

QUAD CHANNEL T1/E1/J1 SHORT HAUL LINE INTERFACE UNIT

IDT82V2044E

FEATURES:

- Four channel T1/E1/J1 short haul line interfaces
- Supports HPS (Hitless Protection Switching) for 1+1 protection without external relays
- Programmable T1/E1/J1 switchability allowing one bill of material for any line condition
- Single 3.3 V power supply with 5 V tolerance on digital interfaces
- Meets or exceeds specifications in
 - ANSI T1.102, T1.403 and T1.408
 - ITU I.431, G.703, G.736, G.775 and G.823
 - ETSI 300-166, 300-233 and TBR 12/13
 - AT&T Pub 62411
- Per channel software selectable on:
 - Wave-shaping templates
 - Line terminating impedance (T1:100 Ω , J1:110 Ω , E1:75 Ω /120 Ω)
 - Adjustment of arbitrary pulse shape
 - JA (Jitter Attenuator) position (receive path or transmit path)
 - Single rail/dual rail system interfaces
 - B8ZS/HDB3/AMI line encoding/decoding
 - Active edge of transmit clock (TCLK) and receive clock (RCLK)
 - Active level of transmit data (TDATA) and receive data (RDATA)
 - Receiver or transmitter power down
- High impedance setting for line drivers
- PRBS (Pseudo Random Bit Sequence) generation and detection with $2^{15}-1$ PRBS polynomials for E1
- QRSS (Quasi Random Sequence Signals) generation and detection with $2^{20}-1$ QRSS polynomials for T1/J1
- 16-bit BPV (Bipolar Pulse Violation)/Excess Zero/PRBS or QRSS error counter
- Analog loopback, Digital loopback, Remote loopback and Inband loopback
- Adaptive receive sensitivity up to -20 dB
- Non-intrusive monitoring per ITU G.772 specification
- Short circuit protection for line drivers
- LOS (Loss Of Signal) detection with programmable LOS levels
- AIS (Alarm Indication Signal) detection
- JTAG interface
- Supports serial control interface, Motorola and Intel Non-Multiplexed interfaces
- Package:
IDT82V2044E: 128-pin TQFP

DESCRIPTION:

The IDT82V2044E can be configured as a quad T1, quad E1 or quad J1 Line Interface Unit. The IDT82V2044E performs clock/data recovery, AMI/B8ZS/HDB3 line decoding and detects and reports the LOS conditions. An integrated Adaptive Equalizer is available to increase the receive sensitivity and enable programming of LOS levels. In transmit path, there is an AMI/B8ZS/HDB3 encoder and Waveform Shaper. There is one Jitter Attenuator for each channel, which can be placed in either the receive path or the transmit path. The Jitter Attenuator can also be disabled. The IDT82V2044E supports both Single Rail and Dual Rail system interfaces

and both serial and parallel control interfaces. To facilitate the network maintenance, a PRBS/QRSS generation/detection circuit is integrated in each channel, and different types of loopbacks can be set on a per channel basis. Four different kinds of line terminating impedance, 75 Ω , 100 Ω , 110 Ω and 120 Ω are selectable on a per channel basis. The chip also provides driver short-circuit protection and supports JTAG boundary scanning.

The IDT82V2044E can be used in SDH/SONET, LAN, WAN, Routers, Wireless Base Stations, IADs, IMAs, IMAPs, Gateways, Frame Relay Access Devices, CSU/DSU equipment, etc.

1 IDT82V2044E PIN CONFIGURATIONS

Figure-2 IDT82V2044E TQFP128 Package Pin Assignment

2 PIN DESCRIPTION

Table-1 Pin Description

| Name | Type | TQFP128 | Description | | | | | | | | | | | | | | | |
|--|------------------|--|--|------|------|--------------|---|---|-------|---|---|----------------|---|---|----------------|---|---|-------|
| Transmit and Receive Line Interface | | | | | | | | | | | | | | | | | | |
| TTIP1 TTIP2 TTIP3 TTIP4 TRING1 TRING2 TRING3 TRING4 | Output Analog | 104 114 48 58 103 113 47 57 | <p>TTIPn¹/TRINGn: Transmit Bipolar Tip/Ring for Channel 1~4</p> <p>These pins are the differential line driver outputs and can be set to high impedance state globally or individually. A logic high on THZ pin turns all these pins into high impedance state. When THZ bit (TCF1, 03H...)² is set to '1', the TTIPn/TRINGn in the corresponding channel is set to high impedance state.</p> <p>In summary, these pins will become high impedance in the following conditions:</p> <ul style="list-style-type: none"> • THZ pin is high: all TTIPn/TRINGn enter high impedance. • THZn bit is set to 1: the corresponding TTIPn/TRINGn become high impedance; • Loss of MCLK: all TTIPn/TRINGn pins become high impedance; • Loss of TCLKn: the corresponding TTIPn/TRINGn become high impedance (exceptions: Remote Loopback; Transmit internal pattern by MCLK); • Transmitter path power down: the corresponding TTIPn/TRINGn become high impedance; • After software reset; pin reset and power on: all TTIPn/TRINGn enter high impedance. | | | | | | | | | | | | | | | |
| RTIP1 RTIP2 RTIP3 RTIP4 RRING1 RRING2 RRING3 RRING4 | Input Analog | 109 119 53 63 108 118 52 62 | <p>RTIPn/RRINGn: Receive Bipolar Tip/Ring for Channel 1~4</p> <p>These pins are the differential line receiver inputs.</p> | | | | | | | | | | | | | | | |
| Transmit and Receive Digital Data Interface | | | | | | | | | | | | | | | | | | |
| TD1/TDP1 TD2/TDP2 TD3/TDP3 TD4/TDP4 TDN1 TDN2 TDN3 TDN4 | Input | 96 90 80 74 95 89 79 73 | <p>TDn: Transmit Data for Channel 1~4</p> <p>In Single Rail Mode, the NRZ data to be transmitted is input on these pins. Data on TDn is sampled into the device on the active edge of TCLKn. The active edge of TCLKn is selected by the TCLK_SEL bit (TCF0, 02H...). Data is encoded by AMI, HDB3 or B8ZS line code rules before being transmitted to the line. In this mode, TDNn should be connected to ground.</p> <p>TDPn/TDNn: Positive/Negative Transmit Data for Channel 1~4</p> <p>In Dual Rail Mode, the NRZ data to be transmitted is input on these pins. Data on TDPn/TDNn is sampled into the device on the active edge of TCLKn. The active edge of the TCLKn is selected by the TCLK_SEL bit (TCF0, 02H...) The line code in Dual Rail Mode is as follows:</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>TDPn</th> <th>TDNn</th> <th>Output Pulse</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Space</td> </tr> <tr> <td>0</td> <td>1</td> <td>Positive Pulse</td> </tr> <tr> <td>1</td> <td>0</td> <td>Negative Pulse</td> </tr> <tr> <td>1</td> <td>1</td> <td>Space</td> </tr> </tbody> </table> | TDPn | TDNn | Output Pulse | 0 | 0 | Space | 0 | 1 | Positive Pulse | 1 | 0 | Negative Pulse | 1 | 1 | Space |
| TDPn | TDNn | Output Pulse | | | | | | | | | | | | | | | | |
| 0 | 0 | Space | | | | | | | | | | | | | | | | |
| 0 | 1 | Positive Pulse | | | | | | | | | | | | | | | | |
| 1 | 0 | Negative Pulse | | | | | | | | | | | | | | | | |
| 1 | 1 | Space | | | | | | | | | | | | | | | | |
| TCLK1 TCLK2 TCLK3 TCLK4 | Input | 97 91 82 75 | <p>TCLKn: Transmit Clock for Channel 1~4</p> <p>These pins input 1.544 MHz for T1/J1 mode or 2.048 MHz for E1 mode transmit clock. The transmit data on TDn/TDPn or TDNn is sampled into the device on the active edge of TCLKn. If TCLKn is missing³ and the TCLKn missing interrupt is not masked, an interrupt will be generated.</p> | | | | | | | | | | | | | | | |

Notes:

1. The footprint 'n' (n = 1~4) represents one of the four channels.
2. The name and address of the registers that contain the preceding bit. Only the address of channel 1 register is listed, the rest addresses are represented by '...'. Users can find these omitted addresses in the **Register Description** section.
3. TCLKn missing: the state of TCLKn continues to be high level or low level over 70 clock cycles.

Table-1 Pin Description (Continued)

| Name | Type | TQFP128 | Description | | | | | | | | | | | | |
|--|------------------------------------|--|--|-----|-------------------|------|------------------------------------|-----|----------------------------------|--------------|---------------------------|----|--------------------------|----|-----------------------|
| RD1/RDP1 RD2/RDP2 RD3/RDP3 RD4/RDP4 CV1/RDN1 CV2/RDN2 CV3/RDN3 CV4/RDN4 | Output | 93 87 77 71 92 86 76 70 | <p>RDn: Receive Data for Channel 1~4 In Single Rail Mode, the NRZ receive data is output on these pins. Data is decoded according to AMI, HDB3 or B8ZS line code rules. The active level on RDn pin is selected by the RD_INV bit (RCF0, 07H...).</p> <p>CVn: Code Violation for Channel 1~4 In Single Rail Mode, the BPV/CV errors in received data streams will be reported by driving pin CVn to high level for a full clock cycle. The B8ZS/HDB3 line code violation can be indicated when the B8ZS/HDB3 decoder is enabled. When AMI decoder is selected, the bipolar violation can be indicated.</p> <p>RDPn/RDNn: Positive/Negative Receive Data for Channel 1~4 In Dual Rail Mode with Clock & Data Recovery (CDR), these pins output the NRZ data with the recovered clock. An active level on RDPn indicates the receipt of a positive pulse on RTIPn/RRINGn while an active level on RDNn indicates the receipt of a negative pulse on RTIPn/RRINGn. The active level on RDPn/RDNn is selected by the RD_INV bit (RCF0, 07H...). When CDR is disabled, these pins directly output the raw RZ sliced data. The output data on RDn and RDPn/RDNn is updated on the active edge of RCLKn.</p> | | | | | | | | | | | | |
| RCLK1 RCLK2 RCLK3 RCLK4 | Output | 94 88 78 72 | <p>RCLKn: Receive Clock for Channel 1~4 These pins output 1.544 MHz for T1/J1 mode or 2.048 MHz for E1 mode receive clock. Under LOS conditions, if AISE bit (MAINT0, 0AH...) is '1', RCLKn is derived from MCLK. In clock recovery mode, these pins provide the clock recovered from the signal received on RTIPn/RRINGn. The receive data (RDn in Single Rail Mode or RDPn/RDNn in Dual Rail Mode) is updated on the active edge of RCLKn. The active edge is selected by the RCLK_SEL bit (RCF0, 07H...).</p> <p>If clock recovery is bypassed, RCLKn is the exclusive OR(XOR) output of the Dual Rail sliced data RDPn and RDNn. This signal can be used in the applications with external clock recovery circuitry.</p> | | | | | | | | | | | | |
| MCLK | Input | 10 | <p>MCLK: Master Clock MCLK is an independent, free-running reference clock. It is a single reference for all operation modes and provides selectable 1.544 MHz or 37.056 MHz for T1/J1 operating mode, while 2.048 MHz or 49.152 MHz for E1 operating mode. The reference clock is used to generate several internal reference signals:</p> <ul style="list-style-type: none"> • Timing reference for the integrated clock recovery unit. • Timing reference for the integrated digital jitter attenuator. • Timing reference for microcontroller interface. • Generation of RCLKn signal during a loss of signal condition. • Reference clock during Transmit All Ones (TAO) and all zeros condition. When sending PRBS/QRSS or Inband Loopback code, either MCLK or TCLKn can be selected as the reference clock. • Reference clock for ATA0 and AIS. <p>The loss of MCLK will turn all the four TTIP/TRING into high impedance status.</p> | | | | | | | | | | | | |
| MCLKS | Input | 40 | <p>MCLKS: Master Clock Select If 2.048 MHz (E1) or 1.544 MHz (T1/J1) is selected as the MCLK, this pin should be connected to ground; and if the 49.152 MHz (E1) or 37.056 MHz (T1/J1) is selected as the MCLK, this pin should be pulled high.</p> | | | | | | | | | | | | |
| LOS1 LOS2 LOS3 LOS4 | Output | 128 1 2 3 | <p>LOSn: Loss of Signal Output for Channel 1~4 These pins are used to indicate the loss of received signals. When LOSn pin becomes high, it indicates the loss of received signals in channel n. The LOSn pin will become low automatically when valid received signal is detected again. The criteria of loss of signal are described in 3.5 LOS AND AIS DETECTION.</p> | | | | | | | | | | | | |
| Control Interface | | | | | | | | | | | | | | | |
| P/S | Input | 8 | <p>P/S: Parallel or Serial Control Interface Select Level on this pin determines which control mode is selected to control the device as follows:</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>P/S</th> <th>Control Interface</th> </tr> </thead> <tbody> <tr> <td>High</td> <td>Parallel Microcontroller Interface</td> </tr> <tr> <td>Low</td> <td>Serial Microcontroller Interface</td> </tr> </tbody> </table> <p>The serial microcontroller interface consists of CS, SCLK, SDI, SDO and SCLKE pins. Parallel microcontroller interface consists of CS, A[7:0], D[7:0], DS/RD and RW/WR pins. The device supports non-multiplexed parallel interface as follows:</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>P/S, INT/MOT</th> <th>Microcontroller Interface</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>Motorola non-multiplexed</td> </tr> <tr> <td>11</td> <td>Intel non-multiplexed</td> </tr> </tbody> </table> | P/S | Control Interface | High | Parallel Microcontroller Interface | Low | Serial Microcontroller Interface | P/S, INT/MOT | Microcontroller Interface | 10 | Motorola non-multiplexed | 11 | Intel non-multiplexed |
| P/S | Control Interface | | | | | | | | | | | | | | |
| High | Parallel Microcontroller Interface | | | | | | | | | | | | | | |
| Low | Serial Microcontroller Interface | | | | | | | | | | | | | | |
| P/S, INT/MOT | Microcontroller Interface | | | | | | | | | | | | | | |
| 10 | Motorola non-multiplexed | | | | | | | | | | | | | | |
| 11 | Intel non-multiplexed | | | | | | | | | | | | | | |

Table-1 Pin Description (Continued)

| Name | Type | TQFP128 | Description |
|---|------------------|--|---|
| INT/MOT | Input | 6 | INT/MOT: Intel or Motorola Microcontroller Interface Select In microcontroller mode, the parallel microcontroller interface is configured for Motorola compatible microcontrollers when this pin is low, or for Intel compatible microcontrollers when this pin is high. |
| $\overline{\text{CS}}$ | Input | 32 | $\overline{\text{CS}}$: Chip Select In microcontroller mode, this pin is asserted low by the microcontroller to enable microcontroller interface. For each read or write operation, this pin must be changed from high to low, and will remain low until the operation is over. |
| SCLK | Input | 33 | SCLK: Shift Clock In serial microcontroller mode, signal on this pin is the shift clock for the serial interface. Configuration data on pin SDI is sampled on the rising edges of SCLK. Configuration and status data on pin SDO is clocked out of the device on the rising edges of SCLK if pin SCLKE is low, or on the falling edges of SCLK if pin SCLKE is high. |
| $\overline{\text{DS/RD}}$ | Input | 34 | $\overline{\text{DS}}$: Data Strobe In parallel Motorola microcontroller interface mode, signal on this pin is the data strobe of the parallel interface. During a write operation ($\text{R}/\overline{\text{W}} = 0$), data on D[7:0] is sampled into the device. During a read operation ($\text{R}/\overline{\text{W}} = 1$), data is output to D[7:0] from the device. $\overline{\text{RD}}$: Read Operation In parallel Intel microcontroller interface mode, this pin is asserted low by the microcontroller to initiate a read cycle. Data is output to D[7:0] from the device during a read operation. |
| SDI/ $\overline{\text{R}}/\overline{\text{W}}/\overline{\text{WR}}$ | Input | 35 | SDI: Serial Data Input In serial microcontroller mode, data is input on this pin. Input data is sampled on the rising edges of SCLK. $\overline{\text{R}}/\overline{\text{W}}$: Read/Write Select In parallel Motorola microcontroller interface mode, this pin is low for write operation and high for read operation. $\overline{\text{WR}}$: Write Operation In parallel Intel microcontroller interface mode, this pin is asserted low by the microcontroller to initiate a write cycle. Data on D[7:0] is sampled into the device during a write operation. |
| SDO | Output | 36 | SDO: Serial Data Output In serial microcontroller mode, signal on this pin is the output data of the serial interface. Configuration and status data on pin SDO is clocked out of the device on the active edge of SCLK. |
| $\overline{\text{INT}}$ | Output | 37 | $\overline{\text{INT}}$: Interrupt Request This pin outputs the general interrupt request for all interrupt sources. If INTM_GLB bit (GCF0, 40H) is set to '1' all the interrupt sources will be masked. And these interrupt sources also can be masked individually via registers (INTM0, 11H) and (INTM1, 12H). Interrupt status is reported via byte INT_CH (INTCH, 80H), registers (INTS0, 16H) and (INTS1, 17H). Output characteristics of this pin can be defined to be push-pull (active high or low) or be open-drain (active low) by bits INT_PIN[1:0] (GCF0, 40H). |
| D7 D6 D5 D4 D3 D2 D1 D0 | I/O Tri-state | 14 15 16 17 18 19 20 21 | Dn: Data Bus 7~0 These pins function as a bi-directional data bus of the microcontroller interface. |
| A7 A6 A5 A4 A3 A2 A1 A0 | Input | 24 25 26 27 28 29 30 31 | An: Address Bus 7~0 These pins function as an address bus of the microcontroller interface. |
| $\overline{\text{RST}}$ | Input | 38 | $\overline{\text{RST}}$: Hardware Reset The chip is reset if a low signal is applied on this pin for more than 100ns. All the drivers output are in high-impedance state, all the internal flip-flops are reset and all the registers are initialized to their default values. |

Table-1 Pin Description (Continued)

| Name | Type | TQFP128 | Description | | | | | | |
|-----------------------------------|-----------------------------|--|--|-------|------|-----|----------------------------|------|-----------------------------|
| THZ | Input | 4 | THZ: Transmit Driver Enable This pin enables or disables all transmitter drivers on a global basis. A low level on this pin enables the drivers while a high level turns all drivers into high impedance state. Note that functionality of internal circuits is not affected by signal on this pin. | | | | | | |
| REF | Input | 43 | REF: Reference Resistor An external resistor (3 K Ω , 1%) is used to connect this pin to ground to provide a standard reference current for internal circuit. | | | | | | |
| SCLKE | Input | 5 | SCLKE: Serial Clock Edge Select Signal on this pin determines the active edge of SCLK to output SDO. The active clock edge is selected as shown below: <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>SCLKE</th> <th>SCLK</th> </tr> </thead> <tbody> <tr> <td>Low</td> <td>Rising edge is active edge</td> </tr> <tr> <td>High</td> <td>Falling edge is active edge</td> </tr> </tbody> </table> | SCLKE | SCLK | Low | Rising edge is active edge | High | Falling edge is active edge |
| SCLKE | SCLK | | | | | | | | |
| Low | Rising edge is active edge | | | | | | | | |
| High | Falling edge is active edge | | | | | | | | |
| JTAG Signals | | | | | | | | | |
| $\overline{\text{TRST}}$ | Input Pullup | 123 | $\overline{\text{TRST}}$: JTAG Test Port Reset This is the active low asynchronous reset to the JTAG Test Port. This pin has an internal pull-up resistor. To ensure deterministic operation of the test logic, TMS should be held high while the signal applied to $\overline{\text{TRST}}$ changes from low to high. For normal signal processing, this pin should be connected to ground. | | | | | | |
| TMS | Input Pullup | 124 | TMS: JTAG Test Mode Select This pin is used to control the test logic state machine and is sampled on the rising edges of TCK. TMS has an internal pull-up resistor. | | | | | | |
| TCK | Input | 127 | TCK: JTAG Test Clock This pin is the input clock for JTAG. The data on TDI and TMS is clocked into the device on the rising edges of TCK while the data on TDO is clocked out of the device on the falling edges of TCK. When TCK is idle at a low level, all stored-state devices contained in the test logic will retain their state indefinitely. | | | | | | |
| TDO | Output Tri-state | 126 | TDO: JTAG Test Data Output This is a tri-state output signal and used for reading all the serial configuration and test data from the test logic. The data on TDO is clocked out of the device on the falling edges of TCK. | | | | | | |
| TDI | Input Pullup | 125 | TDI: JTAG Test Data Input This pin is used for loading instructions and data into the test logic and has an internal pullup resistor. The data on TDI is clocked into the device on the rising edges of TCK. | | | | | | |

3 FUNCTIONAL DESCRIPTION

3.1 T1/E1/J1 MODE SELECTION

The IDT82V2044E can be used as a four-channel E1 LIU or a four-channel T1/J1 LIU. In E1 application, the T1E1 bit (**GCF0, 40H**) should be set to '0'. In T1/J1 application, the T1E1 bit should be set to '1'.

3.2 TRANSMIT PATH

The transmit path of each channel of the IDT82V2044E consists of an Encoder, an optional Jitter Attenuator, a Waveform Shaper, a Line Driver and a Programmable Transmit Termination.

3.2.1 TRANSMIT PATH SYSTEM INTERFACE

The transmit path system interface consists of TCLKn pin, TDn/TDPn pin and TDNn pin. In E1 mode, the TCLKn is a 2.048 MHz clock. In T1/J1 mode, the TCLKn is a 1.544 MHz clock. If the TCLKn is missing for more than 70 MCLK cycles, an interrupt will be generated if it is not masked.

Transmit data is sampled on the TDn/TDPn and TDNn pins by the active edge of TCLKn. The active edge of TCLKn can be selected by the TCLK_SEL bit (**TCF0, 02H...**). And the active level of the data on TDn/TDPn and TDNn can be selected by the TD_INV bit (**TCF0, 02H...**).

The transmit data from the system side can be provided in two different ways: Single Rail and Dual Rail. In Single Rail mode, only TDn pin is used for transmitting data and the T_MD[1] bit (**TCF0, 02H...**) should be set to '0'. In Dual Rail Mode, both TDPn and TDNn pins are used for transmitting data, the T_MD[1] bit (**TCF0, 02H...**) should be set to '1'.

3.2.2 ENCODER

When T1/J1 mode is selected, in Single Rail mode, the Encoder can be selected to be a B8ZS encoder or an AMI encoder by setting T_MD[0] bit (**TCF0, 02H...**).

When E1 mode is selected, in Single Rail mode, the Encoder can be configured to be a HDB3 encoder or an AMI encoder by setting T_MD[0] bit (**TCF0, 02H...**).

In both T1/J1 mode and E1 mode, when Dual Rail mode is selected (bit T_MD[1] is '1'), the Encoder is by-passed. In the Dual Rail mode, a logic '1' on the TDPn pin and a logic '0' on the TDNn pin results in a negative pulse on the TTIPn/TRINGn; a logic '0' on TDPn pin and a logic '1' on TDNn pin results in a positive pulse on the TTIPn/TRINGn. If both TDPn and TDNn are logic '1' or logic '0', the TTIPn/TRINGn outputs a space (Refer to [TDn/TDPn, TDNn Pin Description](#)).

3.2.3 PULSE SHAPER

The IDT82V2044E provides two ways of manipulating the pulse shape before sending it. One is to use preset pulse templates; the other is to use user-programmable arbitrary waveform template.

3.2.3.1 Preset Pulse Templates

For E1 applications, the pulse shape is shown in [Figure-3](#) according to the G.703 and the measuring diagram is shown in [Figure-4](#). In internal impedance matching mode, if the cable impedance is 75 Ω, the PULS[3:0] bits (**TCF1, 03H...**) should be set to '0000'; if the cable impedance is 120

Ω, the PULS[3:0] bits (**TCF1, 03H...**) should be set to '0001'. In external impedance matching mode, for both E1/75 Ω and E1/120 Ω cable impedance, PULS[3:0] should be set to '0001'.

Figure-3 E1 Waveform Template Diagram

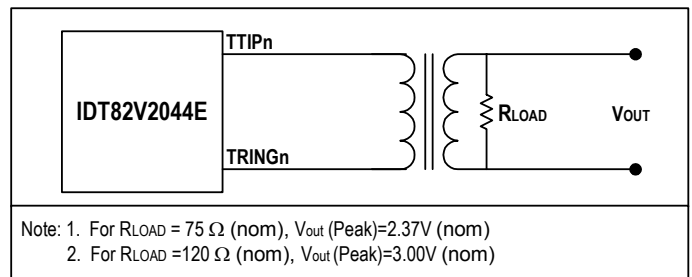

Figure-4 E1 Pulse Template Test Circuit

For T1 applications, the pulse shape is shown in [Figure-5](#) according to the T1.102 and the measuring diagram is shown in [Figure-6](#). This also meets the requirement of G.703, 2001. The cable length is divided into five grades, and there are five pulse templates used for each of the cable length. The pulse template is selected by PULS[3:0] bits (**TCF1, 03H...**).

Figure-5 DSX-1 Waveform Template

Figure-6 T1 Pulse Template Test Circuit

For J1 applications, the PULS[3:0] (TCF1, 03H...) should be set to '0111'. Table-10 lists these values.

3.2.3.2 User-Programmable Arbitrary Waveform

When the PULS[3:0] bits are set to '11xx', user-programmable arbitrary waveform generator mode can be used in the corresponding channel. This allows the transmitter performance to be tuned for a wide variety of line condition or special application.

Each pulse shape can extend up to 4 UIs (Unit Interval), addressed by UI[1:0] bits (TCF3, 05H...) and each UI is divided into 16 sub-phases, addressed by the SAMP[3:0] bits (TCF3, 05H...). The pulse amplitude of each phase is represented by a binary byte, within the range from +63 to -63, stored in WDAT[6:0] bits (TCF4, 06H...) in signed magnitude form. The most positive number +63 (D) represents the maximum positive amplitude of the transmit pulse while the most negative number -63 (D) represents the maximum negative amplitude of the transmit pulse. Therefore, up to 64 bytes are used. For each channel, a 64 bytes RAM is available.

There are eight standard templates which are stored in a local ROM. User can select one of them as reference and make some changes to get the desired waveform.

User can change the wave shape and the amplitude to get the desired pulse shape. In order to do this, firstly, users can choose a set of waveform value from the following eight tables, which is the most similar to the desired pulse shape. Table-2, Table-3, Table-4, Table-5, Table-6, Table-7, Table-8 and Table-9 list the sample data and scaling data of each of the eight templates. Then modify the corresponding sample data to get the desired transmit pulse shape.

Secondly, through the value of SCAL[5:0] bits increased or decreased by 1, the pulse amplitude can be scaled up or down at the percentage ratio against the standard pulse amplitude if needed. For different pulse shapes, the value of SCAL[5:0] bits and the scaling percentage ratio are different. The following eight tables list these values.

Do the followings step by step, the desired waveform can be programmed, based on the selected waveform template:

- (1). Select the UI by UI[1:0] bits (TCF3, 05H...)
- (2). Specify the sample address in the selected UI by SAMP [3:0] bits (TCF3, 05H...)
- (3). Write sample data to WDAT[6:0] bits (TCF4, 06H...). It contains the data to be stored in the RAM, addressed by the selected UI and the corresponding sample address.

- (4). Set the RW bit (TCF3, 05H...) to '0' to implement writing data to RAM, or to '1' to implement read data from RAM
- (5). Implement the Read from RAM/Write to RAM by setting the DONE bit (TCF3, 05H...)

Repeat the above steps until all the sample data are written to or read from the internal RAM.

- (6). Write the scaling data to SCAL[5:0] bits (TCF2, 04H...) to scale the amplitude of the waveform based on the selected standard pulse amplitude

When more than one UI is used to compose the pulse template, the overlap of two consecutive pulses could make the pulse amplitude overflow (exceed the maximum limitation) if the pulse amplitude is not set properly. This overflow is captured by DAC_OV_IS bit (INTS1, 17H...), and, if enabled by the DAC_OV_IM bit (INTM1, 12H...), an interrupt will be generated.

The following tables give all the sample data based on the preset pulse templates in detail for reference. For preset pulse templates, scaling up/down against the pulse amplitude is not supported.

3.2.4 TRANSMIT PATH LINE INTERFACE

The transmit line interface consists of TTIPn pin and TRINGn pin. The impedance matching can be realized by the internal impedance matching circuit or the external impedance matching circuit. If T_TERM[2] is set to '0', the internal impedance matching circuit will be selected. In this case, the T_TERM[1:0] bits (TERM, 1AH...) can be set to choose 75 Ω, 100 Ω, 110 Ω or 120 Ω internal impedance of TTIPn/TRINGn. If T_TERM[2] is set to '1', the internal impedance matching circuit will be disabled. In this case, the external impedance matching circuit will be used to realize the impedance matching. For T1/J1 mode, the external impedance matching circuit for the transmitter is not supported. Figure-8 shows the appropriate external components to connect with the cable for one channel. Table-10 is the list

of the recommended impedance matching for transmitter.

The TTIPn/TRINGn can be turned into high impedance globally by pulling THZ pin to high or individually by setting the THZ bit (TCF1, 03H...) to '1'. In this state, the internal transmit circuits are still active.

Besides, in the following cases, TTIPn/TRINGn will also become high impedance:

- Loss of MCLK: all TTIPn/TRINGn pins become high impedance;
- Loss of TCLKn: corresponding TTIPn/TRINGn become HZ (exceptions: Remote Loopback; Transmit internal pattern by MCLK);
- Transmit path power down;
- After software reset; pin reset and power on.

Table-10 Impedance Matching for Transmitter

| Cable Configuration | Internal Termination | | | External Termination | | |
|---------------------|----------------------|-----------|----------------|----------------------|-----------|----------------|
| | T_TERM[2:0] | PULS[3:0] | R _T | T_TERM[2:0] | PULS[3:0] | R _T |
| E1/75 Ω | 000 | 0000 | 0 Ω | 1XX | 0001 | 9.4 Ω |
| E1/120 Ω | 001 | 0001 | | | 0001 | |
| T1/0~133 ft | 010 | 0010 | | - | - | - |
| T1/133~266 ft | | 0011 | | | | |
| T1/266~399 ft | | 0100 | | | | |
| T1/399~533 ft | | 0101 | | | | |
| T1/533~655 ft | | 0110 | | | | |
| J1/0~655 ft | 011 | 0111 | | | | |

Note: The precision of the resistors should be better than ± 1%

3.2.5 TRANSMIT PATH POWER DOWN

The transmit path can be powered down individually by setting the T_OFF bit (TCF0, 02H...) to '1'. In this case, the TTIPn/TRINGn pins are turned into high impedance.

3.3 RECEIVE PATH

The receive path consists of Receive Internal Termination, Monitor Gain, Amplitude/Wave Shape Detector, Digital Tuning Controller, Adaptive Equalizer, Data Slicer, CDR (Clock and Data Recovery), Optional Jitter Attenuator, Decoder and LOS/AIS Detector. Refer to Figure-7.

3.3.1 RECEIVE INTERNAL TERMININATION

The impedance matching can be realized by the internal impedance matching circuit or the external impedance matching circuit. If R_TERM[2] is set to '0', the internal impedance matching circuit will be selected. In this case, the R_TERM[1:0] bits (TERM, 1AH...) can be set to choose 75 Ω, 100 Ω, 110 Ω or 120 Ω internal impedance of RTIPn/RRINGn. If R_TERM[2] is set to '1', the internal impedance matching circuit will be disabled. In this case, the external impedance matching circuit will be used to realize the impedance matching.

is set to '0', the internal impedance matching circuit will be selected. In this case, the R_TERM[1:0] bits (TERM, 1AH...) can be set to choose 75 Ω, 100 Ω, 110 Ω or 120 Ω internal impedance of RTIPn/RRINGn. If R_TERM[2] is set to '1', the internal impedance matching circuit will be disabled. In this case, the external impedance matching circuit will be used to realize the impedance matching.

Figure-8 shows the appropriate external components to connect with the cable for one channel. Table-11 is the list of the recommended impedance matching for receiver.

Figure-7 Receive Path Function Block Diagram

Table-11 Impedance Matching for Receiver

| Cable Configuration | Internal Termination | | External Termination | |
|---------------------|----------------------|----------------|----------------------|----------------|
| | R_TERM[2:0] | R _R | R_TERM[2:0] | R _R |
| E1/75 Ω | 000 | 120 Ω | 1XX | 75 Ω |
| E1/120 Ω | 001 | | | 120 Ω |
| T1 | 010 | | | 100 Ω |
| J1 | 011 | | | 110 Ω |

- Note: 1. Common decoupling capacitor
 2. C_p 0-560 (pF)
 3. D1 - D8, Motorola - MBR0540T1; International Rectifier - 11DQ04 or 10BQ060

Figure-8 Transmit/Receive Line Circuit

3.3.2 LINE MONITOR

In both T1/J1 and E1 short haul applications, the non-intrusive monitoring on channels located in other chips can be performed by tapping the monitored channel through a high impedance bridging circuit. Refer to [Figure-9](#) and [Figure-10](#).

After a high resistance bridging circuit, the signal arriving at the RTIPn/RRINGn is dramatically attenuated. To compensate this attenuation, the Monitor Gain can be used to boost the signal by 22 dB, 26 dB and 32 dB, selected by MG[1:0] bits (**RCF2, 09H...**). For normal operation, the Monitor Gain should be set to 0 dB.

Figure-9 Monitoring Receive Line in Another Chip

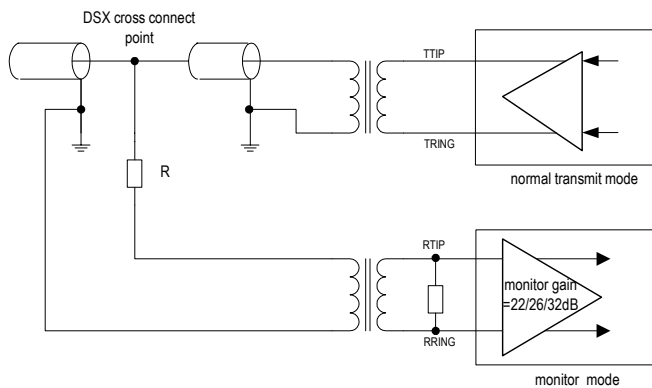

Figure-10 Monitor Transmit Line in Another Chip

3.3.3 ADAPTIVE EQUALIZER

The Adaptive Equalizer can be enabled to increase the receive sensitivity and to allow programming of the LOS level up to -24 dB. See section 3.5 LOS AND AIS DETECTION. It can be enabled or disabled by setting EQ_ON bit to '1' or '0' (**RCF1, 08H...**).

3.3.4 RECEIVE SENSITIVITY

The Receive Sensitivity for both E1 and T1/J1 is -10 dB. With the Adaptive Equalizer enabled, the receive sensitivity will be -20 dB.

3.3.5 DATA SLICER

The Data Slicer is used to generate a standard amplitude mark or a space according to the amplitude of the input signals. The threshold can be 40%, 50%, 60% or 70%, as selected by the SLICE[1:0] bits (**RCF2, 09H...**). The output of the Data Slicer is forwarded to the CDR (Clock & Data Recovery) unit or to the RDPn/RDNn pins directly if the CDR is disabled.

3.3.6 CDR (Clock & Data Recovery)

The CDR is used to recover the clock from the received signals. The recovered clock tracks the jitter in the data output from the Data Slicer and keeps the phase relationship between data and clock during the absence of the incoming pulse. The CDR can also be by-passed in the Dual Rail mode. When CDR is by-passed, the data from the Data Slicer is output to the RDPn/RDNn pins directly.

3.3.7 DECODER

In T1/J1 applications, the R_MD[1:0] bits (**RCF0, 07H...**) is used to select the AMI decoder or B8ZS decoder. In E1 applications, the R_MD[1:0] bits (**RCF0, 07H...**) are used to select the AMI decoder or HDB3 decoder.

3.3.8 RECEIVE PATH SYSTEM INTERFACE

The receive path system interface consists of RCLKn pin, RDn/RDPn pin and RDNn pin. In E1 mode, the RCLKn outputs a recovered 2.048 MHz clock. In T1/J1 mode, the RCLKn outputs a recovered 1.544 MHz clock. The received data is updated on the RDn/RDPn and RDNn pins on the active edge of RCLKn. The active edge of RCLKn can be selected by the RCLK_SEL bit (**RCF0, 07H...**). And the active level of the data on RDn/RDPn and RDNn can also be selected by the RD_INV bit (**RCF0, 07H...**).

The received data can be output to the system side in two different ways: Single Rail or Dual Rail, as selected by R_MD bit [1] (**RCF0, 07H...**). In Single Rail mode, only RDn pin is used to output data and the RDNn/CVn pin is used to report the received errors. In Dual Rail Mode, both RDPn pin and RDNn pin are used for outputting data.

In the receive Dual Rail mode, the CDR unit can be by-passed by setting R_MD[1:0] to '11' (binary). In this situation, the output data from the Data Slicer will be output to the RDPn/RDNn pins directly, and the RCLKn outputs the exclusive OR (XOR) of the RDPn and RDNn.

3.3.9 RECEIVE PATH POWER DOWN

The receive path can be powered down individually by setting R_OFF bit (**RCF0, 07H...**) to '1'. In this case, the RCLKn, RDn/RDPn, RDPn and LOSn will be logic low.

3.3.10 G.772 NON-INTRUSIVE MONITORING

In applications using only three channels, channel 1 can be configured to monitor the data received or transmitted in any one of the remaining channels. The MON[3:0] bits (**GCF1, 60H**) determine which channel and which direction (transmit/receive) will be monitored. The monitoring is non-intrusive per ITU-T G.772. [Figure-11](#) illustrates the concept.

The monitored line signal (transmit or receive) goes through Channel 1's Clock and Data Recovery. The signal can be observed digitally at the RCLK1, RD1/RDP1 and RDN1. If Channel 1 is configured to Remote Loopback while in the Monitoring mode, the monitored data will be output on TTIP1/TRING1.

Figure-11 G.772 Monitoring Diagram

3.4 JITTER ATTENUATOR

There is one Jitter Attenuator in each channel of the LIU. The Jitter Attenuator can be deployed in the transmit path or the receive path, and can also be disabled. This is selected by the JACF[1:0] bits (**JACF, 01H...**).

3.4.1 JITTER ATTENUATION FUNCTION DESCRIPTION

The Jitter Attenuator is composed of a FIFO and a DPLL, as shown in [Figure-12](#). The FIFO is used as a pool to buffer the jittered input data, then the data is clocked out of the FIFO by a de-jittered clock. The depth of the FIFO can be 32 bits, 64 bits or 128 bits, as selected by the JADP[1:0] bits (**JACF, 01H...**). Consequently, the constant delay of the Jitter Attenuator will be 16 bits, 32 bits or 64 bits. Deeper FIFO can tolerate larger jitter, but at the expense of increasing data latency time.

Figure-12 Jitter Attenuator

In E1 applications, the Corner Frequency of the DPLL can be 0.9 Hz or 6.8 Hz, as selected by the JABW bit (**JACF, 01H...**). In T1/J1 applications, the Corner Frequency of the DPLL can be 1.25 Hz or 5.00 Hz, as selected by the JABW bit (**JACF, 01H...**). The lower the Corner Frequency is, the longer time is needed to achieve synchronization.

When the incoming data moves faster than the outgoing data, the FIFO will overflow. This overflow is captured by the JAOV_IS bit (**INTS1, 17H...**). If the incoming data moves slower than the outgoing data, the FIFO will underflow. This underflow is captured by the JAUD_IS bit (**INTS1, 17H...**). For some applications that are sensitive to data corruption, the JA limit mode can be enabled by setting JA_LIMIT bit (**JACF, 01H...**) to '1'. In the JA limit mode, the speed of the outgoing data will be adjusted automatically when the FIFO is close to its full or emptiness. The criteria of starting speed adjustment are shown in [Table-12](#). The JA limit mode can reduce the possibility of FIFO overflow and underflow, but the quality of jitter attenuation is deteriorated.

3.4.2 JITTER ATTENUATOR PERFORMANCE

The performance of the Jitter Attenuator in the IDT82V2044E meets the ITU-TI.431, G.703, G.736-739, G.823, G.824, ETSI 300011, ETSI TBR12/13, AT&T TR62411 specifications. Details of the Jitter Attenuator performance is shown in [Table-64 Jitter Tolerance](#) and [Table-65 Jitter Attenuator Characteristics](#).

Table-12 Criteria of Starting Speed Adjustment

| FIFO Depth | Criteria for Adjusting Data Outgoing Speed |
|------------|--|
| 32 Bits | 2 bits close to its full or emptiness |
| 64 Bits | 3 bits close to its full or emptiness |
| 128 Bits | 4 bits close to its full or emptiness |

3.5 LOS AND AIS DETECTION

3.5.1 LOS DETECTION

The Loss of Signal Detector monitors the amplitude of the incoming signal level and pulse density of the received signal on RTIPn and RRINGn.

- **LOS declare (LOS=1)**

A LOS is detected when the incoming signal has “no transitions”, i.e., when the signal level is less than Q dB below nominal for N consecutive pulse intervals. Here N is defined by LAC bit (**MAINT0, 0AH...**). LOS will be declared by pulling LOSn pin to high (LOS=1) and LOS interrupt will be generated if it is not masked.

- **LOS clear (LOS=0)**

The LOS is cleared when the incoming signal has “transitions”, i.e., when the signal level is greater than P dB below nominal and has an average pulse density of at least 12.5% for M consecutive pulse intervals, starting with the receipt of a pulse. Here M is defined by LAC bit (**MAINT0, 0AH...**). LOS status is cleared by pulling LOSn pin to low.

Figure-13 LOS Declare and Clear

- **LOS detect level threshold**

With the Adaptive Equalizer off, the amplitude threshold Q is fixed on 800 mVpp, while P=Q+200 mVpp (200 mVpp is the LOS level detect hysteresis).

With the Adaptive Equalizer on, the value of Q can be selected by LOS[4:0] bit (**RCF1, 08H...**), while P=Q+4 dB (4 dB is the LOS level detect hysteresis). Refer to Table 33, “RCF1: Receiver Configuration Register 1,” on page 40 for LOS[4:0] bit values available.

- **Criteria for declare and clear of a LOS detect**

The detection supports the ANSI T1.231 and I.431 for T1/J1 mode and G.775 and ETSI 300233/I.431 for E1 mode. The criteria can be selected by LAC bit (**MAINT0, 0AH...**) and T1E1 bit (**GCF0, 40H**).

Table-13 and Table-14 summarize LOS declare and clear criteria for both with and without the Adaptive Equalizer enabled.

- **All Ones output during LOS**

On the system side, the RDPn/RDNn will reflect the input pulse “transition” at the RTIPn/RRINGn side and output recovery clock (but the quality of the output clock can not be guaranteed when the input level is lower than the maximum receive sensitivity) when AISE bit (**MAINT0, 0AH...**) is 0; or output All Ones as AIS when AISE bit (**MAINT0, 0AH...**) is 1. In this case RCLKn output is replaced by MCLK.

On the line side, the TTIPn/TRINGn will output All Ones as AIS when ATAO bit (**MAINT0, 0AH...**) is 1. The All Ones pattern uses MCLK as the reference clock.

LOS indicator is always active for all kinds of loopback modes.

Table-13 LOS Declare and Clear Criteria, Adaptive Equalizer Disabled

| Control bit | | LOS declare threshold | LOS clear threshold |
|-------------|--------------|---------------------------------|--|
| T1E1 | LAC | | |
| 1=T1/J1 | 0=T1.231 | Level < 800 mVpp N=175 bits | Level > 1 Vpp M=128 bits 12.5% mark density <100 consecutive zeroes |
| | 1=I.431 | Level < 800 mVpp N=1544 bits | Level > 1 Vpp M=128 bits 12.5% mark density <100 consecutive zeroes |
| 0=E1 | 0=G.775 | Level < 800 mVpp N=32 bits | Level > 1 Vpp M=32 bits 12.5% mark density <16 consecutive zeroes |
| | 1=I.431/ETSI | Level < 800 mVpp N=2048 bits | Level > 1 Vpp M=32 bits 12.5% mark density <16 consecutive zeroes |

Table-14 LOS Declare and Clear Criteria, Adaptive Equalizer Enabled

| Control bit | | | | LOS declare threshold | LOS clear threshold | Note |
|-------------|-----|----------------|--------|-----------------------|--------------------------|---|
| T1E1 | LAC | LOS[4:0] | Q (dB) | | | |
| 1=T1/J1 | 0 | T1.231 | 00000 | -4 | Level < Q N=175 bits | Level > Q+ 4dB M=128 bits 12.5% mark density <100 consecutive zeroes |
| | | | 00001 | -6 | | |
| | 1 | I.431 | 00000 | -4 | Level < Q N=1544 bits | Level > Q+ 4dB M=128 bits 12.5% mark density <100 consecutive zeroes |
| | | | 00110 | -16 | | |
| 0=E1 | 0 | G.775 | 00000 | -4 | Level < Q N=32 bits | Level > Q+ 4dB M=32 bits 12.5% mark density <16 consecutive zeroes |
| | | | 00010 | -8 | | |
| | 1 | I.431/ ETSI | 00000 | -4 | Level < Q N=2048 bits | Level > Q+ 4dB M=32 bits 12.5% mark density <16 consecutive zeroes |
| | | | 00001 | -6 | | |

3.5.2 AIS DETECTION

The Alarm Indication Signal can be detected by the IDT82V2044E when the Clock&Data Recovery unit is enabled. The status of AIS detection is reflected in the AIS_S bit (STAT0, 14H...). In T1/J1 applications, the criteria for declaring/clearing AIS detection are in compliance with the ANSI

T1.231. In E1 applications, the criteria for declaring/clearing AIS detection comply with the ITU G.775 or the ETSI 300233, as selected by the LAC bit (MAINT0, 0AH...). Table-15 summarizes different criteria for AIS detection Declaring/Clearing.

Table-15 AIS Condition

| | ITU G.775 for E1 (LAC bit is set to '0' by default) | ETSI 300233 for E1 (LAC bit is set to '1') | ANSI T1.231 for T1/J1 |
|---------------------|---|--|--|
| AIS detected | Less than 3 zeros contained in each of two consecutive 512-bit streams are received | Less than 3 zeros contained in a 512-bit stream are received | Less than 9 zeros contained in an 8192-bit stream (a ones density of 99.9% over a period of 5.3ms) |
| AIS cleared | 3 or more zeros contained in each of two consecutive 512-bit streams are received | 3 or more zeros contained in a 512-bit stream are received | 9 or more zeros contained in an 8192-bit stream are received |

3.6 TRANSMIT AND DETECT INTERNAL PATTERNS

The internal patterns (All Ones, All Zeros, PRBS/QRSS pattern and Activate/Deactivate Loopback Code) will be generated and detected by the IDT82V2044E. TCLKn is used as the reference clock by default. MCLK can also be used as the reference clock by setting the PATT_CLK bit (MAINT0, 0AH...) to '1'.

If the PATT_CLK bit (MAINT0, 0AH...) is set to '0' and the PATT[1:0] bits (MAINT0, 0AH...) are set to '00', the transmit path will operate in normal mode.

3.6.1 TRANSMIT ALL ONES

In transmit direction, the All Ones data can be inserted into the data stream when the PATT[1:0] bits (MAINT0, 0AH...) are set to '01'. The transmit data stream is output from TTIPn/TRINGn. In this case, either TCLKn or MCLK can be used as the transmit clock, as selected by the PATT_CLK bit (MAINT0, 0AH...).

3.6.2 TRANSMIT ALL ZEROS

If the PATT_CLK bit (MAINT0, 0AH...) is set to '1', the All Zeros will be inserted into the transmit data stream when the PATT[1:0] bits (MAINT0, 0AH...) are set to '00'.

3.6.3 PRBS/QRSS GENERATION AND DETECTION

A PRBS/QRSS will be generated in the transmit direction and detected in the receive direction by IDT82V2044E. The QRSS is $2^{20}-1$ for T1/J1 applications and the PRBS is $2^{15}-1$ for E1 applications, with maximum zero restrictions according to the AT&T TR62411 and ITU-T O.151.

When the PATT[1:0] bits (MAINT0, 0AH...) are set to '10', the PRBS/QRSS pattern will be inserted into the transmit data stream with the MSB first. The PRBS/QRSS pattern will be transmitted directly or invertedly.

The PRBS/QRSS in the received data stream will be monitored. If the PRBS/QRSS has reached synchronization status, the PRBS_S bit (STAT0, 14H...) will be set to '1', even in the presence of a logic error rate less than or equal to 10^{-1} . The criteria for setting/clearing the PRBS_S bit are shown in Table-16.

Table-16 Criteria for Setting/Clearing the PRBS_S Bit

| | |
|----------------------------|---|
| PRBS/QRSS Detection | 6 or less than 6 bit errors detected in a 64 bits hopping window. |
| PRBS/QRSS Missing | More than 6 bit errors detected in a 64 bits hopping window. |

PRBS data can be inverted through setting the PRBS_INV bit (MAINT0, 0AH...).

Any change of PRBS_S bit will be captured by PRBS_IS bit (INTS0, 16H...). The PRBS_IES bit (INTES, 13H...) can be used to determine whether the '0' to '1' change of PRBS_S bit will be captured by the PRBS_IS bit or any changes of PRBS_S bit will be captured by the PRBS_IS bit. When the PRBS_IS bit is '1', an interrupt will be generated if the PRBS_IM bit (INTM0, 11H...) is set to '1'.

The received PRBS/QRSS logic errors can be counted in a 16-bit counter if the ERR_SEL [1:0] bits (MAINT6, 10H...) are set to '00'. Refer to 3.8 ERROR DETECTION/COUNTING AND INSERTION for the operation of the error counter.

3.7 LOOPBACK

To facilitate testing and diagnosis, the IDT82V2044E provides four different loopback configurations: Analog Loopback, Digital Loopback, Remote Loopback and Inband Loopback.

3.7.1 ANALOG LOOPBACK

When the ALP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured in Analog Loopback mode. In this mode, the transmit signals are looped back to the Receiver Internal Termination in the receive path then output from RCLKn, RDn, RDPn/RDNn. At the same time, the transmit signals are still output to TTIPn/TRINGn in transmit direction. Figure-14 shows the process.

3.7.2 DIGITAL LOOPBACK

When the DLP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured in Digital Loopback mode. In this mode, the transmit signals are looped back to the jitter attenuator (if enabled) and decoder in receive path, then output from RCLKn, RDn, RDPn/RDNn. At the same time, the transmit signals are still output to TTIPn/TRINGn in transmit direction. Figure-15 shows the process.

Both Analog Loopback mode and Digital Loopback mode allow the sending of the internal patterns (All Ones, All Zeros, PRBS, etc.) which will overwrite the transmit signals. In this case, either TCLKn or MCLK can be used as the reference clock for internal patterns transmission.

3.7.3 REMOTE LOOPBACK

When the RLP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured in Remote Loopback mode. In this mode, the recovered clock and data output from Clock and Data Recovery on the receive path is looped back to the jitter attenuator (if enabled) and Waveform Shaper in transmit path. Figure-16 shows the process.

Figure-14 Analog Loopback

Figure-15 Digital Loopback

Figure-16 Remote Loopback

3.7.4 INBAND LOOPBACK

When PATT[1:0] bits (**MAINT0, 0AH...**) are set to '11', the corresponding channel is configured in Inband Loopback mode. In this mode, an unframed activate/Deactivate Loopback Code is generated repeatedly in transmit direction per ANSI T1. 403 which overwrite the transmit signals. In receive direction, the framed or unframed code is detected per ANSI T1. 403, even in the presence of 10^{-2} bit error rate.

If the Automatic Remote Loopback is enabled by setting ARLP bit (**MAINT1, 0BH...**) to '1', the chip will establish/demolish the Remote Loopback based on the reception of the Activate Loopback Code/Deactivate Loopback Code for 5.1 s. If the ARLP bit (**MAINT1, 0BH...**) is set to '0', the Remote Loopback can also be demolished forcibly.

3.7.4.1 Transmit Activate/Deactivate Loopback Code

The pattern of the transmit Activate/Deactivate Loopback Code is defined by the TIBLB[7:0] bits (**MAINT3, 0DH...**). Whether the code represents an Activate Loopback Code or a Deactivate Loopback Code is judged by the far end receiver. The length of the pattern ranges from 5 bits to 8 bits, as selected by the TIBLB_L[1:0] bits (**MAINT2, 0CH...**). The pattern can be programmed to 6-bit-long or 8-bit-long respectively by repeating itself if it is 3-bit-long or 4-bit-long. When the PATT[1:0] bits (**MAINT0, 0AH...**) are set to '11', the transmission of the Activate/Deactivate Loopback Code is initiated. If the PATT_CLK bit (**MAINT0, 0AH...**) is set to '0' and the PATT[1:0] bits (**MAINT0, 0AH...**) are set to '00', the transmission of the Activate/Deactivate Loopback Code will stop.

The local transmit activate/deactivate code setting should be the same as the receive code setting in the remote end. It is the same thing for the other way round.

3.7.4.2 Receive Activate/Deactivate Loopback Code

The pattern of the receive Activate Loopback Code is defined by the RIBLBA[7:0] bits (**MAINT4, 0EH...**). The length of this pattern ranges from 5 bits to 8 bits, as selected by the RIBLBA_L [1:0] bits (**MAINT2, 0CH...**). The pattern can be programmed to 6-bit-long or 8-bit-long respectively by repeating itself if it is 3-bit-long or 4-bit-long.

The pattern of the receive Deactivate Loopback Code is defined by the RIBLBD[7:0] bits (**MAINT5, 0FH...**). The length of the receive Deactivate Loopback Code ranges from 5 bits to 8 bits, as selected by the RIBLBD_L[1:0] bits (**MAINT2, 0CH...**). The pattern can be programmed to

6-bit-long or 8-bit-long respectively by repeating itself if it is 3-bit-long or 4-bit-long.

After the Activate Loopback Code has been detected in the receive data for more than 30 ms (in E1 mode) / 40 ms (in T1/J1 mode), the IBLBA_S bit (**STAT0, 14H...**) will be set to '1' to declare the reception of the Activate Loopback Code.

After the Deactivate Loopback Code has been detected in the receive data for more than 30 ms (In E1 mode) / 40 ms (In T1/J1 mode), the IBLBD_S bit (**STAT0, 14H...**) will be set to '1' to declare the reception of the Deactivate Loopback Code.

When the IBLBA_IES bit (**INTES, 13H...**) is set to '0', only the '0' to '1' transition of the IBLBA_S bit will generate an interrupt and set the IBLBA_IS bit (**INTS0, 16H...**) to '1'. When the IBLBA_IES bit is set to '1', any changes of the IBLBA_S bit will generate an interrupt and set the IBLBA_IS bit (**INTS0, 16H...**) to '1'. The IBLBA_IS bit will be reset to '0' after being read.

When the IBLBD_IES bit (**INTES, 13H...**) is set to '0', only the '0' to '1' transition of the IBLBD_S bit will generate an interrupt and set the IBLBD_IS bit (**INTS0, 16H...**) to '1'. When the IBLBD_IES bit is set to '1', any changes of the IBLBD_S bit will generate an interrupt and set the IBLBD_IS bit (**INTS0, 16H...**) to '1'. The IBLBD_IS bit will be reset to '0' after being read.

3.7.4.3 Automatic Remote Loopback

When ARLP bit (**MAINT1, 0BH...**) is set to '1', the corresponding channel is configured into the Automatic Remote Loopback mode. In this mode, if the Activate Loopback Code has been detected in the receive data for more than 5.1 s, the Remote Loopback (shown as [Figure-16](#)) will be established automatically, and the RLP_S bit (**STAT1, 15H...**) will be set to '1' to indicate the establishment of the Remote Loopback. The IBLBA_S bit (**STAT0, 14H...**) is set to '1' to generate an interrupt. In this case, the Remote Loopback mode will still be kept even if the receiver stop receiving the Activate Loopback Code.

If the Deactivate Loopback Code has been detected in the receive data for more than 5.1 s, the Remote Loopback will be demolished automatically, and the RLP_S bit (**STAT1, 15H...**) will set to '0' to indicate the demolition of the Remote Loopback. The IBLBD_S bit (**STAT0, 14H...**) is set to '1' to generate an interrupt.

The Remote Loopback can also be demolished forcibly by setting ARLP bit (**MAINT1, 0BH...**) to '0'.

3.8 ERROR DETECTION/COUNTING AND INSERTION

3.8.1 DEFINITION OF LINE CODING ERROR

The following line encoding errors can be detected and counted by the IDT82V2044E:

- Received Bipolar Violation (BPV) Error: In AMI coding, when two consecutive pulses of the same polarity are received, a BPV error is declared.

- HDB3/B8ZS Code Violation (CV) Error: In HDB3/B8ZS coding, a CV error is declared when two consecutive BPV errors are detected, and the pulses that have the same polarity as the previous pulse are not the HDB3/B8ZS zero substitution pulses.
- Excess Zero (EXZ) Error: there are two standards defining the EXZ errors: ANSI and FCC. The EXZ_DEF bit (MAINT6, 10H...) chooses which standard will be adopted by the corresponding channel to judge the EXZ error. Table-17 shows definition of EXZ.

Table-17 EXZ Definition

| | EXZ Definition | |
|------|--|--|
| | ANSI | FCC |
| AMI | More than 15 consecutive 0s are detected | More than 80 consecutive 0s are detected |
| HDB3 | More than 3 consecutive 0s are detected | More than 3 consecutive 0s are detected |
| B8ZS | More than 7 consecutive 0s are detected | More than 7 consecutive 0s are detected |

3.8.2 ERROR DETECTION AND COUNTING

Which type of the receiving errors (Received CV/BPV errors, excess zero errors and PRBS logic errors) will be counted is determined by ERR_SEL[1:0] bits (MAINT6, 10H...). Only one type of receiving error can be counted at a time except that when the ERR_SEL[1:0] bits are set to '11', both CV/BPV and EXZ errors will be detected and counted.

The receiving errors are counted in an internal 16-bit Error Counter. Once an error is detected, an error interrupt which is indicated by corresponding bit in (INTS1, 17H...) will be generated if it is not masked. This Error Counter can be operated in two modes: Auto Report Mode and Manual Report Mode, as selected by the CNT_MD bit (MAINT6, 10H...). In Single Rail mode, once BPV or CV errors are detected, the CVn pin will be driven to high for one RCLK period.

• Auto Report Mode

In Auto Report Mode, the internal counter starts to count the received errors when the CNT_MD bit (MAINT6, 10H...) is set to '1'. A one-second timer is used to set the counting period. The received errors are counted within one second. If the one-second timer expires, the value in the internal counter will be transferred to (CNT0, 18H...) and (CNT1, 19H...), then the internal counter will be reset and start to count received errors for the next second. The errors occurred during the transfer will be accumulated to the next round. The expiration of the one-second timer will set TMOV_IS bit (INTS1, 17H...) to '1', and will generate an interrupt if the TIMER_IM bit (INTM1, 12H...) is set to '0'. The TMOV_IS bit (INTS1, 17H...) will be cleared after the interrupt register is read. The content in the (CNT0, 18H...) and

(CNT1, 19H...) should be read within the next second. If the counter overflows, a counter overflow interrupt which is indicated by CNT_OV_IS bit (INTS1, 17H...) will be generated if it is not masked by CNT_IM bit (INTM1, 12H...).

Figure-17 Auto Report Mode

• Manual Report Mode

In Manual Report Mode, the internal Error Counter starts to count the received errors when the CNT_MD bit (MAINT6, 10H...) is set to '0'. When there is a '0' to '1' transition on the CNT_TRF bit (MAINT6, 10H...), the data in the counter will be transferred to (CNT0, 18H...) and (CNT1, 19H...), then the counter will be reset. The errors occurred during the transfer will be accumulated to the next round. If the counter overflows, a counter overflow interrupt indicated by CNT_OV_IS bit (INTS1, 17H...) will be generated if it is not masked by CNT_IM bit (INTM1, 12H...).

Figure-18 Manual Report Mode

Note: 1. It is recommended that users should do the followings within next round of error counting: Read the data in CNT0 and CNT1; Reset CNT_TRF bit for the next '0' to '1' transition on this bit.

3.8.3 BIPOLAR VIOLATION AND PRBS ERROR INSERTION

Only when three consecutive '1's are detected in the transmit data stream, will a '0' to '1' transition on the BPV_INS bit (MAINT6, 10H...) generate a bipolar violation pulse, and the polarity of the second '1' in the series will be inverted.

A '0' to '1' transition on the EER_INS bit (MAINT6, 10H...) will generate a logic error during the PRBS/QRSS transmission.

3.9 LINE DRIVER FAILURE MONITORING

The transmit driver failure monitor can be enabled or disabled by setting DFM_OFF bit (TCF1, 03H...). If the transmit driver failure monitor is enabled, the transmit driver failure will be captured by DF_S bit (STAT0, 14H...). The transition of the DF_S bit is reflected by DF_IS bit (INTS0, 16H...), and, if enabled by DF_IM bit (INTM0, 11H...), will generate an interrupt. When there is a short circuit on the TTIPn/TRINGn port, the output current will be limited to 100 mA (typical) and an interrupt will be generated.

3.10 MCLK AND TCLK

3.10.1 MASTER CLOCK (MCLK)

MCLK is an independent, free-running reference clock. MCLK is 1.544 MHz or 37.056 MHz for T1/J1 applications and 2.048 MHz or 49.152 MHz in E1 mode. This reference clock is used to generate several internal reference signals:

- Timing reference for the integrated clock recovery unit.
- Timing reference for the integrated digital jitter attenuator.
- Timing reference for microcontroller interface.
- Generation of RCLK signal during a loss of signal condition if AIS is enabled.
- Reference clock during a blue alarm Transmit All Ones (TAOS), all zeros, PRBS/QRSS and inband loopback patterns if it is selected as the reference clock. For ATAO and AIS, MCLK is always used as the reference clock.

Figure-19 shows the chip operation status in different conditions of MCLK and TCLKn. The missing of MCLK will set all the four TTIP/TRING to high impedance state.

3.10.2 TRANSMIT CLOCK (TCLK)

The TCLKn is used to sample the transmit data on TDn/TDPn, TDNn. The active edge of TCLKn can be selected by the TCLK_SEL bit (**TCF0, 02H...**). During Transmit All Ones, PRBS/QRSS patterns or Inband Loopback Code, either TCLKn or MCLK can be used as the reference clock. This is selected by the PATT_CLK bit (**MAINT0, 0AH...**).

But for Automatic Transmit All Ones and AIS, only MCLK is used as the reference clock and the PATT_CLK bit is ignored. In Automatic Transmit All Ones condition, the ATAO bit (**MAINT0, 0AH**) is set to '1'. In AIS condition, the AISE bit (**MAINT0, 0AH**) is set to '1'.

If TCLKn has been missing for more than 70 MCLK cycles, TCLK_LOS bit (**STAT0, 14H...**) will be set, and the corresponding TTIPn/TRINGn will become high impedance if this channel is not used for remote loopback or is not using MCLK to transmit internal patterns (TAOS, All Zeros, PRBS and in-band loopback code). When TCLKn is detected again, TCLK_LOS bit (**STAT0, 14H...**) will be cleared. The reference frequency to detect a TCLKn loss is derived from MCLK.

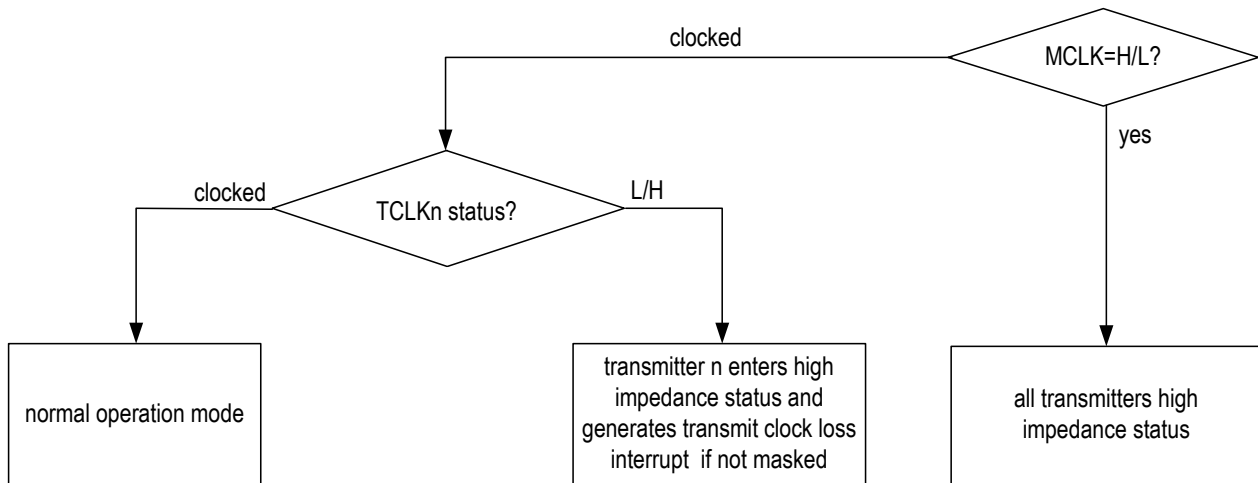

Figure-19 TCLK Operation Flowchart

3.11 MICROCONTROLLER INTERFACES

The microcontroller interface provides access to read and write the registers in the device. The chip supports serial processor interface and two kinds of parallel processor interface: Motorola non_multiplexed mode and Intel non_multiplexed mode. By pulling pin P/̄S to low or to High, the microcontroller interface can be set to work in serial mode or in parallel mode respectively. Refer to [7 MICROCONTROLLER INTERFACE TIMING CHARACTERISTICS](#) for details.

3.11.1 PARALLEL MICROCONTROLLER INTERFACE

The interface is compatible with Motorola or Intel microcontroller. Pin INT/MOT is used to select the operating mode of the parallel microcontroller

interface. When pin INT/MOT is pulled to Low, the parallel microcontroller interface is configured for Motorola compatible hosts. When High, it is for Intel compatible microcontrollers.

3.11.2 SERIAL MICROCONTROLLER INTERFACE

The serial interface pins include SCLK, SDI, SDO, CS as well as SCLKE (control pin for the selection of serial clock active edge). By pulling P/̄S pin to LOW, the device operates in the serial host Mode. In this mode, the registers are programmed through a 24-bit word which contains an 8-bit address byte (A0~A7), a subsequent 8-bit command byte (bit R/W) and an 8-bit data byte (D0~D7). When bit R/W is '1', data is read out from pin SDO. When bit R/W is '0', data is written into SDI pin. Refer to [Figure-20](#).

Figure-20 Serial Processor Interface Function Timing

3.12 INTERRUPT HANDLING

All kinds of interrupt of the IDT82V2044E are indicated by the $\overline{\text{INT}}$ pin. When the INT_PIN[0] bit (GCF0, 40H) is '0', the $\overline{\text{INT}}$ pin is open drain active low, with a 10 K Ω external pull-up resistor. When the INT_PIN[1:0] bits (GCF0, 40H) are '01', the $\overline{\text{INT}}$ pin is push-pull active low; when the INT_PIN[1:0] bits are '10', the $\overline{\text{INT}}$ pin is push-pull active high.

All the interrupt can be disabled by the INTM_GLB bit (GCF0, 40H). When the INTM_GLB bit (GCF0, 40H) is set to '0', an active level on the $\overline{\text{INT}}$ pin represents an interrupt of the IDT82V2044E. The INT_CH[7:0] bits (INTCH, 80H) should be read to identify which channel(s) generate the interrupt.

The interrupt event is captured by the corresponding bit in the Interrupt Status Register (INTS0, 16H...) or (INTS1, 17H...). Every kind of interrupt can be enabled/disabled individually by the corresponding bit in the register (INTM0, 11H...) or (INTM1, 12H...). Some event is reflected by the corresponding bit in the Status Register (STAT0, 14H...) or (STAT1, 15H...), and the Interrupt Trigger Edge Selection Register can be used to determine how the Status Register sets the Interrupt Status Register.

After the Interrupt Status Register (INTS0, 16H...) or (INTS1, 17H...) is read, the corresponding bit indicating which channel generates the interrupt in the INTCH register (80H) will be reset. Only when all the pending

interrupt is acknowledged through reading the Interrupt Status Registers of all the channels (INTS0, 16H...) or (INTS1, 17H...) will all the bits in the INTCH register (80H) be reset and the $\overline{\text{INT}}$ pin become inactive.

There are totally thirteen kinds of events that could be the interrupt source for one channel:

- (1).LOS Detected
- (2).AIS Detected
- (3).Driver Failure Detected
- (4).TCLK Loss
- (5).Synchronization Status of PRBS
- (6).PRBS Error Detected
- (7).Code Violation Received
- (8).Excessive Zeros Received
- (9).JA FIFO Overflow/Underflow
- (10).Inband Loopback Code Status
- (11).One-Second Timer Expired
- (12).Error Counter Overflow
- (13).Arbitrary Waveform Generator Overflow

Table-18 is a summary of all kinds of interrupt and their associated Status bit, Interrupt Status bit, Interrupt Trigger Edge Selection bit and Interrupt Mask bit.

Table-18 Interrupt Event

| Interrupt Event | Status bit (STAT0, STAT1) | Interrupt Status bit (INTS0, INTS1) | Interrupt Edge Selection bit (INTES) | Interrupt Mask bit (INTM0, INTM1) |
|--|---------------------------|-------------------------------------|--------------------------------------|-----------------------------------|
| LOS Detected | LOS_S | LOS_IS | LOS_IES | LOS_IM |
| AIS Detected | AIS_S | AIS_IS | AIS_IES | AIS_IM |
| Driver Failure Detected | DF_S | DF_IS | DF_IES | DF_IM |
| TCLKn Loss | TCLK_LOS | TCLK_LOS_IS | TCLK_IES | TCLK_IM |
| Synchronization Status of PRBS/QRSS | PRBS_S | PRBS_IS | PRBS_IES | PRBS_IM |
| PRBS/QRSS Error | | ERR_IS | | ERR_IM |
| Code Violation Received | | CV_IS | | CV_IM |
| Excessive Zeros Received | | EXZ_IS | | EXZ_IM |
| JA FIFO Overflow | | JAOV_IS | | JAOV_IM |
| JA FIFO Underflow | | JAUD_IS | | JAUD_IM |
| Inband Loopback Activate Code Status | IBLBA_S | IBLBA_IS | IBLBA_IES | IBLBA_IM |
| Inband Loopback Deactivate Code Status | IBLBD_S | IBLBD_IS | IBLBD_IES | IBLBD_IM |
| One-Second Timer Expired | | TMOV_IS | | TIMER_IM |
| Error Counter Overflow | | CNT_OV_IS | | CNT_IM |
| Arbitrary Waveform Generator Overflow | | DAC_OV_IS | | DAC_OV_IM |

3.13 5V TOLERANT I/O PINS

All digital input pins will tolerate 5.0 \pm 5% volts and are compatible with TTL logic.

3.14 RESET OPERATION

The chip can be reset in two ways:

- Software Reset: Writing to the RST register (20H) will reset the chip in 1 μ s.

- Hardware Reset: Asserting the $\overline{\text{RST}}$ pin low for a minimum of 100 ns will reset the chip.

After reset, all drivers output are in high impedance state, all the internal flip-flops are reset, and all the registers are initialized to default values.

3.15 POWER SUPPLY

This chip uses a single 3.3 V power supply.

4 PROGRAMMING INFORMATION

4.1 REGISTER LIST AND MAP

The IDT82V2044E registers can be divided into Global Registers and Local Registers. The operation on the Global Registers affects all the four channels while the operation on Local Registers only affects that specific channel. For different channel, the address of Local Register is different. [Table-19](#) is the map of Global Registers and [Table-20](#) is the map of Local

Registers. If the configuration of all the four channels is the same, the COPY bit (**GCF0, 40H**) can be set to '1' to establish the Broadcasting mode. In the Broadcasting mode, the Writing operation on any of the four channels' registers will be copied to the corresponding registers of all the other channels.

Table-19 Global Register List and Map

| Address (Hex) | Register | R/W | Map | | | | | | | |
|---------------|----------|-----|------|---------|------|---------|------|----------|----------|----------|
| | | | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

4.2 REGISTER DESCRIPTION

4.2.1 GLOBAL REGISTERS

Table-21 ID: Chip Revision Register

(R, Address = 00H)

| Symbol | Bit | Default | Description |
|---------|-----|---------|-------------------------------|
| ID[7:0] | 7-0 | 01H | 00H is for the first version. |

Table-22 RST: Reset Register

(W, Address = 20H)

| Symbol | Bit | Default | Description |
|----------|-----|---------|---|
| RST[7:0] | 7-0 | 01H | Software reset. A write operation on this register will reset all internal registers to their default values, and the status of all ports are set to the default status. The content in this register can not be changed. |

Table-23 GCF0: Global Configuration Register 0

(R/W, Address = 40H)

| Symbol | Bit | Default | Description |
|--------------|-----|---------|---|
| - | 7-6 | 0 | Reserved |
| - | 5 | 0 | Reserved. For normal operation, this bit should be set to '0'. |
| T1E1 | 4 | 0 | This bit selects E1 or T1/J1 operation mode globally. = 0: E1 mode is selected. = 1: T1/J1 mode is selected. |
| COPY | 3 | 0 | Enable broadcasting mode. = 0: Broadcasting mode disabled = 1: Broadcasting mode enabled. Writing operation on one channel's register will be copied exactly to the corresponding registers in all the other channels. |
| INTM_GLB | 2 | 1 | Global interrupt enable = 0: Interrupt is globally enabled. But for each individual interrupt, it still can be disabled by its corresponding Interrupt mask Bit. = 1: All the interrupts are disabled for all channels. |
| INT_PIN[1:0] | 1-0 | 00 | Interrupt pin operation mode selection = x0: open drain, active low (with an external pull-up resistor) = 01: push-pull, active low = 11: push-pull, active high |

Table-24 GCF1: Global Configuration Register 1
(R/W, Address = 60H)

| Symbol | Bit | Default | Description |
|----------|-----|---------|--|
| MON[3:0] | 7-4 | 0000 | MON selects the transmitter or receiver channel to be monitored. = 0000: receiver 1 is in normal operation without monitoring = 0001: reserved = 0010: monitor receiver 2 = 0011: reserved = 0100: monitor receiver 3 = 0101: reserved = 0110: monitor receiver 4 = 0111: reserved = 1000: transmitter 1 is in normal operation without monitoring = 1001: reserved = 1010: monitor transmitter 2 = 1011: reserved = 1100: monitor transmitter 3 = 1101: reserved = 1110: monitor transmitter 4 = 1111: reserved |
| - | 3-0 | 0000 | Reserved |

Table-25 INTCH: Interrupt Channel Indication Register
(R, Address = 80H)

| Symbol | Bit | Default | Description |
|-------------|-----|---------|--|
| INT_CH[7:0] | 7-0 | 00H | INT_CH[0, 2, 4 or 6]=1 indicates that an interrupt was generated by channel 1, 2, 3 or 4 respectively. |

4.2.2 JITTER ATTENUATION CONTROL REGISTER

Table-26 JACF: Jitter Attenuator Configuration Register

(R/W, Address = 01H,41H,81H,C1H)

| Symbol | Bit | Default | Description | | |
|-----------|---------|---------|--|-------|--------|
| - | 7-6 | 00 | Reserved | | |
| JA_LIMIT | 5 | 0 | Wide Jitter Attenuation bandwidth = 0: normal mode = 1: JA limit mode | | |
| JACF[1:0] | 4-3 | 00 | Jitter Attenuator configuration = 00/10: JA not used = 01: JA in transmit path = 11: JA in receive path | | |
| JADP[1:0] | 2-1 | 00 | Jitter Attenuator depth selection = 00: 128 bits = 01: 64 bits = 10/11: 32 bits | | |
| JABW | 0 | 0 | Jitter transfer function bandwidth selection | | |
| | | | JABW | T1/J1 | E1 |
| | | | 0 | 5 Hz | 6.8 Hz |
| 1 | 1.25 Hz | 0.9 Hz | | | |

4.2.3 TRANSMIT PATH CONTROL REGISTERS

Table-27 TCF0: Transmitter Configuration Register 0

(R/W, Address = 02H,42H,82H,C2H)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|--|
| - | 7-5 | 000 | Reserved |
| T_OFF | 4 | 0 | Transmitter power down enable = 0: Transmitter power up = 1: Transmitter power down and line driver high impedance |
| TD_INV | 3 | 0 | Transmit data invert = 0: data on TDn or TDPn/TDNn is active high = 1: data on TDn or TDPn/TDNn is active low |
| TCLK_SEL | 2 | 0 | Transmit clock edge select = 0: data on TDn or TDPn/TDNn is sampled on the falling edges of TCLKn = 1: data on TDn or TDPn/TDNn is sampled on the rising edges of TCLKn |
| T_MD[1:0] | 1-0 | 00 | Transmitter operation mode control bits which select different stages of transmit data path = 00: enable HDB3/B8ZS encoder and waveform shaper blocks, input on TDn is single rail NRZ data = 01: enable AMI encoder and waveform shaper blocks, input on pin TDn is single rail NRZ data = 1x: encoder is bypassed, dual rail NRZ transmit data input on pin TDPn/TDNn |

Table-28 TCF1: Transmitter Configuration Register 1

(R/W, Address = 03H,43H,83H,C3H)

| Symbol | Bit | Default | Description | | | | | |
|-------------|------------------------------------|---------|--|----------|-----------|-----------------|-------------|------------|
| - | 7-6 | 00 | Reserved. This bit should be '0' for normal operation. | | | | | |
| DFM_OFF | 5 | 0 | Transmit driver failure monitor disable = 0: DFM is enabled = 1: DFM is disabled | | | | | |
| THZ | 4 | 1 | Transmit line driver high impedance enable = 0: normal state = 1: transmit line driver high impedance enable (other transmit path still in normal state) | | | | | |
| PULS[3:0] | 3-0 | 0000 | These bits select the transmit template. | | | | | |
| | | | | T1/E1/J1 | TCLK | Cable Impedance | Cable Range | Cable Loss |
| | | | 0000 ¹ | E1 | 2.048 MHz | 75 Ω | - | 0~24 dB |
| | | | 0001 | E1 | 2.048 MHz | 120 Ω | - | 0~24 dB |
| | | | 0010 | DSX1 | 1.544 MHz | 100 Ω | 0~133 ft | 0~0.6 dB |
| | | | 0011 | DSX1 | 1.544 MHz | 100 Ω | 133~266 ft | 0.6~1.2 dB |
| | | | 0100 | DSX1 | 1.544 MHz | 100 Ω | 266~399 ft | 1.2~1.8 dB |
| | | | 0101 | DSX1 | 1.544 MHz | 100 Ω | 399~533 ft | 1.8~2.4 dB |
| | | | 0110 | DSX1 | 1.544 MHz | 100 Ω | 533~655 ft | 2.4~3.0 dB |
| | | | 0111 | J1 | 1.544 MHz | 110 Ω | 0~655 ft | 0~3.0 dB |
| 1000 - 1011 | Reserved | | | | | | | |
| 11xx | User programmable waveform setting | | | | | | | |

1. In internal impedance matching mode, for E1/75 Ω cable impedance, the PULS[3:0] bits (TCF1, 03H...) should be set to '0000'. In external impedance matching mode, for E1/75 Ω cable impedance, the PULS[3:0] bits should be set to '0001'.

Table-29 TCF2: Transmitter Configuration Register 2

(R/W, Address = 04H,44H,84H,C4H)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|---|
| - | 7-6 | 00 | Reserved |
| SCAL[5:0] | 5-0 | 100001 | <p>SCAL specifies a scaling factor to be applied to the amplitude of the user-programmable arbitrary pulses which is to be transmitted if needed. The default value of SCAL[5:0] is '100001'. Refer to 3.2.3.2 User-Programmable Arbitrary Waveform.</p> <p>= 110110: default value for T1 0~133 ft, T1 133~266 ft, T1 266~399 ft, T1 399~533 ft, T1 533~655 ft, J1 0~655 ft. One step change of this value results in 2% scaling up/down against the pulse amplitude.</p> <p>= 100001: default value for E1 75 Ω and 120 Ω. One step change of this value results in 3% scaling up/down against the pulse amplitude.</p> |

Table-30 TCF3: Transmitter Configuration Register 3

(R/W, Address = 05H,45H,85H,C5H)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|--|
| DONE | 7 | 0 | After '1' is written to this bit, a read or write operation is implemented. |
| RW | 6 | 0 | <p>This bit selects read or write operation</p> <p>= 0: write to RAM</p> <p>= 1: read from RAM</p> |
| UI[1:0] | 5-4 | 00 | <p>These bits specify the unit interval address. There are 4 unit intervals.</p> <p>= 00: UI address is 0 (The most left UI)</p> <p>= 01: UI address is 1</p> <p>= 10: UI address is 2</p> <p>= 11: UI address is 3</p> |
| SAMP[3:0] | 3-0 | 0000 | <p>These bits specify the sample address. Each UI has 16 samples.</p> <p>= 0000: sample address is 0 (The most left Sample)</p> <p>= 0001: sample address is 1</p> <p>= 0010: sample address is 2</p> <p>.....</p> <p>= 1110: sample address is 14</p> <p>= 1111: sample address is 15</p> |

Table-31 TCF4: Transmitter Configuration Register 4

(R/W, Address = 06H,46H,86H,C6H)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|--|
| - | 7 | 0 | Reserved |
| WDAT[6:0] | 6-0 | 0000000 | <p>In Indirect Write operation, the WDAT[6:0] will be loaded to the pulse template RAM, specifying the amplitude of the Sample.</p> <p>After an Indirect Read operation, the amplitude data of the Sample in the pulse template RAM will be output to the WDAT[6:0].</p> |

4.2.4 RECEIVE PATH CONTROL REGISTERS

Table-32 RCF0: Receiver Configuration Register 0

(R/W, Address = 07H,47H,87H,C7H)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|--|
| - | 7-5 | 000 | Reserved |
| R_OFF | 4 | 0 | Receiver power down enable = 0: Receiver power up = 1: Receiver power down |
| RD_INV | 3 | 0 | Receive data invert = 0: data on RDn or RDPn/RDNn is active high = 1: data on RDn or RDPn/RDNn is active low |
| RCLK_SEL | 2 | 0 | Receive clock edge select (this bit is ignored in slicer mode) = 0: data on RDn or RDPn/RDNn is updated on the rising edges of RCLKn = 1: data on RDn or RDPn/RDNn is updated on the falling edges of RCLKn |
| R_MD[1:0] | 1-0 | 00 | Receiver path decoding selection = 00: receive data is HDB3 (E1) / B8ZS (T1/J1) decoded and output on RDn with single rail NRZ format = 01: receive data is AMI decoded and output on RDn with single rail NRZ format = 10: decoder is bypassed, re-timed dual rail data with NRZ format output on RDPn/RDNn (dual rail mode with clock recovery) = 11: both CDR and decoder blocks are bypassed, slicer data with RZ format output on RDPn/RDNn (slicer mode) |

Table-33 RCF1: Receiver Configuration Register 1

(R/W, Address = 08H,48H,88H,C8H)

| Symbol | Bit | Default | Description | | |
|---------------|-----|----------|---|------|------|
| - | 7 | 0 | Reserved | | |
| EQ_ON | 6 | 0 | = 0: receive equalizer off = 1: receive equalizer on (LOS programming enabled) | | |
| - | 5 | 0 | Reserved. Should be 0 for normal operation. | | |
| LOS[4:0] | 4-0 | 10101 | LOS Clear Level (dB) | | |
| | | | 00000 | 0 | <-4 |
| | | | 00001 | >-2 | <-6 |
| | | | 00010 | >-4 | <-8 |
| | | | 00011 | >-6 | <-10 |
| | | | 00100 | >-8 | <-12 |
| | | | 00101 | >-10 | <-14 |
| | | | 00110 | >-12 | <-16 |
| | | | 00111 | >-14 | <-18 |
| | | | 01000 | >-16 | <-20 |
| | | | 01001 | >-18 | <-22 |
| | | | 01010 | >-20 | <-24 |
| 01011 - 11111 | | Reserved | | | |

Table-34 RCF2: Receiver Configuration Register 2

(R/W, Address =09H,49H,89H,C9H)

| Symbol | Bit | Default | Description |
|------------|-----|---------|--|
| - | 7-6 | 00 | Reserved |
| SLICE[1:0] | 5-4 | 01 | Receive slicer threshold = 00: The receive slicer generates a mark if the voltage on RTIPn/RRINGn exceeds 40% of the peak amplitude. = 01: The receive slicer generates a mark if the voltage on RTIPn/RRINGn exceeds 50% of the peak amplitude. = 10: The receive slicer generates a mark if the voltage on RTIPn/RRINGn exceeds 60% of the peak amplitude. = 11: The receive slicer generates a mark if the voltage on RTIPn/RRINGn exceeds 70% of the peak amplitude. |
| - | 3-2 | 10 | Reserved |
| MG[1:0] | 1-0 | 00 | Monitor gain setting: these bits select the internal linear gain boost = 00: 0 dB = 01: 22 dB = 10: 26 dB = 11: 32 dB |

4.2.5 NETWORK DIAGNOSTICS CONTROL REGISTERS

Table-35 MAINT0: Maintenance Function Control Register 0

(R/W, Address = 0AH,4AH,8AH,CAH)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|--|
| - | 7 | 0 | Reserved |
| PATT[1:0] | 6-5 | 00 | These bits select the internal pattern and insert it into the transmit data stream. = 00: normal operation (PATT_CLK = 0) / insert all zeros (PATT_CLK = 1) = 01: insert All Ones = 10: insert PRBS (E1: 2 ¹⁵ -1) or QRSS (T1/J1: 2 ²⁰ -1) = 11: insert programmable Inband Loopback activate or deactivate code |
| PATT_CLK | 4 | 0 | Selects reference clock for transmitting internal pattern = 0: uses TCLKn as the reference clock = 1: uses MCLK as the reference clock |
| PRBS_INV | 3 | 0 | Inverts PRBS = 0: PRBS data is not inverted = 1: PRBS data is inverted before transmission and detection |
| LAC | 2 | 0 | The LOS/AIS criterion is selected as below: = 0: G.775 (E1) / T1.231 (T1/J1) = 1: ETSI 300233 & I.431 (E1) / I.431 (T1/J1) |
| AISE | 1 | 0 | AIS enable during LOS = 0: AIS insertion on RDPn/RDNn/RCLKn is disabled during LOS = 1: AIS insertion on RDPn/RDNn/RCLKn is enabled during LOS |
| ATAO | 0 | 0 | Automatically Transmit All Ones (enabled only when PATT[1:0] = 01) = 0: disabled = 1: Automatically Transmit All Ones pattern at TTIPn/TRINGn during LOS. |

Table-36 MAINT1: Maintenance Function Control Register 1

(R/W, Address = 0BH,4BH,8BH,CBH)

| Symbol | Bit | Default | Description |
|--------|-----|---------|--|
| - | 7-4 | 0000 | Reserved |
| ARLP | 3 | 0 | Automatic Remote Loopback Control = 0: disables Automatic Remote Loopback (normal transmit and receive operation) = 1: enables Automatic Remote Loopback |
| RLP | 2 | 0 | Remote loopback enable = 0: disables remote loopback (normal transmit and receive operation) = 1: enables remote loopback |
| ALP | 1 | 0 | Analog loopback enable = 0: disables analog loopback (normal transmit and receive operation) = 1: enables analog loopback |
| DLP | 0 | 0 | Digital loopback enable = 0: disables digital loopback (normal transmit and receive operation) = 1: enables digital loopback |

Table-37 MAINT2: Maintenance Function Control Register 2

(R/W, Address = 0CH,4CH,8CH,CCH)

| Symbol | Bit | Default | Description |
|---------------|-----|---------|--|
| - | 7-6 | 00 | Reserved. |
| TIBLB_L[1:0] | 5-4 | 00 | Defines the length of the user-programmable transmit Inband Loopback activate/deactivate code contained in TIBLB register. The default selection is 5 bits length. = 00: 5-bit activate code in TIBLB [4:0] = 01: 6-bit activate code in TIBLB [5:0] = 10: 7-bit activate code in TIBLB [6:0] = 11: 8-bit activate code in TIBLB [7:0] |
| RIBLBA_L[1:0] | 3-2 | 00 | Defines the length of the user-programmable receive Inband Loopback activate code contained in RIBLBA register. = 00: 5-bit activate code in RIBLBA [4:0] = 01: 6-bit activate code in RIBLBA [5:0] = 10: 7-bit activate code in RIBLBA [6:0] = 11: 8-bit activate code in RIBLBA [7:0] |
| RIBLBD_L[1:0] | 1-0 | 01 | Defines the length of the user-programmable receive Inband Loopback deactivate code contained in RIBLBD register. = 00: 5-bit deactivate code in RIBLBD [4:0] = 01: 6-bit deactivate code in RIBLBD [5:0] = 10: 7-bit deactivate code in RIBLBD [6:0] = 11: 8-bit deactivate code in RIBLBD [7:0] |

Table-38 MAINT3: Maintenance Function Control Register 3

(R/W, Address = 0DH,4DH,8DH,CDH)

| Symbol | Bit | Default | Description |
|------------|-----|------------|--|
| TIBLB[7:0] | 7-0 | (000)00001 | Defines the user-programmable transmit Inband Loopback activate/deactivate code. The default selection is 00001. TIBLB[7:0] form the 8-bit repeating code TIBLB[6:0] form the 7-bit repeating code TIBLB[5:0] form the 6-bit repeating code TIBLB[4:0] form the 5-bit repeating code |

Table-39 MAINT4: Maintenance Function Control Register 4

(R/W, Address = 0EH,4EH,8EH,CEH)

| Symbol | Bit | Default | Description |
|-------------|-----|------------|--|
| RIBLBA[7:0] | 7-0 | (000)00001 | Defines the user-programmable receive Inband Loopback activate code. The default selection is 00001. RIBLBA[7:0] form the 8-bit repeating code RIBLBA[6:0] form the 7-bit repeating code RIBLBA[5:0] form the 6-bit repeating code RIBLBA[4:0] form the 5-bit repeating code |

Table-40 MAINT5: Maintenance Function Control Register 5

(R/W, Address = 0FH,4FH,8FH,CFH)

| Symbol | Bit | Default | Description |
|-------------|-----|------------|---|
| RIBLBD[7:0] | 7-0 | (00)001001 | Defines the user-programmable receive Inband Loopback deactivate code. The default selection is 001001. RIBLBD[7:0] form the 8-bit repeating code RIBLBD[6:0] form the 7-bit repeating code RIBLBD[5:0] form the 6-bit repeating code RIBLBD[4:0] form the 5-bit repeating code |

Table-41 MAINT6: Maintenance Function Control Register 6

(R/W, Address = 10H,50H,90H,D0H)

| Symbol | Bit | Default | Description |
|---------|-----|---------|--|
| - | 7 | 0 | Reserved. |
| BPV_INS | 6 | 0 | BPV error insertion A '0' to '1' transition on this bit will cause a single bipolar violation error to be inserted into the transmit data stream. This bit must be cleared and set again for a subsequent error to be inserted. |
| ERR_INS | 5 | 0 | PRBS/QRSS logic error insertion A '0' to '1' transition on this bit will cause a single PRBS/QRSS logic error to be inserted into the transmit PRBS/QRSS data stream. This bit must be cleared and set again for subsequent error to be inserted. |
| EXZ_DEF | 4 | 0 | EXZ definition select = 0: ANSI = 1: FCC |
| ERR_SEL | 3-2 | 00 | These bits choose which type of error will be counted = 00: the PRBS logic error is counted by a 16-bit error counter. = 01: the EXZ error is counted by a 16-bit error counter. = 10: the Received CV (BPV) error is counted by a 16-bit error counter. = 11: both CV (BPV) and EXZ errors are counted by a 16-bit error counter. |
| CNT_MD | 1 | 0 | Counter operation mode select = 0: Manual Report Mode = 1: Auto Report Mode |
| CNT_TRF | 0 | 0 | = 0: Clear this bit for the next '0' to '1' transition on this bit. = 1: Error counting result is transferred to CNT0 and CNT1 and the error counter is reset. |

4.2.6 INTERRUPT CONTROL REGISTERS

Table-42 INTM0: Interrupt Mask Register 0

(R/W, Address = 11H,51H,91H,D1H)

| Symbol | Bit | Default | Description |
|----------|-----|---------|---|
| - | 7 | - | Reserved |
| IBLBA_IM | 6 | 1 | In-band Loopback activate code detect interrupt mask = 0: In-band Loopback activate code detect interrupt enabled = 1: In-band Loopback activate code detect interrupt masked |
| IBLBD_IM | 5 | 1 | In-band Loopback deactivate code detect interrupt mask = 0: In-band Loopback deactivate code detect interrupt enabled = 1: In-band Loopback deactivate code detect interrupt masked |
| PRBS_IM | 4 | 1 | PRBS synchronic signal detect interrupt mask = 0: PRBS synchronic signal detect interrupt enabled = 1: PRBS synchronic signal detect interrupt masked |
| TCLK_IM | 3 | 1 | TCLK loss detect interrupt mask = 0: TCLK loss detect interrupt enabled = 1: TCLK loss detect interrupt masked |
| DF_IM | 2 | 1 | Driver failure interrupt mask = 0: Driver failure interrupt enabled = 1: Driver failure interrupt masked |
| AIS_IM | 1 | 1 | Alarm Indication Signal interrupt mask = 0: Alarm Indication Signal interrupt enabled = 1: Alarm Indication Signal interrupt masked |
| LOS_IM | 0 | 1 | Loss Of Signal interrupt mask = 0: Loss Of Signal interrupt enabled = 1: Loss Of Signal interrupt masked |

Table-43 INTM1: Interrupt Mask Register 1

(R/W, Address = 12H,52H,92H,D2H)

| Symbol | Bit | Default | Description |
|-----------|-----|---------|--|
| DAC_OV_IM | 7 | 1 | DAC arithmetic overflow interrupt mask = 0: DAC arithmetic overflow interrupt enabled = 1: DAC arithmetic overflow interrupt masked |
| JA_OV_IM | 6 | 1 | JA overflow interrupt mask = 0: JA overflow interrupt enabled = 1: JA overflow interrupt masked |
| JA_UD_IM | 5 | 1 | JA underflow interrupt mask = 0: JA underflow interrupt enabled = 1: JA underflow interrupt masked |
| ERR_IM | 4 | 1 | PRBS/QRSS logic error detect interrupt mask = 0: PRBS/QRSS logic error detect interrupt enabled = 1: PRBS/QRSS logic error detect interrupt masked |
| EXZ_IM | 3 | 1 | Receive excess zeros interrupt mask = 0: Receive excess zeros interrupt enabled = 1: Receive excess zeros interrupt masked |
| CV_IM | 2 | 1 | Receive error interrupt mask = 0: Receive error interrupt enabled = 1: Receive error interrupt masked |
| TIMER_IM | 1 | 1 | One-Second Timer expiration interrupt mask = 0: One-Second Timer expiration interrupt enabled = 1: One-Second Timer expiration interrupt masked |

| T_TERM[2:0] | 5-3 | 000 | These bits select the internal termination for transmit line impedance matching. = 000: internal 75 Ω impedance matching = 001: internal 120 Ω impedance matching = 010: internal 100 Ω impedance matching = 011: internal 110 Ω impedance matching = 1xx: Selects external impedance matching resistors for E1 mode only. T1/J1 does not require external impedance resistors (see Table-10). |
| R_TERM[2:0] | 2-0 | 000 | These bits select the internal termination for receive line impedance matching. = 000: internal 75 Ω impedance matching = 001: internal 120 Ω impedance matching = 010: internal 100 Ω impedance matching = 011: internal 110 Ω impedance matching = 1xx: Selects external impedance matching resistors (see Table-11). |

5 IEEE STD 1149.1 JTAG TEST ACCESS PORT

The IDT82V2044E supports the digital Boundary Scan Specification as described in the IEEE 1149.1 standards.

The boundary scan architecture consists of data and instruction registers plus a Test Access Port (TAP) controller. Control of the TAP is performed through signals applied to the Test Mode Select (TMS) and Test

Clock (TCK) pins. Data is shifted into the registers via the Test Data Input (TDI) pin, and shifted out of the registers via the Test Data Output (TDO) pin. Both TDI and TDO are clocked at a rate determined by TCK.

The JTAG boundary scan registers include BSR (Boundary Scan Register), IDR (Device Identification Register), BR (Bypass Register) and IR (Instruction Register). These will be described in the following pages. Refer to for architecture.

Figure-21 JTAG Architecture

5.1 JTAG INSTRUCTIONS AND INSTRUCTION REGISTER

The IR (Instruction Register) with instruction decode block is used to select the test to be executed or the data register to be accessed or both.

The instructions are shifted in LSB first to this 3-bit register. See [Table-52](#) for details of the codes and the instructions related.

Table-52 Instruction Register Description

| IR CODE | INSTRUCTION | COMMENTS |
|---------|------------------|--|
| 000 | Extest | The external test instruction allows testing of the interconnection to other devices. When the current instruction is the EXTEST instruction, the boundary scan register is placed between TDI and TDO. The signal on the input pins can be sampled by loading the boundary scan register using the Capture-DR state. The sampled values can then be viewed by shifting the boundary scan register using the Shift-DR state. The signal on the output pins can be controlled by loading patterns shifted in through input TDI into the boundary scan register using the Update-DR state. |
| 100 | Sample / Preload | The sample instruction samples all the device inputs and outputs. For this instruction, the boundary scan register is placed between TDI and TDO. The normal path between IDT82V2044E logic and the I/O pins is maintained. Primary device inputs and outputs can be sampled by loading the boundary scan register using the Capture-DR state. The sampled values can then be viewed by shifting the boundary scan register using the Shift-DR state. |
| 110 | Idcode | The identification instruction is used to connect the identification register between TDI and TDO. The device's identification code can then be shifted out using the Shift-DR state. |
| 111 | Bypass | The bypass instruction shifts data from input TDI to output TDO with one TCK clock period delay. The instruction is used to bypass the device. |

5.2 JTAG DATA REGISTER

5.2.1 DEVICE IDENTIFICATION REGISTER (IDR)

The IDR can be set to define the producer number, part number and the device revision, which can be used to verify the proper version or revision number that has been used in the system under test. The IDR is 32 bits long and is partitioned as in [Table-53](#). Data from the IDR is shifted out to TDO LSB first.

Table-53 Device Identification Register Description

| Bit No. | Comments |
|---------|-----------------|
| 0 | Set to '1' |
| 1-11 | Producer Number |
| 12-27 | Part Number |
| 28-31 | Device Revision |

5.2.2 BYPASS REGISTER (BR)

The BR consists of a single bit. It can provide a serial path between the TDI input and TDO output, bypassing the BSR to reduce test access times.

5.2.3 BOUNDARY SCAN REGISTER (BSR)

The BSR can apply and read test patterns in parallel to or from all the digital I/O pins. The BSR is a 98 bits long shift register and is initialized and read using the instruction EXTEST or SAMPLE/PRELOAD. Each pin is related to one or more bits in the BSR. For details, please refer to the BSD file.

5.2.4 TEST ACCESS PORT CONTROLLER

The TAP controller is a 16-state synchronous state machine. Figure-22 shows its state diagram following the description of each state. Note that the figure contains two main branches to access either the data or instruc-

tion registers. The value shown next to each state transition in this figure states the value present at TMS at each rising edge of TCK. Please refer to Table-54 for details of the state description.

Table-54 TAP Controller State Description

| STATE | DESCRIPTION |
|------------------|---|
| Test Logic Reset | In this state, the test logic is disabled. The device is set to normal operation. During initialization, the device initializes the instruction register with the IDCODE instruction. Regardless of the original state of the controller, the controller enters the Test-Logic-Reset state when the TMS input is held high for at least 5 rising edges of TCK. The controller remains in this state while TMS is high. The device processor automatically enters this state at power-up. |
| Run-Test/Idle | This is a controller state between scan operations. Once in this state, the controller remains in the state as long as TMS is held low. The instruction register and all test data registers retain their previous state. When TMS is high and a rising edge is applied to TCK, the controller moves to the Select-DR state. |
| Select-DR-Scan | This is a temporary controller state and the instruction does not change in this state. The test data register selected by the current instruction retains its previous state. If TMS is held low and a rising edge is applied to TCK when in this state, the controller moves into the Capture-DR state and a scan sequence for the selected test data register is initiated. If TMS is held high and a rising edge applied to TCK, the controller moves to the Select-IR-Scan state. |
| Capture-DR | In this state, the Boundary Scan Register captures input pin data if the current instruction is EXTEST or SAMPLE/PRELOAD. The instruction does not change in this state. The other test data registers, which do not have parallel input, are not changed. When the TAP controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-DR state if TMS is high or the Shift-DR state if TMS is low. |
| Shift-DR | In this controller state, the test data register connected between TDI and TDO as a result of the current instruction shifts data on stage toward its serial output on each rising edge of TCK. The instruction does not change in this state. When the TAP controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-DR state if TMS is high or remains in the Shift-DR state if TMS is low. |
| Exit1-DR | This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-DR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Pause-DR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. |
| Pause-DR | The pause state allows the test controller to temporarily halt the shifting of data through the test data register in the serial path between TDI and TDO. For example, this state could be used to allow the tester to reload its pin memory from disk during application of a long test sequence. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. The controller remains in this state as long as TMS is low. When TMS goes high and a rising edge is applied to TCK, the controller moves to the Exit2-DR state. |
| Exit2-DR | This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-DR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Shift-DR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. |
| Update-DR | The Boundary Scan Register is provided with a latched parallel output to prevent changes while data is shifted in response to the EXTEST and SAMPLE/PRELOAD instructions. When the TAP controller is in this state and the Boundary Scan Register is selected, data is latched into the parallel output of this register from the shift-register path on the falling edge of TCK. The data held at the latched parallel output changes only in this state. All shift-register stages in the test data register selected by the current instruction retain their previous value and the instruction does not change during this state. |
| Select-IR-Scan | This is a temporary controller state. The test data register selected by the current instruction retains its previous state. If TMS is held low and a rising edge is applied to TCK when in this state, the controller moves into the Capture-IR state, and a scan sequence for the instruction register is initiated. If TMS is held high and a rising edge is applied to TCK, the controller moves to the Test-Logic-Reset state. The instruction does not change during this state. |
| Capture-IR | In this controller state, the shift register contained in the instruction register loads a fixed value of '100' on the rising edge of TCK. This supports fault-isolation of the board-level serial test data path. Data registers selected by the current instruction retain their value and the instruction does not change during this state. When the controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-IR state if TMS is held high, or the Shift-IR state if TMS is held low. |
| Shift-IR | In this state, the shift register contained in the instruction register is connected between TDI and TDO and shifts data one stage towards its serial output on each rising edge of TCK. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. When the controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-IR state if TMS is held high, or remains in the Shift-IR state if TMS is held low. |
| Exit1-IR | This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-IR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Pause-IR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. |

Table-54 TAP Controller State Description (Continued)

| STATE | DESCRIPTION |
|-----------|---|
| Pause-IR | The pause state allows the test controller to temporarily halt the shifting of data through the instruction register. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. The controller remains in this state as long as TMS is low. When TMS goes high and a rising edge is applied to TCK, the controller moves to the Exit2-IR state. |
| Exit2-IR | This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-IR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Shift-IR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. |
| Update-IR | The instruction shifted into the instruction register is latched into the parallel output from the shift-register path on the falling edge of TCK. When the new instruction has been latched, it becomes the current instruction. The test data registers selected by the current instruction retain their previous value. |

Table-63 Transmitter and Receiver Timing Characteristics

| Symbol | Parameter | Min | Typ | Max | Unit |
|---------------|---|------------|------------------------------|------------|------|
| | MCLK frequency | | | | |
| | E1: T1/J1: | | 2.048/49.152 1.544/37.056 | | MHz |
| | MCLK tolerance | -100 | | 100 | ppm |
| | MCLK duty cycle | 30 | | 70 | % |
| Transmit path | | | | | |
| | TCLK frequency | | | | |
| | E1: T1/J1: | | 2.048 1.544 | | MHz |
| | TCLK tolerance | -50 | | +50 | ppm |
| | TCLK Duty Cycle | 10 | | 90 | % |
| t1 | Transmit Data Setup Time | 40 | | | ns |
| t2 | Transmit Data Hold Time | 40 | | | ns |
| | Delay time of THZ low to driver high impedance | | | 10 | us |
| | Delay time of TCLK low to driver high impedance | | 75 | | U.I. |
| Receive path | | | | | |
| | Clock recovery capture range ¹ | E1 | | ± 80 | ppm |
| | | T1/J1 | | ± 180 | |
| | RCLK duty cycle ² | 40 | 50 | 60 | % |
| t4 | RCLK pulse width ² | | | | |
| | E1: T1/J1: | 457 607 | 488 648 | 519 689 | ns |
| t5 | RCLK pulse width low time | | | | |
| | E1: T1/J1: | 203 259 | 244 324 | 285 389 | ns |
| t6 | RCLK pulse width high time | | | | |
| | E1: T1/J1: | 203 259 | 244 324 | 285 389 | ns |
| | Rise/fall time ³ | | | 20 | ns |
| t7 | Receive Data Setup Time | | | | |
| | E1: T1/J1: | 200 200 | 244 324 | | ns |
| t8 | Receive Data Hold Time | | | | |
| | E1: T1/J1: | 200 200 | 244 324 | | ns |

1.Relative to nominal frequency, MCLK= ± 100 ppm

2.RCLK duty cycle widths will vary depending on extent of received pulse jitter displacement. Maximum and minimum RCLK duty cycles are for worst case jitter conditions (0.2UI displacement for E1 per ITU G.823).

3.For all digital outputs. C load = 15pF

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009

Офис по работе с юридическими лицами:
