DESCRIPTION

The DS1816 EconoReset uses a precision temperature reference and comparator circuit to monitor the status of the power supply (V_{CC}). When an out-of-tolerance condition is detected, an internal power-fail signal is generated which forces reset to the active state. When V_{CC} returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 150ms to allow the power supply and processor to stabilize.

OPERATION — POWER MONITOR

The DS1816 provides the function of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When V_{CC} is detected as out-of-tolerance, the $\overline{RST}$ signal is asserted. On power-up, $\overline{RST}$ is kept active for approximately 150ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before $\overline{RST}$ is released.

NOTES:

1. All voltages are referenced to ground.
2. Measured with $V_{CC} \geq 2.7V$.
3. A $1k\Omega$ external pull-up resistor may be required in some applications for proper operation of the microprocessor reset control circuit.
4. Measured with $\overline{RST}$ output open.
5. Measured with $2.7V \leq V_{CC} \leq 3.3V$.
6. $t_R = 5\mu s$
7. V_{OH} and I_{OH} are a function of the value of R_P and the associated output load conditions.
8. The t_F value is for reference in defining values for t_{RPD} and should not be considered a requirement for proper operation or use of the device.
