Master Mode (4-Pin and 5-Pin)

Figure 6-36. SPI Timings—Slave Mode (4-Pin and 5-Pin)

6.18 Enhanced Capture (eCAP) Peripheral

The device contains up to three enhanced capture (eCAP) modules. [Figure 6-37](#) shows a functional block diagram of a module. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

Uses for ECAP include:

- Speed measurements of rotating machinery (e.g. toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor triggers
- Period and duty cycle measurements of Pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

The ECAP module described in this specification includes the following features:

- 32 bit time base
- 4 event time-stamp registers (each 32 bits)
- Edge polarity selection for up to 4 sequenced time-stamp capture events
- Interrupt on either of the 4 events
- Single shot capture of up to 4 event time-stamps
- Continuous mode capture of time-stamps in a 4 deep circular buffer
- Absolute time-stamp capture
- Difference mode time-stamp capture
- All the above resources are dedicated to a single input pin

The eCAP modules are clocked at the SYSCLK2 rate.

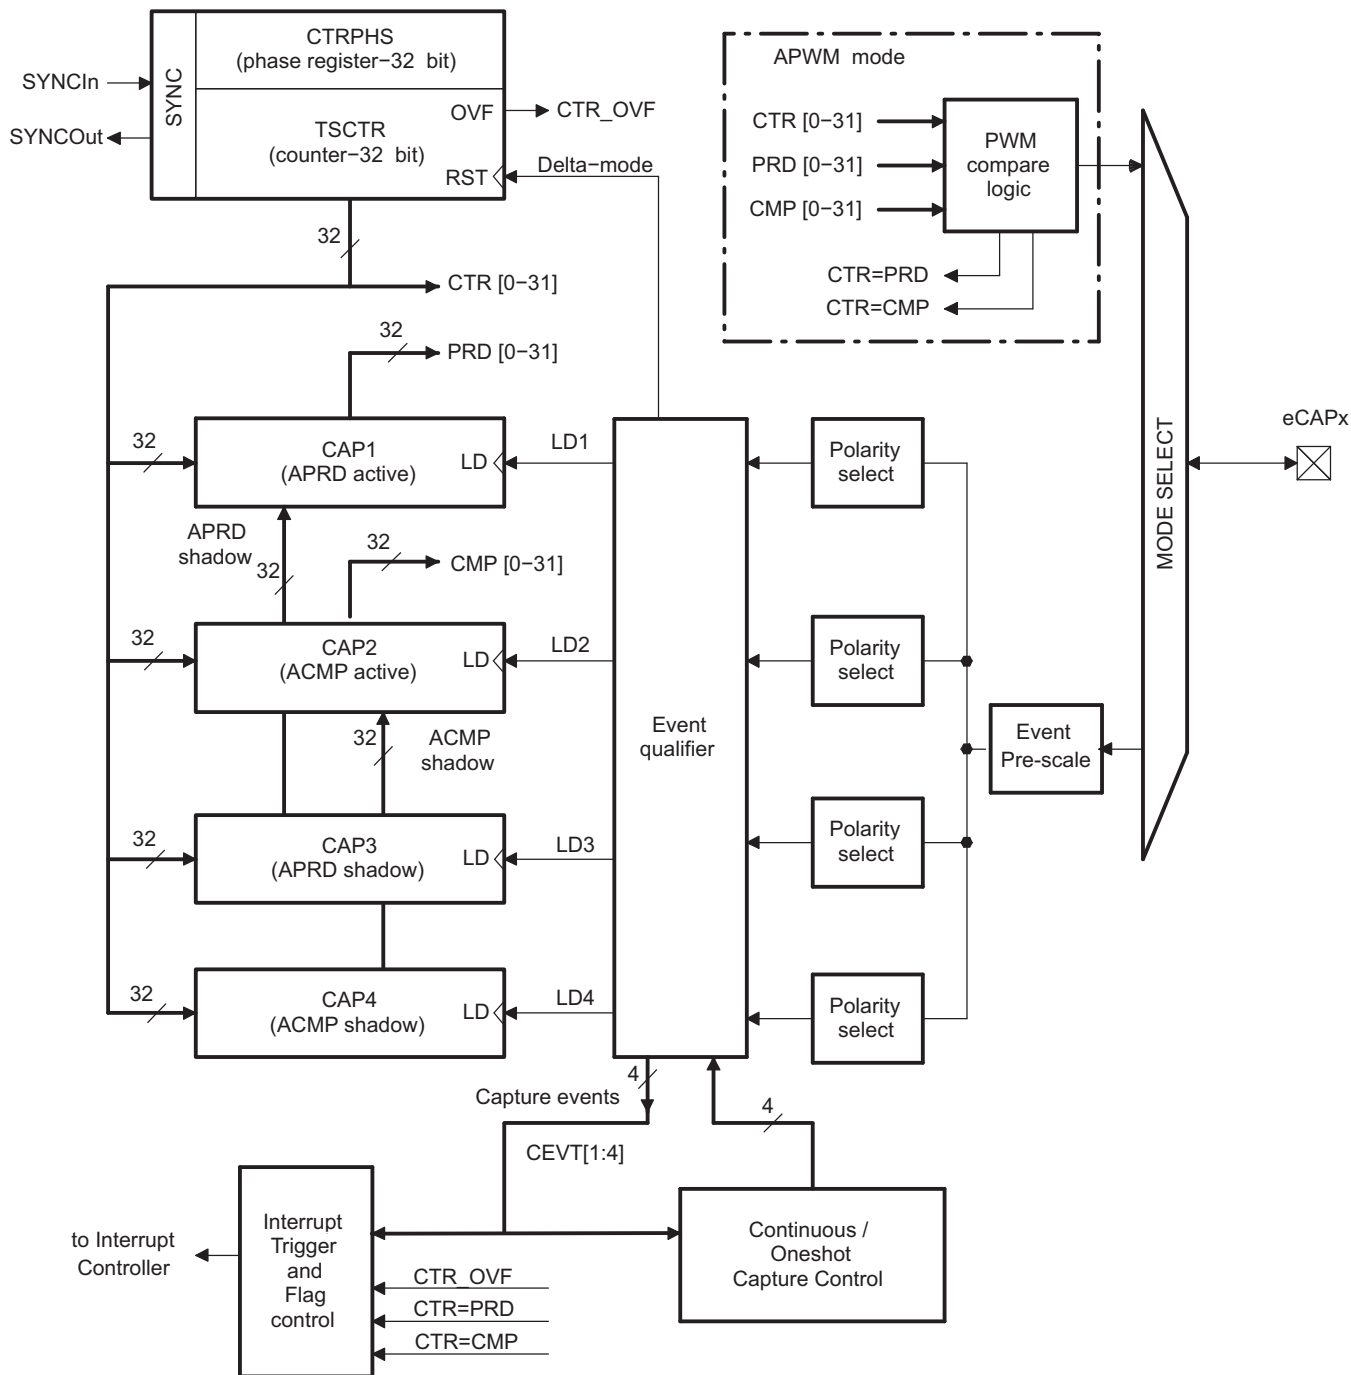

Figure 6-37. eCAP Functional Block Diagram

Table 6-55 is the list of the ECAP registers.

Table 6-55. ECAPx Configuration Registers

High-Resolution PWM (HRPWM) Submodule Registers						
0x01F0 1040	0x01F0 3040	0x01F0 5040	HRCNFG	1	No	HRPWM Configuration Register ⁽²⁾

(2) These registers are only available on eHRPWM instances that include the high-resolution PWM (HRPWM) extension; otherwise, these locations are reserved.

6.20.1 Enhanced Pulse Width Modulator (eHRPWM) Timing

PWM refers to PWM outputs on eHRPWM1-6. Table 6-62 shows the PWM timing requirements and Table 6-63, switching characteristics.

Table 6-62. eHRPWM Timing Requirements

		TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{SYCIN})}$	Sync input pulse width	Asynchronous	$2t_{c(\text{SCO})}$		cycles
		Synchronous	$2t_{c(\text{SCO})}$		cycles

Table 6-63. eHRPWM Switching Characteristics

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{PWM})}$	Pulse duration, PWMx output high/low	20		ns
$t_{w(\text{SYNCOUT})}$	Sync output pulse width	$8t_{c(\text{SCO})}$		cycles
$t_{d(\text{PWM})\text{tza}}$	Delay time, trip input active to PWM forced high	no pin load; no additional programmable delay	25	ns
	Delay time, trip input active to PWM forced low			
$t_{d(\text{TZ-PWM})\text{HZ}}$	Delay time, trip input active to PWM Hi-Z		20	ns

6.20.2 Trip-Zone Input Timing

- A. PWM refers to all the PWM pins in the device. The state of the PWM pins after $\overline{\text{TZ}}$ is taken high depends on the PWM recovery software.

Figure 6-41. PWM Hi-Z Characteristics

Table 6-64. Trip-Zone input Timing Requirements

		TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{TZ})}$	Pulse duration, $\overline{\text{TZ}}$ input low	Asynchronous	$1t_{c(\text{SCO})}$		cycles
		Synchronous	$2t_{c(\text{SCO})}$		cycles

Table 6-65 shows the high-resolution PWM switching characteristics.

Table 6-65. High Resolution PWM Characteristics at SYSCLKOUT = (60 - 100 MHz)

PARAMETER	MIN	TYP	MAX	UNIT
Micro Edge Positioning (MEP) step size ⁽¹⁾		200		ps

- (1) MEP step size will increase with low voltage and high temperature, and decrease with high voltage and cold temperature.

6.21 Timers

The timers support the following features:

- Configurable as single 64-bit timer or two 32-bit timers
- Period timeouts generate interrupts, DMA events or external pin events
- 8 32-bit compare registers
- Compare matches generate interrupt events
- Capture capability
- 64-bit Watchdog capability (Timer64P1 only)

[Table 6-66](#) lists the timer registers. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

Table 6-66. Timer Registers

TIMER64P 0	TIMER64P 1	REGISTER NAME	REGISTER DESCRIPTION
0x01C2 0000	0x01C2 1000	REV	Revision Register

6.21.1 Timer Electrical Data/Timing

Table 6-67. Timing Requirements for Timer Input⁽¹⁾⁽²⁾ (see Figure 6-42)

NO.		MIN	MAX	UNIT
1	$t_{c(TM64Px_IN12)}$ Cycle time, TM64Px_IN12	4P		ns
2	$t_{w(TINPH)}$ Pulse duration, TM64Px_IN12 high	0.45C	0.55C	ns
3	$t_{w(TINPL)}$ Pulse duration, TM64Px_IN12 low	0.45C	0.55C	ns
4	$t_t(TM64Px_IN12)$ Transition time, TM64Px_IN12		0.25P or 10 ⁽³⁾	ns

(1) P = OSCIN cycle time in ns.

(2) C = TM64P0_IN12 cycle time in ns.

(3) Whichever is smaller. P = The period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.

Figure 6-42. Timer Timing

Table 6-68. Switching Characteristics Over Recommended Operating Conditions for Timer Output⁽¹⁾

NO.	PARAMETER	MIN	MAX	UNIT
5	$t_{w(TOUTH)}$ Pulse duration, TM64P0_OUT12 high	4P		ns
6	$t_{w(TOURL)}$ Pulse duration, TM64P0_OUT12 low	4P		ns

(1) P = OSCIN cycle time in ns.

Figure 6-43. Timer Timing

6.22 Inter-Integrated Circuit Serial Ports (I2C0, I2C1)

6.22.1 I2C Device-Specific Information

Having two I2C modules on the device simplifies system architecture, since one module may be used by the DSP to control local peripherals ICs (DACs, ADCs, etc.) while the other may be used to communicate with other controllers in a system or to implement a user interface. Figure 6-44 is the block diagram of the I2C Module. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide (SPRUFK9)* for more details.

Each I2C port supports:

- Compatible with Philips® I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- General-Purpose I/O Capability if not used as I2C

Figure 6-44. I2C Module Block Diagram

6.22.2 I2C Peripheral Registers Description(s)

Table 6-69 is the list of the I2C registers.

Table 6-69. Inter-Integrated Circuit (I2C) Registers

I2C0 BYTE ADDRESS	I2C1 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01C2 2000	0x01E2 8000	ICOAR	I2C Own Address Register

(1) I2C must be configured correctly to meet the timings in [Table 6-71](#).

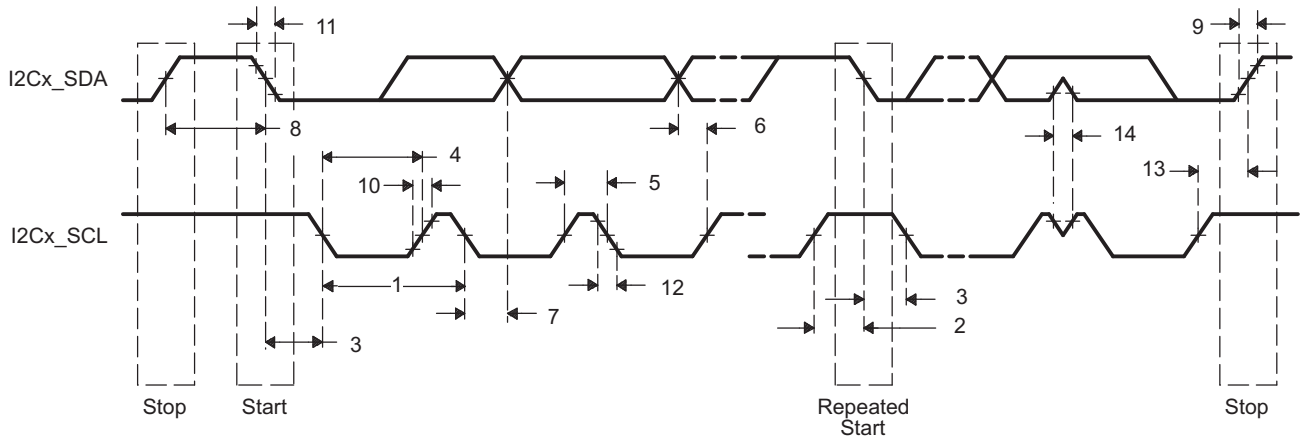

Figure 6-45. I2C Receive Timings

Figure 6-46. I2C Transmit Timings

6.23 Universal Asynchronous Receiver/Transmitter (UART)

The device has 2 UART peripherals. Each UART has the following features:

- 16-byte storage space for both the transmitter and receiver FIFOs
- Autoflow control signals (CTS, RTS) on UART0 only.
- 1, 4, 8, or 14 byte selectable receiver FIFO trigger level for autoflow control and DMA
- DMA signaling capability for both received and transmitted data
- Programmable auto-rts and auto-cts for autoflow control
- Programmable Baud Rate up to 3Mbaud
- Programmable Oversampling Options of x13 and x16
- Frequency pre-scale values from 1 to 65,535 to generate appropriate baud rates
- Prioritized interrupts
- Programmable serial data formats
 - 5, 6, 7, or 8-bit characters
 - Even, odd, or no parity bit generation and detection
 - 1, 1.5, or 2 stop bit generation
- False start bit detection
- Line break generation and detection
- Internal diagnostic capabilities
 - Loopback controls for communications link fault isolation
 - Break, parity, overrun, and framing error simulation

The UART registers are listed in [Section 6.23.1](#). See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

6.23.1 UART Peripheral Registers Description(s)

[Table 6-72](#) is the list of UART registers.

Table 6-72. UART Registers

UART0 BYTE ADDRESS	UART2 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01C4 2000	0x01D0 D000	RBR	Receiver Buffer Register (read only)
0x01C4 2000	0x01D0 D000	THR	Transmitter Holding Register (write only)
0x01C4 2004	0x01D0 D004	IER	Interrupt Enable Register
0x01C4 2008	0x01D0 D008	IIR	Interrupt Identification Register (read only)
0x01C4 2008	0x01D0 D008	FCR	FIFO Control Register (write only)
0x01C4 200C	0x01D0 D00C	LCR	Line Control Register
0x01C4 2010	0x01D0 D010	MCR	Modem Control Register
0x01C4 2014	0x01D0 D014	LSR	Line Status Register
0x01C4 2020	0x01D0 D020	DLL	Divisor LSB Latch
0x01C4 2024	0x01D0 D024	DLH	Divisor MSB Latch
0x01C4 2028	0x01D0 D028	REVID1	Revision Identification Register 1
0x01C4 2030	0x01D0 D030	PWREMU_MGMT	Power and Emulation Management Register
0x01C4 2034	0x01D0 D034	MDR	Mode Definition Register

6.23.2 UART Electrical Data/Timing

Table 6-73. Timing Requirements for UARTx Receive⁽¹⁾ (see Figure 6-47)

NO.			MIN	MAX	UNIT
4	$t_w(\text{URXDB})$	Pulse duration, receive data bit (RXDn)	0.96U	1.05U	MBaud
5	$t_w(\text{URXSB})$	Pulse duration, receive start bit	0.96U	1.05U	ns

(1) U = UART baud time = 1/programmed baud rate.

Table 6-74. Switching Characteristics Over Recommended Operating Conditions for UARTx Transmit⁽¹⁾ (see Figure 6-47)

NO.	PARAMETER	MIN	MAX	UNIT
1	$f_{(\text{baud})}$		D/E ⁽³⁾⁽⁴⁾	MBaud
2	$t_w(\text{UTXDB})$	U - 2	U + 2	ns
3	$t_w(\text{UTXSB})$	U - 2	U + 2	ns

(1) U = UART baud time = 1/programmed baud rate.

(2) Baud rate is not indicative of data rate. Actual data rate will be limited by system factors such as EDMA loading, EMIF loading, system frequency, etc.

(3) D = UART input clock in MHz. The UART(s) input clock source is PLL0_SYSCLK2.

(4) E = UART divisor x UART sampling rate. The UART divisor is set through the UART divisor latch registers (DLL and DLH). The UART sampling rate is set through the over-sampling mode select bit (OSM_SEL) of the UART mode definition register (MDR).

Figure 6-47. UART Transmit/Receive Timing

6.24 Power and Sleep Controller (PSC)

The Power and Sleep Controllers (PSC) are responsible for managing transitions of system power on/off, clock on/off, resets (device level and module level). It is used primarily to provide granular power control for on chip modules (peripherals and CPU). A PSC module consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, PSC interrupts, a state machine for each peripheral/module it controls. An LPSC is associated with every module that is controlled by the PSC and provides clock and reset control. See the *TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide* ([SPRUFK9](#)) for more details.

The PSC includes the following features:

- Provides a software interface to:
 - Control module clock enable/disable
 - Control module reset
 - Control CPU local reset
- Supports IcePick emulation features: power, clock and reset

6.24.1 PSC Peripheral Registers Description(s)

Table 6-75. Power and Sleep Controller (PSC) Registers

PSC0 BYTE ADDRESS	PSC1 BYTE ADDRESS	REGISTER NAME	REGISTER DESCRIPTION
0x01C1 0000	0x01E2 7000	REVID	Peripheral Revision and Class Information Register

		MDCTL0-MDCTL31	Module Control <i>n</i> Register (modules 0-31) (PSC1)

6.24.2 Power Domain and Module Topology

The device includes two PSC modules.

Each PSC module controls clock states for several on the on chip modules, controllers and interconnect components. [Table 6-76](#) and [Table 6-77](#) lists the set of peripherals/modules that are controlled by the PSC, the power domain they are associated with, the LPSC assignment and the default (power-on reset) module states. The module states and terminology are defined in [Section 6.24.2.2](#).

Table 6-76. PSC0 Default Module Configuration

LPSC NUMBER	MODULE NAME	POWER DOMAIN	DEFAULT MODULE STATE	AUTO SLEEP/WAKE ONLY
0	EDMA3 Channel Controller	AlwaysON (PD0)	SwRstDisable	—
1	EDMA3 Transfer Controller 0	AlwaysON (PD0)	SwRstDisable	—

26	SCR12 (Br 18)	AlwaysON (PD0)	Enable	Yes
27-31	—	—	—	—

6.24.2.1 Power Domain States

A power domain can only be in one of the two states: ON or OFF, defined as follows:

- ON: power to the domain is on
- OFF: power to the domain is off

In the device, for both PSC0 and PSC1, the Always ON domain, or PD0 power domain, is always in the ON state when the chip is powered-on. This domain is not programmable to OFF state.

- On PSC0 PD1/PD_DSP Domain: Controls the sleep state for DSP L1 and L2 Memories

6.24.2.2 Module States

The PSC defines several possible states for a module. These states are essentially a combination of the module reset asserted or de-asserted and module clock on/enabled or off/disabled. The module states are defined in [Table 6-78](#).

Table 6-78. Module States

MODULE STATE	MODULE RESET	MODULE CLOCK	MODULE STATE DEFINITION
Enable	De-asserted	On	A module in the enable state has its module reset de-asserted and it has its clock on. This is the normal operational state for a given module
Disable	De-asserted	Off	A module in the disabled state has its module reset de-asserted and it has its module clock off. This state is typically used for disabling a module clock to save power. The device is designed in full static CMOS, so when you stop a module clock, it retains the module's state. When the clock is restarted, the module resumes operating from the stopping point.
SyncReset	Asserted	On	A module state in the SyncReset state has its module reset asserted and it has its clock on. Generally, software is not expected to initiate this state
SwRstDisable	Asserted	Off	A module in the SwResetDisable state has its module reset asserted and it has its clock disabled. After initial power-on, several modules come up in the SwRstDisable state. Generally, software is not expected to initiate this state
Auto Sleep	De-asserted	Off	A module in the Auto Sleep state also has its module reset de-asserted and its module clock disabled, similar to the Disable state. However this is a special state, once a module is configured in this state by software, it can "automatically" transition to "Enable" state whenever there is an internal read/write request made to it, and after servicing the request it will "automatically" transition into the sleep state (with module reset re de-asserted and module clock disabled), without any software intervention. The transition from sleep to enabled and back to sleep state has some cycle latency associated with it. It is not envisioned to use this mode when peripherals are fully operational and moving data.
Auto Wake	De-asserted	Off	A module in the Auto Wake state also has its module reset de-asserted and its module clock disabled, similar to the Disable state. However this is a special state, once a module is configured in this state by software, it will "automatically" transition to "Enable" state whenever there is an internal read/write request made to it, and will remain in the "Enabled" state from then on (with module reset re de-asserted and module clock on), without any software intervention. The transition from sleep to enabled state has some cycle latency associated with it. It is not envisioned to use this mode when peripherals are fully operational and moving data.

6.25 Programmable Real-Time Unit Subsystem (PRUSS)

The Programmable Real-Time Unit Subsystem (PRUSS) consists of

- Two Programmable Real-Time Units (PRU0 and PRU1) and their associated memories
- An Interrupt Controller (INTC) for handling system interrupt events. The INTC also supports posting events back to the device level host CPU.
- A Switched Central Resource (SCR) for connecting the various internal and external masters to the resources inside the PRUSS.

The two PRUs can operate completely independently or in coordination with each other. The PRUs can also work in coordination with the device level host CPU. This is determined by the nature of the program which is loaded into the PRUs instruction memory. Several different signaling mechanisms are available between the two PRUs and the device level host CPU.

The PRUs are optimized for performing embedded tasks that require manipulation of packed memory mapped data structures, handling of system events that have tight realtime constraints and interfacing with systems external to the device.

The PRUSS comprises various distinct addressable regions. Externally the subsystem presents a single 64Kbyte range of addresses. The internal interconnect bus (also called switched central resource, or SCR) of the PRUSS decodes accesses for each of the individual regions. The PRUSS memory map is documented in [Table 6-79](#) and in [Table 6-80](#). Note that these two memory maps are implemented inside the PRUSS and are local to the components of the PRUSS.

Table 6-79. Programmable Real-Time Unit Subsystem (PRUSS) Local Instruction Space Memory Map

BYTE ADDRESS	PRU0	PRU1
0x0000 0000 - 0x0000 0FFF	PRU0 Instruction RAM	PRU1 Instruction RAM

Table 6-80. Programmable Real-Time Unit Subsystem (PRUSS) Local Data Space Memory Map

BYTE ADDRESS	PRU0	PRU1
0x0000 0000 - 0x0000 01FF	Data RAM 0 ⁽¹⁾	Data RAM 1 ⁽¹⁾
0x0000 0200 - 0x0000 1FFF	Reserved	Reserved
0x0000 2000 - 0x0000 21FF	Data RAM 1 ⁽¹⁾	Data RAM 0 ⁽¹⁾
0x0000 2200 - 0x0000 3FFF	Reserved	Reserved
0x0000 4000 - 0x0000 6FFF	INTC Registers	INTC Registers
0x0000 7000 - 0x0000 73FF	PRU0 Control Registers	PRU0 Control Registers
0x0000 7400 - 0x0000 77FF	Reserved	Reserved
0x0000 7800 - 0x0000 7BFF	PRU1 Control Registers	PRU1 Control Registers
0x0000 7C00 - 0xFFFF FFFF	Reserved	Reserved

- (1) Note that PRU0 accesses Data RAM0 at address 0x0000 0000, also PRU1 accesses Data RAM1 at address 0x0000 0000. Data RAM0 is intended to be the primary data memory for PRU0 and Data RAM1 is intended to be the primary data memory for PRU1. However for passing information between PRUs, each PRU can access the data ram of the 'other' PRU through address 0x0000 2000.

The global view of the PRUSS internal memories and control ports is documented in [Table 6-81](#). The offset addresses of each region are implemented inside the PRUSS but the global device memory mapping places the PRUSS slave port in the address range 0x01C3 0000-0x01C3 FFFF. The PRU0 and PRU1 can use either the local or global addresses to access their internal memories, but using the local addresses will provide access time several cycles faster than using the global addresses. This is because when accessing via the global address the access needs to be routed through the switch fabric outside PRUSS and back in through the PRUSS slave port.

Table 6-81. Programmable Real-Time Unit Subsystem (PRUSS) Global Memory Map

BYTE ADDRESS	REGION
0x01C3 0000 - 0x01C3 01FF	Data RAM 0
0x01C3 0200 - 0x01C3 1FFF	Reserved
0x01C3 2000 - 0x01C3 21FF	Data RAM 1
0x01C3 2200 - 0x01C3 3FFF	Reserved
0x01C3 4000 - 0x01C3 6FFF	INTC Registers
0x01C3 7000 - 0x01C3 73FF	PRU0 Control Registers
0x01C3 7400 - 0x01C3 77FF	PRU0 Debug Registers
0x01C3 7800 - 0x01C3 7BFF	PRU1 Control Registers
0x01C3 7C00 - 0x01C3 7FFF	PRU1 Debug Registers
0x01C3 8000 - 0x01C3 8FFF	PRU0 Instruction RAM
0x01C3 9000 - 0x01C3 BFFF	Reserved
0x01C3 C000 - 0x01C3 CFFF	PRU1 Instruction RAM
0x01C3 D000 - 0x01C3 FFFF	Reserved

Each of the PRUs can access the rest of the device memory (including memory mapped peripheral and configuration registers) using the global memory space addresses

6.25.1 PRUSS Register Descriptions

Table 6-82. Programmable Real-Time Unit Subsystem (PRUSS) Control / Status Registers

6.26 Emulation Logic

The debug capabilities and features for DSP are as shown below.

DSP:

- Basic Debug
 - Execution Control
 - System Visibility
- Real-Time Debug
 - Interrupts serviced while halted
 - Low/non-intrusive system visibility while running
- Advanced Debug
 - Global Start
 - Global Stop
 - Specify targeted memory level(s) during memory accesses
 - HSRTDX (High Speed Real Time Data eXchange)
- Advanced System Control
 - Subsystem reset via debug
 - Peripheral notification of debug events
 - Cache-coherent debug accesses
- Analysis Actions
 - Stop program execution
 - Generate debug interrupt
 - Benchmarking with counters
 - External trigger generation
 - Debug state machine state transition
 - Combinational and Sequential event generation
- Analysis Events
 - Program event detection
 - Data event detection
 - External trigger Detection
 - System event detection (i.e. cache miss)
 - Debug state machine state detection
- Analysis Configuration
 - Application access
 - Debugger access

Table 6-84. DSP Debug Features

CATEGORY	HARDWARE FEATURE	AVAILABILITY
Basic Debug	Software breakpoint	Unlimited
	Hardware breakpoint	Up to 10 HWBPs, including: 4 precise ⁽¹⁾ HWBPs inside DSP core and one of them is associated with a counter. 2 imprecise ⁽¹⁾ HWBPs from AET. 4 imprecise ⁽¹⁾ HWBPs from AET which are shared for watch point.

(1) Precise hardware breakpoints will halt the processor immediately prior to the execution of the selected instruction. Imprecise breakpoints will halt the processor some number of cycles after the selected instruction depending on device conditions.

Table 6-84. DSP Debug Features (continued)

CATEGORY	HARDWARE FEATURE	AVAILABILITY
Analysis	Watch point	Up to 4 watch points, which are shared with HWBPs, and can also be used as 2 watch points with data (32 bits)
	Watch point with Data	Up to 2, Which can also be used as 4 watch points.
	Counters/timers	1x64-bits (cycle only) + 2x32-bits (water marke counters)
	External Event Trigger In	1
	External Event Trigger Out	1

6.26.1 JTAG Port Description

The device target debug interface uses the five standard IEEE 1149.1(JTAG) signals ($\overline{\text{TRST}}$, TCK, TMS, TDI, and TDO).

$\overline{\text{TRST}}$ holds the debug and boundary scan logic in reset (normal DSP operation) when pulled low (its default state). Since $\overline{\text{TRST}}$ has an internal pull-down resistor, this ensures that at power up the device functions in its normal (non-test) operation mode if $\overline{\text{TRST}}$ is not connected. Otherwise, $\overline{\text{TRST}}$ should be driven inactive by the emulator or boundary scan controller. Boundary scan test cannot be performed while the $\overline{\text{TRST}}$ pin is pulled low.

Table 6-85. JTAG Port Description

PIN	TYPE	NAME	DESCRIPTION
$\overline{\text{TRST}}$	I	Test Logic Reset	When asserted (active low) causes all test and debug logic in the device to be reset along with the IEEE 1149.1 interface
TCK	I	Test Clock	This is the test clock used to drive an IEEE 1149.1 TAP state machine and logic.
TMS	I	Test Mode Select	Directs the next state of the IEEE 1149.1 test access port state machine
TDI	I	Test Data Input	Scan data input to the device
TDO	O	Test Data Output	Scan data output of the device
EMU0	I/O	Emulation 0	Channel 0 trigger + HSRTDX

6.26.2 Scan Chain Configuration Parameters

Table 6-86 shows the TAP configuration details required to configure the router/emulator for this device.

Table 6-86. Router TAP Configuration

ROUTER PORT ID	DEFAULT TAP	TAP NAME	TAP IR LENGTH
17	No	C674x	38

The router is revision C and has a 6-bit IR length.

6.26.3 JTAG 1149.1 Boundary Scan Considerations

To use boundary scan, the following sequence should be followed:

- Execute a valid reset sequence and exit reset
- Wait at least 6000 OSCIN clock cycles
- Enter boundary scan mode using the JTAG pins

No specific value is required on the EMU0 pin for boundary scan testing. If $\overline{\text{TRST}}$ is not driven by the boundary scan tool or tester, $\overline{\text{TRST}}$ should be externally pulled high during boundary scan testing.

6.27 IEEE 1149.1 JTAG

The JTAG ⁽¹⁾ interface is used for BSDL testing and emulation of the device.

The device requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the device, $\overline{\text{TRST}}$ initializes the device's emulation logic. Both resets are required for proper operation.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the device to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and device's emulation logic in the reset state.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality.

$\overline{\text{RESET}}$ must be released only in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$.

For maximum reliability, the device includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

Note: The sequencing of all the JTAG signals must follow the IEEE.1149.1 JTAG standard.

6.27.1 JTAG Peripheral Register Description(s) – JTAG ID Register

Table 6-87. JTAG ID Register

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
0x01C4 0028	JTAGID	JTAG Identification Register	Read-only. Provides 32-bit JTAG ID of the device.

(1) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. The register hex value each silicon revision is:

- 0x0B79 F02F for silicon revision 1.0.
- 0x8B79 F02F for silicon revision 1.1.
- 0x9B79 F02F for silicon revision 3.0, 2.1, and 2.0.

For the actual register bit names and their associated bit field descriptions, see [Figure 6-48](#) and [Table 6-88](#).

Figure 6-48. JTAG ID (DEVIDR0) Register Description - Register Value

7 Device and Documentation Support

7.1 Device Support

7.1.1 Development Support

TI offers an extensive line of development tools for the TMS320C6743 platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of TMS320C6743 applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the device, visit the Texas Instruments web site on the Worldwide Web at www.ti.com uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

7.1.2 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., TMS320C6743). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX	Experimental device that is not necessarily representative of the final device's electrical specifications.
TMP	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.
TMS	Fully-qualified production device.

Support tool development evolutionary flow:

TMDX	Development-support product that has not yet completed Texas Instruments internal qualification testing.
TMDS	Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZWT), the temperature range (for example, "Blank" is the commercial temperature range), and the device speed range in megahertz (for example, "Blank" is the default).

Figure 7-1 provides a legend for reading the complete device name for any TMS320C674x member.

Figure 7-1. Device Nomenclature

7.2 Documentation Support

The following documents describe the TMS320C6743 Low-power digital signal processor. Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

DSP Reference Guides

[SPRUG82](#) *TMS320C674x DSP Cache User's Guide.* Explains the fundamentals of memory caches and describes how the two-level cache-based internal memory architecture in the TMS320C674x digital signal processor (DSP) can be efficiently used in DSP applications. Shows how to maintain coherence with external memory, how to use DMA to reduce memory latencies, and how to optimize your code to improve cache efficiency. The internal memory architecture in the C674x DSP is organized in a two-level hierarchy consisting of a dedicated program cache (L1P) and a dedicated data cache (L1D) on the first level. Accesses by the CPU to these first level caches can complete without CPU pipeline stalls. If the data requested by the CPU is not contained in cache, it is fetched from the next lower memory level, L2 or external memory.

[SPRUF8](#) *TMS320C674x DSP CPU and Instruction Set Reference Guide.* Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C674x digital signal processors (DSPs). The C674x DSP is an enhancement of the C64x+ and C67x+ DSPs with added functionality and an expanded instruction set.

- [SPRU186](#) **TMS320C6000 Assembly Language Tools User's Guide.** Describes the assembly language tools (assembler, linker, and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C6000 platform of devices (including the C64x+, C67x+, and C674x generations).
- [SPRU187](#) **TMS320C6000 Optimizing Compiler User's Guide.** Describes the TMS320C6000 C compiler and the assembly optimizer. This C compiler accepts ANSI standard C source code and produces assembly language source code for the TMS320C6000 platform of devices (including the C64x+, C67x+, and C674x generations). The assembly optimizer helps you optimize your assembly code.
- [SPRUH90](#) **TMS320C6743 DSP Technical Reference Manual.** Describes the System-on-Chip (SoC) and each peripheral in the device.
- [SPRUFK5](#) **TMS320C674x DSP Megamodule Reference Guide.** Describes the TMS320C674x digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.
- [SPRUFK9](#) **TMS320C674x/OMAP-L1x Processor Peripherals Overview Reference Guide.** Provides an overview and briefly describes the peripherals available on TMS320C6743.

7.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

[TI E2E™ Online Community](#) **TI's Engineer-to-Engineer (E2E) Community.** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

[TI Embedded Processors Wiki](#) **Texas Instruments Embedded Processors Wiki.** Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

7.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

7.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

8 Mechanical Packaging and Orderable Information

This section describes the orderable part numbers, packaging options, materials, thermal and mechanical parameters.

8.1 Thermal Data for ZKB

The following table(s) show the thermal resistance characteristics for the PBGA–ZKB mechanical package.

Table 8-1. Thermal Resistance Characteristics (PBGA Package) [ZKB]

NO.	CHARACTERISTIC		°C/W ⁽¹⁾	°C/W ⁽²⁾	AIR FLOW (m/s) ⁽³⁾
1	R θ _{JC}	Junction-to-case	12.8	13.5	N/A
2	R θ _{JB}	Junction-to-board	15.1	19.7	N/A
3	R θ _{JA}	Junction-to-free air	24.5	33.8	0.00
4	R θ _{JMA}	Junction-to-moving air	21.9	30	0.50
5			21.1	28.7	1.00

15		5.9	8.7		9.8	1.00
16		5.8	8.6		9.7	2.00
17		5.8	8.5		9.6	4.00

- (1) Simulation data, using a model of a JEDEC defined 2S2P system with a 12mmx12mm copper pad on the top and bottom copper layers connected with an 8x8 thermal via array and soldered to the package thermal pad. Power dissipation of 1W assumed, 70C Ambient temp assumed. Signal layer copper coverage 20%, inner layer copper coverage 90%. Actual performance will change based on environment as well as application. For more information, see these EIA/JEDEC standards – EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)* and JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*.
- (2) Simulation data, using the same model but with 1oz (35um) top and bottom copper thickness and 0.5oz (18um) inner copper thickness. Power dissipation of 1W and ambient temp of 70C assumed.
- (3) Simulation data, 1S1P PCB model with 12x12mm copper pad on the top layer soldered to device thermal pad and connected to the bottom copper layer (90% copper) with an 8x8 thermal via array. Power dissipation of 1W and ambient temp of 70C assumed. Copper thickness 2oz (70um) top and bottom.
- (4) Simulation data, 1S1P PCB model with 12x12mm copper pad on the top layer soldered to device thermal pad and connected to the bottom copper layer (90% copper) with an 8x8 thermal via array. Power dissipation of 1W and ambient temp of 70C assumed. Copper thickness 1oz (35um) top and bottom.
- (5) m/s = meters per second

8.3 Supplementary Information About the 176-pin PTP PowerPAD™ Package

This section highlights a few important details about the 176-pin PTP PowerPAD™ package. Texas Instruments' *PowerPAD Thermally Enhanced Package Technical Brief* ([SLMA002](#)) should be consulted when creating a PCB footprint for this device.

8.3.1 Standoff Height

As illustrated in [Figure 8-1](#), the standoff height specification for this device (between 0.050 mm and 0.150 mm) is measured from the seating plane established by the three lowest package pins to the **lowest** point on the package body. Due to warpage, the lowest point on the package body is located in the center of the package at the exposed thermal pad.

Using this definition of standoff height provides the correct result for determining the correct solder paste thickness. According to TI's *PowerPAD Thermally Enhanced Package Technical Brief* ([SLMA002](#)), the recommended range of solder paste thickness for this package is between 0.152 mm and 0.178 mm.

Figure 8-1. Standoff Height Measurement on 176-pin PTP Package

8.3.2 PowerPAD™ PCB Footprint

In general, for proper thermal performance, the thermal pad under the package body should be as large as possible. However, the soldermask opening for the PowerPAD™ should be sized to match the pad size on the 176-pin PTP package; as illustrated in [Figure 8-2](#).

Figure 8-2. Soldermask Opening Should Match Size of DSP Thermal Pad

8.4 Mechanical Drawings

This section contains mechanical drawings for the ZKB Plastic Ball Grid Array package and the PTP Thin Quad Flat Pack package. Additionally, for the PTP package a detailed drawing of the actual thermal pad dimensions as well as a recommended PCB footprint are provided.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

MECHANICAL DATA

ZKB (S-PBGA-N256)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
 - B. This drawing is subject to change without notice.
 - C. This is a Pb-free solder ball design.

PTP (S-PQFP-G176)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. Falls within JEDEC MO-026

PowerPAD is a trademark of Texas Instruments.

PTP (S-PQFP-G176)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4209350-6/F 04/13

NOTE: All linear dimensions are in millimeters

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
