## Description

The SKY13421-486LF is a pHEMT GaAs double-pole, double-throw (DPxDT) switch designed for cellular infrastructure band switching applications. This device is a paired DPDT switch, controlled synchronously, that includes two single-pole, double-throw (SPDT) switches with RF lines that cross inside the chip. The internal crossed switch arrangement is designed to switch balanced RF filters.

Switching is controlled by a single control voltage. Depending on the logic voltage level applied to the control pin (VCTL), the RFCA and RFCB pins are each connected to one of two switched RF outputs (RF1A, RF1B, RF2A, or RF2B) using a low insertion loss path, while maintaining a high isolation path to the alternate port. DC blocking capacitors are required on all RF ports.

The switch is manufactured in a compact, 1.6 x 1.6 mm, 14-pin exposed pad plastic Quad Flat No-Lead (QFN) package.

A functional block diagram is shown in Figure 1. The pin configuration and package are shown in Figure 2. Signal pin assignments and functional pin descriptions are provided in Table 1.

**Table 2. SKY13421-486LF Absolute Maximum Ratings (Note 1)**

Parameter	Symbol	Minimum	Maximum	Units
Input power	P <sub>IN</sub>		+30	dBm
Supply voltage	V <sub>DD</sub>	2.0	5.5	V

**Note 1:** Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal value. Exceeding any of the limits listed here may result in permanent damage to the device.

**CAUTION:** Although this device is designed to be as robust as possible, electrostatic discharge (ESD) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions should be used at all times.

### Functional Description

The SKY13421-486LF is comprised of a CMOS decoder that enables a differential input signal to be switched between two different differential outputs. This is particularly useful when switching between two Surface Acoustic Wave (SAW) filters.

The recommended startup sequence is:

Step 1: Apply  $V_{DD}$

Step 2: Apply control voltage ( $V_{CTL}$ )

Step 3: Apply RF input

The device must be turned off in the reverse order. The part can not have  $V_{CTL}$  high without  $V_{DD}$  applied.

### Electrical and Mechanical Specifications

The absolute maximum ratings of the SKY13421-486LF are provided in Table 2. The recommended operating conditions are specified in Table 3 and electrical specifications are provided in Table 4.

Typical performance characteristics of the SKY13421-486LF are illustrated in Figures 3 through 8.

The state of the SKY13421-486LF is determined by the logic provided in Table 5.
