MICROCHIP MCP4901/4911/4921

8/10/12-Bit Voltage Output Digital-to-Analog Converter with SPI Interface

Features

- MCP4901: 8-Bit Voltage Output DAC
- MCP4911: 10-Bit Voltage Output DAC
- MCP4921: 12-Bit Voltage Output DAC
- Rail-to-Rail Output
- SPI Interface with 20 MHz Clock Support
- Simultaneous Latching of the DAC Output with $\overline{\text{LDAC}}$ Pin
- Fast Settling Time of 4.5 µs
- Selectable Unity or 2x Gain Output
- External Voltage Reference Input
- External Multiplier Mode
- 2.7V to 5.5V Single-Supply Operation
- Extended Temperature Range: -40°C to +125°C

Applications

- Set Point or Offset Trimming
- Precision Selectable Voltage Reference
- Motor Control Feedback Loop
- Digitally-Controlled Multiplier/Divider
- Calibration of Optical Communication Devices

Description

The MCP4901/4911/4921 devices are single channel 8-bit, 10-bit and 12-bit buffered voltage output Digital-to-Analog Converters (DACs), respectively. The devices operate from a single 2.7V to 5.5V supply with an SPI compatible Serial Peripheral Interface. The user can configure the full-scale range of the device to be V_{REF} or 2*V_{REF} by setting the gain selection option bit (gain of 1 of 2).

The user can shut down the device by setting the Configuration Register bit. In Shutdown mode, most of the internal circuits are turned off for power savings, and the output amplifier is configured to present a known high resistance output load (500 kΩ, typical).

The devices include double-buffered registers, allowing synchronous updates of the DAC output using the $\overline{\text{LDAC}}$ pin. These devices also incorporate a Power-on Reset (POR) circuit to ensure reliable power-up.

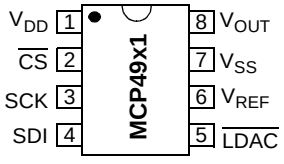
The devices utilize a resistive string architecture, with its inherent advantages of low Differential Non-Linearity (DNL) error and fast settling time. These devices are specified over the extended temperature range (+125°C).

The devices provide high accuracy and low noise performance for consumer and industrial applications where calibration or compensation of signals (such as temperature, pressure and humidity) are required.

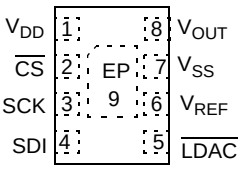
The MCP4901/4911/4921 devices are available in the PDIP, SOIC, MSOP and DFN packages.

Package Types

8-Pin PDIP, SOIC, MSOP



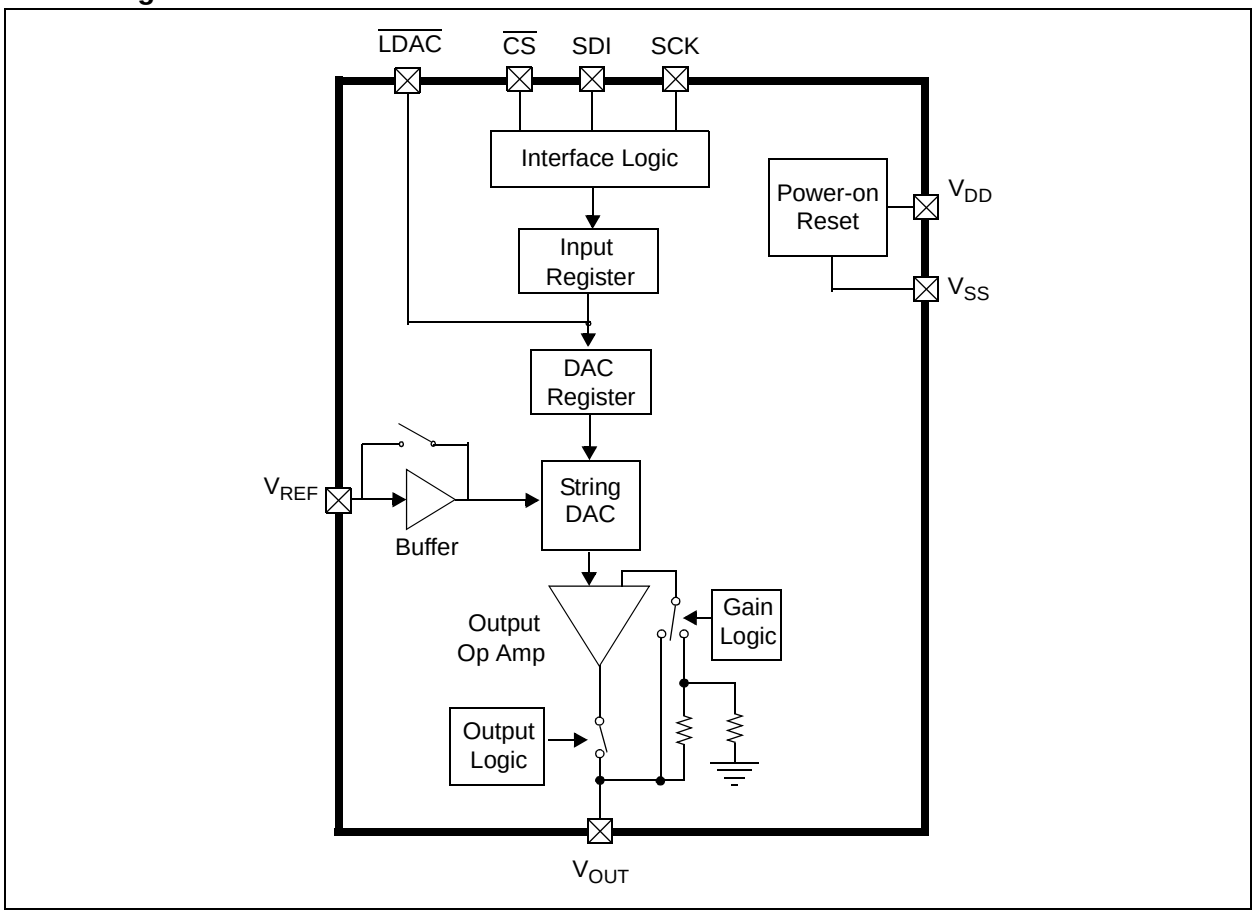
DFN-8 (2x3)*



MCP4901: 8-bit single DAC
MCP4911: 10-bit single DAC
MCP4921: 12-bit single DAC

* Includes Exposed Thermal Pad (EP); see Table 3-1.

Block Diagram



1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

V_{DD} 6.5V
All inputs and outputs w.r.t ..... V_{SS} –0.3V to V_{DD}+0.3V
Current at Input Pins ..... ±2 mA
Current at Supply Pins ..... ±50 mA
Current at Output Pins ..... ±25 mA
Storage temperature ..... -65°C to +150°C
Ambient temp. with power applied ..... -55°C to +125°C
ESD protection on all pins ..... ≥ 4 kV (HBM), ≥ 400V (MM)
Maximum Junction Temperature (T_J) ..... +150°C

† **Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, V_{DD} = 5V, V_{SS} = 0V, V_{REF} = 2.048V, Output Buffer Gain (G) = 2x, R_L = 5 kΩ to GND, C_L = 100 pF T_A = -40 to +85°C. Typical values are at +25°C.

Parameters	Sym	Min	Typ	Max	Units	Conditions

TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, V_{DD} = +2.7V to +5.5V, V_{SS} = GND.						
Parameters	**Sym**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
Temperature Ranges						
Specified Temperature Range	T_A	-40	—	+125	°C	
Operating Temperature Range	T_A	-40	—	+125	°C	**Note 1**
Storage Temperature Range	T_A	-65	—	+150	°C	
Thermal Package Resistances						
Thermal Resistance, 8L-DFN (2 x 3)	θ_{JA}	—	68	—	°C/W	
Thermal Resistance, 8L-PDIP	θ_{JA}	—	90	—	°C/W	
Thermal Resistance, 8L-SOIC	θ_{JA}	—	150	—	°C/W	
Thermal Resistance, 8L-MSOP	θ_{JA}	—	211	—	°C/W	

Note 1: The MCP4901/4911/4921 devices operate over this extended temperature range, but with reduced performance. Operation in this range must not cause T_J to exceed the maximum junction temperature of 150°C.

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, T_A = +25°C, V_{DD} = 5V, V_{SS} = 0V, V_{REF} = 2.048V, Gain = 2x, R_L = 5 kΩ, C_L = 100 pF.

NOTES:

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

PDIP, MSOP, SOIC	DFN	Symbol	Description
1	1	V_{DD}	Supply Voltage Input (2.7V to 5.5V)
2	2	$\overline{CS}$	Chip Select Input
3	3	SCK	Serial Clock Input
4	4	SDI	Serial Data Input
5	5	$\overline{LDAC}$	DAC Output Synchronization Input. This pin is used to transfer the input register (DAC settings) to the output register (V_{OUT})
6	6	V_{REF}	Voltage Reference Input
7	7	V_{SS}	Ground reference point for all circuitry on the device
8	8	V_{OUT}	DAC Analog Output
—	9	EP	Exposed Thermal Pad. This pad must be connected to V_{SS} in application

3.1 Supply Voltage Pins (V_{DD}, V_{SS})

V_{DD} is the positive supply voltage input pin. The input supply voltage is relative to V_{SS} and can range from 2.7V to 5.5V. The power supply at the V_{DD} pin should be as clean as possible for good DAC performance. It is recommended to use an appropriate bypass capacitor of about 0.1 µF (ceramic) to ground. An additional 10 µF capacitor (tantalum) in parallel is also recommended to further attenuate high-frequency noise present in application boards.

V_{SS} is the analog ground pin and the current return path of the device. The user must connect the V_{SS} pin to a ground plane through a low-impedance connection. If an analog ground path is available in the application Printed Circuit Board (PCB), it is highly recommended that the V_{SS} pin be tied to the analog ground path or isolated within an analog ground plane of the circuit board.

3.2 Chip Select ($\overline{CS}$)

$\overline{CS}$ is the chip select input, which requires an active-low signal to enable serial clock and data functions.

3.3 Serial Clock Input (SCK)

SCK is the SPI compatible serial clock input.

3.4 Serial Data Input (SDI)

SDI is the SPI compatible serial data input.

3.5 Latch DAC Input ($\overline{LDAC}$)

The $\overline{LDAC}$ (latch DAC synchronization input) pin is used to transfer the input latch register to the DAC register (output latches, V_{OUT}). When this pin is low, V_{OUT} is updated with input register content. This pin can be tied to low (V_{SS}) if the V_{OUT} update is desired at the rising edge of the $\overline{CS}$ pin. This pin can be driven by an external control device such as an MCU I/O pin.

3.6 Analog Output (V_{OUT})

V_{OUT} is the DAC analog output pin. The DAC output has an output amplifier. The full-scale range of the DAC output is from V_{SS} to G*V_{REF}, where G is the gain selection option (1x or 2x). The DAC analog output cannot go higher than the supply voltage (V_{DD}).

3.7 Voltage Reference Input (V_{REF})

V_{REF} is the voltage reference input for the device. The reference on this pin is utilized to set the reference voltage on the string DAC. The input voltage can range from V_{SS} to V_{DD}. This pin can be tied to V_{DD}.

3.8 Exposed Thermal Pad (EP)

There is an internal electrical connection between the Exposed Thermal Pad (EP) and the V_{SS} pin. They must be connected to the same potential on the PCB.

NOTES:

4.0 GENERAL OVERVIEW

The MCP4901, MCP4911 and MCP4921 are single channel voltage output 8-bit, 10-bit and 12-bit DAC devices, respectively. These devices include a V_{REF} input buffer, a rail-to-rail output amplifier, shutdown and reset management circuitry. The devices use an SPI serial communication interface and operate with a single-supply voltage from 2.7V to 5.5V.

The DAC input coding of these devices is straight binary. Equation 4-1 shows the DAC analog output voltage calculation.

EQUATION 4-1: ANALOG OUTPUT VOLTAGE (V_{OUT})

$$V_{OUT} = \frac{(V_{REF} \times D_n)}{2^n} \; G$$

Where:

V_{REF} = External voltage reference
D_n = DAC input code
G = Gain Selection
= 2 for <$\overline{GA}$> bit = 0
= 1 for <$\overline{GA}$> bit = 1
n = DAC Resolution
= 8 for MCP4901
= 10 for MCP4911
= 12 for MCP4912

The ideal output range of each device is:

- **MCP4901 (n = 8)**

(a) 0V to 255/256*V_{REF} when gain setting = 1x.

(b) 0V to 255/256*2*V_{REF} when gain setting = 2x.

- **MCP4911 (n = 10)**

(a) 0V to 1023/1024*V_{REF} when gain setting = 1x.

(b) 0V to 1023/1024*2*V_{REF} when gain setting = 2x.

- **MCP4921 (n = 12)**

(a) 0V to 4095/4096*V_{REF} when gain setting = 1x.

(b) 0V to 4095/4096*2*V_{REF} when gain setting = 2x.

Note:	See the output swing voltage specification in **Section 1.0 "Electrical Characteristics"**.

1 LSb is the ideal voltage difference between two successive codes. Table 4-1 illustrates the LSb calculation of each device.

TABLE 4-1: LSb OF EACH DEVICE

Device	Gain Selection	LSb Size
MCP4901 (n = 8)	1x	$V_{REF}/256$
	2x	$(2*V_{REF})/256$
MCP4911 (n = 10)	1x	$V_{REF}/1024$
	2x	$(2*V_{REF})/1024$
MCP4921 (n = 12)	1x	$V_{REF}/4096$
	2x	$(2*V_{REF})/4096$
where V_{REF} is the external voltage reference.		

4.1 DC Accuracy

4.1.1 INL ACCURACY

Integral Non-Linearity (INL) error is the maximum deviation between an actual code transition point and its corresponding ideal transition point, after offset and gain errors have been removed. The two endpoints (from 0x000 and 0xFFF) method is used for the calculation. Figure 4-1 shows the details.

A positive INL error represents transition(s) later than ideal. A negative INL error represents transition(s) earlier than ideal.

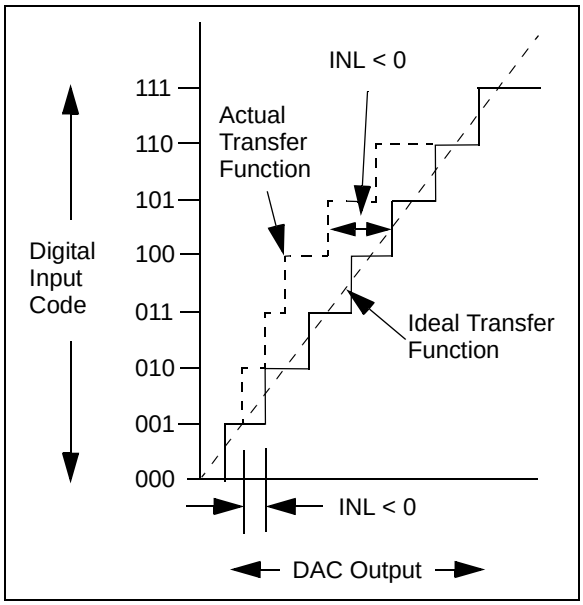

FIGURE 4-1: *Example for INL Error.*

4.1.2 DNL ACCURACY

A Differential Non-Linearity (DNL) error is the measure of variations in code widths from the ideal code width. A DNL error of zero indicates that every code is exactly 1 LSB wide.

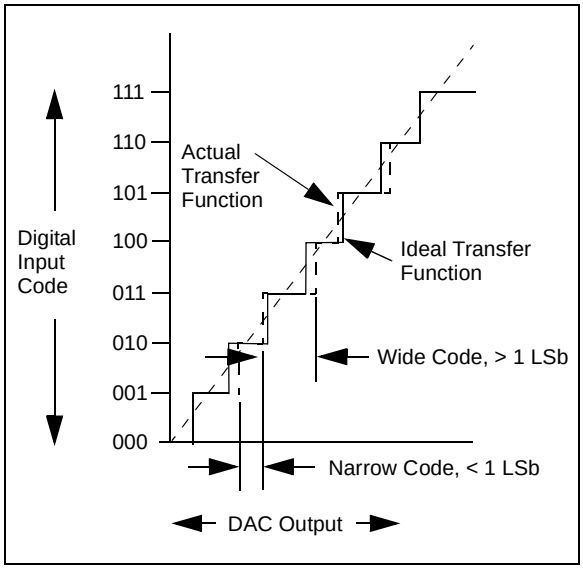

FIGURE 4-2: *Example for DNL Accuracy.*

4.1.3 OFFSET ERROR

An offset error is the deviation from zero voltage output when the digital input code is zero.

4.1.4 GAIN ERROR

A gain error is the deviation from the ideal output, V_{REF}– 1 LSB, excluding the effects of offset error.

4.2 Circuit Descriptions

4.2.1 OUTPUT AMPLIFIER

The DAC's output is buffered with a low-power, precision CMOS amplifier. This amplifier provides low offset voltage and low noise. The output stage enables the device to operate with output voltages close to the power supply rails. Refer to **Section 1.0 "Electrical Characteristics"** for the analog output voltage range and load conditions.

In addition to resistive load driving capability, the amplifier will also drive high capacitive loads without oscillation. The amplifier's strong output allows V_{OUT} to be used as a programmable voltage reference in a system.

Selecting a gain of 2 reduces the bandwidth of the amplifier in Multiplying mode. Refer to **Section 1.0 "Electrical Characteristics"** for the Multiplying mode bandwidth for given load conditions.

4.2.1.1 Programmable Gain Block

The rail-to-rail output amplifier has two configurable gain options: a gain of 1x (<GA> = 1) or a gain of 2x (<GA> = 0). The default value is a gain of 2x (<GA> = 0).

4.2.2 VOLTAGE REFERENCE AMPLIFIER

The input buffer amplifier for the MCP4901/4911/4921 devices provides low offset voltage and low noise. A Configuration bit for each DAC allows the V_{REF} input to bypass the V_{REF} input buffer amplifier, achieving Buffered or Unbuffered mode. Buffered mode provides a very high input impedance, with only minor limitations on the input range and frequency response. Unbuffered mode provides a wide input range (0V to V_{DD}), with a typical input impedance of 165 kΩ with 7 pF. Unbuffered mode (<BUF> = 0) is the default configuration.

4.2.3 POWER-ON RESET CIRCUIT

The internal Power-on Reset (POR) circuit monitors the power supply voltage (V_{DD}) during device operation. The circuit also ensures that the device powers up with high output impedance (<SHDN> = 0, typically 500 kΩ). The devices will continue to have a high-impedance output until a valid write command is received, and the LDAC pin meets the input low threshold.

If the power supply voltage is less than the POR threshold (V_{POR} = 2.0V, typical), the device will be held in its Reset state. It will remain in that state until $V_{DD} > V_{POR}$ and a subsequent write command is received.

Figure 4-3 shows a typical power supply transient pulse and the duration required to cause a reset to occur, as well as the relationship between the duration and trip voltage. A 0.1 µF decoupling capacitor, mounted as close as possible to the V_{DD} pin, can provide additional transient immunity.

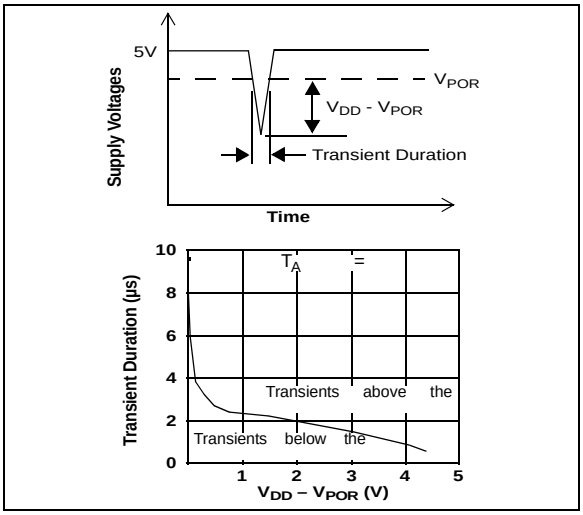

FIGURE 4-3: *Typical Transient Response.*

4.2.4 SHUTDOWN MODE

The user can shut down the device by using a software command. During Shutdown mode, most of the internal circuits, including the output amplifier, are turned off for power savings. The serial interface remains active, thus allowing a write command to bring the device out of Shutdown mode. There will be no analog output at the V_{OUT} pin, and the V_{OUT} pin is internally switched to a known resistive load (500 kΩ, typical). Figure 4-4 shows the analog output stage during Shutdown mode.

The device will remain in Shutdown mode until it receives a write command with <$\overline{SHDN}$> bit = 1 and the bit is latched into the device. When the device is changed from Shutdown to Active mode, the output settling time takes less than 10 µs, but more than the standard active mode settling time (4.5 µs).

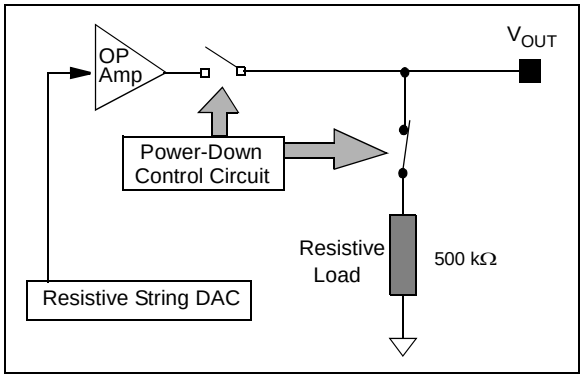

FIGURE 4-4: *Output Stage for Shutdown Mode.*

NOTES:

5.0 SERIAL INTERFACE

5.1 Overview

The MCP4901/4911/4921 devices are designed to interface directly with the Serial Peripheral Interface (SPI) port, which is available on many microcontrollers and supports Mode 0,0 and Mode 1,1. Commands and data are sent to the device via the SDI pin, with data being clocked-in on the rising edge of SCK. The communications are unidirectional, thus the data cannot be read out of the MCP4901/4911/4921. The $\overline{CS}$ pin must be held low for the duration of a write command. The write command consists of 16 bits and is used to configure the DAC's control and data latches. Register 5-1 through Register 5-3 detail the input register that is used to configure and load the DAC register for each device. Figure 5-1 through Figure 5-3 show the write command for each device.

Refer to Figure 1-1 and the SPI Timing Specifications Table for detailed input and output timing specifications for both Mode 0,0 and Mode 1,1 operation.

5.2 Write Command

The write command is initiated by driving the $\overline{CS}$ pin low, followed by clocking the four Configuration bits and the 12 data bits into the SDI pin on the rising edge of SCK. The $\overline{CS}$ pin is then raised, causing the data to be latched into the DAC's input register.

The MCP4901/4911/4921 utilizes a double-buffered latch structure to allow the analog output to be synchronized with the $\overline{LDAC}$ pin, if desired.

By bringing the $\overline{LDAC}$ pin down to a low state, the content stored in the DAC's input register is transferred into the DAC's output register (V_{OUT}), and V_{OUT} is updated.

All writes to the MCP4901/4911/4921 devices are 16-bit words. Any clocks past the 16th clock will be ignored. The Most Significant 4 bits are Configuration bits. The remaining 12 bits are data bits. No data can be transferred into the device with $\overline{CS}$ high. This transfer will only occur if 16 clocks have been transferred into the device. If the rising edge of $\overline{CS}$ occurs prior to that, shifting of data into the input register will be aborted.

REGISTER 5-1: WRITE COMMAND REGISTER FOR MCP4921 (12-BIT DAC)

W-x	W-x	W-x	W-0	W-x	W-x	W-x	W-x	W-x	W-x	W-x	W-x	W-x	W-x	W-x	W-x

NOTES:

6.0 TYPICAL APPLICATIONS

The MCP4901/4911/4921 family devices are general purpose DACs intended to be used in applications where precision with low-power and moderate bandwidth is required.

Applications generally suited for the devices are:

- Set Point or Offset Trimming
- Sensor Calibration
- Digitally-Controlled Multiplier/Divider
- Portable Instrumentation (Battery Powered)
- Motor Control Feedback Loop

6.1 Digital Interface

The MCP4901/4911/4921 devices utilize a 3-wire synchronous serial protocol to transfer the DAC's setup and output values from the digital source. The serial protocol can be interfaced to SPI or Microwire peripherals that are common on many microcontrollers, including Microchip's PIC® MCUs and dsPIC® DSCs.

In addition to the three serial connections ($\overline{CS}$, SCK and SDI), the $\overline{LDAC}$ pin synchronizes the analog output (V_{OUT}) with the pin event. By bringing the $\overline{LDAC}$ pin down "low", the DAC input code and settings in the input register are latched into the output register, and the analog output is updated. Figure 6-1 shows an example of the pin connections. Note that the $\overline{LDAC}$ pin can be tied low (V_{SS}) to reduce the required connections from 4 to 3 I/O pins. In this case, the DAC output can be immediately updated when a valid 16-clock transmission has been received and $\overline{CS}$ pin has been raised.

6.2 Power Supply Considerations

The typical application will require a bypass capacitor in order to filter high-frequency noise. The noise can be induced onto the power supply's traces from various events such as digital switching or as a result of changes on the DAC's output. The bypass capacitor helps to minimize the effect of these noise sources. Figure 6-1 illustrates an appropriate bypass strategy. In this example, two bypass capacitors are used in parallel: (a) 0.1 µF (ceramic) and (b) 10 µF (tantalum). These capacitors should be placed as close to the device power pin (V_{DD}) as possible (within 4 mm).

The power source supplying these devices should be as clean as possible. If the application circuit has separate digital and analog power supplies, V_{DD} and V_{SS} should reside on the analog plane.

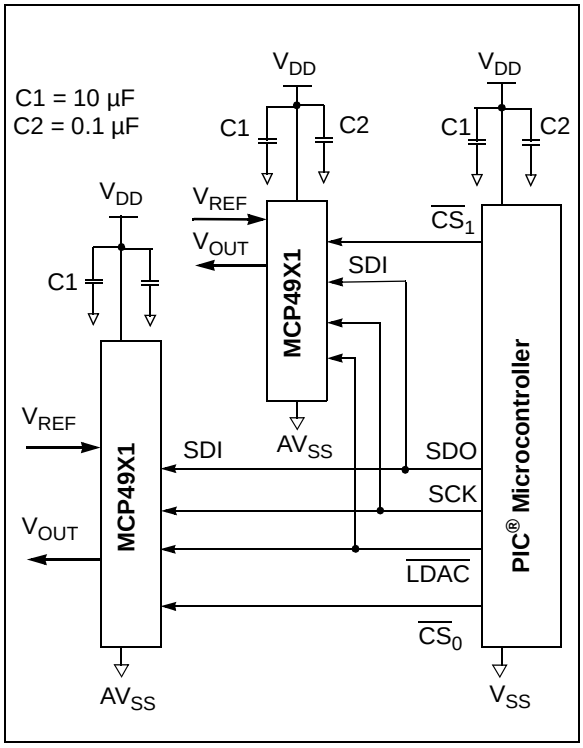

FIGURE 6-1: *Typical Connection Diagram.*

6.3 Layout Considerations

Inductively-coupled AC transients and digital switching noises can degrade the input and output signal integrity, potentially reducing the device's performance. Careful board layout will minimize these effects and increase the Signal-to-Noise Ratio (SNR). Bench testing has shown that a multi-layer board utilizing a low-inductance ground plane, isolated inputs, and isolated outputs with proper decoupling, is critical for best performance. Particularly harsh environments may require shielding of critical signals.

Breadboards and wire-wrapped boards are not recommended if low noise is desired.

6.4 Single-Supply Operation

The MCP4901/4911/4921 devices are rail-to-rail voltage output DAC devices designed to operate with a V_{DD} range of 2.7V to 5.5V. Its output amplifier is robust enough to drive small signal loads directly. Therefore, it does not require an external output buffer for most applications.

6.4.1 DC SET POINT OR CALIBRATION

A common application for DAC devices is digitally-controlled set points and/or calibration of variable parameters, such as sensor offset or slope. For example, the MCP4921 and MCP4922 provide 4096 output steps. If the external voltage reference (V_{REF}) is 4.096V, the LSb size is 1 mV. If a smaller output step size is desired, a lower external voltage reference is needed.

6.4.1.1 Decreasing Output Step Size

If the application is calibrating the bias voltage of a diode or transistor, a bias voltage range of 0.8V may be desired with about 200 µV resolution per step. Two common methods to achieve a 0.8V range is to either reduce V_{REF} to 0.82V or use a voltage divider on the DAC's output.

Using a V_{REF} is an option if the V_{REF} is available with the desired output voltage range. However, occasionally, when using a low-voltage V_{REF}, the noise floor causes an SNR error that is intolerable. Using a voltage divider method is another option and provides some advantages when V_{REF} needs to be very low or when the desired output voltage is not available. In this case, a larger value V_{REF} is used while two resistors scale the output range down to the precise desired level.

Example 6-1 illustrates this concept. Note that the bypass capacitor on the output of the voltage divider plays a critical function in attenuating the output noise of the DAC and the induced noise from the environment.

$$V_{OUT} = V_{REF} \cdot G \cdot \frac{D_n}{2^N}$$

$$V_{trip} = V_{OUT}\left(\frac{R_2}{R_1 + R_2}\right)$$

G = Gain selection (1x or 2x)
D_n = Digital value of DAC (0-255) for MCP4901/MCP4902
= Digital value of DAC (0-1023) for MCP4911/MCP4912
= Digital value of DAC (0-4095) for MCP4921/MCP4922
N = DAC Bit Resolution

EXAMPLE 6-1: EXAMPLE CIRCUIT OF SET POINT OR THRESHOLD CALIBRATION.

6.4.1.2 Building a “Window” DAC

When calibrating a set point or threshold of a sensor, typically only a small portion of the DAC output range is utilized. If the LSb size is adequate enough to meet the application’s accuracy needs, the unused range is sacrificed without consequences. If greater accuracy is needed, then the output range will need to be reduced to increase the resolution around the desired threshold.

If the threshold is not near V_{REF} or V_{SS}, then creating a “window” around the threshold has several advantages. One simple method to create this “window” is to use a voltage divider network with a pull-up and pull-down resistor. Example 6-2 and Example 6-4 illustrate this concept.

(a) Single Output DAC:

MCP4901
MCP4911
MCP4921

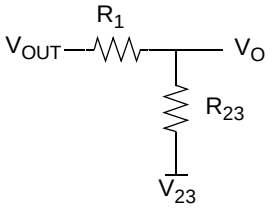
= Digital value of DAC (0-4095) for MCP4921/MCP4922
N = DAC Bit Resolution

Thevenin Equivalent

$$R_{23} = \frac{R_2 R_3}{R_2 + R_3}$$

$$V_{23} = \frac{(V_{CC+} R_2) + (V_{CC-} R_3)}{R_2 + R_3}$$

$$V_{trip} = \frac{V_{OUT} R_{23} + V_{23} R_1}{R_2 + R_{23}}$$



EXAMPLE 6-2: SINGLE-SUPPLY “WINDOW” DAC.

6.5 Bipolar Operation

Bipolar operation is achievable using the MCP4901/4911/4921 family devices by using an external operational amplifier (op amp). This configuration is desirable due to the wide variety and availability of op amps. This allows a general purpose DAC, with its cost and availability advantages, to meet almost any desired output voltage range, power and noise performance.

Example 6-3 illustrates a simple bipolar voltage source configuration. R_1 and R_2 allow the gain to be selected, while R_3 and R_4 shift the DAC's output to a selected offset. Note that R4 can be tied to V_{REF} instead of V_{SS} if a higher offset is desired. Note that a pull-up to V_{REF} could be used, instead of R_4, if a higher offset is desired.

(a) Single Output DAC:
MCP4901
MCP4911

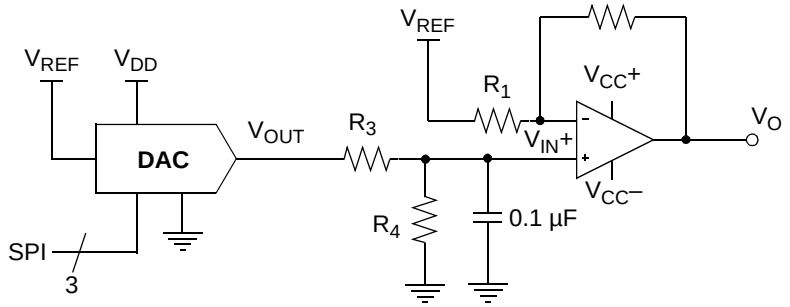
(b) Dual Output DAC:
MCP4902
MCP4912
MCP4922



$$V_{OUT} = V_{REF} \cdot G \cdot \frac{D_n}{2^N}$$

$$V_{IN+} = \frac{V_{OUT} R_4}{R_3 + R_4}$$

$$V_O = V_{IN+}\left(1 + \frac{R_2}{R_1}\right) - V_{DD}\left(\frac{R_2}{R_1}\right)$$

G = Gain selection (1x or 2x)
D_n = Digital value of DAC (0 – 255) for MCP4901/MCP4902
= Digital value of DAC (0 – 1023) for MCP4911/MCP4912
= Digital value of DAC (0 – 4095) for MCP4921/MCP4922
N = DAC Bit Resolution

EXAMPLE 6-3: DIGITALLY-CONTROLLED BIPOLAR VOLTAGE SOURCE.

6.5.1 DESIGN EXAMPLE: DESIGN A BIPOLAR DAC USING EXAMPLE 6-3 WITH 12-BIT MCP4912 OR MCP4922

An output step magnitude of 1 mV with an output range of ±2.05V is desired for a particular application.
The following steps show the details:

1. Calculate the range: +2.05V – (-2.05V) = 4.1V.
2. Calculate the resolution needed:
   4.1V/1 mV = 4100
   Since 2^{12} = 4096, 12-bit resolution is desired.
3. The amplifier gain (R_2/R_1), multiplied by V_{REF}, must be equal to the desired minimum output to achieve bipolar operation. Since any gain can be realized by choosing resistor values ($R_1 + R_2$), the V_{REF} source needs to be determined first. If a V_{REF} of 4.1V is used, solve for the gain by setting the DAC to 0, knowing that the output needs to be -2.05V. The equation can be simplified to:

$$\frac{-R_2}{R_1} = \frac{-2.05}{V_{REF}} = \frac{-2.05}{4.1} \qquad \frac{R_2}{R_1} = \frac{1}{2}$$

If R_1 = 20 kΩ and R_2 = 10 kΩ, the gain will be 0.5

4. Next, solve for R_3 and R_4 by setting the DAC to 4096, knowing that the output needs to be +2.05V.

$$\frac{R_4}{(R_3 + R_4)} = \frac{2.05V + 0.5V_{REF}}{1.5V_{REF}} = \frac{2}{3}$$

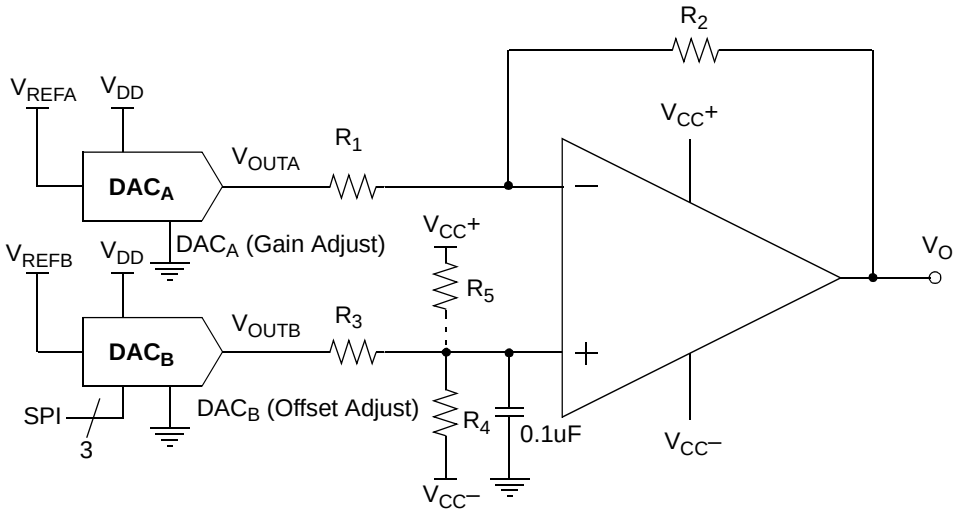
If R_4 = 20 kΩ, then R_3 = 10 kΩ

6.6 Selectable Gain and Offset Bipolar Voltage Output Using DAC Devices

In some applications, precision digital control of the output range is desirable. Example 6-4 illustrates how to use the DAC devices to achieve this in a bipolar or single-supply application.

This circuit is typically used in Multiplier mode and is ideal for linearizing a sensor whose slope and offset varies. Refer to **Section 6.9 "Using Multiplier Mode"** for more information on Multiplier mode.

The equation to design a bipolar "window" DAC would be utilized if R_3, R_4 and R_5 are populated.



$$V_{OUTA} = (V_{REFA}G_A)\frac{D_A}{2^N}$$

$$V_{OUTB} = (V_{REFB}G_B)\frac{D_B}{2^N}$$

$$V_{IN+} = \frac{V_{OUTB}R_4 + V_{CC\text{-}}R_3}{R_3 + R_4}$$

$$V_O = \underbrace{V_{IN+}\left(1 + \frac{R_2}{R_1}\right)}_{\text{Offset Adjust}} - \underbrace{V_{OUTA}\left(\frac{R_2}{R_1}\right)}_{\text{Gain Adjust}}$$

Gx = Gain selection (1x or 2x)
N = DAC Bit Resolution
D_A, D_B = Digital value of DAC (0-255) for MCP4901/MCP4902
= Digital value of DAC (0-1023) for MCP4911/MCP4912
= Digital value of DAC (0-4095) for MCP4912/MCP4922

Bipolar "Window" DAC using R_4 and R_5

Thevenin Equivalent

$$V_{45} = \frac{V_{CC+}R_4 + V_{CC\text{-}}R_5}{R_4 + R_5} \qquad R_{45} = \frac{R_4R_5}{R_4 + R_5}$$

$$V_{IN+} = \frac{V_{OUTB}R_{45} + V_{45}R_3}{R_3 + R_{45}}$$

$$V_O = \underbrace{V_{IN+}\left(1 + \frac{R_2}{R_1}\right)}_{\text{Offset Adjust}} - \underbrace{V_{OUTA}\left(\frac{R_2}{R_1}\right)}_{\text{Gain Adjust}}$$

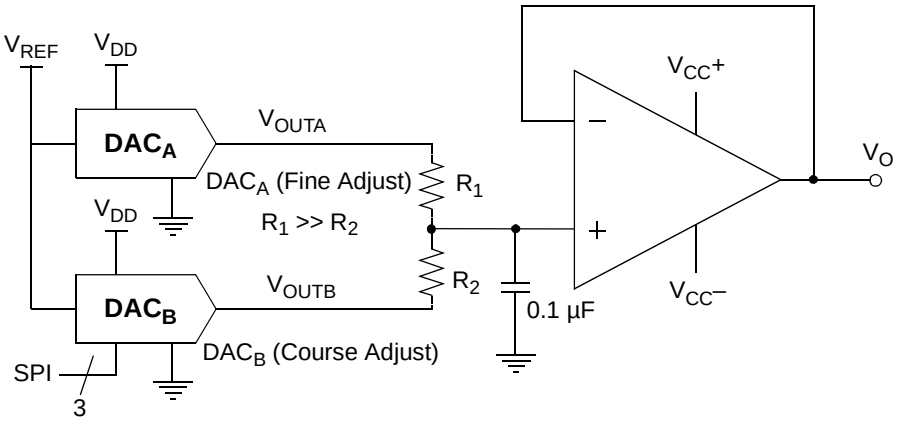
EXAMPLE 6-4: BIPOLAR VOLTAGE SOURCE WITH SELECTABLE GAIN AND OFFSET.

6.7 Designing a Double-Precision DAC

Example 6-5 illustrates how to design a single-supply voltage output capable of up to 24-bit resolution by using 12-bit DACs. This design is simply a voltage divider with a buffered output.

As an example, if a similar application to the one developed in **Section 6.5.1 "Design Example: Design a bipolar dac using example 6-3 with 12-bit MCP4912 or MCP4922"** required a resolution of 1 µV instead of 1 mV and a range of 0V to 4.1V, then 12-bit resolution would not be adequate.

1. Calculate the resolution needed: 4.1V/1 µV = 4.1x 10^6. Since 2^{22} = 4.2 x 10^6, 22-bit resolution is desired. Since DNL = ±0.75 LSB, this design can be done with the MCP4921 or MCP4922.
2. Since the DAC_B's V_{OUTB} has a resolution of 1 mV, its output only needs to be "pulled" 1/1000 to meet the 1 µV target. Dividing V_{OUTA} by 1000 would allow the application to compensate for DAC_B's DNL error.
3. If R_2 is 100Ω, then R_1 needs to be 100 kΩ.
4. The resulting transfer function is not perfectly linear, as shown in the equation of Example 6-5.



$$V_{OUTA} = V_{REFA} G_A \frac{D_A}{2^{12}}$$

$$V_O = \frac{V_{OUTA} R_2 + V_{OUTB} R_1}{R_1 + R_2}$$

$$V_{OUTB} = V_{REFB} G_B \frac{D_B}{2^{12}}$$

G = Gain selection (1x or 2x)
D = Digital value of DAC (0-4096)

EXAMPLE 6-5: SIMPLE, DOUBLE PRECISION DAC WITH MCP4921 OR MCP4922.

6.8 Building Programmable Current Source

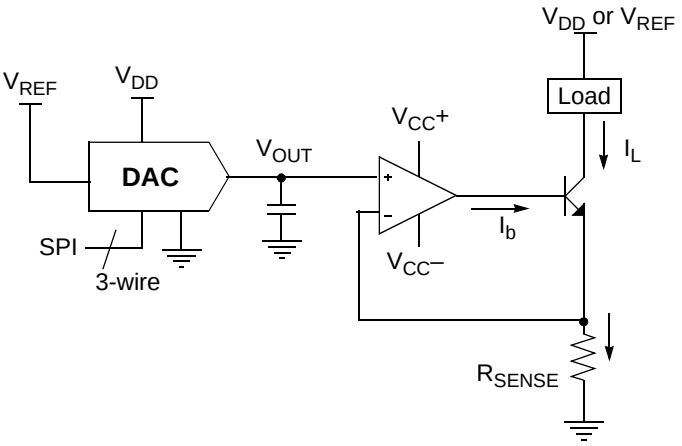
Example 6-6 shows an example for building a programmable current source using a voltage follower. The current sensor (sensor resistor) is used to convert the DAC voltage output into a digitally-selectable current source.

Adding the resistor network from Example 6-2 would be advantageous in this application. The smaller R_{sense} is, the less power is dissipated across it. However, this also reduces the resolution that the current can be controlled with. The voltage divider, or "window", DAC configuration would allow the range to be reduced, thus increasing the resolution around the range of interest.

When working with very small sensor voltages, plan on eliminating the amplifier's offset error by storing the DAC's setting under known sensor conditions.

(a) Single Output DAC:
MCP4901
MCP4911
MCP4921

(b) Dual Output DAC:
MCP4902
MCP4912
MCP4922



$$I_b = \frac{I_L}{\beta}$$

$$I_L = \frac{V_{OUT}}{R_{sense}} \times \frac{\beta}{\beta + 1}$$

where β = Common-Emitter Current Gain.

$$V_{OUT} = V_{REF} \cdot G \cdot \frac{D_n}{2^N}$$

G = Gain select (1x or 2x)
D_n = Digital value of DAC (0-255) for MCP4901/MCP4902

= Digital value of DAC (0-4095) for MCP4921/MCP4922
N = DAC Bit Resolution

EXAMPLE 6-6: DIGITALLY-CONTROLLED CURRENT SOURCE.

6.9 Using Multiplier Mode

The MCP4901/4911/4921 and MCP4902/MCP4912/MCP4922 family devices use external reference, and these devices are ideally suited for use as a multiplier/divider in a signal chain. Common applications are: (a) precision programmable gain/attenuator amplifiers and (b) motor control feedback loops. The wide input range (0V – V_{DD}) is in Unbuffered mode, and near rail-to-rail range in Buffered mode. Its bandwidth (> 400 kHz), selectable 1x/2x gain and low power consumption give maximum flexibility to meet the application's needs.

To configure the device for multiplier applications, connect the input signal to V_{REF} and serially configure the DAC's input buffer, gain and output value. The DAC's output can utilize any of the examples from 6-1 to 6-6, depending on the application requirements. Example 6-7 is an illustration of how the DAC can operate in a motor control feedback loop.

If the gain selection bit is configured for 1x mode (<$\overline{GA}$> = 1), the resulting input signal will be attenuated by $D/2^n$. With the 12-bit DAC (MCP4921 or MCP4922), if the gain is configured for 2x mode (<$\overline{GA}$> = 0), codes less than 2048 attenuate the signal, while codes greater than 2048 gain the signal.

A DAC provides significantly more gain/attenuation resolution when compared to typical programmable gain amplifiers. Adding an op amp to buffer the output, as illustrated in Examples 6-2 through 6-6, extends the output range and power to meet the precise needs of the application.

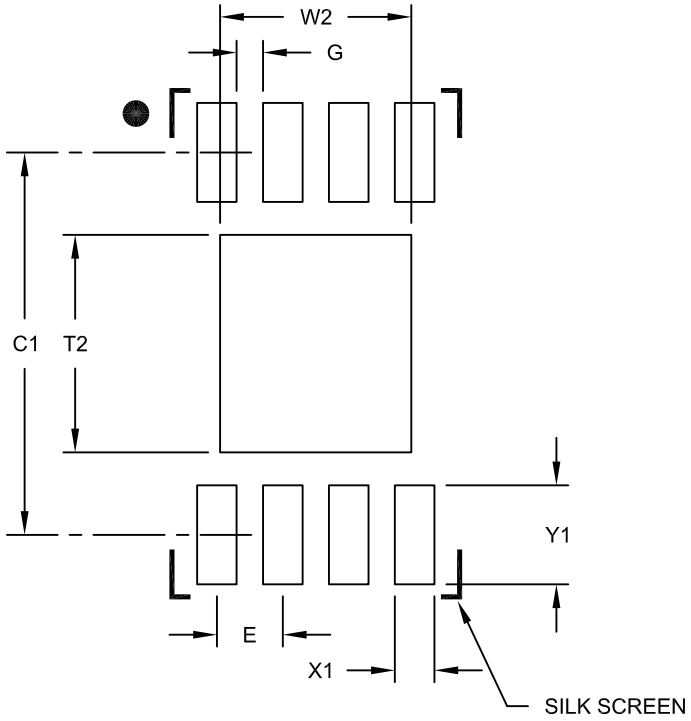
3. Package is saw singulated.
4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-123C

8-Lead Plastic Dual Flat, No Lead Package (MC) – 2x3x0.9 mm Body [DFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.50 BSC		
Optional Center Pad Width	W2			1.45
Optional Center Pad Length	T2			1.75
Contact Pad Spacing	C1		2.90	
Contact Pad Width (X8)	X1			0.30
Contact Pad Length (X8)	Y1			0.75
Distance Between Pads	G	0.20		

Notes:

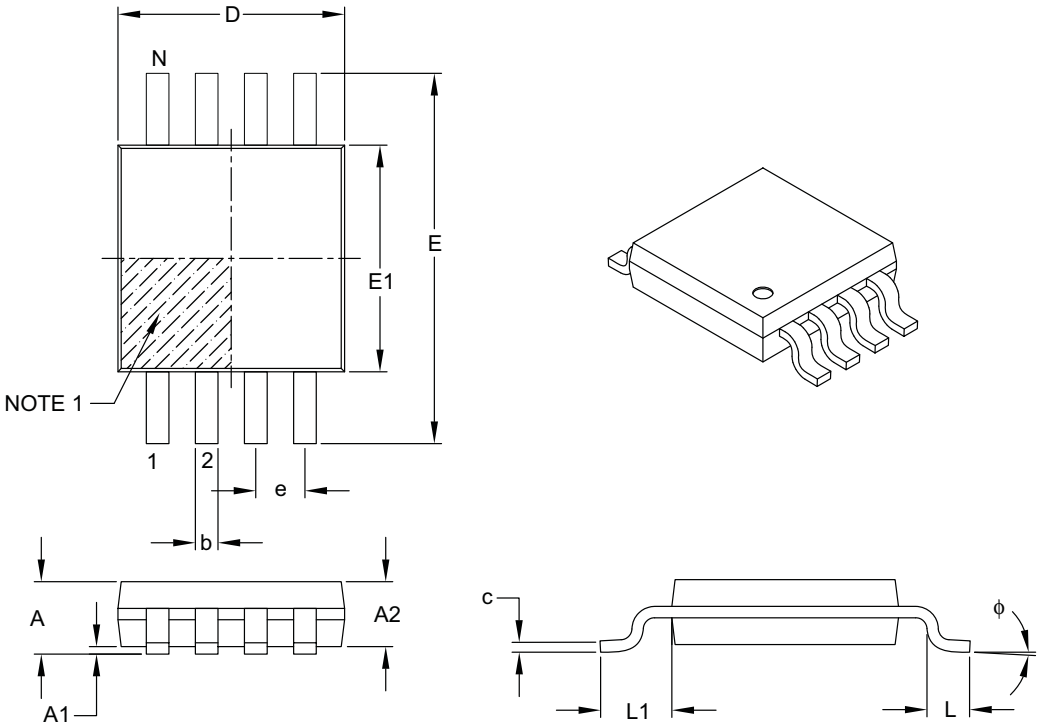
1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2123A

8-Lead Plastic Micro Small Outline Package (MS) [MSOP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Pins	N		8	
Pitch	e		0.65 BSC	
Overall Height	A	–	–	1.10
Molded Package Thickness	A2	0.75	0.85	0.95
Standoff	A1	0.00	–	0.15
Overall Width	E		4.90 BSC	
Molded Package Width	E1		3.00 BSC	
Overall Length	D		3.00 BSC	
Foot Length	L	0.40	0.60	0.80
Footprint	L1		0.95 REF	
Foot Angle	ϕ	0°	–	8°
Lead Thickness	c	0.08	–	0.23
Lead Width	b	0.22	–	0.40

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15 mm per side.
3. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-111B

APPENDIX A: REVISION HISTORY

Revision A (April 2010)

- Original Release of this Document.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X	/XX
Device	Temperature Range	Package

Device	MCP4901:	8-Bit Voltage Output DAC
	MCP4901T:	8-Bit Voltage Output DAC (Tape and Reel)
	MCP4911:	10-Bit Voltage Output DAC
	MCP4911T:	10-Bit Voltage Output DAC (Tape and Reel)
	MCP4921:	12-Bit Voltage Output DAC
	MCP4921T:	12-Bit Voltage Output DAC (Tape and Reel)
Temperature Range	E =	-40°C to +125°C (Extended)
Package	MC =	8-Lead Plastic Dual Flat, No Lead Package - 2x3x0.9 mm Body (DFN)
	MS =	8-Lead Plastic Micro Small Outline (MSOP)
	SN =	8-Lead Plastic Small Outline - Narrow, 150 mil (SOIC)
	P =	8-Lead Plastic Dual In-Line (PDIP)

Examples:

a) MCP4901-E/P: Extended temperature, PDIP package.

b) MCP4901-E/SN: Extended temperature, SOIC package.

c) MCP4901T-E/SN: Extended temperature, SOIC package Tape and Reel.

d) MCP4901-E/MS: Extended temperature, MSOP package.

e) MCP4901T-E/MS: Extended temperature, MSOP package Tape and Reel.

f) MCP4901-E/MC: Extended temperature, DFN package.

g) MCP4901T-E/MC: Extended temperature, DFN package Tape and Reel.

h) MCP4911-E/P: Extended temperature, PDIP package.

i) MCP4911-E/SN: Extended temperature, SOIC package.

j) MCP4911T-E/SN: Extended temperature, SOIC package Tape and Reel.

k) MCP4911-E/MS: Extended temperature, MSOP package.

l) MCP4911T-E/MS: Extended temperature, MSOP package Tape and Reel.

m) MCP4911-E/MC: Extended temperature, DFN package.

n) MCP4911T-E/MC: Extended temperature, DFN package Tape and Reel.

o) MCP4921-E/P: Extended temperature, PDIP package.

p) MCP4921-E/SL: Extended temperature, SOIC package.

q) MCP4921T-E/SL: Extended temperature, SOIC package Tape and Reel.

r) MCP4921-E/MS: Extended temperature, MSOP package.

s) MCP4921T-E/MS: Extended temperature, MSOP package Tape and Reel.

t) MCP4921-E/MC: Extended temperature, DFN package.

u) MCP4921T-E/MC: Extended temperature, DFN package Tape and Reel.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

ISBN:

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001
Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
